AMERICAN SURVEY

MacArthur Has His Day

Washington, D.C.

RETURNING to the United States after fourteen years, General MacArthur astonished those who had feared—or hoped—that he would prove a bitter disappointment to the millions whose imaginations, aided by a large staff of public relations officers, had promoted him to something like divinity. When he had finished speaking to Congress there was no doubt that he was a formidable personality, even when removed from the careful staging of Tokyo, a better orator than any contemporary American, except General Eisenhower, a superb actor of the old school and a more able speech writer than any in the coverts of ghosts who haunt the White House and the Department of State. “We heard God speak here today,” said Representative Dewey Short of Missouri, “God in the flesh, the voice of God.” Mr Short was probably exaggerating; but the rows of weeping Congressmen and military leaders, when the General promised to “fade away” and uttered his pianissimo “Goodbye” with a brave and tolerant smile, were a tribute to his artistry.

And it is his artistry, rather than his arguments, which will plague the Administration for months to come. If anybody takes the trouble to analyse the speech, to disregard the

jibes at “lay circles” and foreigners and to forget the sentimental passages, the quarrel between the General and the President becomes a disagreement over whether to take any, or all, of a number of steps which might bring about a full-scale war with China or the intervention of Soviet Russia. It is only natural that the civilian head of the government should want rather more evidence than the General’s opinion that “the Soviet will not necessarily mesh its actions with our moves,” before starting on a policy which could produce either or both of these consequences.

The steps which are involved in this quarrel are three: naval blockade of the Chinese coast; bombing of the “privileged sanctuary” in Manchuria; and the “removal of restrictions on the forces of the Republic of China on Formosa with logistical support to contribute to their effective operation.” On the first and third of these General MacArthur claimed to have had “in the past” the support of the Joint Chiefs of Staff. On the second he did not claim their support, though the speech was so constructed as to give that impression.

★

As far as can be discovered in Washington—and the truth will no doubt come out in the Congressional hearings during the next two or three weeks—the Chiefs of Staff have never liked the idea of a naval blockade or thought that it could add much to an economic blockade. No doubt the “intensification” of the economic blockade, which the General also advocated, has the agreement of the Joint Chiefs; in fact, it is being intensified every day. But a true naval blockade, one which would, for instance, stop coastwise traffic and vessels from Russian ports, is technically an act of war as well as being costly in ships and men. The Chiefs of Staff, however, are well aware that they would have a better case for resisting attempts to impose such a naval blockade if the British Government were inclined to co-operate more wholeheartedly in intensifying the economic blockade.

A more important bone of contention, and one which has been bitterly fought over for months, is that of the “privileged sanctuary.” The opposition of the Joint Chiefs to bombing the bases in Manchuria has been founded on the most practical grounds of all—that, on balance, it pays not to do it. “Communist air intervention,” General Bradley said on April 17th, “has not been a factor in the ground action to date. Neither has it been any serious threat to our air force.” The air war has been fought so far according to a formal set of what the Pentagon calls “ground rules,” rules which have been generally to allied advantage. The United Nations have not bombed the Manchurian sanctuary and the enemy has not bombed allied bases in South Korea and Japan. Until it does, the Chiefs of Staff will be satisfied to leave well alone; when it does, the whole matter will need to be reconsidered.

Even more emotional is the disagreement about the use of Chinese Nationalist troops, because it is complicated by violently conflicting opinions on the value of the Generalissimo and Mme Chiang Kai-shek. But it was

disingenuous of General MacArthur to say that “no man in his right mind would advocate sending our ground forces into continental China” and, a few sentences later, to recommend logistical support to help the operations of troops from Formosa. This logistical support, so negligently proffered, would have to consist of enough planes to achieve mastery of the sky and enough ships to achieve mastery of the sea along a considerable length of the Chinese coast; enough landing craft to put “the friendly Chinese force of some six hundred thousand men” ashore and enough ships, material and men to keep them supplied as they consolidated their beach-head and moved inland—supposing that they could do this. The Joint Chiefs of Staff have shown no inclination, unless in private to General MacArthur, to recommend such a large investment in a force which has too often in the past shown a regrettable tendency to desert with all its equipment as soon as it obtains enough American material to make the change financially worth-while.

★

What was, perhaps, most interesting about General MacArthur’s recommendations was that they came so close, excepting only in his belief in the efficiency of the Chinese Nationalist army, to those that the Secretary of State was trying to sell to Mr Attlee in December. Mr Acheson’s “limited war,” which then had wider limits than the Joint Chiefs thought comfortable, had something of the air of a holy war, just as the General’s has now. Yet it is Mr Acheson who is the target for most of the abuse which comes today from the apostles of “Americanism,” whose prophet is General MacArthur.

It was Mr Acheson, too, who was condemned, eighteen months ago, for saying that, for Asia, “national independence has become the symbol both of freedom from foreign domination and freedom from the tyranny of poverty and misery” and that Communism had only been shrewd enough to use the forces of nationalism. But, in his speech, General MacArthur said the same thing:

World ideologies play little part in Asian thinking and are little understood. What the people strive for is the opportunity for a little more food in their stomachs, a little better clothing on their backs, a little firmer roof over their heads, and the realisation of the normal nationalist urge for political freedom.

These passages were, in many ways, the best part of the speech, though it was, perhaps, a pity to follow this approval of nationalism so quickly with the reference to dominating “every Asiatic port from Vladivostok to Singapore.” And some who spent the war years in prison camps will want a little more time before they believe that “the Japanese people, since the war, have undergone the greatest reformation in recorded history” and that they are now “economically, politically and socially . . . abreast of many free nations of the earth and will not again fail the universal trust.” But no doubt the American officials now dealing with the failings of the Philippines will be glad to hear that the capacity of the islands for “high moral leadership in Asia is unlimited.”

The General’s appreciation of the changes in Chinese culture and character over the past fifty years was spoiled by a mistake when he placed the start of the nationalist urge “at the turn of the century under the regime of Chang Tso-lin,” a slip, perhaps, but one which could make an audience of Asian experts as doubtful of his knowledge as an American audience would be of the credentials of a lecturer on American history who began: “In 1903, when Huey Long was President. . . .” And it was hard to under-

stand how the General could be so confident of bringing the war to a quick and comparatively cheap victory, by bombing Chinese bases and allowing the Nationalists to invade the mainland, when he had just said that

the Chinese people have become militarised. . . . They now constitute excellent soldiers with competent staffs and commanders. This has produced a new and dominant power in Asia . . . which . . . has become aggressively imperialistic, with a lust for expansion and increased power normal to this type of imperialism.

But few people will examine his arguments when they need only adopt his slogans. “Don’t scuttle the Pacific” sounds splendid. So does “In war there is no substitute for victory”; though it is only another phrase for the “unconditional surrender,” of which, when it was President Roosevelt’s property, General MacArthur was critical. “It was not precisely,” said Mr James Reston next morning in the *New York Times*, “the speech of a man who was determined to fade away”—certainly not as an old soldier fades away. The General is more likely to follow the example of the Cheshire Cat.

Loyalty by Oath?

[FROM A CORRESPONDENT IN CALIFORNIA]

OPPONENTS of loyalty oaths have been greatly encouraged by a unanimous decision of the California District Court of Appeals on April 6th, holding that a special political test for officers of public trust, including university professors, is unconstitutional. The issue was raised by eighteen members of the teaching staff of the University of California who are seeking reinstatement; they were dismissed in August last year for refusing to sign a declaration that they were not Communists.

The court’s support for their position promises to have wide repercussions, for it is not only university professors in California who may be required to give special proofs of their patriotism. One of the bitterly contested provisions of the Taft-Hartley Labour Act forced officers of trade unions to sign an anti-Communist affidavit before their unions might enjoy certain advantages; the Supreme Court has just upheld a Maryland law requiring candidates for state office to give a similar pledge. Critics, while agreeing that Communists should be barred from teaching and government service, fear that the loyalty oath is the thin end of control of opinion; they suspect that those who will suffer are not Communists, who will sign anything, but radicals and dissenters whose patriotism may be different from the prevailing variety, but is none the less genuine. University professors and trade unionists also deeply resent being singled out as unreliable groups in need of special procedures to guarantee their loyalty.

The decision of the Appellate Court, which is to be reheard and perhaps appealed, found that the professors should be reinstated, for, as holders of “offices of public trust,” they were subject only to the regular oath of allegiance required of all office-holders. The state constitution, in the words of the decision, provides that

“AMERICAN SURVEY” is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Clear two-way view...
of transatlantic trade

The Chase National Bank is well situated to assist British businessmen engaged in trade with the United States. As an established American bank in Britain, the Chase affords a service based on clear understanding of British requirements and thorough knowledge of business and trade conditions across the Atlantic.

no one should be subjected, as a condition of holding office, to any test of political or religious belief other than his pledge to support the constitution of this state and of the United States; that that pledge is the highest loyalty that can be demonstrated by any citizen. . . .

The present case arose out of a two-year long dispute at the university over means of implementing the regents' standing policy of excluding Communists from the staff. The spark which set off the explosion was the threat of the Un-American Activities Committee of the California Legislature to investigate alleged Communism in the university's nine branches. As the university is dependent upon funds appropriated by the Legislature, it was suggested early in 1949 that some strong demonstration of its anti-communist policy would be desirable. The long and bitter debate that ensued produced a compromise proposal offered by a committee of former students. Under this plan, all the university staff would continue to take the standard oath of allegiance demanded of all state employees. In addition, they would sign a statement that they were not Communists. Those who failed to sign the latter could appeal to the Committee on Academic Privilege Tenure of the Academic Senate, which includes in its membership all associate and full professors. The committee's findings would go to the regents through the president of the university. This proposal was welcomed because it seemed to preserve the staff's right to regulate its own membership and to assure the public that the university harboured no subversives.

Thirty-nine members of the staff who had refused to sign the anti-communist statement then appeared before this committee. Of these, six declined to state their views on Communism and were dropped from consideration. The others, including professors of great distinction and ex-servicemen with outstanding war records, satisfied the committee on the

score of their anti-communist attitude and were recommended for retention. The recommendations were upheld by Mr Robert Sproul, president of the university, at the meeting of the Board of Regents in July, 1950, when he asked that the screening procedure be accepted as an alternative to signing on the dotted line. By a vote of 10 to 9 his recommendations were accepted. But when the matter was reconsidered at the next meeting, the pro-oath faction carried the day, securing a 12 to 10 vote for compelling the non-signers to comply as a matter of discipline.

*

This reversal served to bring clearly into focus the fact that the real issue was no longer Communism, but the assertion of the regents' authority. The carefully built structure of relationships between a self-disciplining staff, the president, and a governing board with final authority was dealt a destructive blow by the sudden insistence of a small majority of the regents on full exercise of their legal powers. In the sharp division on this point personalities and local politics played important roles. Mr Earl Warren, the State Governor and chairman of the Board of Regents, led the moderates, pleading for respect for the dignity of the teaching staff and contending that the oath was both ineffectual and discriminatory. Supporting the Governor were nine regents, seven of them impeccable Republicans. The pro-oath faction, thenceforth known as the "oath regents," included Mr Warren's rival, Lt. Governor Goodwin Knight, the majority of members from southern California, where the university's largest branch, at Los Angeles, aspires to greater autonomy, and, leading the opposition, the redoubtable Mr John Francis Neylan, formerly a Hearst lawyer. The inevitable lineup of the press behind these factions gave the entire controversy the flavour of a political campaign, emphasising

Do We Know Our Shot Tower?

"On your right," cries the man with the megaphone in the Greenwich bound pleasure steamer, "On your right is the celebrated Shot Tower! On your left . . ." As if we needed to be told! For the Shot Tower is...the Shot Tower was *our* Shot Tower. Not so many months ago our molten lead was falling* from its dizzy upper heights into our tank of water at the bottom. Not so many years ago our lookouts were watching uneasily from its balcony for somebody else's flying bombs. Pneumatic drills stammer and stutter. The South Bank changes. Trumpets tootle. The Festival of Britain arises. Transformation triumphant . . . total turnabout . . . but no! For there stands the Shot Tower, as tall as ever—though it looks rather more like a lighthouse now, and we have heard murmurs of radar messages to the moon. Well, what of that? In the respectability of its age, in the adaptability of its outlook, our Shot Tower is a true representative of

* As it still is from our tower in Chester.

the chronic cleavage between northern and southern California and the split in local Republican ranks.

The effect of the controversy on the university has been equally disruptive. In addition to the twenty-six professors dropped by the regents' action, there have been thirty-seven resignations in protest. The academic world has moved quickly to condemn the inroads on security of tenure and staff authority at California and a virtual professional boycott of the university is now in effect. The reasons for this condemnation are the same as those given by the non-signers for their stand: refusal to accept political censorship of teaching and to surrender the staff's right to determine its own standards. In this connection, it is interesting that recent attempts in the California Legislature to impose loyalty oaths on doctors and lawyers have met with strong and successful professional resistance. The powerful doctors' lobby has insisted that the California Medical Association must make its own rules for the practice of medicine in the state. The lawyers have been equally resistant to a state loyalty oath.

Still to be settled is the validity of the Levering Act, passed by the last Legislature, requiring loyalty oaths from all state employees, including teachers. This law is now being challenged in the courts. The California voters will be able to have their say on the entire oath problem in 1952. The Legislature has just passed an amendment to the state constitution to add to the text of the present oath of allegiance a statement that the signer does not advocate overthrow of the government by force and has not during the last five years belonged to any organisation advocating such a course. This must be approved by the voters. But the Appellate Court's decision now casts real doubt on the validity of the measure and raises again the question of whether it is possible "to judge men by what they sign instead of what they are."

American Notes

Foreign Aid at Sea

When the President's request for funds for foreign aid in 1952 at last puts out to sea, as it must before long, it is likely to be more badly battered by Congressional storms than its predecessors, even though this year, instead of a fleet of smaller vessels, only one big ship is setting sail. It will be loaded with both military and economic assistance, and its estimated value is about \$10.5 billion. The President may try to pour oil on the Congressional waters by proposing that the Marshall Plan itself should end a year early, but waves of opposition are already piling up at the suggestion that the Economic Co-operation Administration should be kept on deck indefinitely to deal with the economic aspects of foreign aid. Mr Hoffman himself considers that it would be a breach of faith not to push ECA overboard in mid-1952, as was promised when the agency was first established.

Paradoxically, the thing that may save ECA, in fact if not in name, is Mr Truman's attempt to take away its independence. He has recently written to Mr Foster, its present head, telling him that the changing international situation demands that the Secretary of State, through his Committee on International Security Affairs, should decide on the distribution of foreign aid funds between military and economic programmes, and between countries. Only the actual administration in their respective fields would be left to the Defence Department and ECA; the State Department itself would apparently continue to be in charge of the Fourth Point programme. It is of course true that the State Department can hardly exercise its responsibility for the country's foreign policy without controlling military and economic

assistance. Mr Foster is said to be ready to allow ECA to become an operating agency under the State Department, which seems to be the logical course. But from past experience it is not so sure that it is the practical one.

Mr Hoffman has said that, as Economic Co-operation Administrator, he would have been hamstrung had he not had direct access to the President and been at the head of an independent agency. It was Congress that originally insisted on giving ECA that independence, and its distrust of the State Department is even greater now than it was when the Marshall Plan began. If Congress decides that the United States can still afford to give economic assistance to foreign countries, it will probably also decide that a special agency is still necessary for that purpose. There is already a blueprint for ECA's successor available, one that was recommended by independent experts working on the Gray and Rockefeller Reports and one that until recently was thought to be acceptable to Mr Truman himself.

* * *

Labour Goes Back

For the moment, at least, the trade unions have won their two-months' strike to enlarge the authority of the Wage Board—a victory likely to whet their appetite for a greater say in policy. On the recommendation of his new board on mobilisation policy, itself a concession to labour, the President has reconstituted the Wage Board, giving it authority to consider not only disputes over wages, but also those concerning non-economic issues. The President will refer to the Board any dispute which threatens to interrupt the defence programme, and if the two parties agree to abide by its decision, its ruling will be final. Otherwise, it will merely make recommendations to the President.

The vote in the advisory board was carried over the protests of industry's representatives, who strongly oppose allowing the Wage Board to deal with non-wage disputes; they contend this scuttles the Taft-Hartley Act and means the end of collective bargaining. Senator Taft is already calling the Board "extra-legal" and its wings may be clipped when the Defence Production Act is extended. This is because the Act requires agreement between management and labour before a disputes tribunal is set up, and says that nothing shall be done to circumvent the Taft-Hartley Act.

The new Board, made up of public, labour and industry members, will find on its doorstep nearly 300 claims for exemptions from the present wage formula. Mr Johnson, the Economic Stabiliser, has however dealt with the most embarrassing. He has permitted the wage increase agreed between the Army, which is still running the railroads, and their non-operating employees; this includes an adjustment for cost of living increases which carries the award above the permitted maximum.

These "escalator" clauses will be a nightmare to the Board unless their sting can be drawn by stabilising prices. Mr DiSalle, the Price Administrator, is hopeful that the peak may have been reached at only 2 or 3 per cent above January levels; a few months ago he expected a 5 per cent increase. He bases his belief on the existence of heavy inventories and the saturation of consumer demand. It is harder to see on what grounds he believes that a new series of price control orders for manufacturers will reduce prices. The main order, issued this week, permits manufacturers, whose prices were fixed in the January freeze, to add to their pre-Korean prices any increases in the cost of labour and materials; no increase in overhead costs may be included. Other orders are expected shortly for machinery, clothing, meat and cotton textiles. When these are issued, price control will have moved, theoretically, into its second stage, though retailers, who led the way, have had to be given two extensions of time to fill out the required forms and enforcement lags even farther behind.

TRANS WORLD AIRLINES

Wheat for India

The wheat for India which should have started moving from the ports a month ago has just started to move through Congress. It was never conceivable that the American people would permit political disagreements to stand in the way of aid to the starving, but the value of the gift would have been much greater, in both practical and moral terms, if it had been made at once. It has taken ten weeks, since the President first asked for emergency action, for the foreign affairs committees of both houses to give their unanimous approval to the project of sending 2,000,000 tons of wheat.

No doubt it jogged the complacency of Congress to realise that China and Russia saw the value of playing the good Samaritan in India. But it would be wrong to attribute all the delay to an unworthy desire to punish Mr Nehru for his stand on Korea, or to irritation over Kashmir. India asked for a loan on easy terms; it was the Administration which insisted upon a grant, on the grounds that India would not be able to repay a loan. The House Rules Committee held up the measure because it doubted whether it would pass in this form.

The chances of both the House and Senate Bills have been improved by abandoning the idea of a grant, altogether in the House and partially in the Senate. The latter, if it accepts its committee's draft, will make the wheat half loan, half grant; it is to be hoped this view will prevail. The loan, from the Economic Co-operation Administration, would be repaid either in dollars or strategic materials—a reminder that India's refusal to sell minerals needed for the atomic energy programme has been a factor in the delay. But the great need now is speed, for the famine is already upon India and ships must be taken from the reserve fleet and the wheat got to the ports on overcrowded railway lines before it can even set off on its mission. What is ironic is that wheat will represent a greater sacrifice today than it would two months ago; the prospects for the new crop are the worst in eight years, because of the weather and the farmer's failure to respond quickly enough to the change from surpluses to shortages.

* * *

Too Much Expansion?

The resignations of Mr Bevan and Mr Wilson have reminded thoughtful Americans that for the United States to have both unlimited guns and butter may mean, because of the drain on raw materials, that its allies go short of both. But suspicions had already been growing that even the United States could not afford to expand in all directions at once. The "voluntary restraint" committee of the Federal Reserve Board has pointed out that about half of private industry's record programme of expansion for this year—totalling nearly \$24 billion—has no direct connection with the defence effort; it merely intensifies the scramble for scarce materials, adds to inflationary pressures, and gets in the way of the military programme. The committee, which has already urged private lenders not to make more inventory loans, now urges that credit for industrial expansion be confined to projects which aid the defence effort.

Even desirable defence projects eat up scarce materials and labour, and may be excessive. Three committees of Congress, one the joint "watch-dog" committee on the defence programme, are now holding hearings to determine whether government agencies charged with expanding production have not taken too liberal a view of what is needed and paid too high a price for it. Direct loans, loan guarantees and commitments to buy are being made, but by far the most effective device is the privilege of writing off in five, instead of the normal twenty, years the proportion of new facilities attributable to defence needs. This

is a highly prized concession in a period in which taxes may be expected to be at their highest; it is also an expensive one in revenue lost to the government.

So far the Defence Production Administration has granted "certificates of necessity," which permit rapid write offs, on \$4 billion of new facilities; from 40 to 100 per cent of this is eligible for speedy amortisation. As the chart shows, the lion's share has gone to the steel industry, overcoming its fears of a deflationary day of reckoning to come. A "certificate of necessity" is, however, despite its name, no guarantee that a plant will be built; if it were, steel mills would be springing up everywhere. Money has turned shy with the conviction that projects in hand will assure more than ample steel for all by 1953; even the

mill designed to satisfy New England's desire for industrial independence may fail to find the financing it needs.

During the last war, concessions were granted on \$7 billion of facilities. The more rapid pace today is due to the victory of those who believe that a great expansion is needed not only in military production, but also in the basic materials which support the defence industries and strengthen the whole economy. What worries Congress is that big business is monopolising tax privileges; that civilian industries are being given unintended concessions ("rayon never went to war"), and that much of the expansion probably would have taken place without extravagant rewards. The effect of Congressional criticism has already been to tighten the purse-strings; late-comers—unless their project is strictly military—are receiving much less liberal treatment than the early birds.

Shorter Notes

When the Supreme Court reversed a conviction of two Negroes charged with the rape of a white girl in Florida, it did so on the time-honoured grounds that there was racial discrimination in selecting the jury. But Justice Jackson, in a concurring opinion, supported by Justice Frankfurter, dismissed this consideration as trivial and immaterial. Such a reign of terror had been incited by the local press, he wrote, that no Negro would have dared to vote for acquittal, while the sheriff was guilty of telling the newspapers that the accused had confessed. In fact, no confessions were produced in court, presumably because if they existed they had been obtained by third degree methods. In Justice Jackson's view, if the freedom of the press is so abused, the judicial process must be protected by removing the trial to another place.

Surplus Texas grapefruit, which Sweden has not been able to enjoy since 1946 because of a shortage of dollars, are to be exchanged for Swedish prefabricated houses and vegetable packing cases, under a barter agreement worked out last year by an enterprising Texan.

THE WORLD OVERSEAS

The French in Morocco—I

Little Change Since Lyautey

(From Our Special Correspondent)

THE *démarche* made by the Sultan of Morocco last November on his state visit to the French capital and the subsequent agitation of the Istiqlal clandestine party for the abolition of the Protectorate have led to no change in the juridical or practical relationships between Moroccans and Frenchmen. The Resident, General Juin, backed by all the parties in France except the Communists (who support any and every opponent of the Protectorate), has continued the Roman policy of direct administration initiated by Marshal Lyautey in 1912. According to the treaty of that year France reserves the legislative power, foreign policy, defence and jurisdiction in all matters affecting persons who are not Moroccan subjects. The *Maghzen* (government of the Sherifian Empire), which functions parallel to the Residency, exercises authority in purely Moroccan or Islamic affairs which comprise justice as between Moroccans, and religious discipline. In effect, the French either control or supervise (*contrôle*) every aspect of Moroccan life which is of interest to them, using to this end either their own officials or the Sultan's representatives in the locality (pashas) or in the tribes (caids). It is this system of direct administration which has transformed the complexion of Morocco in the last forty years.

Before examining Moroccan politics in more detail it is perhaps worth while taking a view of French colonial thinking as a whole. France, if it has distantly admired the British Empire, has never appreciated the medley of mercantilism, missionaries, medicos and public schoolboys which, with a seasoning of high aristocrats, has won the British such success among native peoples. The French conception of administration, at home as well as abroad, is essentially Napoleonic and Roman. It is something which is rigidly superimposed upon a supposedly chaotic society: it is the will of the central government overriding the local clashes of opinions and interests. Above all, the administration is a thing which, while it may well be torpedoed by the free play of opinion and parliamentary democracy, has absolutely nothing to gain from them. It is this profound distrust of politicians and the disunity that they naturally bring which has made it so hard instinctively for the French abroad to countenance even the most gentle movements of indigenous populations towards political expression. Just as in France the parliament is the natural enemy of the government, so overseas the emergence of native assemblies is the proconsul's ultimate nightmare. Thus the concepts of a Lyautey: *la force*; *la grandeur*; *le désintéressement*; *la simplicité*; though they seem near to former British practice at its best are really so different in their racial overtones. There is always a gulf between the vague progressive liberalism of English colonial thought since 1918 and the precise (if only fragmentarily realised) French aim of *assimilation*.

Conquest by Culture

La mission civilisatrice is, moreover, a notion which derives from the belief that not only French administration but also French culture is an indispensable element of human happiness. The French believe in their own way of life to the

point of producing faithful replicas of it overseas. The intellectual fascination of French ideas and dialectic is, indeed, strongly felt by the indigenous *élites* of the French Union, a fact which partially explains the extraordinary tenacity with which the French have been able to cling to their overseas territories. It is this cultural receptivity towards France which makes it still not impossible for the French to reply on different grounds to British and American charges of illiberalism. "Your policies," they may say, "are not proved right. The game has hardly begun. Fifty years hence perhaps we shall see if the British were right to leave India and Burma; if the Americans were right to force the Dutch out of Indonesia. It will be sad if it then appears that the Europeans had too little faith in their own cultural superiority and sold the pass because of their infatuation with political jargon." In sum; the French do not accept the dogma that the only way to make a country evolve is to grant it sovereignty. For them dependent peoples can only progress by absorbing superior cultures which already exist; not through an optimistic casting off of constraints. (In a sense it may be said that what is best in the French occupation at least of Morocco stems from the belief that France will be there for ever and what is worst from the fear that France's days are numbered.)

Arguments Against Independence

What justification has this general French philosophy in regard to Morocco? There are certainly powerful arguments against independence. First, it is difficult to understand what the Sultan and the Istiqlal mean by their contention that the Sherifian Empire may be converted into a constitutional monarchy on the European model. The separation of powers has never yet been achieved effectively in the Arab world and to anticipate its transplantation from Europe to Morocco is something of an act of faith. In the recent Tangier declaration the Istiqlal has suggested that an independent Morocco would be axed ideologically on a kind of Islamism composed perhaps of all the Moslem states of the world. However, a political bloc united by a religious creed does not on the face of it promise a speedy internal evolution of the country. Egypt is the symbol of modernism for Moroccans (the proletariat of Casablanca looks neither to Moscow nor to Hollywood but to the *demi-monde* portrayed in Egyptian films). When, therefore, the Istiqlal speaks of improving the state of the Moroccan population the French point to the performance in late years of the doubtful plutocracies of the Levant. This political argument gains support from the actual feudal structure and venality of much of Morocco which is mitigated by the protectorate. It is one thing for the Istiqlal to condemn the pro-French "mediaeval" chieftain El Glaoui, Pasha of Marrakesh; it is another thing to show how, on independence day, his rule over the Atlas region would be either dislodged or replaced by a better system.

Then there is the question of the safeguarding of the interests of the 400,000 Europeans in Morocco. The French well know that, even if businessmen and technicians held

their own, the end of the Protectorate would mean the end of 6,000 French farms on the best land in Morocco. The fact that the French presence in Morocco is theoretically temporary has not prevented an intensive settlement of French in the country. This is the reason why the Istiqlal is anxious to gain independence before Morocco has become a second Algeria, a land which after 120 years holds over a million French. This permanent colonisation may be anathema to the Moroccans but no French government can ignore its reality any more than it can turn a blind eye to the French predicament in Indochina. Finally there is the argument that the Moroccans lack the cadres to administer their country.

It is here that the French attitude takes on a somewhat sinister twist. For unquestionably far too little has been done to train Moroccans for jobs in the modern Morocco which the protecting power claims to be creating. (There is, after all, something fantastic about letters being delivered in Rabat by French postmen.) The natural bent of intellectual young Moroccans is towards law and philosophy. The result has been that the few who have the opportunity to go to the Sorbonne return and become nationalist politicians. Meanwhile very little effort seems to be made by the French to create cadres of engineers, financial experts, doctors, scientific farmers, or even telephonists and engine drivers. It is this extraordinary exclusiveness which has polarised the Moroccan population into two classes: on the one hand a tiny French speaking intelligentsia consisting of the Palace, the pashas and caids, some merchants of Fez and other places and their sons; on the other hand the peasantry and that part of it which has become the proletariat of Casablanca and the bigger towns. If there is nothing yet desperately tragic about this situation, it nevertheless demonstrates a quite inadequate grasp by the Residency of the indispensable conditions of partnership between distinct races in a plural society. If France wishes to consolidate the Protectorate and all French North Africa into a Eurafrian adjunct to Europe itself—a policy which has serious arguments in its favour—it will have to devise a much more magnanimous and energetic practice of association.

(To be concluded)

The Lebanon at the Polls

THE short coastline of the Lebanon is marked by the terminal of two important pipelines where petroleum from Iraq and Saudi Arabia is loaded into tankers which transport the crude oil across the Mediterranean to European markets. In the South the historic port of Sidon is, after centuries of decay, once again prosperous because of the petroleum port of the Arabian American Oil Company pipeline which carries oil across over a thousand miles of desert from Dharhan on the Persian Gulf. At Tripoli, in the extreme north, oil from the two pipelines of the Iraq Petroleum Company is loaded into tankers in an elaborate new harbour built by the oil company. Thus, although the Lebanon has no known mineral deposits, large industries or agricultural potentialities, it is of importance to the Atlantic Pact Powers. Major disturbances in the country would prevent the transport of Middle East petroleum from well to market. There is little doubt that companies favoured establishments in the Lebanon not only because this country has a far more agreeable climate than any other in the Middle East, but because there is a small Christian majority and far more amenities for European residents. There is less likelihood of political disturbances or anti-foreign riots and in addition, as the Lebanon is an Arab country and a member of the Arab League, the companies do not experience the difficulties between Jews and Arabs which make use of the Haifa pipelines or installations in Israel impossible.

The Lebanon claims to be the most advanced of all Middle

Eastern states; but its curious system of proportional representation for all the religious groups when they elect a new Chamber of Deputies must be improved or abolished before its improvised democracy can function effectively. Defects in the present system have been illustrated in the recent general election, the second to be held since the Lebanon became an independent state on the termination of the French Mandate. Tempers were short and the atmosphere tense before the elections, but although many a man carried his gun there were only forty people killed and seriously wounded—far fewer than on the earlier occasion.

Before the elections the President of the Republic who is, by custom, a Christian, dismissed his Premier, Riad Bey el Solh, who had been in office for four years and formed a so-called neutral government. The President maintains a façade of neutrality, though his brother, Sheikh Selim el Khoury, the *eminence grise* of the Lebanon, is the head of

the Constitutionalist or Government Party. This party represents the rich landowners and a large proportion of those who have profited through the financial activities of the free gold and dollar market of the Lebanon and the re-establishment of the large and illegal hashish trade with Egypt. The President increased the total number of deputies in the Chamber from 55 to 57. He found it difficult in so small a Chamber to find a place for all his friends and supporters who demanded rewards, and for important enemies who needed placating. The President's brother also placed key men to control the elections in the Ministry of the Interior, the police and the *gendarmérie*. The country was divided into nine electoral

divisions and the Government began the work of compiling a list of thirteen candidates for each division. The composition of the lists varied according to the population of the district but always included a Maronite Christian, a Sunni Moslem, a representative of the Greek Orthodox Church, Greek Catholic Church, a Druze and a Shi Moslem. In theory a voter might select the Maronite from the Government's list and a Moslem from the opposition but he would not in practice as it is simpler and quicker to vote for the list as a whole. Candidates paid vast sums of money to be included on the Government lists and, as these were not made up until the last moment, men who hoped to be included were cleverly prevented from beginning their campaigns in opposition. It was clear from the beginning that the Government would be returned.

One of the most amusing pre-election incidents occurred at the Registrar's office when Mustapha el Ariss, the leader of the Communist-led trade unions, paid an unexpected visit and registered as an independent. A warrant for Mustapha's arrest was issued well over a year ago and the police had persistently pretended it was impossible to find him. On this occasion when the Registrar recovered from his surprise and called the police, Mustapha had disappeared. The Communist Party is illegal so it had little opportunity of demonstrating its strength at the polls.

Opposition Groups

There is little difference in the policy of the various parties. The opposition had a common list composed of three main groups of which the first—Djimblatts "progressive Socialist Party"—has the most reasonable policy of social reforms and has obtained in addition to the traditional Druze support the support of some progressives as well as of the remnants of the Antoun Saade Party whose leader was executed eighteen months ago after an ill-fated attempt to organise a coup d'état similar to that of Colonel Hosni Zaim in Syria. The whole opposition group was led by M. Camille Shamoun, a Maronite who was formerly a great friend of the President and the Lebanese Minister in London. He will now lead the opposition in the new chamber. He quarrelled with the Nationalists and there is reason to believe that had the opposition won the elections they would have challenged the legality of President Khoury's second term of office. Camille Shamoun would have been the obvious alternative candidate for the office. A third group in the opposition was led by Raymond Edde, son of the former pro-French leader; has the somewhat odd name of Nationalist. A more realistic name is the Mediterranean Culture Group which prefers to see the Lebanon more closely tied to the Christian countries of Europe than to the Moslems of the Arab League. It is most significant that this party was largely unsuccessful at the polls. The Phalange, an illegal party which operates under the name of the Lebanese Union, managed to secure one or two seats. The position of Riad Bey el Solh is important but slightly

obscure. He has secured his seat in the chamber but whether or not he had completely made up his quarrel with the head of state it is impossible to guess. However it is not rash to prophesy that this able Moslem, whose amusing bearing and crude wit hide an astute and calculating mind, will soon return to power, especially as his foreign policy of close association with Egypt and the Arab League has been endorsed by a majority of the electorate. No change is likely in internal or external policy. The results demonstrate that personalities are still more important than parties in the Lebanon.

The Lebanon has somewhat disappointed many of those Americans and Englishmen who believed the country was ready for independence. Corruption has greatly increased, relations with Syria, on whom the Lebanon depends for cereals, have deteriorated. The true prosperity of the country, which is based on Beirut harbour, has been jeopardised. A great wave of gambling has swept across the land. The activities of the illegal Communist party have increased. The illegal trade in hashish and traffic in other drugs has grown to dangerous proportions. Yet the Lebanon could easily lead the Middle East in social reforms. Its politicians are not so prejudiced about receiving advice from western advisers as the other Arab States. But the British adviser on air raid precautions in Beirut needs to be reinforced by a team of agricultural and economic experts who will assist the Lebanese to put into operation the much discussed schemes for increasing the country's resources and reorganising its social services.

Next Stage in Soviet Planning

[BY A CORRESPONDENT]

THE fourth Soviet Five-Year Plan was ended at the close of last year. Yet hitherto no announcement has been made about a new plan. This has led many western observers to conclude that this first postwar plan has also been the last, at least the last to be made public. Outwardly many signs have pointed in that direction: the summing up of the finished plan was delayed (the balance was at last drawn last week); during the budgetary debates in the Supreme Council of the Soviet Union the Finance Minister A. G. Zverev made no reference to a new plan; other ministers dealing with economic departments took part in the debate, but M. Z. Saburov, chairman of the State Economic Planning Committee (Gosplan), remained silent. Hence here and there the conclusion was drawn that the Soviet authorities were dropping long-term planning altogether.

Yet planning is too inherent a part of the Soviet economic system to be abandoned suddenly; and the delay in the announcement of a new plan is not unprecedented. A glance at the history of Soviet planning shows that on the close of a planning period delay in the announcement of the new plan has been the rule not the exception. Faced with stiff economic obstacles, and particularly with a tense international situation, Stalin has always preferred to keep his game secret and to wait before proclaiming to the wide world the plans and targets set for the Soviet economy.

The first five-year plan had been in operation for some time before it was officially proclaimed. It covered the five years between 1928-29 and 1932-33, yet it was not formally launched until April, 1929, at the sixteenth congress of the All-Soviet Communist Party. This first plan was officially carried out in four years—i.e., it ended in 1932 instead of 1933. In spite of this the second plan was proclaimed after a time lag of one year—namely, in January, 1934, at the seventeenth congress of the Party. There were many reasons for this delay. One of them was probably that

Stalin wanted an interval to boost up the Soviet iron ore production, which was badly lagging behind the target. (The original target of 10 million tons was increased to 15 million, yet at the end of the plan output reached only 6,500,000 tons.) Considerations of security were probably even more important; there was the Japanese danger in the Far East—which Stalin counted as a cause of some failures in the plan, since it had compelled a partial switch-over to defence—and Hitler's rise in the West.

The time lag was even longer between the second and third plans. The second five-year plan, it was claimed, had been fulfilled in four years and three months. In other words, it was ended early in 1937. Yet the third plan was proclaimed by the eighteenth congress of the Party as late as March, 1939. This time international tension was certainly the main reason for the postponement. In the West there was the threat of a German invasion. Soviet-Japanese relations had further deteriorated. There was the possibility of an attack on two fronts. The Kremlin therefore wondered whether it was the right time to proclaim its economic plans. Finally, after much hesitation, it was decided that the proclamation of plans for the speedy development of heavy industry could deter Hitler and also make the Soviet Union look more attractive as a potential partner for the Western powers.

Far-reaching security measures, however, were applied. The first plan had been accompanied by three volumes of detailed statistics, giving an insight into the USSR's economic geography, the distribution of raw materials and of the planned industrial sites. The material on the second plan which was passed for publication was less detailed. The explanatory material for the third plan was reduced to the data supplied by Molotov when he presented the plan at the Party congress; the statistical yearbooks no longer appeared. Finally, after the war, a special decree was passed labelling as treason the unauthorised publication, or any other disclosure, of statistical data. Already on the eve of World War II the publication of annual targets had ceased. Since then the veil of secrecy has been drawn tighter and tighter. Thus Voznesensky's speech in March, 1946, before the Soviet Supreme Council, in which he commented on the fourth five-year plan, did not add much information to what had already been given in the official decree launching the plan.

More Secrecy Probable

There have also been enigmatic changes in the staff of the central planning institution—the Gosplan—itsself. N. A. Voznesensky, its chairman for many years and the official author of the third and fourth plans who had survived the stiffest purges of 1937 and 1938, was suddenly dismissed in March, 1949. He also ceased to be a vice-premier and member of the Politbureau, and since then his name has not been mentioned. The Gosplan itself, however, was not attacked. Founded in 1920, this institution has been steadily strengthened during nearly a quarter of a century of systematic planning and, despite all rumours about its twilight, the Gosplan continues to be a vital link in Soviet economic life.

In the atmosphere of the cold war, with the possibility of atomic attack uppermost in their mind, the Russians think twice before deciding on the geographical distribution of new industrial enterprises, and particularly before making this distribution known. Moreover, some vital decisions concerning the new plan are probably still in suspense and may remain so until the international situation has been further clarified. All this may account for some hesitation and delay in the framing of the new plan. All the same, some of its features have been known and publicised for some time now; these include the schemes for electrification, canal building and the so-called Stalin's "Plan for Changing Nature." The full plan, if precedent offers any

SUGAR: According to an old Polynesian legend the ancestors of the human race originally sprang from a sugar cane plant and it may well be that the South Pacific is indeed the place of origin of sugar, if not mankind.

Sugar cultivation has however also been established in the British West Indies ever since the seventeenth century. Barbados—the oldest English Colony in the British West Indies—has always been among the largest sugar producers in the Empire, and today sugar is the most important industry in the island.

Full and up-to-date information from our branch in Barbados on market conditions and industrial trends in the island is readily obtainable on request. Those interested are invited to write to the Intelligence Department at the address given below.

guidance, should be announced at a new congress of the All-Soviet Communist Party—there has been none for the last 12 years. However, even if the fifth plan is proclaimed, it would be presumptuous to expect three large volumes of statistical data like those issued in 1929. The information given this time will probably be scantier than ever. Stalin will try to reveal as little as possible to the outside world.

Nehru—Idealist or Appeaser?

[FROM OUR INDIAN CORRESPONDENT]

SINCE the Korean war began there has grown up in India an increasing opposition to the foreign policy of Pandit Nehru, the Prime Minister. There has been concern that he might go too far and alienate a West in which are embodied all the values by which India stands, and from whom alone the assistance can come which India so desperately needs. This opposition reached its peak some time ago when Dr John Matthai, the former Finance Minister, delivered one of the first effective and outspoken criticisms of Mr Nehru's foreign policy as a whole. After that, dissatisfaction died down, as Mr Nehru himself appeared so obviously satisfied with the victories of the United Nations in Korea. But a hard core of criticism still remains.

Mr Nehru is always news. His record over the last few years has built him up into a world figure. Nevertheless, his activities on the international stage have not been particularly successful. His peace efforts have certainly misfired. They have not only failed at the United Nations, but have somehow left a bitter taste at home. In all that he did in trying to settle the Korean dispute, he had overwhelming public support; yet a suspicion is spreading inside India that he is too woolly, too impetuous, and too inclined for India's own good to take the centre of the stage.

Only a few on the right consider Mr Nehru a fellow-traveller. The mass of Indian opinion takes him at his face value. Certainly he is perfectly consistent in his endless repetition of one theme—that war is the supreme evil. Another war, he feels, would so brutalise humanity that the values for which we fight would be destroyed anyway. Nobody really wants war; therefore, like Gandhi, one must negotiate endlessly, lovingly, until the other side's sense of right at last brings them to reason. This method, in Indian eyes, finally justified itself in Indian independence. But Nehru's application of it seems to overlook the fact that Gandhi talked but did not budge. Gandhi did not hate even the rioters who beat him up in Durban; but having decided upon independence he took nothing less. In Korea, Nehru has taken expediency, not principle, as his guide. In his argument it was inexpedient, not immoral, to cross the 38th parallel, or name China as the aggressor. The result has been appeasement of the sort where one explains for so long that the aggressor has a case, that one forgets that his victim has a better. Nehru's inspiration is not the Mahatma, but Sir John Simon arguing Japan's case in Manchuria, or Lord Runciman mediating Hitler into the Sudetenland. And Nehru's whole syllogism, his whole belief that no one *can* want war because war would be so disastrous, is exactly like Chamberlain's. The emotions which applaud Nehru today are those which once acclaimed Munich.

Nehru's Attitude to China

Nehru may be as much an appeaser as Chamberlain; but he is more dangerous. Chamberlain's assessment of Hitler was straight error. In Nehru's analysis there is a great deal of truth which the West, in its annoyance at his conclusions, can disregard only at its peril. Nehru is strong neither on facts nor on law; but for the expression of Asian emotions he is unique. Other nations may abstain where Nehru will rush in and cast his vote, but only the Philippines will actually vote the other way. Nehru brings to the surface,

as no one else in Asia can, the suspicions of his continent. In Asia colonialism is not dead; even the Japanese occupation is suspect, still more so Pondicherry or New Guinea or Indo-China. Nehru may be unhelpful in not realising just how difficult it is to make Indo-China independent in the middle of a war; but his insistence that somehow it must be done is chastening to a West still too inclined to cling to the symbols of a power that is gone.

Nehru's affection for China goes further. The Congress has achieved great things in India. But politically it is bogged down in an unprofitable dispute with Pakistan; economically it has as yet brought to fruition little of that great transformation of society of which Nehru dreamed; even the abolition of *zemin-dari* is not yet completed. So Nehru, and with him much of Indian and Asian opinion, is desperately interested to see whether Mao Tse-tung can succeed where he has failed. He realises that India has not the capital for the American way of life; and he is genuinely allergic to the Soviet police state. But Communism, if he could have it without concentration camps, has an enormous appeal for him. He suppresses Indian Communism with an iron hand, but explains that it is not the Communist doctrine but "armed rebellion" to which he objects. In Mao he sees a new hope arising; for China is as poor as India and, if China can do it, so can India. Therefore Mao must have his chance—however far one has to lean over backwards in order to give it to him. Much of this may be subconscious. Certainly so long as the whole Mao experiment is not destroyed by atom bombing or a general war, Nehru does not mind his being defeated in Korea. He indulged in no serious peace efforts after the tide of battle turned in favour of the United Nations.

Meanwhile, and in retrospect, India itself is beginning to grumble. Nehru's attitude to the Americans is criticised as being far too influenced by Old Harrovian disdain. His insistence at first that national honour required that India should pay for any food it gets, his total lack of gratitude, even of ordinary graciousness, for American generosity, arouse real anger. And over many minds there is coming a creeping suspicion that the results of his peace efforts have only been to make nonsense of India's own argument in Kashmir. People are beginning to remember that it was China whose troops recently trespassed in Assam and whose actions in Tibet made necessary so much firmness in Nepal. Nehru is still more India's leader than anyone else, but more and more of those who make opinion are wondering how long India can afford a leader so incapable of descending from the abstract ideal to the concrete fact, and so unconscious of India's particular interests in a world still largely governed by national interest. Western pictures of Nehru as the cunning statesman who shrewdly and coolly plays his cards according to the strict interest of his own country, rouse in India a very wry smile indeed. People are now saying that Nehru is indispensable only for the emergencies he creates.

Communists and Colonial Students

[BY A CORRESPONDENT]

THE Cominform has for some time shown a special interest in colonial students; the International Union of Students is the agency through which the direct appeal is made. The IUS claims to represent the students of 71 countries; what it does not mention is that many of these affiliates are minority groups in the countries that they represent. The majority unions in a number of the western countries have never been members; and some who have been have now disaffiliated. The British NUS, after much heart searching, has stayed in, not as a full member but on the basis of a special fraternal membership.

In 1946, the IUS established a "Bureau of Students fighting against Colonialism." It is headed by a Chinese, and an Indian woman is the driving force. It publishes pamphlets making charges about the iniquities of educational conditions in the Colonies and the martyrdoms suffered by colonial students in defence of their liberties. But its major activity is to court colonial students and bring them either to special international events, or actively to study in eastern Europe. The special events may be the world student congresses held every three years; or the world festivals of youth and students, held at two-yearly periods, the next of which is to take place in Berlin in August. To pay for this solidarity, funds are "voluntarily" raised by students in eastern Europe who do special shock shifts. Eight scholarships were recently offered to Nigerians for study in East Germany; the Nigerian Government refused permission for any local support. Nevertheless, it is reported that seven students have in fact arrived in Berlin; they include the son of one of the miners who was killed in the riots in 1949.

When the students arrive, whether for study or for special events, they become public exhibit no. 1. They are paraded as objects of particular interest; their vanity is flattered and every word they say is seized upon for propaganda use. The European students exert themselves to look after them; girls, in particular, make them their special charge. The contrast with the indifference accorded to colonial students in Britain is quite conspicuous. The British student is neither more nor less reserved with a colonial student than with any other, but he remains reserved enough. An African or West Indian in Britain does not automatically become a hero just because his skin is black. In eastern Europe he will be dropped the moment he ceases to be "useful" or the moment he takes an independent stand; but that is an experience which comes only later.

Many of the members of the British NUS watch these events unhappily. They cannot compete, even if they wanted to, in this insidious courtship of the colonial student. The only effective answer lies outside the student world altogether: it is that conditions in the Colonies should be such that when the student returns home he finds expression in a satisfying life of his own.

Inflation at Sweden's Throat

[FROM OUR STOCKHOLM CORRESPONDENT]

THE problems of inflation in a planned economy are now embroiling the socialist Government of Sweden in complications with which the British public is becoming only too familiar. As the House of Commons has just debated the British budget for 1951, it may be interesting—and a little sobering—to review the perilous progress of the Swedish Government in the last few months.

The basic tenet of Swedish financial policy is that runaway inflation can best be controlled by strict budgeting for a revenue surplus over current government expenditure, and sufficient to cover as large a part as possible of the outlay on public investment. During the last few months, the need for deflationary measures has become more urgent from day to day. Expenditure on defence has been mounting steadily, and it has proved politically impossible to cut civil expenditure sufficiently to accommodate the increased military commitments. This has forced the Minister of Finance, Mr Sköld, to abandon any attempt to keep the economy stabilised at the 1950 level, and to aim, as a *pis aller*, at a planned, once-for-all measure of inflation, to be followed by stabilisation at a higher level. As a consequence, the wage freeze has been lifted while the import subsidies and many of the subsidies on home-produced food have been removed. This followed the interim measures taken last autumn, which were designed to restrict private investment by raising the obligatory currency cover for the commercial banks and putting up the rate of interest by a half per cent.

In this way, Mr Sköld had hoped to allow a controlled rise in the cost of living to a level which would be more or less realistic in relation to the general rise in real values at home and abroad. On his original calculations, this should have meant an increase of about 10 per cent in the cost of living. On this basis, he had hoped that there would be room for the newly freed wages to rise by a little more than the equivalent amount, say 12-13 per cent. Thereafter, he had intended, to hold the situation stable by an appropriate fiscal policy.

In practice, events proved him too optimistic. With the removal of the import subsidies, the cost of living has already risen the full 10 per cent, and has not yet reflected the secondary reactions—internal wage and price increases—which are bound to follow. The unions, for their part, have on the whole behaved with restraint. The first increases granted were comparatively moderate but some of the agreements recently negotiated have brought a rise in wages of 20 per cent or even more.

The Minister of Finance is thus faced with the need for even fiercer fiscal measures than he had envisaged in his original budget. He himself has clearly decided that the point at which they are most badly needed, and at which they will most effectively curb inflation, is industrial and commercial investment. The outstanding new proposal that has just been adopted by the Swedish parliament is, therefore, a new 10 per cent tax on private investment.

The importance of this particular tax and the failure of the more moderate restrictions which were imposed in the autumn are to be found among a variety of factors. The autumn measures only came into effect in cases where investment funds had to be raised on the open market or from the banks. In many cases, however, this did not apply. To reduce the incidence of direct taxes on distributed profits, and of income tax on distributed dividends, Swedish firms have in many cases tended to plough back rather more of their profit than normal business would require. They have been encouraged in this by the fact that, under the prevailing tax laws, industrial and commercial firms (and particularly joint stock companies) have considerable freedom in the valuation of their inventories and capital depreciation. It is the purpose of the new investment tax to provide a strong disincentive to this "over-investment."

More Taxes Proposed

If the tax is effective in operation, the Government stands to gain on two counts. The consequent fall in investment will ease the direct inflationary pressure; and the additional revenue from the higher profits and dividends which may then be forced out into the open will help to balance the budget. There is some reason to doubt, however, whether even this tax will be really effective in practice. So long as there is a prospect of continued inflation, so long will investment tend to be attractive, in spite of the new tax. An unending vista of rising prices may more than compensate for an extra 10 per cent on the cost of the investment.

Even those who believe the tax will be effective do not believe that it alone will be sufficient to stem the inflationary pressures. Mr Sköld seems to hope that it will yield an additional revenue of about 200 million kronor. This is probably a generous estimate, but even if it is right, it will not be enough. The Finance Minister is therefore simultaneously looking for yet further sources of additional income. As he believes that direct taxation has reached its practical limit, he has had to concentrate on indirect taxes. His new proposals include a tax in the consumption of electricity and a double rate of taxation on vehicles.

Mr Sköld's fundamental problem is how to raise prices by duties on consumption goods without producing a compensatory rise in incomes. The idea of a general turnover tax which might solve the financial difficulties has so far been rejected by the Government, probably because of its possible influence on wages. His experiences afford fresh

INCREASED TRADE through British Skill

Industrial development programmes need more than capital and man-power. They require knowledge: the technique of production applied to a wide range of industries. As a result of its long history of industrial achievement, Britain is able to supply this knowledge—and has the manufacturing resources to back it up. The Vickers Group, for instance, can provide capital equipment for land, sea and air transport, factory construction, and primary and secondary industries of many kinds—as well as skilled advisers and technicians to help put the precepts of efficiency into practice. Some idea of what this means in terms of productive capacity is given by an Exhibition opening on May 8th at Vickers House, Broadway, S.W.1.

VICKERS

evidence of the difficulties which block any attempt to create by budgetary measures a satisfactory defence against inflation. When taxation is as heavy as it is in Sweden at the moment, there is a grave risk that to make it even heavier will only reinforce the inflationary pressures which it is designed to counteract. If the Swedish problem is to be solved, the main weapons against inflation may have to be sought elsewhere. If a monetary policy on what was once "orthodox" lines is rejected, the only practicable alternative seems to be a system of "direct" controls, including a return to such unpopular things as wage ceilings—or possibly some combination of both methods.

The Problems of Northern Greece

[BY A CORRESPONDENT RECENTLY IN GREECE]

NORTHERN Greece, as the most important contributor to the national economy, has long resented Athenian indifference. The visit of the Cabinet to Salonika for a few weeks in January was unprecedented. Whether or not this will result in effective action for the solution of the area's outstanding problems remains to be seen.

Many of these problems are common to the rest of Greece. There are, however, some fundamental differences in general conditions. A harsh climate intensifies the hardships of village life in the north. Unlike the smallholder of the south, who can usually subsist from his own produce, large sectors of the northern peasantry are exposed to economic uncertainties by their dependence on cash crops such as tobacco. As

well as acute poverty in rural areas, the north has to contend with industrial discontent greatly aggravated by postwar slumps. The immediate tasks of resettlement and reconstruction are made more difficult by the fact that fighting lasted much longer in this region. Moreover, in the present international tension activities are restricted by the proximity of dangers, which, though of national significance, are easier to forget south of Olympus. Security forces, therefore, have the exacting task of providing defence against widely dispersed *andarte* raids, and at the same time must be organised to resist concentrated attack in the event of major aggression. Security in the mountains of Western Macedonia and Epirus has been much improved by strategic roads under military construction; such roads also help to raise civilian morale by linking isolated communities to the main centres and bus routes.

Repatriation is now complete to the extent that most of the refugees have left the towns; but they are not yet all back in their own villages, and it will not be practical for them to

return until there is adequate protection against the theft of crops and livestock by *andartes* in the frontier regions. Gendarmerie posts are in the throes of undergoing reorganisation; as the larger villages are rebuilt, units are transferred to permanent quarters which are geographically better suited for the fulfilment of peacetime duties. Village housing has proved an even greater problem than was originally anticipated. In many places the shelter provided is primitive and temporary, and housing is likely to absorb considerable resources for the next year or two. Village recovery varies in different districts. Epirus, with the help of the Army, got off to an excellent and early start. But inaccessible villages elsewhere, which were not repatriated until after the Army had moved back to its permanent positions, suffered through their dependence on the civilian authorities for transport and technical assistance.

Wider decentralisation—a measure repeatedly urged by the ECA Mission—is essential to efficient local government; without this, rural reconstruction is bound to be held up. The increased powers of the nomarchs have already proved useful, but some of their authority needs to be delegated lower, to the level of demarchs and village presidents. A deeply ingrained distrust of junior officials on the part of a people long accustomed to finding that nothing can be done except at top level, combined with a shortage of trained staffs, obstructs the fulfilment of these objectives. Administration and local trade are handicapped by poor communications. Trunk and toll calls on anything other than military lines can take days, and frequently result in complete inaudibility. Much still has to be done, especially in Thrace, before even the main roads are adequate. Recent travellers describe the international route at this stage as the worst stretch of road between Dunkirk and Delhi; beyond Alexandroupolis, rotting wooden bridges, usually not repaired until after an accident, add to the motorist's perils. Secondary roads in many districts are no better than a network of cart tracks—sometimes so indistinct that not even the local gendarmes can find the way.

Peasants' Hardships

For the time being, emergency projects have had to take precedence over long-term development schemes which can reduce the inherent poverty of Northern Greece as a whole. Nevertheless a fuller exploitation of local resources is urgent if military victory against the Communists is not to be nullified by growing discontent. Peasants have returned to country life expecting conditions to be better only to experience greater hardship than in the past. Although as refugees they lived in squalor in the towns, they saw a way of life easier than their own. Athenian luxury is still too remote to make much impression; the small-town wealth of the middleman in, for instance, Kastoria or Alexandroupolis is more likely to cause resentment.

Among backward areas the most neglected is perhaps Thrace—first acquired by Greece in 1920. In the neighbourhood of Neas Orestias miserable groups of mud-brick settlements scattered over open grain country give the impression that problems here are Asiatic rather than European in scale. Villages in the strategic triangle to the north of the Evros, where the frontiers of Greece, Turkey and Bulgaria meet, are accessible in winter only by a railway bridge of little use to the peasants. During the months when the river can be crossed, a day's ride or more by bullock cart is necessary to obtain medical attention, or to take produce to market. Scope for land reclamation is extensive. Flood control work on the Evros—first contemplated in 1934—is now scheduled to start this summer. A joint Greco-Turkish scheme, financed by the ECA, will bring about the improvement, on the Greek side alone, of approximately 102,000 acres. And the resumption of diplomatic relations with Yugoslavia is of special interest to Northern Greece. This, with the recent renewal of rail communications, is expected to bring trade to Salonika.

THE BUSINESS WORLD

Raw Materials and Defence

THE fact of three ministerial resignations within a week, all on the ostensible ground that the defence programme is "dead" or an "illusion" because shortage of raw materials makes its achievement impossible, argues that there is something wrong with the ministers who have resigned and with raw materials. It is difficult to follow the ex-President of the Board of Trade in his assertion that "today British industry stands disorganised and threatened by paralysis" because "we have not had our rightful share of the raw materials available." The ex-Minister of Labour's talk of the prospect of "mass unemployment" presupposes that this country will never get its "rightful share," whatever that may be. Whether these sweeping statements about the present and the gloomy speculations about the future help, or are intended to help, the aim of the western democracies to defend themselves is open to question. To recognise difficulties is one thing; to resign because of them is quite another.

The furore itself, and the very inadmissibility of Mr Bevan's reasoning, have, however, already produced a sharper focus, on both sides of the Atlantic, upon the really critical issues. Mr Morrison has since emphasised that any failure by Britain to obtain sufficient materials to sustain the volume of production upon which present plans are based would weaken the whole economy and depress the standard of living. But he made it abundantly clear that if production were to be thus affected every effort would be made to concentrate the effects upon domestic consumption, and thus to minimise any interference with the defence and export programmes. The Government does not, in any case, take a grim view of the prospects—because it counts upon the United States' "sense of partnership with Europe." The American Secretary of State, for his part, has responded to the accusations of Britain's resigning Ministers by declaring that America's import and export policies are designed to take full account of the needs of friendly powers, and that shortages of materials inevitably caused by the rapid rearmament drive would have to be shared by all members of the Atlantic pact. It is too soon to guess whether this portends any notable trimming of American policy, but it was apparently intended to be reassuring.

In the last nine months, since the pace of defence began to quicken, the difficulties of providing enough raw materials to carry through the defence programmes of the United States and Western Europe have been obvious enough. The impact of a record demand on raw materials for civil production, coupled with new defence needs and with the grasping gathering-in of the stockpiles, has distorted the commodity markets out of all semblance to normal conditions. The Americans complained at the price of their imports, but continued to buy and to protest at being "gouged." The American economy sucked in raw materials at an astonishing pace,

both to use for current civil and defence production and also to put by in case of war.

When the United States, Britain and France announced three months ago proposals to secure the international allocation of raw materials, hopes were raised of a solution of the extreme shortages of key materials, based on freely given co-operation between major producers and consumers in the common defensive interests of the west. It was stated at the time in these columns that the scheme could become a bold experiment in international co-operation—if the participating countries were determined to make it work. It now seems, unfortunately, that such determination was missing. The task of the participating countries was not easy, but it seemed well within the realms of possibility, given an accommodation between the major producers and consumers.

Six commodity committees have met in Washington and invitations to form a seventh—the pulp-paper committee—have been sent out. None of the six has been able to report progress on the delicate question of allocating supplies among the different users according to need and merit. The copper-zinc-lead committee has so far agreed upon a questionnaire to be sent to governments asking for estimates of production and requirements in 1951 and 1952. The replies should be received this week and the committee expects to meet again next month. The committee on sulphur is preparing a report on methods of expanding the production of sulphur and sulphur-bearing materials, of conserving sulphur and substituting other materials for it, and of controlling the uses to which it is put. The cotton-cotton linters committee is busy drafting a questionnaire. The tungsten-molybdenum committee has been occupied with collecting statistics on production and consumption. The manganese-nickel-cobalt committee has completed its calculations and has asked governments to submit information on measures taken or contemplated "to increase production, restrict consumption and economise in the use of materials." The wool committee has prepared estimates of production and consumption in 1951 and 1952. Tin and rubber have not been brought within the scope of the conference. A special meeting of tin producers and consumers was indeed held in Washington last month but it failed to reconcile the opposing views. An international rubber conference met in London in February; it was adjourned, met again in Rome a fortnight ago, and again arrived at no agreement.

Thus the result of more than a month's labours is to put in train a series of statistical exercises, all of which may be expected to show that there is a critical shortage of materials. These no doubt have their importance, but even more important is the fact that international allocation of these scarce key materials has not been tackled as a necessary act of co-operation for defence. If blame is to be laid anywhere for the failure of the

Washington conference—and at present failure seems complete—it must be laid on both sides of the Atlantic, for in the final analysis any successful scheme of international allocation would involve a bargain between sterling area and dollar commodities.

It cannot yet be claimed, however, that the breakdown in the raw materials conference has brought British industry to the edge of disaster, threatening defence, exports and the standard of living with calamity. Statistics about British consumption and stocks of raw materials in the first quarter of this year are not yet available. Some indication of the rate at which critical raw materials have been reaching this country is given in the accompanying table. Imports of sulphur during the first quarter of this year amounted to 86,700 tons, or 10,200 tons less than in the same period of 1950 and 9,000 tons less than in 1949. Much has already been made of the shortage of sulphur. One of Mr Wilson's strongest speeches was devoted to it a week before he

resigned; yet his department was, perhaps, more responsible indirectly for Britain's shortage through its control of imports and prices than any other body—a point Mr Wilson forgot to mention. It is right and necessary to keep this shortage constantly before the attention of the American authorities, for it could do

more widespread damage than any other. The United States Government apparently appreciates this, for it has now allocated Britain a total of 195,465 tons of sulphur for the first six months of this year—an annual rate only 11 per cent less than Britain's total imports of sulphur in 1950. This allocation is in fact only slightly below Britain's most optimistic hopes.

Of the critical non-ferrous metals, imports of nickel concentrates and nickel metal were higher in the first quarter than in the same quarter of 1950 or 1949. More copper and more slab zinc and zinc concentrates arrived, but much less lead, because of the delay in shipments from Australia. Imports of bauxite and aluminium were much heavier than a year ago and larger quantities of antimony and chrome ores arrived. On the other hand, imports of manganese ores, molybdenum ores, tin concentrates, tungsten ores and cobalt fell quite sharply.

Imports of softwood were more than double those of the first three months of 1950. Imports of raw cotton and raw wool have declined slightly, but much more flax, hemp and jute was received than in the first quarter of either 1950 or 1949, and imports of crude petroleum, paper-making materials and rubber were also higher.

These figures do not argue that there is no crisis in raw materials. But they do throw doubt on the contentions of Mr Bevan and Mr Wilson about industrial disaster. Stocks are admittedly low and consumption of raw materials this year will be governed by what can be secured from imports. As defence requirements expand, less material will be available for civilian use unless supplies are more or less guaranteed by some form of international allocation.

In the past two months commodity prices have shown some tendency to fall; a few have fallen quite sharply. At least the fantastic pressure of demand that blew the commodity markets sky high during the past six months has now lessened, mainly because of the reduction in American purchases. The price-freeze introduced by the United States Government at the end of January confused American manufacturers and traders, but it left no doubt of the American Government's determination to limit the rise in retail prices. Cuts imposed by the American Government on the civilian consumption of non-ferrous metals have been severe—manufacturers call them vicious—and limits have been put on the size of stocks that manufacturers and traders can carry. In themselves, these controls may not have reduced

American demand for raw materials, but they made the American buyer cautious. Commercial stocks of raw materials were built up very rapidly in the United States in the six months after the invasion of Korea and are now at a high level. Manufacturers have found that

defence contracts have not been placed as quickly as they expected and that incomes have not risen as fast as prices. They are now in the process of living on their stocks, and the United States is experiencing a minor "inventory recession," altogether milder than that of two years ago, but not without its effect on commodity prices.

A further and perhaps more important factor has been the slackening of stockpiling in the United States. No more purchases of tin, lead and wool will be made for stock, though current contracts will be allowed to run their course. Purchases of copper and zinc for stock have been extended to cover a longer period. Stockpiling of natural rubber has also declined. This slackening of stockpiling has coincided with the pause in American commercial buying. But this pause is likely

to be temporary. Once stocks have been reduced to a more moderate level, demand will again reassert itself, and, if stockpiling were also resumed, the raw material shortage might quickly become as acute as it was at the beginning of this year.

In this situation, the whole policy of stockpiling must be examined critically. To build up stocks of raw materials sufficient to meet one or two years' needs for defence and essential civilian consumption could be justified in circumstances where surpluses of the materials already existed or production could be rapidly increased. That is not true today. If the western powers as a whole are to form a cohesive industrial alliance the order of priorities for raw materials should be: first, the combined rearmament programmes, which are unlikely to be beyond what is necessary for purely defensive needs; secondly, the maintenance of essential production to maintain exports, capital formation and if possible, consumption in the co-operating countries; and, thirdly, if supplies of raw materials suffice to meet the first two requirements, the creation of emergency stocks. Such a policy would not mean merely the cessation of future purchases for stock but also making present use of those materials already accumulated for the American defence programme. Surely it is wise at this stage to store weapons rather than raw materials. In the end, this implies some system of international allocation that could at the same time encourage an expanding output of raw materials. Primary producers would no doubt require encouragement and protection against some future slump in prices if the defensive aims of the world now strained beyond their capacity and to the aid of productive energies against governments, the resolution of which is most particularly a common threat will be grievous. The weight of this responsibility falls on Britain and the United States.

Bad Bargain in Beef

THE latest and most protracted chapter in the sorry tale of postwar trade negotiations between Britain and Argentina was brought to an end last Monday with the signature of a one-year protocol to the five-year trade and payments agreement of June, 1949. The breaking of a deadlock that has bedevilled Anglo-Argentine relations for nearly twelve months and has forced the British meat ration down to a derisory level is obviously welcome—especially to British housewives. The outcome will be an early resumption of shipments of Argentine meat, though not, apparently, any immediate increase in the substance of the British meat ration. This one consideration apart, the new agreement is almost wholly unsatisfactory. Britain appears to have made concessions all along the line.

The terms of the arrangement, when viewed against the background of last year's abortive negotiations, do, indeed, throw into relief all the major weaknesses inherent in government trading—weaknesses that naturally appear at their worst when it is practised by the seller as well as by the buyer. Once more it is demonstrated that a bargain struck by such means is never closed, but is always liable to be reopened by

demands for retrospective adjustments; that it be confined strictly to the major issue in hand—take account of concession and counter-concession many extraneous matters, so that it becomes impossible to appraise the outcome in commerce or even to determine the effective price that will be for the major commodity involved; and that the bargaining will always be irrationally by considerations of political prestige. Under arrangement Britain gets less meat at a higher price could have been obtained at a time when British, instead of recognising the changing world prices, were talking about Argentine "black" and hoping to call a supposed bluff. Britain accedes two retrospective adjustments—one specific on the price of meat delivered in 1949-50 and one on the effects of sterling devaluation upon Argentine sterling balances, on the strength of which Argentina agrees to release accumulated arrears of private firm remittances to Britain. To the general public, the protocol is a meat agreement; but in fact it is of the sort—it resolves a jumble of claims and claims covering, in the words of the official commu-

"the whole range of Anglo-Argentine commercial and financial relations." Any attempt to appraise it has therefore to consider, first, the arrangements for meat; secondly, the intentions (so far as they are yet settled and disclosed) about reciprocal exports from Britain; and, thirdly, the particularly important provisions governing financial remittances and Argentine sterling balances.

Arrangements for Meat

The upshot of the agreement is that Britain is to get 200,000 tons of carcase meat and 30,000 tons of corned beef during the next twelve months. The quantity of corned beef is 10,000 tons more than in the 1949 agreement—the additional quantity is presumably for the Ministry's emergency stock—but the amount of carcase meat is 100,000 tons less, despite Argentina's undertaking in the earlier agreement to ship not less than 400,000 tons a year in 1950-51 and the remaining three years. Contrary to precedent, both the amounts and specified prices of the different qualities to be purchased have been revealed. This might mean that the Ministry of Food, chastened by its ill-success in trade negotiations in recent months, has decided at last to abandon its policy of secrecy. But the very purpose of disclosure this time may be to obscure the real price the Ministry has had to pay. The 200,000 tons of carcase meat include 35,000 tons of chilled beef at £146 a ton; 73,000 tons of grade A frozen beef at £126 a ton; 34,000 tons of grade B frozen beef at £118 a ton; 8,000 tons of manufacturing beef with bone at £95 a ton; 36,000 tons of lamb at £130 a ton and 14,000 tons of

offal at £140 a ton. The relative prices of these different qualities are inconsequential when, as everyone knows, the bargaining embraced not only the meat purchases as a whole but also the extraneous matters. The Argentine Government offered a total quantity of meat and wanted in return a total sum of sterling; hence the prices for the different grades were subject to haggling mainly for the purpose of apportioning the total payment. The important concept is the average price, which for the 200,000 tons of carcase meat works out at £128 12s. a ton, compared with £97 10s. a ton in 1949-50 and a ridiculous British offer of £90 a ton last July. As recently as last January, Argentina was asking an average price of only £120 a ton; but Britain then found that offer unacceptable.

The increase in the average price over that paid for 1949-50 is large; it amounts to 32 per cent. But that is not all, for Britain is to pay Argentina a further £6,250,000 in final settlement of the Argentine claim for a higher sterling price for meat shipped to Britain since devaluation on provisional invoices. Any such retrospective payments have in the past been included in the Ministry's subsidy bill for the year in which the payment is made. If this procedure is followed now, the effective average price for Argentine meat during the next twelve months will be £160 a ton, an increase of 63 per cent. The British Government has already agreed to pay higher prices for home-killed meat and 7½ per cent more (the maximum increase under the long-term contracts) for meat from New Zealand and Australia. If the whole of this extra cost, including the retrospective payment, is to be passed on to the consumer so as to prevent the bill for meat subsidies from

rising, the average retail price will rise by about 25 per cent—from 1s. 5d. to 1s. 9d. a lb. The Minister of Food, when he announced the terms of the agreement in the House last Tuesday, added that the retail price of meat would have to go up soon and that "the increase will be about 3d. a lb. on average." On the basis of consumers' habits at present, it seems that between 1½d. and 2d. of any increase in the money value of the meat ration would be absorbed merely by the increase in prices.

*

The price Britain has had to pay, both in terms of money and in concessions, is a high one. But, given the mistakes made in the earlier negotiations, there was probably no alternative—except to do without Argentine meat altogether. Even the 200,000 tons of carcase meat will not mean a large addition to the weekly ration; the quantity might go up from an average of about 9 oz. to one of 12 oz. a person. During the next twelve months Britain's supplies of meat might conceivably total 1,700,000 tons, or 50,000 tons less than in 1950. Shipments from Argentina will be 60,000 tons smaller, and those from Australia and New Zealand 40,000 tons smaller, while home production should increase by 50,000 tons. But the agreement should at least prevent a further reduction in the meat ration in June or July; this would otherwise have been necessary because of the delay in shipments from New Zealand and Australia.

It is true that under the new agreement Britain has also agreed to buy any quantity of carcase meat, offals, canned corned meat, pork and pig offals that Argentina may offer in addition to the 230,000 tons specified in the agreement. But the purchase of pork is subject to prior agreement on prices, and the Argentine price is known to be very high. Argentine pork is therefore likely to be available in quantity only if the British Government is willing to take it off the ration. Additional supplies of Argentine beef are conditional on a sharp expansion in Argentine production or on a sharp decline in Argentine consumption coupled with smaller purchases by the United States; but these conditions are not likely to be fulfilled. It is well known that Britain wanted to buy 300,000 tons and more from Argentina this year, but that quantity was no longer on offer.

Argentina has not been content, moreover, to drive a hard bargain on the specified quantities. Britain's undertaking to buy additional quantities of beef, if offered, gives Argentina a scope for rendering only chilled beef, which for Britain is particularly expensive. Three months ago, when Argentina insisted that half of the 300,000 tons it then offered should be chilled beef, Britain refused to accept—although, from the consumers' standpoint, chilled beef is much to be preferred to frozen beef. But the new arrangement does not necessarily mean that the British public will get more chilled beef, for the relevant clause goes on to state that if Britain does not want the meat to be shipped in the chilled state (presumably because of its own difficulties in distribution), it would still pay the higher price of £146 a ton for it. Chilled beef must be consumed within a relatively short time after its arrival; but the Ministry of Food's system of meat distribution is apparently too inflexible to cope with large supplies of it. Yet, to make it storable by freezing is wasteful not only of public money but also

of good meat, and the British consumer must suffer in consequence. Private trade would not have adopted so wasteful a procedure.

Britain's Export Commitments

The second facet of the agreement covers Britain's export commitments to Argentina. Discussions on this vital aspect (which presents much scope for disagreement) are not yet concluded, and only slight information has been released. It seems evident, however, that Britain has given significant assurances about releases of scarce commodities. The official communiqué refers only to crude oil and petroleum products, stating that "approximately 4,000,000 tons of crude oil and petroleum products will be made available to Argentina by Britain." Reports from Buenos Aires, however, suggest that Britain is to supply a maximum of 4,000,000 tons of crude oil and fuel oil and a maximum of 40,000 cubic metres (32,000 tons) of petroleum products, as well as 500,000 tons of coal and 27,000 tons of tinplate. All these quantities are to be sent within the next twelve months. Under the 1949 agreement, Britain agreed to send in the first year 5,550,000 tons of crude oil and fuel oil, 250,000 tons of petroleum products, 1,500,000 tons of coal and 30,000 tons of tinplate. At least it can be said that the quantities to be exported this year are smaller than those of two years ago. But, in view of its defence commitments and its export drive to dollar and Commonwealth countries, Britain can less afford to spare even these smaller quantities.

World production of petroleum is expanding sufficiently to meet the increase in consumption in Britain, the United States and elsewhere, so that, on supplies alone, this export to Argentina could easily be met. The limiting factor is once more carrying capacity, as supplies shipped to Korea have to be stored there in tankers. It may be that Argentina will merely join the queue of prospective buyers; the protocol says nothing about giving priority to shipments to Argentina.

The shipments of coal envisaged in the reports from Buenos Aires are only a third of the quantity agreed in 1949. Total exports of British coal (excluding foreign bunkers) last year amounted to 13,550,000 tons; in 1951 they are expected to be in the region of 7-8,000,000 tons—a decline of about 45 per cent. The contemplated export to Argentina should therefore be possible, even at this reduced rate of total exports, without imposing proportionately more drastic cuts on other markets; part of the 500,000 tons would not in any case be shipped until 1952.

Supplies of tinplate to Argentina have received the smallest cut, presumably on the grounds that they are related to the quantity of tinned meat to be sold to Britain. The negotiations on this critical commodity appear to have taken no account of the fact that Britain continued to send tinplate during the nine months Argentina refused to ship carcase meat, although the tinplate enabled Argentina to export a record quantity of canned meat to the United States. British production of tinplate this year is expected to reach 760,000 tons against 742,000 tons in 1950. The home canning industry was assured by the Minister of Food in February that it would receive the same supply as last year—270,000 tons—and the Minister added that exports to Argentina, Russia and the Scandinavian countries were to be cut slightly. Argentina is in fact

to receive 10 per cent less than in 1949-50, which presumably is the order of cut that the Minister of Food had in mind.

It may be that these export commitments will not add further to the stresses of scarcity upon the domestic economy. But, in view of the high price Britain has had to pay for Argentine meat and in view of the other concessions extracted from it, the question is bound to be asked whether even these reduced quantities of petroleum, coal and tinplate are not excessive. Britain still enjoys a sellers' market for all three products and the fact that these exports had to be thrown into the scale to balance Argentina's demands brings into still sharper relief the real cost that Britain is paying for an extra 3 oz. a week on its meat ration.

The Financial Provisions

Among the financial provisions, the most onerous and unexpected is an agreement by the British Government to pay £10½ million to Argentina "in full and final settlement" of claims based on the revaluation guarantees of the 1949 agreement. These revaluation guarantees applied to Argentina's current account in sterling. An adjustment of £10½ million, when related to the extent of sterling's devaluation, implies that there was some £26 million on this account in September, 1949. This is a most surprising implication, for in September, 1949, Argentina had already defaulted on substantial financial remittances. The general assumption has been that, taking into account forward commitments and amounts due in respect of past debts, Argentina had a net debit position in sterling at the time of devaluation

and therefore was not entitled to any revaluation adjustment. The £10½ million settlement is said to have been a good deal less than the original Argentine claim; it is none the less difficult to believe that it is not a great deal more than the amount to which Argentina was entitled under a strict interpretation of the 1949 agreement.

The open-handedness of this concession is, however, slightly condoned by the fact that the amount in question is to be paid into a "special account" and used exclusively for the transfer of overdue financial remittances to Britain. All such remittances awaiting transfer since June 27, 1949, will be made at the rate of 19.36 pesos to the £, but remittances accrued between June, 1949, and August 27, 1950, will be transferred only at the free market rate of exchange of around 40 pesos to the £. The £10½ million in question will approximately suffice to clear these arrears. Remittances accruing since August 27, 1950, will also be cleared at the free market rate, but a recent Argentine Government decree limits all remittances of profits since that date to a maximum of 5 per cent per annum of the registered value of each investment and permits the Central Bank to refuse even this if it judges that it has not sufficient foreign exchange available. In other words, the exchange resources required to clear arrears up to last August will be provided not by Argentina but by the British taxpayer, and the question of how many exchange permits will be granted for financial remittances accruing after last August seems to have been left uncomfortably in the air.

The agreement also makes detailed provisions to maintain the mechanism of sterling payments between

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

Strand Branch: 263 Strand, London, W.C.2

the two countries. It has been agreed by each party to provide a "swing" of £20 million in the bilateral payments arrangements. Argentina will be prepared to hold in its "D" current account a working balance of up to £20 million, while the British Government, for its part, has agreed that whenever sterling balances of the Argentine central bank are not sufficient to meet payments to the sterling area, it will make sterling available to the Argentine Government up to £20 million, on terms still to be agreed. The working balance that Argentina is prepared to maintain is to be calculated after deducting from the gross balances in the "D" account a sum sufficient to cover contingent commitments to the sterling area. If the net sterling balances maintained by Argentina exceed £20 million—so calculated—Argentina will be allowed to transfer the excess to third countries and, in the last resort, to an American account; this is equivalent to saying that any excess over £20 million will be convertible into dollars. If, however, any such conversion into dollars has taken place and if, within the ensuing 18 months, the Argentine sterling balance falls again below £20 million, Argentina will have to resell to the British Government an equivalent amount of dollars provided under the convertibility clause. It may be assumed that the British and Argentine authorities will co-operate to prevent a rise in Argentine sterling balances beyond the ceiling of £20 million, and that, well before that ceiling has been reached, administrative decisions will have been taken to allow Argentina to use its sterling to make payments to third parties, such as countries within the transferable account area. What is far more probable, however, is that the current balance of payments will for a time run against Argentina and that the swing will call for the extension of credits by Britain and not by Argentina. The agreement does not appear to specify whether financial remittances to Britain are to

count as "contingent commitments" to be deducted from the gross working balances when calculating the ceiling of £20 million. It is thus possible that in certain circumstances Argentina might again run into arrears on financial remittances and yet convert sterling into dollars. This is a point on which further elucidation of the agreement is needed.

The agreement makes no specific provisions for financing the transfer to Argentine ownership of public companies owned mainly by British shareholders. This problem was reviewed by the two governments in the recent discussions, but the agreement limits itself to the statement that "the Argentine Government have declared that it is their intention within the limits of the powers they exercise in these matters, to use their best endeavours to promote a settlement of these problems at the earliest possible moment." This is a form of words that will bring little comfort to British shareholders in nationalised public utility undertakings in Argentina.

The financial provisions of the agreement appear generous in the extreme to Argentina. They, like the other concessions and the high price paid for meat, can be condoned only on the ground that, at this late stage, they had become part of the sacrifice that had to be made to secure any general arrangement that would reopen the channels of trade between Argentina and the sterling area and would help to lift Britain's meat consumption a little above the pathetic level to which it has lately been reduced. As a monument to the miscalculations, political vanities and sheer administrative follies of government trading, the Anglo-Argentine agreement of April 23, 1951, will be hard to excel; let the proponents of government trading advance, if they can, a single point of advantage that this country has gained from it.

Business Notes

Political Markets

The reaction of stock markets to this week's cabinet crisis, and to the possibility that the general election might be thrust upon the country even sooner than had been expected, has seemed both paradoxical and confusing to people not in close touch with the City scene—and even to many observers within it. The post-budget boom in equities impelled by expectations of rising inflationary pressure had gone merrily on at the end of last week, when the *Financial Times* index of industrial ordinary shares rose to 131.8—its highest level for nearly four years, and no less than 9.2 points above its level on Budget day. But on Monday, immediately upon the news of Mr Bevan's resignation, this movement was abruptly reversed, the index falling by 0.9. Gilt-edged securities, which had lost ground heavily after the budget, suddenly became strong, with rises on Monday ranging up to 1½. It is futile to try to find strictly logical explanations of this behaviour; the reaction was too swift to have been founded on any close reasoning—such, for example, as the assumption that a Conservative Government might succeed in arresting the inflation, or the argument that, whatever the course of domestic politics, industrial profits will be menaced by the raw material shortages to which the resigning Ministers so spectacularly drew attention. Both considerations no doubt played some part, but the main explanation must be sought in the technical position, in the fact that the pace in industrials had

seemed already to have been too hot to last without a pause. This being so, professionals and private investors alike reacted in the traditional way to the new uncertainty—by taking their profits and reducing their open positions without waiting to assess the implications of what was afoot.

Second thoughts suggest a widening conviction among investors that the market prospect has not been altered in any fundamental way by the political changes. On any hypothesis—except an outbreak of peace—the rise in prices and the pressure of inflation seem likely to mount; and the opening of the Chinese offensive, not to mention the violence of the language of Mr Gromyko in Paris, has reinforced this expectation. Since Monday, high-grade industrials have been edging upwards again—in a much more selective and less active market—while gilt-edged have shed a large part of their sudden and anomalous rise. From the market standpoint, the check to last week's exuberance deserves a welcome; it may help to ensure that the case for equities, though well established, is not accepted uncritically—in disregard of the effects of shortages and of the sharply mounting pressures on costs and on industrial capital.

News of American Sulphur

Britain is to receive 95,000 tons of American sulphur in the second quarter of this year: this will bring its total

allocation for the first six months of 1951 to 195,465 tons. According to the analysis put forward last week by the former President of the Board of Trade, this would mean total supplies of 114,000 tons for the second quarter—for Mr Wilson insisted that the 19,000-ton supplementary allocation recently conceded should relate to the second quarter of the year. Whatever the merits of that chronological controversy the amount of the second quarter's allocation would indicate that industry need not as yet contemplate the "unparalleled disaster" of which Mr Wilson talked last week. It seems certain that the Board of Trade's allocation scheme, if it is put into effect from May 1st, will be the less severe of the two alternatives it had prepared.

The American version of the allocations so far puts the figures at roughly 100,000 tons for the first quarter, and 95,000 tons for the second: this might suggest a total allocation for the year of perhaps 370,000 tons—or about 15 per cent less elemental sulphur than Britain purchased from the United States last year. Upon that assumption, the ingenuity of sulphur and sulphuric acid users in obtaining imports of sulphur from elsewhere (which will not affect their allocation of American sulphur), in economising in their use of these materials, and to some extent in substitution, should make the proportionate effect upon output of most of the wide range of products affected somewhat less serious.

Imperial Chemical Industries, which is co-operating with the new United Sulphuric Acid Corporation formed to produce acid from anhydrite, is also to extend its own plant at Billingham by installing a third anhydrite kiln. This will raise the output of acid at this plant from 100,000 tons a year to 175,000 tons; together with the new company's projected plant, it should eventually more than treble the acid output from this indigenous raw material. Conversion to pyrites, which involves the partial rebuilding of some plants, may place some strain upon the two equipment makers mainly

concerned, though the size of the conversion programme was originally limited rather by the amounts of pyrites likely to be available from Spain and Cyprus. Certain of the doubts about the advisability of conversion raised by some producers on account of the higher capital and operating costs of plant for producing acid from pyrites and anhydrite are at present exerting less influence; the rising price of raw sulphur is now largely offsetting these higher process costs for the other materials.

Economies in Acid

Another approach to the problem of sulphuric acid shortage is the use of alternative reagents. The fertiliser industry is a case in point. In the production of superphosphates, two-fifths of a ton of sulphuric acid is used for every ton of fertiliser; about a million tons of superphosphate were produced last year and the shortage of sulphuric acid has reduced current production to 62.5 per cent of capacity. Nitric acid may be used in place of sulphuric acid, but the calcium nitrate that appears in the finished fertiliser absorbs moisture so rapidly that the product turns liquid in storage. According to trials carried out by the Department of Scientific and Industrial Research, removal of the calcium nitrate is too slow and costly to be practical, but sulphuric acid requirements can be reduced by combining it with nitric acid in the proportion of four parts nitric to three parts of sulphuric acid. Fertiliser produced by this method can be stored safely.

Imperial Chemical Industries chemists have been working on similar lines for about 20 years. They appear to have found an economic method of nitrophosphate production based on nitric acid alone; a pilot plant is now being built. The process is likely to give a more expensive product than one produced from sulphuric acid, but the fertiliser

contains an additional plant nutrient, nitrogen, which is not present in superphosphates.

The Department of Scientific and Industrial Research has also carried out field trials using unrefined tar oils in place of sulphuric acid to burn off potato haulms before harvesting. This takes more time but the cost is no greater than that of sulphuric acid, with the added advantage that spraying equipment is not corroded. About 10,000 tons of acid a year have been used in past seasons for potato spraying, but this year considerable quantities of tar oils are expected to be used. Agricultural industries, with their low priority for acid supplies, have the strongest stimulus to look for substitutes, but comparable opportunities probably exist in a number of other industries.

Export Drive Slows Down

The export drive has lost momentum, and the daily rate of export in each of the first three months of this year has shown little change. What the export trades have lost in quantity through delays in shipping and congestion at the ports has, however, been more than made up by the rise in export prices. Although the volume of exports in the first quarter of this year was fully 1 per cent less than the average for 1950, their value was 7 per cent greater. The Board of Trade index of export prices rose by three points last month to 112 (1950=100). The main increase occurred in textiles, which at 123 were five points higher, and in manufactures other than metal goods, which were also five points higher at 112. Prices of metal goods rose by only a point, to 107. These price movements suggest that British exporters still largely base their selling prices on actual costs rather than replacement costs. Last month import prices also rose by three points, to 128 (1950=100); the index for raw materials alone rose by seven points, to 156.

One welcome sign in the March trade figures was the continued expansion in textile exports, particularly wool textiles; their value in the first quarter of the year was 32 per cent above the average for 1950. The quantity of wool tissues shipped abroad was 14 per cent larger than last year, and 10 per cent more carpets were exported. Exports of cotton goods were 18 per cent higher by value than the average for 1950; the quantity of cotton piece-goods increased by 3 per cent and cotton yarns by 11 per cent. Canada is still by far the main market for wool textiles, but the United States now ranks fourth, following closely on South Africa and Australia.

The value of vehicle exports in the first three months was 4 per cent above 1950's level. But the number of new cars and chassis shipped abroad was 11 per cent smaller than last year's average. Some 60 per cent fewer motor cars were sent to Canada during the quarter compared with the average for 1950, whereas the number sent to the United States showed an increase of 9 per cent. Much less rolling stock, also, has been exported this year; but more agricultural tractors, cycles, motor cycles, aircraft and steamships. Exports of machinery were slightly less than their average value of 1950 and the total tonnage declined by 6 per cent; exports of electrical machinery fell by 16 per cent and textile machinery by 12 per cent. Iron and steel exports were also down on last year; their value declined by 4 per cent and their volume by 10 per cent. Of the smaller export groups, electrical goods declined by 5 per cent compared with 1950; pottery showed no change and cutlery and hardware increased by 6 per cent.

Miners Win the Race

When the "Prime Minister's target" of an extra 3,000,000 tons of coal by the end of April was set at the beginning of the year, the National Union of Mineworkers, the National Coal Board, and most outside observers

ventured to doubt whether it could be achieved: inside the industry, indeed, there appeared a certain disinclination even to define exactly what Mr Attlee meant. The miners, however, have done it, barring accidents; by the end of last week they had raised 2,897,000 tons more coal since the beginning of the year than in the same period of 1950, and this week should see them well past the mark.

Congratulations are in order; and some stocktaking. The increase has been achieved partly by the widespread working of Saturday shifts, fulfilling the extension of hours agreement concluded in 1947. It has always been somewhat difficult to judge the extent to which attendance at overtime rates on Saturday is offset by less coal-getting at normal rates of pay during the week: and during the first 15 weeks of the year "voluntary" absenteeism was 13 per cent higher than in the same period of 1950. But compared with the same weeks last year the average shifts worked per wage earner, despite the influenza epidemic, show a slight increase, and output per manshift, throughout the mines and at the coalface, shows an increase of more than two per cent. The extra 3,000,000 tons would certainly not have been attained if the decline in manpower throughout the first eleven months of last year had continued: but the work has been done almost entirely by miners who never left the industry, since the contribution of this year's recruits and returning miners has yet to be felt. An upward turn in the level of total coal stocks on April 14th signalled that the end of the coal winter is approaching: in order to make a start in building stocks to a much higher level than has been considered necessary since the war, the miners are to continue Saturday working until the end of May, when they begin three months of five-day weeks before resuming again in September for their autumn "spurt."

Inquiry into Premium Gold Sales

The staff of the International Monetary Fund is preparing to hold its promised inquiry into premium gold sales by member countries. The Governments concerned are sending expert representatives to Washington to take part in these discussions. The South African member of the study group is already on his way. He will be able to announce to the IMF that the additional revenue received by the South African gold mining companies from premium sales of gold in the first quarter of 1951 totalled £1,937,977, or very little less than the £2,123,547 that accrued from this source in the whole of 1950. Since the average premium in free market gold prices last year was at least as high as that in the first quarter of this year, these two figures give an impressive indication of the recent expansion in the volume of premium sales.

The IMF's study group will be confronted with a growing demand by other producers for the right to sell at premium prices. The Southern Rhodesian industry has recently tabled a demand for the right to sell the whole of its output, of about 40,000 ounces a month, in this way. The vice-president of the Rhodesian Chamber of Mines has argued that an increased gold price is necessary to extend the lives of existing properties and to make new marginal ventures profitable; he disclosed that two properties, the Wanderer and the Bushtick mines, will be forced to cease operations shortly unless conditions are changed. The Southern Rhodesian Minister of Mines has assured the Chamber of Mines that no effort will be spared to impress the urgency of the matter on the International Monetary Fund. This will not be the only pressure to which the IMF will be subjected.

Machine Tools from America

Expansion of British defence production in accordance with the three-year programme depends largely upon the

tools from the United States. Mr S. W. Rawson, the new Director-General of Machine Tools at the Ministry of Supply, is leaving for Washington this weekend to discuss their delivery. The Ministry was quick off the mark in placing its orders under the limited programme approved last autumn, but since then America's own defence needs have naturally begun to take priority.

These now pre-empt 70 per cent of the current output of machine tools by manufacturers named by the National Production Authority in Washington. The British orders placed last year—roughly 4,200 machine tools valued at perhaps £30 million, though final prices have yet to be fixed—come generally at the head of the queue for the remaining output of these companies. Priorities have now been issued for the "thirty percenters" as well as for the American defence orders; in these, too, the British orders occupy a high place with the added advantage that work upon many of them had been started before the rush of American orders was placed. The second wave of British orders, placed under the £4,700 million defence programme approved this year, have been less easy to place, and delivery periods have lengthened considerably. The total orders to be filled in time by American makers may well reach between six and seven thousand tools.

The British programme requires the bulk of these tools (together with those supplied by British manufacturers and those imported from the Continent) to be ready for installation by the summer of next year. Whether this can be done is uncertain. The relatively favourable treatment that British orders in the United States have so far received cannot of itself guarantee delivery dates. British and American defence demands, inevitably, are concentrated upon certain specialised tools not ordinarily produced in large numbers; as in England, pressure upon the various sections of the machine tool industry will necessarily be uneven for some time. The American makers, moreover, are apprehensive about raw materials, and less than confident that defence "ratings" will ensure adequate supplies of certain specialised steels. Labour is already scarce. But it appears that the industry may to some extent underestimate its ability to expand quickly and to organise sub-contracting.

More Light on Torquay

More information about the tariff negotiations between the United Kingdom and other participants at the Torquay conference was given in Parliament this week. Mr Bottomley, the Secretary for Overseas Trade, confirmed that no agreement that satisfied the criterion of mutual advantage had been possible between the United States and Britain, because the Americans felt that they could not enter into a wide agreement without a considerable reduction in Commonwealth preferences. The Americans' discussions with Australia, New Zealand and South Africa broke down for the same reason. The British negotiations with the Benelux countries also reached deadlock. These countries have a relatively low tariff—considerably lower than the British, which is now one of the highest in Europe—and Britain was prepared to accept a balance of tariff concessions that would work in favour of Benelux; unfortunately, however, the Benelux countries have been driven to threaten quantitative import restrictions in order to supplement the defences of their low duties and it was impossible to extract from them satisfactory assurances about how these import restrictions might be applied. Another notable failure was in the negotiations with Italy. Italy was unable to offer Britain acceptable concessions on certain particularly important items and the negotiations were, by agreement, dropped. It is significant that in his review of the Torquay conference Mr Bottomley should have dealt exclusively with the failures. There can have been very little to say on the credit side of the picture.

More Stock Exchange Statistics

The Stock Exchange's decision to pull its light out from under a bushel is slowly approaching the stage of action. The Council has confirmed that it does not intend to appoint a Public Relations Officer, although it is in consultation with a well-known firm of publicity agents. Meanwhile, it has asked members to hand in certain confidential figures from their books to a leading firm of chartered accountants. These figures will be aggregated under conditions of complete secrecy and, as a result, some time in the late summer or autumn it should be possible to publish an estimate of the total turnover of the Stock Exchange in 1949 and 1950. Included in this estimate, but shown separately, will be estimates of the total turnover in the gilt-edged market, of the business arising from placings before the grant of quotation, and of business done by members outside the Stock Exchange. Other statistics will show the number of bargains in 1949 and 1950; the number of partners and of their employees; and the total commissions charged by the Stock Exchange, together with the amounts returned to agents, clerks and so on.

RAND MINES, LIMITED.

The full Report and Accounts may be obtained from the London Secretaries, A. Meir & Co., 4, London Wall Buildings, London, E.C.2, from whom a general Plan of Properties is also obtainable.

This will be a welcome—although not immediately exciting—addition to the store of information about the national economy. Only when estimates of turnover for a fairly long run of years are available will it be possible to make some assessment of the trend of the proportion of the nation's saving that flows towards productive use through the Stock Exchange mechanism. Hidden within the books of Stock Exchange members are some highly important pointers to the effect that the welfare state is exerting on the flexibility of the capital market, and thus on the future prospect for sound economic development in this country. It is perhaps not surprising that the ignorant detractors of the Stock Exchange are unaware of this, since members themselves do not always seem to be alive to it. Mr Braithwaite and the Council of which he is chairman are performing a real public service by this belated—and still rather small—step towards statistical enlightenment.

Scarce Alloy Metals

The shortage of non-ferrous metals has spread to nickel, tungsten and molybdenum, and the Minister of Supply announced last week that he was taking steps to restrict civilian consumption of these three metals. As from May 1st supplies of nickel for stainless steel production will be cut to 70 per cent of the 1950 level, and supplies of nickel anodes for plating will be reduced to 50 per cent of last year's level. An order prohibiting the use of nickel for "less essential" purposes will be tabled shortly. The use of tungsten and molybdenum cannot be controlled so easily; they are primarily ingredients in the manufacture of alloy steel and to some extent they can be substituted for one another. Technical committees of the iron and steel industry have been set up to examine possible modifications to specifications of alloy steels in order to economise in all three metals. The Minister added that "all these measures will have to be supplemented as soon as possible by closer control of the distribution of nickel, tungsten, molybdenum and the alloy steels."

The shortage arises from a sharp increase in consumption for rearmament rather than from a curtailment in supplies. A table on page 999 gives a comparison of imports of non-ferrous metals for the first quarter of this year compared with 1950 and 1949. Supplies of nickel increased in this period, but imports of tungsten ores were less than half those of the same period of 1950—914 tons against 1,911 tons; supplies from Portugal, Burma and Bolivia were all much smaller. But tungsten could be bought at a price; at the end of February it was over five times its price of last June, though it has since fallen somewhat. Imports of molybdenum ore, which come entirely from the United States, totalled 13,700 tons in the first quarter of this year. This quantity was some 2,700 tons smaller than in the same period of 1950, but 2,200 tons more than in the first quarter of 1949.

The International Nickel Company of Canada is planning to expand its production of nickel this year by 5 per cent, and although its surface mines are expected to be exhausted by 1953, output will continue to increase through the expansion in underground mining capacity—a bold but costly move at the present time. Tungsten production is expanding in Portugal and new deposits are to be worked in Africa. The mining of tungsten ore is also to be started again in Devonshire. But there is little chance of any large-scale increase in the production of molybdenum, though the United States Government has taken steps to expand American output.

Special Steels

The restrictions expected upon supplies of alloy steels are likely to be dictated rather by the specific needs of defence than by any decline in output. In February, the latest month for which detailed figures are available, alloy

steel production as a whole, for the first time since the war, exceeded the rate of 1,000,000 tons a year, and output of high-speed (tungsten-bearing) steel ingots reached the annual rate of 17,700 tons a year. Production of these steels in the first two months of this year was higher than the 1950 rate for all qualities except nickel and manganese-molybdenum steels. But civilian consumption of these special steels may have to be restricted more drastically than even the 30 per cent cut in stainless steel (a typical example of which contains 18 per cent chromium and 8 per cent nickel) may suggest.

About two-fifths of the deliveries of alloy steels ordinarily go to the engineering and aircraft industries, two-fifths to the motor industry (including tractors), an eighth for export and the remainder to miscellaneous British consumers; by contrast, only about 25 per cent of total steel deliveries as a whole go to engineering and aircraft, and another 10 per cent to the motor industry. Nickel, together with chrome and other specialised metals, is a major ingredient of the special heat-resisting alloys, such as "Nimonic," used particularly in gas turbine manufacture; power units for jet aircraft take two or three times the quantity of nickel used in piston engines. Tungsten steels are most important to the defence programme, as to civilian industry, in machine tools; recently the high price of tungsten has led to the use of molybdenum as a substitute in high-speed steels, but now supplies of molybdenum, according to the Minister of Supply, amount to little more than will be required for rearmament needs. It is impossible to estimate the total demands that rearmament will make upon these steels; but it is worth noting that in 1943 British production of all qualities amounted to nearly 1,600,000 tons, and had to be supplemented by very heavy imports from America that added perhaps 20 per cent to the total home-produced supplies.

Tungsten and molybdenum are mainly used in alloys, but nickel is the most important raw material of another industry—electroplating. The 50 per cent cut in the supply of nickel anodes to this industry will accelerate the economies in decorative "trim" already being considered by car manufacturers; and will tighten the screw upon cutlery and tableware firms, which will also be affected by the cut in supplies of stainless steel. For many of the small metal-using firms in the Midlands, these cuts, following upon the restrictions in the use of copper, zinc, and aluminium, mean simply that unless they can secure a defence contract or sub-contract, they may quickly be forced to contract their business.

Firmer Wool Prices

The wool market has become firmer. Prices at the Australian sales last week rose by about 5 per cent and in London, though prices recovered more moderately, much less wool was withdrawn from the auctions. There is still no evidence of a resumption of American buying. Bradford and the continent between them have provided the main support to the market and, because of the absence of the United States, manufacturers have been able to procure much-wanted supplies at cheaper prices. The fall in prices in the first two weeks of April was the sharpest ever recorded in the wool market, and the lower qualities fell proportionately more than the higher. On average the fall amounted to about 25 per cent and most of it occurred in the first two days. Prices now are slightly higher than last December's, but well below the levels reached in January, February and March.

So far only the froth has been taken off the market. The sharp rise in wool prices in the first three months of this year was encouraged by official American pronouncements that large quantities of raw wool would be required to clothe American servicemen and to fill the American stockpile. The proposed pre-emption scheme to channel supplies to meet American military requirements was abandoned in Decem-

ber. British and European manufacturers, fearing an even more acute scarcity than existed, bid for whatever was offered; they had to compete with American manufacturers who were expecting to receive large defence orders, and prices rose to fantastic heights. It is noteworthy that the sub-

sequent fall has not forced prices below their December levels, for at this time of year offerings in the Dominion markets are generally very large. No doubt the suspension of the New Zealand sales because of the waterfront strike provided some support.

Wool is only one example of how American buying methods have upset the normal market mechanism. American merchants have swung from one extreme to another, but primary producers reacting to their influence have been blamed for "gouging" the American public. In December and January American merchants were willing to buy wool at any price. Now they will not buy at all. And these same tactics were evident in the American Government's own buying policy. At first there was no intention

to stockpile raw wool. This decision was reversed at the beginning of the year after criticism from a Senate committee. Yet a few weeks ago it was announced that no more purchases for stock would be made. In these circumstances it is surprising that wool prices have not fluctuated more violently.

No Change for Rubber

The international rubber conference has adjourned once more, but this time indefinitely. No agreement was reached on either international allocation or guaranteed prices, though on leaving Rome the delegates were pleased with the work they had accomplished. Before the conference opened, Britain and Malaya had already introduced export licensing for rubber and thus met part of the American case—that abnormal shipments to China and Russia should be stopped. An allocation scheme was discussed at the conference, based upon a lower price now in return for a guaranteed market for the next two or three years. Agreement in principle was apparently achieved, but numerous practical difficulties remained to be solved. Rubber is not a homogeneous commodity and, if the different grades were apportioned to consumers on a percentage basis, some of the smaller countries would receive quantities of low-grade that their manufacturers could not use. On the other hand, the larger consumers who could use the low-grade rubber were not willing to allow the smaller countries a larger proportion of the higher grades.

Such practical difficulties could have been overcome had the participating countries considered the present shortage sufficiently acute to warrant the effort involved. But rubber is no longer so scarce as it was in February (when the conference first met in London); nor is it so dear. The United States as champion of the consumers' cause had begun to believe that supplies this year might be adequate to meet

THE UNITED COMMERCIAL BANK LIMITED

(Incorporated in India, Liability of Members is limited)

Head Office:

2 ROYAL EXCHANGE PLACE,
CALCUTTA

G. D. BIRLA, Esq., Chairman.

AUTHORISED CAPITAL Rs. 80,000,000

SUBSCRIBED CAPITAL Rs. 40,000,000

PAID-UP CAPITAL Rs. 20,000,000

RESERVE FUND Rs. 6,000,000

With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

Binding Cases

Binding cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 26 issues and the half-yearly Index; that for RECORDS & STATISTICS will hold 52 issues. The year can be stamped on the spine.

The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.,

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

its own requirements for defence and civilian purposes as well as those of other western powers, provided shipments to countries behind the iron curtain could be restricted to normal quantities. It therefore did not press the case for allocation.

The Rubber Study Group also met in Rome last week and made a statistical survey of world production and consumption of both natural and synthetic rubber. It estimated world output of natural rubber in 1951 at 1,870,000 tons, or only 20,000 tons more than in 1950; Indonesian output is expected to remain at 700,000 tons, while Malayan output, it was thought, would decline slightly. Requirements for manufactured goods were put at 1,530,000 tons. Synthetic production in member countries is expected to reach 915,000 tons this year compared with a consumption of 900,000 tons. Defence requirements and purchases for stock are expected to absorb the apparent surplus of both natural and synthetic rubber.

* * *

Electrical Industries and Defence

Exports of electrical equipment last year reached a value of £159 million, compared with £140 million in 1949: this figure represents roughly seven times the value of prewar exports and three times the prewar volume. Approximately 32 per cent of these exports were made up of electrical machinery, including turbines and condensers, and the remainder consisted of electrical goods and apparatus. The Commonwealth took about 60 per cent of all British exports of electrical products: the three largest foreign buyers were the USSR, the Netherlands, and Eire. Though the total is not large, Canadian electrical imports from the United Kingdom rose by 50 per cent during 1950.

The industries in this group, which have a yearly output valued at more than £500 million, are among the most

important consumers of non-ferrous metals and other scarce raw materials. It would appear from the annual report of the British Electrical and Allied Manufacturers' Association and the speech last week of its chairman, Mr G. Leslie Wates, of Johnson and Phillips, that these shortages have hardly yet begun to affect output—though exports have shown a decline in the first quarter of 1951. The association is taking a census to estimate the minimum amounts of the wide range of raw materials that would be necessary to maintain or increase production. While some sections of the industry expand, others may have to switch to different work or close down. At one end of the scale, makers of domestic electrical appliances such as toasters come under the prohibitions upon the use of copper and zinc after the middle of this summer; at the other, makers of certain types of electrical machinery and equipment may need to expand their output to meet defence production and to interfere as little as possible with exports and supplies for essential investment. Up to now production in all sections appears to have been maintained by running down stocks of materials.

Mr Wates devoted much of his speech to the industry's attitude towards the Monopoly Commission. He made clear his preference for investigation by the Commission to the American anti-trust investigations, and he mildly rebuked those in the industry into whose discussions of monopoly control "politics would keep creeping in." Attention from the Commission was "not a lawsuit or a prosecution . . . but an inquiry as to whether our business practices conform to modern ideas of the public interest." These practices, Mr Wates emphasised, were not as yet matters of law but matters of economic judgment. But his further conclusion—"What a wonderful opportunity for us to educate the Commission and through them the whole country as to the reasonableness of our well-established customs"—may be greeted by the Commission with some reserve.

BULLINGTON RURAL DISTRICT COUNCIL

APPOINTMENT OF GENERAL ASSISTANT IN THE TREASURER'S DEPARTMENT

It is desired to fill the above position as from the beginning of July and applications, upon forms which may be obtained from me, should be made not later than May 19th. The appointment (which will be made subject to production of evidence of medical fitness) will be in the Clerical Division salary scale, carrying an initial salary of £400 rising by one increment of £10 and two increments of £15 to £440 per annum.

The Council will assist the successful applicant in obtaining housing accommodation.

The duties attaching to the position will cover a wide range and include the collection of cash when required. Applications are sought from those wishing to make a career in local government finance and to take the appropriate professional examinations.

A. E. OSWIN,
Clerk of the Council.

URWICK, ORR & PARTNERS seek additional staff for the Accountancy and Administrative Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—

1. Professional qualification in Accountancy.
2. Some years' responsible executive experience in senior industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Successful candidates will be trained as Management Consultants at the Company's own Training Centre.—Applications should be addressed in writing to the Company's Offices, at 7, Park Lane, London, W.1, quoting Reference: C/1047.

HOLIDAYS ABROAD AND IN BRITAIN—planned with imagination for people with fastidious tastes and a limited budget. Full details from: Erna Low, 9, Reece Mews, London, S.W.7. Kensington 0911.

ASSOCIATION OF CHEMICAL AND ALLIED EMPLOYERS requires Assistant Secretary. Principal duties visiting and advising member firms and assisting with business of meetings. Good education and industrial experience essential. Knowledge of law or economics desirable. Salary according to qualifications.—Reply by letter, giving full details of training and experience and copies of testimonials to the Secretary, A.C. and A.E., 2/3, Duke Street, St. James's, London, S.W.1.

ASSISTANT SECRETARY required by the Scottish Council (Development and Industry). Good administrative and business experience essential. Initial salary £1,000 p.a. Superannuable.—Applications, with copies of not more than three recent testimonials, to The Secretary, Scottish Council (Development and Industry), 1, Castle Street, Edinburgh, 2.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (periodicals excluded).

Company Notes

British Oxygen.—The strength of the latest balance sheet of British Oxygen fortifies the good impression of the preliminary profits statement, discussed in a recent note. Trading profits have risen from £3,300,567 to £4,312,514, and a final ordinary dividend of 12 per cent has been declared on the enlarged capital of £4,162,922, after the payment of an interim dividend of 8 per cent on £3,469,102 capital; in 1949 a total distribution of 20 per cent was made on the smaller capital. The year's achievement is impressive, for one stage of the capital development programme was completed and finance for the next stage has been provided by the private placing of £4,000,000 unsecured loan stock and the issue on right's terms of 693,820 new ordinary shares.

The rise in the net book value of fixed assets from £9,347,327 to £12,057,397 reflects the addition of new capital equipment and the modernisation of old equipment; a good part of the year's capital expenditure has been used for plant, machinery and cylinders, the book value of plant at cost having risen from £6,187,651 to £7,871,975, and of cylinders from £5,643,891 to £6,564,498. Nor will the pace slacken this year, for outstanding capital commitments are put at £3,800,000. Part of this outlay will be met by retained earnings, and as in the previous year over £600,000 has been ploughed back from revenue.

	Years to December 31,	
	1949	1950
Consolidated earnings:—		
Trading profit	3,300,567	4,312,514
Taxation	1,250,673	1,749,167
Depreciation	966,624	1,212,220
Group earnings for ordinary shares	837,672	1,030,623
Ord. divs.	381,602	414,905
Retained by subs.	251,919	319,899
Added to gen. reserves and c/f.	354,151	295,819
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	9,347,327	12,057,397
Net current assets	3,063,668	8,475,003
Stocks	5,360,795	5,705,629
Cash	613,653	2,685,266
Reserves	5,723,519	8,464,583
Ord. capital	3,469,102	4,162,922
£1 ordinary stock at 94s. yields £4 5s. per cent.		

The raising of new money last year has augmented the company's liquid resources. All but £119,010 of bank overdrafts of £2,120,539 outstanding at the end of 1949 have been repaid, while cash has risen from £613,653 to £2,685,266 and there is £1,078,787 as the balance of the new issue proceeds to swell this total. With the expansion of working capital from £3,063,668 to £8,475,003, further capital developments should not impose too great a strain on the company's financial resources. The programme of capital expansion suggests that the company is looking to the future with every confidence and shareholders will expect, and no doubt will receive, their fair measure of return.

*

Union Castle.—Despite a sharp fall in profits, Union Castle are to pay a higher ordinary dividend of 10 per cent, against 8 per cent; these results disappointed some investors' expectations and after the dividend announcement the price of the £1 ordinary shares fell 4s. 9d. to 41s. 3d., giving a yield of £4 17s. per cent. The fall in group profits, before taxation and depreciation and excluding credits relating to previous years, from £5,110,859 to £4,302,729 is attributable by the directors "wholly to increased operating costs." As four new or reconditioned ships were brought into service between the autumn of 1949 and the end of 1950, it is possible that gross revenue was higher, but operating costs probably rose far more rapidly to outstrip any increases in revenue in 1950. Special credits relating to previous years of £45,075, against £318,066, have contributed to the parent company's net profits of £1,478,579, against £1,972,917. While the provision for British taxation has fallen from £1,826,417 to £1,055,046, depreciation charges have risen from £1,431,496 to

£1,714,117. As the ordinary dividend only absorbs £143,850, against £120,560, net profits may appear to provide ample cover for the dividend; but cautious investors will appreciate that reserve appropriations made by shipping companies often partake of a specific rather than a free character, and are not therefore necessarily to be regarded as freely available for distribution.

It is doubtful whether increased freight rates will keep pace with rising costs in the current year, but equity shareholders will surely have ground for disappointment if the raising of the ordinary dividend despite an easing of profits is not to be interpreted as a sign that the company is confident of being able to maintain this dividend in 1951. A problem of concern to Union Castle and to all shipping companies is the suspension of initial allowances and the outcome of the representations of the Chamber of Shipping to the Chancellor will be awaited with particular interest.

*

Vickers.—The doubling of Vickers' ordinary dividend from 6½ to 12½ per cent appears to have exceeded the best hopes of the market, for on the day following the announcement the £1 ordinary shares spurted 7s. 9d. to close at 54s. 9d. At the current price of 52s. 3d. the yield is nearly £4 16s. per cent, but the price may partly reflect market conjectures about the company's policy regarding the compensation received for its majority holding in English Steel. The year's total distribution, the directors state, represents 10 per cent and an additional 2½ per cent having regard to the transfer to reserve of £3,036,110 as supplementary dividends from subsidiaries, representing profits not required to be retained by them. This qualification may arouse some speculation about the distribution for the current year, but it is not unreasonable to hope that, even without further supplementary dividends from subsidiaries, earnings will grow to cover at the least a dividend of 12½ per cent. Much, of course, depends on the future course of trading, and the latest results give good grounds for confidence. In the year to December 31, 1950, after charging £3,575,537, against £3,354,711, for British taxation, and after making a special provision of £317,800 (nil) for depreciation of British Government securities, group net profits have risen from £2,712,193 to £2,838,074. Group revenue reserves and undistributed profits have also risen from £17,900,039 to £19,592,824. The figures for 1950 and the comparative totals for 1949 exclude any sums relating to English Steel, now that the company is vested in the Iron and Steel Corporation.

Probably the most important factor affecting the market valuation of Vickers' equity is the still unsettled question of how the company will deal with the compensation, valued in February at £15,300,000, received for its holdings in English Steel. The English Steel figures are not consolidated in the latest results, but that merely records the legal fact that Vickers no longer have any direct interest in the assets or profits of English Steel, and is not in itself a pointer to the treatment of the compensation money received for the English Steel undertaking. Shareholders, with the knowledge that the compensation is equivalent to 24s. 10d. per ordinary share, will await the full report in the hope that the Vickers' directors will make some announcement about the possibility of a capital repayment.

Rearmament will keep Vickers' plant busy for some time to come. This factor and the chairman's statement last year that between £6 or £7 million might have to be spent on new plant in 1950 and 1951 may have some influence on any capital distribution proposals. Whatever decision is made, the middle-term prospects for the group, and for its shareholders, seem satisfactory.

COMPANY MEETINGS

THE EMPLOYERS' ASSURANCE

CONTINUED SATISFACTORY EXPANSION

The seventieth annual general meeting of The Employers' Liability Assurance Corporation Limited will be held on May 16th in London.

The following is an extract from the statement by the chairman, the Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B., circulated with the report and accounts for 1950:

The combined premiums of our group for 1950 were £20,930,730, an increase of £5,830,847 on those for 1949. The corporation's underwriting profit for the year was, at £537,772, of only moderate size compared with that of 1949, when the results were outstandingly favourable. The interest earned on our investments was £688,377. After making a contribution of £230,000 to the staff pension account and charging sundry other expenses of £37,138, there is a total trading profit of £1,023,304. The provision for United Kingdom taxation is £542,497, and the net profit for the year is £480,807. We have appropriated £150,000 to increase the provision for unexpired risks in the fire account.

The directors are recommending the payment of a final dividend of 2s. 6d. per share, less income tax, making a total dividend of 4s. per share, less income tax, for the year. This modest increase can hardly be said to conflict with the national policy of moderation and restraint in these matters. The net sum distributed by way of dividend for 1950 would then amount to £164,490, and the carry-forward in the profit and loss account would be increased by £166,317 to £730,866.

FIRE, ACCIDENT AND GENERAL

The fire account again shows a good increase in premiums at £1,519,228, compared with £1,165,766 in 1949.

Motor business, again our largest separate class, yielded £7,236,249 in premiums. The bulk of this came from the United States, where our premium income showed an increase in total, but a small underwriting loss resulted. In the United Kingdom, results in the motor class were again unsatisfactory.

Premiums from workmen's compensation insurance at £4,493,589 are higher in total by £1,162,779. The rest of the premiums in the accident and general account, derived mainly from personal accident, burglary, fidelity and public liability insurances, amounted to £5,429,371. The total premiums in the United Kingdom show an increase of 8 per cent. on those of 1949, but our margin of profit was generally narrower. A notable exception was fire business, where we had a satisfactory year.

LIFE AND MARINE

Our associated life office, the Clerical, Medical and General Life Assurance Society, continues to do well, and has recently announced the result of its valuation for the five year period ended on December 31st last. The divisible surplus amounted to £1,357,200. New business for 1950 amounted to £5,385,498, an increase of £928,840 on the 1949 figure; the life assurance fund improved by £853,820 to £19,320,054.

Our marine subsidiary, the Merchants' Marine Insurance Company Limited, made further progress in the year under review. The net marine premiums were £572,797, an increase of £14,216, and the marine fund at the end of the year amounted to £871,391, or 152 per cent. of the premiums.

Taken at market values, our investments as a whole show appreciation over book values.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

INCOME £15,100,000
TOTAL ASSETS £92,900,000

BONUSES TO LIFE POLICY-HOLDERS

The ninetieth annual general meeting of the Royal London Mutual Insurance Society, Limited, was held on April 24th in London.

Mr J. K. Wiseman, F.C.I.I., chairman and joint managing director, in the course of his speech, said: Life assurance has for many years been recognised by the people of this country as an attractive and convenient method of regular saving. Particularly does this apply in the 10 million homes regularly called on by the agents of the industrial life assurance offices, for the periodical visit of the insurance man creates the habit of regular saving; there is no other form of thrift which provides comparable machinery for regularly putting something by.

The aim of the Labour Party is to create a State monopoly, which could not possibly be of advantage to the policyholders. So long as this danger threatens, your board will consider it their duty to do everything in their power to avert it.

FIVE YEARS' PROGRESS

December 31, 1950, was the end of another quinquennium in the society's history.

The annual income, which in 1945 was £11,686,000, has increased in 1950 to £15,141,000, while the funds in the same period have shown an increase of £24,751,000, being now £92,603,000.

ORDINARY BRANCH

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £3,416,000, an increase of £111,000 over the previous year.

As I have already mentioned, December 31, 1950, was the occasion for a valuation of the liabilities of the ordinary branch by the society's actuaries.

The surplus shown by the valuation amounts to £3,363,497.

A simple reversionary bonus at the rate of 1 per cent. in respect of the four years 1946-49 and 1 4s. 0d. per cent. in respect of the year 1950 is allotted to fully participating with-profit policies.

The directors have pleasure in announcing that interim bonus will be payable during the ensuing year at the increased rate of £1 10s. 0d. per cent. per annum.

GENERAL REFRACTORIES LIMITED

FRESH RECORDS IN HOME AND EXPORT MARKETS

SIR RONALD W. MATTHEWS'S STATEMENT

The fifty-first annual general meeting of General Refractories Limited, was held on April 24 at the Royal Victoria Hotel, Sheffield.

The following are extracts from the statement by the chairman (Sir Ronald W. Matthews, D.L., J.P.) which has been circulated with the report and accounts:

It is my privilege once again to submit for your consideration my statement on the operations of the company for the year to December 31, 1950. It gives me particular pleasure on this occasion because the year under review was the Jubilee year of your company.

From small foundations the present structure has been built, growing steadily from year to year, until today you have a large group of companies producing practically every type of refractory product required by the consuming industries, not only in the home market but also in most foreign countries where refractory materials are used.

An interesting feature during the year was the development of "Ferrocilad." Your board looks forward to increasing sales of these bricks when their intrinsic advantages are fully realised.

RECORD TURNOVER

The turnover figures for 1950 were the highest ever recorded by the organisation, and fresh records were achieved in both the home and export markets. The trading surplus of the group amounted to £485,753, an increase of £20,502 over the corresponding figure for 1949.

Very strenuous efforts have been made in recent years to expand the company's export business, and the very substantial increase for the year of more than 40 per cent. over 1949 is particularly gratifying.

The group profit for the year, after providing for interest, depreciation and taxation, amounts to £173,483, to which has to be added £25,089 provision for taxation in past years no longer required, making a total of £198,572. The balance of £149,966 represents the group profit dealt with in the accounts of the parent company. There has to be added to this sum the amount brought forward £84,216, aggregating £234,182. From this has to be deducted the transfer to general reserve £75,000, leaving available £159,182, out of which your directors recommend a dividend of 15 per cent., less tax. In addition, to celebrate the Jubilee of the company the directors recommend a dividend of 15 per cent., less tax. In addition, to celebrate the Jubilee of the company the directors recommend a special additional dividend of 5 per cent., less tax. This leaves a balance to be carried forward of £87,682, as compared with £84,216 brought in.

In the company's balance sheet, the outstanding feature is the strength of the financial position, the liquid surplus being £440,618, compared with £386,128 last year.

As regards the future, there must be, as a result of the regrettable need for rearmament, an enormous demand for the products of the industries we serve; whether the supply of raw materials necessary to meet that demand will be available only time can show. On that and on the effect that nationalisation will have on the output of steel must depend the demand for our own products. One assurance I can safely give you—your company will not fail to play its full part in meeting national needs.

The report was adopted.

THE RHEOSTATIC COMPANY

LARGER TURNOVER AND INCREASED PROFIT

The fourteenth annual general meeting of The Rheostatic Company, Limited, was held on April 26th at Slough.

Mr M. J. Gartside, B.Sc.(Eng.), A.M.I.E.E., M.Amer.Soc.H.V.E., chairman of the company, in the course of his speech, said: The resulting larger turnover has provided increased profit compared with the previous year. The net profit amounted to £31,308 after providing £38,688 for taxation. The board have increased the general reserve by £14,535 to £60,000 and recommend a final dividend of 12½ per cent., making 16½ per cent. for the year.

Your company now has a greater volume of orders for temperature controls than ever before in its history and although output of the Slough and Frimley Works has been expanded considerably it is still insufficient to meet current demands and deliveries are consequently lengthening.

As a result of the excellent work of the company's development departments, the products now manufactured cover a wider range of applications than previously. Apart from the domestic markets of electric water heating and cooking, in which your company maintains its paramount position, a larger proportion of the total output is now spread among the important fields of central heating, air conditioning, gas firing, coal stoking and oil burning.

The original business of the company, the manufacture of unbreakable resistors, is steadily maintained and a new design of resistor particularly suited to electric traction applications is now available to the market and is attracting great interest at home and abroad.

RECORD EXPORT SALES

Orders received from overseas and the corresponding export sales have attained record figures and their value continues to rise.

The consolidated accounts presented to you indicate that the profits earned by your subsidiary companies in France and South Africa are more than double those of the previous year. Subsidiary and associated companies have not only provided useful revenue by way of dividends and royalties on local manufacture, but have enabled the company's position to be strengthened in their respective fields and have brought substantial export orders to the parent company for the many instruments not locally manufactured.

INCREASED PRODUCTIVE CAPACITY

Referring now to practical details at home, the increased demand on our productive capacity has necessitated the building extensions foreshadowed a year ago, and part of these extensions will be in use very shortly.

I know that shareholders would like some indication of the future trend of the business. It is impossible to make any forecast in the present unsettled conditions but, half way through the current financial year, I can say that your company has so far earned profits at a rate which would be adequate to maintain the present standard of dividend despite the burden of the increased tax on distributed profits.

The further extensions of buildings and plant which are necessary to meet the growing turnover of the company will require additional finance in the near future and your board hopes to be able to announce plans for increase of capital at an early date.

The report and accounts were adopted.

INTERNATIONAL NICKEL OF CANADA

RECORD PEACE-TIME DELIVERIES

The annual meeting of The International Nickel Company of Canada, Limited, was held on April 25th at Toronto.

Dr John F. Thompson (chairman and president), in the course of his speech, said: The year under review was a year of transition from civilian to defence economy. During 1950 world business in all metals developed at a rapidly increasing rate, as rearmament demands were added to those of industry. Concurrent with this increasing demand, we went into full production at our Canadian plants and at our subsidiary operations in the United States and the United Kingdom.

During the year our deliveries of nickel established a new peace-time peak record. Deliveries in all forms totalled 256,410,543 pounds, an increase of 47,118,286 pounds over 1949. The company's deliveries of platinum, palladium, rhodium, ruthenium and iridium totalled 267,316 ounces in 1950, as compared with 214,735 in 1949.

PRODUCTION PROGRAMME

For the second time within a decade your company's production facilities are being taxed to the utmost by abnormal demands for nickel. Today, as during World War II, these are being engendered primarily by defence requirements of the Western nations, but are augmented also by heavy civilian requirements. Although all military requirements are being met—in addition to substantial deliveries to stockpiles—the abnormal overall demand has exceeded the current nickel supply.

Notwithstanding the fact that ore-reserve tonnages have to date been fully maintained, the realisation that mines are a wasting asset keeps the company actively engaged in exploration for new sources of nickel.

Ore reserves at the year-end stood at 252,859,725 short tons, compared with 251,805,157 short tons at the end of 1949. The nickel-copper content stood at 7,669,219 short tons, compared with 7,630,009 at the end of 1949.

Steady improvement in our mining and metallurgical methods over the past twenty years has made it economically possible to use ores of lower-grade than could have been considered in the past.

As reflected in our statement of earnings for the year, our net earnings increased £16,513,535 over 1949; the cost of pay-rolls, supplies and services increased £18,894,359; and taxes based on income increased \$9,622,601. The net profit of \$48,765,849 was equivalent to \$3.21 per share on the common stock, compared with \$2.08 per share for 1949 and \$2.55 for 1948.

It is estimated that capital expenditures in 1951 will exceed \$20,000,000. Such expenditures in 1950 were \$18,683,606, an increase of \$129,755 over 1949. By countries expenditures last year were: \$16,604,594 in Canada, \$1,519,928 in the United States and \$559,084 in the United Kingdom and other countries.

DIVIDENDS

During 1950, four quarterly dividends of forty cents per share were paid on the common shares, with an extra dividend of forty cents in December, the same as payments in the past three years. Four regular quarterly dividends of \$1.75 per \$100 of par value were paid on the preferred shares.

Mr Robert C. Stanley, who presided at these annual meetings as president or chairman of the board for the past twenty-eight years, died on February 12, 1951. He contributed a lifetime of distinguished service to Canada and the nickel industry.

The report was adopted.

MAPLE AND COMPANY LIMITED

RECORD GROUP TURNOVER

MR C. C. REGNART'S STATEMENT

The sixty-first annual general meeting of Maple and Company, Limited, was held on April 19th in London, Mr Charles Clare Regnart (president of the company) presiding.

The following is an extract from his circulated statement:

The turnover of our whole group has again shown a very large increase, amounting to over half a million pounds, breaking all records. Had it not been for the "free market" rate of exchange in the Argentine being depreciated from 25 pesos to the pound to 38.26 pesos to the pound, the dividend and bonus would have easily been maintained. In fact this depreciation has caused us a loss of more than the equivalent of 5 per cent. dividend on the ordinary stock capital.

Now a word about our subsidiary companies. First, Maple and Company (South America), Limited. Our trade increased and the profit in pesos is satisfactory.

Maple and Company (Paris) Limited.—I am pleased to say this company is again expanding satisfactorily.

Henry Barker Smart and Brown, Limited, have had an excellent year, and go from strength to strength.

H. H. Martyn and Company, Limited, of Cheltenham, have again a full order book,

and are still heavily committed for many months to come.

CONTRACT DEPARTMENT

The contract of the year without doubt was the completion of the Southampton Ocean Terminal Dock Building for British Railways, which was formally opened by the Prime Minister on July 31st last.

We are now busily engaged on extensive orders for furnishing and decoration for the *Ocean Monarch*, for Messrs Furness Withy and Company, Limited, *Oronsay* for the Orient Line, *Normannia*, for British Railways, *Port Adelaide*, for Messrs Port Line, *Patricia*, for Messrs Svenska Lloyd, and *Aureol*, for Messrs Elder Dempster.

Contracts in hand, other than for ships, include among others very large ones indeed for the complete reconditioning, redecoration and refurbishing of the Washington Hotel, Mayfair; we have similar contracts for the Criterion Restaurant and also for the extensive alterations, additions and re-equipment of the Shakespeare Memorial Theatre at Stratford-on-Avon. This department has again a full order-book for the coming year, and the most outstanding one is the American Military War Memorial at Cambridge.

Exports again exceeded the previous year, and large orders are now in hand in Egypt, French North Africa, South America and the Persian Gulf.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: The effect of profits tax on the company is a serious one, and now it is proposed

by the Chancellor of the Exchequer to increase this tax from 30 per cent. to 50 per cent. on distributed profits.

However, providing the peso exchange position does not deteriorate further, which seems improbable, but which, of course, is unpredictable, there should be a substantial profit accruing this year from our subsidiary in the Argentine, as opposed to the serious losses of the past two years already mentioned in the balance sheet, which in both cases we have met out of revenue.

This fact should more than offset the effect of the proposed increased tax.

Our home trade still continues to expand both in London and all our branch establishments to a very marked degree, and we can only hope that this trend will continue throughout the year.

Our new branches at Bristol and Leicester which opened in June, 1950, and March of this year respectively will provide a substantial contribution to the group for the first time. The opening of these branches has once more demonstrated the wonderful appreciation and popularity of the name of Maple throughout this country, and I look forward with every confidence to their being established as successfully as those of Leeds, Birmingham and Nottingham, where you will appreciate there is a big and increasing potential market for furniture and furnishings, from the least expensive to the best. It is realised that the services your company can give in conjunction with the goods offered are unique throughout these provincial centres.

The report and accounts were adopted and a dividend of 10 per cent., together with a bonus of 2½ per cent. was approved.

NOTICES

THE UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited from candidates for appointment to Assistant Lectureships in the Faculty of Commerce and Social Science. The appointments will be in Grade III (£400-£500 per annum) and in the first instance for a probationary period of three years. Qualifications, or an interest, in finance or economic statistics for commerce (economics, accounting and commercial law) would be an advantage. The University is prepared to consider applications from men and women taking their degree in June of this year who expect to win high honours.

Applications, accompanied by the names of three persons willing to act as referees, should be received not later than May 31, 1951, by the undersigned, from whom further particulars may be obtained.

C. G. BURTON,
Secretary.

BOARD CHANGES

INSURANCE ENGINEERS LIMITED.—Mr J. Kirk, A.C.I.I., has been appointed Chairman, and Mr W. A. Osborne, F.I.A., Deputy Chairman.

AN International Company manufacturing fine pharmaceuticals has vacancies for one or two first-class propagandists. These will be senior appointments and only experienced applicants with proved success in the field of medical propaganda will be considered. The Company's present employees have been notified of these vacancies. Applications will be treated in strictest confidence and should be made in writing to Box 630.

LEVER BROTHERS AND UNILEVER LIMITED require a deputy to the Chief Accountant with a view to early promotion to the position of Chief Accountant. Applicants must have professional qualifications, preferably Chartered, and outstanding professional or industrial experience and achievement. Character, ability and qualities of leadership of highest order are necessary. Age preferably 35 to 40 but not over 45.—Apply, The Chief Accountant, Unilever House, Blackfriars, London, E.C.4.

STATISTICAL ASSISTANT (female) required for market research department of large manufacturing concern in the Greater London area. Preference given to applicant with academic qualifications. Reply giving full particulars of age, education and experience to Box 632.

SALES MANAGER.—Substantial Company requires a Sales Manager to develop their speciality trade. Permanent post for right man. Commencing salary £1,200 per annum rising on results. Replies in confidence giving full particulars of past experience.—Box 163, Robertson and Scott, Edinburgh, 2.

DIRECTOR Social Research organisation requires experienced personal assistant (man). Someone with writing ability and who is acquainted with social sciences preferred. Salary £450-£500.—Write, giving age and full details, to Box 631.

AMERICA—Transportation only from £50 return. Sailings s.s. *Charlton Star* chartered by The Open Road, Inc. Rotterdam, Southampton, Montreal, from May to October. Write International Travel and Study Commission, 2, Littlegate, Oxford, for details.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the following posts:—
(1) READER, SENIOR LECTURER OR LECTURER IN THE HISTORY OF ECONOMIC THOUGHT.

(2) SENIOR LECTURER OR LECTURER IN ECONOMIC HISTORY (with special reference to the period before 1750). Preference will be given to candidates who have a special interest in General or European Economic History.

(3) LECTURER OR ASSISTANT LECTURER IN SOCIAL HISTORY.

Salary scales per annum: Reader £1,250 x £50 x £1,600, Senior Lecturer £1,150 x £50 x £1,500, Lecturer £500 x £50 x £1,100, Assistant Lecturer £450 x £25 x £500. Initial salary and status according to qualifications and experience. Membership of the F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than May 15, 1951, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the whole-time post of Secretary to the Appointments Board (woman). The post will be concerned mainly with advising Arts and Economics undergraduates and graduates, both men and women, about careers, with their placing in suitable employment, and with the establishment and maintenance of contacts with employing bodies and schools. Candidates should be under 40 years of age, and the possession of a University degree is desirable. Salary from £850 to £1,200 per annum, according to age and experience, with membership of the F.S.S.U. Duties to commence as soon as possible. Further particulars may be obtained from the Registrars, The University, Manchester, 13, to whom applications should be sent not later than May 19, 1951.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN HISTORY. Candidates should have special qualifications in Economic History. Salary scale £450-£500 per annum with membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent NOT later than May 15, 1951, to the Registrar, the University, Manchester 13, from whom further particulars may be obtained.

SOUTH WESTERN ELECTRICITY BOARD

Applications are invited for the position of INFORMATION OFFICER at Board Headquarters, Bristol.

Commencing salary within the range £705-£1,020 per annum according to qualifications and experience. Applicants should preferably possess a University education, a knowledge of printing processes and layout (production of staff magazine), and have experience in Press relations and preparation of material for publication. An intimate knowledge of South-West England will be an advantage.

Applications, giving age, qualifications and experience, present appointment and salary, to the Assistant Secretary (Establishments), Electricity House, Colston Avenue, Bristol, 1, within 14 days.

INFORMATION Bulletins, Journals of Societies or Institutions: editing, design, layout and finalisation of text for printer. Moderate fees. Inquiries from Embassies, literary, social and industrial bodies.—Box 611.

ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN that the seventy-third ORDINARY GENERAL MEETING of the Shareholders will be held at the Company's Offices, 61, Avenue Fouad 1er, Alexandria, on Thursday the 24th May, 1951, at four o'clock in the afternoon, for the transaction of the ordinary business of the Company, pursuant to Act of Parliament, to fix the directors' remuneration and for the purpose of considering and, if thought fit, passing the subjoined resolutions as special resolutions:—

Resolution I.—To elect Mr. Robert Walton, O.B.E., the manager of the Company, as a director of the Company and, for that purpose, to declare Article 106(a) of the Articles of Association suspended in his favour.

Resolution II.—To substitute for Article 80 of the Articles of Association, the following Article:

The number of the directors of the Company shall not be less than five nor more than ten, and such one more director as the Egyptian Government shall have power to appoint and shall appoint.

Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before May 10, 1951, or in Alexandria before May 21, 1951, until after the Meeting, at the National Bank of Egypt, 6, King William Street, London, E.C.4 or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

A Member of the Company is entitled to appoint a proxy to attend and vote at the Meeting in his stead and any proxy so appointed need not be a Member of the Company.

Dated, Alexandria, Egypt, March 22, 1951.

By Order of the Board.

ROBERT WALTON, Manager.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—CANADIAN PACIFIC RAILWAY PERPETUAL FOUR PER CENT. CONSOLIDATED DEBENTURE STOCK.—NEW BRUNSWICK RAILWAY FOUR PER CENT. DEBENTURE STOCK.—CALGARY AND EDMONTON RAILWAY FOUR PER CENT. DEBENTURE STOCK.—ATLANTIC AND NORTH-WEST RAILWAY FOUR PER CENT. FIRST MORTGAGE REDEEMABLE DEBENTURE STOCK.—In preparation for the payment of the half-yearly interest due July 2, 1951, on the above Stocks, the Transfer books will be closed on May 18th and will be reopened on July 3, 1951.—E. F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. April 20, 1951.

REQUIRED by Chief Chemist of large chemical manufacturers in Lancashire, TECHNICAL SECRETARY to supervise the administration of laboratories. Applicants should preferably have a Science Degree, although previous experience in a similar capacity might be acceptable. Good shorthand and typing speeds and previous experience of office administration essential. Salary around £500 per annum according to qualifications, etc., age preferably over 30, but a younger person with the requisite experience would be considered.—Box 633.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

WICKETS fall to the good-length bowler who occasionally lets loose a "wrong 'un"—and in advertising it is careful planning plus ideas that are different that breaks up sales resistance.—Consult Samson Clark & Co., Ltd., 57-61, Mortimer Street, London, W.1. MUSEUM 5050.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments, if desired.

Prospectus from the Director of Studies, Department P17

WOLSEY HALL, OXFORD

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 345 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA

108, Old Broad Street, London, E.C.2.

Established in Canada in 1832 with limited liability.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for two posts in the Department of Economics and Social Science.

(a) Lecturer in Economic Statistics at a starting salary within the range of £550 to £850 p.a. according to qualifications and experience.

(b) Research Assistant in Economics for one year, with the possibility of renewal for a further one or two years. Salary £450 per annum.

Further particulars may be obtained from the Registrar, University College, Cathays Park, Cardiff, to whom six copies of application together with the names and addresses of three referees should be sent not later than May 18, 1951. (Signed) E. R. EVANS, Registrar, Cathays Park, Cardiff.

BRITISH ELECTRICITY AUTHORITY

ADMINISTRATIVE OFFICER—COMMITTEE SECTION
SECRETARY'S OFFICE

Applications are invited for an appointment as Administrative Officer in the Committee Section of the Secretary's Office at the Authority's headquarters in London.

The Committee Section, which is in the charge of an Assistant Secretary, services all Standing Committees, Conferences and Joint Committee Meetings of the Authority, other than those concerned with the negotiating and advisory machinery and certain technical engineering meetings. The successful candidate will be required to assist in organising and supervising the work of the Section and to deputise for the Assistant Secretary in his absence.

Applicants must have some practical experience of Committee work in a large organisation. Knowledge of the electricity supply industry, although not essential, will be an advantage.

The salary for the appointment, which is superannuable, will be within the provisional salary range £900—£1,250 per annum (men) or £800—£1,100 per annum (women).

Letters of application, stating age and giving details of experience and qualifications, should be forwarded to D. Moffat, Director of Establishments, British Electricity Authority, British Electricity House, Great Portland Street, London, W.1, to be received by Monday, May 7, 1951.

Please quote reference AE/160.

THE CUNARD STEAM-SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS for ORDINARY STOCK and PREFERENCE STOCKS will be closed from May 9th until May 22, 1951, both dates inclusive.

By Order of the Board.

H. EAVES,

Secretary.

Offices: Cunard Building, Liverpool.
April 26, 1951.

SECRETARY/RESEARCH ASSISTANT required for Manager of Market Research Department, in leading Advertising Agency, average speeds in Shorthand and Typing. Higher School Certificate or degree Economics. Research responsibilities will depend on qualifications. 5-day week. Canteen.—Apply Mr. Caffin, F. C. Pritchard Wood and Partners Ltd., 25, Savile Row, W.1.

STATISTICAL ASSISTANT (lady aged 25-35) required for a position of confidence with a leading commercial establishment in London. Applicants should have experience in statistical, actuarial or costing work. Apply, in writing, giving full details of age, education, qualifications and experience, to Box 629.

Persia's Road to Ruin

SUCH is the state of emotion and confusion in Teheran that Mr Morrison could safely say little more in the House of Commons on Tuesday than he did say. Confronted with the Persian threat to seize without further ceremony the property and interests of the Anglo-Iranian Oil Company, he said quite rightly that there could be no negotiation on the matter under duress. Knowing that power in Teheran now lies with extremists who have misled and intimidated their countrymen, Mr Morrison went as far as he could in saying that the British Government were "most anxious" to settle the dispute by negotiation. He would have been fully justified in speaking more strongly, even in alluding to the powerful cards that can still be played by the Company and the Government; but to do so might have fanned the ardour of the nationalists. And the one hope now—admittedly a very frail one—is that the consequences of what Dr Mossadegh proposes to do with Persia's oil will become apparent to his countrymen and that their ardour will cool before the prospect. The situation is grave and deserves far more attention in this country and in the United States than it has received. For the next few days should show whether the Persians, having nationalised their oil, will now proceed to expropriate by force, or threat of force, an enterprise of vital international importance.

Events have moved with a swiftness that has taken the Anglo-Iranian Oil Company, the British Government and public opinion in both countries by surprise. On March 15th the Majlis and later the Senate unanimously endorsed proposals to nationalise the petroleum industry and a commission was set up to consider ways and means of carrying them out. Before the time appointed for the commission to report its findings, the extreme Nationalists forced their way to power; then, without thought or even proper discussion, both houses, the Majlis and the Senate, unanimously supported the Nationalists' resolution to declare the Anglo-Iranian Oil Company already "nationalised" and proposed that a commission of eleven Persians should forthwith take over the affairs of the "late Company."

As recently as last Thursday (April 26th) the thirteen-day strike in the Company's refinery of Abadan and in the petroleum fields came to an end. Hussein Ala, who was then Prime Minister, thought it a suitable moment to discuss with the British Ambassador, Sir Francis Shepherd, possible solutions to the problems of nationalisation. He appeared to favour a project somewhat similar in general outline to that suggested in *The Economist* of April 21st, which was, however, far too generous to the Persians to be supported at that time by all the members of the board of the Anglo-Iranian Oil Company. This envisaged the formation of a new, purely Persian, company which would hold the sole rights to the oil from the present oilfields and would own and operate the wells, pumping stations and pipelines. The role of the Anglo-Iranian Company would be to refine the oil and market it—in fact deal with all the essential international operations.

The Persian Government would ultimately obtain its revenue not from royalties on the oil extracted, as at present, but by selling its own nationalised oil to the A.I.O.C. But, as neither the proposed new company nor indeed the Persian Government would have sufficient funds to compensate the Anglo-Iranian for the loss of its concession and at least £300 million of equipment, compensation would be paid for some forty-odd years to come in oil, with an additional agreement that the highly trained British staff should work for the new Persian company during the period that compensation was being paid. Some such solution would have gone a long way to meet "nationalist aspirations," would have ensured efficiency in the industry and revenue to Persia, and provided a means for Persians to take a governing part in running their own oilfields.

*

While this solution was actually being discussed, the Soviet-inspired Azerbaijani radio, doubtless alarmed by the end of the strike and the restoration of order and normal working conditions in the Abadan refinery and the fields, launched an attack on the extreme Nationalist leader, Dr Mossadegh, to whom they had previously given their support. He was accused of betraying the people's cause and "supporting the treacherous Government of Ala, who is an agent of the imperialists."

Hussein Ala, who had never wished to be Prime Minister, then resigned because the Petroleum Commission, apparently inspired by Dr Mossadegh, refused even to consider his reasoned proposals. The Commission immediately suggested that Dr Mossadegh should become Prime Minister. This proposal appears, at least for a few hours, to have shocked the irresponsible and reckless Persians, as the Nationalist leader was well known to have no policy, nor did he wish to consider any policy save the immediate "nationalisation" of the petroleum industry. Dr Mohammed Mossadegh is a rich, educated landowner, over 70 years old, who has devoted himself to the organisation of a party whose sole aim is to "nationalise" or rather expropriate the Anglo-Iranian Oil Company. In his deep and bitter dislike of foreigners he has convinced himself that the miserable poverty of millions of Persians is entirely due to the fact that their only large industry is in the hands of foreigners. Naturally such a theme, coupled with the promise of riches for all Persians as soon as the "wicked foreigners" have been expelled and Dr Mossadegh's plan has been realised, finds enormous support among the illiterates of Teheran. They have not seen the excellent living conditions of the refinery and petroleum workers, and it would make little difference to these highly volatile people if they had. The sick, downtrodden Persians cannot be expected to think for themselves, and the educated Doctor just has not bothered to do so. He does, however, admit that his policy is, at least for the moment, exactly the same as that of the Communist (Tudeh) Party; he even acknowledges that his extreme right-wing nationalism is helping the Communists. He claims, however, to believe that when he has pushed the British lion out of Southern Persia he will be able to escape from the mouth of the Russian bear in the north.

Unhappily, Dr Mossadegh who, if stupid, is at least sincere in his beliefs, is surrounded by a gang of criminals, religious fanatics and adventurers. Many

members of his clique show the muzzle of their guns so often that they have succeeded in intimidating the Persian politicians and the townsfolk of Teheran, who were never famous for their bravery, and, indeed, since the assassination of General Razmara there has been some justification for their fears. The gunmen in the background account for the unanimity of the support for "nationalisation" in the Majlis and the Senate.

The extreme form of violent nationalism preached by Dr Mossadegh bears little or no resemblance to the idealistic nationalism of Pole, Czech and Greek in the nineteenth century. Persia has no oppressor save its own rich and corrupt landlords, and with the exception of a few years during the last war there has been no foreign interference in its Government or administration. The press of Teheran, which has given its full support to Dr Mossadegh, is corrupt and cowardly. The editors are normally willing to print anything so long as suitable payment is made. But recently their fear of the bullets of Mossadegh's henchmen has made them devote themselves solely to vilifying the oil company and attacking the British.

*

The manner in which the Persian Governments have rushed towards their ultimate ruin during the past few weeks leaves no doubt in the minds of observers on the spot that they will continue to race ahead to destruction until such administration as exists in Persia, which has been neither efficient nor effective since the war, breaks down altogether. The possible danger to British lives and property cannot lightly be dismissed. Student riots in Teheran or Abadan can so easily be started with a few coins and, if the new and inexperienced Prime Minister loses control of the police and the army, there is a possibility of the largest refinery in the world being reduced to rubble.

Englishmen, even those who have lived for some time in Persia, find it difficult to understand or to accept the wanton lunacy of a considerable section of the Nationalist Party. There are, of course, hundreds and thousands of Persians who fully realise the folly of the present policy. There were about sixty-seven plans put before the original oil commissioners, many of which were moderate and sensible. Today, however, the known moderates are keeping themselves well in the background, away from the gunmen. Even some of the extremists know that if the rule of law breaks down and anarchy develops, the only people who will benefit are the Tudeh Party. This well-organised, well-disciplined Communist Party could, without doubt, organise a *coup d'état* and take charge of the country. It might well have the support of a considerable section of the Teheran population, who are inclined to feel that they have tried every type of government and can lose nothing by giving the Tudeh leaders a chance.

Apart from the dangers of the Soviet-inspired party taking over the country, it is obvious that Dr Mossadegh's proposals are technically unworkable. The Persians could not run the drills, the pumps or the refinery for more than a few days without foreign technical assistance. They could easily ruin the plant within a few hours. Dr Mossadegh in his maddest moments would be willing to see the petroleum run from the wells into the sea if he could rid Persia of the British. He

appears at times to forget that his Government must depend entirely on payments from the oil company. Perhaps the urgent need for ready cash in the state till caused by the fact that the company has wisely refused to hand over the £2 million advance for May will cause him to be more reasonable.

*

If this, the largest British oversea investment, is destroyed by violence or expropriated under duress, every other oil concession in the Middle East will be threatened with a similar fate. Production and selling of oil will be at the mercy of political passions and the economic and strategic plans of the western world will be deeply affected, for oil is perhaps the most vital of all raw materials. If only for this reason the United States, too, is vitally affected by the dispute, and it is regrettable and alarming that the effect of American counsels so far has been to weaken rather than strengthen British resolution. Quite apart from the State Department's tendency to misunderstand the passions that agitate the Middle East nationalist and the kind of measures needed to deal with them, it would be deplorable if Dr Mossadegh should be acting in the belief that a team of American technicians would be

The Festival

THE Festival of Britain was conceived in the mood of victory and has come into being long after that mood has passed. It has had, until lately, an unsympathetic Press and has become entangled in party controversy on the view—which is quite unjustified, as any visitor to the South Bank can see for himself—that it is a propaganda stunt by the Labour party. People of all parties have complained that scarce labour and raw materials would have been better used to build houses, schools and hospitals—and perhaps in the next breath have objected to an import of Italian prefabricated buildings. They have grumbled at the estimated net cost to the taxpayer of £9,000,000, with some additional loss on the Festival Gardens. They have echoed the question, "What have we to celebrate?" In the middle of 1950, indeed, we might have celebrated economic recovery and independence of Marshall aid. This year, like a family which has arranged a picnic on a wet day, we can only determine to enjoy ourselves nevertheless. That, in fact, is what the public, by all the signs, has decided to do. And not the public of the United Kingdom alone. Advance bookings at home have been heavy, and it is impossible to book a passage from South Africa, Australia or New Zealand. The Festival bids fair to be a success.

The highly successful Exhibition of 1851 (it made a profit of £190,000) also had a bad Press before it opened. When the idea was first put forward *The Times* thundered against the use of Hyde Park, which would "be turned into the bivouac of all the vagabonds of London." And "can anyone be weak enough to suppose that a building erected on such a scale will ever be removed?" Battersea, thought *The Times*, would have been a better place for it. Another main criticism concerned the extreme undesirability of attracting so many foreigners to this country. These were expected, com-

quickly available to take over and run an industry expropriated from its British owners. The least that Washington can do in the present situation is to make it clear in Teheran that such action would not be allowed; and that no American petroleum company would seek to obtain any form of concession in Persia.

Persian oil is absolutely vital to Britain. The British public has not yet awakened to the full consequences that would follow from an interruption of its flow. But if, when they do, it has to be said that the Americans have deserted the British in the first real test of their relationship in the Middle East, then the North Atlantic alliance will have suffered a blow from which it might never recover. The whole structure of western policy is crucially at stake in Persia. The present crisis may or may not be due in part to past mistakes of British policy—but certainly no more so than the Korean crisis was due to past mistakes of American policy. It is imperative that America, like Britain, should back up its partner with full loyalty in action, however many doubts and hesitations may be felt and publicly expressed. Washington should realise that this is a test of the partnership that is likely to be decisive and cannot be evaded.

plained the Prince Consort, "to commence a revolution here, to murder Victoria and myself, and to proclaim the Red Republic in England; the plague is certain to ensue from the confluence of such vast multitudes and to swallow up those whom the increased price of everything has not swept away." Britain could afford its xenophobia in 1851. Today visitors are presented on landing with a card saying "Welcome to Britain," and it is anxiously hoped that in spite of the international situation some 700,000 of these undesirables—100,000 more than last year—may be persuaded to visit these shores with some £60 million in their wallets.

There was anxiety in 1851, too, about whether the exhibition would be ready. A *Punch* cartoon showed the Prince struggling into a footman's jacket and saying to Britannia, "Oh, Mum. . . Here's all the company come . . . and the candles isn't lighted, nor the supper ready . . . nor Nothing." Such was the anxiety about the paintwork that what the Queen called a "bribe" of £1,000—a deplorable word for an incentive bonus—was offered to the contractor Mr Fox to get it ready on time. The Queen was "happy to record" that Mr Fox would not take the money, and he did, in fact, get it finished. When the exhibition opened contemporary comment was as full of superlatives as a film trailer; *The Economist* said that May 1, 1851, was one of the most memorable days in the history of the whole human race.

Whatever the pleasures of the Festival of Britain we shall not experience the awe, the wonder and the faith which caused our forefathers to break into torrents of emotional prose. To them the 1851 Exhibition was a festival of peace, "which," in the words of the Queen, "united the Industry of all Nations of the Earth." Three years later the nation was at war, against the Russians.

The faith in the beneficence of scientific and industrial progress is another Victorian sentiment which is hard to share. Those who watched the "Machinery in Motion" section at the Crystal Palace were filled with pride, not only at man's growing power over his environment, but that the Almighty "had vouchsafed to confer on us so much of His Own Power." Whereas to us in our middle-aged disillusion the greatest wonder of our time, atomic science, appears not as a contribution to world civilisation, but as the possible instrument of its destruction. Nor can we share the Victorian delight in the cheapness and plenty which, they were sure, went hand in hand with industrial progress. In 1800, a contemporary commentator exclaims, the price of smelter tin was £100 per ton, in 1849 it was only £75 (Britain was at that time the largest tin producer in the world); linen which was 1s. 4d. a yard in 1832 was only 8½d. a yard in 1849. Such comparisons moved *The Economist* in an article entitled "Some Moral Aspects of the Exhibition" to argue that progress towards "an equality of enjoyments" was such that the Queen was hardly any better off than her subjects.

Better garments than are made of cotton, wool and silk, her Majesty cannot command, and they are now possessed by the bulk of the people. Than the railway, she has no swifter means of locomotion.

The writer would have been surprised to find how much further the equality of enjoyments could go, and still more surprised that industrial progress could be accompanied by sharply rising prices. Britain in 1851 had left the lean years behind, imports were being freed and food was, therefore, cheap and plentiful. Britain in 1951 is reducing imports of basic foodstuffs and paying more for them.

★

Alas, we shall not experience that certainty of superiority which was such a comfort to our forefathers. Foreigners, observed *The Economist* of 1851, might have something to teach us in the way of manners, "but in general they will have more to learn from us than we from them." The Great Exhibition allowed people to make comparisons between British and foreign goods, and in this way had a special interest and satisfaction which the Festival lacks. For the comparisons of 1851 were almost invariably favourable to Britain. We awarded ourselves 78 out of 174 prizes, and France 54. Of our competitors in the twentieth century, Germany was beginning to show signs of its later industrial strength, but Japan was not in the picture and we were able to be comfortably contemptuous about the United States. The Americans, boastfully it was thought, had applied for more space than they could adequately fill. "What was our astonishment," wrote *Punch*, "to find that their contribution to the world's industry consists as yet of a few wine glasses, a square or two of soap, and a pair of salt cellars." (But there was also that great invention, the sewing-machine.) The wooden agricultural implements shown by the Americans were described as heavy and clumsy, contrasting unfavourably with the light but strong British models in iron. The reaping machine shown by Mr McCormick, of Chicago, was admittedly important; but Britain could boast a combined threshing, straw-shaking and dressing machine drawn by a small steam engine—the beginning of mechanised agriculture.

Fundamentally, perhaps, the purpose of the 1851

Exhibition was to demonstrate to the British a superiority of which they were already convinced, while the 1951 Festival is to dispel the intrusive twinges of inadequacy which they have been feeling in recent years. The complacency of a hundred years ago perhaps helped to produce later discomfiture in that it led manufacturers to be slow in matching the technical improvements of competing foreign industries. Some of the industries which were pre-eminent in 1851 had lost that position by the end of the century. The watch industry, for example, until the mid-nineteenth century the largest in the world, was completely killed by German and Swiss competition, and has been revived only since 1945 with Government assistance. Other old-established industries, such as steel, cotton textiles, textile machinery, which did not feel the full impact of foreign competition until after the first World War, then sought a defeatist solution in tariff barriers and restrictive practices. And, meanwhile, other countries were getting ahead in great new industries such as rayon, light metals, plastics, machine tools and chemical engineering.

★

The collapse of Germany and Japan in 1945 gave British industry an opportunity to which it has risen well. At the same time the war lengthened the lead of American industry, which was able to continue its development while our own was engrossed in war production. Most of the people who admire the exhibits in the "Power and Production" Pavilion would ruefully take for granted the generally greater technical efficiency of the United States. There are a few industries which have always held their own. British shipyards turn out 40 per cent of the total tonnage of all the world's shipyards. The china shown at the South Bank is as unchallenged as when Queen Victoria bought Mr Herbert Minton's tea service as a gift for the Emperor of Austria. The finer British worsteds are still preferred. British cutlery holds as high a place as when schoolboy visitors to the Great Exhibition yearned for the huge knife with 1,851 blades. And if we have nothing to rival the combine harvester, no country caters as Britain does for the smallholder.

It is encouraging, too, to be in the van of some newly developing industries. In jet aircraft Britain has led not only in design but in developing the special heat-resistant steels for their manufacture. Exciting experiences await the public in the "Telekinema" where television and three-dimensional sound pictures are shown—this is getting perilously near the "feelies" of Mr Aldous Huxley's "Brave New World." Evidence of Britain's important contribution to radar is there in plenty, a sad reminder, however, of the usual routine that British scientists provide the ideas, and the United States, being richer in capital, technologists and the spirit of competitive enterprise, applies them.

The Festival will be a source of pride and delight. Why envy the Victorians their fool's paradise? Their faith was rooted in a belief that temporary advantages were permanent; yet we could make that mistake, too. Their complacency ignored the appalling living conditions of half the population; our danger is the contrary error—that of excessive concern with welfare while our industrial position, on which all welfare ultimately depends, goes by default.

Ministry of Materials

THE Prime Minister has stated that the decision to create a separate Government department to handle all questions relating to the procurement—that is, to the domestic production and to the import—of industrial raw materials was taken long before the disputes within the Cabinet over the budget blew up. He did not say whether his decision to recommend the appointment of Mr Richard Stokes to the new post also dates back to the same period; but it well may, since he is obviously the man in the Parliamentary Labour Party best equipped to fill it. Nevertheless, since the announcement came after Mr Bevan's and Mr Wilson's resignations and not before them, the new Ministry inevitably wears the air of an attempt to meet criticism and to make a fresh start in raw materials policy.

A fresh start is certainly needed. Raw materials—not simply since the outbreak of the war in Korea, but throughout the whole postwar period—provide perhaps the clearest particular example of a general defect that has run through the Labour Government's economic policy. An over-elaborate mechanism of control has been kept in being; but it has not been operated with any sense of direction. Disavowing control for control's sake, the Government has not used it for any other purpose. Bulk buying has been insisted upon as a dogma; but its performance has been a long series of attempts to outguess the world or to defy events. Little has been done on principle; far too much *ad hoc*. There has been plenty of planning, but no plan. There has been no discernible policy save to judge every case upon its merits.

This record has been due in part to this Government's chronic inability to make up its mind to any decisions that might disturb its complacency. But in the particular case of raw materials it is also very largely due to the absence of a single department whose primary responsibility they were. It is important to analyse exactly why the creation of a separate Ministry of Materials will, it can be hoped, bring an improvement. The creation of a Ministry does not mean that any new administrative functions will be performed. It ought not to mean that any new jobs are created or any new civil servants employed to perform them. As Mr Strauss said in Tuesday's debate, "the new department will be staffed by people now engaged in the work to be transferred." The only inevitable consequence of the formation of a new department is that there is an additional Minister and an additional Permanent Secretary.

But this is the vital difference. It is very difficult for a civil servant to take any decision that may be publicly challenged or that involves the expenditure of public funds without the express authority of the responsible Minister, obtained through the Permanent Secretary. Raw materials have hitherto been divided between the Board of Trade and the Ministry of Supply. The Ministry of Supply has been busy nationalising steel and organising the production of munitions; the Board of Trade has been busy with an extraordinary catalogue of varied duties. As a result, problems of raw material supply have not been able to engage more than fugitive fractions of the attention of those alone who can make policy. The problems have had to wait interminably

for answers—only, far too often, in the end to be remitted back to what the civil service calls lower levels to be settled *ad hoc*.

★

This, it is to be hoped, is what is now to be put right. There need be no more administration of raw materials; but there should be a great deal more decision, out of which a policy can be shaped. The change can hardly help but be for the good. In the international discussions on raw materials, which are growing daily in complexity, it will be a great gain to have a single focal point in London, which will have at least the opportunity to form a view of the whole picture and keep it steadily in mind. An opportunity—for the creation of a Ministry and the appointment of a Minister, though they make a consistent policy possible, do not by any means make it certain. The international discussions will inevitably take on the form of bargaining this position against that—a maze in which it is very easy to get lost without a clear head. And Mr Stokes's own qualities are those of courage and energy perhaps more than of synoptic judgment.

Nevertheless, the new move is a good one, and it comes at a time when it is possible to hope for progress in the field of raw materials. The statements of American policy made in the last few days by Mr Acheson and Mr Charles Wilson were generalisations; but as such they were encouraging, and the American decision on the allocation of sulphur to Britain provides at least one example of good will in practice. But the chief reason for a certain optimism lies in the possibility that the shortage of raw materials may be slightly easing. What has been happening in the past ten months is that on top of a high level of consumption of materials there was imposed an enormous wave of re-stocking, partly by governments but in much the largest degree by private industry. This supernumerary demand is now very much smaller—either because the re-stocking is completed or because high prices have made it too expensive—and supplies are increasing. (The moral can be pointed in passing that it is the functioning of the price system that has enabled at least the first steps to be taken towards the restoration of balance.) If the re-stocking demand continues to fall, it may be discovered that the level of demand for consumption is not—or at least not yet—so far above the level of supply as to place a negotiated international allocation out of reach. The task that Mr Stokes is confronting is not an impossible one.

It was nevertheless declared to be impossible on Tuesday by one Labour and several Conservative speakers, for a reason that bears examination. The criticism was that while the new Minister is to be responsible for the procurement of materials he is not also to be responsible for their allocation between different demands upon them. This is, at first sight, an impressive line of argument; it sounds very plausible that the "two halves" of the raw materials job should be put together. But in point of fact it is a mistaken argument. Other things, as well as raw materials, are procured, and allocated between different uses, and the two functions are rarely entrusted to the same hands. The Ministry of Supply

procures munitions; but it does not allocate them among the service departments. The Ministry of Labour, in a sense, "procures" manpower; but even at the height of its wartime powers under Mr Bevin, it never allocated manpower. In the case of raw materials, the distinction is even clearer. Procurement is an administrative function; it involves dealing with an immense mass of detail and creates work which can appropriately be handled by a hierarchy with upper and lower levels and more or less responsible work; in short, it is proper to be performed, if it has to be performed at all by the state, by a government department. But allocation is a judicial function which can be performed, and during the war was very successfully performed, by a single Minister and one or two skilled advisers. It does not require a Ministry; in fact, there are positive advantages in those who allocate being entirely separate from those who procure. On this point, the Government's decision has been right.

★

But there is another question to be asked. Has the process of administrative reorganisation gone far enough? Are the Ministry of Supply and the Board of Trade now reduced to manageable size? The proper size of a government department can be almost precisely determined. All matters of any importance, as has been said, must pass across the desks of the Permanent Secretary and of the Minister; it is essential to the proper functioning of the British constitutional system that it should be so. It follows that the maximum desirable size of a department is the size that throws up no more matters of importance than can adequately be dealt with, in reasonable working hours, by one Permanent Secretary and one Minister, assisted, to the limited extent that such assistance can be given or taken without diluting responsibility, by a Deputy Secretary and a Parliamentary Secretary. Judged by this test, both the Ministry of Supply and the Board of Trade are still too large. Some part of the undeniable delay in placing defence contracts can almost certainly be traced to the preoccupation of the Minister of Supply and his chief

advisers with the nationalisation of iron and steel, a preoccupation which has not by any means diminished since the setting-up of the Iron and Steel Corporation. Even with raw materials gone, the range of the Board of Trade is enormous, and though some of the miscellaneous sections doubtless put little strain upon the heads of the department, there is still the big division between the problems of industry and those of external commerce which, though they impinge upon each other (as what groups of problems do not in the modern world) are basically distinct and quite different in character. The process of reorganisation would be advanced another step by the creation of a Ministry of Industry, to take over from the Ministry of Supply and the Board of Trade their functions of control and regulation over domestic productive industry, leaving the one to concentrate on supplying the needs of the armed forces and the other on managing the external trade of the country—both of them large enough tasks to absorb any one Minister's energies.

This is not, it is perhaps necessary to repeat, a plea for more civil servants or more government interference with private activities. It is simply an argument that such functions as the state does perform it should arrange in such a way that they can be performed with intelligence and despatch. So long as the state has so much to do there is an inescapable dilemma between a large number of departments, creating the difficulty of seeing that they move in step with each other, and a smaller number of departments so huge that they can hardly move at all. The former difficulty can be considerably reduced by the device, which is much more recent than most people appreciate, of standing committees of the Cabinet, acting as little Cabinets for the resolution of difficulties within groups of Ministries and served, if need be, by their own secretarial staffs. Many Ministries of manageable size, with all the difficulties that numbers create, are clearly preferable to a few gigantic sloths. "Co-ordination" is certainly desirable; but it is no substitute for policy, nor deliberation for decision.

Development by Corporation

SOME three and a half years ago, when the Overseas Resources Development Bill was making its way through Parliament, the public corporations it was setting up were widely applauded as a notable contribution towards colonial development and as a necessary supplement to the development and welfare plans of the colonial governments. Since then, development by corporation has come under a cloud. The Overseas Food Corporation is drawing a retirement pension; and shortly after its groundnut scheme was reduced to a small experimental project, at a loss of some £30 million, it was announced that the Colonial Development Corporation's scheme for producing eggs in the Gambia had also failed. At the same time, misgivings had been aroused for another reason. During the second reading of the Overseas Resources Development Bill, the Under-Secretary of State, then Mr Rees Williams, said flamboyantly

We are going forward hand-in-hand in co-operation with the colonial peoples, facing all difficulties together, and

finally rejoicing and benefiting from the results of our labours.

Instead, the Colonial Development Corporation has largely ignored the provision in the Overseas Resources Development Act requiring it to consult local interests in the colonies about its activities. As a result it has on more than one occasion provoked local hostility—and at least once hilarity at the way it was being bled.

The publication last week of the Colonial Development Corporation's third report would therefore in any case have been an occasion for some new thinking about its function. The most significant fact about the report, however, is its revelation that a great deal of new thinking has been done within the corporation itself. The text bears the unmistakable imprint of Lord Reith, who succeeded Lord Trefgarne as chairman last November, and it gives the impression of complete candour—a readiness to admit mistakes and to remedy them, and a readiness also to acknowledge the forces working in the corporation's favour. A new broom sweeping very

clean is clearly illustrated in the following passage:—

The organisation at headquarters is being clarified and strengthened; responsibilities better defined. An executive management board of chief officers will shortly be in regular operation. All affairs and all staff will have their focus of decision, responsibility and authority in one or other of its members.

More important is the statement that "all overseas representatives and managers have been told to take appropriate steps" to ensure that colonial peoples understand, approve of and co-operate in the corporation's schemes and objectives."

★

Yet, this administrative overhaul, desirable as it is—and even essential in some respects—is not the first thing to be looked for in the report. The uncertainty about the place of the public corporation in colonial development has still to be dispelled. But it is important that the reason for this uncertainty should be made clear. Very often, the Colonial Development Corporation is criticised because it has undertaken projects that private enterprise would not have touched. This criticism, by itself, is unjustified. The whole point of setting up the corporation was, in the words of the report, "to undertake work which others were not prepared to do." The corporation was never intended to take the place of ordinary commercial enterprise. It was intended to undertake or participate in schemes that were necessary or desirable but beyond the scope of the private investor. Through its activities not only would publicly owned capital be introduced into the colonies, but the way might be made easier for private capital to come in at a later date.

This concept of the Colonial Development Corporation does not excuse some of its mismanagement in the past—particularly its rushing into the Gambia poultry scheme without proper trials, on which the new report is severely self-critical. But even though this, and other schemes that show no prospect of paying their way, are radically overhauled or closed down—as the report promises—the corporation still seems to be faced with an impossible task.

The difficulty is that although it is absolved from undertaking only ordinary, commercially attractive, schemes, it is still bound, over a period and over the whole of its operations, to be a financial success. For the first seven years the advances made to it by the Colonial Office are to be interest-free; but the interest accumulates, and eventually both capital and interest will have to be repaid by annuities over thirty-three years. Thus eventually enough money must be earned by its successful schemes, not only to pay back the advances made in respect of them, but also to carry the weight of the unsuccessful ventures like the Gambia poultry scheme.

Perhaps it is not surprising that, in the circumstances, the corporation has behaved somewhat like a chicken, picking and pecking at a miscellaneous set of projects, some because they look commercially attractive and revenue-earning, others because they are of obvious value to the development of the territory concerned. The criticism has often been made of the corporation that it has started too many schemes at once, instead of concentrating on a few good ones. The corporation's defence—and it is justified—is that it is bound

by its constitution to promote colonial development, and that when a sound and reasonable scheme is put forward it cannot hold back.

In its new report, the corporation tries to play down its own importance. It says that its potential influence in the colonies is apt to be exaggerated because, in relation to the size of the colonial populations and the new capital needed, £100 million is a small sum. This is perfectly true. The point is that even if the sum were ten times as great, it would still be doubtful whether the corporation, under its present constitution, would achieve its avowed purpose—"corporation investments should be so laid out as to attract other capital, and to stimulate capital accumulation within the colonies." How can a corporation, with such limitations on its freedom as are inherent in its terms of reference, so direct its investments that they become a growing point for colonial development?

A way out of the difficulty can, however, be dimly seen in the report itself. Perhaps the most promising of all the undertakings it describes is the Tanganyika coalfields investigation. At the request of the Tanganyika Government, the corporation has so far committed £409,000 to investigating the coal resources of the territory, a sum which is by no means large in relation to the possible eventual capitalisation. But, in the present context, the significant point of the investigation is, not that it is being done at the request of the local government—colonial governments have often put up schemes to the corporation, some of which have been most dubious—but that it is closely linked with the Tanganyika Government's plans for extending the railways. In fact, the programme of investigation was speeded up last year at the request of the Government because "results are required for determining [railway] alignments." If it is assumed that the results of the investigation are satisfactory, the exploitation of the coalfield will have to be co-ordinated with other aspects of economic development—labour is an obvious example.

★

Does this not point to an obvious conclusion? Can co-ordination of this sort properly take place by a triangular route between Tanganyika, Dover Street and Whitehall? Even if regional devolution, on which much emphasis is placed in the corporation's report, is as effective as it is evidently intended to be, major decisions involving the expenditure of the British taxpayer's money cannot be taken by the man on the spot. Instead of one corporation, with headquarters in London and bearing eventual responsibility for all the varied schemes started all over the colonies, should there not be local development corporations in the colonies, or in groups of colonies, themselves? The essence of the proposal is that the local governments should have a large stake in the finance and management of the boards; instead of hoping to secure funds for doubtful propositions, or for desirable but isolated projects, they would then be much more likely to relate the corporations' schemes to their development and welfare plans and to their labour and fiscal policy.

It would not be feasible to have a separate development corporation for each colony. Moreover, a central organisation in London would still be needed, for advice, and for help in obtaining technicians and equip-

ment. It may be asked how the colonies can provide the funds for investment in the colonial boards. At the moment, the boom in raw material prices has altered the whole financial picture of many colonies. Already, they are using their extra revenue to participate with the corporation in some of its projects. The advantage of breaking up and decentralising the corporation is that its projects would then be based on intimate local knowledge and tempered by the thought that local money is at stake.

NOTES OF THE WEEK

Last Round of the Deputies

The western deputies have very properly decided to force Mr Gromyko's masters out into the open, or to finish with the talks for good. For nine weeks, the three deputies have let him talk, in private discussion to them, and in formal conference to public opinion outside. They have given him every opportunity to show that his Government wants a conference at which real negotiation might take place on questions that have not been prejudged. Nine weeks, they have rightly concluded, is enough for anyone.

They have now put before him three possible bases on which the Foreign Ministers might meet. The first is a final attempt to find a detailed statement of the outstanding problems, in a form and order on which both sides could agree. The latest western offer contains the major concession that German demilitarisation appears as item one before the general discussion of armaments; the only point at which it conflicts with the Russian demands is that "level of armaments" still appears before "reduction of armaments." For Mr Gromyko to reject this would be to strengthen the suspicion that Moscow is primarily interested not in disarmament but in checking the American and European attempt to catch up to its own level of strength.

The second proposal is that the deputies should agree to differ on the basis of their previous positions, and leave the outstanding differences to be resolved by the Ministers themselves when they meet. The third is to abandon any detailed formula and merely to present the Ministers with a list—in the barest possible terms—of the general headings of the problems which even the Russians have agreed that they must discuss if there is to be a meeting at all.

It is true that the Deputies must be said to have failed if they cannot reach agreement on the first possibility. Neither of the other two could fulfil the real purpose of the preliminary meeting, which was to prevent the Ministers from sliding out of substantive negotiations because they could not decide what they were really negotiating about. But those two proposals had to be made; for through them, the west have imposed on Mr Gromyko the sole responsibility for deciding whether the Ministers shall meet. If he is instructed to turn down all three, having already given them the chilliest of receptions, it will take all and more than all the ingenuity of Communist propaganda to convince the free world that the failure was not Moscow's fault.

Streamlining Nato

It is important not to feel too impatient at the announcement of further organisational changes in the North Atlantic Treaty Organisation (Nato). It is true that little seems to have been done in the last few months except to deepen the confusion and conflict over the practical problems of western defence production; and the organisation of Nato cannot be exonerated from the charge that it has spent the first two years of its existence fiddling with committees while

The idea of colonial development companies is not new. They were contemplated when the Colonial Development and Welfare Bill of 1945 was passing through Parliament. One of their purposes, it was then said, would be to educate the colonial capitalist in the virtues of sound investment and in management. At a time when the colonies are advancing so fast in the political sphere, the economic education that could be provided by local development corporations would be a very valuable counterweight.

the needs which those committees were set up to meet have been clamouring for attention. But for a fairer judgment it is necessary to examine rather more closely than has so far been done the causes of the present disorganised scramble and shuffle towards rearmament.

It is being forgotten that the reactions of Europe and America to the unexpected Korean attack were fundamentally different. Europe was cautious, America was bold—and both had very good reasons for their attitudes. Europe stepped hesitatingly into the preliminaries of rearmament; America began rearming fast. What was intended as recently as last spring to be one process—the joint effort to organise the defence of Western Europe and the approaches to the Atlantic—has become two processes. One is the independent rearmament of the United States, the predominant world power; the other is the organisation of a peacetime—or cold wartime—deterrent alliance. The former has gone ahead since Korea with all the freedom and power that American ways allow; the latter has from the first been tangled in unfamiliar problems of organisation and procedure, almost crippled by the growing pains of a new institution about whose future no one has clear ideas. This was bound to produce just the confusion which now reigns in practically all the economic aspects of western planning. But amid the tumult over prices and the recrimination over sulphur it must be remembered that it is only because the first—the American process—has been bounding forward, that the latter—the Nato process—has been able to afford the luxury of deliberation in its provision of men, weapons and supplies.

A stage has been reached where no one, least of all the Americans, any longer pretends that the two processes can be allowed to stay apart. America has now to cut its cloth with the needs of Europe in mind, and Europe must organise its own efforts up to a level comparable with the American if its claims on resources are to be justified. The efforts of individual nations have to be co-ordinated in the light of world needs and resources.

This is the new task which Nato can no longer escape. Hitherto it has been incompetent to plan economic strategy in this sense. It has had two high level bodies that function really efficiently: the representatives of American, British and French chiefs of staff in the Standing Group—all fighting men handling military matters; and the Committee of Deputies—all civil servants handling political matters with expertise and economic questions with the diffidence of amateurs. In principle they were charged with looking after the butter as well as guns; in fact they have been incompetent to do so, and have relied largely on the already flourishing organisations of OEEC and ECA.

This has now been changed. There is now to be a Finance and Economic Board, which will provide not only a planning body where experts can pool their information and ideas, but a forum where economic grievances can be examined before they become political issues. The Deputies, too, are

to change their role; in future they are to represent heads of governments and all their interests instead of representing primarily the interests and points of view of Foreign Offices. In short, specialisation is to be reduced, the walls between compartments fall away, and there should at last be a chance to see the defence problem as a whole through the eyes of a properly qualified and international team of officials.

Australia Votes

It is almost certain that Mr Menzies's Liberal-Country party coalition has won the Australian elections with a majority in both the Senate and the House of Representatives. His majority in the lower house has dropped from 27 to almost 15, but in a membership of 121 this is still a workable figure. However, his gamble of asking for a double dissolution—for only the second time in Australia's history—made the voting for the Senate the crucial test. The key state was Queensland, where the Communist issue on which Mr Menzies based his campaign is more prominent than elsewhere. If his coalition secures six Senate seats from Queensland to the Opposition's four he should obtain a majority of two in a membership of 60 and so break Labour's hold on the upper house, which has been a carry-over from the period of Labour government before the general elections of 1949. This success in Queensland is virtually assured, although there are still votes to be counted; the government looks now like getting a bonus by winning in Western Australia.

The election campaign has been quieter and less bitter than might have been expected. It began with a good fighting speech from Mr Chifley, the Labour leader, and a rather tame start by Mr Menzies. But the Prime Minister soon made up for this in a rousing tour of Queensland and at Cairns held one of the best meetings of his career. In general, his two parties succeeded fairly well in deflecting attention from the problem of inflation, on which Labour placed its main emphasis, to that of Communism, which was the fundamental issue over which he had gone to the country. Mr Menzies's own proposals for dealing with Australia's galloping inflation are to concentrate on increasing production, for which there is certainly scope, rather than try to clamp down on prices. Whatever happens, prices, incomes and costs will go on rising for the next twelve months.

The big question now is whether a new Liberal-Country party coalition can carry through by referendum the amendment to the constitution which Mr Menzies desires, if the central government is to have increased powers to deal with the Communists. In attempting to obtain more authority for Canberra, he has still to face opposition from within his own Liberal party as well as from the State governments. In seeking to ban the Communists, whose 22 election candidates secured only 40,000 votes and all forfeited their deposits, he will antagonise many to whom such legislation is understandably repugnant. On both counts, the government will need to present a crystal-clear case if it is to secure the necessary support in the country and the sympathy of Australia's friends in the world.

Washing Their Linen

Both issues on which Mr Bevan based his resignation—the health service charges and the raw materials shortage—were debated in the House of Commons this week, the first on the committee stage of the National Health Service Bill, and the second on a Conservative motion. Surprisingly enough, the more serious and important of these discussions proved to be that dealing with the health service charges. In it not only did the rebel section of the Parliamentary Labour party demonstrate its dislike of the proposed charges for spectacles and false teeth, but many of these

members made it clear that they based their dislike on their opposition to the view that rearmament should have priority over the social services. Though only five Labour members were prepared to carry their opposition into the voting lobby, when the clause imposing the charges was put to a division, at least 20 to 30 others abstained in a way reminiscent of the revolts on foreign policy in the last Parliament.

This demonstration took place despite the announcement, made early in the discussion by the Minister of Health, that the Government would go some way to meet its critics by limiting the charges to a period of two full financial years, that is, until April, 1953. The committee discussions on the main clause of the Bill presented the extraordinary Parliamentary spectacle of the Labour party thrashing out, in the publicity of the Chamber, this major issue of policy, in front of a delighted audience of Tories who had enough sense on this occasion to keep silent, except for an occasional stir to make sure that the pot stayed on the boil. It was as if the public had been admitted to a private meeting of the Parliamentary Labour party.

The depth of feeling on this issue is at first sight surprising—and it certainly appeared to surprise some Ministers in the early hours of Thursday morning—for the party has swallowed other more drastic inroads on the social services; for instance, the ceiling on food subsidies met with little protest. This feeling cannot be adequately explained as personal support for Mr Bevan, since this remains mainly limited to the circle of his friends. Its true explanation may well be that what is finding expression in this health service issue is an underlying uneasiness among a section of the Labour movement about the new level of rearmament. Sacrifices in the social services, which in the autumn of 1949 were accepted as a price of economic recovery, are being bitterly opposed when they appear as the price of armed defence. This certainly weakens Mr Attlee's hand on the central issue of national security and must contribute to forcing a general election this year.

Three-Halfpence

The penny daily newspaper disappears after today, and its departure marks the end of a period. The last of the regular penny purchases to survive, it now joins the company of the mourned—the penny postcard, the penny bun, the penny bus fare, the penny bar of chocolate, the penny dreadful. That it has lasted so long in a world of rising costs is a matter of surprise. Its reprieve has been due to

three factors: the great increases in the circulation of all newspapers since 1939; the shortage of newsprint which kept down the size and therefore the cost of production of each paper; and the greatly enlarged revenue from advertisements.

The immediate occasion of the increase to three-halfpence (and the *Daily Worker's* increase to 2d.) is last week's announcement that the equalised price of newsprint was to go up from £47 to £60 a ton. This is the biggest of the

long series of increases that have occurred in the last thirteen years and have carried the price of the newspapers' main raw material to six times what it was in 1938. Today's meagre five (average) pages cost as much as thirty pages before the war, and no penny paper was as big as that even in those days of plenty. Unfortunately this latest increase does not look like being the last; there seems every likelihood that the price of Scandinavian pulp will be higher still for the second half of this year, with a consequential rise in the price of newsprint over here. Even with the price at £47 a ton, several newspapers were already making losses, and might have been compelled to put their prices up. What is interesting is that the various newspaper proprietors should have been prepared to take concerted action. Their interests vary so much that on a short view they might well have preferred to act individually. The finances of combines with morning and Sunday papers differ from those with only morning and evening papers; those with a chain of provincial papers are different again. Some could have carried on at a penny for some time to come even with newsprint at £60 a ton. What has brought them together is the certainty that some newspapers would be compelled immediately to go to three-halfpence, and that this would upset the delicate balance of advertisement rates and distributive margins. By acting together, the newspaper proprietors can insist on a reconsideration of the whole basis of their terms with advertisers, wholesalers and retailers.

*

These are, however, matters of domestic concern to the newspapers. Of more general interest is the question whether the extra halfpenny will reduce circulations and whether readers will be given anything better for it. A higher price for a single newspaper might well have affected its sales. It is doubtful if the all-round increase will seriously affect circulation, since a newspaper will still cost less than a single cigarette. As far as quality is concerned the newspapers have been quick to promise their readers an increase in editorial matter and a reduction in advertisement space. In the short run, the profits from the extra halfpenny should provide an ample margin for this. The future will depend on how much further the price of newsprint is pushed up.

* * *

Dearer Food

The first effects of the Government's decision to keep the total cost of food subsidies at £410 million, in the face of rising world prices, are now being felt. Last week-end, the Ministry of Food announced higher prices for butter, margarine and cooking fats. Butter is to go up from 2s. to 2s. 6d. a lb., making a total rise of a shilling during the past twelve months. Margarine will be 4d. a lb. dearer at 1s. 2d., and the price of cooking fat will also rise by 4d. to 1s. 4d. a lb. The cost of imported butter and vegetable oils and oilseeds has risen during the past year but the subsidy on each of these three foods has also been reduced—from 1s. to 8½d. a lb. in the case of butter, from 4½d. to 3½d. for margarine and from 3½d. to 3d. for cooking fat.

The Minister of Food warned housewives five weeks ago that the weekly cost of rationed foods would increase by about eightpence. On present rations, the higher prices for fats account for threepence. The prospective rise in the price of meat may add another 1½d. or 2d. to the weekly bill and the 4d. a lb. increase in the price of tea will add a halfpenny. This brings the total weekly increase up to fivepence or fivepence-halfpenny. Another threepence has still to be found to reach Mr Webb's figure. Price is only one factor that affects weekly expenditure on food; the other is the size of the ration. The scale of rations this year is unlikely to be higher than in 1950—it may not be so high—so that further increases in food prices seem

probable if Mr Webb's prophecy of an eightpenny increase in weekly expenditure on food is to be fulfilled.

Butter is now becoming expensive, but few, if any, cannot afford to pay 7½d. for their weekly four ounces. The subsidy has been reduced sufficiently for it to be removed altogether at one bold stroke, and then rationing might also be abolished. Supplies of margarine have been more than adequate for the past twelve months and, but for the Korean war, rationing might well have come off last September. Only a brave government, however, would raise the retail price of margarine to 1s. 5½d. a lb. in order to drop the subsidy. Nevertheless, the Government has at last decided to break loose from the fetters of the retail price index, for these new increases in food prices, though they may mean only 5d. a week more on the cost of rations, are likely to raise the index by at least a point or two.

South African Liberalism Rallies

The ill-wind of Dr Malan's attack on the Coloured vote has at least blown good to the South African Opposition. It has been forced into the open with a positive policy of its own. Mr Strauss has pledged his party, if returned to power, to entrench a Bill of Rights in the constitution. This Bill would secure the political rights of the Coloured people (but no word of hope for the nine million Natives?), the equality of the two official languages, the freedom of the press, religion and speech, freedom of movement, the right of free access to the courts, and the Union's position as a member of the Commonwealth. Here is a programme behind which the liberal forces in the Union can rally, though exactly how it is to be carried out remains obscure. Will this mean the calling of a national convention and the drafting of a new constitution? Will the entrenched clauses of a new constitution prove more solid against the determined onslaughts of any extremists of the future than the present constitution has shown itself to be? And how many weary years will it take to achieve so momentous a change?

There are those—including Dr Malan—who claim that this declaration is a gift to the Nationalists; that it will split the United Party, driving straight into the Nationalist camp its many members who feel strongly on the need to secure white supremacy. Dr Malan has stated, further, that to entrench freedom of speech will be catastrophic in view of the Communist danger; to secure freedom of movement will allow the Indians to spread across the country; and freedom of association will mean that Native trade unions must be recognised—all arguments likely to play on the worst fears of the Europeans.

But the struggle before liberals has now, at least, been crystallised around a crusading programme, which the United Party has hitherto sorely lacked. This, in itself, should break through the unhappy defeatism in which many South Africans have been caught, and canalise the feelings of decency which have fretted impotently at the course of the Union's policy since Dr Malan's advent to power.

A Council of Empire?

That hardy annual of imperial policy—the creation of a Colonial Council or a Council of Empire—has shot up recently in the correspondence columns of *The Times*. There is a certain appeal in the idea. The Dominions have their Commonwealth Conferences, at which that strong but intangible unity of spirit which marks the Commonwealth association is given remarkable expression; but for the colonies there is nothing. On no occasion is there a joint and ceremonial manifestation of their relation to the Crown and to one another, and incalculable good might come from this relationship if it were wisely handled on all sides.

May

In May the British Industries Fair, at which the finest products of Britain's industrial skill and craftsmanship are displayed, attracts buyers from all over the world. As usual, the banking needs of exhibitors and visitors alike are met by the Midland Bank, which has branches at the Fair at Olympia, Earls Court and Birmingham, in addition to 2,100 offices in England and Wales.

Whether you are a customer of the Bank or not,

you are invited to make use of these

extensive services.

MIDLAND BANK LIMITED

Progress in Electronics

There is hardly a branch of human activity in which electronics does not play a part today. And research is constantly opening up new fields of application. In the Mullard laboratories, the endless quest for greater knowledge is directed towards a variety of objectives. One of them is the development of new and more efficient materials. It is not, for instance, an elaborate plaything that you see in the photograph below right. It is a model—hundreds of millions of times actual size—of the crystal structure of a fluorescent substance. This and similar models have helped to reveal new facts of profound importance to the progress of electronics.

Bringing the benefit of its research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants are manufactured complete electronic equipments for specialised purposes. Behind the name Mullard is a store of experience in electronics that may well prove of immense importance to your own organisation.

Magnetic materials are essential to electronics. Here is an important stage in the casting of "Ticonal", the world's most efficient permanent magnet.

(Mullard)

Particularly today, when nationalism is sweeping colonial politics, and "Self-Government Now" is a certain rallying-cry, a good case can be made for demonstrating the broader framework into which nationalism can fit, with advantage to all and yet without losing its identity. A realisation by the colonial peoples of these possibilities would provide one answer to those who see in the present spectacular progress towards self-government nothing other than a disintegration of the Commonwealth.

The practical difficulties of creating a Council of Empire are legion. The Dominions already form a select "high table" of their own; a colonial council might seem to mark off the lesser fry and their position below the salt, and cause resentment rather than pride. The fact that this is a gathering of non-sovereign peoples might become painfully clear, and intensify impatience with anything short of complete sovereign status. Wrangles would develop as to the exact moment when an all but self-governing colony should move from one conclave to the next; and there would always be marginal cases arousing dispute.

One possibility, not sufficiently explored, is to call regional conferences in London. This was done once, and with success, in 1948 when an Africa Conference was summoned, consisting of members of the legislatures of all the African colonies. It was addressed by Cabinet Ministers, entertained by the King, and provided for Africans, Europeans and Indians from the different territories an appreciated opportunity to meet each other and also the British public. Why was this experiment not repeated and extended in similar regional conferences for the West Indies and the British territories in Asia? Burke dreamed of the links "light as air but strong as iron" which could bind Britain and its former dependences; but the links have to be wrought again in a design palatable to the task of twentieth-century nationalism.

American Aid for Formosa

Mr Acheson has now published the text of an agreement reached at the beginning of February for American military aid to the Nationalists in Formosa. It is an agreement with "the Chinese Government," which the United States still formally recognises, and it binds the former to use the war material only "to maintain its internal security or its legitimate self defence." The aid is to be supervised by a military mission of about 100 officers headed by Major-General William C. Chase, who served in the Philippines before the war.

This agreement rules out any offensive action of Nationalist forces against the mainland of China, as advocated by General MacArthur, but it indicates an American commitment to continued support of the Nationalists in their last stronghold, and it would hardly be compatible with any American recognition of the Peking Government as part of a settlement in Korea. The quantity of equipment to be delivered is reported to be small for the time being, but the Defence Department will ask Congress for a much larger allocation for the coming fiscal year. This implies a long-term policy and suggests that the American Government, however much it disagrees with General MacArthur's views on other matters, now accepts his contention that on strategic grounds Formosa should not be allowed to fall into Communist hands. The protection of the American fleet is due, in accordance with President Truman's declaration, to be withdrawn from Formosa at the conclusion of the Korean war; but the intention is apparently meanwhile so to strengthen the Nationalist forces in the island that they may be able to hold out there indefinitely. This is what the Nationalists themselves say that they want, for they are humiliated by direct dependence on American naval protection and are confident that if they have a sufficiency of

American supplies they can defend Formosa so long as the Chinese Communists are not reinforced by Soviet naval units.

This American policy on Formosa can hardly fail to accentuate the cleavage between Washington and London over the question of recognition of the Peking Government and the seating of its delegates in the United Nations. Fundamentally the difference is that whereas the British Government apparently still hopes for friendly relations with the new China and is prepared to forgo any local strategic advantage in order to avoid conflict with it, American opinion, both official and unofficial, now regards Communist China as a hostile power which is already belligerent in Korea and would be an active enemy everywhere on the outbreak of a world war. On this view it would be the worst of folly to abandon an important strategic position and a friendly army of some 300,000 men. But the Americans cannot help the Nationalists if they recognise the People's Republic; it looks, therefore, as if they will go on refusing to recognise it, with all the international complications that this entails.

Spaniards Strike Again

Last week's strikes in the northern provinces of Vizcaya and Guipuzcoa have heightened the sense of expectancy in Spain, which started to mount when riots flared up in Barcelona during March. For the first time since the civil war people are on tiptoe, waiting for something to happen, though they are not quite sure what they expect or want. The cause is economic, and the great question is whether during the next few months its effects can stretch so far into the iron-clad realm of Spanish politics as to unseat General Franco himself.

In Bilbao, as in Barcelona, strikers have now defied the law—which bans all strikes—as a protest against the high cost of living. On the government's own statistics they have every cause. The real wages of the average Spanish worker today stand at about 55 per cent of their value in 1936 when the civil war broke out. But in Bilbao, unlike Barcelona, the disturbances were not spontaneous. They showed careful planning, designed to bring out over a quarter of a million workers before May Day and thereby to forestall the Communists who certainly had very little to do with the strikes in the form that they eventually took. Now the northern provinces have returned uneasily to normal and the strikers say that the government must "do something about it so that we can live."

General Franco can do little that will have any immediate effect, except to put new heart into the people of Spain by purging his government of men who have been allowed for too long to batten on position and privilege. The chances are that he will associate himself with some move of this kind, that, if he does, the bulk of the army will stand by him, and that this will give the regime at least a breathing space. But what then? Even now the Spaniards are very unwilling to risk a violent upheaval and the exiled politicians have very little following. For Franco himself, the short term trend is favourable: a better harvest than last year's is in prospect, more hydro-electric power is available for industry, and most of the \$62.5 million loan from the Export-Import Bank is still in his pocket. On the other hand nothing being done at present is on a big enough scale to stop Spain's economy continuing its slide downhill, and sooner or later this must affect the political structure of the country. For the Generalissimo, as for every other Spaniard, the need is to reverse these trends before they again promote a violent conflict. He would be wise to use his breathing space gradually to retire from exclusive control of his country's destiny, and to allow the regime to soften into something more likely to receive sympathy—and a faster flow of economic aid—from abroad.

Pensions and Assistance

The debate on the second reading of the new National Insurance Bill provided an opportunity for two important ministerial statements. One, by Mr Douglas Jay, answered Mr Bevan's accusation, in his speech of resignation, that the Chancellor of the Exchequer was raiding the National Insurance Fund and that rearmament was being

financed out of the contributions that the workers have paid into the fund in order to protect themselves.

This accusation was not well received in the House of Commons at the time it was made. But among the electorate it may well win more sympathy; economic enlightenment has not gone far enough for the place of the National Insurance Fund's surplus in the national savings to be readily appreciated, and it is still widely believed that pensions and other benefits could be increased, without a corresponding increase in contributions, simply by drawing on the surplus. Some official propaganda on the economic function of the surplus, together with the facts given by the Government actuary on the mounting cost to the Exchequer of old age pensions, is greatly needed.

The other important statement was that the Assistance Board is revising its scales of payments to meet the higher cost of living and that the new scales will be brought into force at the same time as the higher pensions. This increase is unavoidable. If it were not made, old age pensioners who have to have their basic pensions supplemented by national assistance—that is, those whose needs are greatest—would merely have their assistance payments reduced by the amount that their basic pensions are increased and would consequently be no better off. At the same time, the higher assistance scales will help many elderly pensioners, under 70, whose basic pensions will be unchanged, and all those whose resources are inadequate for their needs and who consequently have to be given national assistance.

Yet, as was pointed out in the debate, the prospect of one form of government relief expenditure chasing another indefinitely is not reassuring. It is only too likely that further rises in the cost of living in the course of the next year or two will provoke further demands for such expenditure. What the Government—of whichever party—should set its face against is another increase in old age pensions. Relief should be concentrated on cases of real hardship, and the best way of achieving this is through national assistance.

* * *

Agricultural Committees

The report of the committee on the organisation of the Ministry of Agriculture (HMSO, 1s. 9d.) represents an interesting investigation into the working of a Government department by a joint group of civil servants and independent industrialists. The Ministry in question has been placed in an unusual position by the rapid development of agriculture over the last twelve years. Agricultural policy has been executed locally by the county agricultural executive committees, acting as the Minister's agents, which, starting as a wartime expedient, have received statutory recognition and an increasing range of functions. It was an important part of the investigating committee's task to advise on the future organisation and relations of the county committees.

The report recommends two major changes. It wants to end the arrangement by which officers of the National Agricultural Advisory Service act also as officers for the county committees and their district committees. It is felt that farmers cannot have full confidence in consulting an advisory service whose officers (in a different capacity) may be called upon to take disciplinary action against them. In addition, it is hardly satisfactory that advisory officers should be burdened with extraneous duties. This recommendation

does mean, however, that the advisory service will lose an important means of contact (however suspect) with local farmers, and its success will depend on farmers showing a greater readiness to seek advice and on the advisory service displaying greater ingenuity in supplying it.

The second main recommendation is that the county committees should cease to operate trading services and to administer certain subsidies. These functions would become the direct responsibility of the Ministry, operating through a new county organisation. The argument put forward for this adjustment is that the committees are overburdened with routine duties. (May it not also be thought that the trading services will be run more economically if they are taken out of local farming politics?) The report is careful to stress that these changes should assist the county committees to concentrate on their fundamental duty of "promoting the development and efficiency of agriculture." It appears that many committees are not giving enough attention to ways of coaxing inefficient farmers to improve their standards.

* * *

Good Sense in Housing

Dr Dalton has taken two steps forward where Mr Bevan refused to budge. He has accepted the fact that housing standards are too high in relation to current resources and has agreed to modifications which will reduce costs without sacrificing essentials. He has also recognised that housing authorities are competent bodies, capable of building houses to agreed standards without having every draining board and power plug passed by a Ministry official.

The circular which embodies these changes of policy was sent to local authorities at the end of last week. It leaves the basic structural standards unaffected, but local authorities are now to be permitted to build 3-bedroomed houses below the present minimum of 900 square feet provided that the size of individual rooms is not reduced. They may also omit the second lavatory. The recent competition for the design of a £1,000 house, organised by *The Builder*, showed that economies in "circulation" space can be made without affecting "living" space and that costs can thereby be reduced. It is indeed clear that this pioneer work by the architects as well as economic pressures have affected Dr Dalton's decision. The circular justifies the change of policy by the success of "many able architects" in designing houses which are smaller than the Ministry's new minimum standard, but which still provide adequate living-space and are much cheaper.

The circular also releases housing authorities from the obligation to submit plans to Ministry officers, provided that the Ministry's standards of construction and space are adhered to and that the plans are prepared by a qualified architect. This delegation of authority is long overdue. It will also be welcomed by architects, since the incentive for local authorities to employ them will now be almost irresistible. Dr Dalton is to be congratulated on these two steps forward in the attempt to get houses built more quickly and more cheaply without a return to the shoddiness of the interwar years.

* * *

Jews in Arab Countries

Jewish communities throughout the Arab world have been gravely alarmed by recent events in Baghdad, which were described in *The Economist* of April 21, 1951. Many Jews in Egypt and the Lebanon are apprehensive lest renewed anti-Zionist agitation and legislation against foreigners may force them to emigrate to Israel, leaving behind the bulk of their possessions and the way of life they enjoy. Their rich communities in Cairo, Alexandria and Beirut are composed largely of hard-working businessmen. Their linguistic abilities, combined with patience, energy,

and a wealth of international connections, have enabled many Jews to conduct successful and expanding businesses in the Middle East where less able men gave up, overcome by postwar restrictions and the manifold difficulties resulting from "the state of war with Israel." In the banks of Beirut and Cairo and the cotton market of Alexandria the Jews would be sorely missed. Especially in Egypt owing to the Nationality Bill and the appalling difficulties experienced by many foreigners working there, it is hard to think where replacements could be found. The Egyptians are well known to be lamentably short of men trained for responsible work in the field of international finance and banking.

These Jews are generally able to speak Arabic and are loyal Egyptian and Lebanese subjects with no desire to move to Israel. Indeed, they have always been strongly anti-Zionist because they realised that the creation of a Jewish state would endanger their position in the Moslem world. Jews deemed loyal to Egypt were, with few exceptions, well guarded by the Egyptian police against the possibility of action from the hostile Moslem crowds. In fact, the police still mount extra guards outside the synagogues during religious services on Friday and Saturday. The Jewish community were relieved and surprised that they remained so unmolested. Although peace with Israel was not achieved, tension in the Arab States lessened. The Jewish communities believed their danger was past and they were safe in remaining in Egypt and the Lebanon until recent events in Iraq caused renewed fears.

The Israeli Government would be well advised to avoid any action that might further endanger the position of Jews in Arab countries. A gesture of generosity, such as releasing the money of refugees blocked in banks in Israel, would relieve possible pressure on those members of their race who have no desire to become subjects of Israel. The Arab Governments, on their side, would do well not to underestimate the large and important role played by Jews in the commercial prosperity which they now enjoy.

* * *

Stately Homes

Legislation to be presented next session for the preservation of "Historic Houses" will be no more than a step in the direction indicated by the Gowers Committee. It will embody the recommendation that the powers now distributed between the Ministry of Works (uninhabited ancient monuments only), the Ministry of Local Government and Planning and the local planning authorities should be concentrated in the hands of a single minister. The Gowers Committee had favoured the Minister concerned with Planning for this task, on the ground that it could not logically be separated from his other concerns. But the new Bill will propose that the responsible Minister should be the Minister of Works, for the sensible reason that he already has the necessary experts for his ancient monuments, royal palaces and ministries. The proposal of autonomous Historic Buildings Councils (one for England and Wales, one for Scotland) to "designate" the houses and watch over their preservation is rejected in favour of normal ministerial responsibility and Parliamentary control.

In an effort to keep houses and their contents together the present arrangement, whereby land and houses can be taken over in payment of death duties, and the Inland Revenue reimbursed out of the National Land Fund, will be extended to cover chattels. But it was not to be expected that the Government would take kindly to the main proposals of the Gowers Committee—income-tax relief for approved expenditure on maintaining a house and its contents, and relief from death duties so long as they were not sold. Instead the Ministry of Works will either do the work itself or make grants or loans for the purpose—provided that the occupier fulfils certain conditions such as making the house accessible to the public.

This is to reject the main premise of the Gowers report, which was that the best people to take proper care of historic

houses are the people who own them, love them and live in them. The scale of work done would then be far greater than it will be when entangled in departmental machinery and limited by the Ministry's technical and financial facilities—Mr Gaitskell gave a warning that "only a very small sum" could be released for this work. At least, however, the measure will be very welcome. To give special privileges to the rich to enable them to live in the style to which they are accustomed is out of the question for a Labour Government—and still more for a Conservative one.

Shorter Note

It is reassuring to learn that the British Chiefs of Staff, so much preoccupied with the defence of other countries, have delegated some of the domestic burden to a small planning group under the chairmanship of General Sir Miles Dempsey. With a sailor and an airman to help him he will consider the quite special problems of defending the British isles and prepare for himself and his colleagues to take command at sea, on land and in the air in case of war. There must be some reluctance in welcoming the appearance of any new committee, but this one is more necessary than most. What is surprising about the announcement that was made on Tuesday is the absence in this planning group of any representative of civil defence. So heavily is the civil defence organisation counting on the fighting services in case of war that the need for such representation should be obvious.

The Great Exhibition

London had a general holiday on Thursday. The bulk of the population were early on foot wending their way to Hyde Park, to be present at the inauguration of the festival of industry. Though her Majesty was, as on all such occasions, the principal attraction, and did not proceed from her Palace till 11 o'clock, yet the great multitude of persons who had tickets, and who fell into a procession reaching from Hyde Park corner almost to Holborn, caused a very early gathering. . . . Without pretending on the present occasion to appreciate all the bearings of this Exhibition, the opening of which at the time specified is almost a miraculous achievement, we may briefly notice its moral signification. The Queen of the mightiest empire of the globe—the empire in which industry is the most successfully cultivated, and in which its triumphs have been greatest—was fittingly occupied in consecrating the temple erected to its honour. . . . The contrast and the change we have noticed—the present devotion to peace, and the former appliance to war, telling of a future still more peaceful than the present—the former disdain of political power for humble industry, and the present honour it bestows, telling of a future when the hand or the skill of the labourer shall be held in still higher honour. . . . are convincing proofs of the moral improvement already made; and they give us irresistible assurances that a yet higher destiny awaits our successors even on earth. The Great Exhibition, as a sign of present peace throughout the civilised world, is a subject of great satisfaction; but as a sign of future and permanent peace, and of a community amongst nations, typified by their union in Hyde Park. . . . it is for reflecting minds a source of delight. . . . Some vanities it will foster, some needless luxuries it will encourage, some selfishness to gratify vanity and a desire for luxury it will strengthen—for what human exertion or contrivance is without alloy—some emulation growing into hateful rivalry or morbid spite it will engender, but notwithstanding the effects in this respect of the ostentatious display, it will produce a multitude of good; and the first of May, 1851, will, for a long period, be described in our books as one of the most memorable days in the history of Great Britain and of the whole human race.

How to earn dollars without spending them

On a pleasant flight via North America to Australia or New Zealand, you can stop over for no extra fare in the U.S.A. or Canada, give a good hard pull at the dollar gap, and be on your way to the welcome of Sydney or Auckland before anyone has taken a single dollar from you.

All perfectly legal, too!

Do business in the dollar area on a sterling ticket. Then fly across the Pacific from San Francisco or Vancouver by British Commonwealth Pacific Airlines. Enjoy DC-6 sleeper service luxury at no extra cost. See Honolulu and Fiji en route.

Excellent connections are available from London, Glasgow or Shannon via New York or Montreal.

FARES: Sydney £260 single, £458 return. Auckland £279 single, £502.40 return. (Includes dollar allowance for transit expenses.) Book through any accredited Travel Agent or through B.O.A.C., our General Agents in the U.K. (telephone: VICtoria 2323).

BRITAIN AND AMERICA

NOW that Mr. Morrison has just had time to gather the reins at the Foreign Office, the most urgent task requiring his action is obvious.

The security of European civilisation rests upon equitable co-operation between Britain and the United States. *Not only on foreign policy, where there are differences, but in practical working arrangements for mutual defence, there is grave danger in anything less than the closest understanding.* It is necessary that Britain's problems and views should not only be well known but widely known in the U.S. and that realities should be thoroughly appreciated.

Our shortage of raw materials and essential tools for defence, due to American demands upon the world's supplies, is of the utmost seriousness. It menaces the defence programme. It threatens to cause unemployment. It has been stressed in Ministerial statements throughout this year; in the resignation speeches of Mr. Bevan and Mr. Wilson it has been again emphasised, and the Government has been constantly concerned to work out agreements with the United States for fair sharing. *Mr. Attlee placed this question strongly in the forefront of his discussions when he met President Truman, but unfortunately American public opinion has hardly an inkling of its significance.*

To a gathering of American business men in London yesterday Mr. Morrison himself underlined the need for foresight by the U.S. to prevent breakdown of the Western defence plans.

In our opinion Mr. Morrison ought to go to Washington and get things straight. There are also problems of the policies of the two nations towards China. Everything points to the need for conversations at top level, and Mr. Morrison should not wait for a problematical Four Power Conference before meeting his opposite number.

There is need for leadership from Britain. Mr. Morrison's journey is necessary.

Letters to the Editor

The Budget

SIR,—In his letter in *The Economist* of April 28th, Mr Harrod criticised the Chancellor of the Exchequer for having taken credit for the whole of the expected deterioration in the favourable balance of payments as an offset to the reduction in the budget surplus, although this deterioration is (at any rate as forecast!) due mainly to a worsening of the terms of trade. Surely the Chancellor has his answer? In estimating savings (in money terms), he said that "it is difficult, I think, to count on any increase in personal savings, in view of the rise in the cost of living." His estimate of home investment (in money terms) was an increase of £30 million; and he said: "Having regard to the rise in prices of investment goods—capital equipment and so on—this implies no increase in total real investment." It seems reasonable to suppose that these increases of prices for which the Chancellor allowed include those associated with the adverse movement of the terms of trade. (Those who prefer to work in real terms can refer to paragraph 109 of the *Economic Survey*.)

There is, however, a similar line of criticism to which the Chancellor's presentation is more vulnerable. It appears to assume that extra taxes, and discouragement of dividend distributions, will operate entirely at the expense of consumption.—Yours faithfully,
King's College, R. F. KAHN
Cambridge

Malan's Breach of Faith

SIR,—There exists a very great controversy with regard to the representation of the coloured population in the South African Parliament, and popular opinion outside the Union appears to take for granted that these people will be deprived of practically all rights of freedom, should the Representation of Non-Europeans Bill be made law.

The facts will be that the coloured will have their own representatives—European—in the Union Parliament, the business of those so appointed being solely concerned with that of the folk

who elect them, viz. the particular problems and requirements in day-to-day life of the coloured population.

The position which has reigned up to the present, i.e. the coloured being on the common electoral roll—or, in other words, voting together with the European population—would naturally appear to most people living in democratic Europe as being quite fair and reasonable; but this in complex South Africa meant that their votes simply boosted those of the Europeans, whose subsequently elected representatives were always far more concerned with affairs of the European electorate, to the great detriment of the coloured electorate, used more or less as political pawns.

I trust that what I have said above may help to make more clear what is happening in this respect in South Africa, and to remove the idea that non-white skinned people in the Union are being persecuted to an almost Nazi degree.—Yours faithfully,

H. P. C. SIMS-WHITE
London, W.2

That Billion

SIR,—Your reply to Professor Gordon Manley's protest against your use of "billion" for one thousand million disappointed me. It may be that the large majority of users of the English language use "billion" to mean 1,000 million, though I myself doubt this. I am sure, however, that the large majority of those who read and study *The Economist* themselves use "billion" to mean one million million and that they, knowing moreover that *The Economist* is an English publication, interpret its technical terminology in the English sense. In these circumstances a good deal of misunderstanding must arise and it would be safer not to use the word billion at all, or at least to state its American meaning clearly when it is used.—Yours faithfully,

E. R. HONDELINK
Petersham

[We are not imposing "billion" on anyone—or even on ourselves, except in American contexts. But when "billion" is used in *The Economist*, without further

explanation, it means 1,000,000,000.—EDITOR.]

SIR,—In your editorial note appended to Professor Manley's letter in your issue of March 10th, you wrote that "Milliard has never been an English word." The following is a quotation from your own columns:—

Persia, which has expected milliards as a rightful reward for services in the war, tends to spurn such conditions.

The Times of April 4th, in its first leader, has this

... the armed welfare state, fattened by half a milliard pounds of subsidies, cannot be kept within those limits.

Do you still maintain that "milliard" has never been an English word?—Yours faithfully,

C. H. GRAY, Secretary,
International Executive Council,
World Power Conference
[Yes.—EDITOR.]

The Stone, Scot Free

SIR,—The Note in *The Economist* of April 27th will, I am sure, engender yet further feelings of "Celtic emotion."

The Stone of Destiny was taken to England and held there to act as a symbol giving the false impression that the ancient Kingdom of Scotland had been completely suppressed. The passage of time surely does not make the Stone any less an article of stolen property, removed by a conqueror, and as such its lodgement in a church is an act of sacrilege. The restoration of the Stone to Scotland was also, I believe, intended to act as a symbol of the fact that the spirit of Scotland is still very much alive.

For over eighteen months the Scottish Covenant Association, with the backing of 2,000,000 Scots, have been trying to obtain from the Government and the Opposition, respectively, consideration of Scotland's claims to a form of self-government within the United Kingdom. These attempts have met with rebuffs. How much longer can the English afford to ignore the feelings of the patient people of Scotland on the question of Home Rule?—Yours faithfully,
Glasgow J. M. Y. BROWN

Books and Publications

Subjective History

Camille Desmoulins and Other Studies of the French Revolution. By J. B. Morton. *Werner Laurie, London.* 208 pages. 13s. 6d.

One of the purposes of Mr Morton's studies is to show that revolutionaries need not be "ignoble adventurers slaking their thirst for power." That in private life they may be tender friends and gentle husbands is very probable. But while contemporaries often cannot help looking at political figures subjectively, posterity must judge their action in its political context. Napoleon's attitude towards Josephine, Stalin's towards Alliluyeva or Camille Desmoulins's towards his wife Lucille is of small historical interest for both the apologist and the detractor.

The author seems more interested in personalities than in social developments. Yet revolutionary history can only be explained by conflicts of social forces; even when the guillotine is running amok heads are not cut off quite gratuitously or without political discrimination. Mr Morton's approach often handicaps his analysis. Thus in the title essay on Camille Desmoulins, the *Gavroche* of the Revolution, he is at pains to explain why the self-styled attorney-general of the lantern, the brilliant pamphleteer who did so much to send the Girondins to their graves, subsequently, in the *Vieux Cordelier*, attacked the terror and pleaded for clemency. We are left under the impression that this seeming contradiction is to be explained by the conflict between the "guttersnipe" and the "noble" streaks in Camille's character. The whole attitude of Desmoulins, of course, must be seen in the light of the struggle between Danton and Robespierre, the interpretation of which has split French historians into warring factions.

To ask Mr Morton for social analysis is somewhat unfair. His purpose seems to be to describe and to entertain, which he does successfully, and not to analyse and to explain; though scholarly in their exposition, some of the sketches border on what the French call history in slippers. Thus there is an entertaining description of Mirabeau's pantagruelian youth and loves; an essay on the puzzling, because not profitable, marriage of the ex-bishop of Autun, Talleyrand; the mysterious break between St. Just and Henriette, the sister of his friend Le Bas, is restated; and the life of Théroigne de Méricourt, the leader of the women's march on Versailles, is outlined.

Mr Morton's method is at its most interesting in the essay on Fouquier-Tinville. Usually the very name evokes the image of a bloodthirsty executioner. Yet here the Public Prosecutor is shown as the civil servant of the guillotine, pleading superior orders for his defence. The combination of civil servant and revolutionary seems now less self-contradictory than before. Though it

does not analyse its deeper forces, the book brings out the external pathos of the revolution through accurate descriptions and skilful use of quotations. Thus in the title essay the famous scene is revived, when, at Robespierre's instigation, the Jacobins decide to burn the *Vieux Cordelier*, and Desmoulins answers his former friend, who always fancied himself as a practical Rousseau, by a quotation from his idol: "To burn is not to answer." More than a century and a half later this reply has lost none of its force.

Pressure Groups in America

The Nineteen Fifties Come First. By Edwin G. Nourse. *Henry Holt and Company, New York.* 184 pages. \$2.00.

Dr Edwin Nourse, known to all economists as sometime head of the Brookings Foundation, resigned last year as Chairman of the Council of Economic Advisers to the President. He disapproved of reckless deficit spending at a time of full employment. In this little book, he brings home to his countrymen the seriousness of the issue. He does not object to government planning; but he appears to fear that present day American democracy makes intelligent planning next to impossible, on the grounds that it is not directed by the country's constitutional authorities—the President and Congress—but by farmers' unions, organised labour and, to a lesser degree, by business men. All represent shortsighted collective egoism and act on the assumption that the national cake grows automatically larger whenever they manage to snatch a bigger slice of it.

Dr Nourse praises those farmers' executives, labour leaders and business men who recognise, regret, and sometimes even reprove the foolish greed of their mandatories; but he records, sadly, their inability to control it. He quotes, as an example of the prevailing blend of Keynes-Marxist economics, a statement by the American Federation of Labour—as bourgeois-minded a body as can be imagined:

The long-term tendency from the beginning of the century until the boom of World War II has been for the rise of national productivity to exceed the rise in national income, with an accompanying proportionate rise in unemployment.

Its remedy is shorter hours, with of course the same wage packet. This will either push down output to the level of national income, as John Lewis does when he decrees a miners' holiday, or will expand the national income because more workers will be paid for the same task. Fortunately, the American worker

is still profit-minded. He expects his employer to find ways and means for increasing production and productivity, so that he can earn higher wages. He is now getting frightened of inflation, but he knows no better way of fighting rising prices than to clamour for higher wages. In Dr Nourse's opinion, the politicians who dare not resist pressure groups are as culpable as the pressure groups themselves.

Though this little book was written before the struggle over the new war economy had fully developed, it is an invaluable guide through the maze of present day American perplexities. It underlines the futility of fighting secondary inflation by price controls while primary inflation goes on and new money is created by the Reserve Banks, which have to issue it against the government bonds forced upon them. Controls can hide secondary inflation for some time; they are like an ointment, which relieves the rash, but does not kill the infection which causes it.

Jane's Trains

World Railways, 1950-51. Edited by H. Sampson. *Sampson Low, Maiston.* 620 pages. £3 3s.

"Jane's Fighting Ships" has been published for more than fifty years, and "Jane's All the World's Aircraft," hitherto its only companion, was founded as long ago as 1909. It is at first sight odd that so obvious a subject as railway transport has had to wait so long for similar treatment. No doubt the main reason is that, while the ocean and the air are much the same everywhere, the operating conditions of the world's railways vary greatly. This diversity is the source of much of the railway enthusiast's satisfaction, but it makes the task of compiling and selecting material for a book of this kind very difficult. It must be regretted, though it is understandable, that "World Railways" is published for the first time only when developments in locomotive power, and particularly the growing use of diesel electric traction, threaten to accelerate the progress of standardisation. But there is no reason to fear that the romance will be taken out of the railways fast enough to destroy the appeal of this and many successive editions.

For many of the largest systems, "World Railways" succeeds admirably in giving a concise account of working conditions and methods and thorough analyses of the types of locomotives in use. There are two main weaknesses. It is not the editor's fault that the countries of Eastern Europe get comparatively little attention; but with all allowance for differences in the amount of information obtainable, to devote 283 pages to the United States and only 126 pages to the whole of Europe, including Britain, is not quite a balanced "survey of representative rail systems." Secondly, where plenty of information is given,

THE ECONOMIST, May 5, 1951

it is sometimes annoyingly uneven. The comparisons that readers will want to make are hampered by some inconsistency as to what facts are put in and what are left out in describing railway systems of comparable importance.

But such a book as "World Railways" cannot spring fully fledged before the public. It must grow by adaptation through successive editions. For a first edition, it is admirably edited and produced. At least one boy of two years old has looked rapturously at every page; that is to say, the illustrations are good. The older enthusiast, whether amateur or professional, will not fail to get his more sophisticated pleasures from the tables and diagrams and all the symbolism of locomotive description.

Basic Economics

The Substance of Economics. By H. A. Silverman. *Pitman.* 387 pages. 18s.

An Introduction to Economic Analysis. By J. K. Eastham. *The English Universities Press.* 392 pages. 15s.

Very broadly speaking, introductory works on economics fall into two classes; those designed for the general reader, enabling him to judge more intelligently the economic component in current social questions, and those designed as foundation reading for students whose future careers depend in one way or another on acquiring familiarity with theoretical techniques and terms. Both the books under review fall into the second class, being comprehensive introductions for those contemplating a definite course of study. Neither makes any attempt to woo that shadowy figure, the General Reader, nor makes concessions to the skimmer. But there the likeness ends.

Mr Silverman's well-known textbook, substantially revised for this its thirteenth edition, is a crammer's magic carpet to an undistinguished pass. Neatly laid out, with heads and subheads, definitions and classifications, it enables any conscientious parrot to produce a reasonable facsimile of an answer (however approximately relevant) to practically any question likely to be found in a paper of Intermediate standard. For anyone ambitious to proceed beyond that standard it is rather worse than useless. It is incurably obsolete, the revisions hanging on the thirty-year-old original (already old-fashioned when published) like a nickel-plated radiator on a Model T Ford; it abounds in first approximations disguised as axioms; it gives more space to Ricardo than to Keynes. Nevertheless, one can confidently predict its continued success. Few students of elementary economics really aspire to know anything about economic problems or theories; most merely want to pass, as effortlessly as possible, an examination in which a "subject" called economics is a necessary impediment, and then forget the whole thing. For this majority, "The Substance of Economics" is made to measure.

Mr Eastham's book is for the minority who are genuinely interested, who mean to do more than scrape a pass, who regard the intermediate examination as

what its name implies. It is also for those teachers—one may hope not a minority—who regard education otherwise than as a production-belt process. It is accurately described in its blurb as giving "a coherent account of contemporary analytical technique"; its limited but admirably achieved task is to provide the student with a well-chosen, sharp-edged and tempered outfit of tools. The actual practical uses and limitations of these tools in understanding real-life situations are a matter outside Mr Eastham's scope; this is not yet the (probably unattainable) perfect introductory volume, which should at once analyse the economic problem and integrate it with its social setting. There might accordingly be some danger, for the solitary and unguided student, of acquiring from this book a slightly cut-and-dried habit of thought. This is only to say, however, that "An Introduction to Economic Analysis" needs to be read either in conjunction with other complementary matter, or with appropriate mental reservations; that need is the price of its excellence within its own deliberately narrow field. Comparative statistics of its sales and those of "The Substance of Economics" would throw an interesting light on the current quality of basic economic teaching.

Communist Envelopment

The Curtain Falls. The Story of the Socialists in Eastern Europe. Edited by Denis Healey. *Lincolns-Prager, London.* 99 pages. 4s. 6d.

Czechoslovakia, Poland and Hungary are the three countries of Eastern Europe with the longest and strongest socialist traditions. The socialist parties of these countries grew up towards the end of the last century on a solid foundation of working class support. This book tells the story of how, after the war, the Communists first embraced them because they were—in the words of Aneurin Bevan in his foreword—"a temporary convenience," and then proceeded rapidly to destroy them. After a general survey by Denis Healey of the "new Russian empire," the gradual liquidation of the Hungarian, Czech and Polish socialist parties is described by a leading member of each, Antal Ban and Vaclav Majer, who both held Cabinet posts in Hungary and Czechoslovakia respectively from 1945 to 1948; and Adam Ciolkosz, who was a Socialist MP in Poland before his escape in 1940.

The dispassionate and sober accounts of these three men bring out clearly the difficulties of the democratic Socialists in Eastern Europe after the war. Their Communist opponents were completely unscrupulous and ruthless, and possessed the decisive advantage of the backing of the Red Army. They were themselves fatally weakened by their fellow-travelling left wings which in each case provided a grapple by which the whole party could be hauled into suicidal fusion with the Communists. There was not much chance for a prolonged independent existence when even the official leaders were under Communist domination. In retrospect, it is easy enough to say that those who clearly

understood the real nature of the Communists' game should somehow have prevented so many of their associates from being taken in by them. But in the immediate postwar years the socialists of Eastern Europe were not the only people to believe that peaceful co-operation with the Communists was possible, necessary and preferable. Even today the lessons of Communist history have not been completely assimilated; and it is to help drive them home that this book has been written.

Text and Reference Books

Rail and Road Statistics. By F. A. A. Menzler. *Royal Statistical Society.* 23 pages. 1s.

The Housing Statistics of Great Britain. By Marian Bowley. *Royal Statistical Society.* 15 pages. 1s.

Oils and Fats Statistics. By the Economics and Statistics Department of Lever Brothers and Unilever Limited. *Royal Statistical Society.* 19 pages. 1s.

These papers are welcome contributions to a series designed to cover the sources and nature of statistical information in certain fields of statistics. In both transport and housing statistics, the main problem is to try to find the way through the maze of official figures by understanding any changes in their scope over time and the precise meaning of the various definitions which are often in the unhelpful phrasing of official language. Mr Menzler is an invaluable and orderly guide and, although his paper is intended to cover mainly British statistics, he adds some interesting references to the problems of international comparisons. Dr Bowley's survey shows up very clearly the inadequacy of information about many aspects of housing and, although remedies may not always be feasible, it is hoped that the appropriate authorities will follow up some of her suggestions. Both these papers fill in some of the historical background.

Statistics about oils and fats are in a different category. Their collection in any useful form is only of comparatively recent date and even today their interpretation requires considerable care and technical handling. This paper, dealing mainly with the British position but touching also on world production and trade, gives many instructive examples of the computation of estimates of supplies and disposals of oils and fats, using both official and private statistics.

Wining & Dining

SOON AFTER THE HOUR OF NOON, and again when the set time of dinner draws nigh, a tide of guests sets towards the Connaught Rooms. The Connaught Rooms is a peculiarly English institution—if, indeed, tradition be not the better word. No other capital city possesses a group of banqueting rooms, all housed under one roof, equipped to cope with anything from a dozen up to a thousand guests. A staff in a position to draw on a wealth of banqueting experience unequalled anywhere in the world ensures that food, wines, and, above all, service, is beyond reproach.

CONNAUGHT ROOMS

Atlantic Perils

Washington, D.C.

THE proper personification of Anglo-American relations is the appealing figure of dear little Vera, to whom, as the song relates, the great big saw keeps coming nearer and nearer and nearer. There she lies, bound and helpless, awaiting her fate while the world watches and shudders. But the great big saw never does actually cut her in two; it cannot do so if the serial is to be continued through further instalments. Nevertheless, it gives many a spectator a nasty turn, wondering how Vera is going to be saved each time.

Anyone who has taken recent note of developments in the Anglo-American serial may well have resigned himself to a succession of possible nasty turns in the coming weeks. Mr Aneurin Bevan has sketched out one situation; General MacArthur has done the preliminary work on another; and still others are visible to the practised eye as it ranges over the prospect from Japan to Iran.

Mr Dean Acheson, the Secretary of State, in a statement last week, reduced Mr Bevan's rather rambling complaint to twenty crisp words. The allegation, he said, was that "the United States was gobbling up most of the raw materials Britain also needs with resultant jeopardy to Britain's economy." To nobody's surprise Mr Acheson rejected this view of the effects of American stockpiling and offered to America's allies soothing assurance that "the export and import policies of the United States are designed to take full account of the essential needs in other friendly countries for materials to supply their basic economy and defence programmes." Mr Acheson's best friend, however, could not have felt that this was a statement which disposed of the raw materials problem. It left high in the air the question of what is to be done about Britain's (to mention nobody else's) needs, and it did little to discourage the imaginative from forming vivid mental pictures of what could conceivably happen to Vera in this episode.

Suppose raw materials shortages were to produce in Britain serious unemployment at a time when, whatever Government might be in office, the temper of the people was already being severely tried by the new,

sharpened austerity promised by Mr Herbert Morrison. Suppose the Russians were to exploit this moment with a new peace offensive. What would there be to prevent the spread in Britain and across Western Europe of a wave of anti-American "neutralism," such as might divide and wreck the Atlantic community, disrupting at the tenth or eleventh hour the chance of Western arms superiority on which the peace of the world depends?

It can probably be assumed that any cold sweat which may have broken out in London over the contemplation of this prospect has been reproduced even more freely in Washington. Mr Charles E. Wilson, the defence mobiliser, has flown from Washington to Paris and London to see what can be done. Maybe he would have gone whether or not Mr Bevan had extended the area of disagreement with Mr Attlee from teeth to tanks; but it will be difficult to argue that the revelation that a potentially serious anti-American, anti-rearmament brew is simmering in Britain has not made the Administration in Washington think harder about raw materials. It is not possible, though, to conclude that the better-than-it-might-have-been American allocation of sulphur to Britain, announced last week, was an outcome of Bevan-phobia. The allocation was decided upon before the Minister of Labour took his leave and it represents the utmost the responsible

Herblock in the Washington Post

American government officials felt they dared do in the face of very heavy pressure from home consumers—pressure that will be maintained in respect of all scarce materials, whoever may resign from the British Cabinet.

But these are perils which may be deferred for a little while. Before they materialise, grievous trouble could overtake Anglo-American relations from another direction. Even if the Communist Chinese should not begin, in the meantime, to bomb the United Nations forces and supply centres from the air, and even if there should be no need for a swift co-ordination of British and American views on the bombing of Chinese bases in Manchuria, there are General MacArthur's theories, influence and personality to be reckoned with.

In Chicago last week the General—until recently the repository of the world's hope that this first international police action was going to point the way to collective security—spelled out more plainly the argument to which he has now dedicated himself. It is that, although the "nations with but token forces" in Korea are well content to see a prolonged and indecisive campaign there which involves the "slaughter of America's sons" on a "staggering" scale in relation to the forces committed, America's interests require swift victory by way of a "positive policy attuned to the military realities."

This is a line which can hardly fail to appeal to the isolationists and jingoes, and it is one which could hardly be improved upon as a means of exciting distrust and scorn of Britain. More of it will doubtless be heard as the Congressional committees pursue their investigations and the well-financed China lobby gets into its stride. Other charges may be woven into the indictment: the reluctance of Britain to cut off Hong Kong's trade with Red China, the willingness of Britain to trade with Russia and Poland, and the anxiety of Britain to see Red China given an opportunity of participating in negotiations on the Japanese Treaty.

*

General MacArthur's Republican-isolationist-China-first supporters can be counted upon to make every use of the most serious contemporary threat to Anglo-American unity: the cleavage of policy which has tied one country to the recognition of the Communist Chinese and the other to the support of the Nationalist Chinese. The consequences of the new military aid agreement between the United States and General Chiang Kai-shek's regime, announced in Washington last week, are yet to be revealed. The American objective is to make the Generalissimo better able to resist any forcible attempt to reunite Formosa with the Chinese mainland. But it needs no political genius to conceive of circumstances in which the long-term effect of the agreement might be to make him better able also to resist a peaceful United Nations solution of the problem of Formosa.

The evidence that the Administration is making Formosa secure against Communist attack may weaken one of the arguments of General MacArthur and the Republicans (though the agreement was made long before the General was relieved of his command); and, in time, public preference for the judgment of the elected President, his Cabinet and his military chiefs may defeat the MacArthur crusade. It also may be true, as is now being suggested, that much good will come, in the end, out of the new "great debate"—that it will clarify American thinking on the Far East, underline the truth that the principal enemy is imperialist Russia, and dispose of the threat to the policy which gives Europe priority over Asia. Events in Iran may draw the United States and Britain closer together and the earlier unfortunate tendency of each nation to sing "Anything You Can Do I Can Do Better" may disappear.

The Pacific Pact may be negotiated and signed without any further recourse by Mr Herbert Morrison to the theme that Britain is being frozen out—a curious theme, in the light of the known background. And the Japanese Treaty may be completed without serious Anglo-American complications over the question of which China is to be consulted about it. Everything may turn out all right for dear little Vera; but the script at this point cannot be seen to promise her much rest or relaxation.

Migrants on the Move

[FROM A CORRESPONDENT IN IOWA]

THE distressed "Okies" of "The Grapes of Wrath," who came to California as migrant farm labourers in the nineteen-thirties, found employment in the nineteen-forties in the bomber factories and petrol stations, or perhaps bought a small irrigated farm cheaply from the Japanese-Americans who were deported inland in the panic of 1942. The Joads from Oklahoma are prosperous now, but most of them have been replaced amongst the seasonally migrant "stoop" labourers, ill-paid, ill-housed, unorganised and under-employed, by Mexican or Mexican-American families. In March, 1950, more than 5,000 of the migrant families wintering in the rich San Joaquin Valley of California were found to be destitute. The local authorities and farm organisations, tired of being called inhuman monsters and honestly troubled about what to do with these people, asked the Governor of California for an inquiry. They got one. So did the members of Congress who asked President Truman for a nation-wide investigation. The reports of both inquiries have recently been issued, and a Congressional committee is also now investigating the influx of Mexican migrants, which swelled sensationally in 1950.

Adolf Hitler saw the film of "The Grapes of Wrath" in 1940 and was convinced that the Americans had destroyed their sturdy farmer class and hence could not fight a real war. Americans prefer to exaggerate in the other direction, to see seasonal migrant labour as only a temporary, marginal phenomenon bound to disappear as mechanisation takes over the hard work. Yet seasonal migrant labour has been going on, with many of the same characteristics, for fully seventy years, and the technological changes of the past decade or two have increased its relative importance as a part of hired farm labour.

The tractor, the combine, the maize-picker, and a host of other machines have greatly reduced the amount of hired labour needed on grain and livestock farms. The combine long ago drove into folklore the hordes of men and boys who "rode the rods" under railway goods wagons from Texas into Canada to bring in the wheat harvest. Some combine crews still make the great trek, but they are skilled workers and the owners of expensive machinery, not foot-loose hoboes.

By 1945, 30 per cent of California's sugar beet crop was harvested by machine; by 1950, 85 to 90 per cent; and in Michigan in 1950 60 per cent was by machine. Even in cotton, great progress has been made: 1 per cent of the crop was picked by machine in the San Joaquin Valley in 1945, 17 per cent in 1949, 35 per cent in 1950. In the Mississippi Delta, where hand-picking wages are lower and climate and conditions more difficult for machines, only 5 per cent of the cotton was harvested mechanically in 1950; but the Delta already has more machines than the San Joaquin Valley, and their use is spreading steadily on the larger farms.

Nevertheless, by eliminating much winter and round-the-year work, machinery has sharpened the remaining seasonal peaks. Instead of nearly every farm having a "hired man,"

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

only a few do now. The agricultural labour force consists of some 10 million farmers and working members of their families, with, in addition, 1,000,000 regular "hired men" who work 150 days or more a year, 2,250,000 who work for shorter periods in one place, and 1,000,000 who migrate to follow the crops. These migrants work almost entirely on some 125,000 farms out of the nation's 6,000,000, chiefly the large commercial farms specialising in cotton, fruits, vegetables or sugar beets.

The migrants go into 44 States, men, women and children jammed into the lorries of the labour contractors, working a few weeks here, a few days there, and spending long periods looking for work or just waiting. The East Coast circuit is nowadays traversed mostly by Florida Negroes; the Texas-to-Michigan-and-Minnesota and Texas-to-California-to-Vancouver routes mostly by Mexicans or Mexican-Americans from the border areas. Puerto Ricans were flown in to save the Michigan beet crop last year.

The 1,000,000 migrants went down to 600,000 during the war, but the number has crept up again since. As a result under-employment and hardship have reappeared, yet each year contract labour has been imported from the West Indies and from Mexico. In addition, swarms of illegal Mexican immigrant labourers have come in; even though nearly 600,000 of these "wetbacks" were deported, or left voluntarily, in 1950, the President's Commission estimates that there are still 400,000 of them amongst the 1,000,000 migrants. There is no quantitative limit on legal immigration from Mexico, but there are troublesome qualitative tests and formalities; with only 900 border patrol officers on the 1,500-mile frontier, it is easy enough to slip or swim across. Attempts are now being made to legalise these entries, as has already been done in thousands of cases since 1947.

*

The various investigations produced a large number of specific remedies for the appalling situations which often arise. The President's Commission, among its 56 separate recommendations, proposed that less reliance be put on foreign labour, that the immigration laws be enforced more strictly, and that the sequence of work for the migrant families be more carefully planned; it also suggested that better social services and education should be provided for them and that a minimum wage law, an unemployment compensation law and child labour laws should be applied to migrants. The California committee made nearly as many recommendations, along the same lines; it also advocated active efforts to make migrants feel that they really belong in the community. In practice, the new war boom is likely

to ease the hardships of the migrants far more than any amount of social services. So whether or not the recommendations are adopted, their purpose will nevertheless be attained for a time, giving mechanisation another chance to nibble away at the necessity for them.

Meanwhile the Mexicans and Negroes of the migrant crews are no longer strangers in the land. They have colonies and connections all over the country now, which help them to find other work than following the crops, as most of them want to do. And while the wandering lasts it offers an unparalleled way of searching for a choice spot to settle down. In the key states of Texas and California there have been boom conditions for a decade; this makes it easier for the migrants to get a living wage.

Hopeful also is the spread of a new attitude towards migrant labourers and of a new sense of responsibility among employers. All over the United States, employers are returning as a matter of policy to the measures to which they were driven by harsh necessity during the wartime manpower shortage; they are trying, by organisation, to make better use of the supply of migrant labour. Since 1943 Texas has had an official Good Neighbour Commission, charged with improving relations between "Anglo-Americans" and "Latin Americans," by means of education and conciliation. Mexican officials at first were sceptical about it, but they are beginning to think it means business. Instead of banning Mexican contract labour from the whole state of Texas, as they used to do, they now only put communities which have had too many unpleasant incidents "out of bounds" for a time. Even the exploiters of cheap "wetback" labour no longer try to defend their system in terms of "Anglo" supremacy over swarthy cotton choppers and stoop labourers, but in terms of the civil and human rights of these fine, hard-working Mexicans, whose brothers and cousins and aunts are American citizens.

American Notes

Storm Warning on Inflation

The Defence Production Act must be renewed for two years and its provisions expanded, the President has told Congress, if the United States is to ride out the inflationary storm which is expected to break with full force next autumn and winter. He asked Congress not to be deceived by the temporary economic calm, by the falling-off in buying, steadier prices, and a momentary budget surplus. This quarter the government will begin once more to run a deficit. Since last June, military orders worth over \$26 billion have been placed, but only a small portion of these has been filled, and nearly \$60 billion more are still to come. The present

... requires a well planned and executed sales program. Irving Trust Company will put you in touch with competent organizations in the United States to help you develop or expand your sales there.

breathing-spell must be used to make everything ship-shape for the big blow.

The Defence Production Act is the basic charter for mobilisation: it provides for economic stabilisation through authority to control prices, wages, and credit, and for the defence programme by powers to control materials and provide incentives for industrial expansion. Most of the new plant will be built by private enterprise, but the President now asks the authority, used extensively during the last war, for the government to build defence factories which are not attractive to the private investor. He also wishes power to pay subsidies to high-cost producers; price controls, however fair they are in the main, run the risk of choking off marginal production which is needed.

Most of the new powers the Administration seeks, however, are anti-inflationary, and highly controversial. If they are granted, rent control, which has been quietly withering away, will be revived in full force, and applied for the first time to new houses and commercial premises. Credit terms for the purchase of old houses financed by private lenders would be regulated, also for the first time; licensing of traders would be introduced to make the enforcement of price controls easier; margin controls would be applied to the commodity exchanges, and a restraining finger laid on farm prices, the chief free element left in the economy. The effectiveness of all controls will be imperilled, however, if Congress does not give the President the \$10 billion tax increase he has requested.

Hearings on the Bill begin next week and may last a month or more. The first witness is expected to be Mr Wilson, the defence mobiliser, who has found that for every \$10 billion appropriated by Congress for arms, about \$2 billion worth of weapons has been lost through inflation of costs. But even this alarming testimony is unlikely to secure a smooth passage for the President's amendments. Senator Maybank, the technical sponsor of the Bill, who must pilot it through committee, strongly disclaims any closer relationship; he says openly that he dislikes some of its provisions. Few Congressmen are enthusiastic about giving the President fresh powers and many think that the rigorous regulation of the economy which he proposes should be necessary only when the nation is engaged in a full-scale war.

Freezing the Farmer

What Senator Maybank, a Democrat, but the chief spokesman for the agricultural south, cannot stomach is the proposal to freeze parity prices for farm products at the beginning of each marketing season. When the Defence Production Act was passed last year, the farm bloc insisted that no price controls should be imposed on farm products selling below parity. Parity is a calculated price, at which a farmer would secure the same purchasing power he enjoyed in an earlier period; it takes into account the changing costs of the things a farmer must buy.

Mr DiSalle, the Price Administrator, has found that this provision ties his hands as far as most farm products are concerned; the only important ones selling above parity are meat, wool, and cotton. To make matters more difficult, parity prices are recalculated each month; as industrial prices have risen, the level at which agricultural prices might be brought under control has continued to mount. As the chart shows, maize, selling at \$1.60 a bushel in March, was above the parity price of a year earlier, but in the meantime parity has risen to \$1.74.

The Administration's proposal would not freeze most farm prices; it would merely fix, for a year, ceilings—and generous ones—above which they could not rise. It would not end, but it would slow down, the process by which higher food costs justify labour in demanding cost of living adjustments, which in their turn make dearer the things the farmer buys and raise his parity price.

Mindful of the farm vote, which gave him his second term, and of the fact that Democrats, as well as Republicans, are loyal to their rural constituents, Mr Truman has not gone nearly as far as the trade unions want; they have demanded that authority be sought to fix all farm prices. But he may have gone too far for Congress. The House Agriculture Committee, scenting what was in the wind, has just staged special hearings at which Mr Brannan, the President's Secretary of Agriculture, was the star witness for the farmer. Mr Brannan's argument was that farm income has fallen steeply since 1947 (its peak year) while other incomes have been rising; any attempt to prevent farmers regaining on the swings what they lost on the roundabouts would be unfair and discourage the drive for greater production. Some Congressmen are even talking of a farmers' boycott of the mobilisation programme, similar to that staged by labour

when the unions were over-ruled on a wage formula. What is more likely is that if the Defence Production Act is to be extended by June 30th, parity may have to be left as it is.

Livestock producers are already up in arms because the Price Administrator has at last moved to use his powers to control the prices at which slaughterers buy cattle. A series of reductions has been ordered which will total about 18 per cent by October. Beef normally makes up about half the meat consumed in the United States, but at present prices pork and poultry have had to take its place on all but wealthy dinner tables. If the roll-back does not drive too many cattle into the black market, consumers should begin to benefit by the summer and by the autumn they should be paying not much more for beef than they did before the Korean war.

Ready to Strike Back

President Truman has at last filled in for Congress the details of the defence expenditure which was outlined only by a round \$60 billion in the budget for the 1952 fiscal year which he presented last January. Congress, already restive at this four months' delay, may not take very seriously the request that the appropriations be dealt with as a matter of urgency, but at least it should be relieved that the services' original hopes of \$104 billion have been squeezed down to \$60.7 billion. This compares with \$47.6 billion, either approved or in process of approval, for the current fiscal year which ends on June 30th. Only \$39.5 billion will be spent directly during the coming year, compared with \$19.4 billion during the 1951 year. The remaining appropriations for 1952 are either to liquidate previous obligations or authorise future contracts. Funds for the atomic energy programme, for stockpiling, and for military aid to other countries (estimated at \$6.5 billion) will be dealt with separately.

In his accompanying message, President Truman said that the rulers of the Soviets had made it clear that they were ready to push the world to the brink of war to get what they

Highlights of the 1950

Annual Report

RHEEM MANUFACTURING COMPANY

Operations in 1950 were the most profitable in the Company's history—net earnings were \$4,862,593, equal after preferred dividends, to \$4.75 per common share. Net earnings in 1949 were \$2,625,862, or \$2.51 per common share. Net sales in 1950 totalled \$74,465,686, or a 49% gain over the \$49,754,531 reported for 1949.

The Company's nation-wide physical operating position is now well founded—management is mature and seasoned, yet as always, fired with enthusiasm. To those men and women who have made the past twenty-five years such a success, we dedicate this statement of accomplishment.

R. S. Rheem, President

wanted. The purpose of his military programme was to ensure that the free world would be able "to strike back decisively and at once at the seats of the Soviet power," should the Russians decide to push the world over that brink.

The following table shows what the President's programme will mean in terms of men in the various services during 1952. In that fiscal year the goal of 3,500,000 in the armed forces will be achieved; the total, now in the neighbourhood of 3,000,000, has more than doubled since Korea. The Army has already nearly reached the figure given in the table, but it will be the autumn of 1952 before the Air Force completes its 95 wings, as groups are now called; it expects to have 87 wings in service by the end of next month.

ARMED FORCES IN 1952

Service	Expenditure \$ Million	Men Serving (thousands)	Units	Men In Reserves (thousands)
Army	15,700	1,831	18 divisions	465
Air Force	13,000	659	95 wings	36
Navy	{ 11,400 }	780	1,161 ships	195
Marines		182	24 divisions	

Broken down in a different way, the President's budget provides \$10.5 billion for the costs of military personnel, mainly pay and allowances; \$12.3 billion for operation and maintenance; \$29.7 billion for major procurement costs, which include \$14.5 billion for aircraft and \$4.9 billion for combat vehicles and artillery; \$1.5 billion for research and development, an increase of 20 per cent over this year; and \$4.5 billion for a military public works programme, understood to be chiefly a question of expanding bases. Details of this last item, not yet authorised, will be given to Congress later and will apparently for once be kept private. The Russians must be grateful for the American thirst for knowledge and distrust of concealment, which forces the President to support his case for defence funds with 223 pages of particulars, and means that the testimony of military officials before Congressional committees seldom remains secret.

* * *

Crime in the Open

The British may be a nation of gamblers, but their little flutters add up to less than \$2 billion a year while the gambling turnover in the United States is about ten times as much. This difference in scale is one reason why, in the opinion of the Kefauver crime investigating committee, the British solution of making off-course betting legal is not applicable to the United States. The other reason put forward by the committee is that the American gambling empire is built on corruption, of police and government officials in particular. There are many who believe that, if gambling were made legal, its unsavoury foundations would crumble away; but at the moment such a proposal is hardly practical politics.

The empire, as charted by the committee, is really two interlocking cartels, centred in New York and Chicago, with branches in the main gambling centres, California, Nevada and Florida, and elsewhere. The cartels are connected in a number of ways, but the chief links are said to be Mr Frank Costello, the New Yorker whose cloak of respectability were very thin during the committee's hearings, and the Mafia, the secret society of Sicilian origin which murders to order. Such an empire can only be broken up by vigorous law enforcement at the local level and by an aroused public opinion. But the Kefauver Committee has struck telling blows and in its latest report it also suggests some twenty ways in which the federal government can help to pull down the structure of organised crime. Among the new laws it recommends are stricter tax regulations, which would force gamblers to disclose details of their operations, and restrictions on the transmission of money for gambling and of betting information by interstate communications.

The Republicans are, of course, making the most of the committee's refusal to temper the wind to Mr O'Dwyer. Its report states categorically that, as mayor of New York, both by his actions, and failures to act, he contributed to the growth of organised crime in the city. This blast at Mr O'Dwyer will strengthen the Republican view that there are still a number of Democratically-controlled cities where hearings might be held to the political advantage of the opposition. Senator Kefauver contends that, after examining 800 witnesses in 14 cities in the past year, the committee has collected all the information needed as a basis for federal action and that, if it is not to be allowed to die quietly, it should at least concentrate on drafting the necessary laws for Congress. This is what it hopes to do, the Republicans permitting, during the remainder of its life, recently extended to September 1st. Senator O'Connor, a Democrat from Maryland, will now be chairman, to give Mr Kefauver more time for his political and private family.

* * *

Paper for the News

As the American Newspaper Publishers Association met in New York last week, its main concern was shortage of paper for the country's 1,772 daily papers and 549 Sunday papers. The dailies have a circulation of nearly 54 million, the Sundays of over 46 million, both records. Nevertheless, the publishers' concern seems somewhat exaggerated when it is realised that the Association's members, who do not include by any means all of the American publishers, used 394,387 tons of newsprint in March, that the United States takes about 60 per cent of world output and that annual consumption of newsprint in America has increased in the last five years from 50 to nearly 80 pounds a head. But newsprint companies have been reducing supplies to their customers by 10 per cent and publishers have had on occasion to pay as much as \$300 a ton, nearly three times the official price, which in any case is likely to go up before long. It is already double the prewar price.

Worse still, from the publishers' point of view, Canada is preparing to bring newsprint under government control. This should be of assistance to the International Materials Committee, which has just started work on newsprint, but it may also be a by-product of President Auriol's visit to Canada. Its object may perhaps be to enable larger supplies of newsprint to be sent to France for the use of the anti-communist newspapers there. This is presumably the sort of thing that Mr Carroll Binder, US representative on the UN committee on freedom of information, had in mind when he told newspapermen that the United States should try to help the free press abroad to continue publishing, and that it should look for ways of increasing the supply of newsprint and of allocating such increases fairly. But the United States will have to curb its appetite for Canadian newsprint if more is to be fed to countries abroad, at least until additional newsprint machines can be installed. And by the time that can be done, the shortage of sulphur will almost certainly be causing output of newsprint to be reduced.

North American production of newsprint in March was just under 557,000 tons; all but about 90,000 tons came from Canada, which at present sells 90 per cent of its output to the United States. Twenty-five years ago the United States manufactured nearly 1,700,000 tons of newsprint annually. Output fell sharply during the depression years; it is now climbing back, but is still below 1,000,000 tons a year. This year imports from Europe are expected to provide about 200,000 tons and the United States will have to get the rest of its requirements from Canada. Altogether about 5,820,000 tons of newsprint should be available for the United States this year, rather more than in 1950, but 130,000 tons less than estimated needs.

THE WORLD OVERSEAS

Dangers to German Democracy

(From Our Special Correspondent)

THE communal elections in Schleswig-Holstein on April 29th and the state elections in Lower Saxony next Sunday are of more than local importance. The election campaigns have set many straws floating in the wind of German political life. They show that the weak, decentralised government is in no state to stand the strains imposed by the post-Korean situation; and while it gives a lamentable exhibition of helplessness in the economic field, the political extremists are becoming more actively opposed to each other and to Bonn. Communists, neo-Nazis and the refugees (who form one-fifth of the population) are all in one way or another enemies of the democratic central Government. As a result of the sharpening of the cold war, German politics are now beginning to show some of the ominous symptoms of the Weimar Republic in the twenties, in spite of the many differences between the two situations.

With all reserve, the present warning signals cannot be overlooked. The Government, indeed, is not doing so; it is trying to strengthen its power over the *Länder* in order to meet the danger at the outset. Dr Adenauer and his Minister of the Interior, Dr Lehr, have found it necessary to declare that there is now a threat to the constitution from the extremists on both sides, and that police action must be taken by the *Länder* at once. The *Bundestag* last week (April 26th) banned the Communist campaign for a referendum on the issue of a peace treaty in 1951—an obvious trick by which Moscow hoped to pose as the champion of German patriotic aspirations. The *Land* governments agreed to follow the Federal lead. And Dr Lehr has gone to Lower Saxony to induce that State to thwart the activities of the Nazis, notably the Socialist Reich Party, led by the Nazi "hero" ex-Major-General Remer and a new figure named Doris. The Federal Minister has almost no police of his own, and is dependent on the good will of the *Land* ministries as well as on the political opinion of the men in the local forces. He has complained at the way in which the police have hitherto failed to do their duty. The president of the *Bundestag*, Dr Ehlers, was insulted not long ago in a Lower Saxony town, by members of the Socialist Reich Party and the organisation of ex-officers known as the *Bruderschaft* (which incidentally has connections with pro-Russian military colleagues in the Soviet Zone). The Federal flag, they declared, was "the flag of the 1945 collapse and of crawling to foreigners." The Remer party's own election meetings reproduce the familiar Nazi atmosphere, with jackbooted guards, and cries of "Hang him!" echoing the orators' denunciations of Bonn politicians.

Confusion of Fronts

The political fronts, however, are not clear. This is largely owing to the "wait-and-see" attitude of the public, which is waiting to see whether Moscow or Washington is the winning side in the world. Some Nazi groups are purely anti-Communist and totalitarian. Among them is a group ("call us a movement") formed by an associate of the dissident Nazi, Otto Strasser. The "leader" of this body, Erwin Berner, is aided by a son of the ex-Kaiser and Princess Hermine, Prince Ferdinand von Schönaich-Carolath. It is typical of the confused alliances, however, that Otto Strasser's representatives in Western Germany, men named Giessen

and Fricke, have recently taken preparatory measures to form a party in the Ruhr which will, it is reported, maintain contact with the party of Dr Gereke. The latter was removed from the post of Agricultural Minister of Lower Saxony for negotiating with Moscow's envoy, Ulbricht, and is one of the leading advocates of an agreement with the Soviet Germans on unity. Various former Hitler Youth leaders and SS officers have joined groups with this line.

It is disquieting that, in Schleswig-Holstein, all the big parties which form the Bonn coalition government have proved too weak to stand alone. They have melted away into election pacts with local groups, including Remer's party. Altogether 200 "parties" contested the communal seats last Sunday. The politics of Schleswig-Holstein and Lower Saxony are dominated by the problem of the dispossessed, since the greater number of refugees, and, consequently, the greatest proportion of unemployed, are to be found in these two *Länder*. The state elections in Schleswig-Holstein last autumn brought the refugee party, the BHE (*Bund der Heimatvertriebenen und Entrechteten*), into a position of importance for the first time, and also made this *Land* the first to have an ex-member of the Nazi party as Premier, in the person of Dr Bartram of the Christian Democratic Union. Dr Bartram still thinks it was patriotic to support Hitler, and finds it an advantage that the Schleswig-Holstein Government now "consists of men who for twenty years have not left the political stage" and so "have never lost touch with practical realities."

Dr Adenauer himself has given up trying to find experienced democrats to fill all the posts in his new civil service. The backward trend has now gone so far that men who occupied positions of some importance under Hitler—careerists who cannot be excused like the "little men" who stayed in obscure jobs at the price of becoming nominal party members—are now back at their desks. In some cases, they are in more important positions than ever. Moreover, those civil servants who sacrificed their careers for their consciences now often find themselves unwanted "dug-outs" drawing lower pensions than their colleagues who "never left the political stage."

In general, the central government is being administered by men who are either inexperienced or else are unconvinced democrats: and all of them have gone through years which have undermined the old Prussian spirit of integrity. The country is, moreover, vastly over-governed by these officials. Owing to the decentralisation upon which the Americans and French insisted and which the Germans—except for the Socialists—willingly accepted, there are no less than eighty Federal and *Land* ministries for a population about equal to that of Britain.

But what of the best guardians of political democracy, the Social-Democrats? It is one of the most deplorable signs of the times that Dr Schumacher should be fighting the elections in Lower Saxony, and to a lesser extent in the Rhineland-Pfalz, on the Schuman Plan. After winning last autumn by denouncing rearmament, he finds it good tactics now to call the Plan a plot for enslaving Germans for fifty years to come. Dr Adenauer, aided by the French and the free trade unions of the west, has drawn the ground from under Dr Schumacher's feet by winning the German T.U.

Federation for the Plan. But the Federation is refraining from announcing its approval until after the elections next Sunday. It may therefore still be possible for the Social-Democrats to convince the Protestants of Lower Saxony that they are to be the victims of a Catholic conspiracy against their national, class and religious interests in the Saar and Ruhr.

Next Sunday will show whether Dr Schumacher can hope eventually to come to victory in Bonn on the strength of his slogans. In the meantime he has greatly embittered those Frenchmen who have been working for an understanding and strengthened the hand of M. Schuman's opponents. It was the right-wing coalition group, the *Deutsche Partei*, which was directly responsible for the fact that a placard bearing photographs of British tanks crushing crops in Lower Saxony was displayed last week in the hall of the *Bundeshaus*, while parliament disclaimed responsibility for the 1950-51 occupation costs; but Dr Schumacher's propaganda was indirectly to blame for this and other signs of hostility to the west.

The Camel Hair Curtain

THE camel hair curtain effectively prevents many tourists, business men and journalists from visiting Egypt and the Arab states. In addition, it provides a barrier through which news from these countries is intercepted before reaching the world outside; and news from London, Washington and the countries beyond the curtain is held up or even changed in tone before the Arabs are allowed to read it.

The curtain fell on the member states of the Arab League—Egypt, Jordan, Iraq and Syria, the Lebanon, Transjordan, Saudi Arabia and the Yemen—as the British Mandate for Palestine ended in May, 1948. Martial law was declared and a strict censorship imposed. In Egypt senior officers merely redrafted the proclamations issued by the British Army during the war. A press, telegraph and mail censorship was instituted which was based on the instructions drawn up by the Allied authorities in 1939. Censors were hastily collected from government offices and street cafés to control all English and French language, press and news agencies operating in Egypt; and as letters and books were also carefully censored, a large staff was needed. The results are only funny in retrospect. Telegrams were all handed by the Cable Company to a censor, after which, as the process was “blind,” no one knew what garbled message—if any—reached London, nor, indeed, what instructions were sent from London offices to their agents in Egypt. Cable addresses were forbidden and any name, however unlikely, which the censor thought to be Jewish caused the sender or receiver to be put on a list of suspects even if he escaped actual arrest. Few British correspondents attempted to report the war in Palestine because the only despatches the Egyptians allowed to be sent to the outside world were glowing accounts of the daily victories of the brave Egyptian army. No correspondents were allowed to go to the front.

The censors cut anything and everything that came their way. One senior British correspondent mentioned in a feature article that the Egyptian Prime Minister was born in a dusty and remote town of upper Egypt. The words dusty and remote were deleted because, as the censor explained on one of his rare public appearances, “Our towns are not dusty and to suggest a place is remote is an insult to the Egyptian State Railways.” A publication of the Royal Institute of International Affairs entitled “Land and Poverty in the Middle East” was banned. The official reason given was “because there is no poverty in Egypt.” History text books which mentioned Israel or the Jews were all banned and many hundreds destroyed. The air-mail edition of London newspapers were all delayed and any news item from the Middle East was torn out or the entire issue burned. *The Economist* was banned for many months because any form of criticism was forbidden.

For the traveller the dreary formalities which were necessary to obtain an exit visa took four or five days of concentrated effort in dirty overcrowded government offices. The visa was finally stamped in the passport only if the applicant had behaved as the Egyptian authorities required. Entry visas were even more difficult to obtain, and if the applicant was a Christian he had to produce a letter from a clergyman to confirm his statement of faith.

In Transjordan two gentlemen with but a slight knowledge of English were appointed as censors. One of them, unable to understand the telegrams handed to him but anxious to retain the extra pay received for his special work, crossed out with red pencil every other line of the telegrams. The second merely placed telegrams in the drawer of his desk for a week or two until all interest had faded. He then stamped them for transmission to London and New York. A censor operating in Damascus used to transmit the last page of a telegram and allow a few days to elapse before sending the first. In Beirut the censor's office was miles from the centre of the town and the censor, who was rarely in his office for more than two or three hours daily, could only speak French and Arabic. In quiet times he allowed business men and foreign correspondents to make their own translations, but at times of political crisis he referred everything to the Ministry of the Interior and messages were often delayed for days. Every Arab censor was guilty of changing messages, adding a glowing word of praise about their King or President and sometimes altering the sense of a despatch.

The Arabs through their lack of method, efficiency and common sense wore their friends down more quickly even than the Russians. It was exasperating to observe that the Tass correspondents in Cairo and Beirut always had their messages promptly passed by the censor: “We know the message will be sent by the Russian Legation radio if we don't pass it,” the censors said. Some censors could, of course, be bribed with money, others with whisky, but those who drank the whisky and burnt the message were common.

Camps in the Desert

Behind the camel hair curtain it is dangerous to disagree too strongly with the regime. The desert concentration camps of Egypt to which men and women said to be Jews, Communists or members of the Moslem Brotherhood are sent, bear some comparison with those of central Europe or the Soviet Union. Even in the small country of Jordan a few of the more violent members of the opposition have been taken to the waterless fortress of Bekir in the desert some two hundred miles away from the nearest human habitation. A truck brings food and water every week to the inhabitants, who can wander as they wish. They can never escape.

Although the Palestine war is over “the state of war with Israel” still exists and many of the inconveniences which were introduced as emergency measures are likely to remain permanently. Today it is easy to obtain an exit visa, but it is still a tedious and lengthy task to collect an entry visa. It is particularly stupid of the Egyptians who wish to boost their tourist industry, which was once so flourishing but has naturally suffered a most serious decline. The emergency laws were said to be retained to prevent Israeli agents entering Egypt, but several of these gentlemen retained their pre-Israeli passports and with nordic names and foreign passports several Israeli officials have enjoyed winter trips to Cairo. Letters and telegrams are still delayed by censorship and in Cairo there is a large warehouse packed full of old letters and parcels—a backlog that has piled up waiting for someone to censor.

Throughout the Middle East the local press is virtually controlled by the governments in power, which permits criticism according to their mood and their power. Naturally the more firmly they are established the less censorship they impose. In Egypt this control is serious,

as Cairo newspapers are technically well produced and they circulate throughout the whole area. At the moment the Egyptian Government allows comment and even mild criticism of themselves, but only flattering references may be made to the Palace. But Egyptian writers like to be abusive and editors find this form of journalism most popular and financially profitable and they praise Allah that there is always the British lion to bait. The Arab viewpoint is best illustrated by the following incident. An Englishman was delayed by the censor at Almarza Airport (Cairo) and as the Egyptian slowly scrutinised every paper in the brief case he protested by saying, “Please be quick, you have already delayed me three-quarters of an hour.” To this the Egyptian replied, “We have waited seventy years to keep an Englishman waiting three-quarters of an hour.”

Behind the camel hair curtain it is more difficult to collect accurate information than in a European or Christian country. The foreign correspondent knows that if he writes messages the local government really dislikes he will be expelled at a few hours' notice. Thus much of the news we read and to which we listen is coloured by censorship and distorted by omissions. But there is no doubt that, if the present restrictions were lifted and Americans and Englishmen could enjoy the freedom to work in the Arab countries that Arabs appreciate in the United States and England, relations between Moslems and Anglo-Saxons would improve. It is because truth is suppressed that sensationmongers, especially those who have no affection for the Arabs, write articles for the daily press and magazines which exaggerate Arab faults and weaknesses and omit their many virtues. The Arab peoples, like the Russians, must rely on the BBC and the Voice of America for news not only about the world but, more important, about themselves.

The French in Morocco—II

Economic and Financial Difficulties

[FROM OUR SPECIAL CORRESPONDENT]

THE drama of contemporary Morocco lies in the fact that the protecting power is too poor to undertake the massive economic development which all “undeveloped” peoples both need and demand. Thus France can do no more than preside over a small-scale European colonial expansion in a country which requires an injection of about 500 thousand million francs. “*C'est un bon petit boom du dix-neuvième*” said one happy settler in Casablanca and it certainly is. To the European visitor this kind of Indian summer of the good things of French colonial life hardly a thousand miles from Paris has indeed a kind of period charm; but as a pioneering venture in the mid-twentieth century it is pulled up short in its urban aspect by the social demands inseparable from the industrialisation of a native population, in its rural aspect by the impossibility of rapidly extending to the Moroccans the advantages which European capital has brought to the *colons*.

The French Morocco of today is, it must be admitted, something of a *tour de force*. It is startling enough to find the Moroccan economy held firmly within the monetary zone of a drastically impoverished *métropole*; when, into the bargain, the country is ruled directly by a consul who manages to dispense both with his own government and with the natives who would like to help him it is difficult not to render homage to “eternal France.” But the stark facts of economic life suggest how much more will have to be done if, during the rest of the century, Moroccan sentiment is not to be canalised into the stream of abstract propaganda for political self-determination.

General Juin's explosion of wrath in the Council of Government in December of last year was prompted by attacks on the policy of the administration in the general budget report presented by Si Ahmed Lyazidi, President of the Moroccan Federation of Chambers of Commerce, Industry and Artisanate. The main objections advanced by Lyazidi, who is a prominent member of the Istiqlal, were that a vast army of French functionaries ate up 80 per cent of the ordinary budget; that the corps of police was altogether excessive; that only 7 per cent of Moroccan children could go to school and that, at the present rate of population increase and with the present policy of the protectorate, the school problem would take a century to solve.

Grievances—and the Reply

The Budget report also claimed that there was in Morocco only one doctor for 45,000 inhabitants; making 200 doctors in the whole country against 14,000 policemen; that the Residency's housing policy was directed preponderantly towards building houses for the European immigrants into Morocco (the European population increased from 280,000 in 1939 to 420,000 in 1950); and that the 75 per cent of the Moroccan population which lived on the land had gained almost nothing from the Protectorate's technical services or from tertiary road-building, which was for the sole benefit of Europeans. (The only agricultural enterprise mentioned with favour by Si Ahmed Lyazidi was the abortive attempt at collectivisation and tractor farming in certain areas which was made by the *Direction de l'Agriculture* soon after the war with the aid of certain Communist-minded civil servants.) The Budget Report further complained of the unjust exonerations of Europeans from a differential tax, the *fellahs* paying nine-tenths of the *tertib* (the tax on agricultural production which provides two-fifths of the total of direct taxes) in spite of their relatively poor holdings. Finally Lyazidi objected to the taxes on the import of sugar, textiles and tea which fell on the poor masses of the Moroccan population.

To these and similar charges the Residency has replied partly by contesting the statistics, partly by the general affirmation that without the French the Moroccans would be in a very much worse plight than they are in at present; that, in fact, there would be no roads, no modern medicine, no irrigation, etc.; that Morocco was benefiting from the Marshall Plan funds which are channelled to Morocco through Paris (13 thousand million francs in 1950). As to fiscal policy as a whole, it is undoubtedly the policy of the Protectorate to attract capital from France, Belgium and Switzerland by keeping taxes low for immigrants. The entry of foreign capital is thus viewed as the only means of creating taxable revenue at a later date. Consequently there is really no question of soaking the *colons* immediately in order to finance more advanced social legislation.

The expansion of the economy to a point at which a large budget would be feasible will never, it seems, be done by the Saff sardine boom or the development of the phosphate mines. To achieve such a state of affairs American capital is necessary. But the Residency is very firm on the point that there is no economic possibility of a *grand boom américain* in Morocco, an opinion which reflects its shyness of letting American capital in for fear of the United States gaining too great a hold on the country. But without private investment by Americans it is hard to see how the little postwar boom can do more than exacerbate the incipient xenophobia of the natives and increase the influence of the Istiqlal. The flight of capital from France to Morocco has been greatly exaggerated by rumour. According to one official estimate it scarcely exceeded 17 thousand million francs in 1950 or about 0.7 per cent of the French budget of that year. This kind of economic expansion obviously cannot inaugurate a second phase in the French administration of Morocco; it can only provide a sanctuary for middle-aged French provincial businessmen for whom, as for the

English fox hunting community in Eire, *la vie est plus agréable là-bas*.

Taken together, the postwar influx of Europeans and the continued administrative aloofness of the French from the native population have made the Moroccans afraid that the Protectorate intends to go on protecting for ever; protecting not Morocco against external enemies but the French against the Moroccans. This inkling of a future submersion is a highly inflammable fuel. It is hard to leave Morocco without feeling that France should ideally stay there, but as things are will not be able to stay except by force. Hitherto the proud religious spirit of Islam has led the Moroccans to accept foreign domination as the will of Allah—in feudal south Morocco among the Berbers there still seems to be almost no strain between Moroccans and Europeans. But a further intensive settlement of Europeans in the Atlantic towns and the northern plain must surely stir up nationalism among the masses, who are beginning to come in to work in the towns. Should the French promise independence in the year 2000? Should they stonewall on the constitutional issue but at the same time do everything possible to bring technical education and all forms of amenities to the Moroccans?—“*pour les associer*,” as General de Gaulle says. Should they enlarge the Protectorate by associating with themselves in some way other European powers? Should they actively seek American economic aid? Only one thing is sure. They must do something new.

(Concluded)

China Behind the Korean Front

[FROM OUR HONGKONG CORRESPONDENT]

UNTIL recently, the Mao Tse-tung regime in China was mild, especially in the South; it stopped short of the all-out Communism applied in the Soviet Union. In the last few months there have, however, been marked changes, with some abandonment of the façade of “people’s government” and the pretence of a united front of all national interests. The swift and ruthless communisation of the whole country is now being imposed by dictation and terrorism.

Regional differences are, however, important. Manchuria and the Peking-Tientsin area are “mobilised” as the main war-bases for the present stage of the conflict. The remote northwest (Chinese Turkestan) is undergoing energetic, but necessarily long-term, development by the Russians themselves—a clear indication that they are planning for a more fundamental, and not yet imminent, phase of the conflict. The South is not on the same footing; it is less important industrially, and is still in an early stage of communisation. That process has, however, begun. In February the frontiers were closed, and trade, navigation and travel were controlled; new measures of conscription and thought control were applied. Meanwhile, the long awaited extension of the agrarian reform to the southern provinces took place. Mass trials and mass executions became the rule. This news is not an invention of counter-revolutionary propaganda; these proceedings are reported and praised in the Communist press, which counts thousands of persons liquidated, and urges the extension of the purge. It is officially decreed that “compassion” (*jen*) has no place in revolutionary thought, and must be totally eradicated.

It seems that an attack on the China coast—General MacArthur’s prescription—would not strike anywhere near the real centres of Communist power in China. And the step might alienate the sympathy of a large part of the population. At first sight, this moment of turmoil and

resentment might seem a good one in which to strike. But such a move would merely confirm the Communists’ contentions of American aggression, and lead to popular acceptance of their version of “national defence.”

No Welcome for Chiang

A few months ago the opinion was widely voiced that American troops would not be wholly unwelcome in Kwangtung Province, by reason of the general stagnation of the area under the Communists, who have concentrated on the development of the North. It is now seen that the paramountcy of Soviet interests in general, and the war situation in particular, must lead to the accentuation of this regional inequality; action against South China now would throw the blame on the “imperialist warmongers,” but later the animus will be against the Communists, and South China could be to Peking the sort of false asset that Italy was to Hitler.

It would be dangerous to underestimate the extent to which the Kuomintang faction is discredited in China. While sooner or later American forces might conceivably be welcomed there, few would seriously suggest that the welcome would extend to the former regime or its troops. General MacArthur’s demand for the immediate use of the 600,000 troops now in Formosa is the most dubious part of his calculations. Most Chinese and foreign observers of the civil war know that the Communists got their arms and equipment not so much from the Soviet Union, as from the American supplies they captured from the Nationalists; they fear that this process might largely be repeated. Moreover the unpopularity of the previous regime was so great that many are unwilling to believe that there can have been any progress in Formosa, despite loud claims and some evidence.

Meanwhile staggering blows have been struck in Korea. Some people anticipate an early Communist collapse on that front. Many consider that the Korean war is unpopular in China; the drain of good troops, and the sense of practical dependence on the Soviet Union are actively resented. The regime in its early days got credit for restoring the international dignity of China and winning serious consideration, and even fear, abroad. Negative results in Korea have since damped this ardour.

Denmark in the Second Round

[FROM OUR COPENHAGEN CORRESPONDENT]

ELECTIONS to minor second-rate constitutional assemblies are often a nuisance. For three to four months the elections for renewing only one-third of the Danish Upper House (*Landstinget*) which anyway in its present form is obsolete and rudimentary paralysed most political and economic activity in the country, at a time when quick action was needed. In November last year Parliament, as a preliminary, had put an extra £25 million on the taxpayers’ shoulders to meet the cost of new defence measures and, partly, the deficit on the balance of payments. But everybody knew that still more drastic cuts were necessary to meet the inflationary pressure and the foreign exchange deficit. Politicians enjoyed different views spoke openly about a threatening Stall delayed ruptcy like that of 1813. But because of unimporise packed tions, which politically could only be a straw in is piled up action was postponed for three months, while i balance of payments was deteriorating at the rate of virtually than one million kroner a day. A compromise has, however, now been concluded amongst the four big political power. Ceiling prices are to be set for grain. Butter and bacon the less are to be frozen, the Government’s subsidy for sugar prious,

A MARKET of over 148,000 progressive people

There is no doubt at all that The Listener readership offers a first-class market for a wide range of goods and services. Here you have an A.B.C. Certified Circulation of 148,217—a market of educated men and women from trade, industry and commerce, from the professions and the arts, from public services and private life. They include some of the most influential people in almost every

sphere of activity. Listener readers are, naturally, people of more than average discrimination and taste, and their confidence in the journal extends to the very sound advertisements it carries and the products they offer.

If you have a first-class product or service appealing to substantial people, you will do well to consider advertising in The Listener.

The Listener

Hoover Men in the Service of British Industry

In addition to serving their own Company, Hoover Directors and Executives are prominent in the activities of a number of national and professional bodies, where their advice and experience can be utilised for the improvement of industrial and merchandising efficiency generally. They are valuable members of this country’s economic, marketing and engineering organisations, and are also active in industrial welfare and training schemes.

Thus, much that Hoover Limited have learnt in service to the families of the nation is given back readily in the nation’s further service.

Besides supplying the home market, Hoover Limited are exporting electric cleaners and washing machines, fractional horse power motors and plastic commutators to sixty-three countries, in six of which there are large and rapidly developing subsidiaries of the Company. A large percentage of Hoover exports is going to hard currency areas.

HOOVER LIMITED

Manufacturers of Electric Cleaners and Washing Machines, F.H.P. Motors, Plastic Commutators, etc

Factories at:—PERVALE, GREENFORD, MIDDLESEX • CAMBUSLANG, SCOTLAND • MERTHYR TYDFIL, SOUTH WALES • HIGH WYCOMBE, DUCKS

It'll cost you less to take things easy

Let Burroughs take the strain

THE NERVES of a business are in the office—and they're just as easily overstrained as the nerves of its executives. Once antiquated figuring methods lead to delays and bottlenecks, mounting tension endangers the whole health of the organization. Rising office costs can upset the carefully balanced budget of the business.

There's a quick antidote to inefficient calculating—"Burroughs." Whatever your problem, there will be a Burroughs business machine that exactly meets your requirements. Economies begin as soon as you get vital facts and figures when you want them—and in the way you want them.

Burroughs have sound advice to offer on the use of these machines. Their long and varied experience is yours for the asking.

You can count on

Burroughs

ADDING · CALCULATING · ACCOUNTING · STATISTICAL MACHINES

AND NOW AT THE B.I.F.—INTRODUCING BURROUGHS MICROFILM . . .

Announcing—the coming of Microfilm. At this year's B.I.F., Burroughs proudly demonstrate equipment that gets straight to the heart of another business problem—that of saving space. By use of Microfilm, the millions of documents that an organization has to have, and has to keep safe, can be stored in space no bigger than that of an average

filing cabinet. In addition, Microfilm eliminates duplication, speeds and simplifies office procedure, and makes records easily available. Burroughs give a preview of Microfilm equipment—the recorder, reader, and processor—at their Stand No. G5 at the B.I.F., (Olympia). When you think of Microfilm—think of BURROUGHS.

The new Burroughs factory at Strathleven, Scotland, is now turning out an ever-increasing supply of modern business machines for home and overseas markets.

Special Act of Parliament

A World Wide
Organisation Transacting
All Classes Of Insurance

General Manager: William Graham Robertson

HEAD OFFICE: St Andrew Square, Edinburgh
LONDON OFFICE: 5 Lothbury, London, E.C.2

BANK-INSURANCE UNITS

THE investor in Bank-Insurance Units secures a freely marketable investment spread over 50 high-grade equities, the Trust Fund being made up as follows:

Insurance companies	...	38%
Canadian \$ Bank Shares	...	16%
Other Dom., Col. & O-seas banks	...	14%
Home banks	...	20%
Discount companies	...	7%
Trustee securities	...	5%

In recent years there has been a steady upward trend in the distributions paid on Bank-Insurance Units, and the Managers consider that the distributions for the coming year will be at least maintained.

Offer price, 2nd May 23/11d. Yield calculated in accordance with Board of Trade requirements, £3/9/5%, subject to reduced rate of tax allowing for D.I.T. relief.

Units can be freely bought and sold at quoted net prices (and information obtained) through any Stockbroker or Bank.

30 CORNHILL, LONDON, E.C.3.

is to be reduced. Other measures are the compulsory saving of 200 million kroner (£10 million), a number of new domestic excise taxes, amounting to another 200 million kroner, and higher prices for public services.

Altogether, through the two sets of legislation, the purchasing power of the population has been reduced by about 1,000 million kroner (£50 million) a substantial amount, considering that the total State budget is about £125 million. The economic situation is, however, still not under control. In 1950 the deficit on the balance of trade with foreign countries doubled again, the total deficit being 750 million kroner. Marshall aid reduced this to half, but the financing of the remainder has drained Danish resources to the limit. Denmark is, therefore, facing the second phase of its reconstruction.

As more taxes are out of the question, the Government will have to attack the citizens' income through restriction of credit. This can largely be done administratively through reducing public works and cutting state support for house building. An increase of the National Bank's discount (5 per cent since November, 1950) is not contemplated but another technical financial method, a revaluation of the krone by up to 12 per cent, is being sponsored by the Conservatives, one of the two government parties, and by industry. The Liberal Agrarians, however, who head the Government, oppose the idea; under it the farmers would get less money for their exports.

Complaints Against Britain

Considerable bad feeling has indeed been voiced recently against the British Ministry of Food. The Ministry's spokesmen have constantly maintained during trade negotiations that they could see no reason for increasing the prices paid for Danish bacon, butter, and eggs, as the profitability of Danish agriculture was still very satisfactory and as present prices evidently had encouraged increased production. This has been true so far, principally owing to extraordinarily good harvests. But today the situation has changed. Denmark's farming industry is exporting to Great Britain for sterling but has to pay for its imports in dollars. Bacon production may be taken as an example. In December, 1950, the price of feed grain was 45-50 kroner, today it is 78 kroner. Under these circumstances, as the president of the Danish Producers' Association, Mr Clausen, recently said, "it is very poor business indeed" to feed pigs on imported grain, if the British Government is unwilling to increase the price beyond the 5½ per cent extra it gave in December.

Denmark is delivering 60 per cent of Britain's total imports of bacon, but it can now be seen that there will be a severe reduction in the exports of bacon at the end of this year. The farmers have already delivered many porkers to the factories. The long-term agreement with Britain, which expires at the end of September, 1952, does not oblige the Danes to export a certain quantity, but only says that they must sell Great Britain 90 per cent of their surplus bacon. Denmark rejoiced when it heard that Great Britain could abstain from taking any more Marshall aid, but commentators added bitterly that Denmark is doing a lot to foot the bill.

Denmark has in fact bound its whole economy to Britain. Although agricultural products no longer make up all its exports—one-third are now industrial—its whole economy is based on long-term contracts with Britain, which probably were sound before devaluation and the Korean war. The Danes are worried because they now have to fight for the 7½ per cent increase in prices which the long-term agreements provided for while they have to pay the much higher prices prevailing in the world markets for imports of coal, steel, feeding stuffs, manufactured goods, and so forth. Even then they cannot get their usual imports of coal from Britain, but have to go as far away as India to get their scanty supplies.

Towards the Birth of a Nigerian Nation

AFTER the Gold Coast—Nigeria. Plans are now speeding forward for the holding of the first nation-wide general elections in the summer; the new constitution is to be introduced at the end of the year. An Order-in-Council has been published empowering the Governor to compile a voters' roll and to make the final electoral arrangements. But although Nigeria is to undergo political changes no less radical than those in the Gold Coast, there is unlikely to be the same excitement about them. For this huge country—four times the size of Britain and with a population of over 25 million (no one knows the exact number) is to have a federal constitution. The first elections will be for three separate Houses of Assembly for the three main regions—North, West and East. Dignified buildings are already being erected in Kaduna, Ibadan and Enugu. Later the central House of Representatives in Lagos will be constituted.

The elections in the regions will be indirect. Each province or division will in the first instance choose an electoral college, and these in turn will select the members of the Regional Houses of Assembly. The Regional Houses, in their turn, will elect the members of the House of Repre-

sentatives. This combination of federalism and indirect elections will obviously cut across straightforward party politics, and it is next to impossible that any one leader or any one party should gain the sweeping successes, and the limelight of world publicity, which has been achieved by Kwame Nkrumah in the Gold Coast. Each of the regions is inhabited by nations or tribes distinct in origin, social structure, race and language—each nursing a certain suspicion against the others—and there is no individual politician who can command much support or enthusiasm outside his own area. In Lagos, the capital, with its mixture of persons from all parts, party politics undoubtedly flourish, but Lagos has been incorporated in the Western region, albeit with special representation, and must work through the Western House of Assembly.

Yet Nigerians, as such, will have the dominating voice in the new political framework. The House of Representatives will be composed of 148 members, of whom 136 will be elected Nigerians—the remaining 12 being officials and commercial representatives. The executive body is to be a Council of 18 Ministers, drawn from the House of Representatives, and consisting of 12 Nigerians (four from each region) and six officials. This Council will decide all matters of policy, introduce legislation to the House and prepare the annual budget. Under the new ministerial system, individual ministers will have portfolios and answer for their subject in the House of Representatives.

The formulation of this constitution has involved a complicated process of consultation with Nigerians, right down to the village level. In each region different demands were made, with the result that each regional legislature will be composed and elected in a different way—in the North and West there are to be two chambers (a House of Chiefs as well as a House of Assembly), but in the East, where the institution of chieftainship is undeveloped there will be only one. The greatest problems were, however, encountered when it came to finding a compromise between the three regions on the central legislature and executive. The North, with half the population of Nigeria, demanded half the seats in the House of Representatives, and eventually won its way, though only by agreeing to have no more than a third of the unofficial seats in the Council of Ministers. It also claimed that half the budget should be devoted to its needs—a special committee, which has not yet reported, has had to grapple with this difficult matter. No less delicate issues were involved when it came to separating off the subjects on which the Regional Houses would be empowered to legislate from the powers of the centre, but a division has now been agreed upon.

If this complex structure can stand the strain of regional antipathies, loyalties to the chiefs and nationalist ambitions, the achievement will be extraordinary. It is an attempt, among a preponderantly illiterate and widely diverse population, to bring together all elements in the founding of a new nation.

Soviet Foreign Trade

[BY A CORRESPONDENT]

THE immense difficulty of obtaining reliable statistics, upon which conclusions of some value could perhaps be based, is well known to all who have made any attempt to study the Soviet Union's economic relations with foreign countries. Since 1939 the Soviet authorities have stopped publication both of statistical reports on foreign trade and also of total figures of turnover; and the disclosure of any unpublished information is treated as a matter of high treason. But a recently issued report on "The Economic Relations of the U.S.S.R. with foreign countries during the war and the postwar period," by B. H. Kerblay*, summarises the results of what has evidently been a careful and scholarly piece of research on such evidence as exists.

During the war years the various Lease-Lend agreements enabled the Soviet Union to maintain a very adverse trade balance; but the cessation of these agreements in 1945, coupled with the Soviet Union's greatly reduced ability to export, suddenly curtailed supplies from the West. It was clear that large-scale foreign trade would be possible only if fresh credits could be obtained to replace those which had been provided for the war period. At one time the support which the Soviet Government had given to the negotiations for the creation of the International Monetary Fund and the International Bank for Reconstruction and Development encouraged the belief that the USSR might benefit by way of a considerable annual credit. The possibility of fruitful collaboration between East and West did not seem so utterly remote in 1946: indeed, in that year the Soviet press was pointing out the great benefits which American assistance would confer upon European countries. However, the fundamental incompatibility of Soviet and western aims put an end to all hope of genuinely flourishing trade relations. It is true that, in spite of all obstacles, a certain amount of business has continued to pass between the Soviet Union and West European countries. Switzerland, for instance, has to some extent attempted to profit by Germany's collapse by creating a new market for itself in Russia; and Britain has imported grain and raw materials from there, with a view to conserving

* Published as Bulletin 5 on Soviet Economic Development by the Department of Economics and Institutions of the USSR, Faculty of Commerce and Social Science, University of Birmingham.

dollar reserves. But, in general, the Soviet trade relationship with the West is stagnant, and it is difficult to envisage circumstances in which it might revive.

The Soviet Union's dealings with East European countries are, of course, a very different story, and they are probably the most interesting aspect of Soviet foreign trade relationships; but, in view of the prevailing political circumstances, it is perhaps doubtful whether the word "foreign" is really applicable. East German exports to the Soviet Union, which, in 1947, represented only 1 per cent of the Soviet Zone's total exports, rose to 42 per cent in 1948, while imports from the Soviet Union occupied 34 per cent of the total in the same year. According to an agreement signed in April, 1950, a further 35 per cent increase in trade was envisaged.

Mr Kerblay points out that, in proportion as the Soviet Union's economic interests have extended beyond its own frontiers into the territories of its East European neighbours, so has its foreign trade ceased to be simply an expression of its own needs, as was the case before the war, and has become an expression of the needs of a vast economic zone, in which the Soviet Union plays, in certain respects, the role of a central exchange. Such extensive economic co-operation has naturally transformed the functions of the Soviet foreign trade monopoly: instead of being, as formerly, an instrument for protecting a single economic system, it is now an instrument for the integral planning of several related economies.

De Gaulle and the Elections

[FROM OUR PARIS CORRESPONDENT]

GENERAL DE GAULLE's pre-election speech on May 1st in the Bois de Boulogne added little to the political philosophy he has repeatedly expressed during the past four years. It now only remains for the nation to decide whether his prescription for the cure of the French body politic is really what the doctor ordered. This time, however, as recently at Rheims, the General threw a bouquet to certain unnamed leaders of *Les Parties* "who made their glorious contribution in the struggle for the fatherland and liberty," thereby showing his intention to win over, after the election, a great number of deputies elected on other tickets. Thus the tactics of the RPF are to be philosophically exclusive before the vote and politically inclusive after it; first to *rassembler le peuple* and later *rassembler* the remains of the party politicians. The General ended with the words "when the people have spoken I will make a rendezvous with them and inaugurate the enterprise. Where? Why? In the Champs Elysées." At the same time de Gaulle has asked the nation to send him postcards at his home in Lorraine and make suggestions as to how "France should be governed, served and made to prosper." It is this type of utterance, with the tendency towards the use of referenda, which, if the press is any guide, continues to cause a certain anxiety in the nation. It does not want the coach and four driven through even so poor a thing as the Fourth Republic.

If the RPF get a big vote and manages to win the allegiance of a large group of Radicals it is possible that the new parliament will show a stable majority in face of an unstable opposition of Communists and a few score Socialists and MRP—the reverse of the dying house. Much would then depend upon the successful government's attitude to the Communists—who are, of course, longing for a large Gaullist representation. Were the RPF to undertake large-scale repression of Communism as such, disorders would certainly result. The need to push ahead with the defence of the country is vital, but at the same time the population must be nursed out of its indifference and distrust of the Centre—a change so important for the public finances among other things. De Gaulle may be the rallying point but much political wisdom will have to be exercised by his party, otherwise M. Queuille, the Moderate, will be greatly lamented.

Aspects of enterprise

No. 14.

Twelve thousand miles by Great Circle lie between the Millgate power station in Stockport (boilers and civil engineering by Simon-Carves) which stands, as it were, on the Simon doorstep, and the power stations now being built by Simon-Carves in Australia. Not an inch of difference lies between the standards of experience, service and technical skill provided in the design and construction of steam power plant at opposite ends of the world.

The Start

A GOOD START sets the right rhythm for the whole race. The full capacity of John Laing and Son Limited is applied to the start of every contract.

As soon as a tender is accepted all departments are immediately in action to a pre-arranged programme. The requirements of the job have been worked out in advance. Within hours the transfer of picked men is arranged; materials are on order for specified dates; plant is ear-marked and perhaps on the move; key staff and mobile offices are on their way to the site.

This immediate, co-ordinated action is team work at its best. It sets the rhythm which will be maintained until the job is done and another Laing contract completed smoothly, efficiently and on time.

For speed and efficiency in building and civil engineering

JOHN LAING AND SON LIMITED Established in 1848
London, Carlisle, Johannesburg, Lusaka.

Tradition

When in 1485, King Richard the Third cried:—"A horse! a horse! my kingdom for a horse!" a Catesby was there to serve his need.

Successive Generations of the House of Catesby offer the same tradition of service to the Leaders of Commerce and Industry of to-day in Catesby's Office Furnishing—for a complete new office or a single item we invite your enquiry to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

CATESBYS LIMITED

Units of the Trust are quoted and dealt in on the Stock Exchange, London.

THE 'M & G' GENERAL TRUST FUND

THE PIONEERS

OF UNIT TRUSTS

Trustee : Lloyds Bank Limited

Managers : Municipal & General Securities Company, Limited

The Managers announce a CONVERSION OFFER TO UNITHOLDERS OF FIRST, SECOND, THIRD AND FOURTH BRITISH FIXED TRUSTS

Bearer Unitholders of the "First Four" British Fixed Trusts or their agents should apply to the Managers for details of their Conversion Entitlement. Registered Unitholders have already been notified by post.

In addition

OFFER FOR CASH SUBSCRIPTION OF 500,000 UNITS

Initial Price on 1st May, 1951 : 20s. 0d.

The Price is calculated daily on the market value of the underlying securities and is, therefore, liable to fluctuation.

YIELD.—The Managers anticipate that, allowing for all charges and buying expenses, the yield on the initial price of 20/- will be £4 15s. 0d. per cent. This estimate takes into account reinvestments consequent upon conversions from the "First Four" British Fixed Trusts and investment of cash subscriptions. Such reinvestments may take some time to complete and the first distribution may be at a lower rate.

The "M & G" General Trust Fund is a Managed Unit Trust. It offers to all an opportunity of investing sums of £10 or more in a well-spread and carefully managed selection of sound securities.

MANAGEMENT POLICY

The fundamental principles of the "M & G" General Trust Fund are :—

- (i) A wide spread of carefully selected investments.
- (ii) The property is exclusively owned by the Unitholders in their appropriate proportions—no prior charges can be created against their capital.
- (iii) Every Unitholder is entitled to realize the market "asset" value of his share, or part thereof, at any time.

The soundness and effectiveness of these principles have been tested and proved by 20 years of "M & G" Trust Management. They have given Unitholders in the "M & G" Trusts regular and substantial dividends—255 payments in all to date, totalling over £5,691,000 gross. As for capital, all Units and Sub Units of "M & G" Trusts are today quoted above their original issue price and most of them have risen in value to an extent that at least goes some way towards counteracting the results of inflation.

In the future as in the past it will be the policy of the Managers to earn for Unitholders at all times the highest income consistent with paying due regard to capital.

INVESTMENTS

The Trust has been created primarily for conversion of the First, Second, Third and Fourth British Fixed Trusts and its original investments will be those taken from these Trusts. Investments will be made and changed, however, as determined by the Managers within the range of Authorised Investments. These include any security in respect of which permission to deal is effective on a recognised Stock Exchange in the United Kingdom, which means that many shares quoted on Dominion, Colonial and Foreign Stock Exchanges will also be eligible. All investments will be held in the name and custody of the Trustee or its nominees. No investment in any company may be made so as to bring the total investment therein above 5% of the funds of the Trust.

Particulars of the portfolio of investments will be published half-yearly as percentages of the total Fund.

MANAGEMENT CHARGES

The following charges will be made on account of the remuneration and expenses of the Trustee and the Managers :—

Full particulars may be obtained from any Bank Manager, or Stockbroker, or from the Managers :—

MUNICIPAL & GENERAL SECURITIES COMPANY, LIMITED

Directors : S. I. Fairbairn (Chairman), George M. Booth,
P. S. Harper, R. N. Whitcomb.
Secretary : W. Rann.

9, Cloak Lane, Cannon Street, London, E.C.4.

Telegrams : Munigenco Cannon London.

Telephone : City 5201.

THE BUSINESS WORLD

The Case for Monetary Policy—I

The Budget not Enough

IN one sentence of his budget speech, Mr Gaitskell went further towards admitting the case for higher interest rates than any Chancellor of the Exchequer has done for many years. "The recent rise in interest rates," he conceded, "may also exercise some check on investment." The market has taken this to mean that, despite the advent of a quasi-war economy, the Chancellor has no intention of adopting wartime techniques of interest rate management or of abandoning the policy pursued since the collapse of the Daltonian experiment in ultra-cheap money. In other words, the authorities will continue to allow "natural" forces to exert their effect on gilt-edged values, and will not be prepared to create credit merely with the object of trying to resist any fundamental trend in the market. Given this prudent aloofness and given, too, the prospect of rising inflationary pressure, it seems certain that the long-term trend of interest rates will continue to be upwards.

There is no sign, however, that Mr Gaitskell has any intention of deliberately encouraging their rise. On the contrary, even in the budget speech he declared that "other measures" besides the "recent rise" in rates would be necessary to check investment—these "other measures" being next year's withdrawal of the initial allowances, the issue of further instructions to the Capital Issues Committee, and a new appeal to the banks. It is significant that when Mr Gaitskell speaks of "restraint in credit policy," he means restraint, not by the monetary authorities in the classical manner, but restraint by the commercial banks—in pursuance of a "qualitative" directive that makes the very opposite approach to that of discipline by the interest rate. It is precisely because the interest rate is eschewed as a deliberate weapon that the system of priorities and directives is needed.

Later in the budget debate the Chancellor showed his standpoint more clearly still. He challenged members of the Opposition to show how a more vigorous use of monetary policy could bring down prices, claiming that it would not do so

unless it was pushed so far that it created losses and unemployment. That is our argument. I cannot see that if we were to tighten credit further we should have any perceptible effect on the price of wool, on the price of rubber, on the price of tin. As a matter of fact, the probable consequence of doing that would be that we should make our own merchants unable to buy the goods.

This leaves little room for doubt about the Chancellor's attitude. But although there are elements of truth in his contention, it still begs the real question—which is not whether a tighter monetary policy in Britain could reverse the rise in world primary prices, but whether it could assist him to resist inflation at home. An increasing number of expert observers, both in the City and

among professional economists, are convinced that it could and indeed that it is only by this means that the inflation can be kept within reasonable bounds.

It is common ground that a really tough deflationary policy would provoke an increase in unemployment, whether it were pursued by budgetary or by monetary means. It is clear, too, that if an attempt were made to push deflation to the point at which the rise in import costs might be absorbed without any considerable rise in the domestic price level, the resulting unemployment might be very heavy indeed. But this is not the object of the advocates of tighter money, any more than it is the Chancellor's object. The purpose of both is to ensure that the rise in domestic prices that is resulting from the rise in import costs shall not have superimposed upon it an inflationary rise resulting from an excess of monetary demand at home; though both will hope that any measures designed to extinguish that excess demand may make some contribution (though perhaps only a slight one) towards relieving the pressure on world commodity markets as well. The Chancellor approaches this problem exclusively from the budgetary side; but the fact that a budgetary deflation based on a "true" surplus of, say, £500 million might provoke severe unemployment does not deter him from pursuing budgetary disinflation by a much smaller surplus. Similarly, the fact that a credit contraction consonant with a long-term interest rate of, say, 5 per cent or more might be dangerously severe is no logical ground for refusing to pursue disinflation by a much milder degree of credit contraction. The difference in both cases is one of degree. Restraint by monetary policy is not, in principle, any more antagonistic to employment than is restraint by budgetary policy.

On these supposedly "social" grounds there is not, therefore, any logical reason for pursuing the one policy and rejecting the other. On the contrary, the advocates of monetary restraint find genuine social grounds for urging that both policies should be pursued simultaneously—because budgetary policy alone is unlikely to suffice and because a failure to keep inflation within bounds will jeopardise both the defence programme and the level of employment, will cut the standard of living of the masses more severely than it need be cut, and will unjustly erode still further the worth of all social payments, private pensions and life assurance, and all fixed incomes. Believers in the efficacy of monetary policy do not suggest that it should take the place of disinflationary budgeting. Since monetary restraint perforce exerts its main impact on the private sector of the economy, any such suggestion might imply that the private sector (and especially industrial investment) should accept disproportionately severe cuts in order that

Government spending should escape correspondingly lightly, which would be quite unacceptable.

Since the budget, Mr Gaitskell has in effect conceded the first stage in this argument. He emphasised last week-end that if production fails to rise this year by the officially assumed 4 per cent, a still tougher budget will be needed; yet he is very conscious of the difficulties of raising taxation. His critics believe that, even if the output target were to be achieved, the budget would still be insufficient to repel inflation, because his tax measures will not exert as large a disinflationary effect as he assumed. The general level of taxation has long passed the point of diminishing returns; the effect of any addition is increasingly frustrated by repercussions on private savings, on consumption of high-taxed commodities and on output. The full efficacy of the budgetary weapon of disinflation can be restored only by substantial retrenchment in Government spending—and Mr Gaitskell professes to believe that there is no scope for anything more than marginal economies. Given such a policy, the persistence of an inflationary gap appears inevitable even on sanguine assumptions about output, and it is likely to widen throughout the rearmament phase. It will certainly be much more dangerous, in any case, than in recent years, because the virtual collapse of the wage-stabilisation policy means that any given inflationary pressure will produce a spiral movement much more rapidly.

★

For all these reasons, there is urgent need to reinforce the budgetary effort at disinflation; and it is foolish to refuse, for merely doctrinaire reasons, to bring monetary policy to its aid. Opponents of this policy generally assume that it could achieve nothing unless it produced a sudden plunge into really dear money. They agree that an interest structure related to a Bank rate of, say, 6 per cent or more really would check demand, and yet deny that a rise in rates by $\frac{1}{2}$ per cent or even 1 per cent would have any effect at all. Their technique of argument generally resembles Mr Gaitskell's when denying the scope for retrenchment: "Tell us," they say, "any single project that would be held back or diminished at a time of full employment by a moderate rise in the cost of borrowing." Many definable projects could in fact be instanced as vulnerable to a rise in interest rates—notably, for example, the more ambitious of the longer term projects of the British Electricity Authority and, of course, housing, if interest rates were to be allowed to reflect themselves properly in the level of rents (though in this case the benefit would probably be reaped not so much by a contraction in the volume of housing as by greater economy in its use and by maintenance or conversion of properties that are now being allowed to decay). The opponents of monetary policy may retort that these are precisely the kind of projects that, for "social" reasons, they desire to keep immune from any effort at disinflation. If Government and Parliament accepted this view, they could still devise ways of keeping them immune—with the added advantage that, if a rational rate of interest figured in their costs, the nation would clearly see precisely how large a price it was paying (in terms of Government subsidy) for its decision to prefer allegedly "social" tests to economic tests of the optimum outlay of national resources.

The proper reply to those who deny the effectiveness

of interest rates is not, however, to cite instances in which they would be effective; on the contrary, it is to point out that it is precisely because no one can possibly know and catalogue the manifold instances, and neatly classify them in degrees of vulnerability, that the sifting function of a variable interest rate cannot be duplicated by a planning mechanism. Such a mechanism, if operated by a physical licensing system of sufficiently great complexity, might conceivably succeed in exerting a sufficient restraint upon total demand; but, if it did succeed, it would be at the cost of intolerable frictions, wastages and anomalies. A variable interest rate, like any other price mechanism, sifts automatically a virtually infinite number of marginal and near marginal demands, and discriminatingly grades the remainder according to economic "priorities" established naturally in the market-place. In particular, it provides an objective calculus of the relative worth of short-term and long-term projects. In the eyes of doctrinaire critics, the strongest condemnation of it is that it is "blind." That, in a sense, is its virtue; but if it is admitted that "social" priorities must be distinguished from economic tests, the sifting process of variable rates can still be combined with the planning mechanism—helping to reduce its anomalies and dealing with the innumerable demands that are physically beyond its compass.

A defence of interest rates on these classical grounds alone is perhaps unlikely to convince the confirmed sceptics. They appear to regard the demand for finance as infinitely inelastic—at all events at moderate levels of interest rates. Is it really to be supposed, however, that if the average rate charged on bank advances and by the building societies and insurance companies, and the rate effectively paid by a seller of gilt-edged were one half to one per cent higher, the volume of finance through these channels would be precisely the same? Even Mr Gaitskell does not believe that, because he fears that tighter money might make it impossible for "our merchants" to buy expensive and scarce raw materials. The very object, however, of any disinflation policy, whether budgetary or monetary, is to make marginal buyers unable or less able to exert their demand, especially for the scarcest materials, in order that there shall be a better supply for those catering for more essential needs and more assured markets. This is in principle the purpose both of the Government's budgetary policy and of its physical controls; and it is absurd to suppose that the process of curtailing marginal demand is right and proper when pursued by these methods yet dangerous when pursued by monetary policy.

The truth is that either policy might work dangerously or unconscionably if pushed to extremes; and the more it is desired to secure effective but not over-drastic disinflation, the more necessary is it to apply both policies in parallel. Provided that it were linked to a reasonable degree of budgetary restraint, a policy of monetary restraint could unquestionably give very valuable aid—even though it was never pushed to the point at which it would create a larger volume of temporary unemployment than the Government is at present prepared to countenance. A second article will suggest the kind of monetary policy required on this assumption—without prejudice to the much wider question whether the arms programme can in any case be achieved without some inflation unless the volume of transitional unemployment rises from time to time above its present level.

Taxation and Profits

AMID all the excitement about half charges for dentures and spectacles, one aspect of the recent Budget seems to have gone almost unnoticed. This is the new dependence upon company profits as a source of tax revenue. In this, there is an admission and an assumption—the admission, that other taxes have reached their point of maximum return with no further room for exploitation, and the assumption that there is a strong case in terms of social justice that the cost of rearmament should be charged on business profits. The Economic Secretary's contribution to the Budget debate three weeks ago laid great stress on this argument. Indeed, Mr Jay proved to his own satisfaction the general benefit that could be expected to flow from the raising of the profits tax to 50 per cent—profits would be high enough to pay shareholders the same dividends as last year, plus the increased profits tax and to put to reserve sufficient "to cover the whole of the higher valuation of commodity stocks." He pursued these ideas in a general proposition:—

I suggest that if there is one really outstanding economic lesson of these last five years, it is that taxation on profits can be pushed to much higher levels than were once thought possible, without any of those evil consequences that many people . . . used to predict.

Thus are the automatic fruits of inflation, bred by errors of economic policy, harvested to nourish the present purposes of the Government. In this dialectic, there is no admission of the drain upon industry's fixed and circulating capital caused by the heavy taxation of unnaturally inflated profits. "The evil consequences" are not plain to see; they are the things that are not done—the depreciation provision that falls short of what is needed, the drain on current savings that should be devoted to new enterprises but instead are used up merely to keep existing capital assets in being. A recent inquiry by the Federation of British Industries based on a sample of 90 companies with £1,000 million of assets, suggests that in real terms their physical assets were slightly lower in 1949 than in 1938—and much lower in relation to turnover. This may not seem a calamity, but it is a challenge to the easy assumption that the present physical stuff of industry, after the tax collector has taken his toll of that part of it that accountancy conventions allow to be dressed up as "profits" year by year, can be relied upon to furnish an automatic increase in productivity and output so that the damage can be hidden.

It will be more than ever necessary to keep these doubts in mind this year. All the pointers suggest a year of bumper profits—on paper. The Stock Exchange sees no other prospect before it; planners and Ministers have assumed a profits boom as one ingredient of their financial policy, forgetting that it is also largely a consequence of financial and economic policy in the past; industry is of a mind to distribute rather higher dividends where it reasonably can and not to make too much of the extra cost of profits tax in absorbing resources that would otherwise be put to reserve, and in this it is being aided and abetted by the Chancellor and his colleagues. This would be a perfect situation but for one fact—that these claims upon business profits will be met only by making further depredations on the real

substance of industry's resources. Every argument about the money figures for profits and dividends ought to be concerned, not with the peculiar new school of public morals that holds that "profits are a very good thing in the right place and in the right amount" but with the real nature of the processes that make them as high as they are—the weakened forces of competition, the conventional methods by which they are measured, the patent inadequacy of provisions for replacement of assets, the paper increases that reflect rising prices of stocks that have to be replaced at higher cost.

These are a few of the considerations that should be kept in mind this year as the profits boom proceeds—for there is little likelihood that it will stop. Certainly in the company accounts published in the first quarter of this year there is every sign of boom and the second quarter's figures, when they appear, will show a further increase. The accompanying table summarises the first quarter reports; detailed figures with the usual analysis by industry appear in this week's issue of the *Records and Statistics Supplement*. The gross trading profits of 542 companies whose reports appeared between January

and March show an increase of 15½ per cent, from £186½ million to £215 million; the previous quarter's companies had shown an increase of 18 per cent. The total income of the first quarter companies was nearly £30 million higher at £242.2 million. Of this increase £3 million extra was set aside for depreciation reserve, taxation absorbed nearly £12 million, reserves (including in many cases amounts set aside for extra depreciation) were increased by £11 million and ordinary shareholders received dividends increased to the extent of £3½ million net. The increase in the previous quarter was just over £2 million net. It is a little difficult to understand what all the fuss about increased dividends amounts to when sums of a few million pounds only are at stake. The National Income White Paper put the increase in "dividends and interest" at £24 million, from £803 million to £827 million; this includes debenture interest and preference dividends, both of which have shown some tendency to increase, and it is a gross figure equivalent to about £13 million after tax is deducted. The same document showed that wages

and salaries, after provision for taxes, rose last year by £377 million.

It is old-fashioned to argue that the shareholder deserves something better than a penny for every two-pence that the Chancellor now collects in taxation on his profits. His fate, in the view of those who believe that a healthy and expanding economy needs no assistance from personal savings, is a matter of indifference. But even if this is true, the fate of industry's capital resources is of the highest importance. There is a limit, as Mr Jay has recently acknowledged, beyond which taxation on profits cannot be pushed without doing damage to the economy. The Economic Secretary did not attempt to say where the limit should be put, and the Chancellor, by removing the initial allowances next year, has conveyed the impression that in his view the limit is a long way off. This is against all the advice and experience of industry, and the danger is that this year profits will give the appearance of the limitless cruse, to be tapped at will without risk to the lifeblood of industry.

Business Notes

Barbed Wire for the Ring Fence

Mr Gaitskell's budget eschewed new taxes, and changed existing taxes in ways that are simply understood—6d. on the income tax, and the total suspension of the initial allowances, for examples. Interest in the Finance Bill is thus largely concentrated on the details of the measures heralded in the budget speech, particularly those to circumvent the avoidance of Profits Tax. The Bill includes one obnoxious feature about which the Chancellor was silent in his speech, namely the clause that seeks power to obtain information from banks and other financial institutions about interest paid gross to individuals; this is criticised in a following note.

On the "avoidance clauses" the broad conclusion is inescapable; they are widely and indeed harshly drawn, and if they succeed in their object, which is doubtful, it will be by virtue of a further incursion of administrative decision instead of clear law-making and by erecting further barriers to the free movement of capital. In other words, Clauses 28 and 32, as they stand, confess the consequences of driving taxation to the very limit. The first resurrects the old and objectionably wide formulas used in the hope of preventing avoidance of EPT; the Commissioners, being of the opinion

that the main purpose or one of the main purposes for which any transaction . . . was effected was the avoidance or reduction of liability to the profits tax

may make "such adjustments as they consider appropriate." It is true that there is appeal to the Special Commissioners, but the clause as it stands opens the door far too widely to administrative decision. Of Clause 32, it can only be said that it is wholly incompatible with the idea that London is the financial centre of the world or that Britain is a satisfactory place to which new capital can be brought. No company can cease to be resident in the United Kingdom, or transfer its business to a non-resident, or allow an overseas subsidiary to raise capital, or transfer shares in an overseas subsidiary, without Treasury consent. These acts become unlawful, on the ground that they conduce to avoidance of income tax and profits tax. Similarly, any person

who does or is a party to the doing of any act which to his knowledge amounts to or results in, or forms part of a series of acts which together amount to, or result in, or will amount to or result in

something that is so unlawful will in the absence of proof

to the contrary be liable to imprisonment for up to two years and/or to a fine not exceeding ten thousand pounds.

Thus, the Government seeks to add another stretch of barbed wire to the fence erected by the Exchange Control Act. The precise legal force of that Act and the need in particular for Treasury consent to the transfer of residence of companies (as, for example, in the recent cases of Rhokana and Rhodesian Anglo-American) has been a matter of argument among lawyers; the Finance Bill seeks to establish, on quite different grounds of loss of taxable capacity, a barrier to the movement of capital and enterprise. The price of success in this endeavour will be high, for to the extent that the Clause succeeds in keeping within this country what is already here, it will certainly deter new capital from coming at all.

Capital Bonuses and Profits Tax

Clause 28 of the Finance Bill provides that where there has been a bonus issue of capital at any time after April 6th, 1949 (it is hard to assess the significance of the date except that it is retrospective), any subsequent capital reduction will be treated as a distribution for purposes of the Profits Tax. Similar provisions apply where the reduction comes first and the capital is later increased by a bonus issue. In both cases the amount of the distribution is limited to the lesser of the amounts applied in increasing or reducing the capital, and loan capital is covered equally with share capital except for loan capital subscribed in cash. The clause will apply only where the sum capitalised could have been utilised in making a "distribution" under existing rules. Hitherto, although the law has not been specific on the point, reductions of capital have not been treated as distributions and this has led some concerns to attempt to avoid the higher rate of tax chargeable on distributions by capitalising reserves and then, sometimes almost contemporaneously, having a capital reduction. Such attempts might be frustrated by the decision in the recent Scottish case of *In re A and D Fraser Ltd.* in which the Court of Session refused to confirm a reduction of capital on the ground that it was a transaction to avoid taxation. This, however, was a Companies Act case and the Revenue are clearly taking no chances.

The consequences of the new clause, however, extend

beyond the prevention of avoidance. Profits Tax is now charged at the rate of 50 per cent, relief being given at 40 per cent on the excess of the chargeable profits over the distributions to members. The total of this non-distribution relief represents the maximum additional profits tax that will become payable if in any year distributions exceed the chargeable profits; as the years pass this quantum of relief becomes greater, and its possible withdrawal is a more serious danger. It must be remembered also that non-distribution relief arises not only when profits are withheld from distribution but also where they are paid to non-resident corporations holding control. The expression "distribution" already covers much more than dividends paid out of profits earned since the beginning of 1947: it includes dividends paid out of balances of profits of earlier periods, distributions of capital profits and, in the case of director controlled companies, certain remuneration or loans paid to controlling directors. Now it is to be wider still.

* * *

Effect on Redeemable Preference Shares

If after April 6, 1949, a company makes a bonus issue out of reserves that would otherwise have been distributable, and also redeems redeemable preference shares, the amount applied in such redemption will be treated as a distribution and the rate of profits will be fixed accordingly. This week's Monsanto Chemical issues, in which a bonus issue of ordinary shares was followed by a cash issue of redeemable preference shares, will presumably not be affected, even when (and if) the preference shares are redeemed, since the bonus issue was made by the capitalisation of the share premium account, which would not appear to be a distributable sum. But many other companies that in the past issued redeemable preference shares on mandatory redemption terms, and that have made bonus issues in the last two years, or make them in the future, will find themselves faced with heavy additional liabilities, which may amount to as much as 40 per cent of the amount capitalised or applied in redemption. It is not clear from the Bill whether any premium on redemption would be treated as a distribution.

Thus the clause is a further blow at redeemable preference shares, which can be a very useful form of capitalisation where there are expectations that, given time, profits can be ploughed back to provide permanent finance. It is true that no distribution will result from the redemption unless there is, at some time or other, a bonus issue, but this would involve an act of abnegation that should not be required: after all it is often necessary to tie up free reserves in the form of a bonus issue before further cash capital can be obtained. The clause does not appear to affect companies that make bonus issues of capital without there being any likelihood of reductions of capital in the future.

Up to the present only a few enlightened companies have disclosed the amount of non-distribution relief they have received. Such relief merges with the free reserves and would not normally be drawn upon. But the hazards are increasing and reserves are not really free if on a distribution part would be payable, not to the members, but to the tax-collector.

* * *

Breach of Banking Secrecy

Much concern has been aroused in banking circles at the proposal in the Finance Bill to empower the tax authorities to demand from the banks returns of all interest payments made or credited, without deduction of tax, for amounts of £15 or more in any specified year, and the names and addresses of the individual recipients. The traditional principle that a banker's dealings with his customers shall be strictly confidential has always been guarded as jealously as

though it were one of the essential freedoms—and, indeed, it can well be argued that it is. If bank accounts were open to scrutiny by Government officials at will, the door to the police state would be opened very wide indeed. In the past, governments have respected this principle; in particular, it was carefully and deliberately preserved in the Bank of England nationalisation Act, in the course of the debates upon which Dr Dalton was constrained to accept an appropriate delimitation of the new power given to the Treasury to "request" information from the banks. Desirable though it is to take all reasonable steps to check tax evasion, this is not a sufficient ground for breaching a principle of such significance. Any breach at all would be bound to ease the way for possible future intrusions for less desirable purposes. Mr Gaitskell should think again; and, so far as bank accounts are concerned, should be content to rest upon the quite different existing power—to secure information, in cases of law-breaking, only by order of the Court related to an individual account.

In view of the importance of the issue at stake, it is remarkable that this proposal did not find a place in the budget speech; it thus came as a shock, on publication of the Finance Bill, to all save a handful of senior bankers. The banks had been informed beforehand of what was afoot, but not, apparently, in such a way that there could be said to have been any real consultation with them. It may be presumed that their response left the Chancellor in no doubt about the extent of their distaste for the project. So far as can be gleaned from a scrutiny of the Bill, the intention would not be to order the returns in question for all bank accounts affected. The wording of the clause specifically gives power to require returns either from a bank as a whole or from any of its branch managers—a phrasing that suggests that the authorities might be contemplating a programme of regional drives. A piecemeal approach would, of course, reduce the labour thrust upon the banks; but it would still be very

An Annuity

will offset reductions in income

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

considerable—even though the proportion of personal deposit accounts carrying balances averaging at least £3,000 (thus yielding £15 gross at $\frac{1}{2}$ per cent) must be small. To sift these out for the authorities a bank would, of course, have to survey the whole.

* * *

Imperial Chemical Industries

A 12 per cent dividend (against 10 per cent for 1949) was a little less than the market had expected from ICI, but that fact has not prevented the £1 ordinary stock units from advancing this week to 51s. ex dividend. The figures revealed in the preliminary statement are of dimensions without rival among British industrial concerns. Group profit, before taxation and depreciation, amounted to nearly £39½ million compared with approximately £24 million in 1949. Thus the setback in trading results recorded by the 1949 figures has been handsomely made good. The group's manufacturing assets have been revalued at their replacement cost on January 1, 1950, discounted for their remaining useful lives; on this basis depreciation has been provided amounting to £8,694,823 in 1950, a figure not strictly comparable with that of £6,660,622 for 1949.

After charging depreciation on this scale, group profits amount to £31,018,457 against £17,323,509 for 1949. The tax collector seizes practically £12½ million (against £6,500,000 in 1949), and the net income of the parent company, after allowing for some increase in profits retained by subsidiaries and other adjustments, amounts to £16,843,912 against £9,791,503. The increase in the ordinary dividend absorbs an extra £530,000 net; this is a sum almost insignificant by comparison with the increase in net profits, the bulk of which feeds the capital purposes of the group, including obsolescence and replacement of assets reserve (£5,000,000) and stock replacement reserve (£4,000,000).

Revaluation of the assets has resulted in a surplus over previous book values of £96,120,273, which has been transferred to capital reserves; this sum, approximately £58½ million represents provisions to central obsolescence and depreciation set aside up to the end of 1949. This revaluation, coupled with the transfers from profits in 1950, raises the total capital reserves of the company to £118,154,089 and total revenue reserves to £26,368,816. Together with the share and loan capital, these figures indicate that ICI commands total resources of £250 million. It is a matter for congratulation that the company has come nearer than many to meeting the enormous responsibilities of maintaining its resources—and such gigantic ones—intact.

* * *

Argument on Raw Materials

The debate on raw materials in the House last Tuesday was disappointing. It was expected to be something of a fireworks display, but the fireworks proved to be damp squibs. Government spokesmen gave no facts or figures to demonstrate that the plight of industry was not as serious as Mr Bevan and Mr Wilson had recently suggested—as, indeed, it is not. They made no attempt to assess the supplies of materials that may be forthcoming during this year; all that, presumably, is left to Mr Stokes's new Ministry. The Government's view was perhaps best summed up by Mr Strauss, the Minister of Supply:

It is too early to say whether we will get the raw materials we need for our defence and essential civil production, but we are certainly not justified, here and now, in saying that we will not.

This is comfort of a sort, but it would be more reassuring if past experience had shown that the Government's foresight in these matters was more to be relied on.

Of twenty-six of the raw materials that Britain has to import (listed on page 999 of *The Economist* last week),

only two—sulphur and molybdenum—come entirely from the United States. In addition Britain gets about half of its import of cotton linters from America, about a third of its import of raw cotton, a fifth of its petroleum, less than a fifth of its copper (refined from British scrap and/or Rhodesian blister), a tenth of its softwood, and less than a tenth of its zinc. Six of the twenty-six commodities (tin, antimony, cobalt, rubber, wool and jute) come entirely or almost entirely from the sterling area. The others come from Canada, Europe and European overseas territories. These figures do not suggest that Britain is particularly dependent on the United States for most of its raw materials. The offence for which the United States is indicted by critics on the Left is that American industry stocked up quickly—thus offending the principle that all horses should run at the same speed and that the fair result of the Derby is a dead heat of the whole field.

* * *

Priority for Machine Tools

Mr Strauss was able to be more specific—and encouraging—about the provision of machine tools for defence production. He confirmed that so far the Ministry of Supply has ordered 6,500 tools, the value of which he put at £49 million, and is ordering a thousand more. He reported that United States Government priority ratings had been obtained for some 4,500 machines—and since he spoke Mr Charles Wilson has added that defence order priorities are likely to be issued from Washington for another 2,600 tools for Britain within the next few days. The Ministry had “ordered all the machine tools of the types required that were available in Western Europe”—some 8,000, costing £27 million, many of them from Germany. Ordering the balance of machine tools required—14,000 to 16,000—from British firms has gone rather more slowly, with orders for only 8,000 now placed, but the Minister did “not anticipate much difficulty about getting the remainder.” Mr Strauss emphasised that much depended upon the administration of American tool priorities and the expansion of the American industry's capacity; study of these problems will be the purpose of the delayed visit to Washington of the Director General of Machine Tools.

Mr Shinwell later added that supplies of machine tools would not materially affect production for defence in the current year. Deliveries of tools are at present somewhat behind expectations, and may well continue to be so until this autumn; but the expansion of American output should then progressively redress the balance of deliveries, and there is some reason for confidence that such quantity production for defence as depends upon installation of new machine tools will not lag seriously behind the programme.

* * *

Sulphur as Before

As was expected, the allocation to Britain of 95,000 tons of American sulphur for the present quarter has enabled the Board of Trade to bring into force the less onerous of the two schemes it had prepared to govern the distribution of sulphur within British industry from the beginning of this month. This scheme, based upon supplies of 100,000 tons for the quarter, will allow most users of sulphur and sulphuric acid between 80 and 90 per cent of their rate of consumption during the whole of 1950. This is equivalent in most cases to rather lower percentages of their consumption at the end of last year, on which earlier quotas were based, but the Board added that when the schemes are fully implemented “no consumer should receive either less sulphur or sulphuric acid than he has had since the start of the year, and many will benefit by some increase in the rate of supplies.”

Supplies to the producers of superphosphates are to remain

THE TEST OF TWO CENTURIES

In the two hundred years since Glyn, Mills & Co. became a name in Lombard Street, great changes have shaped the course of history. In those changes this now famous bank has preserved unaltered its tradition of a private Banking House offering the most comprehensive financial facilities. To-day, as in 1753, Glyn, Mills & Co. provides a banking service to meet the special requirements both of the large public corporation and of the private customer.

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

LIMITED

at the present level of approximately two-thirds of capacity, while those to key industries such as iron and steel, explosives, metal extraction, tinplate, and certain oil refining processes will be maintained in full. The rayon industry will continue to receive supplies of sulphur and acid at its present level, 20 per cent below the 1950 rate. Mr Harold Wilson's verbal "disaster," therefore, can be relegated to the stockpile of purple Parliamentary phrases. One of its queerer results, in the meantime, was the description, in the House of Commons, of bacteriological production of sulphur in the laboratory as "a result which might help to relieve the shortage of sulphur." The production of sulphur by the action of bacteria—first noticed in the sediment of certain pools in the Libyan desert—is indeed being studied by the Department of Scientific and Industrial Research, which some months ago produced a properly restrained account of the phenomenon. But the DSIR was at pains to emphasise the impressive remoteness of this natural phenomenon from the practical job of turning out sulphur on any scale; Mr de Freitas's bacteria are hardly likely to be harnessed to help the present sulphur shortage unless it lasts longer than the most doleful estimates.

Steel Facts and Implications

By the end of last summer the steel industry's stocks of imported iron ore, pig iron, and scrap had been built up to an exceptionally high level. In part this reflected the need to have "everything always available everywhere" to permit of uninterrupted operation to capacity and record output; in part, it marked the industry's normal attention to future prospects for materials. By drawing upon these stocks to supplement current deliveries of materials, steel output was maintained during the winter, until the slight fall recorded in March, in spite of disorganised shipments that cost the industry 600,000 tons of ore and of reduced deliveries of German scrap. During the six months from September last these drawings on materials in stock afforded rather more than a million tons of steel; by the end of March, stocks of imported ore and of scrap had been reduced by slightly more than half and those of pig iron by two-fifths. Such reductions are far beyond the limited drawings upon stocks that normally take place in the industry during the winter and the present level of stocks would not permit of any appreciable further reduction during the remainder of this year.

What these facts may imply was the subject of some difference early this week between the Minister of Supply (briefed by the nationalised Iron and Steel Corporation) and the British Iron and Steel Federation. The facts were not in dispute. Nor were such details of immediate prospects as the Minister gave. All parties agree that total imports of German scrap this year can be "nothing like last year's 1,900,000 tons"; about a million tons this year appears to be the general hope. Ore imports should slightly improve as soon as the disorganisation of shipping by hastily contrived bulk shipments of coal and other materials has subsided. Imports of pig iron may increase slightly. And there should be some increase in the smelting of home ore, though this, owing to its lower iron content, will require more coke and reduce the average productivity of the blast furnaces. There may be some slight differences in the expectations that the Government and Corporation on the one side, and the Federation on the other, attach to the home scrap drive, though all protest its supreme importance.

Mr Strauss, however, deduces from this evidence that steel production this year will be lower than last year. The Federation has again expressed its confidence that the lower limit of the target set in this year's Economic Survey, 16 million tons, can be achieved. On the face of it the two views are not inconsistent; last year's output, after all, was nearly 16,300,000 tons. But it does appear that the Government and Corporation may be thinking in terms of an output

slightly below that forecast in the Survey. The margin is probably not beyond a reasonable range of error; and the difference has perhaps been somewhat exaggerated. The variance in conclusions from the same set of facts probably represents, on the one hand, the natural bullishness of the Federation, speaking for an industry that since the war has been able to confound the pessimists and, on the other hand, the bearishness of the Corporation, now entering upon responsibility for an industry it is as yet unable to control, coupled with the automatic anxiety that now besets any production department of the Government at the mention of raw materials. It does seem, however, that on the most sanguine estimates demand for steel by the end of this year will be exerting great pressure upon supplies and that the pattern of output may be changed as materials are diverted to Margam. Though all parties are reluctant to decide upon allocation, details of the least obstructive form for such a scheme are being carefully studied by all three.

* * *

How Much Scrap?

Nearly half the ferrous scrap used in steel-making in this country comes from within the steel industry itself. The "scrap cycle" as described in a recent issue of the British Iron and Steel Federation's *Statistical Bulletin*, is more complex than is generally realised. To begin at the steel furnace, every hundred tons of crude steel ingots and castings (together with two tons of imported ingots and semis) yield 74 tons of finished steel products and 25 tons of "circulating scrap" (the waste cut off the ingot in primary operations and returned to the furnace within a few hours); the remaining three tons consist of mill scale and irrecoverable losses. Of the 74 tons of finished steel, 13 are exported and thus lost for scrap recovery purposes, 11 return as "process scrap" from the steel-using industries, and one is lost. This leaves 49 tons for steel consumers at home, who export 12 tons in manufactured form. For every 37 tons retained for home use, about 17 tons of "capital scrap" (i.e., discarded plant and equipment) were returned to the

iron and steel industry last year. Total home scrap supplies, therefore, amounted to 53 tons for every 100 tons of ingots and castings produced; two tons of this go to the blast furnaces and 51, plus 12 tons of imported steel scrap, back into the steel furnace. About 30 tons of the final 63 tons come from within the steel industry.

Would a much larger return of scrap be possible? This question derives special importance from the shortage that now besets the steel industry owing to the decline of supplies from Western Germany. It is not easy to answer. It is

AMERICA'S THIRD

LARGEST INDUSTRY

The series on Hollywood, now appearing in six special instalments in Picture Post, makes an absorbing study of America's third largest — and most fantastic — industry. Interviews with stars: and would-be stars: a preview of the film which Chaplin considers to be "the best ever to come out of Hollywood": pictures which illustrate the intricate details of film-making: Hollywood's spectacular plans for the future: its finest achievements and most blatant vulgarities: all this and more is revealed in these frank and penetrating articles. As was expected, the series is arousing very great interest. But — however fascinating in itself — it is chiefly important to advertisers as yet another significant proof of Picture Post's great and ever-increasing popular appeal. And it is this distinctive character of Picture Post — popular yet responsible — which makes it the best of all possible backgrounds for creating public confidence and demand, in a mass market.

unlikely that returns of circulating and process scrap could be greatly increased. The return of only 17 tons of capital scrap for every 37 tons of steel retained at home may seem inadequate; but it must be remembered that present home consumption is more than twice the annual rate for 1926-35, when much of the steel now becoming available for scrap may have been incorporated into equipment. The life of steel products, of course, varies from the few months of a tin can, through the 5-10 years of a motor vehicle (at present artificially extended) to the 40 years or more of structural steel. Bearing in mind the irrecoverable losses, such as steel in ships lost at sea, in expended ammunition, and loss by rust and corrosion, it seems that a high proportion of the available home scrap is being secured, and it may be that not a great deal more is to be had—though the rate of return could usefully be accelerated in many cases. This conclusion, perhaps, lies behind the not wholly surprising omission, in the Federation's otherwise exhaustive survey, of any discussion whether economic incentives would bring out more scrap or bring it out faster.

* * * "M and G" General Trust Fund

Several features in the offer of units in the "M and G" General Trust Fund command attention. It is the first unit trust to seek and obtain a Stock Exchange quotation. It is the first offer of units for cash of a size to require and receive the consent of the Capital Issues Committee. And it marks a twenty-year anniversary of the first unit trust introduced in this country, by the same management. This last feature, indeed, explains the conversion offer that is made, concurrently with the cash offer, to unit holders of First British Fixed Trust, the fixed life of which comes to an end in June; at the same time, conversion offers are extended to holders of the Second, Third and Fourth British units, which terminate at various dates up to 1954. These conversion offers appear to be on very satisfactory terms, particularly as the trusts, as originally constituted, have been increasingly affected by nationalisation.

The yield on the new "M and G" units at the opening price of 20s. is put at 4½ per cent. The managers will have power to invest "in any security in respect of which permission to deal is effective on a recognised Stock Exchange in the United Kingdom." It will be conducted, in accordance with the long-standing policy of the Municipal and General Group, as a "cash fund" trust, as a result of which the benefits of advantageous dealing will accrue to the trust.

The experiment of Stock Exchange dealing will be watched with interest, not least by other unit trust managers. The market will be provided with units by the managers at a commission of one half per cent; jobbers will then be free to make their own price, and it should in general be narrower than the margin on which the managers would normally operate. Thus, a Stock Exchange quotation, though it gives an undoubted cachet to the units, may reduce the

opportunities open to the managers for dealing at their own quotation. Such competition should not be regarded merely as an act of abnegation on the managers' part; it may be that the volume of demand via the Stock Exchange will show considerable powers of expansion. At any rate, the experiment is timely, the operation well conceived, and the management highly esteemed. These are at least the right ingredients for attracting risk capital from the small saver.

* * * New Aluminium Agreement

The twenty-year agreement made by the Ministry of Supply at the end of last year with the Aluminum Company of Canada has now been replaced by a new agreement valid until 1974. In return for an additional sum of \$15 million, making a total loan of \$40 million by the British Government, the amount of aluminium metal received by the United Kingdom from Canada will be increased from 220,000 metric tons to 250,000 tons in 1952 and to 260,000 metric tons in 1953. A programme of expansion, to be partly financed by the British loan, was announced last week; it is to include new development in north-eastern Quebec which should result in increased output of ingots in a year's time, and also in British Columbia, which is likely to take about three years to come into production. The ingot capacity of the organisation will as a result eventually be increased by 150,000 metric tons to a total of more than 550,000 tons.

The Ministry of Supply decided that new arrangements were necessary primarily because supplies of aluminium scrap have not come up to expectation; indeed, the drive for scrap non-ferrous metal has produced inadequate results generally. The immediate postwar accumulation of aluminium scrap from discarded aeroplane bodies and engines is now probably exhausted and supplies are likely to be limited. The new agreement does not affect the quantity of virgin aluminium in prospect this year. For 1952 it means an increase of 30,000 metric tons and in 1953 of 40,000 metric tons. British ingot output was about 30,000 metric tons in 1950 and can be increased only marginally by a thousand tons or so. Norway is not likely in these years to be able to send to this country more than 15,000 tons, and supplies from elsewhere are doubtful. Thus some 295,000 metric tons of virgin aluminium should be available to the British fabricating industry in 1952 and over 300,000 tons in 1953. These amounts should be sufficient in 1952 and 1953 to meet both the needs of rearmament and the demands of all but inessential civilian manufacture; indeed, the Ministry expects to increase the monthly allocation later this year.

For twenty years from 1954 the new agreement provides for the Ministry of Supply to have first call on 250,000 metric tons instead of 200,000 tons. Thus after 1951 adequate supplies of aluminium should be forthcoming. Moreover by 1954 it is hoped that the proposed Norwegian plant at

Sunddalsöra will be ready with a capacity of 40,000 tons; this would double Norwegian capacity and the new plant will provide entirely for export trade in aluminium, in which Britain is Norway's biggest customer. These signs of expansion suggest that one shortage, at least, is on the way to being remedied. On the other hand, it was indicated at the annual meeting of the British Aluminium Company this week that no decision has yet been taken whether the joint British-Canadian project for aluminium production is going to be sited in the Gold Coast or in North Borneo.

* * * Penny on the Pint

It seems that the increase in the retail price of Guinness by 2d. per pint (following the wholesale increase of 12s. per barrel) is to be followed by increases in most other beers of one penny per pint. The publicans have long complained to the brewers that rising costs have been causing them hardship and that an increase in the retail gross margin is imperative if they are to make ends meet; since brewers' profits have been falling, this has virtually meant an increase in the retail price. The brewers have hitherto been bound by their undertaking to the Treasury not to raise the price of beer for twelve months following the 1950 Budget, which raised gravities by three degrees. London brewers have now, through the London Brewers' Council, agreed in principle to an increase of one penny, but have suggested an allocation to licensees from the total proceeds of 24s. per barrel (there are 288 pints in a barrel) less favourable than the 20s. understood to have been requested by the licensees, who have accordingly, through the London Central Board, expressed their dissatisfaction. Similar negotiations about the sharing of extra proceeds are taking place throughout the country, but they are unlikely to delay the general increase in prices.

Costs of brewing, as well as of retail distribution, have risen substantially since the end of the war. At the last annual meeting of Dutton's Blackburn Brewery it was stated that malt had increased between 1939 and 1950 from 64s. 1d. per qtr. to 161s. 7d., hops from 214s. 11d. per cwt. to 563s. 3d., sugar from 25s. per cwt. to 69s. 5d. and coal from 24s. 4d. per ton to 62s. 6d. Public monopolies such as the railways, or a private monopoly, may "justify" an increase in price by recounting its rising costs; industries working in competitive conditions cannot. The customer is not concerned with costs if he can easily buy elsewhere; and today pubs and beer must fight hard to keep their customers. Much as they may wish to help licensees, it is not wholly within the power of the brewers to fix the price of beer and ignore the consequences. An increase in price will affect sales. The secretary of the Licensed Victuallers' Defence League has spoken of "a slight fall in sales." But how "slight"? The Chancellor's estimate of revenue from the beer duty for 1951-52—£250 million—was 5 per cent less than the provisional receipts for 1950-51 of £262 million. If he assumed that the price of beer would remain unchanged, and that demand would continue its downward trend of the past five years, the increase of a penny a pint must be expected to reduce sales even further. Consumption has already fallen from 33.6 million bulk barrels in 1945-46 to 26.8 million in 1949-50; in the year ended March 31, 1951, it will probably have fallen below 26 million. The further 5 per cent fall expected by the Chancellor would alone mean a total consumption of no more than 25 million bulk barrels. An additional penny may increase both brewers' and licensees' earnings in the short run. Are the longer-term effects so certain?

* * * Sharp Rise in Bank Deposits

The clearing banks' statement for the four weeks to April 18th reveals a much sharper rise in bank deposits than

is customary in the first statement of the financial year. Net deposits have risen by nearly £111 million, the biggest April increase ever shown, in contrast with a rise of £76 million twelve months ago and one of £44 million in April, 1949. Rather unexpectedly, the whole of this increase in the rate of credit expansion was attributable to bigger Government requirements for credit. Partly for this reason, too much should not be read into the month's experience, for a period that spans the end of the nation's financial year is apt to be distorted by large movements in Government finance that do not conform to any definable pattern. The form in which the Governmental demands are reflected in bank assets this month was also distorted by special circumstances. Just before the banks' statements were made up, a flood of Government dividend payments and Milk Marketing Board disbursements had caused an unusual glut of liquid funds in the money market, and it was not until the following day that the Bank of England began to mop up this by "reverse" sales of bills to the banks and the discount market. Had the statements been made up on the following day, much of the £30 million rise in cash reserves, shown in the latest statement, would have swollen the banks' holdings of call money, Treasury bills and Treasury deposit receipts instead; even as it is, these assets expanded by nearly £70 million in the four weeks, so that the Exchequer's total borrowing on floating debt from the banking system (including the Bank of England) seems to have risen by £100 million, compared with only £34 million in the equivalent period of 1950.

By contrast to the experience of recent months, bank advances rose during the month by only £12 million, against nearly £37 million last year and £15 million in 1949. It is true that last year's rise was inflated by exceptionally heavy borrowing by the British Electricity Authority, in anticipation of the floating of its market issue. But the comparative stability of advances last month, even though it is in line with seasonal tendencies, is hard to reconcile with the rising needs for the finance of costly imports. Taken in conjunction with the increase in Government borrowing, it must be regarded as an unexpected, and possibly temporary, aberration from the banking trend that has been discernible ever since Britain's surplus on external account drained away into deficit at the beginning of 1951.

* * * Liner Company Results

Recent statements from the chairmen of leading shipping companies underline the diverse experience of various liner trades in present conditions. They tend to emphasise the danger of depending too much on the apparent implications of a single pointer such as a general index of tramp freight rates. The Cunard group, for example, although it has interests in other trades, is largely concerned in trans-Atlantic business, in which it is now beginning to suffer from the "historic result of devaluation"—rising costs. These had not taken full effect during 1950, so that the operating surplus was larger than in 1949, although taxation absorbed practically all the increase. To judge from the results of the first quarter of this year, however, 1950 will probably prove to have been a peak year. On the other hand, Elder Dempster Lines, which is engaged chiefly in the West African trade, suffered a decline of about 20 per cent in voyage results. This was caused partly by increased operating costs, but principally by the expensive delays incurred in the main ports. The group also incurred high costs in taking tramp tonnage on time charter to supplement its normal liner services—made necessary by the continuing development of the West African territories, which appears to be outstripping the capacity of the available terminal facilities.

Reduced earnings in 1950 have been reported also by Royal Mail Lines, but this resulted primarily from another

obstacle with which shipowners in many trades have to contend—the disruption of a normal flow of trade caused by mismanagement in bulk buying. The cessation of meat imports from South America rendered idle many of the costly refrigerated liners specially constructed for this staple import. Similarly, in the timber trade, the Currie Line was adversely affected last year by the refusal of the timber control to accept normal market trends. In that case, however, the Government was forced eventually to pay formidable time charter rates in order to avoid a complete stoppage of imports.

While the experiences of the liner companies have thus varied widely during 1950, certain factors have had effects common to all. The greatest of these common problems is the financing of replacement of tonnage, now becoming obsolescent, at prices that show no prospect of remaining stable. The Orient Line, for example, is about to take delivery of a passenger liner that cost more than £3,000,000; but a similar liner that has just been ordered will cost about £1,000,000 more. The Cunard fleet, which now stands in the accounts at a book value of about £29 million, would cost at least £120 million to replace at current prices. It is hardly surprising that the shipping industry should be seriously perturbed at the proposal of the Chancellor of the Exchequer to abolish the 40 per cent initial depreciation allowances next year.

* * *

Shipbuilding Output

Merchant ships under construction in the world at the end of March, according to the returns published by Lloyd's Register of Shipping, amounted to 5,097,084 tons gross, an increase of 278,331 tons compared with the figures for the previous quarter. In neither case were figures available from Russia, Poland or China, and most of the increase is accounted for by full information from Japan, figures for which were incomplete three months ago. At the beginning of the year 231,350 tons gross were attributed to Japan, whereas the current figure is 479,610 tons. Shipbuilding in Germany has increased by 63,775 tons to 261,285 tons, while both France and the United Kingdom show increases of just over 28,000 tons during the quarter. France and Japan are now the biggest shipbuilding countries outside the United Kingdom, but large orders have since been placed in Germany as a result of the removal of practically all restrictions on shipbuilding in that country.

In the United Kingdom progress during the quarter was at a rather lower rate than in the previous quarter, although higher than in the same quarter a year ago. Taking the average for the last four quarters, however, it is apparent that a steady cycle of production is being maintained at just over 1,300,000 tons gross per annum started, launched and completed. The proportion of tankers under construction continues at slightly more than 55 per cent of the total, and 36 per cent of the total is for export, nearly half of it for Norway. Of the total under construction in the world, 1,332,657 tons are for registry in Britain, 678,610 tons for Norway, 597,024 tons for France, 416,580 tons for Japan, 285,299 tons for Italy, 266,676 tons for the United States and 230,042 tons for Germany; of these countries only Norway and France have ships being built outside their own territories.

Merchant shipbuilding orders received in the United Kingdom during the quarter reached an extremely high level. According to the Shipbuilding Conference they amounted to more than 1,500,000 tons gross, over three times the total for the whole of 1949. The removal of the initial depreciation allowances, however, will adversely affect British shipowners' ability to order further replacement tonnage. This factor will not affect foreign shipowners, who have contracted for one-third of the new tonnage ordered from British yards during the last quarter. The total order book

of the British shipbuilding industry now amounts to 5,000,000 tons gross, of an estimated value of £435 million; two-thirds of this total still remains to be laid down. Nearly 60 per cent of the work on order consists of tankers; this predominance of tankers was maintained in the orders booked in the last quarter, despite the increase in the number of orders for dry-cargo liners and tramps.

* * *

Superphosphate Supplies

A new fertiliser factory built by Fisons, Ltd., opened last week, the first in this country for the production of triple superphosphate. It has an annual capacity of 120,000 tons, but there is no prospect of its working to this capacity until supplies of sulphuric acid improve. The factory would need about 30,000 tons of natural sulphur a year: the industry is receiving enough to permit production only at 62.5 per cent of capacity.

The total output of superphosphates had been running at about one million tons a year, but since last September the industry has borne the brunt of the cuts in sulphuric acid. Easing of sulphur supplies has brought it no more than an assurance that for the present its allocation will be cut no further. Production in the 1950-51 season (which started in July) is not likely to exceed 800,000 tons. Consumption during the 1949-50 season was nearly 1,250,000 tons and the removal of part of the subsidy last July did not appear to have much effect on farmers' purchases during the remainder of the year. In order to meet demand, the Board of Trade last year planned to import about 283,000 tons of superphosphate between last July and June this year; up to the end of March, about 212,500 tons had been brought in. There should be no difficulty in obtaining the remaining 70,500 tons within the prescribed time, since average monthly imports have recently been exceeding 40,000 tons, and in March nearly 47,000 tons were brought in. But production on the continent, the main source of imports, is also affected by scarcity of sulphuric acid; if British fertiliser production remains at its present level, it may prove more difficult to continue to supplement home supplies with imports during the 1951-52 season.

Consumption next season, however, may be considerably lower. The second half of the fertiliser subsidy is due to be removed in July and this, combined with the rising cost of production, is expected to lead to a sharp increase in prices. The cost of sulphur is rising rapidly and the freight charges on phosphate rock have nearly trebled. New prices have yet to be negotiated, but some members of the industry expect them to be high enough to check consumption. Against this there is the change in farming practice that has led to a much greater dependence on fertilisers, and the need to stimulate grassland, which in turn increases the demand for superphosphates.

A further element of uncertainty is introduced by the success of recent experiments using nitric in place of sulphuric acid. With the addition of some new plant, existing fertiliser factories might be converted to these processes; that developed by Imperial Chemical Industries gives a product that contains nitrogen as well as phosphates. ICI at present produces no superphosphates and the company's entry into this field could mean strong competition for existing producers. These experiments, therefore, are being closely watched by the superphosphate producers.

Backroom Boy with a bucksaw Although his name never appears Halloran is one of the most important contributors to the newspapers. In fact, it is on his bucksaw that the publication of the newspaper depends. For Barney Halloran* is a Newfoundland logger, on the pay roll of the largest paper mill in the world — Bowater's at Corner Brook. His job is to fell and cut the trees into four foot logs, using the length of his bucksaw as a measure. They are then ready for the journey to Corner Brook by sleigh, truck, train, ship or most usual of all, floating down by river, there to be pulped and processed into newsprint. Halloran stands five foot eleven in his socks, and weighs 200 pounds, according to the Medical Officer who runs the foot rule over every logger at the start of the season. According to the camp cook, his appetite is built in proportion! "He'd eat a cow between two biscuits." But Barney just smiles tolerantly, knowing that a logger without an appetite is as useless as an axe without a handle.

Seven New Festival Trains TO AND FROM LONDON

These expresses, linking Festival Centres, incorporate the latest advances in comfort and convenience resulting from research and application of new techniques on your Railways. They are the first of many new trains now building. All steel construction has been used in restaurant cars, open-seating saloons, and compartment carriages. Seats can be reserved on each train.

BRITISH RAILWAYS

Busiest Railway System in the world

exported during the period, compared with 102,280 cars and chassis in the preceding quarter. Supplies of sheet steel were cut by 20 per cent from the beginning of the year, and output during February was down to little more than 40,000 cars and chassis, 11 per cent lower than average monthly production at the end of 1950. Output has not yet fallen by the full extent of the steel cuts, because it has been possible in many cases to switch production from complete cars to chassis; there has been no difficulty so far in obtaining in local markets the sheet needed to build bodies for these chassis. Only a small proportion of the scarce non-ferrous metals are used in the chassis; hence, given a small decline in total production, the shortage, for example, of zinc of die-casting quality, has not limited chassis output.

Among the big manufacturers, Vauxhall Motors is still on a four-day week and the Rootes factories are soon expected to start short-time working. The Austin Motor Company, on the other hand, returned to normal working within a week of the imposition of the steel cuts, even though lack of stocks and uncertain deliveries of materials have forced its factories to work on a day-to-day basis. The Morris factories, with one small exception, have returned to normal working after dismissing a few men; the Ford plant has throughout been working normally, doubtless helped by the fact that model changes were being made that would in any case have restricted output. The Standard company has also continued to produce at its normal rate of 600 vehicles a day, though this has been achieved to some extent by increasing the ratio of tractor to car production. Each tractor takes roughly a third of the quantity of scarce materials needed for a passenger car, and the marked increase in tractor exports in the past months suggests that other tractor-producing motor companies are working on similar lines. In the first quarter of the year, 26,724 tractors were exported, compared with a total of 83,939 for the whole of 1950.

The industry does not yet know how big a cut is likely to be made in its supply of alloy steels. These are used extensively in engines and chassis frames; any reduction in supplies may therefore bring about the proportionate fall in the industry's output that ingenuity has averted so far. The cut is not, however, expected to be large.

Private Power Plants

Discussions are about to begin between the British Electricity Authority and the Federation of British Industries concerning a further extension of the waiver upon conditions in the Authority's power supply contracts with certain industrial users that preclude the use of private generating plant except during electricity cuts. These conditions upon the supply of power have not been enforced since 1947, when installation of independent factory generating plant was encouraged by the Ministry of Fuel and Power following the fuel crisis. The Authority has waived them until March 31, 1956. But the removal of the initial allowances for new capital equipment from next April would mean that fuel saving plant that might not be allowed to be used for more than four years would obviously become uneconomical to install. Arrangements are therefore being sought to extend the concession further.

Much of this equipment does save fuel—particularly in industries using process steam. The installation of a back-pressure turbine between the boiler and the heating or process steam system almost automatically generates power with a greater thermal efficiency than the best generating station, simply because the heat in the exhaust steam is utilised; in practice such a measure of re-equipment usually becomes worth while as and when the boiler installation has to be renewed. The same is not necessarily true of small diesel generating plant, though for standby purposes this offers an alternative source of power relying upon a fuel that, for a time at least, is less likely to

become scarce. The turbines, for many industries, are a good commercial proposition, and the diesel plant may at any rate save the interruption of continuous industrial processes. The BEA's opposition to certain installations in the past, manifested in the negotiation of the prices at which it supplies power to the factories at some times and receives it from them at others, in many cases has probably reflected the traditional insularity of the electricity supply industry. But at least in some cases the industrial consumers concerned have sought to buy supplementary power from the authority at the hours of peak load for the same price as they expected to pass it into the grid during off-peak hours; this might be good business for them but not for the BEA. The BEA does not as a rule emphasise the principle that power prices should be based upon the relative cost at the time of consumption; when it does so, it should not be cast as the villain of the piece.

* * *

Meat Ration Secured

Britain's meat supplies during the next three vital months at last seem secure. The large home killings during April and May will enable stocks of imported meat to be built up. But because of the serious delay in shipments from Australia and New Zealand stocks would not have been sufficient to maintain even the eightpenny ration until August or September when the bulk of home-produced meat will be available. The Argentine agreement has provided Britain with 200,000 tons of carcase meat during the next twelve months, though it is still uncertain whether any sizeable quantity will arrive within the next six weeks. The new agreement with Uruguay, however, concluded last weekend, has saved the situation.

Uruguay stopped shipments to Britain last August when this country refused to pay £97 a ton for supplies in 1950-51. Now the Ministry of Food has agreed to pay the same prices as for Argentine meat—an average of £128 12s. a ton in addition to a retrospective payment for supplies shipped after September, 1949. The actual quantity of meat covered by the agreement has not been disclosed. It is certain to be small and probably not more than 60,000 tons. But Uruguay has agreed to ship immediately even though final agreement about adjustments of prices and the period of the contract has still to be reached.

Binding Cases

Binding cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 26 issues and the half-yearly Index; that for RECORDS & STATISTICS will hold 52 issues. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.,

(Dept. E), 84 Newman St., London, W.1.

A binding case can be sent on approval, if required.

Course of Production

The official index of industrial production for February, and the estimate for March, suggest that the first quarter of this year will show an increase of slightly over three per cent compared with the first quarter of last year, and almost exactly three per cent compared with the 1950 average. The quarter is not entirely comparable, owing to the fact that Easter fell in March: February's figure is seven per cent higher than February, 1950, and according to the official index equal to that of November last year. Production at the February level throughout the year would provide the four per cent increase assumed in the *Economic Survey* for this year. The "B"

series of the London and Cambridge index of production, however, shows production in February as only five per cent higher than in the same month last year, and two points lower than in November.

The time-lag in compilation makes it impossible to draw much information from the indices concerning the recent performance of particular industries. In the official index, manufacturing production in February showed an increase of

8 per cent, compared with a 6 per cent increase in January; and building and contracting had recovered from the exceptionally bad weather conditions of January. In the London and Cambridge index, the "motors, cycles and aircraft" group showed a fairly sharp drop compared with January, and was lower than a year before; the "chemical and allied trades" group recovered almost to its highest levels last autumn, and the textile industries also rose compared with January, though not quite to the levels of last October and November.

Shorter Notes

The Standard Motor Company has been asked by the Ministry of Supply to examine the possibility of building the Rolls-Royce Avon jet engine, either in a new factory which would be built on the company's site at Coventry or in a building provided by the Ministry. Large orders have recently been placed for this engine; Rolls-Royce Ltd. is building one new factory for Avons and re-tooling another and three other aircraft manufacturers are putting down assembly lines for its production. The fact that a motor manufacturing concern has been approached to build jet engines suggests that the full engine programme is now thought to be beyond even the large capacity of the British aircraft industry. It seems probable that British manufacturers will be asked to supply engines for aircraft built in Nato countries, in particular the Avon, which has not been licensed for manufacture abroad.

*

United Molasses have recommended a final dividend of 6½ per cent, tax free, payable on the ordinary capital as increased in February by a 100 per scrip bonus issue to £3,909,000. The total distribution for 1950 is equivalent to 43.81 per cent gross on the original capital of £1,954,500 against a payment of 27½ per cent gross and a tax-free distribution of 2½ per cent in 1949. Total profits of the group, which includes Anchor Line, have jumped from £2,238,633 to £3,643,644 and £619,994, against £355,997, has been added to reserves and carry forward.

*

Cammell Laird.—The low yield on the 5s. ordinary stock units of Cammell Laird of £3 16s. per cent. at the current price of 15s. 9d. is more a reflection of investors' hopes that the company will distribute some part of the compensation received for its holdings in English Steel than of immediate dividend prospects aroused by the latest figures. Total profits have fallen from £1,256,529 to £1,195,309, but net profits are up from £436,976 to £465,299, since certain special provisions made in 1949 are not repeated. Ordinary shareholders (who received a 100 per cent bonus issue in June, 1949) are to receive a final ordinary dividend of 9 per cent, making a total payment of 12 per cent, against 9½ per cent. Distributable earnings provide ample cover for the dividend and the company will not be mulcted in additional profits tax on preference dividends, since

	Years to Dec. 31,

Ordinary capital	3,550,000	3,550,000

5s. ordinary stock at 15s. 9d. yields £3 16s. per cent.

it has only one class of share capital. On the intriguing question of the compensation received for Cammell Laird's holdings in English Steel, the contrast between the end-year book value of £819,389 and the payment of £6,827,396 (equivalent to 9s. 7d. per 5s. stock unit) still stands; but no hint on what will be done is given in the latest accounts

beyond the mere recording of the transfer of the English Steel holdings.

Little major change is apparent in Cammell Laird's latest balance sheet. Liquid resources have been slightly strengthened; "quick" assets now total £5,458,632, against £5,195,506. Stocks and work in progress are entered at £9,775,244, against £8,692,385, while instalments received on account of work in progress are shown at £9,793,216, against £8,455,988. Capital reserves have risen by £499,846, representing a bonus issue by Metropolitan-Cammell Carriage and Wagon. This associate company of Cammell Laird has enjoyed a very successful year, with a rise in the trading account balance from £1,001,276 to £1,691,517.

Cammell Laird's order book should be full for some time to come on civil and defence work; and a yield of £3 16s. may not extravagantly discount what lies in store.

*

London Brick.—The most serious problem facing the brick industry, even for such highly mechanised concerns as London Brick, is probably the shortage of labour. London Brick's approach to the problem is marked by a comment in the report which attributes the increase in production and deliveries of bricks last year to "progress in the scheme of increased mechanisation, together with improved labour supplies." Greater production is reflected in the rise of group trading profits from £845,168 to £1,055,498. The company has maintained the ordinary dividend at a rate of 15 per cent, but this is paid on the increased capital of £2,600,000. The earnings cover has also risen, despite the appropriation of £126,659 to a reserve for deferred liability arising from initial allowances over and above the heavier tax provision of £367,264, against £353,270.

Net additions to fixed capital assets amounted to £718,422 in the year. This includes the cost of a brickworks at Bletchley; in November the whole of the property of Bletchley Fletton was sold to London Brick for £110,000. A greater part of this

£1 ordinary stock at 50s. 6d. yields £3 1s. per cent.

capital expenditure reflects further progress in mechanisation to overcome labour shortages. The pace will not slacken this year, for outstanding capital contracts are estimated at £500,000. Cash and other quick assets, which have risen from £1,042,122 to £1,281,184 in a year of heavy capital expenditures, should provide a sufficient means for meeting any strain on financial resources caused by the capital programme. The addition of £350,000 to the share premium account, which now stands at £550,000, represents the premium received from the issue of 350,000 £1 ordinary shares at 40s.

Not only will immediate demands for bricks have to be met this year, but some effort will have also to be made to build up stocks so seriously depleted last year; the government have asked for an output of between 7,000 and 8,000 million bricks in 1951, a target which may prove difficult to hit. London Brick will have its full part to play; and as some progress has been made in solving the problem of labour shortages, the prospects for the firm—and for equity holders—appear good so long as manufacturing costs can be kept under close control.

Cunard Steamship.—The immediate satisfaction felt by ordinary shareholders with the rise in Cunard's operating surplus from £3,894,708 to £10,780,750 has been somewhat damped by the chairman's cautious statement that the indications are that 1950 is likely to have been a peak year. The benefits gained from devaluation are now being swallowed up by rising costs. The volume of transatlantic passenger traffic was well maintained in the year, but was affected by international crises. While devaluation gave a fillip to westbound Atlantic cargo traffic, the eastbound flow was small, and higher freight rates were needed to meet higher handling costs. In trading to India and Australasia, high rates for chartering ships and the slow turn-round led to increased operating costs. The chairman, however, is not unduly disturbed by the prospects of a lower operating surplus in 1951, and equity shareholders will no doubt draw consolation from the fact that the dividend was raised from 10 per cent to 12½ per cent in the knowledge of this possibility.

The most serious problem confronting Cunard is the replacement of tonnage. The charge for depreciation of £2,512,776, against £2,445,203, is described by the chairman, Mr F. A. Bates, as "no better than notional being based on the original but now unrealistic first cost." The company continues to add to reserves to supplement the depreciation provision—£1,250,000, against

£1,000,000, was put to reserves and £1,244,862, against £1,406,215, was retained by subsidiaries in 1950—but "the tax computation has not yet been revised to meet the new replacement factors." Outstanding contracts for new ships are estimated at £3,200,000 and five ships of between 8,000 and 9,000 gross tons are on the stocks. To meet these immediate capital outlays, the company's liquid resources appear adequate; the fall in cash from £17,481,405 to £10,662,587 has, for example, been largely

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 29, 1951, total ordinary revenue was £76,174,000 against ordinary expenditure of £51,280,000 and issues to sinking funds £140,000. Thus, including sinking fund allocations of £480,000 the deficit accrued since April 1, 1951, is £871,000 compared with a deficit of £212,000 for the corresponding period of the previous year.

On April 27th applications for 91 day bills to be paid from April 30 to May 5, 1951, were accepted dated Monday to Saturday as to about 48 per cent. at 99 17s. 5d. and applications at higher prices were accepted in full. Treasury Bills to a maximum of £240 million are being offered for May 4th. For the week ending May 5th the banks will not be asked for Treasury deposits.

COMPANY MEETINGS

FORD MOTOR COMPANY, LIMITED

RECORD PRODUCTION AND EXPORT SALES

PROGRESS OF DEVELOPMENT PROGRAMMES

IMPACT OF WORLD REARMAMENT ON FUTURE OPERATIONS

SIR ROWLAND SMITH ON THE ACHIEVEMENTS

The twenty-second annual general meeting of Ford Motor Company, Limited, was held on May 2nd at Grosvenor House (Park Suite), Park Lane, London, W.1, Sir Rowland Smith, M.I.Mech.E. (the chairman), presiding.

The secretary (Mr J. M. A. Smith, A.C.A.) read the notice convening the meeting and Mr F. Pragnell, F.C.A., of Messrs Mellors Basden and Mellors, read the report of his firm.

The following is the chairman's statement which had been circulated with the report and accounts for the year to December 31, 1950:—

Following the precedent already established this statement is sent to you with the directors' annual report and accounts.

For us 1950 was a notable year, inasmuch as we exported more units than any other motor manufacturer in this country.

Production expanded substantially despite supply difficulties and major changes in factory layout necessitated by the commencement of manufacture of our new cars; our record production of 185,138 vehicles and tractors was 21 per cent. above the average level of the past two years.

A FINE ACHIEVEMENT

While strictly adhering to the Government home market quotas, 82.9 per cent. of cars and 69 per cent. of commercial vehicles sold went overseas; so also did 77.8 per cent. of tractors. In all, 146,099 units were exported, which, together with service parts, totalled £1,300,000, 64 per cent. better than our previous best achievement in 1949. Our exports to Canada and the United States produced over \$16,000,000. I am sure that you will wish me to thank our employees at all levels, from the men on the shop floor to the most senior executives, for their share in this fine achievement.

Prices of our products established in December, 1949, remained unchanged throughout the year. A 12.1 per cent. profit before tax (compared with 9.2 per cent. in 1949) on our record turnover of £64,750,000 yielded £7,816,796, after providing £1,200,000 for expansion of employees' pension and benevolent fund benefits. Of this profit 57.2 per cent. was for tax, 34 per cent. was ploughed back, and 8.8 per cent. is for dividend.

This dividend is at the rate of 12½ per cent. on the ordinary capital, a slight increase on the dividend paid during the past four years, which we believe to be reasonable having regard to the requirements of the business and public policy.

The 1950 profits resulted from exceptional production, and particularly from the consequent spread of overhead. It is now evident that such profits are unlikely to be repeated in 1951, a year during which we have to experience the introductory stages of our new models, substantial further changes in layout and shortages of sheet steel and other materials. It was in fact in anticipation of these coming adverse factors that we aimed at a high profit in 1950.

STIMULATED DEMAND FOR PRODUCTS

It is clear that during 1950 the rising level of world-wide economic activity stimulated the demand for motor products. In this country we reaped the benefit of the relatively stable costs and prices of the past few years, and sterling devaluation in the latter part of 1949 gave a further price advantage and impetus to export sales. Our company, with the good value it offered, participated to the full in this favourable situation, and we secured over 23 per cent. of United Kingdom exports of automobiles and tractors. Our output, though a record, would have been considerably greater had it not been for the restraint upon increased production imposed by restricted sheet steel supply.

The international political situation which developed during the latter part of 1950, and the inflationary trends which followed in its wake, caused a further stimulus to export sales. Many who feared an interruption of supplies took steps to replace articles which experience had shown to be scarce under such conditions, and cars, trucks and tractors were high on their lists.

OVERSEAS ACTIVITIES

Australia and Canada have dominated our export markets; next in importance were Republic of Ireland, Sweden and South Africa. Sweden's high place was largely due to the abolition of import licensing. In Europe generally keen competition was felt from both France and Germany, and this is likely to increase substantially in the near future. In Canada our sales more than trebled—18,749 units.

Tractor exports were maintained at a high level, 32,733 being shipped overseas, against 25,160 in 1949.

Two aspects of our export business have assumed special and increasing importance. During the year arrangements were made for the assembly of our vehicles in Brazil and Holland, while Australia, Egypt and South Africa began to assemble our tractors, making a total of twelve assembly points in all. These developments were dictated by considerations of relative freights, duties, etc., with the purpose of making our products available at the lowest cost and price in foreign markets. Secondly, our export spare parts sales have increased substantially, the inevitable result of greatly expanded post-war shipments, and this trend should continue.

Again in 1950 the Government permitted only a dangerously low supply of cars and commercial vehicles into the home market. In consequence the system of covenant on new cars has been strengthened so as to discourage speculation.

The shortage of vehicles in this country has placed a special responsibility on us and on our dealer organisation to provide complete and prompt service facilities, including reconditioned engines and parts, and their response has added to the fine reputation of Ford service.

The home market has been fully competitive only for tractors, and our position has been maintained. During 1950 we introduced a tractor engine reconditioning

scheme which enables farmers anywhere in the country to replace their engine units economically and maintain their operations without interruption.

INTRODUCTION OF "CONSUL" AND "ZEPHYR SIX"

As I have indicated, preparation for manufacture of the new cars went ahead concurrently with production of our existing range of vehicles. A new assembly line was built, involving intricate new factory layouts and the installation of many new machines. By a really magnificent piece of teamwork by all concerned it was possible to drive the first completed new car off the line on January 1st of this year, the target day which we had set ourselves many months before. The cars are now in production, the Consul in rising volume, and the Zephyr Six as yet only beginning. These cars had an outstanding reception at the Motor Show last October. It is, of course, for the public to pass judgment on them in operation. After extensive tests carried out under extreme conditions—sub-arctic in Scandinavia, mountaineering in Switzerland, and grilling in the Sudan—I am satisfied that they are outstanding in power, economy, safety, road holding, steering, visibility and all the things which go to the making of fine all-round vehicles.

We now have a balanced passenger car range in the Anglia, Prefect, Consul and Zephyr Six.

DEVELOPMENT OF MANUFACTURING OPERATIONS

Over £3½ million have been spent on tooling and development of the Consul and Zephyr Six. In addition, heavy expenditure has been incurred in the rearrangement and reallocation of other manufacturing operations to enable an efficient high volume production line to be set up for these models.

Other development programmes are progressing well. Apart from tooling of the new cars, capital expenditure during 1950 amounted to over £2 million, and a further expenditure of some £8 million is envisaged during the next three years. The forward plans of your company are continually under review by the directors

Recently, we have heard from the Chancellor of the Exchequer that some falling off in exports is inevitable among those industries, including our own, which may be most concerned with defence. We are indebted to our friends in the steel industry for their fine production achievements and co-operation with us in our difficulties, but unfortunately we have now been notified of seriously reduced allocations of sheet steel compared with last year. Other important supplies have also been affected.

Notwithstanding reduction in sheet steel supplies, we are told that export must be maintained to the fullest possible extent, which means that domestic supplies will be reduced to a level which seriously threatens the efficiency and safety of our road transport system.

While accepting in principle that defence must have priority, the reduction in our sheet steel supplies appears more than is necessary at this moment. Each ton of sheet steel diverted from the motor industry means, when converted into terms of motor cars, a heavy loss of export earnings. In particular we recognise the importance of dollar exports as the means of payment for many essential defence materials.

It is regrettable that conditions today are such that we, in common with others, once again may have to divert some of our energies from the making of normal peacetime products to defence requirements, but you can be assured that your company will again play its full part in this national effort.

PROBLEM OF RISING COSTS

Costs of our essential imported materials have risen steeply since the middle of 1950. The index of raw material imports into this country rose during 1950 from 134 to 195; during that period the wholesale price of rubber rose by 265 per cent., and of non-ferrous metals by 60 per cent. There was some time lag in the impact of these costs upon us, and we were able to defer increasing prices until early this year, when we were forced to put them up by a modest 2½ per cent. to 10 per cent., according to model. We look forward to the more rational allocation of world resources which may result from the deliberations of the raw material committees now sitting in Washington, but it is probably too much to hope that our present prices can be maintained indefinitely in the face of world-wide inflationary pressure.

Mr Ernest R. Breech, executive vice-president and director of the American Ford Company and well known for his work as a former member of the Anglo-American Council on Productivity, together with Mr Arthur J. Wieland, general manager of Ford International Division of the American company, were appointed to the board during the year, and now come up for re-election. Both these gentlemen bring with them a wide experience, which will be of great value to your company.

Mr Graeme K. Howard has resigned from the board.

In conclusion, while again paying tribute to the efforts which have made last year's achievements possible, I wish to assure you that the company is going forward with good heart to meet the more difficult times which lie ahead.

The report and accounts were adopted and the dividend of 12½ per cent. (less income tax) on the Ordinary stock and shares was approved.

The retiring directors, Mr Henry Ford II, Sir Rowland Smith, M.I.Mech.E., The Rt. Hon. Lord Perry of Stock Harvard, K.B.E., LL.D., Mr Ernest R. Breech and Mr Arthur J. Wieland, were re-elected.

The proceedings terminated with a hearty vote of thanks to the chairman, directors and employees.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

RECORD PRODUCTION AND TURNOVER MR HAROLD ST. J. JUDD'S STATEMENT

The thirty-eighth annual general meeting of the United Glass Bottle Manufacturers, Limited, will be held on May 24th in London.

The following is an extract from the statement of the chairman, Mr Harold St. J. Judd, circulated with the report and accounts:—

The consolidated profit and loss account opens with the group trading profit of £1,386,600, which exceeds that for 1949 by £71,000. From this, increased deductions result in the group profit before taxation being, at £998,440, £2,000 in excess of that for 1949. The provision of £548,070 for taxation on profit for the year is calculated in the light of the recent Budget and absorbs more than 54 per cent. of the group profit.

The net group profit at £479,390 shows an increase over that for 1949 of £5,000. The holding company profit for the year is £415,226 and exceeds the previous year's profit by £25,000. From the balance of profit available the board have set aside to general reserve £150,000, bringing that reserve to a total of £1,000,000, and to staff benevolent account £20,000, increasing that item to a total of £150,000.

The board recommend a final dividend of 5 per cent., less income-tax, making a total of 17½ per cent. for the year, as compared with a total of 15 per cent. paid for the previous year. The credit balance carried to the holding company balance-sheet is therefore £300,265; similarly the balance carried to the consolidated balance-sheet is £403,585.

PRODUCTION—SALES AND RISING COSTS

The group production and turnover for 1950 again reached higher figures than in any previous year, sales having climbed to a total of over 1,250 million articles. To deal with such output is no mean task considering this automatic machine production cannot escape the necessity for each individual article to be handled in the processes of inspection and packaging.

Our main production, consisting of a great variety of glass containers, earned appreciably less profit during the year under review as compared with the previous year because costs rose at a much more rapid rate than it was possible to adjust selling prices or to meet the rise out of increased turnover and efficiency. This condition was largely corrected by selling price adjustments in the early part of the current year, but is again of necessity under review owing to the recent increase in freight rates, petrol, etc.

The effect of any marked increase in transport charges is most pronounced, measured by the fact that our main factories alone handle inwards and outwards, mostly by rail, of the order of 650,000 tons per annum of materials and finished products. As an offset to the rising costs we were able to well maintain our group profit by the good results attained from our activities other than the bottle section.

Last year I referred to the average price increase applying to glass containers which was approximately 47 per cent. over prices prevailing in 1939 and that figure now totals only approximately 55 per cent. whereas our cost increases run in the 100's per cent. since 1939. Having regard to the purposes served by most of our production, we have kept our selling prices as low as possible, hence the moderate percentage increase in these prices as compared with the much higher rate we have to pay for all materials, equipment and services.

ACQUISITION OF ENGINEERING WORKS

Although our factories are well equipped with machine shops and latest types of machine tools, we have always found it necessary to contract out a certain amount of specialised machinery construction and reconditioning. With the tremendous growth of mechanisation in our factories this outside machine work has assumed great importance to the continuity of our production.

A large amount of this precision engineering work is carried out by Messrs Dilworth and Carr, Limited, Bow Lane, Preston, Lancs, and as an opportunity arose to acquire the shares of this company, after careful deliberation your board decided to purchase the full shareholding, the deal having been completed in June, 1950, and financed from our current funds.

It is the policy of your board not to in any way disturb the activities of Messrs Dilworth and Carr. We shall continue to place our quota of work with them and all other customers' requirements will be catered for as in the past. We consider the investment modest and sound, with the double advantage of every prospect of a reasonable return on the capital invested and the assurance that certain of our essential engineering work will be carried out.

EXPANSION

In my last statement I outlined a plan of expansion at our factory most suitable for the purpose, this being the Charlton-London factory. As our negotiations proceeded to secure the necessary building licence, after considerable delay it became evident that the Government Departments concerned would not grant a licence covering the projected extension to the main factory building. After the exercise of considerable engineering ingenuity we produced a compromise plan whereby the furnace extensions were fitted into the existing factory building.

This still left the absolute necessity for a new warehouse building which was already very much needed and essential to handle any additional production. We were eventually granted a licence for this building which is well on the way to completion and about 40 per cent. of the expanded output is already in successful operation, the remainder due for completion early next year. Even though the capital expenditure would have been much greater, from a manufacturing standpoint the original scheme would have been preferable, but the present plan will give the same amount of additional production and should well serve its purpose for many years to come.

THE FUTURE

So far this year augurs very well, in view of the fact that sales and production have increased and the balance of unexecuted orders is greater than ever before at this time of the year for both home and export markets. Considering the march of events it becomes more difficult than ever to predict future results on any specific basis, particularly considering the trend of rising costs, which, as already stated, oft-times have to be borne by the company pending selling price adjustments.

I have, however, every confidence in our company maintaining its position, so long as industry generally survives whatever ordeals the future may have in store. After patient effort the company has been built up on sound and well-organised lines, with a resiliency capable of meeting most of the impacts which are liable to be encountered.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

DEVALUATION AND SHIP REPLACEMENT COSTS

MR F. A. BATES' STATEMENT

Mr F. A. Bates, chairman of the company in a statement to stockholders for submission at the seventy-fourth annual meeting to be held on May 23rd, says:

On July 4th (Independence Day) 1840, sailed the *Britannia* from Liverpool on her maiden voyage, with Samuel Cunard on board, leaving his partners George Burns and David MacIver to watch the sailing from the dock side. So began the company's Atlantic service. *Britannia* was the ship whose lounge was described by Charles Dickens as "having at the upper end a melancholy stove, at which three or four chilly stewards were warming their hands." From that beginning and that first ship—a sea queen of her day—has sprung the company's present fleet, so different, except in the unchanging Cunard spirit, from the standards of Dickens' description. Nor was he the only one of the great authors of last century to leave some record, critical or otherwise, of their voyages in our ships. Readers of Mark Twain will remember that he also "had a go." It is touches such as these from the brush of history which colour the background of the Cunard stage and mark the 1951 viewpoint of the company's progress.

BOARD AND MANAGEMENT

Where there is progress there must always be change, but with change comes renewal from the strong reserves of experience. It is with this thought that I refer to the death last November of Lord Royden, who remained an active director and a staunch contributor in all the board's deliberations to the last day of his life. He served on the board for 45 years and had been chairman for a period of eight years following the first War. His bequest to his colleagues is a great fund of experience and the memory of a long life devoted to the welfare and interests of our company.

At the end of December last, Mr S. J. Lister decided to retire from the board. He is another of those who have spent a long career in the service of the company, which in his case has extended to 58 years. Mr Lister has been a director of the Cunard Company for 21 years and general manager for 12, and was appointed to the same positions in Cunard White Star, Limited, on its formation in 1934. It would not be possible to put too high a value on his services to the company over so long a time.

Sir Richard Hopkins, who has been a most valued director and colleague, has found it necessary to retire from the board, owing to increasing responsibilities and duties which detain him in London. His sound counsel has been very helpful to myself and to the directors on many occasions and I am glad to know that his great interest in the company's progress is in no way relaxed by his retirement.

The new directors who have taken their seats since the last meeting are—Mr W. H. Brown, Mr Percy Furness, Lt.-Col. Austin G. Bates and Mr C. E. Pierce, and I am sure the members will be glad of the opportunity to confirm their election. Mr Brown, Mr Furness and Mr Pierce bring to the board their already great experience of the company's work in all its diversity both technically and geographically. Mr Pierce will shortly be returning from an extensive tour of our American organisation. Lt.-Col. Bates, long associated with the Brocklebank Company, has many qualifications on the technical and other sides of shipping administration

and on modern ship design which have already been of great service to our group.

As I foreshadowed a year ago, Sir Ashley Sparks has retired from the office of chief representative in the U.S.A. and has been succeeded by Brigadier J. H. Hardy. Sir Ashley, I am glad to say, is still a director and his long experience of our affairs on the other side of the Atlantic continues to be a source of strength to the company. As he has passed the age of 70, I shall be proposing to the members at the annual meeting his re-election, in accordance with the provision of the Companies Act.

Another change to which special reference should be made is the retirement of Mr Robert Crail from the position of general manager, while retaining his seat on the board. Mr Crail's services as general manager since 1945 have been of a very high order, his management responsibility having covered with marked success the very difficult period of renewing our fleet and reorganising the business of our ships following the war.

Mr F. H. Dawson, whose election to the board the members confirmed last year, has been appointed to the managerial position relinquished by Mr. Crail, and the members will, I know, wish him a happy and successful period of office. He has also been appointed to the Port and Brocklebank Line boards and, like his predecessor, has the good wishes and support of all the Cunard team and of its associated companies.

Whilst on the subject of board changes, I would like to draw the attention of the members to the resolution contained in the notice of the annual meeting, regarding the number of directors. The present articles provide for a maximum number of 18, but may be altered by ordinary resolution. The directors recommend that this maximum should now be increased to 22 and the requisite resolution will be submitted for the members' approval.

SPLENDID TEAM-WORK

Before dealing with the year's accounts, may I say how very sensible I am myself, as chairman, and equally so are all the directors and managers of our different companies, of the splendid team-work of all the staffs whether at sea or on land. Especially do I express the company's thanks to the masters, officers, and crews in the ships and to the staffs of all the offices in both hemispheres: they husband our ships and tend so well the passengers and cargo committed to our care. I make a special note of thanks to our agents and friends, many far distant in sea miles, but near to us in the company's esteem. A fitting motto for the companies within our group, including Cunard, Cunard White Star, Port and Brocklebank Lines, and all the rest of our organisation, might well be "Team-work round the clock, the year and the globe." Whether in the U.S.A. and Canada, in Australia and New Zealand, in India, Pakistan and Ceylon, in Europe or at home, or at sea in our ships, the same salt wind is in all our faces and the same bonding cement of joint endeavour in all our sea ventures. I sometimes pause to consider what a wonderful thing is the spirit that pervades the decks of a well-found ship from bridge to engine-room, or for that matter the decks of a company. It is the intangible asset which all are helping to build with every new keel laid in the company's history.

There can be no British way of life which does not prosper the ships and those who sail in them. Their service is rendered under circumstances very different from other industries in our island economy. The carrying of the ships begins where the land-ways end and their sailings from the home ports are into the blue waters of world-wide commerce. A main part of their life and voyages, so essential to the homeland, is yet spent in distant seas in competition with the ships of every other nation.

It is no catch-phrase that the seas are free to all. Competition between the nations to carry commerce is intense, and so it should be. The seas are still free, but, as history affirms, we have the Royal Navy to thank for it against the pirate and aggressor down the centuries. The Royal and the Merchant Navies are indivisible in their need of each other and to slacken in the tenets of our sea faith might be to change the course of history and risk the freedom both of Britain and the Commonwealth.

The urge to adventure and enterprise, which are the foundations of British Commerce, is still as strong as ever. Many a young man wants to go to sea for whom there is at present no ship, and many a would-be merchant adventurer is only barred from travel abroad by currency and other restrictions. This is dead loss to Britain's future. It will be well for the Cunard Company, and for all Britain's merchant navy, when economic theories at home that hamper adventure abroad can be buried in the grave of frustration with a line on the headstone—"Better sail in a ship than live in a sheep-fold."

1950 FIGURES

This is the fourth year of consolidation of the accounts. It becomes a bit easier with each year, but it remains a feat of office management and of accountancy to produce consolidated accounts of our round-the-world shipping companies within four months of the year's end. It is a kind of accounting relay race and congratulations and thanks are due to the departments and offices everywhere who have taken part in the race and made such good time in their relays.

In considering the figures there must be borne in mind the devaluation weight-cloth which is now on the company's back. Its handicapping result has not yet been fully assessed. A transient increase from devaluation came into the profit and loss account of 1950, but as I expected, this is now disappearing in rising expenses. The long-term effect of devaluation on the Cunard company is the depletion in purchasing power of the reserves set aside over twenty years or more to replace the older ships. It will be noted that on this occasion the word "profit" becomes "surplus" in the relevant items of the accounts, thus expressing the present uncertainties in the replacement problem.

The consolidated accounts provide an accounting picture comparable with the consolidated accounts of a year ago.

Depreciation at £2,512,776 is much, the same, but I should be lacking in frankness if I did not give warning that the figure so charged is no better than notional, being based on the original but now unrealistic first cost. It requires suitably multiplying to cover the replacement of the hull plates and machinery reckoned as expended during the trading of 1950. The using-up is obviously a trading expense, like anything else that has to be charged to Voyage Accounts at current cost. It will soon be impossible to get even a telephone call for the pre-devaluation cost and certainly not a steel plate. This £2,512,776 notional depreciation relates to ships the current replacement cost of which is estimated to be about £120,000,000. The useful life of a ship, unless special circumstances prolong it, is

generally taken to be 20 or 25 years. From these two factors—replacement cost and a ship's life—are compounded the real cost to the company of renewing the rusted plates and used-up equipment applicable to a year's trading.

It is clear that devaluation has introduced a new factor which greatly affects the replacement future. Pre-devaluation money expresses one part of the accounts and post-devaluation money another. The directors continue to make additional reserves to supplement the depreciation, but the tax computation has not yet been revised to meet the new replacement factors. The company now has to deal with the twin ills of multiplied replacement cost and inflationary taxation alike nationally imposed. Moreover, the poultice of devaluation, nationally applied has left a dark bruise on the cost of living of everyone. No excuses, however publicly expressed, stop the prices rising little by little of one thing after another. And this is the historic result of a devaluation; a Caesar did it and probably a Pharaoh. I have been told that the record for blue riband in devaluations is still held by John the Good, who became quite an addict. It may be remembered that failing to correct his finances by more and better devaluations and extortionate taxation, he was quite glad to get out of it all after being taken prisoner at Poitiers. He finally retired to England, leaving someone else to clear up his mess.

Commenting on the rest of the consolidated accounts, the operating surplus is shown at £10,780,750, being £1,886,000 more than last year, but taxes absorb £4,918,238, so the increased operating surplus brings no benefit to the company and even adds to the weight of taxation on its back.

It is a depressing thought that apparently the Cunard Company is getting involved in the law of diminishing returns. This is the law with which Chancellors have so often had trouble when trying to find sources of additional taxation. The increased surplus and the still greater tax have been achieved by using up an immense amount of life and work in order to pay so great a figure of tax money. Whip and weight-cloth are the incentives offered to us and without even the proverbial carrot for the donkey.

The consolidated figures below the line are, I think, self-explanatory. Small outside shareholding interests in minor subsidiaries take £1,519—a negligible figure which it has not been convenient to eliminate. The provision for pensions and cognate funds is £350,000—the same as last year. £1,244,862 is retained by subsidiaries and affords strength to their finances. The Cunard transfer to the public reserve at £1,250,000 is £250,000 up from last year's transfer. The consolidated balance carried forward is slightly increased to £1,240,836.

CUNARD PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

As I explained at the time, the figures of 1949 were affected in exceptional degree by the changes in the accounts then in progress, so the figures of 1950 are not in all respects comparable with those of the previous year. The depreciation of ships—£1,322,642—is, as I have already said, of a notional character based on original cost. Owing to the various changes the operating surplus of £7,756,454 is not comparable with the 1949 figure.

The tax debit—£4,218,451—includes provision for the retrospective increases announced by the Chancellor in the 1951 Budget. The 1949 tax was considerably reduced, as explained in my statement a year ago, by the incidence of the initial allowances.

The surplus balance carried down, at £2,231,238, is properly comparable, showing an increase of £136,939 over the 1949 figure,

subject to my caveat about the provision for wear and rust. From this balance the directors recommend the same provision for pension and cognate funds as last year, £350,000; also the transfer of £1,250,000 to reserves, which is £250,000 more than last year, and finally the dividends as already announced. The balance carried forward is £1,240,836, being the slight increase of £40,349 over 1949 already mentioned in my comment on the consolidated profit and loss account.

Turning to the Cunard Company balance sheet, the figures here are comparable with 1949 because the Cunard White Star assets transferred to the Cunard Company were incorporated in the Cunard 1949 balance sheet under their respective headings.

The ships at £13,707,726, as against £14,866,466 a year ago, reflect (a) the coming into service of s.s. *Assyria*, (b) the sale of two cargo ships acquired after the war to tide us over the shortage of tonnage, (c) the disposal, for breaking-up purposes, of *Aquitania*, and (d) the normal depreciation for the year.

The change in the figure of freehold and leasehold properties is unimportant.

The only other assets calling for comment are the holding of £4,500,000 tax reserve certificates to meet our increased tax liabilities and the investment of £2,500,000 in Exchequer stock. These latter transactions leave our cash at bankers at £4,939,172. Part of this money represents passage money received but not earned at the close of the year.

Under the reserves item our share premium account remains the same at £1,566,000. The rest of these reserves have increased to £12,205,000.

The remaining items are either self-explanatory, or of the usual omnibus character including creditors' and debtors' accounts and various provisions and reserves.

DIVIDENDS

An interim dividend of 2½ per cent. has been paid, and it is now proposed that a final dividend of 10 per cent. be paid, making a total of 12½ per cent. for the year as against 10 per cent. for the previous year. This increase of 2½ per cent. will cost us net—£143,295, including the increase in taxation, leaving the carry forward at £1,240,836.

The aspects which have to be considered in relation to any dividend declaration are manifold. In the first place the stockholder-members' services to the company, past, present and future, are as essential to its continuance and healthy growth as any other part of the company's economy. When they invest their funds in our adventures and in the risks of our shipbuilding and ship-operating they become members of the company, sharing the hazards with us all. Only two years ago they put up £3,900,000 more capital to buttress the company's fortunes. It is important to the company's future that the stockholder-members should realise that the company is grateful to them for their support, for on that road lies the company's credit when we next need their help. As to the prospects of maintenance of any particular dividend rate, the members will realise that the times are full of risk. Each year's accounts are the company's stepping stones, and caution is enjoined in stepping to the next. The directors have to bear in mind the wide interests of all concerned, stockholder-members, staff members, managers and directors alike, and not least of the old company itself, which holds our loyal duty as part of His Majesty's Merchant Navy.

LAST YEAR A PEAK YEAR

It is not very wise to try to be a prophet. If right, one gets no thanks; if wrong, the pro-

phesy becomes one's mustard plaster—not that so excellent a corrective is not good for all of us sometimes. However much a man may think he knows, he will always be a bit the wiser if he remembers history. The wise man of Ecclesiastes did not think much of prophets. He may have been quoting the wisdom of Solomon when he wrote—"a fool also is full of words: a man cannot tell what shall be; and what shall be after him, who can tell him?" It might be sensible, I suppose, to rest on that comforting remark about prospects, but I cannot help feeling that on this occasion I owe it to the members to risk the mustard and venture my present thoughts.

We have just completed the first quarter of the 1951 trading and the indications are that 1950 will prove to have been a peak year. In the present circumstances of our trades, I anticipate that the operating surplus in our consolidated profit and loss account for 1951 will be down from the comparable surplus of 1950. This is not to suggest that we are disturbed by that prospect and our managements and staffs are striving to promote all feasible economies. Our aims—preserving the interests of the stockholder-members, watching those of our staffs, and replacing our tonnage to serve the Cunard Company's future as well as that of our island home—are unchanged. We are watching the stepping stones.

In our sea business there are all the risks attendant on trading abroad with the open competition of the world coming up on our quarter and as well there are now looming risks which attend a home economy unsuitable for an island nation and planned by folk who do not seem to have much, if any, regard for history. For instance, I do not think anyone through the centuries has ever prophesied that the British people, so completely dependent on world trade and travel, would restrict themselves from freedom to travel to the degree at present in vogue, and from liberty to pay their way abroad at will. Unfortunately, too, there is another school who sprinkle their philosophy with urgings to each other that Britain will live all the better when the trade and belongings abroad by which the British get so much of their living, have been bandersnatched by someone else. This philosophy, alien to British history, seems not unlike the patter of a pre-stidigator, who removes a man's braces on the stage without his knowing it and leaves the victim clutching his trousers.

£15,000,000 IN TAXES OVER FOUR YEARS

The tax items in our consolidated accounts for the last four years amount practically to £15,000,000—too large a sum to be extracted before realistic provision is made for replacing the worn-out tonnage. Must it indeed be that so large a proportion of the labour expended on British ships by the countless hands that build, sail and cherish them shall be remembered only to have gone as dust with the wind, leaving nothing even to mark its going, like the imagery of Solomon in his Wisdom Ch. 5. vv. 9 to 14?

Let us mark well the foresight of all who have gone before us and the devotion of all now with us—the team-work which runs this young-old company. Thus in each of our trades have ships been built to be proud of and to win humble pride in their sailings and their service. Our larger ships may take five years or even more to plan and build. Built by British hands skilled in the shipwright's arts in whatever shipyard it may be, they sail out and home again a lasting asset to our country to focus and to foster commerce from round the world to all the ports of Britain—a hub of commonwealth. Is not this a finer concept to engage our hard-won fruits of trading than to tip them in a sandstorm of devaluation and taxation into an economic waste-bin borrowed from the days of John the Good.

BRITISH ALUMINIUM COMPANY LIMITED

INCREASED PROFIT

The annual general meeting of The British Aluminium Company, Limited, was held on May 1 in London.

Mr R. W. Cooper, M.C., the chairman, in the course of his speech, said: The profit for the year amounted to £1,784,774, an increase of £313,296 on the figure recorded last year brought about by a general hardening in the demand for our semi-fabricated products which is not solely related to the increases in defence demands.

Much work has been carried out to develop new uses for our metal in many fields since the war, and it is regrettable that it will probably be impossible fully to exploit some of these new outlets until the present world shortage of ingot aluminium has been relieved and more stable world conditions restored.

Our production of virgin ingot during the year was slightly less than in the previous year, owing to the disturbance caused by the installation of new and larger furnaces at our Reduction Works. The whole of this production was again sold to the Ministry of Supply.

Throughout the entire period under review the price paid to us has been considerably lower than that at which metal could be obtained anywhere in the world outside North America, and has provided only a meagre return on the large capital employed in the production of virgin metal.

It is our earnest desire to keep the price of ingot aluminium at the lowest possible level consistent with a healthy industry. We are, however, seriously handicapped by the steady increase in the cost of every material which we have to purchase.

Our Alumina Works at Burntisland and Newport have continued to operate satisfactorily. The reconstruction of our Reduction Works at Kinlochleven has now virtually been completed. Work is still proceeding at Lochaber. Our rolling mills continue to operate satisfactorily and their output has been increased over the previous year.

PRICE ADVANTAGE

The price of virgin aluminium was increased by the Ministry of Supply from £112 per ton to £120 per ton in October, 1950 and to £124 per ton in January of this year. These increases and increases in wages and the costs of many materials and of transport, have made it necessary to raise the price of all our products. Nevertheless, aluminium still retains a marked price advantage over other non-ferrous metals, all of which have been subject to greater increases during the period under review. Our metal has become so well established that by volume rather than weight it is now the second metal in the world, after iron and steel.

The demand for Super Purity metal steadily increased during the year. The shortage of ingot metal has made it necessary for us to ration users of our material, both at home and overseas.

As to the short-term future, although we expect to be hampered to some extent by shortage of raw material, we anticipate operating to the full extent of our capacity subject only to that limitation. In the long term we look forward to a continuation of steady expansion.

We recommend a final dividend of six per cent. on the old Ordinary Stock, making ten per cent. less tax, for the year, and a First and Final dividend of three per cent. on the £2,000,000 new Ordinary Stock.

The report was adopted.

FRIENDS' PROVIDENT AND CENTURY INSURANCE

The annual general meeting of the Friends' Provident and Century Life Office was held on May 2nd in London. Mr Herbert G. Tanner, J.P., the chairman, said—

A chairman is indeed fortunate who is able to report continued progress, greater prosperity and an increase in the bonus to policyholders of no less than 20 per cent. Such is my happy position today.

1950 was the first year of a new quinquennium and it closed as the last year of the old quinquennium had done with still further progress and more profit. New life sums assured increased by more than £1,600,000 to £11,282,896—a new record. The life premium income increased by over £400,000. The expense ratio in the life department has been substantially reduced. On the recommendation of the actuary the rate of interim bonus has been increased from £1 5s. per cent. to £1 10s. per cent.

Our fire trading has been outstandingly good and we have transferred to profit and loss the record figure of £266,968. The income has increased to just less than £2,500,000 and there is now a reserve in the fire account of more than 73 per cent. The excellent claims ratio has been achieved in spite of the high claims which resulted from the heavy destruction in the United States caused by storms and hurricanes.

The accident account is not so good owing to our misfortunes at home in the motor and employers' liability sections. There will come into operation on June 1st a much overdue increase in rates on certain classes of motor business. It is clear that the rates for employers' liability are in many cases much too low. The total effect is to transfer the very modest figure of £329 to profit and loss.

It has not been my practice to elaborate on the marine accounts. It is difficult when one starts on marine insurance not to become involved in matters which are in the realm of conjecture. In view of present conditions the future in this section of the business does not look too good. Underwriters have agreed that over and above any increases in particular cases there must be an increase of 10 per cent. in all hull premiums. From this department we have transferred £49,560 to profit and loss account.

The other departments have continued to prosper and I would in particular refer to the profits earned in sinking fund, continuous disability and hire purchase sections.

I am pleased to report that the gross rate of interest earned in the Friends' Provident has been maintained at £5 7s. 9d. per cent.

So far as capital is concerned there was substantial appreciation during the year, making the figures in the balance sheet much below market prices. You will see from the balance sheet that our holdings of mortgages increased by more than £1,600,000. This is largely due to the continued popularity of our house purchase schemes. Loans in excess of £1,000,000 were made to industrial and commercial companies. The total funds are now in excess of 36 million pounds.

The year has been outstandingly good. The dividend from the century has been maintained. There are record profits and the balance carried forward on profit and loss is increased by £196,146.

I think the results of recent years indicate that our reorganisation has more than justified itself and that whatever the future holds for us we are well equipped to meet it with confidence.

The report was adopted.

THE SEA INSURANCE COMPANY LIMITED

RECORD PREMIUM INCOME

The seventy-fifth annual general meeting of The Sea Insurance Company Limited was held in Liverpool on May 1st. A statement by the chairman, Major A. Harold Bibby, D.S.O., D.L., had been circulated with the report and accounts for the year ended December 31, 1950.

The total premium income for the year in all departments amounted to £2,274,848, the highest in the company's history.

The marine, aviation and transit account for 1949, after providing a sum of £534,319 to meet outstanding claims, shows a balance of £215,824 transferred to profit and loss account. The premium income for 1950 amounted to £1,579,474, a slight increase over the previous year. The falling cargo rates, heavy claims for theft, pilferage and bad handling all tend to make the future of the marine business uncertain.

The fire department premium amounted to £881,305, an increase of £283,355 on last year. An amount of £58,857 has been transferred to profit and loss account.

The accident department premium amounted to £609,080, an increase of £104,541 on the previous year. The account was closed by a transfer of £3,699 to profit and loss account.

The profit and loss account shows £158,000 reserved to meet U.K. taxation. It is again recommended that a final dividend of 8½ per cent. be paid which, with the two interim dividends already paid, makes a total payment of 22½ per cent. for the year, which is an increase of 5 per cent. over previous years.

The investment income of £71,771 compares favourably with last year's figure of £61,547 and amply covers the cost of the dividend at £61,875. The total assets now stand at £5,832,825, and the market value of the investments is considerably in excess of the figure shown in the balance sheet.

As from January 1, 1951, the directors' fees were increased to £7,500 from £4,500 at which figure they had stood since 1919.

The report and accounts were adopted.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY LIMITED

CONTINUED WORLD-WIDE PROGRESS

In a statement issued with the 115th annual report and accounts of The Liverpool and London and Globe Insurance Company Limited, the chairman, Col. A. C. Tod, C.B.E., T.D., D.L., said he presented his annual review with a sense of satisfaction at the excellence of the results.

New record figures were reached in premium income at £22,629,000 and in New Life business at £5,853,000.

Underwriting profit was £1,206,000. Apart from the exceptional results of 1949, this figure represented the highest profit in the Company's history.

Fire premiums rose to £9,738,000; accident premiums advanced to £11,162,000; Marine premiums increased to £1,729,000.

The directors recommend a final dividend of 17s. 6d. (against 13s. 6d. last year), making 31s. (against 27s. last year) per share, less tax, for 1950.

DERBYSHIRE STONE

SUCCESSFUL OUTCOME OF DIFFICULT YEAR

The fifteenth ordinary general meeting of Derbyshire Stone, Limited, was held on May 3rd at The New Bath Hotel, Matlock Bath, Derbyshire, Mr John Hadfield, M.Sc., A.R.I.C. (chairman and managing director) presiding.

The chairman, in the course of his speech, said: The trading profit and other income amount to £218,074, the corresponding figure for 1949 being £252,250, and for 1948 £194,570. The profits for 1950 are quite healthy, though your directors did anticipate, at this time last year, that the profit for the year would be higher than that earned in 1949. Until the end of August, 1950, cumulative profits were greater than those in the comparable period for the previous year, but from September onwards profits were adversely affected by the continuous, abnormally wet weather, culminating in heavy losses in December. On balance, and in view of all the circumstances, your directors consider that the company has emerged successfully from what turned out to be an unexpectedly difficult year.

Your directors recommend for the year ended December 31, 1950, a payment of 12½ per cent., less income-tax, on the issued Ordinary stock.

CAPITAL EXPENDITURE

Capital expenditure during the year amounted to £221,267. The budget for capital expenditure in 1951 is a little over £100,000, and when this has been spent our programme of extension and mechanisation at our larger works and the development of the Louth and Cotswold units will be virtually complete. At the Louth unit the production of agricultural chalk commenced in 1950, but the wet weather already referred to severely affected demand. The plant for the production of special whittings came into operation in March, 1951; the products are of high quality and are now available in useful quantities for such consuming industries as paint, rubber, putty, linoleum, etc., to which they will be offered. The new crushing and grinding units at our Cotswold works will be in production by the early summer, and the extensions, additions and schemes of mechanisation at Caldon Low Quarries, Staffordshire, which have been in progress for over three years, will come into operation in the latter half of 1951.

CURRENT YEAR'S OUTLOOK

Weather conditions during the months of January, February and March, 1951, have been exceptionally bad and the trading results for those three months have as a consequence been adversely affected; this is notably so in connection with the sale of agricultural lime and limestone, and the demand for roadstone materials has also been reduced. In attempting to assess the prospects for 1951, and providing the weather for the remainder of the year is average rather than bad, the tonnages lost during the first three months should be compensated for in some degree by a consequently increased demand. The ancillary activities of the company are in a healthy condition and the departments concerned with the production and sale of special products have all developed satisfactorily during the last twelve months and should show increased profits during 1951. Your company has more activities than at any time in its past, it is better equipped than ever before for the manufacture of its staple products and, provided that the general demand for roadstone supplies, for lime and limestone for agriculture and for chemical and industrial purposes is maintained, the company should have a successful year.

The report was adopted.

JOSIAH PARKES AND SONS, LIMITED

RECORD NET PROFIT

The annual general meeting of Josiah Parkes and Sons, Limited, was held on April 27 at Willenhall, Mr Cyril W. Parkes, J.P., chairman and managing director, presiding.

The following is an extract from his circulated statement for 1950:

The accounts for the year ending December 31, 1950, reflect in a large measure the benefits from the additional buildings, plant and equipment that have been brought into productive use during the year.

I referred, in my review last year, to the extensions which were then being built, and from the results you now have before you I feel you will be satisfied that the large expenditure involved has been fully justified. The major part of the transfer of plant and personnel to the new factory buildings was completed by the end of August, and during the whole of the time that this transfer was taking place production was maintained at a satisfactory level. The efficiency of the factory as a whole has continued to improve, and we are very pleased that our own production figures show a greater increase than is disclosed by the National Index of Industrial Production. This reflects great credit on the staff and workers who had to put up with considerable inconveniences for several months during last year.

Whilst shortages of materials are making manufacturing extremely difficult our order book continues to increase, and it would appear that not only in this country, but all over the world, people are doing a little "stockpiling." As in other times of shortage during the last ten years, we shall endeavour to keep our old friends supplied and what goods we have available will be distributed on an equitable basis rather than by reference to some of the "extreme" orders that have been sent to us which bear no relation at all to actual requirements.

INCREASED MANUFACTURING EFFICIENCY

The bright side of the picture is the continued improvement in the company's affairs generally. There has been a substantial increase in the profit earned, due, not to an increase in our margin of profit, but to the larger turnover and increased manufacturing efficiency. The net profit on trading at £119,601 is a new high record, comparing with £79,486 earned in 1949, but out of this it has been necessary to provide £73,519 for taxation, leaving £46,082 as retainable profit, compared with £30,507 in the previous year. These figures emphasise yet again the hampering effect of high rates of taxation upon an expanding business. Even on the results we are able to show this year, the amount of profit we are allowed to retain is inadequate to meet our costs of replacement and expansion, especially as the situation is aggravated by the steadily increasing replacement costs both of fixed assets and stocks. Out of the retainable profit of £46,082 we are proposing to distribute £16,500 net, leaving a balance of £29,582, against which, after allowing for depreciation, we have spent on capital account £86,868.

Having regard to the profits earned your directors decided that they were justified in recommending a moderate increase in the distribution to shareholders, particularly bearing in mind the substantial proportion of profit ploughed back into the business during past years. Even at the increased rate proposed the gross dividend represents a return of only 6½ per cent. on the total capital employed in the business.

The report was adopted.

GENERAL ACCIDENT

INCREASED NET INCOME

The sixty-fifth annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, will be held at Perth on May 23rd.

The following is an extract from the circulated address by the chairman, Mr R. G. Simpson:

The net income from all sources amounted to £31,493,669, an increase of £6,003,295. The operations of the year resulted in a balance of £1,285,422, which with the balance carried forward from last year, namely, £422,291 is available for allocation to the various reserves and funds, and in payment of dividends. We have transferred £358,644 to pension funds, and this includes a further sum provided in respect of the widows pension fund, which has become fully operative as from the commencement of this year and is highly appreciated by the staff.

The additional reserves of the accident and fire accounts have been increased by £350,000 and £200,000 respectively, sums deemed appropriate to the increase in business, and the reserve for future taxation requires an upward adjustment of £83,074. The interim dividends absorbed £113,438. It is recommended that a final dividend of 2s. 6d. per share on the ordinary shares be paid. The final ordinary dividend proposed compares with 2s. per share for 1949.

From the balance sheet you will observe that the assets have increased by £4,492,266 and now stand at £57,850,130. Your directors are satisfied that the investment portfolio is pre-eminently sound, and, with the substantial reserves carried, the financial strength of the organisation has been further enhanced during the year.

We embark on this new half century with full confidence in the corporation's ability to cope successfully with whatever difficulties may be encountered.

B. MORRIS AND SONS, LIMITED

INCREASED CIGARETTE SALES

The annual general meeting of B. Morris and Sons, Limited, was held on May 2nd in London.

Mr A. J. May (chairman and managing director) in the course of his speech, said: Compared to 1949 last year was a year of increased costs. This applied practically to everything pertaining to the manufacture of the company's products, and it was not possible to pass on all extra costs to the consumer. This, in conjunction with the falling off in the consumption of cigars and tobaccos generally, explains the difference in profit as compared to 1949. Fortunately, there was a considerable increase in the sales of our brands of cigarettes, which we hope to maintain this year.

We are well covered at present as regards leaf tobaccos, and the company is in a strong financial position. In view of the rise in values our fixed assets stand at a low figure in the balance sheet, and we may have them revalued during the year.

The high rate of duty is having a retarding effect on the trade. The level of prices for tobacco, owing to this high duty, is too high and is affecting consumption. This is a difficult matter to get over, but we shall do our best to do so, and hope there will be some reduction in duty before long.

In these days no one would try to forecast the future, but every effort will be made by those connected with the company this year to overcome the difficulties which exist, and produce a satisfactory result.

The report was adopted.

G. HOPKINS AND SONS, LIMITED

PROFITS WELL MAINTAINED

The fifteenth ordinary general meeting of G. Hopkins and Sons, Limited, was held on April 27th in London, Mr A. H. Johnson, O.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1950:

It is with great regret that I have to report the untimely death of our late managing director, Mr H. A. Culham, who passed away in March, 1950.

Profits have been well maintained, and this is very satisfactory, particularly in face of increased labour rates, rising raw material costs, and overhead charges, and an increasingly difficult material supply position. These adverse factors are, of course, common to all industry today and give much anxiety to those responsible for the management and continued prosperity of your company.

Turning to the parent company's balance sheet, you will see that the issued Ordinary share capital has been increased during the year by 282,266 shares. Of these, 31,066 shares were issued at a premium as purchase price for the Mitcham Plating Works, Limited, which has proved a useful addition to our production, and 251,200 shares were issued to shareholders at 3s. 6d. per share towards the close of last year. The premium on these shares, less issue expenses, amounted to £18,546, which has been added to share premium account and represents a useful addition to the company's capital reserves.

A certain amount of new plant and equipment has been received, and some of it has been installed in the subsidiary company's premises to increase that company's general usefulness, and further plant to a value of £11,609 is on order. It is hoped, subject to the delivery position, to re-equip the parent and subsidiary companies with up-to-date plant, partly to replace that which has become outmoded and partly to extend the general range of work capacity. The subsidiary companies have again contributed usefully and profitably to the group activities.

STRONG LIQUID POSITION

Your company's liquid position is strong, although rising costs are reflected in the increased stock and work-in-progress figures, and, partly on this account and partly on account of plant and machinery already received and paid for, the company is fully employing all its cash resources.

Turning now to the accounts and directors' report, compared with £51,646 in 1949, the parent company has shown a net trading profit of £52,800. Adding to this £39,083, the balance brought forward from 1949, and £55 interest received on tax reserve certificates, there is a total of £91,938, of which taxation provision requires £34,744, leaving an available balance of £57,194. After deducting £7,605 in respect of the Preference dividend and 7½ per cent. interim dividend on the Ordinary shares paid during the year, there remains a balance of £49,589.

Your directors have decided to recommend a final dividend of 10 per cent., which with the interim of 7½ per cent., makes a total distribution for the year of 17½ per cent., the same rate as has been paid over several years past. You will, I think, agree that this represents a very reasonable return, particularly bearing in mind that the proposed final dividend of 10 per cent. will be payable on the total Ordinary issued capital of £137,500, which includes that part issued towards the close of the year and therefore fully employed in earning the profits out of which the final dividend will be paid.

The report was adopted.

GOLD COAST SELECTION TRUST, LIMITED

The twenty-fifth annual general meeting of Gold Coast Selection Trust, Limited, was held on April 30th in London.

Major-General W. W. Richards, C.B., C.B.E., M.C., the chairman, in the course of his speech, said: The profit for the first six months of the current year exceeds that for the corresponding period of last year, and the operations of the companies in which we are mainly interested—Amalgamated Banker Areas, Ariston, Bremang, Gold Coast Main Reef and Marlu—generally show steadily improving results. We can therefore expect with some confidence that the dividends we shall recommend, based on this year's results, will be satisfactory. We paid an interim dividend last year in special circumstances and it will be our endeavour to present our accounts for the year ending September 30th next before the close of this calendar year.

The following is an extract from the circulated statement of the chairman for the financial year to September 30, 1950: Dividend revenue from our investments aggregated £113,373. Although stock markets showed signs of more general activity, the West African market, in which we are interested, was to a large extent clouded over by the uncertainty of the political future of the Gold Coast Colony, with the result that opportunities for extensive market operations were practically non-existent. We did, however, show a profit of £28,514 on the transactions effected. Expenditure, including depreciation, etc., aggregated £7,828, and the recorded profit is therefore £134,266.

In November last I went to the Gold Coast and visited all the mines in which this company is interested, and it was satisfactory to note the progress being made.

The report was adopted.

MARLU GOLD MINING AREAS, LIMITED

The sixteenth annual general meeting of this company was held on April 30th in London, Major-General W. W. Richards, C.B., C.B.E., M.C., chairman of the company, presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended September 30, 1950:

Some 90,000 tons more ore was put through the mill compared with the previous year, yielding an additional 9,200 ounces of gold; costs showed a reduction of 8d. per ton. The erection of a plant, to treat the sulphide ore-body is proceeding, and it is expected that this plant, capable of treating 4,500 tons per month, will be in partial operation by about the end of the year.

The operating profit for the year is £187,570, compared with a loss of £12,045 for the previous year. Revenue from gold won was higher by approximately £260,000, while operating expenditure increased by approximately £60,000. The debit balance on profit and loss account is now reduced to £27,188. Provided no unforeseen events intervene, and subject to our capital requirements for our proposed underground mining, future profits should place the company in a position to resume dividend payments.

After noting the continuous improvement being shown in the monthly returns, members will have felt a measure of disappointment at the results disclosed in the progress circular for the quarter ended December 31, 1950. I am afraid such setbacks are inevitable in mining, but I can assure you that everything possible is being done to minimise such occurrences. The manager has stated that he has every reason to believe that we will be able to maintain future production at the anticipated level. This has been achieved for January and February.

The report and accounts were adopted.

AMALGAMATED BANKET AREAS, LIMITED

The fifteenth annual general meeting of Amalgamated Banket Areas, Limited, was held on April 27th in London.

Major-General W. W. Richards, C.B., C.B.E., M.C., the chairman, in the course of his speech, said: I am pleased to report that the current year's operations to date have been even more satisfactory than those for the year under review. We cannot expect to maintain quite such a high average profit for the whole year but our total profit for the current year after all charges and appropriations have been deducted is likely to be a considerable improvement on last year's results. It is our intention to recommend a dividend out of the current year's profits and to initiate a dividend policy which we intend to maintain. In the meantime we are consolidating our improved position.

The company is in a fundamentally sound position and we can look forward to a prosperous future. Great importance is attached to development of underground ore reserves and this will be top priority for the next three or four years.

The following is an extract from the statement of the chairman which was circulated with the report and accounts for the year to September 30, 1950:

The tonnage of ore mined and milled, at 537,690, was greater than that of the previous year's record by 31,151. Similarly, the gold recovery at 79,002 ozs. showed an increase of 5,594 ozs. The percentage recovery of 95.5 was fractionally lower by 0.2, but was yet very satisfactory. The final balance to the credit of profit and loss account after appropriations is £126,452. This result may be considered distinctly satisfactory.

The report was adopted.

JOHN BARKER AND COMPANY, LIMITED

RECORD TURNOVER

The fifty-eighth ordinary general meeting of John Barker and Company, Limited, was held on April 26th in London.

Mr Trevor A. Bowen, D.L., J.P., chairman and joint managing director, in the course of his speech, said: The results of the year's operations was a net profit of £946,749. Of this amount taxation in all the schedules (other than purchase tax) takes £469,016, or nearly one-half.

Our turnover constituted a record in the history of the company, but this is no doubt in some measure due to increased prices, and also to the extraordinary spate of buying by the general public recently. Taxation in all its schedules absorbs nearly one-half of our profits, but the higher taxes imposed by the recent Budget will further lessen the amount of our earnings.

A factor which is helping to maintain the high cost of living is purchase tax. I am definitely of opinion that the abolition or substantial reduction of this tax would not only give incentive to trade, and incidentally force much-needed economies in Government expenditure, but would also contribute greatly to general public satisfaction and undoubtedly ease the burden of young people desirous of setting up their own homes.

The directors recommend a final dividend of 15 per cent. on the ordinary shares, making 20 per cent. for the year. In the face of the slight fall in net profit it may seem a little unusual to recommend an increase in the amount of dividend, but I feel that the ordinary shareholders have earned this extra by their continued support of our conservative policy over many years.

The report was adopted.

THE INSTITUTE OF CHARTERED ACCOUNTANTS

MR H. G. ASH'S ADDRESS

The seventeenth annual general meeting of The Institute of Chartered Accountants in England and Wales was held in London on May 2nd.

The following are extracts from the presidential address of Mr H. Garton Ash, O.B.E., M.C.:—

At the end of March last a notice was issued to all members drawing their attention to a report by the Council on Education and Training for Membership. This report had been prepared because of the recommendations of the Carr-Saunders Committee on Education for Commerce. When it became apparent that the Minister contemplated the implementation of some of the recommendations which might affect the Institute, the Council decided to publish its report on Education and Training for Membership.

I feel obliged to stress three of the matters arising out of the Carr-Saunders report. The first one is the recommendation which would involve raising to at least eighteen years the age at which articles may be entered into. The Council has no desire to discourage young people from continuing their education to as late an age as they wish, but the Council takes the view that it would be unjust to close the door to persons between the ages of sixteen and eighteen.

The second matter is the proposal which would involve considerable interference with the Institute's examination system, by way of revision of syllabuses and the granting of exemptions based on the national certificates for commerce. It is the Council's duty to the present and future members of the Institute and to the public to resist interference with control of its own examination system, which is constantly under review.

The third matter is the alarming proposal for the adoption of the "sandwich" principle during the articles whereby courses in technical and commercial colleges would be taken in the daytime concurrently with practical training. It would be difficult to visualise any proposal so remote from the realities of the profession or so prejudicial to the interests of articled clerks.

TAXATION

Speaking personally, I find some trends in fiscal policy a little disturbing. For example, the initial allowances were to a large extent originally intended as an encouragement to post-war re-equipment and development. The Tucker Committee has in effect recommended that the initial allowance could be used as a means of at least partial solution of the problems created by rising costs of replacement of fixed assets. Then, four days after the publication of the Tucker Committee's report, the Chancellor announced the suspension of initial allowances as a means of discouraging capital expenditure in the interests of the defence programme. We seem, therefore, to have completed the circle and I think it is at least open to question whether the taxation machinery ought properly to be adapted to this extent as part of a system of economic planning.

Our economy will always be strained so long as there exists a threat of war. Nevertheless, the strain can be reduced provided every individual employer and employee does his or her utmost to achieve maximum production. The standard of living—and indeed the social services themselves—depend for their maintenance and improvement not on any form of financial gymnastics, but on the amount of productive work that everyone is prepared to do.

ILLINGWORTH, MORRIS AND COMPANY, LIMITED

The thirty-first ordinary general meeting of this Company was held at Bradford on May 2nd, Sir J. Donald Horsfall, Bt., J.P. (chairman), presided.

In his statement to the stockholders (issued with the company's accounts) Sir Donald reviewed the financial results of the year ended September 30, 1950, and said:

The circumstances and conditions in our industry cannot but be regarded with some misgiving. The consumer public have not yet felt the full impact of the enhanced prices of wool, and I very much doubt whether, during 1951, worsted clothing will come on to the market based on prices anything higher than those levels of some nine or ten months ago. No one can fail to be apprehensive about the measure of consumer resistance when the burden of these later prohibitive prices falls on the buying public.

To attempt to make an analysis as to future trends is an extremely complicated, if not impossible, task. I am, however, very pleased to be able to tell you that, providing there is no serious break in wool prices, the present year's results should be considerably in excess of those for the year under review.

The serious rises in wool prices have forced your directors to the decision that further capital is essential. Plans are, therefore, in hand for a further issue of capital in the near future.

The directors' report and the accounts, together with the board's dividend recommendation were approved; and Mr C. G. Tankard and Mr G. R. Mackay, F.C.A., were re-elected directors.

[Note—Sir Donald Horsfall's statement was written before the recession of wool values at the beginning of April.]

J. BERRY AND SONS

FULL ORDER BOOKS

The fourteenth ordinary general meeting of J. Berry and Sons, Limited, was held on May 2nd in London, Mr Leslie Berry, the chairman, presiding.

The following is an extract from his circulated review for the year ended December 31, 1950:—

Your company has again traded successfully, with a slight increase of the net trading profit at £52,118, after charging all working expenses and reserves for known liabilities. Full provision has been made for taxation, and a further transfer of £7,500 has been made to the general reserve, now standing at £32,500. The directors have decided to commence a capital redemption reserve fund for the redemption of the issued preference shares and have transferred £5,000 for this purpose.

The carry-forward has been increased slightly at £11,019. The balance sheet this year reflects the full operation of the revaluation of the company's freehold premises, capitalisation by way of bonus issue of 50,000 6 per cent. redeemable cumulative preference shares of £1 each, and the net difference of £41,261 standing to the credit of the capital reserve account. The balance sheet therefore reflects a much stronger and truer position of your company.

The demand for your company's products continues to grow and at the moment our order books are completely filled. The position regarding raw materials is becoming more and more difficult, but your directors have been concentrating on this for some time now and I believe that as a result of their efforts and provided nothing untoward occurs, we shall again experience another successful year's trading.

I once again pay tribute to the staff for contributing to the company's progress.

The report was adopted.

"SOFINA"

The annual shareholders' meeting of Société Financière de Transports et d'Entreprises Industrielles (Sofina) was held on April 26th in Brussels, Vicomte Van de Vyvere, chairman of the board, presiding.

After a brief reference to the transient nature of the stimulus given to business activity by Marshall Aid, the European Payments Agreement and rearmament expenditure, the directors' report makes, *inter alia*, the following statements:

"The Governments concerned are endeavouring to curb the consequent rise in prices, which, owing to its unequal incidence as between countries, commodities and income groups, threatens to upset international and domestic trade. Adequate safeguards against a business recession cannot, however, be found merely in price control. Business activity will not remain at its present level unless a policy which aims at keeping the means of production fully employed and gradually adding to those means is systematically pursued. . . .

"The essay which, in accordance with our custom, is appended to this report, recalls the magnitude of the needs calling for satisfaction and the extent of the resources by which they could be met. It also mentions the obstacles which hinder adequate utilisation of the wealth that nations could enjoy in common, obstacles which a rational policy could overcome in a world at peace.

"The business undertakings to which our company gives technical and financial assistance can make a substantial contribution towards developing resources in the countries where they operate and raising the standards of living. But several of these companies still find their progress impeded by the difficulties set out in previous reports. . . .

"In many countries the yield on investments in companies operating utilities is manifestly inadequate, and abnormally low returns are reflected in market quotations of their shares. In marked contrast with these quotations, current prices of industrial securities attest the satisfactory returns which large customers of the same utilities have not ceased to earn. Yet a moderate adjustment of their tariffs—far less than the general rise in commodity prices—would enable these utilities to obtain the fresh capital needed for progressive extension of their means of production. In the case of electricity companies this fair and indispensable adjustment would involve no more than a negligible increment in the costs of industrial production, and electricity bills would still stand at a very small percentage of total outlay in the budget of an average household at the same time, the general welfare of the country would benefit greatly from their improved productive capacity and from the investments which their successful development would attract."

Addressing the meeting, Mr Dannie N. Heineman, chairman of the Standing Committee, drew attention to methods of accounting and practices of price-limitation which may lead to a fatal shrinkage of productive resources.

Earnings for the year 1950 amounted to Belgian francs 176,752,370.69, as against 180,381,759.63 for the previous year. In these totals are included respectively 55,896,234.53 and 64,858,458.37, which could not be cashed in Belgian francs. In addition to the above earnings, profits realised on sales of securities amounted to Belgian francs 41,165,160.60 in 1950, as against 28,742,816.71 in 1949.

In the company's balance-sheet as at December 31, 1950, holdings are carried at B. fr. 1,922,988,375 or B. fr. 72,141,000 less than in the preceding balance-sheet.

Acquisitions of securities exceeded sales and redemptions by B. fr. 13,893,706.30, but total write-off, amounted to B. fr.

86,034,706.30, of which 68,088,785.43 were charged to profit and loss account.

Liquid assets (U.S. Government bonds and cash) stand at B. fr. 507,113,929.02, which is B. fr. 31,482,896.26 less than at the close of the preceding year. On the other hand, liabilities have been reduced by B. fr. 77,579,013.98 and advances granted—principally to subsidiary companies—have increased by B. fr. 64,855,985.28.

That part of the income of 1950 which could not be cashed in Belgian francs, and part of the profits on sales of securities have been applied, as in the previous year, to amortisations, the balance of the profit on sales of securities being carried to reserve.

As for the preceding year, a dividend of B. fr. 70 net per share has been declared.

Translations of the report and of the essay above referred to ("Unused Resources"), as also of Mr Heineman's address, are obtainable on application to Electric and Railway Finance Corporation Limited, Claridge House, 32 Davies Street, London, W.1.

CONWAY STEWART AND COMPANY, LIMITED

(Fountain Pen and Gold Nib Makers)

FURTHER SUBSTANTIAL PROGRESS

MR S. W. JARVIS'S SPEECH

The sixteenth annual general meeting of Conway Stewart and Co., Ltd., was held on May 3 at the Holborn Restaurant, High Holborn, London, W.C., Mr S. W. Jarvis (chairman and managing director) presiding.

The Chairman said: The accounts and directors' report for the year ended December 31, 1950, have been in your possession for some little time, and with your permission I will take them as read. (Agreed.)

It is again my privilege to announce, on behalf of the directors, further substantial progress. The net profit for 1950, after making full reservation for depreciation of plant and taxation, is £33,653, which compares with £25,471 for 1949. You will notice that in addition to the same allocations as in the previous year £3,067 has been written off, being the expenses of the purchase of the freehold property, and the sum of £2,516 written off goodwill, which now stands at £10,000 only.

CONSIDERABLE SALES EXPANSION

I am glad to say that during the past year our sales showed a considerable expansion, both at home and abroad; in fact, I can say, with confidence, that our prestige is higher than ever.

There are certain new features in the balance sheet which need some explanation. After 28 years we have been compelled to move from Shoe Lane. It had been obvious to us for some time past that increasing business has made larger premises necessary, and we have been fortunate to purchase an excellent freehold factory situated at 36-44, Copperfield Road, E.3, where the potential output is at least 50 per cent. more than at our late premises. The contingency reserve of £15,000 has been raised to meet the expenses of removal, etc.

NOTICES

DOMINION OF CANADA

THREE AND A QUARTER PER CENT. REGISTERED STOCK, 1955-63

For the purpose of preparing the Interest Warrants due July 1, 1951, the BALANCES will be STRUCK at the close of business on June 1, 1951, after which date the Stock will be transferred ex-dividend.—For Bank of Montreal, Financial Agents for the Government of Canada in London, A. D. HARPER, Manager, 47 Threadneedle Street, E.C.2. May 1, 1951.

QUIET ROOMS for meetings just off Trafalgar Square.—For details and bookings apply Housing Centre, 13, Suffolk Street, S.W.1. Whitehall 2851-3.

The cash position is particularly strong. Although we had paid £28,067 in respect of the purchase of the factory, the bank balance is increased from £30,903 in 1949 to £55,912.

MOVE TO NEW PREMISES

I am pleased to say that our sales for the first quarter of 1951 show a considerable advance on 1950. The move to the new premises was completed over the last week-end, and your directors hope that production will not be affected for very long. Under normal conditions I would have no hesitation in saying that we could continue to increase our sales, but it is difficult to forecast in these uncertain times.

Before closing, I would like to propose a vote of thanks to all members of our staff who have continued to give us such loyal service. A number have followed us to Copperfield Road, and we wish them and all new members happy times at the new factory.

The report and accounts were unanimously adopted, and a final dividend of 30 per cent. (making 40 per cent. for the year) was approved.

The retiring director, Mr T. H. Garner, was re-elected, and the remuneration of the auditors, Messrs. Chalmers Wade and Co., having been fixed the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

I. GRIEW AND COMPANY

(Furniture Manufacturers)

SATISFACTORY RESULTS

The fifteenth annual general meeting of I. Griew and Company Limited was held on May 1st in London, Mr Louis Samuels (the chairman) presiding.

The following is an extract from his circulated statement: I am pleased once again to present to you a report which I am sure you will find not unsatisfactory, for I feel that the reduction in trading profits is only a small reflection of what has been a difficult year for us. The combined trading profits for the year amounted to £75,787, and after making various deductions, including taxation, there remains a net profit of £20,350.

If we take into account the fact that the actual capital applicable to the ordinary shareholder is £194,826, the dividend of 25 per cent. payable for the year represents a net payment of only 6.2 per cent., which can in no circumstances be considered excessive.

During the middle of 1950 there was a general and unaccountable falling off in demand throughout the furniture trade, and in the latter part of the year we experienced certain labour difficulties, which have since been satisfactorily resolved. These factors had a somewhat adverse effect on production and resulted in lower profits being earned by the parent company. The adverse factors have to some extent been offset by economies, and by improvements in methods of production. The latter end of 1950 brought with it a steady demand for furniture which has continued into this year, and the company has a very full order book. The company will continue its policy of giving its many retail

DAVEY AND ARMITAGE LIMITED

The position in regard to supplies of imported softwoods showed a further deterioration during 1950, but fortunately our subsidiary company was able to obtain greater supplies of hardwoods and wallboards. As a result, the trading profit showed an improvement of nearly £7,000 and the net profit was £10,131. The accounts provide for a dividend of 30 per cent. actual which represents a satisfactory return upon the parent company's investment.

From March 1, 1951, the quota system and price control for timber importers and merchants was cancelled although consumption of softwoods is still controlled by licence. The company has entered into substantial forward commitments and so can look forward to increased trading during 1951. It is probable that prices will continue to rise until world supplies are commensurate with the demand for timber, and we may, therefore, hope for the improvement experienced in 1950 to be continued.

The report was adopted.

BIRMINGHAM RAILWAY CARRIAGE AND WAGON COMPANY, LIMITED

FURTHER IMPROVEMENT IN OUTPUT

The ninety-seventh annual ordinary general meeting of The Birmingham Railway Carriage and Wagon Company, Limited, was held on May 1st at Birmingham, Sir Bernard D. F. Docker, K.B.E., J.P. (chairman), presiding.

The following is an extract from his circulated statement:—

The available balance is £296,464, as compared with £235,627 last year, and your directors have decided upon a modest increase in the rate of dividend and in distributing 10 per cent. on the ordinary capital we have reverted to the rate which was paid upon many occasions prior to the war.

I consider the liquid position of the company satisfactory.

There was a further small improvement in output for the year and I am pleased to report that the proportion exported constituted a record for the company. A notable export was the first diesel electric five car train for Egypt under our contract with the English Electric Company. We have had many contracts from Egypt and I trust that by their performance, these trains will further strengthen our relationship.

South Africa, Australia, New Zealand, the Argentine, Hongkong, Nigeria and Iraq have all featured in our more important exports this year and although competition is pressing very strongly and our increasing costs are making conditions more difficult, we are hoping to continue to obtain our proper share of the work on offer.

The report and accounts were adopted.

PROVINCE OF QUEBEC

FOUR AND A HALF PER CENT. REGISTERED STOCK, 1951 For the purpose of preparing the Interest Warrants due July 1, 1951, the BALANCES will be STRUCK at the close of business on June 1, 1951, after which date the stock will be transferred ex-dividend.—For Bank of Montreal, A. D. HARPER, Manager, 47 Threadneedle Street, E.C.2. May 1, 1951.

VACANCY will occur during the summer for a man or woman with bookkeeping or library experience and some secretarial training, knowledge of books on Economics and the Social Sciences an advantage.—Handwritten applications, giving age, experience, salary required, marked *personal*, to The Manager, The Economist's Bookshop, 11-12 Clements Inn Passage, Aldwych, London, W.C.2.

PRESS NOTICE

NOTICE IS HEREBY GIVEN that the Seventy-fourth Annual General Meeting of The Cunard Steam-Ship Company Limited will be held in Cunard Building (Fifth Floor), Pierhead, Liverpool, on Wednesday, May 23, 1951, at eleven o'clock a.m.

(1) To receive and consider the Statement of Accounts and Balance Sheet to December 31, 1950, with the Reports of the Directors and Auditors.

(2) To sanction the declaration of final dividend for the year 1950.
(3) To elect Directors in place of those retiring but who, being eligible, offer themselves for re-election. In accordance with the provisions of The Companies Act, 1948, special notice has been received of the intention to move at the Company of Sir T. Ashley Sparks, K.C.M.G., K.B.E., who at the date of the Meeting will be aged 74 years and who retires and offers himself for re-election.

(4) To confirm reappointment of Auditors, and to fix their remuneration.

(5) To consider and, if thought fit, to pass the following Resolution as an Ordinary Resolution:—

"That until otherwise determined by the Company by Ordinary Resolution, the Directors shall not be less than three nor more than twenty-two in number."

By Order of the Board,

H. EAVES, Secretary.
Note.—A Member entitled to attend and vote is entitled to appoint one or more proxies to attend and vote in his stead. A proxy need not also be a Member.

BRITISH ELECTRICITY AUTHORITY

EDITORIAL ASSISTANT

Applications are invited for the post of Assistant to the Editor of the Authority's Annual Report.

Preference will be given to applicants with some experience of editorial and publications work. Candidates should be able to handle simple statistics with a pen and to deal with correspondence, inquiries and other matters on their own initiative. A knowledge of shorthand and typing would also be considered an advantage.

The starting salary will be in accordance with qualifications but within Grade 2 of the National Council Permanent Salary Agreement, £420 per annum by £20 per annum to £480 per annum, inclusive of London Allowance.

Applications, stating age and full details of qualifications and experience, should be forwarded to D. MOFFAT, Esq., Director of Establishments, British Electricity Authority, British Electricity House, Great Portland Street, London, W.1, so as to be received not later than May 18, 1951.

Please quote Reference AE/167.

HOSTEL OF ST. LUKE, 14 Fitzroy Square, W.1—A Nursing Home for Anglican Clergy and families. Majority of patients treated free. Not under Ministry of Health. Dependent on voluntary contributions. Expenses heavy. Please help by subscription, donation, legacy to the Secretary.

THE PROGRESSIVE BUSINESS MEN'S FORUM—Luncheon, Criterion Restaurant, W.1, Thursday, May 10th, 12-2.30 p.m. Mr. Harold Wilson, M.P. will speak on "Raw Materials—Britain's Dilemma." Admission ticket only (12s. 6d. each). Phone WEL. 0136, 9.30 a.m.—5 p.m.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT

ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN that the seventy-third ORDINARY GENERAL MEETING of the Shareholders will be held at the Company's Offices, 61, Avenue Fouad Ier, Alexandria, on Thursday the 24th May, 1951, at four o'clock in the afternoon, for the transaction of the ordinary business of the Company, pursuant to Act of Parliament, to fix the directors' remuneration and for the purpose of considering and, if thought fit, passing the subjoined resolutions as special resolutions:—

Resolution I.—To elect Mr. Robert Walton, O.B.E., the manager of the Company, as a director of the Company and, for that purpose, to declare Article 106(a) of the Articles of Association suspended in his favour.

Resolution II.—To substitute for Article 80 of the Articles of Association, the following Article:—

The number of the directors of the Company shall not be less than five nor more than ten, and such one more director as the Egyptian Government shall have power to appoint and shall appoint.

Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before May 10, 1951, or in Alexandria before May 21, 1951, until after the Meeting, at the National Bank of Egypt, 8, King William Street, London, E.C.4 or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria. A Member of the Company is entitled to appoint a proxy to attend and vote at the Meeting in his stead and any proxy so appointed need not be a Member of the Company.

Dated, Alexandria, Egypt, March 22, 1951.

By Order of the Board,

ROBERT WALTON, Manager.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable June 15, 1951, to shareholders of record at the close of business May 15, 1951.

Toronto,

By Order of the Board,

April 27, 1951.

J. R. BRADFIELD, Secretary.

MARKET RESEARCH OFFICER required. Must have degree in Economics (including specialisation in Statistics). The person appointed will work in close touch with the Manager of the Department, and preference will be given to a man (or woman) under 35 with practical experience of Market Research. Write fully and in confidence, stating salary asked, to J. K. Lambert, Messrs. F. C. Pritchard, Wood and Partners, Advertising Agents, 25 Saville Row, W.1.

CHARTERED ACCOUNTANT COMPTROLLER required for highly successful multiple factory public company manufacturing with headquarters London. Must have broad experience and administrative ability, knowledge of systems, procedures, costs, budgets, taxation, etc. Wonderful opportunity for the right man. Salary commensurate with responsibility and performance. Replies will be treated in strict confidence, but must be typed and accompanied by full details experience and training.—Write Box 4163, c/o Charles Barker & Sons, Limited, 31, Budge Row, London, E.C.4.

Look to the Bridge

EVEN those who thought they knew the volatile nature of American public opinion have been astonished at the breadth and force of the emotional wave that has swept across the United States since General MacArthur returned from Japan. Precisely because it has been so largely emotional, there is bound to be a reaction; but meanwhile one of the things that has been brought to the surface by the eruption is a burst of resentment against Britain. This is nothing new—indeed, it is a tradition in America to blame on Britain anything that goes wrong—and it would be foolish to take an alarmist view of it. But to disregard it completely would be still more foolish. The peace of the world—or, if peace cannot be maintained, the safety of the western world—so obviously and absolutely depends upon the firmness of the alliance that binds the free nations together, that anything that weakens the bonds, be it only for a time or only in appearance, should be taken very seriously. Any British Government which has its eye fixed on the main chance ought to be re-examining its own attitudes and policies to see whether there is not something it can do to strengthen the one central and essential bridge across which all the traffic of foreign policy must pass. There is, of course, no call to abandon any vital interests or to solicit any humiliations; but there is a call to offer something more than a graceless and obviously last-minute concession to pressure, which would seem (these words have to be written before Thursday's debate in the Commons) to be all that can be said about this week's decision to agree to a wider embargo on trade with Communist China.

There is one last chance to see whether Britain and America cannot work together in the Far East—and the task may not be nearly as difficult as it has been made to appear. There are, broadly speaking, four positions taken in the western world on the subject of the Far East. There is, first, reading from the right, the position of the American Opposition. The Republicans are by no means all of one mind—there is an obvious split between the Asialationists who want more war in Asia and the isolationists of the Taft-Hoover stamp who want to retreat into the western hemisphere—but they are all for the moment united behind General MacArthur, and they are permanently united in detesting European commitments. Secondly, there is the position of the American Administration. This policy favours confining the war, if possible, to Korea. Under pressure, it has agreed to help Chiang Kai-shek maintain himself in Formosa, but it does not favour letting him loose on the mainland. Nor does it favour bombing Manchuria or even—in deference to the views of the United Nations—pursuing enemy aircraft over the Yalu River. Next is the position of the British Government, which still hopes to secure an early end to the Korean war by negotiation with Peking, and in that hope will do nothing, if it can help it, to irritate the Chinese Communists, and will even make some gestures, such as inviting them to join the negotiations for a Japanese peace treaty, calculated to give them positive pleasure. Finally, there is the position of the British

and European Opposition of the Left, with its shades of opinion from the Bevanites through the Third Forcers, the neutralists, the Sinophiles, the pacifists and the fellow-travellers to the Communists.

In this spectrum, what is really remarkable is not the wide range from one extreme to the other but the comparatively short distance—the certainly bridgeable distance—between the positions of the two responsible governments. What is more, they are quite considerably closer together than they were five months ago, when Mr Attlee was in Washington. Since then, the American official position has moved quite a long way towards moderation. This has happened partly because the military position has improved and partly in response to the views of the other United Nations, but also—be it recognised with all honour to them—because Mr Truman and Mr Acheson have gradually worked out a sane policy and have had the courage to stick to it in spite of the inhuman pressures put upon them.

Opinions will differ whether or not the British Government has willingly—not counting extorted concessions—done anything comparable to build a bridge and move across it. But in either case, bridge-building ought to be much easier for the British Government now than it was in the winter. For one thing, the British Cabinet, like the American high command, has extruded its dissenting member and should therefore be less tied to immobility by the need for internal compromise. And for another the British alternative policy has collapsed. The policy of conciliating Peking, which was highly dubious at the start, has never paid a single dividend and is now patently bankrupt. There may be some people in the Foreign Office who still cherish a faint hope of having something other than insults to show for so much forbearance; but even they cannot still maintain, save perhaps for obstinacy's sake, that the prospective gains of the recognition policy are other than quite microscopic in comparison with the harm it has done to relations with the United States. It needs only an open Communist threat to Hongkong to bring His Majesty's Government helter-skelter into the American position.

★

But if the change of course waits until then, it will be far too late for any good to be derived from it; indeed, its only fruit then will be deserved mockery. If it were possible, for once, to move in advance of events, some profit could still be earned in the currency of Anglo-American collaboration. The actual modifications of British policy that would be required in any such efforts to achieve unity are, in fact, small. It would probably be necessary to abandon publicly the attempt to seat Communist China in the United Nations—but the attempt has in fact been abandoned, so the acknowledgment ought not to be too painful. Much more than actual modifications of policy, what is needed is a determined effort to emphasise those aspects of British policy which make for harmony, instead of harping on the differences. At the very height of the MacArthur crisis a story, datelined from London, appeared in the reputable American papers to the effect that, in the Japanese peace treaty negotiations, the British Government was insisting on the return of Formosa to the Communists. This was, indeed, turning the knife in the wound. Almost certainly the view expressed to

Mr Dulles was no more than that some day when aggression was at an end in the Far East, Formosa should go back to China—a position not identical with the American, but not impossibly far from it. Unless they are off their heads British Ministers were not proposing to hand Formosa over to the Chinese Communists while they are killing British troops in Korea. But such a misunderstanding was allowed to arise, and to go uncontradicted, at a crucial time. Another example can be taken from the sad case of Hongkong's trade with China. Even as late as last week, it was painfully obvious that the Prime Minister had not bothered to inform himself about the matter. A clearer impression of chilly indifference could hardly have been given—although, when the facts are dug out, it can be demonstrated that the policy pursued has not been unreasonable. Having stirred up a storm in America, the British Government now has to accept much tighter restrictions—with all their painful and possibly dangerous consequences to Hongkong—than would have been necessary if they had remembered all the time that the Anglo-American alliance is paramount and can be kept in being only by constant solicitude—instead of painfully waking up to that obvious fact at a very late hour.

★

Even if the Far East were the only area of crisis in the world today, the case for an open British initiative of *rapprochement* with Washington would be very strong. It is, in fact, immensely strengthened by what is happening in two other critical areas. One of these is that of raw materials. As a result of Mr Charles Wilson's visit to Europe, the crucial importance of a fair distribution of raw materials is now more clearly realised in Washington than ever before and the highest officials there are anxious to see that justice is done. But they will not be able to accomplish very much unless opinion in Washington, official and congressional, is more convinced than it is at present of the reliability and value of Britain as an ally. Mr Stokes, in going to Washington, is trying to catch a favourable tide; but he will find that it is useless for him to talk raw materials apart from high politics.

The other area of crisis is the Middle East. There the almost incredible folly of the Persian Government is creating a very nasty situation indeed. The roles of Britain and America in the Middle East are, in many respects, the opposite of those in the Far East. It is not very difficult to criticise past British policy in the Middle East—but no easier than to point to the misfortunes and mistakes of American policy in the Far East that led up to the Korean affair. But in the Middle East today, as in the Far East a year ago, the essential point is that the power that chiefly represents the western world in the area is being forced by the folly of others into very painful decisions and requires backing up. If Americans hesitate to give their support because they are dissatisfied with the nature and degree of the assistance they have received in the Far East, the answer is that about half as much assistance from them in the Middle East—the diplomatic support without even token forces—would transform the position.

If, in the Far East, as has been argued above, it is for Britain now to make the moves that will build a bridge between the policies of the two governments, then in the Middle East unquestionably it is for the Americans

to move the furthest. It is doubtful whether the real makers of American policy—Mr Truman, Mr Acheson, Mr Marshall—have ever had occasion to think at all deeply about the Middle East, except in connection with Palestine. It is virtually certain that they do not realise how much mischief American policy has done in that area, never willing to take responsibility itself, but equally unready to give any help to those who do bear the responsibilities of the western world in that crucial area. There is fully as much need for a re-examination of

Fair Deal for the Danes

THE visit of the King and Queen of Denmark to this country—a very welcome royal and family occasion—should be treated as something more than an item in the pageantry and ceremonial of Festival May. Such occasions, of course, show London at its most friendly, and some Danes will have felt pleasure in the thought that their royal family should be the guests chosen to grace a unique occasion. If they are many who have felt this pleasure, then the visit will have helped to smooth away the misunderstanding between the two North Sea peoples that the post-war years have bred. For too long the Danes have seen Britain at its worst: as the cause of some of their most acute economic difficulties, as a flint-faced bargainer, with a Government that has proved, in matters of trade, something much less than comradely to fellow Socialists. If pangs of conscience on this score have been felt during the royal visit only among an instructed few in Whitehall, others who take a broader view will ask themselves if all has been done that might have been done for this faithful ally at the mouth of the Baltic, direct neighbour to Russia and Germany, most helpless and vulnerable of the North Atlantic democracies.

Such reflections have a special relevance at a moment when complaints about the economic policies of the great American ally are playing their part in British domestic politics. For in Danish domestic politics the economic policies of the great British ally are a burning issue. If some in this country see American free enterprise and stockpiling as prime causes of high prices and industrial difficulties, most Danes see British Government purchasing and price stabilisation as prime causes of their foreign trade deficit and of the painful measures now being taken to rectify inflation. If the British demand as of right from the United States the raw materials needed for rearmament and full employment in the factories, the Danes demand from Britain as of right the food prices needed for full employment on their farms and for rearmament, as well as the coal needed for their homes and factories. This claim of right springs in each case from the feeling that traditional friends should not so rigidly observe purely business considerations as to damage each other's interests. What is sauce for the goose is sauce for the gander; and let it be said straight away that the Danish case against Britain is in many respects sounder than the British case against the Americans.

The Danish complaint against British trade policy does not need the support of political and strategic facts. These have to be recalled because they are so often lost to view; especially, it seems, in arguments between the Foreign Office on the one hand and

American Middle Eastern policy as there is of British Far Eastern policy.

Two such points of friction could mean disaster. If they are allowed to drift, that is what they will mean—disaster to the Anglo-American alliance that is the hope of the world. But the very fact that the roles are reversed, that each government has something to ask and something to give, provides an opening for statesmanship. We must hope that enough of that noble essence exists both in Washington and in London.

the Board of Trade and the Ministry of Food on the other. Denmark, in a few words, is for the Russians, in case of war, the key to the North Sea, to Norway, and to the envelopment of Sweden. Through the Öre Sound, only three miles wide at its narrowest between Zealand and Sweden, lies the outlet for their submarines from the former German ports of the eastern Baltic. Beyond, through the Kattegat and the Skagerrak, lies the route for transports and cruisers to the ports and former German submarine bases of Norway. Denmark itself is the ideal site for the landing of troops from the air, and to seize its airfields and ports would surely be a first object of Russian strategy against Western Europe. From Germany the road into Jutland by land lies almost open to the Red Army. From the strategic, as distinct from the political, point of view, there is no more important point in the continental defence system of the Atlantic Pact than Denmark and the waters around it. It is to the North Sea and the Atlantic what the Turkish straits are to the Aegean and the Mediterranean, a bottleneck which could and—in case of war—must be kept closed with mines and air power.

These facts are of special significance for the British Government; for the small Danish forces are largely dependent on this country for their training and equipment, for aircraft and ships. And although much help has been given, the present state of Denmark's forces suggests that it is not enough by far. The air force is still negligible, inadequate for local defence, impotent for naval operations. The navy, lacking air cover, could undertake only the most limited coastal operations, and that in safety only by night. The land forces—indeed all the forces—lack men and training because of the shortage of officers and non-commissioned officers. Yet, in spite of these weaknesses and the exposed position of their country, the Danes bravely decided with the Norwegians two years ago to throw in their lot with the nations of the Atlantic Pact. That was a small nation's gesture of trust in allies; but unfortunately the care of small European nations has not been a strong point in the foreign policy of the Labour Government. Indeed, one can go further and say that its public utterances have so far shown almost complete indifference to the strategic problem of the Baltic, to the facts that the Russians at Luebeck are already round the flank and at the rear of Denmark, and that the gateway to the North Sea is guarded by only one power, and that a neutral—Sweden.

Here then are good reasons in plenty for the British to look to their relations with Denmark, and to ask themselves whether it has been wise, or even necessary, to go

so far in their trading policies towards this ally as to run serious risks of estrangement. The root of the trouble can be traced back to the very different economic conditions of the 'thirties. Then, in 1933, the British Government browbeat the Danes into buying British coal, for which markets had to be found at any price. Agreement to buy 80 per cent of their annual requirements from Britain—instead of from Germany and Poland—was the condition for buying Denmark's butter, bacon and eggs. Since then—excluding the six years of war—the farmers of Denmark have produced almost exclusively for the British market and the principal industry of the country has been tied to the British economy. They aimed at producing a high quality of butter and eggs, basing their methods and costs of production on the knowledge that the best produce could be sold at good prices in the free British market. Those were days when people worried about the taste of butter and the freshness of eggs, paid attention to grading and quality, and were free to choose Danish bacon if they preferred it. Secure in this special market, Danish farmers persisted in their quality production, even when the prices of their imported feeding stuffs rose far above the low levels of the 'twenties. A pattern of production and trade was created in which 80 per cent of Denmark's agricultural exports came to this country, with Germany—and occasionally the United States—as the only alternative market.

During the war occupied Denmark ate butter in order to keep it from the Germans; before the war it had eaten margarine to keep butter for the British—much as the British now make do with old cars so as to sell new ones abroad. When peace came this thrifty habit could be restored and exports to Britain maintained only by imposing food rationing. The Danes had settled down to three years of this form of austerity when the British fuel crisis and the devaluation of the pound between them created a new situation. Denmark devalued, too, and immediately the price in Danish currency of imported feeding stuffs (which are absolutely essential to Danish "factory" methods of agriculture) rose by 44 per cent. The British Government, relying on the inability of the Germans to buy from Denmark at this time, refused to raise the prices it would pay for the finished produce, although at the same time it was permitting—indeed, encouraging—a rise in the export price of the coal that the Danes bought from this country. The Danish Government watched helplessly a simultaneous rise in its farmers' costs of production and fall in the value of its exports. Since September, 1949, the prices of Danish imports have risen by 54 per cent while those of exports have fallen. This is not the result of any blind economic

forces but of quite deliberate—though perhaps unco-ordinated—decisions by the British Government.

A point has now been reached where the Danish Government is struggling painfully to reduce a visible trade deficit with the United States of \$427 million and to stop the spiral of inflation resulting from the tying of wages and salaries to a rising internal price index (275 now against 216 just before devaluation). Already there has been one round of drastic measures—increased taxation, compulsory savings, increased railway fares—and another is about to begin, with restriction of credits and a cut in subsidies for new housing. All that London has been willing to do to help has been to increase its buying price for butter and bacon by $7\frac{1}{2}$ per cent, while the selling price of British coal has been going up by 20 to 25 per cent. To make things worse, only 700,000 tons of British coal are to be spared this year against the 4,200,000 tons the Danes require.

British officials can put up strong arguments for every decision that has been taken. Nevertheless, the story as a whole is a deplorable one of a strong country knowingly inflicting economic hardship on a weak Denmark has felt the cutting edge of the same British policy whose blunt edge made no impression on Argentina. Its farmers have been faced with an attitude that has subordinated all other considerations to the aim of keeping down the British cost of living and keeping Commonwealth producers sweet. If the coal that Denmark needs had been available, and at

a reasonable price, the predicament would have been less acute. As things are, its people face a new period of austerity and difficulty at a time when it is being asked to rearm for the common defence. And at the root of the difficulties it sees a British policy which, from the eastern side of the North Sea, looks uncommonly like national socialism.

Without drastic changes in the British Government's buying methods and policies—which are, unfortunately, as unlikely as they would be justified—no quick remedy for the economic side of Anglo-Danish relations is likely to be found; but the question should be asked whether some more could not be done to help Denmark in securing armaments which, with its payments difficulties, it will be unable to buy abroad. It should surely be possible, either within or outside the mutual aid plans of Nato, to give or lend British naval vessels and equipment, to make the purchase of fighter aircraft easier, and generally to assist Denmark in speeding up the strengthening of so crucial a position. Even to discuss such aid would show good will and generosity towards an ally which values the British connection more highly than any other.

Town Planners' Apology

DR DALTON has presented to Parliament a progress report on the work of the Ministry of Town and Country Planning*, covering the eight years (1943-51) of its existence as a separate department. The document is a comprehensive *apologia pro vita sua*, written more in sorrow than in anger by a Ministry whose actions have long required a considerable amount of both explanation and justification. This report meets, at any rate, the need for explanation. The organisation and work of the Ministry, the nature of the planning process, and the policies pursued in various fields are set down lucidly and in detail.

Moreover, criticism is beguiled by the sweet reasonableness with which it is all written. One by one the problems and difficulties of town and country planning in postwar Britain are patiently expounded, until the reader starts to believe that in all the circumstances the Ministry has done well to get anything done at all. Throughout, emphasis is laid on the great number of interests which have to be consulted and, if possible, reconciled. This applies when a planning scheme is being drawn up or the use of a particular piece of land has to be settled. It is hammered home that Britain is a crowded island, which since the war has become a great deal more crowded. More land than ever before is needed by the local authorities for housing, by the public for recreation, by the armed forces for training and defence purposes, by mineral undertakings and public utilities for economic development; at the same time the protection of good agricultural land has become, for the first time, an article of public policy. These facts explain why some planning decisions take a long time to be reached, and why some interests are often aggrieved by the decision—and blame the Ministry.

The report also explains patiently how it is that progress with many planning projects, such as the building of new towns and the redevelopment of the "blitzed" city centres, has been so woefully slow. The main reason given is, of course, that the building of new houses on accessible sites and of factories needed for the export drive had to be given a prior claim on the resources of the construction industries. In addition, it is pointed out that a great deal of preliminary work is necessary before major projects can be started, and that at least they are now ready to be pushed ahead rapidly when the signal is given.

The planning machinery itself, it is asserted, is running reasonably smoothly. The time taken in deciding planning applications has been speeded up, and county councils have delegated a large part of their work to county districts or to area committees. The number of appeals to the Ministry against local planning decisions (inevitably large in the first years following the 1947 Act) fell to 3,168 in 1950. A considerable number of these appeals concerned the building of single houses in country districts, and the Ministry has now urged local authorities to give permission more freely for this type of development. Generally, the Ministry has been lenient by comparison with the more zealous local authorities, some of whom have protested against the removal of planning controls over farm buildings and over modest extensions to private dwellings—

Dr Dalton's "experiment in freedom." Local development plans are now nearing completion and, once they have been approved, there should be much less uncertainty and delay in the operation of planning control.

All in all the Ministry can claim that it has acted with care and caution and a readiness to compromise. For a Government department to be so modest about its achievements and so realistic about its difficulties is without doubt a sign of grace. But it gives rise to an awkward question. If the Ministry's scope for positive action is so small, why should its powers be so large? This elaborate planning machinery was set up and armed with very considerable powers on the plea that it was going to achieve great things in the work of physical reconstruction. It now comes before the public to plead that economic scarcities prevent its plans from being executed, and that it is led a dog's life by the difficulties of arbitrating over land use. The public may well feel sympathetic towards this recital. But it is bound to want to know what it is getting in exchange for its money and for the very considerable disturbance which the planning authorities and their auxiliary, the Central Land Board (whose activities this report is not called on to justify), are causing.

★

This question is not faced in the report. Nevertheless, an implicit reply is offered to it. The claim seems to be that, although town planning may not have achieved much in a positive way to date, yet it will do so in the future. The main Planning Act has been in force for less than three years, and the local development schemes are not yet operative. Everything is almost ready for a great move forward in physical reconstruction when the signal is given. The trouble is to know when the signal will be given, and the economic requirements of rearmament make the answer more dubious than ever. Moreover, there is something rather woeful about the game of seesaw which the Ministry has played with the other Government departments. After much bargaining, £4,000,000 has been set aside this year for a start on the reconstruction of all the "blitzed" cities of England, and the output of houses in the twelve new towns had reached (by the end of 1950) a combined total of 592, with 2,465 houses under construction. These are paltry results in terms of the enormous amount of planning and preparations which have gone towards these projects, and the high cost of overheads and staff connected with them. What is worse is that these programmes are only too likely to be cut back again as they were in 1948.

The Ministry cannot, of course, be blamed for the successive economic crises through which the nation is passing. It can be blamed for not knowing the meaning of effective priority. If the new towns, for instance, are worth having at all, then they are worth building at the cost of a cut in housing programmes in other parts of the country (a point which Dr Dalton at last seems to be realising). To build them in tiny fits and starts is both frustrating and costly, although the latter point is obscured by the elastic channels through which they are financed. The same point applies to the reconstruction of city centres. Alternatively, if these things are impossible luxuries, then they should not be undertaken at all.

* "Town and Country Planning," 1943-51. H.M.S.O. 5s.

A Ministry which spends its energies on carefully doling out resources among a multitude of projects, and calling for a fresh plan with every change in the economic breeze, can hardly expect to get things done.

A second defence which the Ministry can put forward is that, as Dr Dalton says in his preface, "the benefits of planning lie almost as much in what is not done as in what is done." This may well be so. But it is the very point on which the citizen wants more reassurance than the present report is able to give him. The routine work of planning administration mainly impinges on the citizen in a negative sense. It restrains him, on occasion, from doing what he wants with his land and buildings on the grounds that the final result will be in the general social interest. Inevitably, the benefits of town and country planning are slow to emerge. It is not fair to pass judgment on the regulatory aspects of town planning until the local development plans have begun to take shape—in practice (not on paper). But at least the planning authorities should bear in mind that, the less they have to show in the way of spectacular achievements, the more important it is that the routine administration of planning controls should be seen to yield a social dividend.

Dr Dalton is not unconscious of this need. To take one example, it emerges, strangely enough, that the protectors of rural beauty have got more justice out of the Ministry than is often supposed. The section on "Amenity" is the most persuasive in the report. The Ministry is doing a great deal to ensure that mineral workings do not harm the rural scene more than is unavoidable, that the Service departments waive their more unreasonable demands, and that woodlands are saved from unnecessary felling.

The Ministry has also been, on the whole, sympathetic towards the protection of good farmland—not all of which, of course, can be saved from development. It

regards the "lack of balance between town and country" in prewar years as a principal justification for its own existence. It has turned down some sites for new towns, and has greatly modified the acreage of those sites which have been chosen, so as to reduce interference with farming. It has urged local authorities to accept increased building costs in some circumstances as the price of protecting better farmland.

This policy illustrates, however, the grave economic difficulties which attach to deciding land use by administrative decision. It is easy to lay down principles, but to decide actual cases rightly involves (at the least) an enormous collation of information. Moreover, social interests are also involved (is it worth uprooting a few farmers to give a lot of townsmen a little more space and comfort each?), and the most the Ministry has achieved is a sort of rough scale of priorities, which may, in fact, make much less economic and social sense than appears superficially. It is small wonder that the Ministry groans somewhat under the weight of its responsibilities—but, after all, the Government did ask to be given them.

It is clear that the Ministry's optimism about the future, and faith in the efficacy of its own plans, is quite unimpaired. For instance, the report's section about London, after admitting that little has been done as yet to carry out the policy of the London plans ends smugly on the note that fresh plans are available for achieving these objectives. But does the Ministry really believe that in present circumstances it can achieve them? If not, it should give up this planning and replanning in a vacuum. Confidence in the future is a poor compensation for ineffectiveness in the past. The real question for the Ministry to consider is whether its capacities match its powers and responsibilities.

million. Now, and for the next few years, local productivity, though it is beginning to increase fairly rapidly in agriculture and fisheries, cannot keep pace with such a figure. Must the ingathering continue without limit? "Yes," says a majority, "for we have missed so many chances that we cannot leave a single life exposed to danger." Nevertheless, there appears this year in a Jewish Agency document the important phrase that "as long as immigration from Iraq proceeds at its quickened tempo, the Jewish Agency will be compelled to make a temporary cut in immigration from other countries."

But even if some such brake is applied, it seems clear that the admittance of 150,000 a year is planned for some years to come and that international payments must therefore continue to be balanced by extraordinary means. As the accompanying table shows, last year's principal balancing factors were the proceeds of the American United Jewish Appeal, drawings on loans made by the American Export-Import Bank, drawings on the sterling balances still remaining from wartime, and—last but not least—an item known as "imports without payment," which includes a variety of arbitrarily valued goods ranging from food parcels and private capital investments in kind to consignments of goods from "good uncles," which importers have been permitted to acquire provided that in so doing they make no call on the Treasury for foreign exchange. In planning for 1951 the Treasury is still hoping that the figure at which the total international balance is struck will not exceed the 1950 figure by more than 10 per cent. But where are the extra assets to come from? One item will be an all but final £9,000,000 from the sterling balances; these will peter out in February, 1952. The "imports without payment" device has been misused and has had to be curtailed. Some of the \$135 million lent by the Export-Import Bank is still available. Nevertheless a simple piece of arithmetic shows that even a United Jewish contribution at the 1949 level (the rate attained in the first three months of this year) will not fill the gap. The importance of the bond issue—and of a drive that is extra to, and not a replacement of, the older gift appeal—is self-evident. By July 4, when the wealthy American citizen disappears on holiday, the shape of Israel's prospects for this year and next should be fairly clearly discernible.

★

Inside the country, nearly all that good planning and hard work can do to mitigate the unbalance is being done. Capital investment is being directed as far as possible into channels that will quickly reduce the import bill. So far, this policy's most impressive success is in the field of irrigation, achieved, to date, entirely from a persevering boring of deep wells. Thanks to this effort, agricultural production rose in 1950 by 40 per cent over the 1949 figure. Another impressive sight is the instantaneous use of the manpower contributed by the new immigrant. Transferred within days of his arrival to a so-called "transit camp" which is in fact a work camp, he is set to earn good wages (paid to him by the Jewish Agency out of American charity) which buy him his food and necessities; in return for this he terraces hillsides, lays roads, plants trees, lays waterpipes—in general, lays the foundations of more productivity. The army, which—so long as the state of armistice lasts—mops up unknown and excessive amounts of the nation's wealth

and manpower, makes up for some of this by giving at least nine months of its two-year term of conscription to agricultural training. Plans are also laid, of course, for greater production of exports, but, by comparison with the annual rise in the import bill, the increase in these is still negligible. Many projects are held up through world shortages of raw materials. The bulk of export proceeds still comes from two old standbys, citrus fruits and industrial diamonds, which together made up £19,000,000 out of the £112.5 million worth of exports in 1950. The difficulty of finding markets for industrial goods manufactured at an inflated and rising cost of production has therefore not yet become apparent, but it will.

ISRAEL: BALANCE OF INTERNATIONAL PAYMENTS 1950			
£1000,000			
	Credit	Debit	
Current account :—			
Exports and Imports	13.2	92.4	
Shipping	0.9	10.6	
Tourism	1.2	1.0	
Interest and dividends	...	0.5	
Miscellaneous	8.5	8.9	
Total current account	23.8	113.4	
Transfers of capital and Remittances :—

Imports without payment	18.3	...	
Other capital import	21.3	...	
Total transfers of capital and remittances ..	89.6	Nil	
GRAND TOTAL	113.4	113.4	

Whichever way the financial planner turns, he encounters some new difficulty that throws him back to the problem of how to balance payments if large-scale immigration continues. For instance, his "imports without payments" scheme, which looked so promising, has turned out to be like one of those new drugs which produce one disease while relieving another; it entailed purchases of dollars on the free market that have helped to weaken the value of the Israel pound. The weakening has also been caused by using for purchases of capital equipment some of the foreign exchange set aside as backing for the currency. "Our productivity must be our cover," proclaims the Treasury, and, so saying, has allowed a cover which stood at £28.3 million as against circulation of £50 million in December, 1949, to slide to £5.01 million as against a circulation of £83.47 million in mid-April, 1950. Inflationary spectres loom everywhere. Already in February the Government had failed to resist a demand for wage increases by the metal workers. Since then countless other trades have been applying the screw. Wage demands now abound, and no political party wishes to gainsay them with elections due on July 30th. The inflationary spiral is mounting.

Yet, despite the weaknesses—the loss of confidence in the Israeli pound on the international market, the inflation, the mounting cost of production and the uncertainty about how international payments can be made to balance unless American Jewry pays—there is something jaunty, wholesome and invigorating about the scene inside Israel. It is a rare sight in the world today to see so many people who are confident that they are better off than they used to be. A majority are still living in a state of wonderment and pleasure at nationhood, a status which few of them expected nearly so soon.

Funds and Faith for Israel

(By Our Special Correspondent)

ON May 10th, Israel's Independence Day, Mr Ben Gurion, the Prime Minister, gave a command performance in New York. At the request of American Jewry, which has undertaken to run a powerful new campaign for funds provided that Israel will send over every available orator, he inaugurated in Madison Square Garden a drive in aid of a bond issue of \$500 million for Israel. This sum is one third of the cost of an economic development plan which the state hopes to carry out in three years, if world supplies of capital equipment allow. The remaining two equal thirds will be sought, the one from gifts and grants-in-aid (chiefly from the United States also) and the other in loans to be raised in Israel itself and in the Old World.

The bond drive must not be confused, therefore, with the United Jewish Appeal for money gifts which is made annually in America—an appeal which yielded \$150 million in 1948, just under \$100 million in 1949 and between \$70 million and \$80 million in 1950, about two-thirds of which went to Israel. That appeal is in progress also. The bond drive is an extra and a new departure. Whether it will clash with and reduce outright gifts is a matter of speculation and controversy. It

may well not do so while it enjoys the flush of novelty and of the American armament boom; but at a later stage the one method can hardly fail to impair the other.

This consideration, however, is brushed aside by the Israeli Treasury. The force of circumstances—a sheer shortage of resources—has driven that body into a policy that looks no further than rounding the next bend; the problems of 1952 lie beyond it—and can wait. Here is one aspect, probably the most important, of the strange compendium of financial stringency, efficient organisation, thrusting determination, narrow preoccupation with self, hard work, sleight-of-hand, pride of achievement and free grumbling that makes up the scene in Israel today.

The financial crisis constitutes the black side of this jumbled picture. How are the country's international payments to be made to balance year by year if national policy demands the continued admittance of flocks of Jews at present living in actual, or imagined, insecurity? In the year October, 1949, to September, 1950, nearly 173,000 arrived; there are likely to be a further 200,000 in the current calendar year. At present prices, every 150,000 new immigrants send the import bill up by £110

The fact that rations are not always honoured is probably the chief cause of any failure of internal confidence in the currency; but this is mitigated by such devices as the sale of dollar-linked savings bonds, redeemable in dollars in eight years' time.

Of course there is grumbling at the austerity and the shortages. Shop shelves are empty except of goods for which coupons are needed. Of course there is a flourishing black market in a land where requirements range from those of an ex-German to those of an ex-Yemenite; the latter does not need his soap and clothing coupons and sells them at once. There is endless exasperation at the most uncomfortable pressure on public services—telephones, buses, even water in the town of Tel Aviv. There is serious overcrowding in the cities, but there will be plenty of room in the countryside if, as is planned, there is intensive immigration and cultivation. The new agricultural settlements lie cheek by jowl in the strategic areas—notably in the Jerusalem corridor. The road to Jerusalem must never be threatened again. But elsewhere, and notably in the pleasant rolling country between Beersheba and the Jerusalem road, it is possible to drive for miles without meeting a soul. There is no real demand or need for *lebensraum*, and if—as is expected—the expansionist (*Heruth*) party loses seats at the July polls, it will show that the Israelis realise this.

In contrast to all other middle Eastern countries except Turkey, here is a people that does not procrastinate. It does not merely plan "development"; it works at it. Developments in embryo are visible everywhere. Some of them, already in operation, show what can be done, even with a desert, as soon as money, purpose and technical skill work hand in hand. No one contemplates failure. If the citizen of Israel grasps the precarious nature of his country's financial position (which is rare) he does not despair at the thought of it. For does he not hold the joker? What sort of a figure would American Jewry cut if it were to let him down?

NOTES OF THE WEEK

New British Warning to Teheran

The breach between the British and the Persian Government is now in the open. Amiable reiterations of the interests of both governments in "maintaining good relations and in consolidating the ties of friendship" no longer even attempt to hide the deepening bitterness. During the past three months Teheran statements when read in London have appeared unrealistic and unreasonable while London declarations have apparently been received in a similar manner in Persia. Exchanges which have brought the breach into the open began on May 8th when the Anglo-Iranian Oil Company made a proper request to the Persian Government to submit their differences to arbitration in accordance with the terms of the concession. Before the Persian Government had had time to consider this proposal, the Persian Ambassador in London delivered a note to the Foreign Secretary which in the strongest terms rejects the demand for arbitration and suggests that international bodies such as the Hague Court have no right to interfere in what Persia considers to be "a purely domestic matter." The Ambassador refused to discuss with Mr Morrison the terms of the Note on future developments and the methods Dr Mossadeq's Government proposes to employ in making "the necessary arrangements for enforcing the nationalisation law." It seems quite useless to point out to the men now in power in Teheran that

There is one serious shortcoming, besides the financial weakness, in Israel's make-up: that is the proverbial inability of Jewry to see the other fellow's point of view. Israel earnestly wishes to be a good neighbour. "Above all, we need peace with the Arabs." But the man who says so will simultaneously proclaim that his country needs, deserves and must have a \$150 million grant-in-aid from the American Government, and that it is no concern of his if this figure is out of proportion to that granted to any other Middle Eastern state. Again he will say (while treading down ex-Arab vines in his eagerness to show off his tractor) that compensation can never be paid to people who ran away. He sees in resumed relations with his neighbours only the advantage to himself. Their feelings seem to be outside the range of his imagination. His vision is narrowed still further by a disastrous shortage of foreign books, foreign newspapers and facilities for foreign travel, all denied to him on account of the lack of foreign exchange. He is living in a box. Nationhood, therefore, has hardly a chance to cure him of his age-long obtuseness in human relations with non-Jews.

Of all the speculations about Israel in which the mind can indulge, one of the most interesting and important is: what kind of a people is now being formed there? Will its standards fall from the would-be American towards the Oriental if all its people are for years forced to exist in conditions of severe scarcity of goods and services? The more backward newcomers from Asia and Africa are proving quick to adopt the superficial traits of the West, but are they picking up what is best in its way of life? They are breeding far faster than the ex-Germans. Will the children of the two stocks, who are inevitably the mixers, gravitate towards the higher or the lower standard? No one can tell what sort of a mixture will, in a generation, emerge from the crucible. The only fact that is certain at the present stage is that American Jewry will have to keep on buying bonds if it wishes to find out.

they voluntarily conceded certain small sovereign rights when they signed the concession in 1933.

The British Government is seriously hampered in any action it may wish to take by the fact that it is extremely difficult, if not quite impossible, to talk to the hotheaded men now in power in Teheran. London is also gravely disturbed by lack of sympathy and moral support from Washington. However, the issues at stake for Britain, the Atlantic Powers and, incidentally, Persia are so great that the Foreign Secretary has—with Cabinet approval—drafted a reply to the latest Persian Note hinting that if the Teheran Government attempts to take over the installations on the petroleum fields or the refinery at Abadan then the British Government will resist such action by force. It is no secret that there are sufficient numbers of British troops and aircraft in the Middle East to make such an operation possible. The British Government has carefully weighed all the possible consequences of the use of British troops, which include Communist disturbances in Teheran and troop movements on the northern frontier. It still believes force will not be necessary but it has rightly decided that unless some firm attempt be made to control the irresponsible Nationalists now in power in Teheran they will not only destroy their own country but inflame the whole of the Arab Middle East.

The British at Strasbourg

The European Assembly now meeting at Strasbourg presents on the surface a smooth and unusually business-like appearance. "Settling down," it seems to suggest: "accepting the limitations of international action and cultivating the possibilities that remain." Its agenda is precise and well-documented, covering specific issues such as should warm the heart of the most frigid anti-federalist; a report from the OEEC (true, it reveals nothing new and recommends no useful line of action, but contact has been established); a project for integrating European transport; a solid survey of full employment and the current problems of inflation; the Pfimlin plan for European agriculture; and others.

As its agenda has come down to earth, so its scope as a consultative body, which wields influence rather than legislative power, has been given new promise. Western Germany is now a full member; and M. Spaak as well as M. Schuman can claim credit for bringing Germans and French into a joint enterprise. Simultaneously, some move has now been taken towards forging the transatlantic link to which the British have clung so strongly in formulating their attitude to Europe. America and Canada are to be invited, if the Assembly follows the recommendations of its Ministers, to send representatives to the October session of the Assembly; and there is an interesting proposal to form a resources and purchasing board which could represent western Europe as a whole before the producers of raw materials.

So much for the surface. The deep waters remain as troubled as they have ever been. Most of the Europeans have retreated into what is called the functional approach; but they have done so in the hope, if not the belief, that this is merely a longer way to their ultimate goal—federal union for Europe with British participation. As things stand at present, this is a hopeless underestimation of the Labour Government's rooted antipathy to any form of supra-national arrangements with Europe. And it would be rash to expect much more in practice from the Conservatives. The Continent should have been warned by Lord Henderson's objection last week to Dr Adenauer's proposal for a "European" solution of the refugee problem. The truth is that "functional" means to Britain "inter-governmental" in the style of the OEEC; "functional" to the Continentals is exemplified by the Schuman Plan.

Sooner or later, this must lead to a clash, more disillusioning perhaps even than the initial impact of British scepticism on the early ambitions of the federalists. The full realisation of the gulf may dawn in the current debate on the amendments to the Statute; it may only emerge bit by bit as each attempt to set up a supra-national agency is frustrated. The obligation is on Britain to deflect some of the disappointment by a gesture with which it would finally accept the need for some European gathering with real influence if not with real powers. A Socialist M.P., Mr Anthony Crosland, has suggested that the Committee of Ministers of the Council of Europe and the ministerial council of the OEEC should be amalgamated.

Teeth, Spectacles and Pensions

At the cost of an extra £4,000,000 on pensions this year, and the promise to re-examine the health service charges again in 1954, Mr Gaitskill has secured the passage through the Commons of the two measures, the Health Service Bill and the National Insurance Bill, which embody those parts of his Budget that were criticised from his own back benches. With his flanks reasonably secure he will now be able to concentrate, after Whitsun, on the Tory attacks on the committee stage of the Finance Bill.

This has required some difficult Parliamentary manoeuvring which bears the stamp of Mr Attlee's own skill. No sooner

had the tumult on the committee stage of the National Health Service Bill died down, leaving the Parliamentary Labour Party shocked and anxious, than the Government had to face more trouble on the committee stage of the National Insurance Bill. This time, moreover, the pressure came, not from Mr Bevan and his associates, but from a group of trade unionists who stand well to the right, and who had been urging an extension of the higher pension rates ever since Budget Day.

The danger in this situation was that if the Government stood firm, and refused any extension of the pension increases, the trade unionists would be driven into the lobby, or at least would abstain from voting, alongside a gleeful Mr Bevan. Mr Attlee knows that the Bevanites, who so far are almost exclusively left-wing intellectuals, want nothing more than a common front with the trade union wing on some immediate issue, and he decided to compromise. Together with Mr Gaitskill and Dr Summerskill, the Minister of National Insurance, he met a delegation of members concerned with the pension increases, and on Wednesday the Government yielded by extending the benefits to a wider range of pensioners. (In brief, people who have reached the pensionable age of 65 for a man and 60 for a woman by the time the new rates come in will be eligible for them on retirement. People who reach pensionable age later will have to work for the higher rates—or wait five years.) In this way the threatened protest in the Chamber was averted, and a rebuff dealt to Mr Bevan, who got nothing for his denunciations of the health service charges, while the cautious men who pressed the pensions demand got a good deal.

Being "Lavish"

The concessions on old age pensions, announced by Dr Summerskill, Minister of National Insurance, do not go as far as the Labour critics would have liked. They will also, by distinguishing between people who reach pensionable age before and after the day that the new rates come into force, create anomalies which will lead to considerable discontent—and possibly renewed pressure for higher rates all round. But the concessions show once again what strength the pensioners' case can muster at Westminster.

Yet the steadily increasing burden of old age pensions has been emphasised from the Beveridge report onwards.

Recently, the Government actuary, in his report on the financial provisions of the new Bill, stated that the subsidies from the Exchequer will, in twenty-five years' time, have to be larger than was contemplated when the Act of 1946 was passed. And this is true although he has been instructed to assume an average unemployment rate of 4 per cent instead

of 8½ per cent. The accompanying diagram clearly shows the increasing burden on the Exchequer. It gives, for selected years up to 1977-78, the total income that the national insurance fund will need to meet its estimated expenditure; and it shows that, whereas contributions from employers and employees remain fairly constant, the Exchequer payments needed to keep the fund in balance rise rapidly.

Everybody deplores the existence of poverty in old age. The lot of the retired miner, whose circumstances often make it impossible for him to go on earning after reaching pensionable age, has been eloquently pleaded recently. But it cannot too often be stressed that to increase the contributory pensions of the poor by a few shillings also means increasing the pensions of all those who are already adequately, and even comfortably off. In 1954 the whole insurance scheme is to be reviewed, and then the time may come for both pensions and contributions to be altered in the light of the changed value of money. In the meantime, the poverty of old age pensioners should be relieved in the same way as is poverty among other sections of the community, that is, through the national assistance scheme—by which, incidentally, relief can be given more speedily than by changes in pensions. The warning of the Beveridge report ought to be recalled:

It is dangerous to be in any way lavish to old age, until adequate provision has been assured for all other vital needs.

* * *

The Place of Assistance

The recent debates in the House of Commons have thrown into relief the position of the National Assistance Board in the coming months. Last week a Conservative member, who obtained some Labour support, sought to impose on some machinery other than the Board the task of deciding whether a person should be allowed a grant towards the charges for false teeth and spectacles. A similar point was argued before, when the Board was made the instrument for assessing the "net disposable" income of a person applying for free legal aid. But in the present debates a clear division of opinion is apparent over the summoning of the Assistance Board into the national health service. The Conservatives' attitude is that *ad hoc* machinery should be set up to deal with the claims for grants to meet the charges. Their view is that the obligation to apply to the Assistance Board will deter many people with just claims to grants from making them. Their objection is not to the charges but to the method of avoiding hardship, which, in their view, will not be successful. Yet no other body has the organisation and skill possessed by the Assistance Board for assessing applications for financial help. The great virtue of the Board is that it works to national scales of relief but has wide discretionary powers in individual cases.

The Labour objection to the Board is much more fundamental. It is based on the re-entry of the means test, albeit under another name and far more generously applied, into the social services. This objection is very natural. The whole purpose of the Beveridge report and the legislation following from it was to provide, as of right, benefits and pensions adequate for subsistence and a comprehensive health service available to everyone. National assistance was to have a strictly limited and diminishing scope. Instead, basic assistance payments will soon be higher than sickness and unemployment benefits and "elderly" people's pensions, and now the assistance principle is being introduced into the health service.

Yet, once again, there is no alternative. The assumptions underlying the legislation of 1946-48 were that peace would be maintained, and the cost of living be stable. As it is, faced with the new rearmament programme and mounting inflation, the country will have to accept the extension of the assistance scheme, and consequently the return of the means

test, as the only way of keeping Government expenditure within bounds and at the same time relieving the worst hardships.

* * *

Health Service Savings

After its stormy passage through the House of Commons the new National Health Service Bill has gone to the House of Lords, where it received its second reading on Wednesday. The only big change made in the Bill in the Commons cannot be said to have improved it. This is the new clause restricting the duration of the charges for false teeth and spectacles until April, 1954, unless they are continued by affirmative resolution of both Houses for further periods of one year at a time. The clause was moved by the Government in an attempt to placate the dissidents of its own party. It can have point only if by April, 1954, the country's finances will be able to bear a further increase in expenditure on the health service without the charges; or if there is a reduction in the cost of running the hospitals; or if the £25 million to be saved by the charges in a full year can be found by economies elsewhere in the service.

None of these possibilities is at all likely. The cost of the hospital service is virtually bound to go on increasing, particularly as such a large part of it is made up of salaries and wages, which will tend to rise with the cost of living. If the general practitioners' claim to a higher capitation fee is granted, another £7,000,000 will have to be found this year. All that the clause will do is to create uncertainty when hospital committees and boards are drawing up their budgets for 1954-55, which they will be doing in the autumn of 1953. If the clause is to do any good, the enforced renewal of the charges should be made the occasion for a more radical review of the health service. Clapping a charge on false teeth will not re-establish the priority of the local authorities' dental services for mothers and children. If a limit is to be maintained on the total cost of the health service—so that some needs will have to be left unfulfilled—a system of priorities will have to be established. The method of financing the health service should be recast with this object in view.

* * *

Morale in Korea

While the debate on policy between the Truman Administration and General MacArthur goes on before a Congressional Committee, the United Nations forces in Korea are fighting a war as tough and bitter as any of modern times. The Chinese Communists' will to gain decisive victory is apparently still unimpaired, and their plan seems to be to launch a series of offensives in the hope of breaking through the Allied lines or wearing down the resistance of General van Fleet's army. The first blow was parried and ended in an Allied success, but not until after the Allied line had been severely hammered. At the moment there is a lull, and the member nations' forces can claim considerable success in repelling a mass onslaught on their line. In this action the Gloucester Regiment suffered heavy losses in its gallant stand on Hill 235, which symbolised the very nature of this strange campaign. This great action of a British unit in the common cause has been recognised by a United States Presidential unit citation which declared that the "indomitable spirit and heroism of the famous Gloucestershire battalion will long be remembered as an outstanding example of courage and determination by all freedom-loving people."

General Marshall has now put squarely to the American people the choice between the limited war in Korea, at present being carried on and the "great hazard towards developing a much enlarged struggle with consequently larger casualties or a complete world war." General Marshall pulled no punches in his condemnation of General Mac-

Arthur's policy; in particular he flatly contradicted the latter's low estimate of the strength of Russia's Far Eastern forces. As General MacArthur was wrong when he believed that Communist China would not intervene in Korea, Americans may not be easily convinced that he is right when he declares so confidently that Russia would not intervene to save China. General Marshall, however, has not been content to warn America against MacArthurism; he has given his own formula for victory. Part of his testimony on this subject was deleted by the censor, but in the part that was published he defined his aim as inflicting "the greatest number of casualties we could in order to break down not only the morale but the trained fabric of the Chinese armies." In other words, the American Defence Secretary recognises that this is a war of morale and endurance, and it should be clearly recognised also on this side of the Atlantic, where it is important that Government statements and speeches should give more prominence than hitherto both to the great international enterprise in which Britain is taking part and to the fact that British soldiers and sailors are waging war, and it is a war that the free world cannot afford to lose.

This is much more than a war to save Korea; it is ultimately a war to deter Russia which the free world cannot afford to lose and which it can win by forcing a draw on the battlefield. Nothing but experience can be expected to convince Moscow and Peking that aggression will not pay and that the free world has not only the capacity, but also the will, to fight if attacked. Stalin has publicly committed himself to the view that the Communists will win in Korea because Allied soldiers have nothing to fight for. Actions such as the defence of Hill 235 should make Stalin's advisers consider whether there may not be in the free world some native hue of resolution which he has previously overlooked.

* * *

The Lesson of Lower Saxony

The elections in Lower Saxony last Sunday brought success to various groups which have one thing in common—the desire to overthrow Dr Adenauer. Eleven per cent of the voters in a very high poll favoured the blatant Nazis of the Socialist Reich Party. Sixteen members of this party will sit in the new *Land* legislature, including presumably its leaders, the former Major-General Remer, Dr Dorls and Count Westarp—all men who openly aim to revive National Socialism. Their success was achieved in spite of, or even because of, the way in which Dr Lehr, the Federal Minister of the Interior in Bonn, energetically entered the field against the party in the last days before the poll. On the eve of the election, the Federal Cabinet banned "Reichsfront," Remer's copy of the Nazi stormtroopers, although the Land Government of Lower Saxony had permitted its jack-booted members to operate at election meetings.

It is equally disquieting to find that Dr Adenauer's pro-Western party, the Christian Democratic Union, practically disappeared in the elections. It was engulfed in the alliance it formed with the *Deutsche Partei*, a party which has two members in the Federal Cabinet, and is not very much less Nazi than the followers of Remer. The alliance lost ground heavily last Sunday (though it still won 23 per cent of the votes) and most of its victories are attributed to its right wing. The election organiser for the CDU-DP alliance in Lower Saxony, it may be noted, was Dr Ehrlich of the *Deutsche Partei*, who was billed on placards as former *SS Obersturmfuehrer* and Nazi party representative in Italy. The Social Democrats, on a nationalist platform, retained their position as the largest political group, with one-third of the votes; while the refugees' party, the BHE (*Bund der Heimatvertriebenen und Entrechteten*) won 15 per cent.

The lesson of Lower Saxony for Western policy-makers is clear. It is that the dispossessed and unemployed—particularly the Protestants among them—will turn to Nazism

against the predominantly Catholic and Western policy of the Christian-Democrats; and that an unholy alliance between the Neo-Nazis and Moscow's German dupes is always a possibility.

* * *

The Nazis and the Russians

From a different point of view Lower Saxony—like Schleswig Holstein—is bound to be an important danger spot. Both are filled with Protestant refugees, many of whom are unemployed. Lower Saxony's chief heavy industry, the former Hermann Goering works at Watenstedt-Salzgitter, was created by the Nazi regime only to be crippled by Allied dismantlement. The Soviet Germans have had some success in their efforts to show that Salzgitter and Lower Saxony's important canning industry might be saved by reunion with the Soviet zone.

The Socialist Reich Party, like almost every other neo-Nazi group, has some leaders who toy with the Soviet Germans as well as others who proclaim their task to be the fight against Bolshevism. Dr Dorls is alleged to have declared that his party would "act as traffic controllers for the Russians if they marched into the West," and a number of party members split off on the eve of the elections in protest against this attitude. For the west, the fact to bear in mind is that the SRP and the Communists were the only parties in the *Bundestag* who did not vote last January against holding talks with the Communist Herr Grotewohl. It must not be forgotten that whether they oppose Communism or fall in with the Soviet Germans, the new Nazis will never be anything but enemies of democracies. If the SRP is not to multiply, Dr Adenauer's government and the western powers must both heed the lesson of Lower Saxony and seek a political answer to it.

* * *

A Bad Piece of Development

Dr Dalton is to be congratulated on his sensible compromise judgment in the Briar Patch case—a case which has aroused, very properly, a degree of heated public opinion suitable to a symbolic cause. Mr Ralph Kirby's improperly sited, improperly constructed, and generally irregular bungalow is, in principle, condemned; it is a "bad piece of development" and bad pieces of development, one with another, have messed up enough of England already. It is, however, reprieved for three years, which brings its total life up to within a substantial proportion of that allotted, in theory, to a prefab; and much may happen in three years, including, on an optimistic view, such an easing of the housing situation as would reduce the penalty involved in its condemnation from the catastrophic to the merely inconvenient.

This is as it should be. Those stern-souled upholders of the law who claimed that omission to pull down Mr Kirby's home about his ears on Christmas Eve—as was once the amiable intention of the Easthampstead authorities—amounted to a grant of *carte blanche* to every form of illegal development, and the torpedoing of the whole planning principle, have consistently confused two separate matters: the need for a deterrent against infractions of the plan and the desirability of doing away with bits of bad housing. There are plenty of deterrents available, in the form of fine and imprisonment, for other offences; there seems no reason why in this case the punishment should fit the crime more closely than in others. Persons who eat meals in restaurants without paying are not, after all, subjected to a stomach pump. Why, therefore, insist that those who infringe building regulations be punished with homelessness?

Because, it may be answered, the matter of their offence remains a public eyesore, obstacle, danger, or whatever is comprised in the term "a bad piece of development." This

1092

is, however, an argument for demolishing eyesores, obstacles, and bad bits of development in general—starting, according to common sense, with the worst, not with the merely fractionally substandard. When all England from end to end contains no worse “piece of development” than Briar Patch, that will be the time to start pulling Briar Patch down; and that will be a happy day indeed for planners and public alike.

* * *

Mr Bevan and the Unions

It is still too early to say whether Mr Bevan has much support in the country at large for his stand against the Government. Even among the trade unions no clear reaction to his designation is yet apparent. A fairly large minority dissented from the statement by the executive council of the TUC deploring Mr Bevan's action; but some of the dissenters have later explained that they were not objecting to the condemnation of Mr Bevan, only to the implication in the statement that the TUC approved the Budget when in fact the Budget had not yet been studied. The meeting of the economic committee of the TUC on Wednesday has taken the matter no farther forward, and opinions continue to be divided. The Scottish TUC, for its part, has roundly condemned the Budget, particularly the health service charges and the increased entertainments tax, and therefore presumably supports the stand that Mr Bevan has taken. But so far as the major unions are concerned, only Mr Figgins for the railwaymen has come out with unequivocal support for him.

Neither resolution nor statement, however, necessarily represents the opinion of the majority in Scotland or in England and Wales. The delegates have not yet been briefed by their branches, and statement and resolution were made without any reference to the rank and file of the trade union movement. Indeed, the indications at political meetings have been that the great majority of trade unionists were quite undecided in their opinions. Mr Bevan's reputation during his short term at the Ministry of Labour was high, and the unions had strong hopes of what he might do for them. There was also a natural dislike of the return to austerity inherent in the rearmament programme. At the same time, Mr Bevan had yet to win the confidence and trust which Mr Attlee enjoys, and it seems unlikely that many trade unionists will follow him. The non-Communist part of the movement is not so sharply divided into left and right as is the Labour party, and Mr Bevan cannot consequently count on an automatic following of discontented left-wingers. But it will be some months before minds are made up, and opinion may not crystallise before the annual meeting of the TUC in the autumn.

South Bank and Fun Fair

The South Bank Exhibition is brilliantly conceived and staged and architecturally delightful. There is nothing very remarkable about the content of the exhibits: solid fare is provided only in the Dome of Discovery, where perhaps it is too solid. But the *décor* and the *montage* (two French words for which, significantly, there are no English equivalents) are graceful, charming and full of self-mocking humour. This is most in evidence in the “Lion and the Unicorn,” which attempts the self-conscious and difficult task of throwing light on the British character. Its section on the development of British civil liberties is certainly a theme for the times, and could have been extended at the expense of other exhibits whose significance is more obscure. The wafer-biscuit machine, the glass-blowers and the paper-makers in “Power and Production” are very popular, and more of these industrial processes in operation might well

have been included. Fittingly, “The Sea” is one of the most attractive pavilions. Another is “Homes and Gardens,” dealing with today's problem of saving space, and showing fine furniture which recalls a great reputation lost somewhere in Tottenham Court Road.

If British taste has improved in this respect, it remains unchanged in the matter of food. The catering is evidently based on the theory that the English prefer the food they are used to. But do they? They have taken, all too literally like ducks to water, to the continental delights of eating and drinking out of doors. It will be a pity if Britain's “contribution to the arts, science, industry and technology” makes a less vivid impression on the visitor than its lack of contribution to the culinary art.

The fun-fair at Battersea now makes its bow, in spite of yet another dispute to add to the long history of labour trouble. (A high proportion of the manpower is Irish.) Earlier this week some 900 men were working to rule, partly out of pique at some comments in the *Daily Mirror*, partly because the balance of a bonus due to them when the work is 98 per cent completed was still withheld. The appearance of surrender to this blackmail has been avoided by the payment of a bonus by the contractors instead of by Festival Gardens Ltd., as a token of their “faith” that the gardens will be ready for the week beginning May 21st. Presumably it will as usual be Festival Gardens Ltd. which, on behalf of the taxpayer, pays in the end.

* * *

Incentives for Yugoslav Peasants

The way in which the Yugoslavs are taking increasingly practical views of their economic problems was again illustrated last week end, when they moved another step away from the Soviet design for a Marxist economy. They have openly confessed the failure of their attempt to provide adequate supplies of cheap food to the urban population by buying fixed quotas compulsorily from the peasants at prices far below production costs. In future, therefore, the peasants may dispose of all their milk, meat, potatoes, peas, beans and lentils at free market prices. Only grains, animal fats and wool will remain for the time being subject to compulsory deliveries.

This concession was granted to the collective and state farms some weeks ago. Its extension now to the independent peasants (who still farm about 75 per cent of the arable land) represents a determined attempt by Marshal Tito to stimulate greater production and also, incidentally, to come to better terms with some of his least enthusiastic supporters. At the same time, rationing has been restricted to bread, fats, sugar and soap; and it is hoped that the greater supplies coming on to the free markets will eventually bring down prices. Former ration-card holders will be protected meanwhile against excessive prices. They will receive “cash coupons” which will entitle them to an 80 per cent reduction in the free market price of limited quantities of the food-stuffs now freed from compulsory buying. In other words, the Government has undertaken to subsidise the price of some foodstuffs to most sections of the community.

The new policy may well fail in its object if the village shops contain nothing on which the peasant can spend the extra cash put in his pocket. It is also clear that no marketing policy can stimulate agricultural production beyond a certain point if the farms do not simultaneously receive a far greater injection of fertilisers, seeds and machinery than they have so far. It is believed that the Yugoslav Government is well aware of these limitations on its drive to raise more food; and the provision of consumer goods and agricultural machinery, is among the subjects under discussion at the unfortunately prolonged talks on aid to Yugoslavia now taking place in London between the three western powers.

Controversy over West African Marketing

Three years ago the Gold Coast and Nigeria set up statutory boards for the marketing of cocoa, palm-oil products, groundnuts and cotton. Today these boards have already accumulated a tempting reserve of £150 million and are under sharp fire from two parties: first, from Africans who would prefer to see this huge cash reserve distributed in the form of higher prices for producers; second from a range of well-meaning persons who would like to use the funds for a variety of development projects and social services. There are those who go so far as to suggest that the marketing boards be abolished altogether, and that these valuable industries should be left to the unfettered market conditions of prewar days. The strength of the criticism and the unrest it reflects can be measured by merely citing one fact: whereas cocoa is now being sold on the world market at about £300 per ton, the West African producer is receiving about £130 per ton.

What the critics forget is the state of the West African industries in the prewar era, when wide and uncontrollable fluctuations in price and a sense of being “exploited” by buyers and exporters had led to widespread disturbances, culminating in 1938 in a six months' stoppage of all sales by Gold Coast producers. The Nowell Commission, which reported at that time, condemned the way the producers were being treated, and it was generally agreed that a stabilisation policy should be followed. This was the background against which the boards were established and, had there not been an unprecedented sellers' market in the last few years—or should a slump come in the next—the boards would no doubt earn a general blessing.

Today it is explained that the gap between the buying and selling prices of Gold Coast cocoa, for instance, is deceptive. To costs about £100 per ton must be added to cover freight, marketing and the increased export tax, so that the amount remaining for price stabilisation is hardly more than £70. Of the £53 million which this particular board has accumulated, £35 million has been allocated for price stabilisation; the board has also contributed millions towards endowing the University College, awarding scholarships to children of farmers, cocoa research and rehabilitation. The Nigerian boards are financing a whole range of activities under the Regional Production Development Boards. It must surely be a choice between two policies: to pay higher prices to farmers encouraging them to purchase goods already in short supply and tempting them yet further away from local food production, or to skim the cream off the unusually favourable market for general betterment and as a buffer against an uncertain future. In present circumstances the latter is clearly the wiser course.

* * *

Houses for the Old

The latest official manifestation of concern for old people is a new pamphlet, “Housing for Special Purposes,”* which deals principally with houses for the old. This is a manual of guidance for housing authorities who are interested in building houses for old people, for single workers and for other special categories. It is complementary to the two larger manuals already published by the Ministry of Health, which deal mainly with bigger houses.

Preoccupation with houses for the old does not only spring from humanitarian feelings, for, with the present shortage of housing, it is uneconomical for elderly couples or single people to occupy houses that are too large for their needs. It is hoped that the provision of more small bungalow houses or two-storey flats will encourage a better distribution of housing space according to family requirements. This is clearly a sensible policy, although old people are not always so ready to move as the policy-makers would

like. Among those who would gain, if old people could be housed in small bungalows and larger houses thereby released for families, would be the ratepayer, for the same Exchequer subsidy is given for a two-roomed cottage with kitchen and bathroom as for a five-roomed house. But in spite of this financial advantage, the issue is not so simple for a local authority whose waiting list is dominated by the needs of families with children.

The case for building a larger number of smaller houses is demonstrated yet again by the latest quarterly housing returns,† which were published this week. The number of houses under construction continues to hover about the 200,000 mark without any appreciable increase in the number completed. The only short-term steps that could be taken to improve the rate of output are to build smaller three-bedroomed houses, which Dr Dalton has recently agreed to, and to build more very small houses, particularly for the old.

* * *

Harping on the Stone

The debate in the House of Commons on Wednesday, initiated by Lord Brabazon of Tara, did not escape entirely from the Gaelic twilight of the last few months but there was a world of difference between, say, the contribution of Viscount Samuel and some of the outpourings earlier in the year. Lord Brabazon himself began by insisting that the Coronation Stone is old enough to have been Jacob's resting place but at least he marched forward in time beyond 1296. The removal of the stone last December had all the characteristics of a students' raid on the totem of a rival college. At least the Scottish peers who took part in the debate accepted that the stone was a symbol of equal reverence in the two kingdoms. Lord Samuel, speaking as a Liberal, agreed with the view that the stone should be deposited in Scotland but brought to Westminster for a coronation. Lord Strabolgi suggested a double coronation, at Westminster and in Scotland; Lord Llewellyn pointed out that, constitutionally, the King was also King of each of the Dominions, with a separate government in each, which would justify a claim for a separate coronation in each of the seven countries. But Lord Clydesmuir touched on the crucial point in the present argument, the misfortune to relations between the two peoples that has followed the linking of the Coronation Stone itself with the present discontent among the Scots over the amount of say that they have in their own affairs.

The Government has yet to make up its mind about the Stone. It is, of course, idle to suggest that its future custody should be decided by minds uninfluenced by emotion. The whole significance of the stone, on both sides of the Border, is emotional. The present Government, whose response to anything but a conventional class-feeling symbol is unusually low, has shirked the Scottish issue for six years. In con-

† Cmd. 8221 and 8222.

sequence, it has allowed an unsatisfied emotion to crystallise around a concrete, and largely irrelevant, object. The case against depositing the stone in Edinburgh is that, by now, the stone is not only a part of Scottish history. It is part of Commonwealth history. In the same way, Westminster Abbey is not only an abbey in England; it is the spiritual centre of a great part of the Commonwealth. A coronation, in form, may still be the crowning of a King of England. In reality, as the present King is so profoundly aware, it is the crowning of a King of a multitude of peoples.

Israel versus Syria

The quarrel which both Syria and Israel have now laid before the United Nations presents a very even balance of blame on both sides. It concerned a demilitarised zone that was formed as part of their armistice agreement. In March the Jews, pursuing a plan begun in 1934 for the drainage and reclamation of the malarial marshes round Lake Huleh, dug a channel into the zone. The Syrians complained to Uno, and its umpire ruled that the digging must temporarily stop. The diggers went on, and the Syrians put themselves into the wrong by opening fire. The Israelis, instead of leaving them in the wrong, went one worse by bombing from the air a post

inside Syria. Since then, intermittent exchanges of fire have been going on along the whole length of the zone, which is a long thin strip measuring about 16,000 acres, running intermittently from the Huleh area in the north to the point just south of the Sea of Galilee where Syria joins Jordan.

Amidst the noise of argument and gun fire, one major consideration has disappeared from sight. That is: what does each side think it is getting by going on shooting? The Syrians have nothing to lose by it. The state of near-war with Israel is no handicap to them. It scarcely affects their economy. Their army, which loves playing a role in local politics, is deriving nothing but gain from a situation in which it can win banner headlines daily at negligible cost in risk and ammunition.

The sober appraisal of the issue from Israel's standpoint leads to another conclusion. As any Israeli civilian will at once proclaim, peace with the Arab is a major objective. To achieve it would mean a reduction of army expenditure that a needy country can ill afford; it would also mean the import of local meat and fruit that would relieve horrid austerity. Something is wrong in the co-ordination between brain and hand when a country keeps up minor fusillades with a neighbour whose goodwill it needs so badly. In a word, Israel must weigh which matters most to it, hurrying into a few acres of the demilitarised zone, or attaining peace with the Arab states. There seems to be a difference of opinion on this point between its army (which believes in being "tough

with the Arabs") and its civilians who need peace. At the present moment, the army is winning the argument and peace is further off than it was three months ago.

Shorter Notes

As the bogey of General MacArthur grows daily larger, there are renewed and slightly anxious whispers in Europe about the means of preventing the same thing from happening there. Who, in fact, will command the Supreme Commander in Versailles? An article on page 1106 describes the latest reshuffle in the administrative apparatus of the North Atlantic Treaty Organisation; but it will be seen that nothing more has been done to cover this point. The reason is, or ought to be, that nothing is in fact needed. In the first place, SHAPE's task is not to fight a war but to prevent one; there is no question now of crossing parallels. Secondly, NATO, unlike the United Nations, has a comparatively clear line of political control already established, running from the Council, through the Deputies to SHAPE headquarters. Thirdly, the problem is in the last analysis one of personalities; General Eisenhower is not a MacArthur; he would prefer not to be described as a politician, but he undoubtedly has—rather more than a number of professional politicians—a highly developed sense of the diplomatic.

The striking improvement in public health in the British Caribbean, over the past 25 years, is illustrated by statistics of the expectation of life now published by the Development and Welfare Organisation in the West Indies. The average length of life of males in Jamaica in 1920-22 was 35.89 years and of females 38.20 years; in 1945-47 it had risen to 51.25 and 54.58 years respectively. A similar increase of 15 to 16 years in life expectation is registered in all the Caribbean colonies for which figures are available.

Burdening the Government

The extent to which some men, from the suspicion of others, or from a desire of ease and enjoyment beyond their reach, or from mere restlessness, demand the interference of Government, is one of the most curious phenomena of our time. It can never assume power enough to satisfy them. They continually heap new duties on it, and urge it to be grasping and ambitious. Though it be composed of men, a perfection is expected from a mere organisation, and demanded far beyond human nature. We are opposed to their demands, from a thorough conviction that the more heavily the Government is burdened, the more readily it is broken to pieces. The schemers propose to ensure a better supply of water, improved sewerage, or more favourable sanitary conditions; but they tend to bring about the destruction of the Government and the disturbance of the country. They would heap duties on it no human power can perform, and centre on it the irresistible discontent of universal disappointment. Whatever means may be adopted to secure the supply of water, the worst of all is to make it the business of the Executive Government, or of a board appointed by, and responsible to, the Government. . . . Those who have most loudly demanded that all the companies should be swept away now find fault with the Government measure. . . . Probably they would have a new department for the supply of water, another for the sewerage, another for the burials, and their schemes would multiply the cares and departments of Government, till the whole community were occupied in taking care of one another. For them it is unfortunate, but the world will not follow their recommendations, because they would speedily so impede or stop production that at no distant period nothing worth taking care of would be left.

Defence and Export

YEAR ago the difficulty was to make the western populations recognise the urgency of the need to arm. Reverses in Korea taught the lesson which exhortations could not drive home. This is the year of conversion of western industries to the new policy. Already shortages of material threaten; the problems of maintaining international stability in the economic sphere are real and immediate. It is thus entirely in the interests of the rising countries of the new world that Europe should lose no single chance of export trade if it can be taken without jeopardising the concerted effort to rearm.

Because so many of the needs of life, even refined life, which used to be imported from Europe are now manufactured in the new countries it becomes imperative to exploit to the utmost those opportunities where specialised products are offered from Europe which cannot be obtained elsewhere. Such a situation obtains in regard to certain categories of aircraft, turbines, and even the lighter piston engines. It is in the interests of the western countries as a whole that capacity be applied to the drive for exports in these special products.

Furthermore, it is important that wherever possible the needs of rearmament be integrated with the demands of the export markets. There are outstanding examples of aircraft and power units which, with minor differences, are able to serve both requirements. Deliberate action is necessary, however, if the free world is to benefit substantially from such opportunities.

No better example could be cited at the present time than that of British turbine-engined transport aircraft having jet or propeller-turbine power.

"In our haste to build a wall against the threat of bandits from the hills," said the ancient Chinese philosopher, "let us not neglect the seasonal planting of the rice."

DE HAVILLAND

Another important reason for the speed and flexibility of Underwood Sundstrand Accounting Machines.

You're looking at the control plate of an Underwood Sundstrand Accounting Machine. This little device does virtually all the "thinking." The operator simply inserts forms and enters figures. From there, the Control Plate takes over and enables the machine to complete the work automatically. You get controlled accuracy, too. Printed evidence of accuracy is automatically

Simplicity in Aligning Forms. Operators insert forms directly to the writing position in one fast, easy motion. furnished, on either a proof tape or an audit sheet, the instant each posting is completed. May we explain further, without obligation, in your own office?

Letters to the Editor

Baghdad and the Oil Talks

Sir,—Your article of April 14th gives only one of the reasons why the development of oil in Saudi Arabia has been more rapid than in Iraq, namely, that when the war interrupted the flow of materials, priority was given to established fields in Arabia in preference to exploratory work in the Basrah concession. An equally important factor which retarded development in Iraq was the fact that Iraq itself and the route of its pipeline outlets to the Mediterranean were the scene of military operations.

The war not only delayed exploratory work in the Basrah concession but had an even more immediate result in retarding the development of the Kirkuk field. Production from this field began in 1934 when it reached nearly 1,000,000 tons; by 1937 it had risen to 4,000,000 tons per annum, representing the maximum capacity of the 12 in. pipelines from Kirkuk to Haifa and Kirkuk to Tripoli. Plans made in 1939 for new 16 in. pipelines to Haifa and Tripoli were frustrated by the war, during which not only the Middle East, but also the Mediterranean were the theatre of military operations. Pipe for the 16 in. lines was ordered early in 1945 and by the spring of 1948 the line to Haifa was completed to within 50 miles of the Mediterranean seaboard when the disturbed conditions in Palestine caused the suspension of operations. Labour and materials were transferred to the northern line from Kirkuk to Tripoli. Pumping through this line began in July, 1949, reaching full capacity in 1950, with the result that by October, production from the Kirkuk field rose to an annual rate of 7,500,000 tons.

In view of the statement of your correspondent "Iraqi" in your issue of April 28th, that the denial to the Iraq Petroleum Company of the pipeline system to Haifa is "hardly capable of explaining the very low rate of oil production which has been prevailing in Iraq for a long time," it is pertinent also to recall that production installations in the Kirkuk field were planned on the assumption that the 12 in. and 16 in. pipelines to Haifa would be in operation.

By 1950 facilities at Kirkuk were capable of a production of 15 million tons per annum, or nearly four times the prewar production. They are now being expanded to 26 million tons per annum to utilise the capacity of the 30 in. line due for completion early in 1953, as well as the 12 in. and 16 in. pipeline systems.—Yours faithfully,

C. T. BARBER
Iraq Petroleum Company,
London, W.1

Charity and the Hospitals

Sir,—I have read your correspondent's article with very great interest and you may think that the following figures, which I have been able to collect since the beginning of the year, have some bearing on it.

Out of 425 deceased persons' estates of an approximate gross value of rather less than £5,000,000, 63 persons gave 121 separate legacies amounting to rather less than £253,000 to different charities (exclusive of hospitals). Over the same sample of estates I can find only ten testators who have wished to benefit hospitals (twelve separate legacies in all) amounting to almost exactly £40,000, but of these testators two died before the appointed day in July, 1948 (the legacies became payable following termination of limited interests) and these two testators accounted for £38,500 of the £40,000 given to hospitals. In the result, therefore, out of 420 or so testators who had the opportunity of altering their wills after the coming into force of the National Health Service Act only eight felt any desire to leave moneys to hospitals and gave the trivial sum of little more than £1,500.—Yours faithfully,

D. R. MARSH
London, E.C.4

Educational Priorities

Sir,—In your note last week on the House of Commons debate on educational priorities, you say, "Mr Maude went so far as to argue that expenditure on the universities should be sacrificed in favour of the primary schools."

What I actually said (*Hansard*, April 17th, Col. 1690) was this: "If we get to a point where we cannot have enough places for primary school children, and where we cannot give them a decent standard of education, then I, personally, would reduce expenditure on university education to meet that. That is what I meant by a No. 1 priority."

I would respectfully suggest that those two statements are not at all the same.—Yours faithfully,
ANGUS MAUDE
House of Commons

Malan's Breach of Faith

Sir,—I was interested in your comments and those of your Johannesburg correspondent in your issue of April 21st.

The genius of British imperial administration has been to close its eyes to anything that, though not in keeping with the better traditions of the British way of life, could be remedied only by methods too unpleasant to be contemplated—for instance, the withdrawal of British influence. Malan's mistake is not "apartheid" or "basskap," but making a political and administrative issue of these two very necessary bulwarks to white supremacy.

There are many different-hued peoples with whom the white can mix. But, and this is probably the feeling of the bulk of all settlers from Europe to Southern Africa, close association with the black man, on a level of equality, whilst perhaps theoretically desirable, is possible only for the armchair emigrant safely surrounded by millions of fellow whites.

The British consider themselves experts in administering non-white peoples. But let it be remembered that in no lands where the non-white predominate have the British settled and made their home with the exception of Southern Africa. It had best be realised by the British in the United Kingdom that an attitude of disinterested "liberalism" towards problems that affect their personal life not at all will do little to help mutual understanding.—Yours faithfully,

J. H. WINTER
Cape Town

Books and Publications

Cassandra in Search of a Myth

The Age of Longing. By Arthur Koestler. Collins. 448 pages. 12s. 6d.

Mr Koestler does not confine himself to the domain of pure fiction. His latest book is a prophecy of doom, and since it deals with the major political problem of our times—the conflict between East and West—it can also be judged as a piece of political writing. "The Age of Longing" is set in Paris tomorrow, in the early fifties, on the eve of an invasion by the "Free Commonwealth"—the future name of the Soviet bloc. While the latter devours one European "rabbit State" after another the West watches paralysed and can find no purpose for which either to fight or to die. Hannibal stands at the door, but the Frenchmen, if they have no plane to Morocco, are bought, bewitched or bewildered.

The contrast between an oversimplified powerful East and a caricatured impotent West is the theme of the book. This is illustrated even by the love story. Hydrie, a neurotic American Catholic, who has lost her religious faith is fascinated by Nikitin, a "Commonwealth" attaché, and the symbol of the new Soviet generation. He is a half-baked intellectual, who believes blindly and hence has ready-made answers for everything. Even when Hydrie discovers the inhuman side of Nikitin's creed and her attraction turns into revulsion, her attempt at murder is a failure. The invincible self-confidence of the Nikitins is contrasted with the hopelessness of their opponents, who have no faith, no myth, no discipline. True, the "Commonwealth" writer Leontiev "goes to Capua," that is to say, deserts; but he belonged to the Old Guard and anyhow prostituted himself for so long that he can no longer write an honest book. Unless the West can find a driving force, the warning seems to be that the world will belong to the Nikitins.

The picture is skilful and superficially convincing, but there are faults even in the exposition. Did Hydrie's discovery of the real Nikitin have to occur in a bedroom scene? The many anatomical and psychoanalytical metaphors would lead one to believe that the author has been contaminated with a form of French flu. Leontiev's performances in a Parisian cabaret are in bad taste and unnecessary. The characterisation is also poor: there are too many stock figures such as thinly disguised fellow travellers, a stereotyped American student, and the neo-nihilist "whynotist" philosopher. The dividing line between tragedy and farce is blurred. These are faults of invention and of style.

There are, however, graver drawbacks. The basic premise, that European "rabbits" will be devoured under the disapproving eye of an inactive America is outdated. The prophetic novelist, unlike the political writer, can experiment with history. Half-way through this book the Commonwealth Leader dies: yet the monolithic structure of his

State remains unchanged. But is not this picture of permanent Nikitinism too static and unrealistic? Is it not one-sided? History is more complex than Mr Koestler's imagination can conceive. The drama would have gained in intensity and veracity if it had portrayed Capua's impact on the Nikitins as well as the Nikitins' impact on Capua.

Even this unilateral view is distorted. Mr Koestler parodies the "whynotist" circles of Saint Germain, but his story scarcely leaves the Left Bank where Parisian Bloomsbury resides, and crosses the river only to enter a restaurant or salon. A real inquiry into France's dilemma should probe the attractions of the "Commonwealth" for the workers of Lille and the reaction towards it of, say, an Auvergnat peasant. The author's interests, however, lie elsewhere, with those who have lost their faith and seek a new one. Since "Arrival and Departure" the ranks of his crossless crusaders have swollen to include, besides ex-communists, ex-Polish landlords like his character Boris and ex-Catholics like his American Hydrie. It is the latter who finally sums up the longing of those who have left the Party, but still thirst for the myth and discipline of Stalinism:

Oh, if she could only go back to the infinite comfort of father confessors and mother superiors, of a well ordered hierarchy which promised punishment and reward, and furnished the world with justice and meaning.

Is Europe suffering from amnesia? Has it forgotten its recent painful experiences with those who sought and those who created new myths? This Cassandra paints our state in black in order to drive us out in search of a remedy. Yet some remedies run the risk of being more deadly than the presumed disease.

Dynamic Imperfection

Capitalism. By David McCord Wright. Economic Handbooks Series. McGraw-Hill. 246 pages. \$3.50. 28s.

Professor Wright is one of those all too rare economists who can integrate as well as analyse; who, without cheapening their subject, can both relate it to wider social matters and state that relation in language which the civilised layman can understand and enjoy. He has, too, a gift less easily defined; a capacity—one imagines deliberately cultivated—for always looking behind the word for the thing, the real, complex, shifting phenomenon, for refusing to let any argument turn into a mere juggling with semantic counters. These gifts serve him superlatively in "Capitalism."

Capitalism is one of a number of economic settings in which society can deal with its universal civic problems, which Professor Wright lists as the selec-

tion of rulers, the arbitration of disputes, the enforcement of decisions, production for customary living standards, and allocation of that production—plus, in a society with progressive aspirations, growth and the improvement of the quality of life. That these problems are universal and do not "wither away" in even the most perfect Marxist society is a proposition which he demonstrates unanswerably. He concedes that as an economic setting capitalism is not essential or even markedly superior where growth and the improvement of quality are matters of indifference and no importance is attached to giving the consumer what he wants. Growth, however, implies needs which no rival system can meet as well, and problems to which the rivals are equally incapable of providing a perfect solution; while a demand for democratic freedoms (choice of job, choice of consumption, opportunity to find one's own level, participation in decisions) calls for an effective competition among leaders whether in politics or business, and for an economic independence among the rank and file, incompatible with the existence of a sole employer.

Growth demands entrepreneurship, the function of "putting over" the new. Inventions and saving together make progress possible, but in the absence of the "putter-over," the marriage-broker of ideas and resources, the former will lie fallow and the latter run to waste. The entrepreneur can, of course, be a public servant, but outside the free-enterprise economy incentives to dynamic entrepreneurship will be weak, selection of entrepreneurs will be rigid, and, in time, the opposition of vested interests to change will be paralysing. (Anyone believing that Russian experience refutes this is referred, with condolences, to the text.) For growth implies instability. Demand does not increase symmetrically; new techniques devalue existing skills; above all, investment to meet new demands and exploit new techniques is inherently and inevitably discontinuous and jerky.

Professor Wright does not claim for capitalism that it makes the best possible job of this intractable problem, or indeed of others. The question of the degree of competitiveness, the size of the producing or controlling unit, is much less simple than the out-and-out trust-busters believe. The ethics and psychological motives of capitalism are inadequate; its techniques for mitigating the discomforts of growth, even for preventing their unnecessary magnification, are still highly imperfect. Some of its faults are remediable, but not all. The reader, in fact, is left in a mood to quote, *mutatis mutandis*, Harold Laski's famous dictum on democracy:

You can knock down the case for capitalism in ten minutes. You can knock down the case for any other system in five.

One would like to quote Professor Wright himself, extensively, on such matters as profits, pressure groups,

Warring Purposes

Newman's University, Idea and Reality.
By Fergal McGrath. *Longmans.* 537 pages. 30s.

Of the writing of books about Newman there is no end. This strange personality continues to attract biographers year after year. Father McGrath's contribution is of great value and compelling interest. It deals with the period during which Newman was Rector of the Catholic University in Dublin. This stage of his career is described in some detail in Wilfrid Ward's "Life of Newman," but Ward's treatment was necessarily incomplete because he had no access to many relevant sources. Father McGrath has explored every possible hole and corner for new material. The result of his researches has been to throw much new light on this important phase of Newman's life. The great volume of diaries, letters and memoranda has enabled him to tell his story in Newman's own words.

The story is fascinating. It reveals a web of ecclesiastical intrigue and misunderstanding. The Roman authorities, the English Catholics, the Irish bishops and Newman himself were at cross purposes. From the very beginning of

the educational experiment in the Catholic University, the Irish bishops and Newman were in opposition. Newman offended the conservative Archbishop Cullen of Dublin by his progressive views on Irish politics and the ultra-national Archbishop MacHale of Tuam by his English outlook and valuations. He had indeed undertaken a task in which it was impossible to succeed. He did not receive the whole-hearted support either of the Irish hierarchy or of the Catholic laity, and was engaged in a war of conflicting temperaments and opposed ideals to which there could be only one conclusion—his resignation.

It would be, however, a great mistake to dismiss Newman's career in Dublin as an unmixed failure. His rectorship was the occasion of his composing "The Idea of a University" and other essays on academic subjects which are among the acknowledged masterpieces of English prose. His practical administration of the University was, it is shown by Father McGrath, successful. He attacked his problems with courage and found the right solutions. He sowed the seeds of Catholic higher education in Ireland which, after many controversies and vicissitudes, came to fruition in the establishment of the National University. Newman did not himself consider his Irish mission a failure. He had a prophetic hope that his labours would not fail to produce good results, even after a long delay. "When I am gone," he said "something may come of what I have done at Dublin." What has come is University College, Dublin, a large, growing and flourishing establishment, and one of the foremost centres of Catholic learning in the English-speaking world.

The Severest Handicap

Eyes in Industry. Edited by Sir J. Marchant. *Longmans.* 234 pages. 30s.

The severity of the handicap imposed by blindness is generally recognised; it may, indeed, be thought by some to be over-emphasised if the possibilities of re-educating the unsighted are overlooked. Nevertheless the attention paid in this country to industrial hazards which frequently result in permanent reduction of vision, if not in total loss of sight, has been less than they merit. Moreover, the limitations imposed by bad sight are unfamiliar, very often to the individuals concerned. Tasks calling for precise visual judgment, as is the case in numerous present-day industrial processes, are, in these circumstances, performed inaccurately or under conditions of physical strain to the detriment of work and workman alike.

The approach to these problems demands some knowledge of the human visual system, both as an optical apparatus and as an organ of the body. The early chapters of this excellent work, addressed primarily to industrial workers, deal briefly and simply, therefore, with the structure and function of the eye, the defects to which it is subject, and the standards by which its efficiency may be judged. Means of increasing visual capacity by corrective spectacles,

by improved illumination and contrast, and, in special cases, by the use of magnifying aids are dealt with in some detail; the increased efficiency that results is illustrated by statistics drawn, perforce, largely from American sources.

Ocular injuries are quoted as forming some 4.4 per cent of all industrial injuries; but their average cost, in compensation and medical expenses, is found to be twice that of damage to other parts of the body. Their incidence and origin in various branches of agriculture and industry are reviewed at length by the authors, and measures for the prevention of ocular accidents are discussed. The simple and authoritative advice on the recognition and treatment of injuries of the eye is supported by illustrations of unusual value in a book of this character.

Bird's Eye View

A Bird's Eye View of World History.
By Rene Sédillot. *Harrap.* 271 pages. 12s. 6d.

This is an attempt to look at the past through the wrong end of the telescope, to see everything in proportion but very small. In more spacious days there was a vogue for universal histories in 20 volumes; nowadays there is a vogue for universal histories in a few hundred pages. M. Sédillot, who takes only 266 small pages to get from Paleolithic Man to his own generation, must surely have set up a record. The result is such an assembly of dates and facts as will satisfy, if not surfeit, anybody determined to get his money's worth in the course of five hours' reading. Inevitably this breath-taking survey has its limitations. Some of M. Sédillot's judgments are irritating and some of his statements are justified, if at all, only by his self-imposed limitations of space, but the relatively untutored amateur of history should, nevertheless, emerge with a fair general view of the principal events of the past.

On trends or movements M. Sédillot is a less sure guide. He presents modern history as a process dominated by a succession of Top Nations. After the age of Italy came the age of Spain, the centuries of France and the Anglo-Saxon centuries. This sometimes has a distorting effect, as for instance when the American War of Independence, which falls within the centuries of France, is represented primarily as a victory for France against a British challenge. Similarly in the Middle Ages: here we have the Thousand Years of Christianity, during which the barbarians appear as a foil and as mere destroyers who make no contribution to European civilisation. So neat a juxtaposition makes for clarity but it is not always good history.

Italian-English, English-Italian Technical Dictionary. *Ulrico Hoepli, Milan.* 894 pages. Lire 3000.

This is a second and enlarged edition of a dictionary chiefly concerned with engineering technical terms. American technical terms have received special attention. Technical abbreviations in common use, conversion factors and equivalent measurements are included in a special section.

CONSTABLE

AMERICAN SURVEY

Undermining the Government

Washington, D.C.

BY a coincidence of some symbolic significance, Senator Vandenberg died less than three hours before General MacArthur arrived in Washington and, egged on by the Republicans, challenged the constitutional position of the President. For Mr Vandenberg was the last surviving Republican who had been a Senator while a member of his own party was in the White House. And it is only too obvious that the new generation, which has never had responsibility, has grown progressively more irresponsible. By and large, the Republicans in Congress no longer know or care what their tactics are doing to their country's system of government or to public confidence in its institutions; they only care about winning the election in 1952.

There has never been anything effeminate about domestic politics in the United States, but there is a difference, and a profound distinction should be drawn, between trying, by whatever means are handy, to persuade the electorate that the other political party is inefficient, dishonest or even traitorous, and setting out to undermine the whole structure of the federal government by attacking the career officers of the Foreign Service and the regular officers of the Army, Navy and Air Force. Much of what is said by the Republicans suggests a distressing ignorance—or a distressing readiness to believe in public ignorance—of how decisions are reached in a government such as that of the United States.

When Senator McCarthy told an audience that Mr Truman made his policy late at night, after too much Bourbon and Benedictine, it was probably only the mixture of drinks which was a product of his own innate boorishness. No doubt he genuinely believed that important decisions were made, as he would undoubtedly make them himself, if he were President, on the spur of the moment by the light of personal prejudice. And there are many people, in the Senate as well as out of it, who really think that Mr Alger Hiss made American, and, presumably, Mr Churchill's, policy at Yalta all by himself or that Mr Owen Lattimore, by running over to Washington occasionally from Baltimore, changed the course of history in the Far East. There is one Senator on the Republican side, however, who should know better because he lived in the White House in his youth while his father was President.

Yet it was Senator Taft who shocked some of his most respectable supporters by announcing that his confidence in the integrity of the judgment of the Joint Chiefs of Staff had been shaken and that he had come to the point where he no longer accepted them as experts. "It is a strange thing," Senator Fulbright told him, "that only a short time ago, before General MacArthur appeared on the scene, the

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

country had faith in General Bradley," the chairman of the Joint Chiefs. But General Bradley cannot help Mr Taft next year and General MacArthur can, unless he listens to the blandishments of Colonel McCormick and decides to be President himself. Senator Taft would, perhaps, do well to remember the trouble his own father had, as Governor-General of the Philippines, with his military commander, General Arthur MacArthur, the father of the current Messiah.

★

It was not only the integrity of the Joint Chiefs that Mr Taft questioned during a two-day debate in the Senate. It was also the whole range of known information on which American policy in the Far East, whether it has been good or bad, has been based and on which, unless he proposes to accept the wishful accounts of General Chiang Kai-shek's "intelligence," he would have to base his own policy, should he be elected. Senator McMahon, Democrat of Connecticut, asked Mr Taft whether he was not aware that the assistance given to General Chiang Kai-shek enabled him, at the end of the war, to gain control of "the areas and the arms held by 1,200,000 Japanese troops." "I do not think that is true" was his answer. Mr McMahon tried again. Did not the Senator know that, after the end of the war, "we supplied arms to the Chinese Nationalists sufficient to equip thirty-nine divisions"? "No," answered Mr Taft. Mr McMahon persisted:

If the Chinese Nationalist troops should give the same sterling performance they previously gave when they dropped their guns and ran away, is the Senator of the opinion that we should call quits and abandon them, or does the Senator believe that we should follow them up?

To this Mr Taft replied:

The Senator from Connecticut simply shows that he has the same unreasoning prejudice against General Chiang Kai-shek that General Marshall has. . . . He has repeated the rumours as to the Chinese Nationalists giving away our arms and surrendering to the Communists without a fight, and all the rest of it, which are pure propaganda spread by the Chinese Communists and the State Department.

Senator McMahon then asked Mr Taft whether he was aware that General Barr, a member of the Joint Military Advisory Group on China, reported to the Department of the Army that

during the critical year of 1948 no battle was lost by the Chinese Nationalists because of the lack of munitions and equipment, but rather, Barr reported, the military debacle, in his opinion, can be attributed to the world's worst leadership and many other morale-destroying factors leading to the complete loss of the will to fight?

"That is an opinion of a gentleman with which I completely disagree," Senator Taft asserted airily. It would be interesting to know what he would use for information if he were in the White House.

To make his foreign policy he would presumably use General MacArthur, since he told the US Chamber of Commerce that the United States

THE ECONOMIST, May 12, 1951

should at least try the plan of General of the Army Douglas MacArthur; use Chinese Nationalist troops, bomb Chinese Communist bases in Manchuria and blockade Communist China.

The economic policy to accompany this "more aggressive attitude" would, on the other hand, be entirely his own, "a reduction of half a million in the United States armed forces objective and a \$20 billion cut in the American mobilisation budget."

Such irresponsibility in an opposition is only possible, however, with an Administration which permits it. The Democrats in the Senate make reasoned, and sweetly reasonable, speeches; members of the Cabinet, the Joint Chiefs and other officials painstakingly explain the roots and the objectives of American policy. But, as one columnist said the other day,

the masses, who are thinking for themselves even less than ever now that their masters can reach them on a wholesale basis by inflammable mass media, are on a rampage against reason.

In the Senate, the Democrats finally shrug their shoulders in despair before Senator Taft's denials of fact; and, when General MacArthur appeared before the Committees, he was, again and again, backed into a corner and then allowed to escape because nobody had the courage to dispute his equivocations.

The *New Yorker* magazine, commenting on the General's statement that "in war there is no substitute for victory," pointed out that one-half only of each soldier in Korea is fighting a skirmish in the war between East and West; the other half is involved in the first police action ever attempted under a universal banner and "in the cop's unhappy world, there is no substitute for patience." Patience is not one of the prime qualities of the American people and it is on their impatience that the Republicans, and General MacArthur, are now playing—on their impatience and their addiction to ideologies.

The Soviet Union was not the main enemy today, the General said, but "Communism throughout the world, including the interior of many of the fine democratic countries." He proposes, as Senator Fulbright put it, "to proceed to victory without dilly-dallying along." A man with the intelligence that Mr Taft's admirers claim for him should be able to see the flaws in this proposition, but he can, no doubt, also see its attractions. To fight the Thirty Years' War in thirty days—and win it—is an appealing programme. It is a programme that could bring victory at home in 1952. And, as one of the Senator's colleagues remarked recently, whoever worried about campaign promises after the election?

American Notes

Marshall's Reply

General Marshall, unlike General MacArthur, never speaks for the sake of making a political holiday. His evidence this week before the Senate Foreign Relations and Armed Services Committees has naturally been less eloquent and dramatic and has had much less popular appeal than General MacArthur's last week. But the Secretary of Defence presented the Administration's answer to General MacArthur effectively, even if factually and unemotionally. No one who studies his statement objectively can fail to agree with his view that the hazards of General MacArthur's proposals for the Far Eastern war far outweigh their possible advantages, provided at least that it is still hoped to avoid a third world war.

For General Marshall believes that to carry the present war on to the Chinese mainland would not earn a decisive victory in Korea, that it would be likely to bring war with Soviet Russia, in Europe as well as in Asia, and that it would almost certainly mean that the United States would lose its allies, whose help the Secretary of Defence values, even if General MacArthur does not. General MacArthur, as a field commander, was not qualified to balance the global aims and interests of the United States as are those in Washington who are responsible for the nation's total security. It was the General's refusal to recognise his limitations and, above all, his insistence on expressing publicly his dissatisfaction with his country's policy that made his dismissal unavoidable. On the particular point of whether or not the Joint Chiefs of Staff had agreed with the proposals for attacking China, the Secretary of Defence showed that General MacArthur had picked out of a sixteen-point document the four points that supported his views. In any case, the document contained not firm conclusions, but tentative proposals; furthermore, made last January when the situation in Korea was deteriorating, they were designed to counter hypothetical developments which never materialised.

General Marshall, stating the fundamentals of the Administration's case, has left the military details to the Chiefs of Staff, who will follow him on the witness stand. But even so a certain amount of his evidence has not been published, either at his own request or at that of the official censors who are checking the transcript, which now amounts to well over 1,000 pages. Amongst the subscribers to it is the *Daily Worker*, a discovery which has helped the Administration to resist Republican attempts to open the hearings to the public. It already seems that the publication of certain documents may provide the key to secret codes. Security can hardly fail to be further endangered before the proceedings are over, since all members of the Senate are permitted to attend and two Senators are supervising the censors to make certain that all deletions are really necessary.

Confusion about Loyalty

For over two years Miss Dorothy Bailey, a federal employee discharged under the government's loyalty programme on evidence supplied by the Federal Bureau of Investigation, has been contesting her dismissal on the legal grounds that she was not allowed to confront, or even know the names of, those who accused her of having Communist connections. The Court of Appeals upheld the government's view that witnesses in such cases, certified by the FBI to be "reliable," should not be required, for security reasons, to give evidence in public. The Supreme Court has just refused to reverse this decision. But, on the same day as it denied Miss Bailey's right to a full hearing, by a 4-to-4 tie vote, the Court upheld, by 5 to 3, the right to such a hearing of associations named in the Attorney General's list of subversive organisations. In Justice Jackson's outspoken opinion, the Court took "an inverted view of the law" by granting to a group what it refused to an individual.

Government loyalty review boards are required to use the Attorney General's list; membership of an organisation appearing in it makes a person's suitability for federal employment suspect. But after the Supreme Court's decision it is probable that any dismissals based upon membership of a listed organisation will be disputed. This new complication comes just as the task of the loyalty boards had been simplified in another way. The President has authorised the discharge of federal workers when there is reasonable doubt of their loyalty; previously there had to be reasonable grounds for believing them disloyal.

Had the new standard been applied earlier, dismissals would probably have been more numerous; the fact that there have only been 308 in four years has been taken, by critics of the loyalty programme, as evidence that it has not been drastic enough. Pressure for this change from a positive to a negative approach has grown since the conviction of Mr William Remington, who worked for the Department of Commerce, for perjury for concealing his past membership in the Communist Party. He had earlier, after a long fight, been cleared of a disloyalty charge and it is not suggested that he belonged to the party when in government service. Another case that is to be reopened is that of Mr John Service, a well-known Far Eastern specialist in the State Department.

Before announcing the new rule, Mr Truman had hoped to have the advice of his Commission on Internal Security, set up to sort out the confusion arising from these problems of loyalty, security and civil liberty. But it is increasingly doubtful whether the Commission will ever be able to function, as a result of the Senate Judiciary Committee's refusal to waive the law that forbids those employed by the government to work for any private firm that does business with it. This denial of an exemption that has frequently been granted to others looks like another effort by Senator McCarran, chairman of the Senate Committee, to keep loyalty firmly under his own thumb.

Steel Shortages

Week after week America's steel furnaces work at over 100 per cent of capacity, pouring out about 9,000,000 tons a month. But they will soon be forced to slow down unless they can find more steel scrap. One company is already reduced to only five days' supply at some of its plants, instead of the desired 60, and the average for the industry is under 20 days' supply. During the first quarter 12 per cent of this huge output of steel was going into direct military requirements; by the end of the year they will be taking 20 per cent and another 30 per cent, if not more, will be needed for indirect military and essential civilian products, even though the merchant shipbuilding programme of the last war is not likely to be repeated this time.

Already some small consumers are on short commons;

makers of television sets and dairy equipment, for example, complain that they cannot find even the limited amounts of steel that they are permitted to use. It is possible that the coming Controlled Materials Plan may not take effect quickly enough to save a certain number of weak firms from starving to death. There are apparently two kinds of cuckoo in the nests: some of the essential civilian industries, such as manufacturers of railway rolling stock and oil well equipment, who receive special rations of steel, are said to be swallowing more than they can digest, while makers of such things as trucks, who until now have been allowed all the steel they can buy, are consuming more than ever before. The National Production Authority is, however, putting some of

the gluttons on a diet, and may even cut down the plant expansion that is intended to ensure plenty for everyone by 1953.

This industrial expansion is gobbling up structural steel so fast that little is left for anything else. The latest order relating to the use of steel for construction leaves houses costing less than \$35,000 as practically the only buildings that can now be started without permission—and the demand for these has already been curbed by restrictions on mortgages. It is unlikely that even the building of schools, hospitals or highways will be authorised unless their pressing necessity can be proved. The other chief consumer of steel, the automobile industry, is to be limited to 70 per cent of its last year's consumption from July onwards, instead of the 80 per cent which it has had since April. There have been shut-downs in a number of motor factories because of shortages of materials, but the industry is already well enough supplied with defence orders to protect it from any serious transitional hiatus.

* * *

The Marines Dig in

While the Marines earn fresh laurels in Korea, their friends in Congress have not been idle. Ever since the end of the war, and particularly while Mr Johnson was Secretary of Defence, the fear of the Marines has been that their combat functions would be absorbed by the other services—their aviation by the Air Force, amphibious warfare by the Army—and that under the Unification Act the Corps would be unified out of existence. Now, despite the opposition of the Department of Defence, the Senate, without a dissenting voice, has passed Senator Douglas's Bill to authorise the raising of the strength of the Marines from two to four full divisions and from two to four air wings. This means a total strength of about 300,000 men, compared with the present 200,000, and some 80,000 before the Korean attack.

Senator Douglas, who at 50 entered the Marines as a private, was twice wounded in the Pacific and emerged a lieutenant-colonel, sought more for his old Corps. But in the Bill, passed by the Senate, 400,000 has become the maximum, rather than the minimum strength, to avert criticism that the Corps—in open defiance of the Unification Act—

MODERN FACTORY ... out-of-date OFFICE?

★ That's the anomaly of many present day businesses. Once it was the reverse. Now the factory has outstripped the office in the adoption of modern methods. Look to your office efficiency. Electronic science, which has revolutionised so many factory processes, now slashes office wastage. The Emidicta is the Electronic secretary which records on the spot, letters, notes, reports, thoughts, messages—what you will—all for easy transcription by the typist at the most convenient time. Nothing can resist the eventual adoption of the Emidicta by every progressive office management. Use the coupon to obtain a free demonstration and descriptive literature.

The Emidicta

This Electronic Dictation Machine out-dates all past achievements in the field of recorded dictation... produced by E.M.I., the great electronic engineering organisation which includes "His Master's Voice", Marconiphone and Columbia—past-masters in the art of recording and sound reproduction.

Transcription errors are eliminated because dictation is recorded word for word.

was being turned into a "second army." And of the proposal that the Marines should have direct representation on the Joint Chiefs of Staff, all that remains is that the Marines' Commandant is to be made a consultant to the JCS. It was manifestly ridiculous that a force of 200,000 men should be placed upon an equal footing with the three basic services, apart from the Army's suspicion that the proposal was only a device for securing another vote for the Navy.

In its more modest form, the Bill is likely to sail through a sympathetic House. It is more an emotional tribute to the Marines than a considered estimate of the role they should play but, even if it is not mandatory, the Department of Defence cannot wholly disregard it. In private Mr Truman may still feel that the combat glories of the Marines are rivalled by their capacity for self-advertisement. But he is unlikely to repeat his error of last summer, when he complained that the propaganda machine of the Marines was second only to Stalin's, and that they would remain merely the "police force" of the Navy. In fact, their official functions also include the capture and defence of naval bases, and such land operations as are necessary for the success of any naval undertaking. Senator Douglas has an even grander task in view; he would make the efficient, quick-moving Marines—once regarded as the "spearhead of dollar diplomacy"—the American unit to be placed at the disposal of the United Nations when their police force is formed.

Peace on the Assembly Line

The Ford Foundation, the great charitable trust to which the family of Mr Henry Ford has bequeathed the major part of their estates, has put its first important models into production. It has created a Fund for Adult Education, to further non-academic projects, and another for the Advancement of Education, with an initial grant of over \$7,000,000, to encourage experiments in both long and short range educational questions. The first problem with which the second fund is dealing arises out of the present emergency: four hundred promising boys, all less than 16½ years old, are to be given "pre-induction scholarships," which will enable them to take liberal arts courses at four selected universities for two years before they begin their military service. This unusual approach to the educational difficulties arising out of conscription bears the mark of Dr Robert Hutchins, who has resigned from the University of Chicago to become an associate director of the foundation.

But educational experiments are only one of the five classes of vehicles that are to be put on the road by the Ford Foundation. It is to be not merely the finance company that many other charitable trusts already are, but a factory actually contributing to the advancement of world peace. Its production plans, recommended after long study by a group of distinguished Americans, are all connected with the social sciences, since the basic problem is thought to be "man's relations to man." The plans include broad proposals for studying, in addition to educational advancement, the relief of world tension, the strengthening of democracy, the improvement of economic conditions and the conduct of mankind. But the trustees are well aware that it will be a long time before they can hope to put permanent peace on the market.

The detailed job of getting the present models onto the assembly line has purposely been left to the president of the foundation, Mr Paul Hoffman, who is well suited for the work by his experience in the motor industry and as the administrator of the Marshall Plan which helped Europe to help itself. He has not so much money to oil the wheels with this time, but there are some who think it is more than the social science industry can absorb, and that mass production methods are not adapted to research work. The annual income of the foundation, thought to be about \$50 million at present, depends upon the dividends paid by the Ford

Company, for its assets consist almost entirely of non-voting stock in the company. These assets have recently been valued at just over \$500 million, far more than those of any other charitable foundation. The trustees are in theory permitted to realise capital: in practice this might not be easy, for the tax-exempt foundation was originally set up so that the Ford family would not have to sell the company's shares to the public in order to pay death duties.

Shorter Notes

The United Labour Policy Committee celebrated May Day by returning to full co-operation in the defence programme after two months' absence. Mr George M. Harrison, of one of the Railroad Brotherhoods, is to become an assistant to Mr Charles Wilson, the defence mobiliser, and labour representatives are returning to the other emergency government agencies. ULPC emphasises however, that it is not yet satisfied with all defence policies by any means, although considerable progress has been made in settling its grievances. One notable advance has been on the Wage Stabilisation Board, now reconstituted with additional powers and eighteen members, under the chairmanship of Dr George Taylor.

*

New pricing formulæ have been announced for imported manufactured goods, to relieve importers from the chill which has fallen upon their business ever since the January price freeze. They will now be permitted to add to the landed cost of such imports as British cars, Scotch whisky and French perfume the dollars and cents mark-up which prevailed during the year before the Korean outbreak. About a quarter of the country's imports is affected by this order, and around 30 per cent had been held up because importers could not make a fair profit under the price ceiling. Most bulk imports and strategic metals are left out of the new order, either because they have already been dealt with or because they will be covered by orders which are still in preparation.

*

Mr Blair Moody, who has been appointed to succeed the late Mr Vandenberg as Senator from Michigan, is, like him, a newspaperman, but unlike him he is a Democrat. This means that the Democratic majority of two in the Senate has risen to four, and that the party is entitled to two more seats on committees. The opportunity is being taken to oust Senator McCarthy, Mr Acheson's sworn enemy, from the Appropriations Committee, where he was on the sub-committee dealing with State Department funds. Mr Vandenberg's place on the Foreign Relations Committee has been left for a Republican, Senator Owen Brewster of Maine.

*

It now seems certain that the import duty of 2 cents a pound on copper will be lifted before long. Both Houses of Congress have finally accepted the suspension, as long as the price of copper is above 24 cents a lb., and have only to reach agreement on how long it shall last. This relief comes just in time to prevent the price of copper going up by the full 3 cents a lb. which the United States has agreed to add to the price now paid for Chilean copper.

*

The development of a half-size turkey, weighing only about 8-14 lb. when fully grown, will, it is hoped, induce Americans to double their turkey consumption. At present this averages only 5 lb. a year a head. The new turkey will fit into a small oven and a family can polish it off in one or two sittings. When only half grown it can be broiled or fried; regular turkeys are too bony to be cooked in this way. From the producer's point of view, the chief fly in the ointment is that the small turkeys seem to eat just as much as the large.

THE WORLD OVERSEAS

The Soviet Way of Saving

(By A Correspondent)

A FEW days after the May Day celebrations the Soviet Finance Minister A. Zverev launched a new State loan—the sixth since the war—this time for 30 billion roubles redeemable over 20 years with lottery prize drawings equivalent to a rate of interest of approximately 4 per cent. The propaganda machine has been quickly switched over to this field, the subscription campaign is in full swing and by now reports are coming in from all over the Soviet Union about the "enthusiastic reception" given to the new Economic Development Loan. This has become a routine operation somewhat akin to taxation by its quasi-compulsory character and annual regularity. Yet Soviet State loans may be more aptly described as a form of forced saving, a subsidiary means at the disposal of the Government in its efforts to balance saving and investment and to stem the pressure of effective demand on the available supply of consumers' goods.

Last year's 20 billion roubles Reconstruction and Development Loan was quickly oversubscribed. More than 27 billion roubles's worth of bonds were sold and together with the sale of State bonds to banks, co-operatives and industrial undertakings the total of approximately 31 billion roubles forecast in the Budget estimates was reached. This accounted for more than 7 per cent of the total revenue. In this year's estimates the expected share of the State loans is the same and they should account for over 33 billion roubles. By analogy with last year's experience—and there is no reason for the enthusiasm to be abated—this year's State loans should exceed the estimated amount and probably also provide a higher percentage of the revenue. This attempt at transferring a larger proportion of cash from the consumers' pockets to the State's coffers may be one sign that the Soviet Government, with heavy investment, cultural and defence programmes, has difficulty in defending the rouble, revalued in December, 1947, against the inflationary pressure caused by the four reductions in the price of consumers' goods which have occurred since then—the last as recently as March of this year.

A Test of Morale

Through State loans, it may be said, the Soviet Government is taking, or rather borrowing, with one hand a part of what it had given away with the other. Price reductions may result from cost reductions passed on to the consumers or by a lowering of the turnover tax. In both cases the State loses sources of revenue and the purchasing power of the income recipients is increased. The State could make it up by an increased turnover but this method may involve too great a shift towards the production of consumers' goods. True, in the Soviet planned economy—as opposed to a free economic system—the pulls of consumers are unlikely to affect the structure of production, which is determined by the planning authorities. But too much money chasing too few goods brings about all the inconveniences of a "goods famine": shortages, queueing, rationing, etc. Price reductions were probably accompanied by an increased supply, but to check demand the Government has also at its disposal—besides the turnover and profits taxes—the subsidiary means of direct taxation, State loans and a savings drive—in that order of magnitude.

Direct taxation is relatively unimportant in the Soviet Union. Since the wage rates are planned to increase pro-

ductivity, direct taxation is considered as a disincentive and the turnover tax—similar to the British purchase tax—is preferred. Hence direct taxation is not very progressive and accounts for only just over 9 per cent of the Budget revenue against some 55 per cent for the turnover tax. Neither can savings play a very important disinflationary role in the Soviet system. Despite the relative rise in the Soviet standard of life, the growing net of savings banks and the introduction of lottery drawings, only 19 billion roubles were saved last year and this year's expected savings should amount to 21 billion—somewhat less than two-thirds of the State loans. This is understandable, since there is no scope for private investment and none of the advantages of the rentier can be enjoyed. The latter point also applies to State loans, since the winner of a large lottery prize is not allowed to stop working and to live on his capital. Yet during the short subscription drive all sorts of indirect pressure can be made to bear on the Soviet citizen, and his "morale" is at the same time tested; thus the State loan campaign has become a powerful weapon in the disinflationary arsenal of the Soviet authorities.

One Month's Wages Invested

Precedent is here a safe guide and it indicates that about two weeks after the launching of the new loan by Zverev it should be subscribed and over-subscribed, though bonds will still be available for sale. The campaign is now in full swing and in all industrial enterprises the workers are "unanimously" deciding to buy bonds for the equivalent of their monthly wage, the payment to be spread over 10 months. The basic unit is 100 roubles, but multiples up to 500 and fractions down to 10 are available to suit all pockets. Lottery drawings—40 in all—starting next year will be held twice yearly. Redemption drawing starts in 1957. The whole loan should be redeemed by 1972. By that time 35 per cent of the unit bonds should have won prizes (the highest are now 25,000 roubles) equivalent to an overall rate of interest of 4 per cent. The remaining 65 per cent will be redeemed at par.

Technically the loan does not differ from its predecessors. Before the war premiums were a combination of interest and prizes. The public favoured the latter, thus showing that it did not rely on a steady income from State loans. Since the war lottery drawings have been preferred and by now interest tranches have been dropped altogether. Yet, it is clear that despite his fear of the vagaries of money, and loans the Russian prefers this form of contribution than an equivalent 8 per cent income tax. He obviously prefers to lend money, even at the risk of substantial loss, than to give it away. This, combined with the pressure, enables the authorities to sell the loan quickly. Yet the "welcome" is not uniform all over the country. It has always been easier to get "unanimous" subscriptions in town factories than in country collective farms. Till 1937 the towns bought approximately 90 per cent of the loan. Only well after the end of collectivisation did the countryside account for 30 per cent. During the war the share was greater. Loans in general then played a greater role in Soviet economy. Yet the main burden has been probably shifted again on the town dwellers and though Zverev exhorted the peasants to continue their habit of paying for the bonds in cash, it is doubtful

whether the collective farmers—substantially more than half the population—will buy over 30 per cent of the loan.

Generally, State loans are rising, even in real terms, and their incidence is wider, while the rate of interest is falling. This is partly due to the relative rise in wealth, but mainly to the greater efficiency of the subscription collecting machinery. Zverev in his speech mentioned that during the prewar Five-Year Plans a total of 50 billion roubles was raised by loans, 75 billion roubles were raised during the war and 150 billion during the postwar Plan. On the morrow of the revaluation of the rouble all previous loans, except the 1947 issue, were consolidated at one-third of their nominal value. Allowing for redemption, the total floating debt should not substantially exceed 150 billion roubles, and judging from the debt services—5 billion roubles this year—could even be less. There are now 70 million bondholders and the rate of interest has fallen from 8-11 per cent in the first loans to 4 per cent now.

State loans campaigns are used for patriotic exhortation. Zverev has associated the new loan—the first since the war to refer only to economic development and not to reconstruction and development—with vast hydro-electric development and canal building projects. He contrasted these pacific projects with the “war economies” of this country and the United States. References to warmongers are part of the routine, yet it is interesting to note that the Soviet minister has judged it opportune to insist so much on the peaceful character of the Soviet plans while launching the campaign for forced saving in the Soviet Union.

Nato on New Lines

At the end of last week the administrative octopus of the North Atlantic Treaty Organisation suffered an amputation of several legs, in the hope that thereafter it would be able to move with greater speed and with less dispersal of effort. The effect of the operation is simply this: Nato has at last realised (or rather recalled) that its task is essentially one, that its problems cannot be divided, and that in its organisation it must not try to divide them. As the complexities grew, some attempt to handle them was made by setting up specialist committees which could get to grips with specific issues. Up to a point that was right and inevitable; but that point was passed some time ago, and specialisation began to destroy its own ends. The objective, which was and is to find the arms and the men with which to defend Europe became lost amidst a surfeit of experts and a welter of argument about unemployment in Genoa, the state of the foreign exchange reserves, and the correct calibre of the rifle.

Now a move has been made to draw the threads together again. At the centre of the organisation there is to be a body which will be dedicated, full-time, to taking a broad view of the progress, or lack of progress, in all the separate parts. If in future there is an unpremeditated announcement about an Admiral which has unfortunate political repercussions; if one of the smaller countries feels that it has not been able to present in political terms the difficulties of increasing its economic and military efforts; if production plans are frustrated by the lack of materials, there will be someone to blame; for the reconstituted Deputies should now be in a position to weigh all these factors before rather than after the event. As with the broad picture, so with the specialist horizons. Central authorities have already been created for military problems (the Standing Group) and production (the Defence Production Board); now there is to be a consolidated authority for economic and financial matters (the Financial and Economic Board). Thus for each of the three main facets of the Organisation's work there will be a single authority, able both to take a comprehensive view of the problems within its province, and to consult and advise the two other authorities, none of which can operate in a vacuum.

On the political side, the two ministerial committees for

defence and finance have been removed, and the Council itself—previously the monopoly of the Foreign Ministers—has become a gathering of the heads of state, or such other Ministers representing the heads of state as may be appropriate to the subject. It will meet (as did its predecessor) about three times a year. At the same time, the top official committee—previously the Foreign Ministers' deputies—automatically assumes a new status; its members, having acquired an international staff, become the permanent representatives of the heads of state, through whom all recommendations to the Council, military, political or economic, must pass, and who will have the power to settle most current issues off the cuff.

On the economic side, a central authority will handle for the first time all economic problems arising out of the work of the military and production committees. It is to have a permanent director comparable to Mr Herod on the Defence Production Board; it is to be situated in Paris, staffed by senior members of delegations to the OEEC and ECA, and equal in status to (and at least as powerful as) the DPB. It has two theoretical advantages over the old arrangements. First,

it pulls together the scattered groups within the organisation which have been thrashing away at different aspects of the economic dilemma in different places and directions. The advisory group on raw materials in London, the permanent staff of the ministerial finance committee, and the Paris-based working group on the distribution of the financial burden will now become one body, charged with ensuring the “best use of financial and economic resources . . . in support of the common defence effort.”

The second advantage stems from the link with OEEC; it is that the economic problems of defence may no longer be treated as a complex separable from the general economic problems of western Europe as a whole. The two are, of course, one and the same thing and have been ever since real mobilisation began. The anomaly of an organisation for “normal” problems of peace (OEEC) co-existing with an organisation for “special” problems of part-war has been or should have been, ended for good. There remains, however, the question of the FEB's relations with the raw materials groups in Washington, for which no provision seems to have been made. Through the OEEC, which already has a representative on the steering group in Washington, it will acquire an indirect contact; but that is not nearly enough. A solution may require that the new board not only strengthens its lines to Washington, but takes the problems of intra-European raw materials firmly into its own hands.

The theory of the reorganisation, then (which has obviously enchanted the tidy-minded cartographers of Nato) is that there will be a neat line of specialist bodies—military, production, and finance—all reporting directly to the representatives of the heads of state who may deal summarily or submit upwards to the supreme Council itself. The practice, one is told, will not be so neat, there may be joint meetings,

interchange of personnel, direct exhortations to governments and other breaches of the paper hierarchy; and rightly so. The trouble with the working end of Nato so far has been an excessive regard for the organisational proprieties.

Cotton and Discontent in Uganda

THE Secretary of State for the Colonies is now on a visit to East Africa where one of his preoccupations will be to inquire into the workings of the Uganda cotton industry. It is time this was done for Uganda cotton is a classic example of how not to do things. Ill-equipped, riddled with dishonest practices, inefficient and a focus of racial animosity, the industry has so far defied official attempts to put its house in order. In 1929 its position was being investigated; in 1938 a Commission reported on its problems. In 1948 yet another Commission had its say; in 1949 there were violent disturbances in Uganda, in which eight people were killed. One of the main grievances was found, by yet another Commission of Inquiry, to be discontent with the conditions in the cotton industry. Today, at last, there are plans for a drastic reorganisation which may, so it is rumoured, take the form of a complete nationalisation of cotton-ginning. At the mere prospect of this, the existing ginners are up in arms—but some radical changes are now unavoidable.

What happens in this industry is not merely of local interest. It is the kingpin of the economic life of a country of 5,000,000 souls—in 1949 cotton represented more than £17 million out of Uganda's total export of £23 million. One and a half million acres of land lie under cotton, and the market for it appears limitless. The present variety is of a long staple and is mainly sold in India, with Britain as the second customer, but shorter staples could be grown and the British market could take as much as could possibly be produced.

The growing of cotton is exclusively in African hands, and the output per acre is excessively small. The Director of Agriculture has estimated that the present yield of 230 lb. per acre could quite easily be increased to 500 lb., which means augmenting the value of the crop by well over £10 million. But the agricultural staff which might train the peasants is totally inadequate. The Commission of 1948 found only 22 senior officials, supervising not only cotton, but all agriculture throughout the colony. In the Sudan, with a smaller cotton acreage, 125 scientists and inspectors were employed on cotton alone.

The ginners are all owned or staffed by Indians. They are small and scattered. Their equipment is antiquated, their buildings old and unhygienic with unsatisfactory conditions for workers. Furthermore, ginning has become a monopoly. Each gin must have a licence, and as there are already too many, no new licences are given. To enter the field one must go through the difficult operation of buying an existing gin. This, until the Government recently came forward with help, has effectively excluded all Africans.

The Africans are naturally resentful, particularly as the Indian ginners are suspected—and have been declared guilty by a Government Commission—of corrupt practices. The 1948 Commission pulled no punches in describing the deliberate cheating of the grower by the ginners and their agents, the buyers. The buyer falsifies the weights, with the result that the grower only receives payment for about 90 per cent of the cotton that he actually hands over. By secret agreement, the buyer and the ginner share the illegitimate profits thus gained. And even if the ginner should be honest, the buyer may not be; he has his own private tricks whereby he gains an extra illicit profit. Numerous devices

to defraud and befuddle the illiterate seller are recounted. The race animosity consequently aroused is such that one of the recommendations of this particular Commission was that a local African should always do the weighing.

Appalling Storage Conditions

The ginners are also guilty of neglecting the quality of the cotton they produce. There is an absence of any primary classification of the cotton received, which no subsequent grading of the bales can overcome. In the Sudan there is a strictly controlled system of pre-ginning classification, and only seed of the best quality is reserved for the next season's planting. In Uganda's present lay-out of small, decentralised gineries, it seems impossible to achieve anything like this. The storage conditions are also appalling—infested with insects, and rotted by damp.

During the war, with the cessation of private cotton buying in Liverpool and India, arrangements for bulk sales of cotton were introduced by the Uganda Government. More recently a Lint Marketing Board has been created, which fixes the price to the grower for his raw cotton and also the price at which lint is bought from the gins. These arrangements infuriate the Indian ginners, whose profits have been curtailed, and also leave the African growers dissatisfied, as the prices they receive are below those on the world market. The profits made by the Board have been put into a special Cotton Price Assistance Fund, as a buffer against hard times to come. A year ago the balance of this fund—after some money had been used for African welfare—amounted to over £7,000,000. The very existence of such an unspent balance is an irritant to the cotton-growers, yet the Government claims that to distribute the surplus would reduce its reserves against a rainy day, and that to give too high prices for cotton would lead to the neglect of food-stuff production, a risky procedure as Uganda's food supplies cannot easily be met by imports. But the Board has made the bad mistake of not explaining itself sufficiently to the Africans, or associating them in its work.

The Government has been far too slow in tackling all these grievances. Proposals made by the Cotton Commission of 1938 were not fully implemented, and in 1948 African organisations were again petitioning for the remedying of malpractices which had been exposed ten years earlier. When these petitions met with little response tempers rose and were played upon by politicians until bloodshed could no longer be avoided. It was obvious what would be the result of such published statements as the following by the Secretary of the Uganda African Farmers Union:—

Our cotton is our own and we should protect it and rule ourselves and prevent the foreigners who take all the wealth and leave the natives to starvation, while their tummies are growing out, from taking it. Therefore every African of Uganda should avow that it is better to die than give away the wealth of the country of their heredity.

The Government has now announced that it is their policy to provide for the participation of Africans in the ginning industry, and also to train them in the technical and managerial branches of the industry. Co-operative societies have been fostered and two gineries have already been leased to African co-operatives. But everyone knows that this is insufficient, and that a much more drastic reorganisation is being discussed behind the scenes. It might prove possible to help African co-operatives to take over many more gineries; an alternative would be the public acquisition of the whole ginning industry. Either course would arouse violent Indian opposition, but the determining factor will be the wishes of the Africans. One thing is not doubted by any impartial observer—that fundamental changes must come soon if a most valuable industry is to be developed, and an end put to the disturbed conditions from which Uganda has suffered during the last ten years.

Canada Tackles Defence Costs

[FROM OUR OTTAWA CORRESPONDENT]

THE budgetary problem facing Mr Douglas Abbott, the Canadian Finance Minister, this year was in many ways parallel to the problem facing Mr Gaitskell or any other of the western governments. In other ways it was peculiar to Canada, and the peculiar Canadian circumstances produced in the budget passed two weeks ago, its most striking feature, an entirely new fiscal device called "deferred depreciation."

In Canada more than in any other western country the defence programme comes into conflict, not so much with consumer spending or with social services as with capital development. The level of capital development in this country ever since the war has been such that it alone would have strained available supplies of basic materials and of labour without any added defence programme. New mines, new oil and gas wells, new transportation facilities, new building, new factory capacity would, if unrestricted, use all and more than all the steel available. This is the most serious shortage; but others follow. To make room for a defence programme costing \$1,664 million (over \$890 million more than last year) the main Canadian necessity is to restrict non-essential capital expenditure.

The prosperous financial condition of most business corporations raised some doubt about the effectiveness of any of the orthodox means of discouraging expenditure. Even with a corporation income tax at the new rate of 50 per cent (52½ per cent in Ontario and Quebec, where the provincial tax is higher than elsewhere), most corporations are in a liquid position and have adequate resources to finance capital

THE ECONOMIST, May 12, 1951

development without borrowing. If any direct controls could curb expansion, they would have to be controls on construction, and the Canadian Government's experience in the last war was that these are almost impossible to impose effectively and fairly.

The solution adopted by the Government, which looks as though it may become in one form or another a standard device, is to defer depreciation allowances on all new capital assets for four years. The right to charge depreciation for tax purposes is not cancelled or reduced: it is carried forward. A new and depreciable asset acquired now cannot appear in the tax calculations for 1951-52; it may appear in the year 1955-56, and from then on. The effect of this is expected to be to induce a great deal of caution in capital expenditures on what Mr Abbott called "frills, gadgets and generally 'dressing up' offices, stores and buildings." It should remove the incentive to spend corporation funds on "quick turn-over" investments which might otherwise be encouraged by the high rates of tax. The prudent investor will want to feel sure that his project is likely to be profitable in the long-run: unless it is soundly based he may find himself out of profits at the very time when he is allowed to charge his deferred depreciation.

This new device has, moreover, been made flexible in recognition of the fact that capital development of the right sort must be allowed to continue in the interests of the defence programme. Projects of a certain class have a blanket exemption from the new depreciation rule: they are projects for producing or distributing electricity, gas or water, telegraph and telephone services, pipelines, gas or oil wells, and lumbering. In addition other investments may be excepted (and allowed to charge depreciation normally) on a certificate from the Minister of Trade and Commerce. Such certificates will be granted for defence projects, and in general for transport or communications systems, or anything which increases primary production in agriculture, mining, petroleum, lumber or paper. Genuine and proper development of natural resources should not, therefore, be impeded, but the speculative attempt to use up precious materials in meeting inessential consumer demand will be sharply discouraged.

Emphasis on Commodity Taxes

The pre-eminence which this ingenious scheme was given in the Canadian budget reflects the fact that Mr Abbott was more concerned with the economic effects of his fiscal policies than with the bare necessity of raising another \$400 million in new revenue. Nevertheless this money had to be raised, and the means of doing it were designed, so far as possible, to discourage spending without discouraging earnings. For that reason unusual emphasis was put upon commodity taxes, which it is hoped will not stimulate increased wage demands as income taxes might have done if they had been imposed at a lower level. The current exemptions (\$1,000 for an unmarried man and another \$1,000 for a wife) are unchanged, but a "surcharge" of 20 per cent on existing tax rates is imposed as from July 1st. An equivalent 20 per cent surcharge on corporation income tax, applies as from January 1, 1951. With a 5 per cent provincial tax added (7 per cent in Ontario and Quebec) this brings the rate of corporation tax to just over 50 per cent, and Mr Abbott was very emphatic that he does not like a tax rate higher than 50 per cent. "I think it is bad psychology," he said, "to permit people to say that more than half of any income earned or any savings made will go to the government."

These increases in direct taxes are expected to raise just over \$200 million of extra revenue this year. The other \$200 million needed will come from commodity taxes. The general sales tax is increased from 8 per cent to 10 per cent, the highest level it has ever reached. It applies, at the wholesale level, on nearly all consumer purchases, but there is a list of exemptions which includes 95 per cent of all foods, all fuels, building materials and machinery. Mr Abbott, therefore,

THE ECONOMIST, May 12, 1951

was able to claim that it affects only one-quarter of the things bought by people in the lowest income groups, and only one-third of the purchases of people earning up to \$6,000 a year.

The Canadian Government is also going some way along the British path of "luxury taxes," though they are not called that. A special excise tax of 15 per cent was already in force on a long list of goods ranging from motor-cars to toilet articles and including radios, gramophones, clocks, golf balls, cigarette lighters, cameras and films, luggage and suchlike. This tax is now being increased to 25 per cent, which with the 10 per cent sales tax makes a total of 35 per cent. Electric refrigerators, stoves and washing machines are also being brought into the field with a 15 per cent excise tax on top of the 10 per cent sales tax. Cigarette and tobacco taxes are also up, but alcoholic beverages remain unchanged. Tariff changes include the first instalment of a new tariff schedule on plastics and the abolition of duty on a good many items of farm equipment and mining machinery. Immigrants are also given three years within which they may bring in their effects duty-free, a concession designed to enable them to use non-transferable currency in their country of origin to purchase equipment or furniture which they can bring to Canada.

Amid a rising clamour for direct action to reduce prices in Canada, Mr Abbott has had the courage to bring in a budget which actually increases the cost of nearly everything except food and fuel. His intention has been to strike at the roots rather than the flower: to curb spending at both the capital and consumer level without discouraging production. For the mass of people, to whom inflation means high prices and nothing else, it may not be very palatable; but the government believes it is the most effective action open to it.

Slovak Communists on the Mat

At most meetings of Communist Party central committees the same sort of dirty linen is washed, the same sort of sins of omission and commission are confessed. The speeches made at the recent meeting of the Slovak Communist Party's central committee reveal a picture which is fairly typical, to a greater or lesser degree, of the state of affairs inside most of the Communist Parties of eastern Europe. But the frank revelations of the backslidings of the Slovak Communists are particularly interesting just now when there is every indication that some of the most prominent of them—Clementis, Novomesky, and Husak—will shortly be brought to trial for their "bourgeois nationalism" and other crimes.

Indeed, it is "the most repulsive practices" introduced into the Party by these people that are said to be largely responsible for the present unsatisfactory situation. According to Bastovansky, the secretary-general of the Slovak Communist Party, these practices include the suppression of criticism and self-criticism, "fractional grouping," "replacing collective leadership by personal dictatorship," and burdening the Party with circulars and purely administrative work so that it is distracted from its political and ideological work. These faults are now to be ruthlessly eradicated and the Party is to return to the Bolshevik principles of party work first laid down by Lenin, of which the most important are democratic centralism, internal party democracy and criticism and self-criticism.

Whatever Lenin himself may have meant by these principles, it is clear that they are now being used to make sure that the will of the politburo is carried out in the most remote local Party organisation, and that no local leader ever engineers himself into a position in which he can even think of challenging the authority of the central committee. But the existence—admitted by Bastovansky—of all kinds of big and little dictators within the Party is not only a potential threat to the higher authorities; their "arrogant and arbitrary

1109

behaviour" is also dangerous because it destroys the confidence of the workers in the Party. Local Party officials have been resorting "lightheartedly and inadmissably" to administrative action, and Mr Bastovansky found it necessary to point out that authority to issue orders for the arrest of a citizen rested exclusively with the appropriate security officers whose function and authority must not be usurped by Party officials.

Internal Party training and education is also in an unsatisfactory state. Even high Party officials have shown a "negative attitude" towards the problems of political education and have said that they were too busy to study Marxism-Leninism. District Party committees have failed to give enough careful thought and attention to the central committee's directives on educational matters. Lectures have been badly prepared; lecturers have failed to turn up; and valuable Party pamphlets have been carelessly left lying about in drawers and cupboards. This must seem a deplorable state of affairs to those who believe that only a more complete mastery of the theory of Marxism-Leninism will enable Party members to deal with all the problems in industry, agriculture and local government with which they are faced.

The Slovaks, a very large proportion of whom are Catholic peasants, have always shown themselves to be particularly unappreciative of Communist propaganda. It is, therefore, hardly surprising that the Slovak Communists have not managed to create as close ties and as sympathetic relations with the ordinary people as they should have done. The small circulation (106,000) of the chief Party newspaper shows that a large part of the workers—and even a good number of Party members—do not bother to read it. In any case, Party propaganda is not sufficiently lively, concrete or attractive and Party members are not carrying out their duties of political agitation. If Mr Bastovansky's words are heeded, workers in the factories and in the fields must expect to be summoned to endless meetings and inundated with countless leaflets and "other tested propaganda weapons." The object is not only to recruit new members—"extraordinary attention" is to be paid to this, especially as the recruiting of shock-workers has been badly neglected—but also to create around the Party "a vast circle of non-Party activists."

Mr Bastovansky drew particular attention to the "dangerous isolation" of many local Party committees from the life of the peasants and their ignorance of peasant needs, anxieties and problems. His anxiety is clearly a reflection of the intense opposition of the Slovak peasants to collectivisation. This is leading to a lagging behind in agricultural production and, in some districts, to "extraordinarily grave deficiencies." The blame for these agricultural troubles is, of course, laid at the door of the kulaks who have infiltrated into the collectives in large numbers in order to destroy them from within. The district Party committees, largely led astray by the bourgeois nationalist, Husak, have failed to appreciate the dishonest and anti-social nature of the village rich and have not waged a merciless fight against them. To make these committees more efficient and more aware of their duties is now, according to Bastovansky, the Party's most important task.

Finland Holds Out

ON May 2nd an agreement was made between the Finnish Government and the representatives of employers, trade unions and farmers for an "economic truce." Wages and prices are to be kept stable until September 30th, an Economic Council is to be created to draw up a long-term programme of economic stabilisation, and measures are to be studied to relieve those suffering especially from the burden of taxation. The employers' and trade union leaders, in subsequent official statements, expressed their satisfaction and once more exhorted the population to work harder and to observe self-discipline.

This is not the first agreement of this sort. Hitherto the inflation has proved stronger than the good intentions of cabinet ministers or professional bodies. There is, however, one good reason for hoping that this agreement may be more successful than its predecessors. For the last year the trade union leaders, who are Social Democrats, have been unable to resist pressure from the workers for higher wages for fear of being outbid in demagoguery by the Communists. This was the chief reason for the strike in the engineering industry last autumn which did so much harm to Finland's economy. Two weeks ago, however, elections were held for delegates to a new trade union convention, which is to meet next June and will elect the national trade union leadership. Lavish expenditure of funds whose origin is obscure, employment of hundreds of full-time agitators, and the usual threats of Soviet intervention failed to give the Communists victory. The Social Democrats successfully combated the apathy which, in Finland as in other countries, is the best ally of the Communists in workshop elections. In a poll of 80 per cent of those entitled to vote, the Communists only won a third of the delegates. Four years ago at the last elections they had as much as 40 per cent. This impressive Socialist victory has made it much easier for the trade union leaders to act constructively in economic questions of national importance.

Finland, however, is never free from danger. The press and radio of Moscow have recently been generous in their abuse of the Finnish lackeys of American imperialism. The substitution as Soviet Minister in Helsinki of General Savonnikov, inexplicably "relieved of his functions," by Mr Lebedev, an expert in the manufacture and manipulation of puppets who has learnt his skill in Warsaw, is not an encouraging event. Finland will have a general election in July. The prospect of a loss of Communist votes indicated by the trade union election may make Moscow consider more drastic policies. The lesson of February, 1948, in Czechoslovakia has its relevance. But at least this much can be confidently predicted. Unlike Czechoslovakia, Finland will not be taken from within.

Europe's Emigration Needs

[BY A CORRESPONDENT]

THE conception of emigration in the European mind is distorted by more than the usual time-lag in readjustment. Some fifty years ago the golden legend of a universal panacea began to float back across the Atlantic thanks to the phenomenal absorption of European peoples by the United States in the last few decades before the first World War. The legend was accepted as a miracle in southern Italy.

The absorptive capacity of the United States depended, however, to some extent upon the prosperity of Europe. Today—as a recently published booklet* has pointed out afresh—the whole question of emigration has been transformed by catastrophe and upheaval. Thus simply to remove people from Europe may help neither them nor Europe. In the first place the South American republics may have the necessary space, but they lack the resources which need to be on a grander scale than half a century ago because of the greatly increased development of industry. In the second place most West European nations (and it is only with their problems that we are here concerned) have become top-heavy; that is to say they have a high and increasing proportion of old persons who, rather than producing themselves, tend to depend upon the productive efforts of others. A thoughtless facilitation of emigration would simply increase this proportion since it is the young who are naturally predisposed to emigrate; the departure of young people would thus intensify the uneconomic relation of age-groups in most of the countries of Western Europe.

* "The Importance of Emigration for the Solution of Population Problems in Western Europe," by Dr Hilde Wander. Martinus Nijhoff, The Hague 1951. 46 pp. 2.75 Guilders.

Emphasis upon this consideration is perhaps Dr Wander's most important contribution to the study of emigration.

She also gives her attention to the difficulty which has become most conspicuous since the end of the last war. Everywhere there has been a lack of technically skilled workmen; each country has inevitably striven to keep its technicians at home or to send away its unskilled hands. Until the recent agreement by which Britain is bringing in Italians to be trained as miners, little progress was made in the matter of shifting workers from Italy because Italy itself was short of highly trained men, and neither France nor Argentina wanted untrained Italian peasants. The whole trouble was magnified by agricultural unemployment. Even so short a time ago as the slump of the early thirties unemployment in countries less industrialised than Britain was alleviated because town workers could often go home to their country cousins and help there; many unemployed Germans held out in that way. But since then the countryside has become—or been admitted to be—over-populated, in Germany particularly because of the many German refugees from the East; this in its turn means that many of those who would wish to emigrate are unskilled land workers whom no foreign country wants. Nor can post-Korean War rearmament do very much to overcome this difficulty although the demand for skilled industrial workers is every-

where increasing. Dr Wander demonstrates a steady decrease in the West European demand for foreign labour, using OEEC and ILO statistics, but only up to the beginning of 1950.

Over one major issue Dr Wander would herself appear to take an anachronistic view or perhaps only to show vacillation. Several times she implies that the Western world would do well to return to the liberalism—surely an ambiguous word in German—of its fathers. She nevertheless recognises that another cardinal change in the general situation consists of the necessity for governments or international organisations to finance emigration, on the one hand because individuals in general have not the means and on the other because uncontrolled emigration would tend to move the people least suitable either as emigrants or as immigrants.

About two million people, we learn, emigrated overseas from Western Europe between 1946 and 1949 (this figure does not allow for repatriation), and in 1948 and 1949 about 700,000 people, mostly Italian, German, Austrian or DPs, emigrated to Belgium, France, Sweden, Switzerland and Britain. But, as Dr Wander concludes, the remedy for the over-population of Western Europe lies in the increase of productivity and the provision of more employment at home in Western Europe, emigration playing only a secondary part. And clearly a great deal might be hoped from the integration of Western Europe upon the largest possible scale with a proportionate increase in the mobility of labour.

THE BUSINESS WORLD

The Case for Monetary Policy—II

Action Short of Bank Rate

THE budgetary method of resisting inflation during the rearmament phase, it was argued in last week's article, is unlikely to be sufficient; it could and should be reinforced by monetary measures—even though the Government remains determined that the combined effort at disinflation shall not be pushed so far as to raise transitional unemployment perceptibly above its present level. On this assumption, what kind of monetary policy would be appropriate?

Plainly, it must not be either an extreme or an inflexible policy. A too drastic restraint of credit, like a too drastic budget policy, would produce needless dislocation (though some dislocation is a necessary consequence of any serious attempt to check inflation). A too rigid, even though moderate, monetary policy would throw away one of the peculiar advantages of proceeding by this method. Budgetary policy, being normally predetermined for twelve months ahead, is not only extremely rigid and subject to big time lags in its response to given changes, but is also founded upon long-range forecasts that make it peculiarly prone to error. Monetary policy, if wisely deployed, can be infinitely flexible, can be varied appreciably or imperceptibly from day to day, and exerts its effects virtually without time lag. In principle, it is therefore the perfect instrument to complement a policy of budgetary disinflation, and to correct the mistakes of even the best-laid budget.

It follows that monetary policy cannot be founded upon a preconceived level, or any given level, of interest rates. There is no means of determining in advance whether a rate of, say, $4\frac{1}{2}$ per cent at long-term would prove to be either too low or too high to achieve the kind of equilibrium at which the policy would aim; all that is certain is that the requisite level would be above the present level of just over $3\frac{1}{2}$ per cent. But the fact that the need is for variable rates, and for a variable degree of restraint over the volume of credit, does raise one not inconsiderable practical difficulty: the monetary authorities have not for years had any experience of operating a positive monetary policy. Since 1939 they have in effect been acting merely as technical managers of the pool of funds in the short money market—a formidable task in these days of astronomical payments to and by the Government and one that has been tackled with great skill and resource, but not one that demands the penetration and nice judgment that are needed when monetary policy is used positively as a means of economic control. Moreover, even in the 'thirties, when monetary policy last sought this wider objective, the authorities did not appear ever to have evolved any clearly defined principles of operation. Before that, in the most recent period of fully variable interest rates, "management" was closely conditioned by the exigencies of the gold standard. There is not, therefore, any existing body of principles

or precedents that would be directly applicable to present circumstances and needs.

For this reason, it is desirable that in any approach to a positive monetary policy the authorities should feel their way cautiously and experimentally. Some advocates of dearer money believe, indeed, that they should confine themselves to the one sphere in which they have operated positively in recent times—the gilt-edged market. This would certainly be the easiest method; unless a really considerable adjustment were needed, it would not raise any awkward technical problems and might even avoid any interference with the pattern of short money rates (which some people might regard as an added advantage). The authorities would need to do no more, in principle, than to reverse the techniques pursued by Dr Dalton in 1945-46. Instead of fully investing any extra-budgetary income surpluses in the long-term market, they would keep them as short as possible—which means, in effect, that these surpluses would finance the Exchequer's current needs and thus would reduce its borrowings from (or increase its repayments to) the banking system.* If this cessation of net new purchases of gilt-edged, and the corresponding decline in the Government's demands for bank credit, did not produce a sufficient effect, a further adjustment of the same kind could be produced—as delicately or as abruptly as desired—by switching part of the existing departmental holdings from long into short gilt-edged securities and, in particular, into floating debt. This latter process would, of course, involve a net sale of securities to the gilt-edged market; quite moderate selling would be likely to have strong psychological effects on the level of gilt-edged yields.

★

A raising of long-term rates by these means would certainly exert some disinflationary restraint, but its effects would be arbitrarily circumscribed. As the experience of the past five years has demonstrated, yields on gilt-edged can be raised substantially without provoking adjustments in other rates. In this period, the yield on irredeemables has risen from $2\frac{1}{2}$ per cent to over $3\frac{1}{2}$ per cent, but the average rate charged on bank advances has not increased; the rate on commercial bills has risen only moderately; and there has been a very long lag in the response of such rates as those offered on National Savings securities or charged by the Public Works Loan Board. For this reason, such restraint as a gilt-edged policy of this kind would exert upon the

* It is worth noting that the proposed reduction in Exchequer payments to the National Insurance Fund will exert this effect automatically—unless the diminution of purchases of securities by the Insurance Fund is deliberately offset by equivalent switching of departmental funds from floating debt into marketable securities.

creation of credit could be largely frustrated in other ways. For example, an industrialist who was deterred by the rise in rates from financing an "approved" outlay by selling gilt-edged would probably get the finance quite readily from his bank at no increase in cost. The diminution of the Government's dependence upon the banks would merely result in additional loans to industry.

To be really effective, therefore, a positive monetary policy would need to extend beyond the gilt-edged market. Unless a very large adjustment were necessary, this probably does not mean that it would be necessary to raise Bank rate, as many orthodox observers assume. It does mean, however, that the short money market could no longer be kept immune. The fundamental feature of monetary practice since 1939, and one that distinguishes it from all previous phases, is that the central bank has no real control over the volume of its own assets (lendings or purchases of securities) and therefore no real control over the volume of money (mainly in the form of commercial bank deposits). This loss of control dates from a wartime change in its attitude to the discount market. During the prewar cheap money phase, the authorities did indeed generally save the discount market, except at half-year-ends, from any classical recourse to the Bank of England for accommodation at or over Bank rate; they did this by voluntarily buying bills themselves, at market rates, at moments of stringency, thus alleviating the cash shortage and preventing market rates from rising towards Bank rate. Although a policy of stabilised cheap money logically required an automatic release of credit at such times, the authorities firmly insisted on keeping the credit reins in their own hands. During the war, however, they handed them over to the discount market and the banking system: the initiative for the creation of credit by this route in effect now lies with the discount houses. Whenever the market is short of funds, it offers bills to the Bank's agent (the "special buyer"); and this assistance is never refused unless the authorities either know that sufficient credit will be available later in the day or prefer to create it themselves through other channels.

In effect, therefore, the volume of credit has come to be controlled by a planner's priority certificate. The Government gets automatically all the credit it needs from the banking system, and other borrowers usually get it too—provided they have the backing of a Government department or can persuade the banks that they need it for purposes not excluded by the official directive. The banking system never needs to worry whether

any new lendings will strain its resources and compel it, for example, to sell gilt-edged securities; it knows that it can always get automatically whatever additional cash is needed to support its rising deposits by merely refraining from buying bills from, or renewing loans to, the discount market; the latter gets the extra cash by selling its bills, on the same terms, to the central bank.

★

From the moment that these automatic facilities were granted, the central bank in effect abdicated from its position of sovereign controller of the volume of money—except for such limited control as could be exerted through the gilt-edged market. It follows, therefore, that before any policy of monetary restraint can be extended beyond that market the authorities must first revert to the prewar system, under which they kept the formal initiative in credit creation firmly in their own hands. Such a change, though of vital significance, could be made quite unobtrusively and without causing any dramatic effect. The authorities, if they acted in character, would confidentially "remind" the discount houses that they ought not to count upon the facilities of the special buyer "as of right," and would emphasise that in future he would operate only upon his own initiative. Unless they wished to lever up the whole rate structure forthwith, the authorities would no doubt also point out that this was merely the prewar system, under which money and bill rates were generally stable at levels far below the 2 per cent Bank rate.

It is possible that this procedural change, combined with a "positive" gilt-edged policy, could exert a significant effect even though it were never used to create such stringency in the money market as would involve an increase in rates above their present levels. The crucial fact would be the warning given to the banks that they could no longer take it for granted that enough additional cash would always be provided to support any increase in their deposits. Even though supplies continued to be adequate at the current level of market rates, the element of doubt would inject a new and additional caution into the banks' consideration of demands for advances or contemplated purchases of investments. Marginal borrowers would find it more difficult to get accommodation, would get less than they sought, or would even be pressed to reduce existing advances. Inevitably, some of the pressure of excess demand for raw materials and other resources would be relaxed.

If the banks did not react sufficiently to this warning,

the way would have been prepared for more tangible specific action, still short of an increase in Bank rate. There are many fine gradations in the screw of pressure that could be turned upon the short loan market; but any perceptible and sustained tightening would so impress the discount houses with the risk of buying three months' bills at present rates that some increase would be inevitable. If the authorities played their hand astutely, and only gradually tightened the supply of funds in the short loan market, they could probably exert quite a large and salutary effect upon the total volume of bank credit without provoking more than a modest increase in market rates—of the order, for example, of a rise in the Treasury bill rate by successive steps of 1/16 per cent to 3/4 per cent. Any such advance would certainly provoke a more than proportionate rise in rates charged on commercial bills.

If the policy needed to be pushed further still, then, indeed, it would raise the question of an all-round increase in rates. Each successive bout of stringency in the short loan market, and each small advance in market rates, would so intensify the "warning" that, beyond a given point, the authorities would no longer be able to reassure the market that a really abrupt advance was not in contemplation. The discount houses

and "outside" banks, fearing some kaleidoscopic change in the circumstances to which they have been accustomed for so long, would probably then begin to reduce their tenders for Treasury bills; if this forced the authorities to take up an undue proportion themselves, the resultant enlargement of the supply of central bank credit might threaten to frustrate the whole policy, because the market and banks would then presumably refuse to re-purchase the bills from the authorities except at higher rates.

This possibility underlines the fact that, if the object were to exert the maximum effect with the minimum advance in rates, the authorities would need to show a high degree of diplomacy, skill and judgment. But their traditions in market management in the past offer good grounds for hope that much—and perhaps sufficient—could be achieved even by policies of this moderate kind. Within these limits, the effect of any rise in rates upon the cost of financing the floating debt would be insignificant. Up to this point, therefore, the familiar argument that a tighter money policy must be ruled out because of its repercussions on the budget, does not even merit a reply. It deserves consideration only in the context of a more substantial and all-round increase in rates. The kind of policy required if that became necessary will be examined in a concluding article.

British Trade with China

THE extent and propriety of British trade with China are matters on which more exaggeration, more misunderstanding and more British ineptitude are evident than in most of the issues between the American and British peoples and governments. This is indeed a "hot potato" which has lately been given an extra cooking by General MacArthur and tossed at the Prime Minister. Mr Attlee, with lamentable ineptitude, dropped it in a steaming mess in the House of Commons on Thursday of last week, leaving it to the new janitor at the Board of Trade to clear up the traces last Monday. Sir Hartley Shawcross in his full and frank statement showed that Britain had not exported any goods that might directly help China in its military operations. But much damage had been already done and many suspicions remain in the United States.

The key facts in this argument are complicated. They involve direct trade between Britain and China and with Hongkong, and also a similar pair of trade relations between Commonwealth Countries and China and Hongkong. Some of the criticisms of British trade policy in the East treat trade with Hongkong as being synonymous with trade with China. Let the assumption for the moment be accepted. Total British exports to the Chinese mainland (including Hongkong) last year amounted to £30 million, less than 1½ per cent of total British exports. If all these exports had consisted of vital war equipment, which is absurdly untrue, the contribution they would have made to Chinese military operations would have been relatively small. In fact, no part of them consisted of war materials. The development of trade between the Commonwealth and China during the past nine months is another matter, and one far more difficult to assess physically, financially and morally. The figures are defective and delayed;

Hongkong with its large entrepot trade with China creates a major difficulty even when trade figures list China and Hongkong separately and figures often refer to only broad categories of goods.

The question of restricting goods to China did not arise until last September when the first Chinese troops were identified as operating with the North Korean army. On December 3, 1950, the United States Government placed a complete embargo on all exports to the Chinese mainland and to Hongkong. The development of trade with China during the past nine months needs to be traced from quarterly figures, but these, unfortunately, are not available for most countries. Details of British exports to China in the first quarter of this year were given by the President of the Board of Trade on Monday. The total amounted to £1,300,000 for the quarter compared with £3,600,000 in the whole of 1950, and with only £295,000 in the first quarter of 1950.

During the first three months of this year Britain has sent iron and steel manufactures (£230,000) including tubes, pipes, tinplate and wire cable; the tubes, pipes and fittings were mainly for maintenance of the Shanghai power station, and the tinplate was used exclusively for packing liquid eggs for shipment to Britain. Machinery exports totalled £225,000 and consisted mainly of boiler house plant and textile machinery. Electrical goods (insulated cables, and electro-medical apparatus) accounted for £163,000, chemicals, drugs and dyes for £105,000, bicycles and tyres for £70,000 and non-ferrous metals (chiefly lead sheet) for £57,000. These items in themselves look innocent enough. The President of the Board of Trade also assured the House that all

goods of direct military importance and those that might assist Chinese military operations are entirely prohibited while supplies of many other goods are restricted to what are considered normal quantities for civilian use in China. He added that a careful watch has been kept on trade with China since fighting started in Korea last June. It is something that British policy has at last been clearly stated, though the last word has probably not yet been said on the question of an embargo on exports to China.

The wider question of the importance of Commonwealth trade with China and Hongkong can be examined against the background of figures presented in the first table. Last year, the only Commonwealth countries that had a significant trade with China were Malaya, Britain, Pakistan and India—in that order by value. Malayan exports to China, consisting mainly of rubber, increased sharply last year and were substantially larger than in 1948. British exports to China also increased last year but much more modestly. They represented, however, less than half of the value of exports in 1948. More than a third of the total of £3,600,000 consisted of copper manufactures in the form of wire, tubes and strip; a further £500,000 consisted of iron and steel manufactures (tubes, tinplate, wire, bars and rods), £450,000 of textile machinery, £350,000 of wool tops and £150,000 of goods grouped in the trade returns under "vehicles (including locomotives, ships and aircraft)" but which apparently consisted of bicycles and tyres. Trade figures for Pakistan cover only one full calendar year, but it is clear from trade reports that exports to China increased during 1950. Raw cotton and raw jute together accounted for almost all the £2,800,000 worth of goods sent in 1950. India was the only other Commonwealth country listed in Table I that exported to China last year goods worth more than £1,000,000; the total was in fact £1,850,000, not very much larger than for 1949 and barely a third of the exports of 1948. India's exports consisted almost entirely of raw cotton and raw jute and their manufactures. In 1950 the United States exported £13.5 million worth of goods to China compared with £22.8 million in 1949 and £67.8 million in 1948. The volume of trade was thus already declining before the embargo was imposed last December. Nevertheless, the value of American exports to China last year was only a little less than Malaya's exports.

Direct trade with China shows only part of the picture. The other part is covered by trade with Hongkong, but it is impossible to show how much of this trade ultimately goes to China. Of Hongkong's total exports of £235 million last year, £92 million (39 per cent) went to China. In 1949 the proportion was 29 per cent and in 1948 24 per cent of a total that did not reach 30 per cent of the 1950 figure. Hongkong's exports to China doubled last year and were more than five times larger than in 1948. It is proper to add that Hongkong's exports to other countries also increased during this period though not so sharply as those to China. Statistics of entrepot trade can be misleading, unless they show clearly the source of goods. Trade statistics for Hongkong do not show the countries of origin of its exports—hence the disparity of the figures for Hongkong's trade as they appear in the two tables. Nevertheless it is clear from Table II that a significant part of Commonwealth exports to Hongkong and, indeed,

from other countries ultimately find their way into China. The Commonwealth has naturally a much larger trade with Hongkong than with China. Last year South Africa and Ceylon were the only two of the eight Commonwealth countries included in Table I that exported less than £1,000,000 worth of goods to Hongkong. Britain ranked first with £28 million, followed by Malaya with £20 million, Pakistan with £12 million, and India with nearly £10 million. United States exports to Hongkong last year amounted to £38 million, and Japanese exports to £14 million.

Britain's exports to Hongkong covered a host of different goods. Textiles, including apparel, amounted to £6,500,000 but the largest single item last year was ships and boats which amounted to £2,200,000. Motor cars, chassis and tyres added another £1,200,000. Exports of machinery totalled £2,500,000 and consisted mainly of textile machinery, generators, motors and spare parts. Iron and steel manufactures, mainly wrought steel and plate, were valued at £2,400,000; non-ferrous metals (brass and aluminium) at £1,500,000; electrical equipment (cables and electrical instruments) at £1,500,000; and food, drink and tobacco at £1,500,000. Malaya's exports to Hongkong have increased each year since the war, but the rise in 1950 was phenomenal and rubber accounted for most of the total. Exports to Hongkong from both Pakistan and India increased sharply last year and raw cotton and jute and their manufactures were the main items. Australian exports were also significantly larger last year and comprised wheat flour and wool semi-manufactures. Exports from Canada showed little change on the 1949 figures and wheat flour, fertilisers and certain non-ferrous metal manufactures were the main commodities.

★

The results indicated by this analysis of trade with China may be summarised as follows. Direct trade between Commonwealth countries and China increased in 1950 but not to any alarming extent, with the single exception of Malayan exports of rubber. Commonwealth and foreign trade with Hongkong increased more sharply, and the main Commonwealth commodities concerned in this trade were rubber, and to a lesser extent cotton and jute. The chief sources of supply of these goods were Malaya, Pakistan and India. But Japanese and Thai trade with Hongkong also increased quite sharply last year, and some proportion of these supplies presumably went to China. It would therefore seem that the only vital war material that has been sent to China, directly or indirectly, during the past year or so is rubber, and it is clear that the quantities involved have increased surprisingly since last June. Both Britain and Malaya introduced export licensing for rubber at the beginning of April and during that month only 2,500 tons were shipped from Malaya to China. This quantity represents an annual import for China of 30,000 tons, which is considered to be China's normal civilian requirements. It might well be that even this quantity is too large since China can obtain rubber from other countries such as Indonesia, Thailand and Vietnam as well as by smuggling.

Four years ago a British trade mission visited China and reported that vast quantities of material and equipment were required to repair and restore damaged industrial plants, power plants and transport. The

present Communist Government is vigorously pursuing a policy of industrialisation and the goods vital to China, not least in pursuing a war, are capital equipment. Rubber is also a valuable commodity but it is probably much less valuable to the Chinese than petroleum, railway equipment and industrial plant. Few countries are equipped to meet China's industrial needs and of these neither Britain nor the United States has sent any significant quantities of capital equipment during the past nine months.

The problem of imposing a complete embargo on China would raise many issues. The first point is that action would have to be concerted, which implies a decision made by the United Nations. The second point is whether it would be sufficient for the western powers to refrain from exporting to China, or whether they would have to control all shipments to China. A full economic blockade would be difficult to enforce, both technically and politically, in circumstances short of war. The third point is the replacing of supplies from China that the United States, Britain, and other countries of the west require. And finally there remains the delicate position of Hongkong.

*

Trade with China is not a one way affair. Last year, the United States, Britain, Japan and most of the Commonwealth countries imported more from China (in value) than they sent to China, though they exported more to Hongkong than they imported, which may have restored the balance. China's main exports have been tungsten, tung oil, soya beans and other oilseeds, and much larger quantities of these goods were shipped to both the United States and Britain after the Communists assumed power than before. Last year Britain received £3,500,000 of liquid or frozen eggs, £750,000 of vegetable oil and oilseeds, of which £500,000 consisted of tung oil; bristles accounted for £620,000, feeding-stuffs for £530,000 and miscellaneous raw materials for £630,000. Hongkong supplied Britain with vegetable oil and oilseeds (£3,650,000), mainly in the form of tung oil, bristles (£645,000), non-ferrous metals and scrap (£140,000), hides and skins (£390,000), miscellaneous raw materials (£680,000) and foodstuffs (£340,000). The pattern of imports from China and Hongkong into Commonwealth countries has been similar, with perhaps a greater emphasis upon cotton and silk textiles. India has recently taken considerable quantities of Chinese grains and rice. An embargo on trade with China means in the last analysis foregoing these imports. The lack of Chinese supplies of tungsten has already made itself felt in both Britain and the United States.

Hongkong holds a peculiar position in Far Eastern trade. It is virtually the banking centre for the whole of the Far East area and the main centre for marine insurance for the Pacific. It lives entirely on its entrepot trade with China. It is the fourth or fifth largest port in the world judged from shipping returns and it has a large airport. It carries on a certain amount of manufactures, but its prime source of income is from trade and trading ancillaries, and it is an important source of invisible exports for Britain. It would be possible to blockade China without blockading Hongkong, but the volume of business conducted in Hongkong would be seriously curtailed. The colony provides a useful base for naval units and it gives access to the Chinese mainland for the western powers. The importance of Hong-

kong is not that it is a member of the Commonwealth; it is a vital link in the trade between the east and the west. A crippled Hongkong is probably of less political value to Britain and the United States than a prosperous Hongkong that may, inevitably but not disastrously, admit a certain amount of contraband trade with China.

If an embargo on Chinese trade is to be effective it must hurt China more than it hurts the western powers. Rubber is more important for the west than it is for China, and even if all shipments of rubber to China were stopped it would be arguable whether the fighting capacity of the Chinese army would be greatly reduced. On the other hand, Britain and the United States already

have to bear the heavy burden of rearmament, and a blockade could be justifiably added to that burden only if it yielded material results. Action against Italy in 1936 taught the world that economic sanctions are best left alone unless they can be applied effectively. With China it is highly problematical whether an embargo could be effectively enforced. Britain and its dependent territories and the United States might well prevent any of their exports from going direct to China or Hongkong. But it is less certain that countries like Thailand, Indonesia or even India and Japan (after the peace treaty is signed) would be willing to enforce it rigorously. The curtailing of shipments of rubber (now in force) and control of other potential strategic materials, coupled with the prohibition of the export of war equipment and petroleum (also in force), may well yield better results than cutting China off from all trade with the western world.

Business Notes

Finance Bill Debated

At least it can be said of the debate on the second reading of the Finance Bill that the leading speakers on both sides put their points of view with admirable clarity. But of common meeting ground—of the kind that marked some phases of the Budget debate itself—there was little or none. This brought taunts from the Financial Secretary and the Chancellor—presumably in the hope of distracting attention from the features of the Bill that had not been singled out for mention in the Budget speech itself. "As in the war," said Mr Jay, "it is necessary now to counter types of tax avoidance that are steadily increasing." That justified Clause 28 of which he claimed that "although this may at first sight appear drastic, it is only a straightforward reproduction of a provision that was in force throughout the war affecting EPT." This argument was denounced by Mr Lyttelton in properly scathing terms. The clause is a device to give the revenue authorities executive power to rearrange the taxpayer's affairs to best suit the tax collector.

On Clause 32, which seeks to prevent the transfer of companies abroad, Mr Jay argued that it was owed in fairness to the humble taxpayer and others who did not resort to tax avoidance. "Here again," Mr Jay added, as if in final argument, "similar powers existed during the war." As he and the Chancellor described the clause, it became quite clear that the Treasury (whose consent would be needed before such transfers were allowed, without any recourse or appeal on the taxpayer's part from their decision) would look to the consequences and not merely to the intention of the transfer. In the Chancellor's words:

If no loss of tax is involved, or if any loss of tax is outweighed by really compelling reasons, then consent will be given without more ado. In other cases there may be a more difficult balance.

The Chancellor's suggestion that a small advisory committee might be set up to assist him, and his assurance that "the issues will not be decided purely on revenue grounds" are quite insufficient safeguards against the wide powers that the Treasury seeks. This is, on the widest fiscal, economic and constitutional grounds, a thoroughly objectionable clause, and it is outrageous to seek to justify it, as the Financial Secretary did, on the grounds that "similar powers existed during the war." Is this the way that precedent broadens down from precedent, from wartime to peacetime?

Mr Gaitskell's further observations on dividend policy leave a somewhat different impression from that suggested by his remarks in the budget debate. There was, he said, an impression in some quarters, "to judge by certain press comments," that having increased the profits tax, the Government were indifferent to an increase in dividends. He wished to make it clear that this impression was incorrect. The Chancellor does not prefer in the interests of revenue a greater payment of dividends, "because this, in our opinion, would conflict with the interests of the economy," and he added a threat of action "to ward off the inflationary effect of any general departure from the policy of moderation and restraint."

* * *

Machine Tools from Home

A logical third step in ensuring that the 35,000 extra machine tools required for the defence programme will be delivered in time by the summer of next year, was announced by the Minister of Supply this week. Mr Strauss's department originally placed orders with British producers for as many tools—some 8,000 in all—as they could promise without affecting their other commitments. Simultaneously it

began to place extensive orders with machine tool manufacturers overseas, and has since devoted considerable attention to ensuring punctual delivery of these orders which, when completed, should provide some 19,000 to 20,000 tools. It has now come back to the home machine tool industry. The remaining 7,000 to 8,000 tools required will have to be obtained by the diversion of machines promised to civilian customers; in the next eighteen months, the Minister estimated, this diversion will mean a 35 per cent cut in tool deliveries to home civilian customers.

This displacement will bear most hardly upon those civilian industries that use the more specialised tools and are accustomed to re-tooling at frequent intervals. The most obvious example is the motor industry. A general cut of 35 per cent, moreover, would imply the diversion of a much higher proportion of certain very complex tools, of a type ordinarily produced in very small quantities. The effect of the Government's new move may therefore be felt particularly by motor companies that would be turning in the next year or so to the introduction of new models. But other factors, such as material supplies, and defence orders would in any case have affected output and new development during that period. All in all, the proposed cut in prospective deliveries of new tools can hardly be counted as a high price for the defence programme: pressure upon the British machine tool industry is still being held down to a level that many in the industry would have thought impossible a few months ago.

The arrangement by which advisory panels of machine tool manufacturers and users will examine the needs of customers whose promised tools may have to be diverted, and possibly suggest substitution of less scarce equipment, appears a sensible one. It is always possible, of course, that a company denied a particular machine for its civil production may later receive the same tool in order to carry out a defence contract.

* * *

New Purchasing Commission

In obtaining machine tools from abroad the Ministry is relying upon the established trade channels through which it has already placed orders in Europe for 11,350 tools costing more than £30 million, while contracts and deliveries for the 7,000 odd machine tools already ordered from the United States are now being discussed in Washington by Mr Rawson, Director General of Machine Tools. But responsibility for placing other defence orders abroad—with the exception of food or raw materials—is to be centralised in a new purchasing commission set up within the Ministry of Supply, with a number of offices in Western Europe.

Separate departments of the Ministry have already placed big orders for defence stores in Europe, but usually only in cases where they could not be accepted by British manufacturers. Thus orders for £3,800,000 worth of textiles and clothing have been placed in Germany, £2,000,000 worth in Belgium, and £900,000 worth in Italy. Orders for armaments that have been placed in Belgium, Italy and Sweden total £2,200,000 and another £3,000,000 worth of general stores has been ordered from Germany. One function of the new commission will be to carry this policy a stage further and to find out what capacity is available in Western Europe that could be used to meet British defence needs and so "enable British manufacturing capacity to be used for essential home production and exports to a greater extent than the substantial rearmament programme would otherwise permit." This is particularly important in the case of cotton textiles, the only branch of the textile industry

with an opportunity of increasing its exports beyond their present rate.

Mr Strauss has made it clear that the commission will not help foreign contractors to obtain raw materials. Many manufacturers, particularly in Germany, wished these British orders to be related to a definite allocation of scarce materials. But this could be provided by the Ministry only at the expense of British manufacturers, and it has been done on only one occasion. In that instance cotton cloth owned by the British army in Germany was given to German manufacturers engaged on British defence orders. It was about 25 per cent of the total quantity that will be used on these orders.

* * *

Automatic Transfer Machinery

Although the diversion of machine tools from civilian uses will affect the plans for re-equipment of the British motor industry, some concerns, including Vauxhall and Ford, have to some extent anticipated events by the installation of what is called automatic transfer machinery. Firms in the United States and, it is reported, in France have some of this machinery in use. Vauxhall Motors last year installed James Archdale automatic transfer tools, mainly for drilling the cylinder head castings for the Bedford models. The company intends also to machine the Bedford gearbox casing using American transfer machines.

The Ford Motor Company in the machining and assembly of the four-cylinder Consul and the six-cylinder Zephyr models has gone further in reorganisation as part of its £12 million programme of improvement and expansion. Both models are machined by the same tools and assembled in the same line; identical dimensions of the cylinder block (apart from length) and of other parts have been skilfully designed for this purpose. A whole series of machine processes of the cylinder blocks is devised to ensure the minimum of handling. About a dozen automatic transfer milling, boring, drilling and reaming machines are employed; and for each group of operations the cylinder block is moved into position, automatically located and clamped; it is then machined, unclamped and passed on automatically. The Ingersoll 9-station process milling, drilling and reaming machine is one of the more fascinating of the seven multi-station automatic transfer machines used. The pressure of the starting button begins the automatic cycle and the operator controls the operations wholly by a series of press-buttons. Automatic transfer is also used for the transmission cases, gear housings, bearing caps and cylinder heads. The result is an impressive increase in productivity compared with methods that hardly deserve to be called old. However, neither Vauxhall nor Ford is yet getting the full value of the new methods in output, mainly because of limitations in steel supply. Machinery of this kind will clearly strengthen the position of these firms and of others in the British automobile industry in meeting growing competition from the United States and European car manufacturers.

World Bank Loan in London?

During his visit to London this week Mr Eugene Black, president of the International Bank, has been negotiating with the British Treasury and with certain British banks to secure sterling for the financing of loan projects that are in contemplation. Several Commonwealth and other countries have recently approached the Bank for sterling loans; this is partly a sign of the increased strength of sterling, but also a sign that would-be borrowers are still unwilling to borrow dollars for conversion into sterling, thus incurring dollar capital charges. There are two sources from which the World Bank could secure sterling. First, it could, by arrangement

with the British Government, call up for lending purposes part or all of the local currency portion of Britain's paid-in subscription to the Bank (now amounting to about £82 million); this would mean that a previously dormant section of the recorded total of sterling balances would suddenly become a source of strain on the British economy. Alternatively, the Bank could float a loan on the London capital market, as it has already done on five separate occasions on the American and Swiss capital markets.

It is believed that arrangements for a small loan issue of this sort—probably of about £5,000,000—are now under way. The loan would probably be placed in the first instance with a consortium of six British banks, but a Stock Exchange quotation would be sought for it so that these banks could market the bonds. Any sterling raised in this way would, of course, have to be usable only within the ordinary framework of sterling exchange control. The terms on which the loan might be issued must be a matter for negotiation between the World Bank and the proposed consortium—negotiations that will no doubt have to take account of the unpropitious atmosphere for any fixed interest issue at this time. In one sense, World Bank bonds are “super-gilt-edged,” since they carry the guarantee of the governments of all member countries, including Britain and the United States; a provision in the new British Finance Bill will give them the same stamp-free status that British Government securities enjoy. But the market in limited issues of this sort cannot be as wide as that for domestic government securities. In New York, at the present time, the yield on World Bank loans tends to be about 0.4 per cent higher than that on equivalent United States Government bonds. One useful purpose served by an issue in London would be to enable the market here to “get used to the feel” of World Bank loans.

* * *

The Cost of Port Delays

The cumulative effect of waterfront stoppages and port delays in the southern Dominions has now reached the stage at which the movement of trade has almost ceased. In New Zealand the dockers have been on strike since February 19th, and more than 50 ships belonging to the liner companies serving the UK-New Zealand trades are now completely idle or are being worked by ships' officers or New Zealand soldiers. Some ships that arrived in New Zealand from the United Kingdom as long ago as last December are still lying in port without having discharged their cargoes. As a result, about 500,000 tons gross of shipping has effectively been withdrawn from service and other world-wide trade routes have been affected. Even if the strikers were to resume work immediately the arrears of cargo would take weeks to clear. The shipping companies concerned, therefore, have had no alternative but to discourage shippers as much as possible by imposing a surcharge of no less than 50 per cent on all freight rates, outwards and homewards. The fine new passenger and cargo vessel *Ruahine*, due to sail on her maiden voyage from London on May 21st, is one of the first to which the new rates apply. Her owners are quite unable to foresee when she will return to this country for a second round voyage.

While the stoppage has not been as complete in Australian ports, conditions there have been growing progressively worse. A 10 per cent surcharge is already in force for cargoes shipped by the Australian conference line and at the end of March these lines warned shippers that they would be unable to maintain scheduled sailings owing to the disruption to the timetable caused by delays in port. The demand for tramp ships is so strong that the liner companies could not afford to charter extra vessels to maintain their sailing schedules at existing conference rates. But it is apparent that exporters to Australia

are prepared to pay the premium for additional tonnage; the motor car manufacturers have taken matters into their own hands by chartering two tramp vessels on their own account, paying considerably more than liner conference rates. Shippers who have less than complete shiploads to cater for must rely on the liner companies to provide space, and have asked for the opportunity of shipping their cargoes even at greatly enhanced rates. The conference has now succeeded in obtaining three extra vessels to take cargo during this month, for which shippers will be asked to pay an additional surcharge of 40 per cent, which, it is stated, will cover the estimated cost of chartering without any allowance for profit.

* * *

Looking Ahead in Coal

In a paper prepared for the conference of the British Association of Colliery Management at Harrogate this week, Mr Humphrey Browne, head of the production department of the National Coal Board, made public some aspects of the Board's present thinking about future policy. Mr Browne's main theme was that the necessary pressure for immediate output must not be allowed to divert attention from development under the NCB's 15-year plan, in the preparation of which he played a leading part:

Every ounce of production is desperately needed; but not to the extent of prejudicing gravely the whole economic position and security of the nation within a decade—and that is the danger. . . . For ten years—since just after the fall of France—we have lived from crisis to crisis. The deep-seated disease in the industry cannot be cured by palliatives.

Mr Browne recognised the weakness of certain assumptions upon which the figures in the long-term plan were based—in particular those concerning manpower—and stressed the importance of the technical advances that “must” be made within the next decade, but that the plan rightly did not assume. Of these advances, the most important must be at the coal face: the elimination wherever possible of the rigid 24-hour cycle in longwall mining, by the introduction of new power-loading machines and the rearrangement of conventional operations, to complement the emphasis laid upon more efficient underground transport, winding and surface handling in the development plan.

The coal industry's greatest weakness, in all departments, is lack of sufficient men of the right kind. Mr Browne was right to emphasise to an audience of colliery managers, who make up the “line of command” in the industry, their increasing dependence upon specialised staff, a dependence that mining engineers do not always find comfortable to admit. He did not think that the mining industry had developed, as other industries had, a system of technical control attuned to the complications of its operations today. The day-to-day problems of colliery management bear so heavily upon those responsible that the proper assessment of the importance of current output and colliery planning, for example, may be too much for any one mining engineer. The planning department of the industry, at the pithead as well as higher up, needs strengthening to take this responsibility: the shortage of high-grade staff makes this process difficult in itself, and it could be lamentable if it were hampered further by indifference upon the part of colliery managers.

* * *

IFC and Risk Capital

The Industrial and Commercial Finance Corporation has had another moderately successful year, though it has not exactly set the Thames—or for that matter the area of its new branch office in Birmingham—on fire. In the year to March 31st, its advances and investments rose by £4,584,300, to just over £20 million; this rise was rather greater than that in 1949-50, but approximately the same

as in 1947-48 and 1948-49. The flow of repayments from past loans, however, has increased steadily, to £1,301,000 in 1950-51. About half the gross value of the 84 new loans made last year was in amounts of £100,000 or more; most of the rest was accounted for by loans of between £20,000 and £100,000. These loans were spread widely across the country, although the Corporation feels that outlying waters may not yet have been fished as heavily as those in London. They were also spread very widely across industry, although there was a particularly sharp rise in lending to the textile industry last year, to 9.2 per cent of the whole. Some 35 per cent of the Corporation's outstanding investments at the end of the year were in secured loans, some 22 per cent in unsecured loans and 29 per cent in preference shares; the most significant change in this distribution last year was a switch of £665,000 by existing borrowers from unsecured loans into preference shares—a switch that might not have taken place if those borrowers had foreseen the higher distributed profits tax that lay ahead. The Corporation has had to write down another £150,000 of weak holdings out of current earnings; total provisions of this sort have now amounted to £865,000 over five years. Despite this, profit before tax amounted to £580,665, against £360,630 in 1949-50, and it has been found possible to increase the reserve for contingencies from £100,000 to £500,000.

All this, in the eyes of a public that has learned to associate the name of postwar Finance Corporations with groundnut and egg fiascos, makes satisfactory reading, although disappointment may be felt in some quarters that the ICF has still lent only £20 million of its £45 million of investible funds. At a press conference last week, Lord Piercy, the chairman of the Corporation, argued that demand for fixed capital by small and medium industrialists since the war “has not been avid,” although their demand for working capital—in the last year or two—most certainly has. It is natural, however, that industrialists prefer to get working capital at, say, 4 per cent, from the banks rather than preference capital at, say, 6 per cent from the Corporation—especially as the latter costs them the equivalent of 9 per cent under the new rate of distributed profits tax. Despite this, many of the requests for new loans that came to the Corporation last year were probably from industrialists who had expanded their bank borrowing to the limit allowed on their existing capital ratios; one suspects that some of the two hundred odd applications that were transmitted to the Corporation through accountants and solicitors last year, as well as most of the hundred odd transmitted through the banks direct (out of total applications of 634) were in effect requests for the underpinning of bank advances in this way. Lord Piercy estimated on Tuesday that the proportion of the Corporation's current loans going towards provision of working capital may be nearer 75 per cent than 60 per cent, compared with 40 per cent five years ago. Whether the scrapping of the initial allowances system will bring more applications to the Corporation, for the provision of both fixed and floating capital, remains to be seen.

Falling Steel Output

Shortages of scrap and of imported iron ore had a slightly more marked effect upon steel production in April this year than in March. Total output last month, at an annual rate of 16,771,000 tons, was higher than in the previous month, but probably not sufficiently to offset the effect of the Easter holidays upon March output; and it was lower than in the same month of 1950, when Easter fell in April. Pig-iron output was lower than in any month since last August, and considerably lower than in April last year, owing to the shutting down of certain blast furnaces and the reduction of output from others (in some cases caused by the use of lower-grade home iron ore). It is not surprising, therefore, that the central organisations of publicly and privately owned steel should be discussing special arrangements to secure more British tonnage to bring in iron ore from Sweden, Spain, Africa and Newfoundland; only about 2½ million tons of ore have been imported in the first four months of this year, compared with 2,830,000 tons in the first third of 1950. The British Iron and Steel Corporation (Ore), Limited, the subsidiary company of the Steel Federation that is responsible for all ore imports, has already contracted for the 8.6 million tons of ore it requires to import during the whole of 1951, but it needs more ships than it has yet been able to charter. British ships, however, normally carry less than half of Britain's imports of ore. Co-operation in obtaining tonnage, of course, would not reduce the greatly increased freight charges; and whatever the arrangement BISCOR may devise to pass on these rates to the industry, they threaten a rise in steel prices of possibly more than £3 a ton.

Opinion in the industry about the outturn of the year's output continues to be divided, among individual steelmakers as well as between the industry's governing bodies and the Government. There is some apprehension that when the new Margam sheet mill comes into operation this autumn it will absorb a disproportionate share of raw materials, supplies of which are already particularly difficult in Welsh steel plants. The closing of three steelworks in Wales—Bryngwyn Works at Gorseinon, Landore Works at Swansea, and the Briton Ferry Old Works, Glamorgan—may be followed fairly shortly by other closures. The shortages of raw materials have thus caused a return to the original policy under the industry's development plan, which contemplated that Margam should take the place of certain older small melting works and rolling mills in the area; then, after sheet steel became scarce, it was hoped that the new plant would be run in tandem with the old steelworks, at least until it reached full production. Now, when raw materials are short and labour for the new plant is not fully secured, it may well be politic to close some of the older mills and use materials and labour to better advantage at Margam. On the possible control of distribution of other types of steel, the outlook appears unchanged; the nationalised steel Corporation, as well as the private Federation, seems to be favouring something much less than a general paper allocation scheme, possibly with overriding priorities assured for the most essential users and other consumers left to compete for the remainder of supplies.

Dearer Copper?

Agreement has been reached between the United States and Chile on the price for Chilean copper. The American Government has agreed that Chilean copper in the United States should be sold at 3 cents a lb. (£24 a ton) more than the present price. At the moment it seems likely that the official New York price will remain at 24½ cents a lb. (£196 a ton) with the American Government paying a subsidy of 3 cents a lb. on imports from Chile. The Chilean Government's request for a higher price was based on the fact that it obtains a large part of its

revenue from an export tax geared to the price of Chilean copper in the United States. As the official American price of copper has remained unchanged although the "grey" market price has risen to 40-45 cents a lb., Chile claimed that it was deprived of a legitimate increase in its revenue. In return for the higher price, the Chilean Government has undertaken to encourage an expansion in copper production. The price of Chilean copper to other countries will also be raised by 3 cents a lb.

The United States Senate passed a bill this week suspending the duty of 2 cents a lb. (£16 a ton) on copper imported into the United States. The suspension takes effect from last April 1st and will remain in force until February 15, 1953. When this bill becomes law it is probable that the official price for copper in New York will be raised to 26½ cents a lb., which has hitherto been the price for imported copper. The question remains whether the Ministry of Supply will have to raise its selling price of copper. Britain is hoping to get at least 10,000 tons of copper from Chile and will presumably pay the higher price. This extra cost might have been foreseen by the Ministry when it raised the price of copper by £8 a ton six weeks ago. But Rhodesian producers, and possibly Canadian producers, are also likely to claim a higher price. In Europe, copper is at present selling at anything between £300 and £400 a ton compared with the Ministry's price of £210 a ton.

* * *

Limited Achievement at Torquay

A white paper on the Torquay tariff negotiations published this week reveals that 147 bilateral agreements were concluded. Six new countries joined, among them the Federal Republic of Germany, Austria and Turkey. Britain obtained lower import duties on its manufactured goods from Germany, Austria, Turkey, Peru and the Philippines as well as minor concessions from Denmark, Norway and Sweden. France withdrew certain reductions in import duties that it granted two years ago and conceded others in return. But no agreement was reached with Benelux, Italy or the United States. Britain in return has agreed not to increase certain import duties and to reduce others; the total volume of imports involved is very small.

Britain reduced its margin of preference on only one item—dried figs; it imports hardly any from the Commonwealth in any case. But other Commonwealth countries scaled down their preference margins on British goods, though the reductions cover only 2 per cent of their imports from Britain. Canada was torn between remaining faithful to the system of imperial preference and expanding its trade with the United States. Its exports to the sterling area are restricted by currency difficulties and it had little option but to secure concessions from the United States. The price it had to pay was to reduce a number of preference margins and some of them Britain considered important to its trade with Canada.

It is difficult to assess the value of the concessions made and received. Britain made concessions on imports that in terms of 1949 trade were valued at £7,800,000; there were "bindings" in respect of trade worth £3,500,000 and reduction in duties for the remainder. In return Britain received concessions on trade valued at £70 million in 1949; £50 million covered "bindings" and £20 million covered reductions. On this calculation Britain seems to have gained handsomely. But the real value of a concession depends on the possible expansion in trade that it opens up, and under the most favoured nation clause countries benefit from agreement reached between other countries. Moreover the new countries joining the agreement had to make greater concessions to existing members, since the new entrants will automatically benefit from the tariff reductions negotiated in the earlier conferences.

Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect... It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Head Office: 28 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

CATERPILLAR OR BUTTERFLY?

Utility or beauty? Well, as far as it concerns refrigeration we are happy to provide both or either. For 70 years now, we have been producing refrigeration units for every conceivable purpose for trade and industry... for big projects such as ice rinks, marine storage, or meeting the more modest requirements of shops and businesses by way of store cabinets and showcases. We also make it our special concern to ensure that each of our customers, big, medium and small, receives a first-class service in the maintenance of his equipment. Our experience, in other words, is as broad as it is long, and therefore, whether yours is a caterpillar or a butterfly of a problem, we will be only too glad to help you. Why not write to us today?

Oil that is in a laboratory test tube today will fly the jet aircraft of tomorrow. Work in progress at Anglo-Iranian Oil Company's research stations includes the preparation of new aviation fuels and lubricants. New processes and plant are being designed to improve the output of Anglo-Iranian's many refineries. Looking even further ahead, Anglo-Iranian is prospecting for new oil-bearing strata beneath the surface of four continents.

Sulphur Shortage and Prices

The report of the International Sulphur Committee at the end of last week confirmed the statistical shortage of sulphur in the world in 1951; the committee expected supplies to be short by at least one million tons, that is about one-fifth of American output and a little more than double British consumption last year. It is difficult to assess the accuracy of this figure until the bases of the calculation are made available; much depends on the interpretation of consumption and consumption depends in part on price. The committee recommended close examination of resources and control of the use of sulphur. Its suggestions for supplementing the supplies of American sulphur by the expansion in the use of pyrites or anhydrite for sulphuric acid production and by the increased extraction of sulphur from waste industrial gases have already been pondered and are in part being acted upon in this country. But price is really the arbiter. If, for example, the United States raised the price of elemental sulphur, the goad to exploit other sources of sulphur such as pyrites or waste industrial gases would be correspondingly sharper. At the present time the price is unreasonably low.

Of the activities in this country the new company, United Sulphuric Acid Corporation, has not yet decided finally where to site its plant for acid production from anhydrite; and there are plans for further extension of the use of pyrites for acid production. However, although the deposits of pyrites in south-west Spain, which is the main supplier to Britain, are immense, during the next year or two supplies may not be able to keep pace with the expansion of their use. Portugal and Cyprus also send this country pyrites; Norway plans to open up new and large deposits but does not usually export to Britain. But the quantity of pyrites available for export from Portugal, Cyprus and Norway together this year is not likely to exceed the supplies from Spain. Treatment of waste industrial gases could also provide additional sulphur if the processes were considered economic. Experiments were carried out before the war to perfect plant for the recovery of sulphur from waste power-station chimney gases, but since the war none has been put into operation. Another similar source might be the coke-oven gas produced in iron and steel works that is normally fed direct to the furnaces. Such additional and incidental sources of sulphur are certain to gain in importance if reports are true that sulphur deposits in the United States will not last more than a decade or two, but they would have a more immediate significance if elemental sulphur cost more. Many of the existing mines in Italy, too, are nearing exhaustion and although some large deposits are said to exist they have not been surveyed; heavy expenditure is required in Italy to overcome neglect both before and during the war. Reserves are thought to exist elsewhere in the world, in New Zealand and Iceland, for example, which are at present unexploited.

Design Review at the Festival

During the course of several years' preparation for the Festival, the Council of Industrial Design has accumulated an impressive record of the products of British industry from thousands of items submitted to it for display at the exhibitions. Only ten thousand of these could be used as exhibits, but a review has been prepared of between 20,000 and 30,000 of the best that all industries submitted to the Council. This can be consulted at the South Bank Exhibition; indeed, in some ways it is one of the most ambitious projects on view. Under five headings transport, engineering, science, household and personal goods the Council has attempted to give a selective catalogue of the products of British manufacturing industry. Panels composed of technical experts called in by the Council, and usually also of representatives from trade associations, examined the products submitted by each manu-

facturer. They were passed for inclusion in Design Review only if they met a high standard of design functionally as well as aesthetically. About 500 textile samples are shown, and other items are displayed in files giving a photograph, technical details, price and the name of the maker.

A service of this kind and scale, based on critical selection, has never before been attempted and could prove a valuable catalogue covering a wide range of industrial products. Although Design Review was not opened until the end of this week, the Council has had numerous trade inquiries, many from buyers who came to this country for the British Industries Fair. It is unquestionably a trade display, neither the items nor the method of presentation having been designed to attract the public, and it is the kind of service that the Council should be encouraged to put on a permanent basis. There are two difficulties. The first is the cost of preparing and maintaining Design Review. The second is that its comprehensiveness, and hence its value to buyers as a quick source of information, depends on the willingness of industry to submit products to the kind of critical assessment that must be made if the Review is to preserve an essentially selective character. Design Review at the Festival contains an occasional notable omission, which suggests that some manufacturers with good products were not aware of the project. The Council intends to accept new items and revise old ones throughout the Festival.

EEA's Borrowing and Buying

The issue of £300 million to the Exchange Equalisation Account, which was announced by the Chancellor in Parliament at the beginning of last month, was duly effected last week; the latest Exchequer return shows a net increase of £223 million in Treasury bills outstanding. This is the third instalment of £300 million that has been issued to the EEA in ten months to enable it to keep up its heartening rate of net purchases of gold and dollars. When the first postwar issue to the account was announced on July 5, 1950, its sterling resources were believed to be virtually exhausted—even after making allowance for the fact that it must have made a profit by selling dollars at a depreciated sterling rate in the early years of the war. In the nine months to the end of March, 1951, the EEA bought £475 million of gold and dollars and borrowed £600 million in sterling, but up to £50 million of the £125 million "margin" that may have been left to it after these operations was possibly absorbed by net purchases of gold and dollars during April. If the assumptions on which this arithmetic is based are correct, the EEA would seem to have had little more than one month's supply of sterling left at the current rate of gold and dollar purchases before the latest issue was made to it.

Meanwhile, some interesting light on the EEA's buying policy is shed by information recently released in America. This shows that Britain purchased \$1,550 million of gold but added only \$88 million to its dollar balances in 1950; in the second half of the year indeed, Britain is said to have bought \$1,200 million of gold and run down its dollar holdings by \$252 million. The *Federal Reserve Bulletin* for March, in which these figures are published, estimated Britain's gold reserve at \$2,900 million at the end of the year, and its dollar reserve at \$662 million. These estimates, which show Britain's total reserve to have risen by \$1,632 million to \$3,552 million in 1950, are not quite in line with the official British figures, which show it to have risen by \$1,612 million to \$3,300 million. But this discrepancy, which is probably due to the inclusion of some private dollar balances in the Federal Reserve's figures, does not vitiate the main conclusion—namely that the British authorities seem to have been keeping a wary eye in the second half of last year on the possibility that the dollar price of gold might be raised, and that they considered it worth while to forgo interest on dollar investments in order to guard against this eventuality.

"Ardil" in Production

Between 7,000,000 and 9,000,000 pounds of the synthetic textile fibre "Ardil" will be produced this year by Imperial Chemical Industries at its new factory at Dumfries. When the plant comes into full production next year, it should be able to turn out 22 million pounds of fibre a year. The main raw material is protein from groundnut meal after the oil has been extracted. Unilever has worked closely with ICI on this project and will supply the meal from a new plant in Cheshire that has an initial capacity of 30,000 tons of oil a year. A solvent extraction process is being used there which gives a yield of 98 per cent of the oil compared with 93 per cent by older methods. The oil represents just less than half the original weight of the shelled groundnuts, and the remaining 54 per cent consists of meal containing 50 per cent of protein. When it is in full production the "Ardil" factory should be able to use about 44 million pounds of meal a year.

"Ardil" is primarily a wool substitute, intended for blending with wool in proportions of between 30 and 50 per cent. It has several wool-like properties, including warmth and moisture-absorption, but it lacks something of wool's strength or its elasticity. Unlike nylon and some of the other new synthetic fibres, "Ardil" cannot be claimed to add new technical qualities to the wool mixtures in which it is used. But it holds out the prospect of a reduction in their cost; "Ardil" costs 50d. a pound and may become cheaper when the factory is in full production, whereas wool prices today range between 150d. to 200d. a pound.

The wool industry has not been able to offset these price increases to any great extent by increasing the output of mixture yarns because of the difficulty in obtaining additional supplies of rayon and cotton. There should therefore be no difficulty in selling as much "Ardil" as can be produced, even though its present price is double that of rayon staple. There are some in Bradford who are waiting for the new fibre to prove itself. They may be prepared to admit that a wool "Ardil" mixture will bear a closer resemblance to pure wool cloth than a wool-rayon mixture of similar proportions, but they need to be convinced that the tensile strength of "Ardil" will enable them to work it at the

tension normally used for wool spinning, and to apply the same processing of the mixture yarn and cloth as for other materials. A price advantage of the kind now presented by "Ardil" will, however, be a powerful encouragement to ingenuity in its use.

Shorter Notes

The Court of the Bank of England has issued a hand-somely illustrated and wittily written brochure, telling the story of the Bank's development "over two and a half centuries . . . in a typically British way into something quite different from what it was to start with." The brochure, which costs two shillings, is designed for Festival visitors to the City but one suspects that some of the sidelights in it—such as why the Bank's messengers wear pink tail-coats (they are in the private servants' livery of the first Governor) or the reason for the wind-vane in the Court room (which is there to forecast arrivals of sailing ships in the Port of London and with it the probable variations in the day's demand for money) will be new to some of those visitors' hosts.

The report of British European Airways for the financial year ending on March 31st is in preparation, but the chief executive of the Corporation reports that the amount of traffic carried rose by 23 per cent compared with the previous financial year. It was made up of 939,586 passengers, 10,077 tons of freight and 5,248 tons of mail. In spite of rising prices, the cost of each unit of work fell by 10 per cent and the corporation expects to show a revenue of £9,000,000, with some reduction in its net revenue deficit. Operations in the first eight months of the financial year showed a profit, with losses only in the four months from December onwards, when traffic shows a seasonal decline.

Group operating profits of Dunlop Rubber in 1950 jumped from £9,480,850 to £17,620,116. The ordinary dividend has been raised from 15 per cent paid on £8,383,023 capital to 17½ per cent on the revised capital of £12,853,969. Subsidiaries retain £1,259,760, against £301,415, and £1,915,000, against £2,000,000, is added to general reserve.

Company Notes

Babcock and Wilcox.—The substantial advance in Babcock and Wilcox's group trading profits from £2,631,352 to £5,088,289 is mainly due to "an unprecedented increase in output." Since the war, turnover has risen each year by between 12½ and 15 per cent; in the latest year, the increase was as much as 40 per cent. Considerable extensions of the company's plant, the development and adoption of new processes and a greater flow of supplies from sub-contractors have all contributed to this excellent achievement. These results have enabled the company to raise the ordinary dividend from 15 to 18 per cent, a rate which is covered three times by distributable earnings, and to make impressive appropriations to reserves; some £650,000, against £396,029, has, for example, been

transferred to general reserves. Improvements and extensions are still being made as rapidly as possible, as is reflected by the estimate of £1,325,000 for outstanding capital commitments, but the chairman, Mr Lionel Fraser, is still anxious that ways and means should be found to increase "the number of hours of productive effort" in the company's works.

The capital development programme and the burden of stocks, which now total £10,454,414, against £9,143,541, has imposed some strain on the company's liquid resources and cash totals no more than £491,740, against £354,524. "Increased productivity, together with payments to aid the expansion of subsidiary companies," has led to a rise in bank overdrafts from £1,566,907 to £1,945,915, but the chairman expects that "the overdraft should be self-liquidating over the course of a few years." The disposal of certain industrial holdings is reflected in the marked fall in trade investments from £1,284,644 to £460,896.

Babcock and Wilcox's increased rate of output now slightly exceeds the intake of orders, but the order book is described as highly satisfactory. But Mr Fraser refers to the likelihood of "a deterioration in the supply of skilled labour and materials as a result of the pending rearmament programme." Despite these difficulties, output is expected to increase in the current year; the achievement of such an increase would mean shorter delivery periods for steam-generating plant, "the key to the power shortage at home" and the answer to foreign competition.

De Havilland.—Rearmament at home and abroad largely accounts for a year of intensive activity by De Havilland and is reflected in the rise in group trading profits from £1,274,631 to £1,601,612. The directors, who have recommended the maintenance of the ordinary dividend at 10 per cent, are aware that equity shareholders "have not so far shared in the better trading results," but the increased costs of replacement and of investment in stocks at a time of inflation and under the heavy weight of taxation demand "a steady and conservative policy." Moreover, the funds which are retained by subsidiaries, in order to build up ample reserves, are fully employed and "it would be incorrect to consider that we can expect any much greater contribution to the parent company's available surplus for some time." The company took a considerable risk in 1946 when a high rate of production of Vampire fighters was maintained for the export market; this policy has proved successful and many shareholders will hope that they will share in its fruits in the future.

The burden of stocks and work in progress, the book value of which has risen from £8,663,253 to £9,360,956, is admittedly heavy and in order to finance investments in current assets the company have been forced in past years to seek accommodation from the bank. In the latest year, De Havilland have been able to reduce this indebtedness from £2,343,379 to £2,091,911. This sum, however, is still considerable and gives added weight to the company's need for new perma-

(Continued on page 1127)

BROMINE

In ancient Rome, purple was the sign of Imperial rank. The dye they used for colouring their robes came from a sea-snail called murex brandaris, found in the Mediterranean. This dye is now known to be a compound of the element bromine—the only bromine compound ever found in a living organism. Bromine, a brown, fuming liquid related chemically to the greenish-yellow gas chlorine, is highly corrosive and dangerous to handle. Its name derives from the Greek "βρῶμος"—a stench. Most of the bromine needed by industry today is, like that used by the Romans, extracted from sea-water, but the extraction process is carried out by chemists instead of by sea-snails. During the war I.C.I. helped to develop a factory in Cornwall where bromine is extracted from sea-water to make ethylene dibromide—a chemical used with tetra-ethyl lead in the production of anti-knock petrol. Photography needs silver bromide, which is used in practically all films and plates and many kinds of photographic paper; methyl bromide is employed in one type of modern fire extinguisher, and potassium bromide in medicine. I.C.I. uses bromine compounds to make some of the 'Caledon' and 'Durindone' dyestuffs used for the dyeing of cotton.

pent capital. This has been under consideration for some time by the directors, but they have decided, in view of the increase in the distributed profits tax, to reconsider the question. No better example could be found of the arbitrary effects of high profits tax upon the capital structure of industrial companies.

De Havilland's ventures in aircraft design and production have proved highly successful. The defence programme will call for a

Ordinary capital	1,827,275	1,827,275
£1 ordinary stock at 46s. 3d. yields £4 7s. per cent.		

high rate of production for Vampire and Venom fighters, and BOAC have already placed orders for Comet jet airliners; thus De Havilland's order book should be limited only by productive capacity. The three major problems facing the company appear to be factory space, labour and machine tools. Material supplies should not present "too grave a problem," presumably, in part, because the company has long-term contracts for materials.

Marks and Spencer.—Retail buying has been stimulated in the past year by fears of higher prices to come, but even when allowance is made for this fact the advance in Marks and Spencer's profits from less than £6,000,000 to nearly £7,500,000 is a notable achievement. It is a tribute to the skill of the company's buyers in providing attractive and competitive merchandise despite the difficulties of rising costs. After Woolworth and British Home Stores had raised their ordinary dividends, the market had confidently expected similar benefits to come from Marks and Spencer, until on the eve of the dividend announcement the 5s. "A" ordinary shares were around 100s. To some investors the final dividend of 60 per cent and the modest scrip bonus seemed a trifle disappointing. The capitalisation of £49,168 10s. from general reserve (just inside the CIC's limit of £50,000) will provide one "A" ordinary share for every 45 ordinary and/or "A" ordinary shares held. But disappointment did not strike too deep, and shareholders soon showed more confidence that a total distribution of 75 per cent (against 60 per cent) and the scrip bonus was not the end of dividend increases or scrip bonus prospects; after the announcement the shares reacted only slightly and at the current price of 98s. 6d. the "A" ordinary yield 3½ per cent—a yield that looks to the future with the solid assurance of high ordinary earnings in the present.

	Years to March 31, 1950	1951
Earnings:—		
Profits	5,844,656	7,335,898
Depreciation	687,822	733,044

Ordinary dividends	713,925	879,061
Ordinary dividends (per cent)	60a	75b
General reserve	...	505,321
Stock contingency reserve	...	350,000
Added to carry forward	1,377,527	691,932
(a) On £2,163,409 capital. (b) On £2,212,577 capital.		
5s. "A" ordinary stock at 98s. 6d. yields £3 15s.		

With the aid of this generous margin of earnings, Marks and Spencer have been able to strengthen the already impressive reserves; £505,321 has been added to general reserve, £350,000 to stock contingency reserve and

£691,932 to the carry forward. In the previous year £1,377,527 was added to the carry forward, but no appropriations to stock and general reserves were made. This is the third consecutive year that Marks and Spencer have made a scrip bonus issue within £50,000 limit, and the comparatively low yield shows the measure of attraction for some investors of a regular scrip bonus. It is a case, perhaps, of the weight of taxation getting the better of strict investment logic.

Associated Portland Cement.—Group trading profits of Associated Portland Cement have risen from £6,129,325 to the record figure of £7,166,970 in a year of peak output and deliveries. Exports, however, declined slightly owing to shipping difficulties and the need for keeping the home market supplied, but the export trade brought in 33 per cent of the profits in 1950. Full capacity output kept the price of cement low in comparison with the high costs of coal, power and labour; the price of cement, excluding packaging, is now 87 per cent higher than in prewar years, but this compares very favourably with the 130 per cent increase in the price of building materials as a whole. Higher productivity has also made a contribution to these record results, and output per man-week is now 23 per cent better than the best prewar years. Having raised the ordinary dividend from 22½ to 27½ per cent, the directors feel that future prospects are such that it will be possible to maintain the higher rate in the future.

	Years to December 31, 1949	1950

Ordinary capital	4,000,000	4,000,000
(a) Includes £1,816,471 capital works in progress.		
(b) Includes £3,165,163 capital works in progress.		
£1 ordinary stock at 105s. yields £5 5s. per cent.		

The past year was not without its difficulties. Supplies of packaging materials are far from satisfactory; bags, which cost 2s. 6d. per ton of cement before the war, now cost 17s. 6d. In addition, the chairman, Mr G. F. Earle, expresses concern that "crushing taxation makes it very difficult to build up funds necessary to replace out-of-date machinery." In order to make good the shortfall between the normal depreciation allowance and actual replacement costs, the company has transferred £815,000, against £690,000, to replacement reserves.

The considerable additions to fixed capital which Associated Portland are making are reflected in the book value of capital works in progress of £3,165,163, against £1,816,471 and in the estimate of outstanding commitments of £1,499,237. Despite heavy capital expenditure in the year, net current assets are actually higher at £10,924,930, against £10,680,441, but cash has fallen from £2,822,648 to £1,973,133.

Full output is expected to be maintained in the current year and the British Portland works at Shoreham, which are now in almost full production, should contribute to a very high rate of production this year. Production at the moment is a little higher than last year, but the weather and shipping difficulties have held up deliveries. The chairman, however, welcomes larger stocks and looks forward "with reasonable confidence to satisfactory results."

COMPANY MEETINGS

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING

ANOTHER SUCCESSFUL YEAR

TOTAL INCOME EXCEEDS £100,000,000

IMPRESSIVE FIGURES OF GROWTH

SIR GEORGE LEWIS BARSTOW'S REVIEW

The one hundred and second Annual General Meeting of the Prudential Assurance Company, Limited, was held on May 10, 1951, at 142, Holborn Bars, London, E.C.1.

Sir George Lewis Barstow, K.C.B., chairman of the Company, presiding, in the course of his remarks, said:—

PROGRESS OF BUSINESS

First, I may perhaps draw your attention to the fact that last year the total income of the Company for the first time exceeded £100,000,000. In 1933—17 years earlier—our income was only half this figure. During the same period of 17 years our total assets have grown from £277,000,000 to £608,000,000. We take pride in these impressive figures not merely because of their magnitude but because they could not have been achieved if the Prudential had not gained and held the trust of its millions of policyholders.

ORDINARY BRANCH

In the Ordinary branch the number of policies issued during 1950, including those issued overseas, was 130,000, assuring sums of £94,400,000. The total sums assured, including bonuses, under policies in force at the end of the year exceeded £675,000,000. The premium income, including that in respect of deferred annuities and group pension schemes, was £32,500,000.

The business in this branch continues to develop in a satisfactory way. A persisting feature is the favourable mortality experience. The benefits of light mortality are passed on to the public in various ways—by reductions in premiums, by increases in bonus, by a more liberal policy in the assurance of lives without medical examination and in other administrative ways. These benefits have mitigated the effect on our business of other factors which have been adverse in recent years, such as the influence of inflation on expenses and the restriction of investment.

At the beginning of the year the liabilities in the Ordinary branch included a reserve of £5,000,000 for revival and other contingencies not embraced in the main valuation. A sum of £2,000,000 has been released from this reserve for transfer to the Ordinary branch contingency fund and, in addition, £1,000,000 has been allocated to the latter fund out of the surplus for the year. With these transfers the Ordinary branch contingency fund now stands at £5,000,000 and forms a central reserve which is available to support the valuation of either the assets or the liabilities should changes in economic conditions so require.

The Directors have declared a reversionary bonus in respect of the year 1950 at the rate of £1 8s. per cent. for policies issued in the United Kingdom. This represents an increase of 2s. per cent. over the rate for 1949.

OVERSEAS LIFE BUSINESS

Another year of sound progress has been achieved by our Overseas branches. More than 37,000 policies were issued overseas assuring sums of £32,000,000 which is a new record. The overseas sums assured, including bonuses, under policies in force have increased during the year to nearly £200,000,000 and the premium income for the year exceeded £7,000,000. The importance of this part of our business is demonstrated by the fact that the sums assured in force overseas now amount to about 30 per cent. of the total Ordinary branch business.

As I explained last year, it is necessary in determining the rates of bonus to have regard to the varying extent to which factors such as interest, mortality, expense and taxation affect the surplus in the territories in which we are operating. Following this principle the Directors have declared reversionary bonuses in respect of the year 1950 at the rate of £1 6s. per cent. for policies issued in Australia, New Zealand and Canada, £1 14s. per cent. for policies issued in South Africa, East Africa, the Rhodesias and Nyasaland and £1 per cent. for other overseas territories. These rates are an increase of 2s. per cent. for policies issued in Canada, and of 4s. per cent. for policies issued in South Africa, East Africa, the Rhodesias and Nyasaland, and are unchanged for the other overseas territories.

A NEW DEVELOPMENT IN GROUP PENSION BUSINESS

I have now much pleasure in announcing an important extension of our activities. Group Pension Schemes have been assured by a number of life offices for upwards of 20 years and have constituted a considerable and growing proportion of the business written in the last few years. The premium income of the Prudential in respect of such Schemes exceeded £5,000,000 in 1950.

Participation in profits is long established in respect of life assurance policies but it has not hitherto been extended to group pension schemes written in this country. We have felt for some time past that the benefits of participation in profits should be extended to this class of business and it is therefore with satisfaction that I announce that the Prudential is now ready to issue group pension policies with participation in profits. This will constitute an entirely new class of business and we feel that the step which we are now taking will be a major development in the progress of British insurance.

The main principle leading to this new step is fundamentally the same as that which led to the introduction and to the vigorous development of the participating system for individual assurances. This principle is to ensure that there shall be a close relationship between the premiums a policyholder pays and the benefits he receives even though a long period elapses and marked changes of fortune occur between the commencement

of the contract and its termination. The history of the participating system for individual assurances has entirely justified the soundness of this basic principle: through many vicissitudes the with-profit contract has proved to be in the interests of the insuring public. Under group pension business the case for a participating system is even greater than under individual assurances because the uncertainties are increased by the exceptionally long period for which the contracts run.

We have given earnest consideration to the most suitable basis upon which this new participating class of business should be founded. It is true that in the United States there are participating pension schemes under which the profits are distributed each year in the form of a reduction in the premiums payable. This method really amounts to a varying premium scheme and is difficult to apply to the small regular contributions made by employees. We have concluded that a preferable system in the conditions ruling in this country is to allocate the distributable profits in the form of annual additions to the accrued pension together with a special and final bonus addition to the pension when it commences. It is intended that the bonuses should depend upon the profits of this new class of business as a whole, so that each scheme will be protected from chance variations in its own experience.

The new type of participating pension scheme will be flexible and will share in any favourable experience in much the same way as a privately invested scheme. At the same time it will retain the advantages of guaranteed security, pooling of risks, simplicity of administration and freedom from investment responsibility, which are attributes of pension schemes assured through a life office.

I do not hold out the hope that our new business figures will be quickly affected by this development, since it may well take time to establish itself in public regard. Nevertheless we are confident that it is soundly conceived and that it is in the public interest. We believe that it will eventually become a prominent feature of insurance business and we are naturally proud to be the pioneers.

INDUSTRIAL BRANCH

In the Industrial branch the number of policies issued during the year was 1,399,000, assuring sums of £74,300,000. The average sum assured per policy was thus over £53. The total sums assured, including bonuses, under policies in force at the end of the year, exceeded £925,000,000, and the premium income for the year exceeded £40,000,000.

The expenses were 24.23 per cent. of the premiums, as compared with 23.84 per cent. for the preceding year. Remuneration to the staff, including provision for pensions, accounts for 85 per cent. of the total expenses in this Branch. In the inflationary conditions of

Since the inception of the profit-sharing scheme over £99,000,000 has been allotted for providing bonuses to Industrial branch policyholders. The amount of bonus paid on claims by death and maturity in this branch last year represented an average addition of over 19 per cent. to the sums assured payable under the policies.

GENERAL BRANCH

The expansion of fire, accident and marine business to which I have referred in previous years was continued in 1950. The General branch premium income was £8,300,000, an increase of over £1,000,000. In addition, a premium income of £1,000,000 was obtained by our American company, making a total premium income of £9,300,000, of which about £5,100,000 was derived from overseas sources.

The underwriting results again show marked improvement over those for the previous year, a pleasing feature being the continued improvement in our overseas experience. All accounts have contributed substantially to the favourable result and the outcome of the year's operations may be regarded with considerable satisfaction. Whilst the outlook for the General branch is encouraging, it should be mentioned that in 1950 we were remarkably free from those major disturbances which we have to expect from time to time. It would, therefore, be unwise to count on the maintenance of such favourable results.

The net surplus for the year, excluding the amount brought forward, is £564,000, compared with £332,000 for 1949. I indicated last year that we should have to contemplate larger transfers to the Additional reserve fund for strengthening our reserves to match the increasing commitments resulting from the growth of our business and the Directors have accordingly transferred £400,000 for this purpose. In addition, a sum of £50,000 has been transferred to the General branch contingency fund.

A sum of £117,000 has been set aside for dividends and is more than covered by the net interest on the General branch funds after deduction of the relevant profits tax and income tax. The net rate of dividend on the "B" shares is 1s. 9d. as compared with 1s. 6d. a year ago.

The figures of our American company, the Prudential Insurance Company of Great Britain located in New York, are annexed to the accounts before you. The Company's underwriting results have been good. A dividend of 10 per cent. was paid last year and has again been declared for this year. The financial position is such as to permit of expansion in favourable circumstances.

INVESTMENTS

During 1950 the higher level of market rates of interest which was experienced in 1949 was maintained and a larger field for investment outside the gilt-edged market became available to us in the latter half of the year. As a result it has been possible to invest our accruing funds on a more satisfactory basis than for several years.

The trend towards rising commodity prices, resulting from the devaluation of sterling in the previous year, has been intensified by the reaction of the Western democracies to the recent events in Korea. Rearmament programmes and the stockpiling of essential commodities have sharply accelerated the rise in prices. This in turn has increased the cost of new capital development and created a general demand for further working capital to enable industry to maintain adequate stocks of goods and materials. Much as the circumstances that have created this situation are regretted, the necessity for rearmament cannot be questioned and I am pleased

that the Prudential has been able to play its full part in supplying the needs of industry.

In particular, in addition to our subscriptions to public issues, we have taken substantial participations in several large private issues of loan capital raised by important companies in a form more suited to institutional investors than to small subscribers. There is reason to expect that the increased demand for further capital will continue in the immediate future and perhaps for some years to come. The burden of taxation has seriously reduced the ability of industry to accumulate adequate funds. The incidence of profits tax has induced a reluctance to raise additional capital in the form of preference or ordinary shares, and this will be accentuated by the recent increase in taxation on distributed profits. Moreover, the high level of income tax and surtax renders it increasingly difficult to raise any form of fresh capital from shareholders or from the general body of private investors. When possible new capital will no doubt continue to be raised by public flotation but where finance of a specialised character is called for and also when market conditions are unsettled a more direct contact between borrower and lender can be advantageous to both parties and at the same time ensure that industry's essential financial requirements are forthcoming.

During 1950, in addition to new money arising from the increase in our funds, considerable sums became available for reinvestment as a result of maturities and realisations. In total more than £50 million has been invested. It may be of interest if I indicate broadly the net effect of these transactions on our portfolio of investments. Our holdings of British Government and British Government Guaranteed Securities have increased by nearly £4,500,000; United Kingdom Municipal and County and Public Board Securities by over £1,000,000; Dominion and Colonial Government Provincial and Municipal Securities by over £3,000,000 mainly in respect of our overseas business; Debenture and Debenture Stocks, among which are included the large issues of loan capital to which I have referred, have increased by more than £20,000,000, preference shares by nearly £2,000,000 and ordinary shares by more than £3,500,000; properties have increased by £5,000,000 and mortgages and loans by over £1,000,000.

At the end of the year the market values of the assets were as usual compared with their book values and I am pleased to say there was a substantial surplus in each branch.

If you refer to the Revenue Accounts you will observe that in each of our three branches we have this year made a transfer to Investment Reserve Account. The appearance of these items inaugurates a change of practice and it is the intention to make similar transfers each year. The underlying principle is that in respect of the higher yielding classes of securities a part of the interest income should be placed to reserve at the time of receipt as a provision for future contingencies.

The gross rates of interest earned on the Funds during 1950 were £4 1s. 3d. per cent. in the Industrial branch and £3 19s. 10d. per cent. in the Ordinary branch. These rates compare with £4 0s. 7d. per cent. and £3 16s. 9d. respectively in the year 1949. I indicated last year that the rate in the Industrial branch in 1949 was higher than it would otherwise have been because the interest receipts included payments of a non-recurring nature. This in part accounts for the relatively smaller increase in the Industrial branch yield in 1950. The higher rates of interest obtainable on new investments have also had more effect in the Ordinary branch than in the Industrial branch owing to the relatively greater expansion achieved in the Ordinary branch, which branch includes our rapidly increasing overseas business.

The geographical analysis of our assets is as follows:—

United Kingdom	89.8%
Dominion and Colonial	8.5%
Foreign	1.7%

In respect of Stock Exchange securities only, the distribution between the various classes is:—

Government and Municipal	63.3%
Debentures and Bonds	14.5%
Guaranteed and Preference Stocks	9.2%
Ordinary Stocks	12.5%

DIVIDENDS

As shareholders are aware the Prudential is in an exceptional position in regard to the distribution of surplus. Our Articles of Association lay down with precision the respective shares of the policyholders, the staff and the shareholders; and it is not open to the Directors once the amount of the surplus has been fixed to alter the proportions of the respective parties.

In March, 1949, we went so far as to obtain special powers from the shareholders to enable us to carry part of the shareholders' allocation to a Special Dividend Reserve fund in order to conform with the wishes expressed by the Government in the fight against inflation. These powers enabled us to defer payment of dividend and for the years 1948 and 1949, in full accord with the Government's wishes, we pegged the distributed dividend at the 1947 level. However, deferment of payment *sine die* is almost tantamount to cancellation. Moreover, as events developed, wages generally including payments to our own staff continued to rise and it did not seem fair that the shareholders alone should be asked to make sacrifices. Let it not be thought for an instant that the Prudential, the work of which has for so many years been specially among the wage-earning classes, grudges this increase in their earnings: quite the contrary, but we felt that it was our duty to consider also the claim of shareholders. We therefore decided in November last to make a payment from the Special Dividend Reserve fund of 3s. 6d. per "A" share.

It is your Directors' view that they should continue to exercise moderation in dividend declarations. Accordingly, they have declared a dividend of 17s. on the "A" shares and carried to the Special Dividend Reserve fund the balance of the shareholders' share of the surplus in respect of the year 1950. This rate of dividend compares with 15s. 5d. in the previous year.

The Directors have also announced that it is their present intention to declare before the end of the year a further special dividend on the "A" shares of not less than 2s. 6d. The dividend on the "B" shares has been increased from 1s. 6d. to 1s. 9d. All the rates of dividend to which I have referred are free of tax.

INSURANCE PUBLICITY

The threat of State control of the business of the industrial assurance offices and the menace to the future of all British insurance implicit in that threat have not disappeared. The course of events, however, has been unpropitious for the development of ambitious plans for nationalising insurance. We at any rate know that State control of industrial assurance would be contrary to the will of the majority of the policyholders and staffs and that it could not be brought about unless this particular issue were obscured in the public mind by other issues. Although we shall continue to be vigilant it may well be that we can look forward to conducting our business without the disturbance caused by a continuing threat to our corporate existence.

and possibly even without being subjected to ill-informed and out-dated criticism of the kind which was so widely used in attempts to justify State control of our business.

In any event, the insurance industry, profiting from its experiences of the last few years, realises that it has been too modest about its achievements and that in consequence the general public are insufficiently aware of the contribution British insurance makes to the national economy and of the services it is able to render to the individual and to industry. This shortcoming is in process of being rectified. Shareholders have no doubt seen some of the advertisements, dealing with various aspects of insurance, which have been appearing in newspapers throughout the country and in many periodicals. Some of these advertisements are sponsored by the British Insurance Association, others by the Life Offices' Association and others by the Industrial Life Offices. Those of the British Insurance Association deal more particularly with the world-wide services of British insurance, while those of the other two organisations deal with ordinary life and industrial life assurance respectively. We believe that these advertisements fulfil a valuable purpose in creating a better and wider understanding of what British insurance does and of the range and value of the benefits and services it affords.

In our publicity we continue to stress the role of life assurance in the national savings fight against inflation. When it is considered that savings through insurance are the most stable and reliable form of thrift and that they are effected voluntarily by individuals personally shaping their own finances in the way that is most suitable to them, the important role we play in a free society cannot be questioned.

The report and accounts were unanimously adopted.

SILVRO MANUFACTURING COMPANY

(Makers of "Bonsoir" Shirts and Pyjamas)

The fifteenth annual meeting of Silvro Manufacturing Company Limited was held on May 4th in London, Mr Manley Cooper (chairman) presiding.

The following is an extract from his circulated statement:

The present trend of cotton prices is one which causes much anxiety. At the moment we hold large stocks at prices considerably below present market values for many months ahead, and can, therefore, select our own time for any further purchases.

As a result of the year's trading, the net worth of your business is £184,811 as against £168,271 the previous year.

The profits at £72,290 have maintained an upward trend and your directors are able to recommend the same dividend distribution of 30 per cent. as last year, to be paid on the increased ordinary share capital.

We have re-equipped your Crewkerne factory with new machinery and it is now working to capacity. At Stoke Newington the war damage has now been finally completed and the supply of labour has shown some improvement with a consequent increase in production. It is to be hoped that this trend will continue as the plant and machinery has a further productive capacity of some 15 per cent. The order book is such as to require that additional capacity.

Our overseas sales are increasing rapidly. Turnover both with dollar countries and European countries has continued to show an upward movement and we are now exporting to some 18 countries overseas.

So far as the current year has gone, our trade is substantially ahead of the same period last year.

The report was adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

INCREASED BUSINESS

The annual general meeting of the Alliance Assurance Company, Limited, will be held on June 6th in London.

The following are points from the review of the report, accounts and balance sheets for the year 1950 by the chairman, Mr Anthony G. de Rothschild:

Life Department: The net new business completed during the year amounted to £6,264,563, compared with £6,097,458 in 1949. The purchase money for immediate annuities, at £54,860, exceeded the 1949 figure of £47,419, but no very marked increase can be expected in this class of business so long as the present unsatisfactory position with regard to income tax on annuities persists. Deferred annuities were issued, providing for £123,538 per annum against £91,281 in the previous year.

Claims by death amounted to £575,097, compared with £740,964 in 1949. The 1950 figure was exceptionally low and it can hardly be expected that the current year will show so favourable a result. During the year the "Alliance" Life and Annuity Funds increased by £721,495 to £26,080,355.

Fire Department: The net premiums amounted to £5,138,951, an increase of £687,259 over those of 1949. The claims, including contributions to Fire Brigades, amounted to £1,559,843, which is £26,951 more than those for the previous year.

The surplus, after increasing the provision for unexpired risks, amounts to £996,997, compared with £829,999 in 1949, and this has been carried to profit and loss. Apart from the general rise in values at home and abroad, a satisfactory volume of new business has been obtained.

Accident Department: The net premiums amounted to £3,875,964, which is £266,604 more than the income for 1949. The result, after providing for unexpired risks, is a surplus of £443,934, compared with £381,449, and this has been transferred to profit and loss. This satisfactory result has been achieved in spite of a loss on the motor account. The derationing of petrol in this country resulted, as was expected, in an increased number of claims, and the cost of individual claims continued to rise.

Marine Department: The net premiums amounted to £2,007,159, an increase of £144,047 over the premiums for 1949. The underwriting account for 1948 has now been closed with a balance of £347,309, which is £145,424 higher than that for the 1947 account. After providing £215,997 to maintain the reserve for claims attributable to previous years at £425,000, the sum of £131,312 has been transferred to profit and loss.

Trustee Department: The fees received for the past year amounted to £16,143, which is a slight increase on those for the previous year. Here, again, the increased costs of administration of trusts are compelling us to give consideration to the fees to be charged in future.

Investment Department: During the year the market prices of Stock Exchange investments again fluctuated considerably, although the movements were not nearly so marked as in 1949. It is therefore satisfactory to record that the favourable margin between book and market values showed an improvement when compared with the position at the end of the previous year.

The following appropriations have been made: £675,000 to the staff pension trust fund, of which £25,000 relates to the fund of a subsidiary company; £500,000 to the general reserve; £25,000 to the widows' and orphans' fund. The directors have decided to maintain the dividend at 20s. per share, less income tax.

HUMPHREYS LIMITED

(Building and Civil Engineering Contractors)

IMPROVED NET PROFIT

MR A. V. BRIDGLAND'S REVIEW

The fifty-ninth annual general meeting of Humphreys Limited, was held on May 8th in London, Mr Aynsley Vernon Bridgland (the chairman) presiding.

The following is an extract from his circulated statement:

The trading profit for the year ended November 30, 1950, amounted to £50,526, as against £52,436 for the previous year.

There are now 535 preference shareholders and 793 ordinary shareholders. Before tax, the earnings cover the preference dividend over nine times. After paying the preference dividend, the untaxed profits equal 2s. 3d. per share.

The net profit for the year under review amounted to £51,653, as compared with £48,385 for the previous year. Of this £51,653, we must set aside for future taxation no less than £29,045, leaving £22,608 as the taxed profit for the year just ended.

The proposed dividend of 15 per cent. on the ordinary shares, with the 5½ per cent. dividend on the cumulative preference shares, will absorb £11,275, after deduction of tax, and the carry forward will thus be increased from £44,785 to £56,118, that is by £11,333—in other words by an amount slightly in excess of that required for dividends on all shares.

In the balance sheet you will see on the liabilities side that the secured banker's loan now amounts to £473,856. A year ago I told you this figure would increase considerably above the £90,928 at which it then stood. I repeat that this loan is properly safeguarded by firm financial arrangements made for its eventual repayment in full—the major portion, in fact, will be repaid within three months.

During the year we have had all our fixed assets valued for insurance purposes, and I am pleased to tell you that the relative figures in the balance sheet may be taken as very conservative.

The surplus of current assets over current liabilities amounts to £309,188.

The first part of the third, section of Exchange Buildings, Liverpool, was completed ahead of schedule, and caused some favourable comment in that city.

OVERSEAS VISITS

Before long we shall complete a large overseas contract on which we have been engaged for some time. With a view to examining the possibilities for further overseas work, I have myself recently paid a visit to South Africa, and at the end of last summer our overseas contracts manager also visited that continent. I think that profitable work may result from these visits.

The Government's policy of nationalisation affects considerably the cost of building. Since the nationalisation of coal, the railways, electricity and transport—and now steel—advances in prices have been announced in each industry and these may well continue. Each such increase, of course, has the effect of increasing the cost of a building, over and above which there have been the increased wages which have been awarded to building operatives.

Generally speaking, a building now costs nearly three times as much as before the war. The restrictions imposed by the planning authorities, coupled with the rising cost of construction, may soon reach a point when further buildings cannot be erected to let at an economic rental.

The report and accounts were adopted.

NORTHERN ASSURANCE COMPANY LIMITED

115TH ANNUAL GENERAL MEETING

ANOTHER EXCELLENT YEAR

RECORD NEW LIFE ASSURANCES

The one hundred and fifteenth annual general meeting of the Northern Assurance Company Limited was held on May 9th at Aberdeen, The Rt. Hon. the Lord Forbes, D.L., chairman of the Aberdeen Board, presiding.

The following is an extract from the chairman's statement, which had been issued with the report and accounts:—

In our accounts for 1949 the higher sterling value of our transactions in United States dollars and certain other currencies, as a result of devaluation, was not wholly apparent, but those for 1950 now before you reflect this factor throughout. The year itself was relatively free from marked currency fluctuations, however, and the adjustments carried through the 1949 accounts have ensured that the trading results for 1950 fairly reflect the actual currency results.

ASPECTS OF INFLATION

The expansion of the company's business in real terms in all departments is also masked by the rise in prices which occurred with gathering momentum throughout the year, although its impact varied between different classes of business, being most violent in the insurance of key commodities for defence.

The company has enjoyed its full share of business, but there are other aspects of inflation which are less welcome. The marked rise in the values of stocks in transit and in inventories reflects itself almost immediately in values exposed to risk. Similarly, the rise in freights results in an increase in the insured values of vessels to keep pace with their earning power and the cost of replacement. On the other hand, the insured values of static property, such as buildings, tend to follow well in the wake of the rise in money values. Moreover, since claims come after premiums, a continued rise in prices naturally involves an additional strain, particularly in the marine department, where settlements may take several years to run off.

The strain is felt not only on the profitability of the business, but also on the amount of business which can be sustained because, while our resources continue to grow, inflation and high taxes together make it difficult for them to keep pace with the volume of business. There is also a marked accumulation of values exposed to risk, particularly in these days of bulk purchase, when cargoes and stocks may reach values which test the capacity of insurance markets everywhere.

FUNDS EXCEEDINGLY STRONG

The funds of our company are exceedingly strong, enabling us to take our full share of existing markets and to extend our activities into new ones at home and overseas. Nevertheless, this aspect demands constant vigilance and, in spite of the marked increase in our income, your directors would welcome the end of the present inflationary trends.

The limiting effect of actual resources on the amount of business we are able to transact also applies in certain areas overseas where it is necessary to cover currency liabilities as far as possible with assets on the spot. In the United States of America, for example, it would have been possible to underwrite a much larger volume of income

had dollars been available to strengthen our reserve position. Your directors regard it as of supreme importance that our dollar reserves should be kept at the highest possible level in relation to income, consistent with our obligations to the Treasury, and for that reason our dollar business has been held in check, although its sterling value has increased.

I take this opportunity of saying that we much appreciate the friendly and co-operative attitude which the Treasury and the Bank of England have always adopted towards this difficult problem.

CHANGES IN FORM OF ACCOUNTS

The British insurance business has a unique record stretching back over several centuries and for 115 years our own company has made a worthy contribution to it. We believe, therefore, that, through the medium of the annual report and accounts, our company should tell its own story and help to spread the knowledge that private enterprise insurance is serving the community, throughout the civilised world, ably and well. Therefore, the document circulated to you has been prepared in what we hope will be found to be an attractive form and will tell you an interesting story of what the company is doing; copies are also being sent to our staff and connections all over the world.

DEPARTMENTAL RESULTS

It is satisfying to see that the fire profit for 1950 has fallen only slightly below the record figure for the previous year, in spite of a deterioration in our experience in the United States, largely as a result of the severe storm losses which took place in that country in the closing weeks of the year.

The accident account did little more than break even, owing to adverse experience in the motor section—particularly overseas. To some extent, however, this result is mitigated by the conservatism of our provision for unexpired risks, which we have maintained at 50 per cent. of a much larger premium income.

The outlook for marine business is rather less clear today than for some years past, but, although in a period of rapidly rising income the relation of the fund at the end of the year to the premiums written in that year becomes less significant, you may be assured that the marine fund is adequate to enable us to face with confidence any likely deterioration in experience, in spite of the large sum now transferred to the profit and loss account.

LIFE ASSURANCES: A RECORD

Coinciding with its record achievement in securing new life assurances of £5,123,908, the "Northern" life department marked in 1950 the close of its latest quinquennium. Five years ago the total production of this department in sums assured was no more than 30 per cent. of today's figure, and we congratulate the actuary for having preserved the integrity of these funds with such conspicuous success during this period of marked expansion. The "Northern" can rightly claim to have taken its proper place among the life offices of this country and it is confidently hoped that the excellent bonus declared upon our participating policies—

namely, 37s. 6d. per cent.—will enable this success to be maintained.

Life assurance business today has many complications, particularly as regards arrangements for pensions of employees and senior executives. Our clients and agents look to us for a great deal of advice on matters of this nature and we pride ourselves upon the service that we give in this respect. We hope not only to maintain this service in the future but to improve it.

MORE INTEREST EARNED

Although the dividend which your directors feel it proper to recommend must be weighed against the earnings of the company as a whole, it has become the prudent custom of many insurance companies to relate it solely to the interest earned on the investments of the funds. It is, therefore, most pleasing to see a marked increase in this item in the profit and loss account, partly as a result of devaluation, partly due to the amounts retained in the business in the last few years and, of course, to no small extent due to the activities of our investment department.

No major changes in our investment policy occurred during the year. A further substantial sum was invested in mortgages arising out of our house-purchase scheme. In the past few years, owing to the Government's nationalisation schemes, our investment portfolio has undergone a good deal of involuntary revision, but our constant endeavour has been to preserve the real value of our assets. You will see that our holding in ordinary shares is now 13 per cent. and, although this category of investment is far from being a complete protection against inflation, we do believe that to hold a reasonable proportion of our investments in sound equities is the right policy in present circumstances.

DIVIDEND INCREASED

It has given your directors great pleasure to recommend to you an increase of 1s. per share in the ordinary dividend, together with a consequential increase in the dividend payable on the participating preference shares. In these times, when the cost of living is increasing rapidly, the claims of equity shareholders require more than ever to be considered and, while inflationary tendencies cannot in the end benefit companies of our kind and demand the exercise of even more conservative policies your directors feel this increase of dividend to be well justified.

The balance-sheets have been designed to show clearly the surplus resources of the company, amounting to no less than £7,771,706 after valuing all the assets and liabilities on a most conservative basis. The small decline in the amount of this surplus is due to the transfer of £750,000 on July 1, 1950, to start the new staff pension fund, but, as the obligations undertaken by the company under it are generally the same as those carried voluntarily beforehand, this decline is more apparent than real.

WIDE VARIETY OF OPPORTUNITIES

Many of the skills and techniques required to conduct our complicated business on a sound footing can be acquired only by practice and the guidance of experienced colleagues. Nevertheless, the rapid changes of the present time and the conditions under which staff is nowadays recruited combine to call for further measures. Too many young men of good education find their way into academic or Government service and are lost to commercial institutions like our own, and the task of obtaining the right type from a limited field of selection has never been more difficult. Yet the size of our organisation and the absorbing interest of its work offer excellent opportunities to those who wish to extend their abilities fully in satisfying and remunerative employment.

NORWICH UNION INSURANCE SOCIETIES

RECORD NEW BUSINESS

The annual meetings of the Norwich Union Insurance Societies were held at Norwich on May 7th and 8th.

Speaking at the Life Society's meeting, the President, Sir Robert Bignold, said that the Society had had another successful year. The new business at £35½ million (of which £13½ million came from overseas) was a record. The mortality experience had been exceptionally favourable and the net rate of interest at £3 16s. 8d. per cent. showed a small increase on the 1949 figure. The total funds had increased by nearly £5,000,000 and now stood at over £80 million. The decrease of 10s. per cent. in the expense ratio was noteworthy having regard to the large increase in the new business figure.

Pension schemes representing a capital value of £7 million had been completed over and above ordinary life contracts. Each year they had to find investments for about £10 million, and he thought it was a matter of congratulation that they had been able to place nearly 70 per cent. of their new money in first-class mortgages, while another 10 per cent. had gone into real estate.

QUINQUENNIAL VALUATION

On December 31, 1950, they completed another quinquennium. He had no hesitation in saying that the condition of the Society's investments was entirely satisfactory and the value put upon the assets was a very conservative one. It was a source of gratification that on the advice of the actuary they were able to announce on January 1st bonuses in excess of those declared in 1945, whilst interim bonuses would, until further notice, be at the full quinquennial rates.

THE FIRE SOCIETY

At the annual meeting of the Fire Society, the chairman, Sir Robert Bignold, said that the premium income for 1950 for the fire, accident and marine departments amounted to £10,826,023, the highest in the Society's history, and while those figures pointed unmistakably to solid development, it would be readily appreciated that devaluation and inflationary tendencies had registered their effect on the amount of income he had mentioned. The effect in hard currency countries was now reflected for a full year. The bulk of their premiums was derived from overseas and thus they had become very much concerned in the effects of devaluation and inflation. It could be claimed that modern history was reflected in the records and achievements of British insurance. The Society had a long and honourable participation in that important unit of the country's commercial life.

Fire premiums increased by £969,427 to £5,648,776, the resulting profit being £668,744, compared with £463,646 for 1949.

The accident income had increased by £729,042 to £4,304,204, the profit for transfer being £341,097, compared with £413,048. Premiums in the marine department had increased by £189,410 to £873,043; the transfer to profit and loss was £50,000.

Net interest totalled £199,650. Income and other home taxes absorbed £492,796, leaving £749,521 for transfer to the appropriation account. Net dividend required £145,200, £200,000 was transferred to the pension fund and £80,000 was used to write down real estate. £250,000 was added to the Fire and £50,000 to the accident revenue account, leaving the balance carried forward at £327,921 against £303,600.

Total assets had increased by £1,694,785 to £16,356,072.

The reports and accounts were adopted.

LEGAL AND GENERAL ASSURANCE SOCIETY

RECORD NEW LIFE BUSINESS

ACCIDENT INSURANCE ACCOUNT

The one hundred and fourteenth annual general meeting of The Legal and General Assurance Society, Limited, was held on May 9th in London.

The Hon. W. B. L. Barrington (chairman) in the course of his address said:—

Once again I am able to report another record in new life assurance business transacted. In the ordinary section the total net figure amounted to £27,867,600, an increase of £5,116,677 over the previous year. Decreasing term and group business, including increases in existing group schemes, reached a total of £26,313,593, an increase of £4,562,000.

The total net new sums assured in both sections was, therefore, £54,181,193 and showed an increase over 1949 of no less than £9,679,373, the largest increase in new business in one year in the history of the society.

In addition, deferred annuities were issued providing for the payment of £2,959,689 per annum, mainly in connection with pensions.

The net premium income in respect of new business for the year was £3,490,428.

MORTALITY EXPERIENCE

The usual investigation into our mortality experience has been made, and again the death claims for 1950 were less than the amount expected under the mortality tables used.

RATE OF INTEREST

The net rate of interest earned by the life assurance and annuity fund, excluding the amount invested in purchased reversions, was £3 12s. 1d. per cent., compared with £3 11s. 9d. per cent. for the year 1949. The gross rate showed an increase for the year of 3s. per cent., but owing to the heavier incidence of income tax the net rate shows only an improvement of 4d. per cent. I am pleased, however, to record this increase and to report that it has been possible during the year to invest money at a rather higher level of interest than in the recent past.

EXPENSES OF MANAGEMENT

It gives me great satisfaction to be able to state that the ratio of commission and expenses of management to our life premium income was actually reduced during the year from 9.47 per cent. to 9.05 per cent.

FIRE INSURANCE ACCOUNT

The net premium of the fire insurance account, including the business of the "Gresham Fire," amounted to £1,777,272. Claims and contributions to fire brigades absorbed 41.06 per cent. of the premium income; commission and expenses of management including dominion and foreign taxes 46.39 per cent. There was an underwriting surplus in the account of £176,241 which, after adding interest on the fund amounting to £42,343, brought the gross surplus up to £218,584.

United Kingdom taxation paid and reserved, including the tax on the profit for the current year, required the sum of £80,873, and the account has been charged also with £53,844 being its contribution to the staff pension fund and the purchase of annuities for existing staff pensioners. The resultant balance of £83,867 represents the net profit on the account which in accordance with our usual practice during a quinquennium has been added to the additional reserve, which now stands at £447,172.

MARINE ACCOUNT

I am pleased to report the progress of our marine account in the second year of its existence. The new premiums amounted to £291,493. Claims paid for 1949 account, increased from £46,631 to £70,040 and claims paid for 1950 account amounted to £67,971, expenses of management were £8,379 and after allowing for net interest and the exchange adjustment the balance amounting to £308,758, is retained in the fund.

FUNDS AND PREMIUM INCOME

The total funds of the society and its subsidiaries, excluding the Gresham Life Assurance Society, increased by £15,873,587 to £138,991,347, of which £130,876,170 represents life assurance and annuity funds. The total premium income from life business amounted to £19,040,621 and from all classes £22,256,953, an increase of £3,768,313 as compared with the previous year.

ASSETS

The assets of the society now amount to £144,335,792, having increased during the year by £17,034,907.

The directors have carried out a review of all the society's assets and are satisfied that there is a considerable margin of appreciation over the value at which they appear in the balance sheet. In the case of the Stock Exchange securities, these increased by £2,340,214 to £79,437,831, and the fresh investments made during the year are represented mainly by additions to our holdings of debenture stocks and ordinary shares.

As we have now entered into the final year of the current quinquennium, I should like to make a brief reference to the rapid growth of the society's funds. In 1936, the year of the society's centenary, the total assets amounted to £39,724,653. At December 31, 1950, 14 years later, they totalled £144,335,792.

The report and accounts were adopted.

CALEDONIAN INSURANCE COMPANY

ANOTHER SUCCESSFUL YEAR

The one hundred and forty-sixth annual general meeting of this company was held, on May 10th, in Edinburgh.

The chairman, Mr J. F. Carnegie, C.A., in moving the adoption of the report, said:—
Net new business for the year was £2,312,830 and showed an increase of £32,792 over the figures for the previous year. Deferred annuities for £73,900 per annum were issued, as compared with £70,768 for 1949.

The premium income increased by £42,532, and our net interest income at £313,274 was greater by £11,673 than the amount obtained in 1949.

Our mortality experience for the year was again favourable and death claims for 1950 amounted to £244,562, as compared with £275,016 for the previous year. Surrenders at £86,643 showed an increase of £17,186 over the figure for 1949.

The ratio of commission and expenses to premium income was 16.06 per cent. and showed an improvement over the ratio of 16.45 per cent. for 1949.

The life assurance and annuity fund at £10,067,482 increased by £214,087 during the year.

The year 1950 was the last of another triennium. The rates of reversionary bonus declared for the three years ended December 31, 1950, were 32s. per cent. per annum and 30s. per cent. per annum calculated on the sum assured for ordinary participating whole life and endowment assurances respectively. At our last triennial valuation the corresponding rates of bonus declared were 25s. per cent. per annum and 24s. per cent. per annum. Reversionary bonuses have also been declared in respect of all other classes of participating policies. The valuation basis, already strong, has been strengthened further by the creation of additional reserves, and our valuation is stronger than that required if all our assurances had been valued at a rate of interest of 2½ per cent. per annum. During the triennium the average net yield on our funds was £3 3s. 3d. per cent.

FIRE DEPARTMENT

The premium income for 1950 was £3,018,885—almost £1,000,000 in excess of the figure for 1949, which itself was a record for the department. It should be noted, however, that the greater part of the increase was attributable to the devaluation of sterling.

We have decided to revert to our former practice of carrying in the fire insurance fund a provision for unexpired risks in addition to the usual forty per cent. of premium income and have transferred back from general reserve the sum of £500,000, which was placed there in 1942. We also have transferred from the appropriation account the sum of £250,000 to strengthen further this additional provision.

Our fire underwriting at home and overseas other than the United States was very successful, and the sum of £245,375 transferred to the profit and loss account exceeded last year's record figure.

ACCIDENT DEPARTMENT

The premium income for the year at £2,291,522 was again a record for the department. From this department the sum of £51,258 was transferred to the profit and loss account.

MARINE DEPARTMENT

The account is satisfactory, and a sum of £70,000 was transferred to the profit and loss

account leaving the fund at £826,775, which is 209.2 per cent. of the premium income compared with 205.9 per cent. for the previous year.

TOTAL PREMIUM INCOME

The total premium income for all departments for 1950 was £6,569,063 which, quite apart from the increase due to the alterations in the dollar exchange rates to the United States and Canada, indicates continued development of our business.

ROYAL INSURANCE COMPANY LIMITED

105TH ANNUAL REPORT

ANOTHER SUCCESSFUL YEAR

PREMIUM INCOME OVER £35,600,000

STRONG RESERVE POSITION

COL. A. C. TOD'S SURVEY

The annual general meeting of the Royal Insurance Company Limited will be held on May 30th in Liverpool.

The following statement by the chairman (Colonel A. C. Tod, C.B.E., T.D., D.L.) has been sent to stockholders with the one hundredth and fifth annual report and accounts.

Our figures for the year 1950 reflect something of the surge of inflation but something, too, of the high level of industrial activity. Both factors have contributed to the attainment of new high records in our premium income and in our new life business.

Fire, accident and marine premiums show an aggregate increase of £2,000,000 over the previous year, and, at £35,697,000, establish a record.

Claims in the fire and accident departments were considerably heavier than in the previous year.

The fire, accident and marine profit amounts to £2,588,000, or 7.25 per cent. of the premiums. Except for the record year of 1949, this profit is the highest in the company's history.

In the light of present-day costs, our general expenses at 15.56 per cent. of the premiums, demonstrate the economy with which our service—a detailed, personal and expert service—is administered.

BACKGROUND TO OPERATIONS IN 1950

The year will be remembered as a year of happenings leading to large claims. In the United States of America there were hurricanes in May and October and a tragic explosion at South Amboy, New Jersey, in the spring, all of which resulted in substantial claims upon insurers. In November came the severe storm which ravaged the North-Eastern States of America. It cost the insurance industry some \$150 million, and involved our own group of companies in more than seventy thousand individual claims.

In Canada, too, there were the Rimouski and Cabano conflagrations and the Winnipeg floods.

It must be remembered that the basic service of an insurance company is to pay the claims of its policyholders, and occurrences such as these provide an opportunity to demonstrate spectacularly the value of the protection and service we continuously provide to the public. It says much for the inherent quality of our business that, notwithstanding these quite unusual and severe claims, we have been able to show such a satisfactory result in the fire department upon which such claims have mainly fallen.

PROFIT AND LOSS AND APPROPRIATION ACCOUNTS

The amount of interest, dividends and rents (less tax) not carried to other accounts was £103,849.

The balance for the year transferred to the appropriation account was £230,943 after providing for taxation.

The directors are pleased to be able to recommend an increase in the dividend from 3s. to 3s. 6d. per share, and an allocation of £30,000 to the staff pension fund.

The report and accounts were adopted.

Another characteristic of 1950 was the marked increase in motor claims. Both in this country and abroad there was a sharp rise in the incidence of claims, accompanied by a further rise in the average cost per claim. As you know, adjustments have already been made in motor premium rates at home; and in the United States and other places abroad, special and energetic steps have been taken to adjust the rate levels in keeping with current experience. We hope to see an improvement this year, but obviously it will take some time before the effect of the increased rates is fully felt.

OVERSEAS BUSINESS

In the United States of America, our premium income achieved record dimensions. The over-all underwriting profit was very satisfactory, although the casualty business did not contribute on this occasion, largely because of the difficulties attendant upon the underwriting of automobile business.

In Canada, our premium income has never been higher, and satisfactory underwriting profits resulted, although, here again, automobile business did not contribute its quota.

Our business in Australia continues to show considerable expansion, and, whilst claims were somewhat higher than last year, results were nevertheless good.

Premiums in New Zealand also showed an increase, and there was a satisfactory profit.

In South America, South Africa, India, Pakistan, Europe, and indeed in our overseas territories generally, our business continued to progress, the year closing with satisfactory figures and with good auguries for the future.

Only in China is the story the reverse from pleasing, in that adverse conditions have impelled us to decide on withdrawal after over one hundred years of business there, a development I foreshadowed last year.

LIFE DEPARTMENT

Year	1950	1949
New sums assured	9,240,613	8,291,264
New annuities (per annum)	308,178	206,263
Claims by death	1,009,743	883,375
Maturing endowment assurances	1,278,721	1,260,745

The expansion in new life business is to some extent a natural result of rising price levels, but that is not the complete story in that the demand for life cover continues to grow.

The mortality experience has continued favourable, and, with improved investment yields, we found it possible, as from the beginning of this year, to reduce our premium rates for new policies under the

Whole Life and Endowment Assurance tables.

FIRE DEPARTMENT

Year	1950	1949
Net premiums	16,916,294	16,235,608
Profit	1,856,308	1,846,931
Percentage of premiums	10.97	11.36

Our Home Fire business has been well maintained; premiums have continued to increase; and results have been favourable. This important section is always remarkable for its steadiness. It is perhaps all the more necessary to remind you of the vital function it performs in providing the security so very essential to the well-ordered conduct of our national trade and industry.

ACCIDENT DEPARTMENT

Year	1950	1949
Net premiums	15,453,602	14,284,369
Profit	351,159	853,475
Percentage of premiums	2.27	5.97

Our Accident premiums show further expansion, but results are not so good as last year, largely due to unfavourable experience in the motor section. Claims costs in many sections of our accident business—burglary, third party, employers' liability, to name the more important—are all showing a tendency to increase, and the trend needs constant vigilance.

MARINE DEPARTMENT

Year	1950	1949
Net premiums	3,327,386	3,176,741
Fund as at December 31st	6,743,203	6,585,318

Our 1949 Marine underwriting has resulted in a profit of £380,823 after providing for future claims on this account. Full provision has been made for the increasing cost of ship repairs due to high prices of raw materials and rising wage levels. It seems inevitable that this trend will become even more marked because of the demands of rearmament.

PROFIT AND LOSS ACCOUNT

In the light of the increased incidence of profits tax, we are now charging interest with its quota of profits tax as well as income tax, and after this deduction, net interest amounts to £1,671,000. The profits transferred from underwriting accounts, already referred to, aggregated £2,588,000.

The only other item calling for particular reference is the transfer of £1,000,000 to the general reserve, thereby increasing the latter to £3,000,000. Having regard to the development of our business since the general reserve was built up to £2,000,000, this is considered a wise and prudent step.

After providing for the final dividend and other specified outgoings, a balance of £4,531,000 is carried forward, an increase of £276,000.

FOREIGN EXCHANGE

Apart from the United States and Canada, currency figures have been converted at approximately current rates of exchange. In dealing with our business in the United States and Canada, we have continued to convert the dollars at approximately \$4.86=£1. Actual remittances, however, from all countries have been taken at the sterling values realised.

DIVIDEND

In my statement last year, I indicated that it was hoped to recommend an increase in the dividend as soon as conditions allowed. The directors have now felt justified in recommending an increase of 1s. per £1 stock in the final dividend, making 8s. 6d. for the year.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

RESULTS AGAIN VERY SATISFACTORY

LT.-COL. JOHN LESLIE'S REVIEW

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on May 28th at the head office of the company, 24, Cornhill, London, E.C.

The following is an extract from the review by the chairman, Lt.-Col. John Leslie, D.S.O., M.C., D.L., which has been circulated with the report and accounts:—

Our results for the year 1950 have again been very satisfactory. The margin of profit is below that of 1949 but the results then were more favourable than usual by reason of the absence of major catastrophes.

Owing to the fact that our business is world wide we have naturally borne a share of the several very large losses experienced overseas during 1950, but in relation to the volume of our premium income these lose much of their importance and we are able to take them in our stride without any great effect upon our figures.

FIRE DEPARTMENT

Net premium income, 1950	£18,769,329
Net premium income, 1949	£17,372,933
Increase	£1,396,396

The ratio of claims paid and outstanding was 42.26 per cent., commission absorbed 19.95 per cent. and expenses of management accounted for 22.32 per cent. After adjustment of the reserve for unexpired risks, there was an underwriting profit of £2,345,926, of which £1,500,000 has been transferred to profit and loss account. The fire fund now amounts to £16,745,285, or 89.22 per cent. of the premium income.

LIFE DEPARTMENT

The gross sums assured totalled £17,712,084, compared with £12,687,099 in 1949, and the 1950 figures easily set up a new record in the company's history. The average gross new sum assured of £1,466 compares with £1,152 and £1,109 for the two preceding years.

During the year the life fund increased by £1,782,270 to £41,026,789, and the average rate of interest earned thereon was £3 2s. 3d. per cent. after allowance for income-tax, to be compared with £3 3s. 4d. per cent. net for the previous year. The net premium income in respect of life assurance policies was £3,627,183, being £348,934 in excess of the 1949 figure, and in addition £569,673 was received as single and annual premiums under various types of annuity contract.

Until further notice during the remainder of the current quinquennium, which ends December 31, 1952, death claims and maturities of participating policies will receive interim bonuses at the full rate of bonus declared at the last distribution of profits, namely 32s. 6d. per cent. per annum compound reversionary bonus for new series policies, and reversionary bonuses equivalent to a minimum 26 per cent. per annum cash bonus for policies in the old series which was closed to new entrants on December 31, 1939.

MARINE DEPARTMENT

The claims paid and outstanding, after deduction of reinsurances and salvages, amounted to £1,153,350, and out of the profit of underwriting years now closed the sum of £275,000 has been transferred to profit and loss account. The marine fund

now stands at £3,453,064, or 196.05 per cent. of the premium income.

ACCIDENT DEPARTMENT

Net premium income, 1950	£18,308,511
Net premium income, 1949	£17,165,686
Increase	£1,142,825

The ratio of claims paid and outstanding was 54.66 per cent., commission 17.72 per cent., and expenses of management 17.81 per cent. The underwriting surplus was £1,795,565 and, after adjustment of the reserve for unexpired risks, there remained an underwriting profit of £1,338,435 or 7.31 per cent. of the premium income. The sum of £1,000,000 has been transferred to profit and loss account, and the accident fund now amounts to £12,628,824, or 68.98 per cent. of the premium income.

At home the steady expansion of recent years was continued and there was a general increase in our writings in the many classes of accident business transacted. Except in connection with the motor section, there was little change in the factors affecting the business.

PROFIT AND LOSS ACCOUNT

Gross interest, dividends and rents have increased by £297,824 and now amount to £2,140,885. Transfers from departmental accounts amount to £2,775,000, compared with £3,400,000 last year, but in this connection it will be seen in the fire and accident revenue accounts that the additional reserves (beyond the usual 40 per cent. for unexpired risks) have in both cases advanced materially. The necessity for reserves of unquestioned strength needs no emphasis.

After providing for taxation fully, on the basis of the current year's profits, there is a balance of £1,112,219 for transfer to the appropriation account. £250,000 is being transferred to the contingencies and taxation reserve, as against £50,000 last year, and as last year £25,000 is written off leasehold properties. This brings me to the question of the dividend. The revenue from interest, dividends and rents, after deducting income-tax thereon, together with the stockholders' share of life profits, now exceeds the net cost of a dividend at last year's rate of 7s. 6d. per £1 stock by a large margin, even after allowance for the amount of profits tax applicable to the interest income and to the dividend distributed. Reserves in the departmental accounts are exceptionally strong and, in addition, there is a general reserve of £5,000,000 and a contingencies and taxation reserve of over £5,000,000.

It is therefore evident that by the strictest canons of prudence the company could afford to increase the rate of dividend. The interim dividend declared in November last was raised from 3s. 6d. to 4s. per £1 stock, but an indication was then given that this course did not necessarily imply any increase in the final dividend. With the full results for the year before them, the directors have concluded that an increase of 6d. in the final dividend, making a total increase for the year of 1s., is amply justified. Accordingly, they recommend that the final dividend be 4s. 6d. per £1 stock which with the interim dividend of 4s. per £1 stock makes a total for the year of 8s. 6d. per £1 stock. These appropriations will leave a balance of £29,656, which raises the carry-forward from £678,888 to £708,544.

BABCOCK AND WILCOX

GRATIFYING RESULTS

HIGHLY SATISFACTORY ORDER BOOK

MR W. LIONEL FRASER'S REVIEW

The fifty-second annual general meeting of Babcock and Wilcox, Limited, will be held on May 31st at the Waldorf Hotel, Aldwych, London, W.C.2.

The following is an extract from the statement by the chairman, Mr W. Lionel Fraser, C.M.G., which has been circulated with the report and accounts for the year ended December 31, 1950:

It is with the deepest regret that I have to record the death of Sir John Greenly on December 31, 1950. Under his guidance your company made great progress, and the example which he set will remain an inspiration to those who may be called upon to carry on his affairs.

On January 9, 1951, Sir Archibald McKinsty expressed his desire to retire from membership of the board, as he felt it necessary to reduce his business commitments. Your directors desire to record their feelings of sincere gratitude for the devoted manner in which he served your company at all times, and they wish him a long and happy period in which to enjoy his retirement.

THE ACCOUNTS

You will observe that, after setting aside the sum of £732,628 for depreciation, providing for U.K. taxation, and making other adjustments, the balance standing to the credit of profit and loss account is £1,639,047. The preference dividends, less tax, required £52,334, and your directors now recommend that a final dividend of 10 per cent., less tax, plus a bonus of 3 per cent., less tax, be paid on the ordinary stock, absorbing £342,360, making 18 per cent. for the year, as compared with 15 per cent. last year.

UNPRECEDENTED OUTPUT INCREASE

The principal reason for the rise in the trading profit is an unprecedented increase in output. Furthermore, the very substantial extensions undertaken at the various works and the development and adoption of new processes, as well as changes in organisation, have not only much enhanced efficiency of production, but have brought about this gratifying result even earlier than had been expected.

I am happy to report that the order book is still highly satisfactory, although with our increased productive capacity the rate of output now slightly exceeds the intake of orders.

EXTENSIONS AND IMPROVEMENTS

Your Board will continue to exert themselves, to the utmost degree to help to satisfy the urgent need for your company's products. This is a national duty. Although encouraged by the progress already made—considerable progress, one can say—your directors will not fail to use all the skill, experience and ability at their disposal to assist in overcoming the present power shortages so painfully prevalent in our country today. Certainly there are heavy tasks ahead—we are not alone in that respect—but I am convinced that with the exercise of energy, courage and enterprise, your company can meet them successfully.

FUTURE PROSPECTS

As to the future, one hesitates to predict, especially as we are at present contending with mounting difficulties in the supply of

raw materials—the common danger besetting industry just now. Even so, we hope that output will again increase in the current year, although we cannot ignore the possibility that the unexpected may happen in these uncertain days. It is of vital importance that production should rise, for this would enable us to offer shorter delivery periods of steam generating plant, which is not only the key to the power shortage at home, but would also help us to meet foreign competition successfully. As you are aware, the export business of your company has always been on a large scale and has proved most valuable in the past in levelling fluctuations in the home market. Needless to say, we are continuing our efforts to stimulate and develop these exports as far as is possible having regard to our home commitments. Coming fresh into the company, I am conscious of the sense of urgency, alertness and responsibility which stimulates the whole organisation and I find this a healthy augury for the future.

RESEARCH AND DEVELOPMENT

Your directors have pursued energetically the policy of expanding our own facilities for research, and they remain convinced that supremacy can be maintained only by steady technical development of our products on the basis of sound scientific knowledge.

SUBSIDIARIES' ACTIVITIES

Your overseas subsidiary and associated companies and branches are all operating satisfactorily.

I am also glad to say that your subsidiary companies at home are all working with excellent effect. Dewrance and Company, Limited, have made good progress with the rebuilding of their works at Southwark, which will undoubtedly keep them to the fore as manufacturers of valves and similar equipment. The achievements of Edwin Danks and Company (Oldbury), Limited, also call for special comment, and of these the "Oldbury Stoker," one of the principal appliances manufactured by them, has proved very successful in the field of efficient fuel utilisation. Bailey Meters and Controls, Limited, have also made a record showing.

Progress, too, has been made by your company in the marine boiler business, and many ships of the Merchant Navy are now operating with modern designs of B. and W. boilers.

BONUS TO EMPLOYEES

I should like on behalf of all stockholders and of my fellow directors to pay a high tribute to all the staff and operatives, men and women, in the company and in the subsidiary companies and branch offices at home and abroad for their devoted and loyal service during the past year. Their contribution towards increased production is mainly responsible for the pleasing account I am able to render you of your company today, in view of which I am sure that stockholders will endorse the granting by your board, as an exceptional measure, of a special bonus of two weeks' pay to all employees of your company. Your directors want employees to regard this bonus as a tangible expression of appreciation of their fine endeavours during the past and previous years.

BLAW KNOX

PROGRESS IN ALL DEPARTMENTS

The annual general meeting of Blaw Knox Limited, was held on May 3rd, in London, Mr J. Theodore Goddard (the chairman) presiding.

The following are extracts from the chairman's circulated statement:

The net profit for the year which, after providing for taxation and liabilities of every kind, is £142,334, an increase of £32,352 over the previous year.

The past year has been marked by highly satisfactory progress in all departments of the company's business. There has been steady improvement in production, deliveries have been sustained at a high level, and the state of our order book is satisfactory.

I am happy to inform you that the new developments referred to in my previous statement are prospering. It has become necessary to expand production and increase our facilities by the installation of new plant and machinery. Subject to our receiving permission of the Authorities, it is the intention of your board to extend workshop space at our works, and we have accordingly appropriated from our surplus, £100,000 to development reserve. In addition £150,000 has been appropriated to general reserve.

Our overseas interests continue to expand and we now have trading connections with forty countries. Shipments to hard-currency countries are encouraging. The company's Transmission Tower business continues to flourish and is contributing significantly to the fulfilment of large power development schemes throughout the world. It is noteworthy that the company has been successful in obtaining a substantial contract for Transmission Towers for shipment to Canada.

Important contracts are in hand for the supply of special concrete mixing and batching plants for the construction of dams in Scotland, Australia, India and Switzerland.

Our steelworks department is also doing well and it is worthy of note that Blaw Knox open hearth equipment has been selected for the major steelworks expansion schemes that have been undertaken in recent years in this country and abroad.

CONSIDERABLE DEMAND

Currently, the demand for the company's products is considerable and I am confident that progress in the affairs of the company will continue to be maintained.

Times are difficult and although I survey the future with quiet optimism we are dependent upon the availability of supplies of materials used for the manufacture of its products. The supply position is one which your board has constantly under review and every effort is being made to avoid slowing down production due to this cause.

Attention is drawn to a new item included on the liabilities side of the balance sheet, viz., tax equalisation reserve. It has been thought advisable not to take into credit during the fiscal year in which it is allowed the tax on the initial allowances made by the revenue under the Income Tax Act 1945 in respect of new purchases of plant and machinery but to spread these allowances evenly over the useful life of the equipment.

Referring to the recommendations made by your directors on March 2, 1951, the bonus shares issued rank for the final dividend of 20 per cent. which your directors now recommend in their report, and I feel that the effort made to rectify in some measure the disparity which existed between the nominal capital and the capital employed in the business, was fully justified.

The report was adopted.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS

RECORD OUTPUTS AND DELIVERIES PRODUCE RECORD PROFITS MR GEORGE EARLE ON THE OUTLOOK

The annual general meeting of The Associated Portland Cement Manufacturers, Limited, will be held in London on May 31st.

The following are extracts from the report of the directors to be submitted thereat:—

The consolidated net profit of the group, after providing £1,414,093 (1949—£1,227,976) for depreciation and a transfer of £815,000 (1949—£690,000) to plant and machinery replacement reserve, amounted to £4,869,840, which compares with £4,148,178 for 1949, an increase of £721,662.

The profit available for distribution was £713,001, which compares with £574,176 for 1949.

PRODUCTION AND DELIVERIES

The total cement production and deliveries showed an increase over the previous year's record figures. Exports, however, declined slightly, mainly owing to shipping difficulties and to the necessity for keeping the home market supplied. In spite of an advance in world prices for cement, our export prices were kept steady, it being thought best to adopt a policy of moderation when the profit margin was already considered fair. A feature of our export trade during 1950 was the increased business done with the U.S.A. and Canada.

The home trade profit margin remained low. Owing to increased output the cost of production remained practically unchanged in spite of an increase in the cost of coal, labour and stores. The sale of products other than cement was well maintained.

NEW WORK AND DEVELOPMENTS AT HOME

The new works of our subsidiary company, Light Expanded Clay Aggregates, Limited, is now almost completed and it is expected that production will commence in the very near future.

The share capital of Nottinghamshire Gypsum Products, Limited, has recently been acquired. This will assist in safeguarding our supply of gypsum, which is an essential raw material in the manufacture of cement.

The erection of the Central Research Laboratory at Greenhithe is proceeding. When completed all our research activities will be centralised there.

CHAIRMAN'S STATEMENT

The following is an extract from the statement by the chairman, Mr George F. Earle, which accompanied the report and accounts sent to stockholders:—

Our jubilee year was satisfactory. Record outputs and deliveries produced record profits.

In a mass production process, such as the manufacture of cement, full output is of the greatest importance if overheads are to be kept low. Thanks to our being able to do this we are able to sell our cement at a very low price, compared with the high costs of coal, power, and labour which are used in making it. You will find this illustrated in a graph attached to the accounts.

It seems probable that all our works will be kept at full output during this year, and we can look forward with reasonable confidence to satisfactory results. At the time of writing, our production is a little higher than last year, but owing to the weather and shortage of shipping, which was caused largely by the coal importations, deliveries are lower. We are, however, glad to have the larger stocks.

The price of cement, not including packages, is now 87 per cent. higher than prewar, while building materials as a whole show an increase of 130 per cent., and the

cost of manufactured articles, an increase of 126 per cent.

The package position is far from satisfactory. Prewar our bags cost 2s. 6d. per ton of cement—now they cost 17s. 6d. This is almost entirely due to the increased cost of paper, which has gone up from £17 a ton to £132. It is most disappointing that our customers have to pay these prices when they buy cement. It is outside our control, and there seems no likelihood of a drop in prices until the new capacity for pulp production is working.

DIVIDEND POLICY

We have been able to increase our dividend by 1s. per share. This happily coincided with our jubilee year; but your directors felt that the future prospects, which have been considerably helped by the returns from our investments abroad, are such that we ought to be able to maintain this higher rate of dividend in the future.

The higher dividend applies to our profit-sharing schemes—thus everyone in the business is sharing in its prosperity. The figures for this company and its subsidiaries, the British Portland Cement Manufacturers, Limited, and Alpha Cement, Limited, show that our salaries and wages in 1950 amounted to £4,357,000. In addition, our employees received in profit-sharing, pension provisions and other monetary benefits, £675,000—while our ordinary stockholders received, before tax, £1,200,000.

Taxation amounted to £2,475,000. The benefit to the Exchequer of a growing business is shown by the fact that our taxation liabilities in the first year of this company, when the rate of income-tax was 1s. 2d., were about £8,000.

BUSINESS AND POLITICS

It has been practically a tradition that business men take no part in politics, and a very good tradition it was—for, when it was formed, politicians did not interfere with business. They confined their work to producing conditions under which business could prosper, while at the same time, by wise legislation, improving the lot of the working man.

This is no longer the case. Many businesses, including our own, are controlled by the Government, and though we do receive help from our Ministry, especially in dealing with problems which arise owing to the action of other Government Departments, one cannot deny that at times decisions are made which affect business, for political rather than business reasons. Regrettable though it may be, this means that no business man can avoid being mixed up with politics to some extent, and let us all realise that this is so.

To take an example—the prosperity of our country depends on the efficiency of its producers, not only their efficiency today, but in the future, and modern methods of production are essential. Their installation is now extremely expensive, and we are greatly concerned with our crushing taxation which makes it very difficult to build up the funds necessary to replace the out-of-date machinery. The change in the profits tax, with no relief in taxation on undistributed profits, makes the position still more difficult. Government expenditure, for this reason alone, is of great moment to business men. We cannot afford to sit back and say that it is someone else's job to press for economies by our Government. I think that many business men will agree that the Government's policy of "soaking" business and also the senior executives, who receive salaries in line with their responsibilities, is bad economics and bad psychology.

BRITISH OXYGEN COMPANY LIMITED

A RECORD YEAR

The sixty-fifth annual general meeting of The British Oxygen Company Limited was held on May 10th in London.

Mr J. S. Hutchison, the chairman, in the course of his speech, said: I am very pleased to tell you that the year 1950 was a record year at home and overseas. New sales and production totals were achieved, our development programme made excellent progress and there was a substantial improvement in earnings over previous levels.

EARNINGS, DIVIDENDS AND RETAINED PROFITS

The consolidated trading profits are increased by £961,562 at £4,225,584. The allocation for depreciation is increased by £245,596 so that after depreciation the increase in profit is £715,966. Taxation home and overseas, including reserves for taxation on initial allowances, requires the very large sum of £1,749,167, an increase of £458,494 on the preceding year. The profit attributable to outside interests is £166,199, and the net disposable balance of profit for the year of £1,097,998 shows an increase of £192,951. The directors recommend a final dividend of 12 per cent., less income tax, payable on the new total of ordinary stock.

The successful issue of additional shares to ordinary stockholders on favourable terms, and the issue of the £4,000,000 of 3½ per cent. unsecured loan stock 1953-55 at 99½ per cent. in November last, provided the company with total additional resources of £6,408,370. The bank overdraft which had reached a level of approximately £3,000,000 was eliminated and there are substantial funds to meet capital expenditure payments for the next period. The directors regard the issue of the short-dated unsecured loan stock as an appropriate and economical means of balancing out requirements for additional permanent capital. The total of capital reserves, revenue reserves and retained profit is £8,464,583, which is very satisfactory.

PROGRESS OVERSEAS

It is pleasing to be able to record the excellent progress of our associated companies overseas in the past year. There are enormous potentialities for expansion of our business throughout the Commonwealth and we can confidently expect demands there for our products to increase rapidly over the next few years. The Australian company had a particularly good year. In Africa we had increased earnings and excellent progress was made in extending the use of our products and in the completion of our new plants and factories. In India we had a record year with sales and earnings substantially increased and we also fared well in our separate companies in Pakistan and Ceylon.

In Canada our new factory near Toronto will come into operation at an early date. Canada is clearly looking forward to a period of very wide development and we are glad to have the opportunity to offer our service to the rapidly expanding industries there. Our Norwegian company did well and developments are under consideration. Our trading in Egypt expanded and we hope that this improvement may be maintained and increased. Our new company in Hong Kong has made a good start.

New records were established in the United Kingdom last year which place our sales greatly above the peak figures of the war years and these new records indicate a very high level of engineering activity throughout the country. We continue to develop our works, plant and equipment as we have done in past years so that our production capacity will be adequate to meet the highest peaks of industrial demand. Prospects for the current year are good.

The report was adopted.

DOMINION STEEL AND COAL CORPORATION

UNPRECEDENTED DEMAND

The annual meeting of this company was held on May 4th in Montreal.

Mr L. A. Forsyth, the president, in the course of his speech said: Earnings for the year ended December 31, 1950, after provision for taxes, totalled \$4,481,033.99 or \$4.31 per share on the outstanding Common Class "B" shares—a decrease of \$771,029.08 in total earnings and of 74 cents in earnings per share, when compared with those of the year ended December 31, 1949.

This decrease in earnings is largely accounted for by a substantial decline, during the greater part of 1950, in business of the Eastern Can. Company's plant at Trenton, as compared with earnings at other operating units, although radically reduced during the early months of 1950, have, in their total, exceeded those of any corresponding period in the history of the corporation.

Total dividends of \$1.50 per share were declared on the Common Class "B" stock during 1950, consisting of three "regular" quarterly dividends of 25 cents each plus an increased "regular" dividend of 38 cents together with an "extra" of 37 cents per share in the last quarter. Announcement has been made of the establishment of a "regular" annual dividend basis of \$1.50 per share.

INGOT PRODUCTION

Production of ingots at Sydney and at Montreal increased 2.36 per cent. over that of 1949. During the course of my remarks last year, with reference to Wabana ore, I made special reference to the difficulty in securing export orders for iron ore. A programme which had already been undertaken toward the provision of modern and more efficient mining and transportation facilities at our mines, has of necessity been greatly enlarged and is now well under way. Orders have now been placed for the provision and installation of equipment which will enable us to open the shipping season of 1952 prepared to supply the needs of our plant at Sydney and to fulfil our commitments for the sale of ore abroad.

SYDNEY IMPROVEMENT PROGRAMME

During the years 1950 and 1951 capital expenditures, apart from those relating to Wabana and the modernisation of the blooming mill, have been authorised in a total amount of \$5,816,825.23 to purchase and install equipment calculated to improve operations and effect reductions in costs.

We shortly expect to complete and submit to your directors a revised programme which, while based upon the fundamental principle that quality and minimum cost are the primary requirements in the supply of steel, as of any commodity, will respond to the obvious urgency of the immediate future.

CURRENT OUTLOOK

In view of the rather remarkable and rapid change in the trend of commercial events during 1950, to which I have made a previous reference, I find myself today in a situation vastly different from that with which I was confronted when I addressed you somewhat less than twelve months ago.

Today the corporation has on its books orders for its products representing a demand unprecedented in its history. It can be said, I think, that this demand arises in respect of every product which the corporation produces, and that the backlog of orders now in course of execution exceeds, in respect of every product, all previous records. On the face of it, therefore, to say of 1951 that the prospects are excellent, is a form of understatement which I am, I assure you, greatly gratified to employ.

The report was adopted.

BRITISH ENKA LIMITED

CONSIDERABLE EXPANSION IN PRODUCTION

The twenty-sixth annual general meeting of British Enka Limited was held on May 8th in London, Mr A. D. Carmichael, C.B.E. (the chairman), presiding.

The following are extracts from the chairman's circulated statement:

The accounts for the year to December 31, 1950, show a working profit of £941,203, compared with £538,256 for 1949, and the net profit for the year was £300,241, comparing with £152,693 for the previous year. The satisfactory increase in profits in 1950 is the result of a considerable expansion in production and improvements in efficiency following the recent installation and bringing into full production of new additional machinery. The company has spent £2,109,450 on expansion and modernisation of its plant in the past five years.

The directors recommend a dividend of 10 per cent. The dividend recommended is well within a policy of moderation and restraint. It will be remembered that no dividends were paid for the first 20 years of the company's existence, that the nominal capital of the company was reduced by 25 per cent. in 1946 and that new capital was taken up by stockholders at a premium of 20 per cent. in 1946 and 25 per cent. in 1947. The directors have allocated to general reserve the sum of £400,000, part of which is from the profits of the year, and part from over-provision for taxation.

CONSISTENTLY GOOD DEMAND

Production and sales were substantially increased during the year. Progress was made in the modernisation of the plant. Prices of raw materials advanced, and the increases of wood pulp prices were phenomenal. It was no longer possible to meet these continuing increases by greater efficiency and higher production; accordingly the basic prices of our yarn, which had been unchanged since September, 1947, were advanced by a moderate amount in October, 1950, and again in January, 1951. The demand was consistently good for our products throughout the year, both at home and abroad, and we were unable to satisfy all the demands made upon us.

In addition to making high-grade textile yarns, we are the second largest producer in the United Kingdom of rayon yarn for the tyre trade and other industrial purposes. The demand for these types of yarn is strong and expanding.

With regard to the future, the relatively cheap price of rayon yarn creates greater openings than ever. Our present main anxiety is raw material supply, particularly pulp and sulphur derivatives.

It is appropriate to mention that early in 1951, the U.S.A. authorities reduced their exports of sulphur to the United Kingdom. The deliveries of derivatives of sulphur, which we purchase from British chemical manufacturers, were cut at a few days' notice. This compelled a reduction in the production of rayon yarn. By various means we have since been able to regain part of this cut in production, but the expansion which we had planned for 1951 is held up. We have entered into discussions with other large users and with I.C.I. regarding a joint scheme for the production of sulphuric acid from anhydrite, which is indigenous.

Sulphur is a vital raw material, not only for the rayon industry but for the whole economy of the United Kingdom. We hope, therefore, the British Government will be successful in persuading the Government of the United States of America to release the relatively small quantities of sulphur necessary to maintain vital industrial production in the United Kingdom.

The report was unanimously adopted.

ARMY AND NAVY STORES, LIMITED

The seventy-ninth annual general meeting of the Army and Navy Stores, Limited, was held on May 4th in London.

Maj.-General Guy P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., the chairman, in the course of his speech, said: The year to which these accounts refer began badly from a trading point of view, and sales during the first six months, as in most other stores, were considerably below average. In the latter half of the year, however, a great improvement took place, with the result that the total sales for the year show an increase over those for 1949-50.

The net profit, after taxation, together with the balance brought forward from the last balance sheet amounts to £177,941, to which must be added the sum of £50,000 provision for taxation no longer required. It is proposed to pay a dividend of 10 per cent. with a bonus of 5 per cent. which will now incur the new rate of income-tax at 9s. 6d. in the £.

In recent years we have gone some way towards meeting the new requirements of the times.

The organisation and space which we have can lend themselves to considerably increased sales without a corresponding increase in expenditure. A co-ordinated plan has been drawn up covering the many aspects of the problem, and within the last twelve months visible signs have begun to make their appearance.

I do not feel inclined to say much, one way or the other, about the future course of the business, except that the less the interference to which we are subjected by authority, the better our prospects will undoubtedly be.

The report was adopted.

COTTON PLANTATIONS

OUTLOOK IN SWAZILAND

The annual general meeting of Cotton Plantations, Limited, was held on May 7th in London.

Mr P. D. Krollik, the chairman, said: The directors have had an increasing number of inquiries regarding the company's properties, and Mr E. M. Geatinge, a member of your board, is now in Swaziland to report on the position.

I regret to have to tell you that our manager in Swaziland, Mr MacSeveney, died suddenly of heart failure on March 2nd. He had been in the company's service for over 20 years, and since the outbreak of war had been in charge of the estates, cattle, and buildings, which he had maintained in good condition, in pursuance of the policy of care-taking adopted by the board. I feel sure that shareholders will wish to be associated with the messages of sympathy sent to his widow. Last year we engaged an assistant to Mr MacSeveney, and he is now in course of gathering such crops of cotton and tobacco as may be ready.

The comparatively better showing of the profit and loss account is due to the successful tobacco crop. The value of our investments at today's prices shows a substantial recovery on the figure mentioned in the report.

General.—In Swaziland there is nothing further to report on railway construction: investigation into irrigation within the territory continues. In his report on Colonial Development Corporation activity Lord Reith comments favourably on their Swaziland properties and developments.

I would remind you that we own just over 15,000 acres of land, freehold and unencumbered, and that we have no debt; the estates are situated either side of the Ingwavumu River, at Nsoko, Swaziland, 20 miles by motor-bus from the Union border at Gollie station, on the Durban line.

The report was adopted.

UNIVERSITY OF SYDNEY, AUSTRALIA

Applications are invited for the position of SENIOR LECTURER IN MODERN HISTORY.

The salary will be within the range £1,050 to £1,300 (Australian) per annum, plus cost-of-living adjustment (at present £70 males, £55 females), with annual increments of £50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. The successful applicant will be required to commence duties as early as practicable.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is June 9, 1951.

FLY-FISHING has this in common with advertising—it is easy enough for the old hand who knows when and where the fish will rise—and what they are taking. For the voice of experience on how, when and where to catch the market with effective advertising, consult Samson Clark & Co., Ltd., 57-61, Mortimer Street, London, W.1. MUS-um 5050.

AMERICA—Transportation only from £79 return. Sailings r.s.s. *Charlton Star* chartered by The Open Road, Inc., Rotterdam, Southampton, Montreal from May to October.—Write, International Travel and Study Commission, 25, Pembroke Street, Oxford, for details.

INFORMATION Bulletins, Journals of Societies or Institutions: editing, design, layout and finalisation of text for printer. Moderate fees. Inquiries from Embassies, literary, social and industrial bodies.—Box 611.

THIS advertisement, inserted by a well-known firm of Mechanical and Hydraulic Engineers, need only be answered by young men of good education, in their early twenties, who are intelligent, enthusiastic, and who have the ability to sell, allied to some general engineering knowledge and to whom interesting and remunerative careers as Technical Sales Representatives appeal. A thorough training will be given, after which those successful will have their appointments confirmed. There are three vacancies, and applicants should write fully, giving us a clear picture of their background, and their reasons for believing they would be successful, addressing their letters to "General Sales Manager," Box 643.

I.L.O. invites applications from men and women of British nationality aged from 30 to 45 years on May 31, 1951, for a post of Member of Division in the Manpower Division of the International Labour Office, Geneva, Switzerland. Qualifications required:—1. Knowledge and direct experience of vocational rehabilitation work. 2. Mother tongue English. 3. Working knowledge of French. 4. Some knowledge of Spanish desirable. Closing date for applications is May 31, 1951. On application with stamped, addressed foolscap envelope, further particulars and candidature forms may be obtained from the International Labour Office, 38-39, Parliament Street, London, S.W.1.

APPLICATIONS invited for post of Information Officer in Information Department, Office of High Commissioner for Pakistan. Post carries salary of £45 p.m. Duties include press research, writing articles and feature stories, etc. Applications should reach Establishment Officer, 35 Lowndes Square, S.W.1, by May 15th, stating particulars of academic qualifications, actual experience journalistic work and giving two references. Copies of published books, pamphlets, brochures, press articles, etc., should be enclosed with application if possible. These will be returned if so required.

MAJOR Oil Company invites applications from graduates in economics, aged between 25 and 30, with at least second class honours and some business experience. Successful applicant will be required to take charge of a section dealing with general market information.—Write, stating experience and salary required, to Box 639.

NATIONAL organisation has a vacancy for an Education Officer in Southern England. Preference will be given to a University graduate aged 30-40 and some press or publicity experience would be an advantage. Starting salary £700-£900, according to age and experience.—Please state policies when applying to Box 638.

HOLIDAYS ABROAD AND IN BRITAIN—planned with imagination for people with fastidious tastes and a limited budget. Full details from: Emma Low, 2, Roca News, London, S.W.7. Kensington 6911.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER IN SOCIAL ADMINISTRATION. Salary scale £450 to £500 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. The person appointed will be required to assist in the supervision of practical work, as well as in the ordinary teaching of the Department. Duties to commence September 29, 1951. Applications must be sent not later than July 14, 1951, to the Registrars, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY COLLEGE OF HULL

Applications are invited for the Headship of the Department of Social Studies on the scale £1,300 x £50—£1,500 per annum, with superannuation benefits under the F.S.S.U. and children's allowances. Particulars may be obtained from the Registrar, to whom eight copies of the application should be sent, not later than May 31, 1951.

SUEZ CANAL COMPANY

NOTICE IS HEREBY GIVEN that the Annual General Meeting of shareholders will be held at the "Salle d'Iéna," 10 Avenue d'Iéna, Paris, on Tuesday, June 12, 1951, at 2.30 p.m.

Holders of not less than 25 shares who are desirous of being present or represented at the meeting must prove at the Head Office of the Company, 1 rue d'Assolvi, Paris, before 2.30 p.m. on Thursday, June 7, 1951, that they have deposited their shares with the Company or with any of the Company's appointed Agents. Shares may be deposited in London with Messrs N. M. Rothschild and Sons, who will in due course deliver a card of admission for the meeting.

Le Directeur Général,
MICHEL HOMOLLE.

AVELING-BARFORD, LIMITED

Notice is hereby given that the following Resolutions were passed at a meeting of the Board of Directors of the above Company, held May 1, 1951:—

"That dividends be paid on July 1, 1951, on the £250,000 5½ per cent Cumulative Preference Stock at the rate of 5½ per cent per annum for the six months from January 1, 1951, to June 30, 1951, and that the 5½ per cent Cumulative Preference Stock Transfer Books of the Company be closed from June 11 to 25, 1951, both days inclusive."

"That dividends be paid on June 1, 1951, on the £500,000 5 per cent Second Cumulative Preference Stock at the rate of 5 per cent per annum for the period from January 1, 1951, to June 30, 1951, and that the 5 per cent Second Cumulative Preference Stock Transfer Books of the Company be closed from June 11 to 25, 1951, both days inclusive."

By Order of the Board.

Invicta Works, Grantham.

H. C. RYAN, Secretary.

EXPERIENCED Secretary, expert Shorthand-Typist, knowledge of wholesale and retail wine trades; sales; building trade; car-driver. Free-lance or permanent work sought where these qualifications would weigh.—Box 640.

REQUIRED by Chief Chemist of large chemical manufacturers in Lancashire, TECHNICAL SECRETARY to supervise the administration of laboratories. Applicants should preferably have a Science Degree, although previous experience in a similar capacity might be acceptable. Good shorthand and typing speeds and previous experience of office administration essential. Salary around £500 per annum according to qualifications, etc., age preferably over 30, but a younger person with the requisite experience would be considered.—Box 633.

AN International Company manufacturing fine pharmaceuticals has vacancies for one or two first-class propagandists. These will be senior appointments and only experienced applicants with proved success in the field of medical propaganda will be considered. The Company's present employees have been notified of these vacancies. Applications will be treated in strictest confidence and should be made in writing to Box 630.

COMMERCIAL man wanted take charge office small Lincolnshire factory manufacturing essential engineering and aircraft components. Prospects advancement. Age 30-35.—Box 641.

COMPANY SECRETARY, aged 40, Barrister, F.C.I.S., 20 years' first-class commercial/financial/legal/secretarial experience, at present secretary important group, seeks top-level secretarial or administrative post offering increased scope for qualifications, energy and enthusiasm, and prospects of advancement.—Box 638.

YOUNG public school man (30), presently managing director one of director three companies of group is resigning due to lack of commercial principle to which he cannot subscribe. Present salary £2,700. Desires appointment urgently, minimum salary £1,200. Offers himself as P.A. to Chairman, Managing Director or similar. Widely travelled and of good address for personal contact. Accustomed responsibility, administration and negotiation board level home and overseas. Excellent contacts M.O.S. and Government Departments. Happy to work all hours any day.—Box 642.

CAMBRIDGE Honours Graduate, aged 34, at present on sales staff of a well-known publishing house and with previous commercial and financial experience, including four figure position, is anxious for personal reasons to secure a full time permanent administrative or financial position in London with a well established company with substantial prospects.—Box 635.

EXPORT ASSISTANT, female, degree Economics, perfect French, responsible correspondent, good German, wide experience in technical business, seeks position.—Box 646.

CONNEMARA. Small furnished lodge to let short period, or lease. 6 bedrooms, bath, phone. Daily staff available. Preserved trout fishing, grouse shooting.—Write Box 634.

QUALIFIED Engineer, age 31, with sound industrial experience, shortly sitting Commerce degree, would welcome suggestions as to possible future employment yielding about £2,000 p.a.—Box 637.

TO SWITZERLAND IN A DAY. £14 7s. 6d. return.—Details from Continental Transport Company, 357 Strand, London, W.C.2. Tel.: TEM 9176.

FOR SALE.—Two complete volumes of Keating's Archives, 1830-19. £11 or nearest offer.—Box 636.

CROWN AGENTS FOR THE COLONIES

CHIEF INDUSTRIAL OFFICER required by the Government of Nigeria for the Department of Commerce and Industries for one year of 18 to 24 months with prospect of permanency. Salary £1,500 a year, including allowances. Free passages for the officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates under 45, should have had considerable experience of industrial management or of the planning of industrial or commercial enterprises, preferably in the tropics, and should have had accounting experience.

Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper to the Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.28333.C on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

AN ADVERTISING ORGANISATION, such as our own, owes its success and reputation to creating, in turn, success and reputation for its clients—with economy. If you are not entirely satisfied with your own advertising, we believe that our experience, facilities and director level co-operation could more efficiently progress your purpose. We shall be happy to be of service to you.—Townend-Smith Limited, Advertising, 40-41, Conduit Street, London, W.1. REGENT 2600.

Postal
Tuition for **B.Sc.ECON.**

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments if desired.

Outlook Uncertain

THE spirits of the Labour Party are gently on the rise after their deep depression of the early months of the year. The peril of the Bevan secession, which had been threatening for some time, has been surmounted without bringing defeat in the House of Commons any nearer. With only two more months of the session to go, the safe harbour of the long vacation is coming into sight. The municipal elections, though they were hardly satisfactory to Labour, certainly did not, except in one or two places, show that sweeping overturn of votes that the Tories were hoping for. And now the latest Gallup Poll—which politicians watch the more closely the more they deride it—shows a fairly sharp recovery in the party's popularity with the electorate, not enough, indeed, to bring Labour anywhere near the Tories, but enough to revive hopes of at least being able to make a fight of it.

It is interesting to speculate on the causes of this little recovery. There is a certain seasonal tendency to think better of the Government—of any government—in spring, when the rigours of the winter are past; though if spring weather plays any part in it, this is hardly the year when the phenomenon could be expected to appear very strongly. Possibly the two-point rise is the public's tribute to Mr Gaitskell's honesty and to his courage in outfacing the party ogre. Let us hope so; for there is need of as many proofs as can be collected that honesty and courage pay political dividends.

But whatever the cause, the effect of this political ripple will inevitably be to plunge the political outlook back into uncertainty. For some time past, it has been taken for certain—in both parties—that there would be a Conservative government in office before very long. Now it is distinctly less certain that it will be soon; and perhaps a little less certain that it will happen at all. It is now generally accepted that there will be no summer election; and when it is analysed, the almost universal assumption that Parliament will be dissolved in the autumn rests on no very sure foundation—certainly no surer, for example, than the no less universal assumption on February 24, 1950, that another election would follow later in that year.

Only the Prime Minister can advise a dissolution; and he will do so for one of only two reasons: either because he wants to or because he cannot help himself. Each of these motives further sub-divides into two. He may be compelled to dissolve because his party splits and will not support him in the House of Commons. But the Bevan incident has demonstrated that, in the Labour Party, the sin of voting the party out of office is so mortal that not even fallen archangels will commit it. Or a dissolution may be forced if the Government's majority is worn away by the slow attrition of by-elections. It is true that one or two unfavourable by-elections would be enough to do the trick and that any Labour seat held by less than 5,000 must be considered to be in danger. But if the law of averages is to present the Tories with as many as two such opportunities before the autumn,

it will have to work very much more in their favour than it has done so far. It seems highly probable that Mr Attlee will be able to keep his microscopic majority on all save accidental occasions at least through the rest of 1951—and accidental occasions, just because they are accidental and can be deliberately reversed, can be ignored by any Cabinet that wants to stay in office. Snap divisions, though they may annoy, will not put the Government out unless it wants to go.

A Prime Minister may wish to dissolve either because he thinks he can improve his party's position by so doing or because he becomes so oppressed by the cares of office that he prefers to put the Opposition in. It is unlikely that the Labour Party strategists will see an opportunity of winning an election yet awhile. All that the recent recovery means is that, in an election held now, Labour would not be beaten quite so badly as seemed likely in March. So long as defeat seems probable, be the margin large or small, the course dictated by loyalty to the party will always be to hang on a little longer in the hope that some miracle will occur. There are some sound judges who, observing the outward signs of the very heavy strain

under which the leading members of the Government are living, believe that before long they will be praying for a good excuse to put themselves out of their misery. But this also was said fifteen months ago. For the whole of that fifteen months, all the experts have been sure that the election was only a few months off; and it is possible for them to continue in that belief for quite a long time yet.

Prophecy is hazardous and anything may happen. But it would be foolish to count with any assurance on a change of government in this country this year.

This is the conclusion to which assessment of the probabilities leads. But it is a disgraceful conclusion none the less. This journal, as its readers know, is not an advocate for any party and we should want an election no less if the roles were reversed. Our interest is in good government, and paralysed government must be shockingly bad government. For a Cabinet so exhausted in person, so barren in policy and so bankrupt in credit to cling to office for so long is an affront to political decency which deserves to be (and in all probability will be) punished by the electors.

Twelve in Search of a Plan

IF it were not for the suspicion—or hope—that the contortions of the North Atlantic Treaty Organisation over the last year were symptoms of growing pains in a new body politic for the western world, busy people would long ago have lost interest in them. As it is, many have lost patience with the procession of initials and the serried ranks of committees; they have put their faith in General Eisenhower and hope for the best. That is why, presumably, through all the altercation about raw materials and the "unplanned scramble" for guns as well as butter, hardly a word has been said about the role and responsibility of Nato. Yet, in theory at any rate, it should have been giving by now at least a passable imitation of "planning": ensuring fair shares of aid for all members, allocating production where it can be most efficiently done, substituting co-operation between allies for rivalry, and seeing to it that the Nato rearmament plan does not destroy much that the Marshall Plan has achieved. That at least was the theory; some body would do with the economic difficulties of organising Western Europe's defence what the Supreme Commander is doing with the military problems: create a team spirit to handle common resources for the benefit of all. The reality has been very different.

The time may yet come when many Europeans will thank providence that the Americans—and later the British—set about rearmament in their own fashion and at their own pace, without waiting for all the Atlantic partners to argue, agree and then advance in a perfectly dressed line. But at the moment the Europeans are exasperated with the confusion they have experienced and helped to cause. After a year's talk they see a sea of troubles rolling down on them: rising prices; a raw materials boom caused by the attack on South Korea; inflation which makes them recast the finances of their rearmament programmes once a month; a threatening strain on social fabrics which are already too precarious for the liking of politicians. Both privately and publicly they—and, indeed, some British ministers—had believed

that rearmament under Nato might come about without tears; but the shedding of the tears has begun, as it turns out, even before the rearmament. In Holland, for example, one government has fallen because it was reluctant to cut sufficiently deep into its welfare policy to satisfy the Americans of its firmness of purpose. The most recent rearmament proposals from The Hague, suggesting Dutch production of items for the common stock in return for dollar aid, have been turned down by Washington, which objects to being regarded simply as a source of easy dollars. Belgium has been more intent on the defence of its currency than on a programme of effort to defend Europe, as was hinted at in recent remarks of Mr Murphy, the US Ambassador to Brussels. From Rome there come complaints that even the limited measures so far taken have drained off a large slice of the meagre resources available for the rest of the economy. Italian businessmen talk of bankruptcies ahead caused by credit shortage. The final upshot is that in some European countries less than 10 per cent of the orders have been placed for some of the military items agreed on as a rough production schedule for 1950-51. Much of this delay, confusion, misunderstanding and disappointment could have been avoided if there had been an authoritative forum for discussion and decision.

There is now some prospect that these things will be done in a fairer and more tidy manner. Nato has been reorganised, and has set up a central body for economic policy discussion and planning, the new Financial and Economic Board. (To explain how it has replaced four other bodies is to delve into the jungle of the past which is best forgotten; but it is perhaps worth mentioning that it does not replace the Defence Production Board, which is concerned with the actual procurement of munitions, while the new body's field of responsibility is with the total size and with the financial

and economic effects of the rearmament programme.) The Financial and Economic Board (FEB) is to be located in Paris, where it can draw on the experienced personnel of the OEEC and the American ECA, most of them men who made a success of the European Recovery Programme and in the course of three years' work developed a real international loyalty and team spirit.

What can be fairly expected of them, coming as they do a little late on the rearmament scene? The first item on the agenda is an impartial examination by the twelve members of the strains that will be thrown on each nation's economy by its proposed defence effort. Six weeks ago these proposed programmes were supposed to be ready for submission; only the British programme is in fact ready, and the authority of FEB should speed work up. This will immediately involve a study of the effect that American and British rearmament is having on their weaker neighbours. That might lead to some attempt to bring trading and financial policies into line: they might, for instance, have something to say about the coal shortage with which Europe is threatened next winter by the failure of British exports. Lastly, when this work of estimating and comparing has been done, it should be possible for FEB to add up the submitted programmes and place them against the estimated needs presented by the military advisers. If there are deficiencies, its job will be to advise where the extra burden can be best carried and how it is to be financed.

If everything worked as it ideally should, each member of Nato should begin to feel that its special needs and anxieties are the common concern of all, and should cease to regard each ally as a rival for dollars or as a defaulter from real effort. But, it may be asked—as it has already been asked at Strasbourg last week—how can this infant body hope to assert itself in the rushing tide of American rearmament, of British purchasing in Europe and the debates of the international raw materials organisation now working in Washington? Can the wisdom of 12 FEB officials, speaking through one voice, make itself heard at the same table with such world producers as Canada and such eager buyers as the Germans—who are not yet members of Nato? Can they do anything to control the process in which the world powers, the United States and Britain, conduct one rearmament drive while their European partners conduct another? Is Nato to be one team or is it to consist of a first and a second eleven? The answer is that the new FEB can do a lot if it is loyally backed by the Americans and the British.

The significance of this conclusion lies in the fact that the responsibility lies on London as well as on Washington. Much, indeed, depends on whether the Americans decide to take Nato and its new board seriously—which in its turn fundamentally turns, not on what American officials say, but on whether Congress is ready to take the advice of an international body in distributing American assistance. There is no doubt that Congress has a preference for dealing with each beneficiary separately, so that it can keep control. But this prejudice was overcome in the case of the Marshall Plan and could be overcome again. Certainly the multilateral method is the only one that is compatible with the new ideas of Atlantic partnership. The United States is no longer the outside philanthropist, as in the Marshall Plan; it is one of twelve partners each of whom, at least in theory, has the same rights and obligations. Moreover, there is no doubt that in bilateral arrangements the wider effects of rearmament are lost sight of, and that no small nation has much chance of drawing attention to these broader issues when alone confronting the United States.

★

But the issue will also turn on the attitude that the British Government adopts. If by its actions it shows that it prefers to deal with Washington direct and regards Nato chiefly as a device for satisfying other nations, then its chances of ever being anything more will be much diminished. But if London makes a real effort to breathe life into the new machinery and makes it the channel by which its case is stated to Washington, then a powerful argument will be added in Washington to those who advocate the multilateral approach.

Whitehall has an instinctive preference for the direct approach to Washington, based partly on a real belief (for which there is much justification) that more can be achieved more quickly between two parties who speak the same language than in an international committee, and partly on a slightly neurotic insistence that Britain still has the dignity of a great power to protect. Even on a calculation of short-run advantage, however, it is doubtful whether Whitehall's dislike of the multilateral approach is justified. In the Marshall Plan, for example, Britain was formally only one of the many beneficiary members, and no disasters resulted. Indeed, it can be argued that more American aid was forthcoming, and for a longer period, than could have been secured by any strictly bilateral application. Certainly that is likely to be the case in the future, for any specifically British

ication for military aid from America is likely to be nble on the obstacle of Britain's dollar reserves. a common European negotiation with the Americans for a Nato pool of dollars, to be shared out on the principle of "to each according to his contribution to common defence," Britain would appear as the most zealous and powerful, if not as the most exposed, contributor and would receive a generous share.

The arguments of short-term self-interest are therefore strong. But there is a far stronger argument still. The British Government has consistently argued, in opposition to the European federalists, that it preferred arrangements between governments, and that it was more interested in links across the oceans than in links across the English Channel. Nato meets both requirements. Its supreme virtue is that the United States is a member on equal terms with the others. When FEB meets to discuss the balance of North Atlantic rearmament, it will not be the powers of the second class discussing among themselves their joint relation to the giant outside. The American programme and the demands it makes upon

scarce resources will be just as fully open to review there as any other. One may legitimately entertain some doubt about the extent to which the Americans will, in fact, be prepared to submit their actions to international review; but there can be no doubt whatever that it is in the British interest that they should do so to the maximum extent that they can be persuaded to accept.

If there were the quality of imagination in Whitehall of which Mr Bevin could sometimes produce flashes, the British Government would have seized on the conception of Nato and would be pushing its cause with every energy they could command. Not only in the short run, in order to see that Britain gets a fair share of what is now scarce in the western world, but in the wider perspective of building a real North Atlantic community. Nato should be regarded as a great opportunity for constructive statesmanship. Mr Morrison should weigh very carefully the comparative advantages of an exclusive tête-à-tête with Washington against those of leading a western company of which the Atlantic Pact has made the Americans and the Canadians full members.

German Turning Points

MR MORRISON will shortly be leaving to spend a week-end in Germany, for which Mr Bevin unfortunately never found time. Soon afterwards, Mr McCloy, the American High Commissioner, will go to Washington to present to Congress the case for further American aid to Western Germany. And discussions are now in progress between the occupying powers and the German Government about the contractual obligations which are eventually to replace the Occupation Statute. Turning points in Germany are clearly approaching.

A year ago, it seemed a reasonable judgment that Western Germany was firmly on the road to recovery, despite the "crises" which could no doubt be expected to occur and which the Germans could be relied upon to exaggerate. It was possible to feel some confidence that at least the free two-thirds of Germany would be firmly won for the West in the course of time; that its standards of living would continue to rise; and that the occupying powers of the West would be willing gradually to accept Western Germany as an equal partner in the western world and restore its freedom to exercise its own sovereignty, subject only to the two prohibitions that it must not manufacture arms or restore a dictatorship. Korea and its aftermath have brought a sharp change. Materially, the rapid rise in commodity prices has transformed the outlook for the German economy; and the public psychology has reacted no less decisively to the discovery that German manpower and German industries were needed for the defence of Western Europe against Russia. The period during which the Germans were prepared even grudgingly to accept orders from the occupying powers has been brought abruptly to an end. The German economy, which for a time prospered without plans because of the Germans' immense capacity for hard work and their returning confidence in the future, has been shown to have very weak foundations.

It is, perhaps, salutary to recall the immense handicaps under which Western Germany labours. They consist of the artificial division of the country down the middle, the influx of over 9 million refugees, the drastic

reduction of liquid capital brought about by inflation, the enormous destruction wrought by warfare and dismantlement, the seizure of patents and assets abroad, and the imposition of a decentralised and deliberately weak government. It is a formidable list. Yet these material disadvantages are, perhaps in the long run, less severe than their psychological counterparts—hysteria; a tendency to panic; a lack of any firm confidence in money, which the present generation has twice seen lose all its value; an absence of civic responsibility, manifested in tax evasion and corruption; a pervading mood of cynicism, resentment and selfish materialism.

When this is the background, it is small wonder that the foreground, as it shows itself in the policies of the Federal Government, is unsatisfactory. It is now very easy to see the weaknesses of the decentralised system which was imposed on the country by the Americans, the French and the Christian-Democrat Germans, against the protests of the British Government and the German Socialists. Germany has to meet the exigencies of the post-Korean economic situation with a Federal Government which is flouted by individualistic *Land* authorities, with a central bank whose anti-inflationary decisions are interpreted by *Land* banks and *Land* Ministers of Finance according to their local interests. Despite its unplanned and uncontrolled economy, Western Germany is, perhaps, the most over-governed country in the world. With a population of 47½ million, it has eighty ministries; over them are the High Commissions of three different powers. Latterly, a committee of the OEEC has also taken a hand in directing the German economy. It is small wonder that the German citizen, surrounded by this multiplicity of many-voiced authorities, in an occupied, dismembered state which does not command his allegiance or respect, goes his own way on the principle of *saute qui peut*, and the devil take the hindmost. His only loyalties are to himself, to his family and—fortunately for the German economy—to his place of work. In the little Rhineland resort which so hopelessly tries to play the part of a capital city, the Federal

Government ministries and experts half-heartedly sketch out plan after plan for meeting the demands of the High Commission and the OEEC, only to drop them as soon as a rival Minister or a pressure group complains. Lacking a trained democratic civil service, Ministers are forced to rely on inefficient newcomers or, increasingly, on men who have been corrupted by the Nazi system of government by Gauleiter.

Moreover, there is a real doubt whether measures which can be taken in more securely established states would be effective in Germany. Dr Erhard, the Minister of Economics, is sure that it would be dangerous to reintroduce rationing and government "control" of raw materials. The first licence, or ration document, he maintains, would bring back overnight the appalling conditions that prevailed before the Deutschmark was established and controls abolished. He is undoubtedly exaggerating; but those who do not know the psychology of the present-day German should hesitate before they dismiss this line of argument. Rationing may, in strict logic, be a means of avoiding inflation; but in the German mind ration cards are associated with the terrible experience of inflation that has been suffered after two world wars. It would not be difficult to bring about a loss of confidence in the mark, and if it happened, there would be a disastrous fall in output as men simply stopped working. Then, as before June, 1948, no amount of government controls could save the economy. Dr Erhard is, therefore, playing for time, hoping against hope that the world prices of raw materials will drop sufficiently for him to satisfy the trade unions that the cost of living has been stabilised. In the meantime, such controls as exist are exercised by industrialists for their own benefit.

The Federal Minister of Finance, Dr Schaeffer, is in much the same dilemma as his political rival, Dr Erhard. The occupying powers have presented an estimate of occupation costs for 1951-52 for DM6.6 billion or some 6 per cent of the rapidly rising national income. Neither the Government nor the *Bundestag* intends to accept this demand, which is, indeed, probably more than could in practice be spent in a year. But so long as the demand exists, there is little incentive for minor budgetary economies elsewhere and the *Bundestag* has, in fact, been busy passing or preparing a number of measures for increased relief to its own citizens, twelve million of whom are already drawing state aid. Federal Germany has still no budget for the year which began last April and faces the prospect of a deficit amounting to several billions of marks. Dr Schaeffer's modest new taxes have not yet been introduced, no reduction has been made in the over-generous allowances to industry for depreciation and expenses, and the central bank's attempt to reduce and control the flood of bank credit has been very limited in effect.

★

In these circumstances, it is far easier to see what Germany needs than to see how the necessary actions are to be put in hand. The two great problems are raw materials and capital. Despite Dr Erhard's fears, some system of controlling the use of scarce materials is obviously necessary. It is, for example, quite wrong that, while in America cobalt is forbidden to the television industry, it should still be bought, with American money, by German luxury industry. A means of allocating raw materials without driving the public to panic will

have to be found. This would be the easier if it were possible to secure an increase in the total supply of materials available. This is, of course, every country's claim, but there are one or two points special to Germany that deserve mention. Foreign intervention has led to a forcing of German coal exports to the point of shortage at home, and, by recommendation of EPU, to a cutting down of imports. The behaviour of the Germans themselves has been largely responsible for the crisis in EPU, but it should be remembered that a country the size of Britain is still operating virtually without any reserves at all and that for Germany, above all other countries, there is no salvation in restriction. It is a truism—for all the British reluctance to accept it—that only by exporting more can Germany hope to live.

For reasons very similar to those that call for control of raw materials, there is also need for control of capital investment. It is generally recognised that capital must be directed into the basic industries if German industry is to take advantage of the recent relaxation of Allied restrictions, and benefit from western rearmament by recapturing export markets. German concerns have hitherto financed their own reconstruction to an astonishing extent. But much more is now needed, and the Germans agree with the OEEC that investment must now be directed—though not by the State. The Federation of Industries has rejected various plans which would have placed this power in the hands of officials, and has put up a scheme of its own to avoid such a development. But in this field, too, nothing practical has yet been done.

★

It is, in fact, the political means to do the necessary that are not in sight and some impatience among the occupying powers is not unnatural. Just what the western powers can and will do is quite extraordinarily hard to say. But three guiding lines may perhaps be indicated. First, the time is past when the Germans will obey orders against their will. The most that can now be done is to give them a lead in a direction where their self-interest is apparent. In short, relations between Germany and the western powers are already those between sovereign states; they rest upon negotiation and bargaining leading to a freely accepted agreement. Secondly, it must be taken into account that the German attitude towards defence must necessarily be different from that of the other western nations; though the reluctance is no doubt exaggerated for bargaining reasons, it is genuine enough in essence.

The third and most important point follows from these two. Because the Germans are now effectively in command of their own affairs, and because their experiences and their outlook are basically different from those of other western peoples, it is no good wishing upon them policies that are mere copies of those that have been found effective in America or in Britain. One of the greatest dangers at the moment is the tendency which is found among some Americans to believe that the Germans should be good and to order them to be so. It must be realised that the American conception of "good" has changed bewilderingly since 1945. The Germans may some day understand that its fundamentals remain untouched, and that faith in individual liberty remains at the base of American policy; but all they see now is that they have been told to disarm and to rearm, to destroy their strategic industries and to rebuild

them, to free their economy and to control it, to liberalise their foreign trade and to restrict it, to deflate credit and not to shrink from a degree of inflation for the purpose of defence. If they grasp at all that the changed world situation is the cause of this confusion, their short memories lead them to conclude that President Roosevelt is to blame for handing so much of Europe to Stalin at Yalta.

A clue to the best way of handling the Germans may perhaps be found in the Schuman Plan. It is undeniable that the French have been the most relentless of Germany's western victors, and at the same time enjoy the best relations with them. One reason is that they are

the only western nation which has managed to catch the German imagination—a potent force which the British underestimate. The German attitude towards the Plan makes the sole existing breach in a wall of cynicism, bewilderment, egoism and hostility. It offers them solace to national pride, despite the thorny question of the Saar; it gives them food to appease their hunger for a European order and chances of future material benefits in exchange for some present sacrifices. Moreover, it will not, they feel, drag them into a devastating war with Russia. In short, the Schuman Plan provides a pattern for the sort of policy which might win Germany for the west without permitting it to dominate its neighbours.

A Sporting Nation?

THE British, it has often been said—not least by friendly foreign observers—are a sporting nation. Yet anyone who takes the trouble to pry into the facts of the nation's sporting life might well begin to doubt whether the reputation is deserved. There is, indeed, in this country a great interest in sport; the national psychology is deeply impregnated with the *mores* of the playing fields. But to be a sporting nation surely implies a high degree of active participation in sport. How high this degree is in present-day Britain is a subject on which it is difficult to dogmatise. Compared with the mass of statistics concerning wages, hours of work, expenditure on food and clothing, relatively little is known about leisure habits, and few social investigators have turned their attention to sport.

It is possible, however, by piecing together information from various sources, to see the main pattern of this part of the nation's social life. It would be pleasant to be able to quote statistics on the numerical ratio between spectators and players, but unfortunately all that can be said is that the results of several postwar social surveys seem to show that among the active age-groups of the population approximately twice as many confine themselves to watching as actually take part in any form of sport—and one may guess that the two who only watch do so much more often than the one who sometimes plays. Certainly the crowded arenas and stands at important sporting events are filled to a considerable extent with "armchair" critics of form—if tightly packed crowds of standing spectators can be so described.

A little more light can be shed on the relative popularity of sport and other entertainments. With the help of figures given by a number of sporting organisations it is possible to build up fairly complete estimates of attendances. Figures of the receipts of entertainment duty, published by the Commissioners of Customs and Excise, have been used to calculate total public expenditure on admission to entertainments and sporting events, and allowance has been made for tickets sold at prices below the minimum on which tax is payable, and for expenditure on entertainments which for various reasons are exempt from duty. The figures, which are given in Table I, refer to 1949, which is the latest full year for which detailed tax returns are available.

In round figures, there are 140 million attendances of paying spectators each year at football, cricket, boxing

matches and other games; about 50 million at race meetings of all kinds; and over 1,600 million at cinemas, theatres and all other entertainments, including amateur shows, of which the cinema accounts for 1,400 million. It is true that cinemas and theatres are open every evening, often with more than one showing, while opportunities of playing or watching games are largely restricted to the week-end. Nevertheless, it does not exactly correspond with the picture of a sporting nation to find that for every one who ever plays a game there are two content to sit and watch, while another twenty go to the cinema.

	Total Attendances (millions)	Total Expenditure on Admission (£ million)
Football.....	110	8.5
Cricket.....	5	0.45
Greyhound racing.....	33	3.8
Horse racing.....	6	3.7
Speedway.....	12	1.25
All other sports.....	25	2.5
TOTAL SPORT.....	191	20.2
Cinema.....	1,400	103
Theatre and all other entertainments (250±50).....		35

Note.—The rising cost of living and bad weather caused attendances and receipts for most sports to fall in 1950.

If money spent instead of numbers attending is considered, it is possible to include an estimate for the net national expenditure on gambling on sport—though that is a reinforcement of dubious value for the thesis of a sporting nation. Rough estimates give a total expenditure per head of the population in 1949 of slightly under 8s. for watching sporting events—almost half of which goes on tickets for race meetings; of £2 on cinema-going and of 25s. spent—that is to say, lost, for the total turnover is far higher—on betting. These amounts compare with £10 per head spent on beer and over £15 on tobacco.

It is clear from these figures that there is more entertainment than sport, and that, within sport, spectatorship is far more widespread than sportsmanship. How this came about is an interesting historical speculation. Possibly the picture of an older, happier rural England in which everybody joined in games on the village green is a pure fable, and that the workers whom the nineteenth

century cooped up in crowded industrial towns were not, in respect of opportunities to play games, being deprived of anything their rural ancestors had ever effectively enjoyed. Indeed, it may be that the opposite thesis is true—that it was only the emergence of endowed leisure (in the shape of Saturday afternoon off), which is one of the by-products of industrialism, that made organised and regular sport possible. Be that as it may, in football at least, semi-professional teams playing fixtures in competitions and abiding by a national code of rules began to make their appearance in the second half of the nineteenth century.

The connection between spectatorism and professionalism is not an inevitable one. Indeed, the organisation of sport as a public spectacle presents a bewildering variety of combinations of the amateur and professional elements. Some games, such as hockey, have no professionals at all. Others, such as rugby football, preserve a rigid distinction between the amateur and professional games. In Association football and cricket, amateurs and professionals play in the same teams, but the amateur has almost entirely disappeared from first-class soccer and he is fighting a losing battle in first-class cricket. Yet year by year the biggest crowd of all in London is drawn to a sporting contest that is wholly amateur and free, the University boat race.

Nevertheless there is an inevitable and a growing tendency for spectator sports to become more professional. To play a regular programme of matches, especially if travelling is involved, requires at least a nucleus of professionals. But when the wages of professionals have to be paid, it is necessary to have a good "gate," and to have it often—which, in turn, means a higher proportion of men who can give their whole time to the game. To sustain the "gate," it is necessary to win matches. A recent survey by PEP—significantly entitled "The Football Industry"—clearly indicated the importance to a club's financial stability, and even to the prosperity of the local town, of a high and attractive standard of play in order to maintain the level of attendances. That means expenditure on training, daily practice and the "purchase" of star performers. Sport, by this stage, has come close to being big business.

But, it will be objected, race meetings and sporting events that people will pay to see are only a small part of sport in the aggregate. While a round thousand or so professional footballers draw the crowds to league matches every Saturday for two-thirds of the year, there are probably half a million others playing the game for its own sake. And then there is the great volume of private, or non-team, sports such as golf and tennis. It is these things, surely, not the spectator events, that make Britain a sporting nation.

It may be that a higher proportion of the British population play games, for its own amusement, than of most (though hardly of all) other nations. But the proportion is still very small. To begin with, the "private" sports, golf and tennis, do not greatly affect the mass of the people; they are still, broadly speaking, the preserve of the relatively well to do (except for golf in some parts of Scotland). The volume of team sports that can be played is, of course, a function of the playing fields available. There are four main categories of play-

ing fields. First are those maintained by schools—and this article has tacitly set aside the question of sport in schools; generally speaking school playing fields are not available to other players. Second are the playing fields owned by clubs of all kinds, which are not many in the aggregate, if only because the cost of maintenance imposes such a burden on the members—whether directly in subscriptions or indirectly by such means as bar profits—that only those with a margin of income can afford to join. Third are the playing fields provided by employers; this practice (usually coupled with a subsidy for running expenses) is on the increase, but only the large firm can afford it and it does not affect more than a small proportion of the working population.

★

For the great mass of the people who want to play games, the chief recourse is to playing fields provided by, or under the control of, the local authorities, and for this largest constituent of the total it is possible to give some figures. A survey was recently conducted by the National Playing Fields Association and replies were received from local authorities with a total population of 24 million. Some of the results of this survey are shown in Table 2.

TABLE II
PLAYING FACILITIES IN CITIES AND TOWNS WITH POPULATIONS OF OVER 15,000

Type of Playing Facility	Approx. Number of Population per Pitch, Court or Green
Association football.....	6,350
Rugby football.....	75,000
Cricket.....	12,000
Hockey.....	45,500
Tennis (grass).....	9,300
Tennis (hard).....	4,900
Bowls.....	12,500
Running tracks.....	410,000

Cricket and football are best served, but it appears that only two or three in every 1,000 of the urban population of Britain can hope to play football or cricket on a public pitch any Saturday afternoon. Potential players, even if they are confined to the age groups 15 to 35 and entirely exclude women, number about 145 out of every 1,000 of the population, so that a nation of sportsmen could, at best, only play once a year each. But League association football clubs can accommodate one in fifty and cinemas one in ten of the population at any given time.

International comparisons of the availabilities of playing fields are almost impossible to make. It so happens that one of the few available sets of comparative figures relates to the branch of sport that is worst provided for in this country—athletics. In England and Wales, with a population of 44 million, there are only 29 public cinder tracks and 37 private ones. Outside London and the Home Counties there are only 8 public tracks. Sweden with a population of 7,000,000 has 800 public cinder tracks, and Finland has 500, one in every town.

This, no doubt, is a special case. Common observation would suggest that, in general, other countries have even fewer publicly available facilities for team games (though not perhaps for athletics or cycling) than Britain. The Englishman can perhaps claim to be less fully deprived of the possibility of playing games than anyone else. But whether that makes the British a sporting nation must remain a very doubtful matter indeed.

NOTES OF THE WEEK

British Note to Persia

There has been considerable delay in the delivery of the new British Note to Persia and the original stiff draft will be modified in consultation with the United States before presentation to Dr Mossadegh or one of his ministers. This change of tone on the part of the British government coincides with much closer contact between Washington and London on the Persian oil issue than has prevailed hitherto. In short, the Americans have counselled moderation and have been listened to. To what extent they have in return assumed any responsibility for the consequences of "moderation" is much less certain—and is causing some anxiety in London. Mr Acheson, at his press conference on Wednesday, was studiously neutral. But this may have been for public effect, and he did at least make it clear that the American government would not countenance the sending of American technicians to replace British.

The new contacts between Britain and the United States are the only hopeful factor in the situation. In Teheran, security is being precariously maintained since the Prime Minister barricaded himself in the Parliament building, after his quarrel with the fanatical Moslem organisation, Fedayan Islam, whose gunmen lurk around every corner in the Persian capital. This religious terrorist organisation claims that they helped Mossadegh to power and have not received their due reward in full representation on the Petroleum Commission of eleven men appointed "to take over the effects of the late Company." Thus the two right-wing parties are on the point of fighting one another in the streets of the capital while the intentions of the Communist Tudeh party are unknown but menacing and the moderate intelligent Persians are, perhaps wisely, remaining indoors. The problems facing the British Government have greatly increased since Dr Mossadegh sought asylum in the Majlis and it is difficult to see, even if the Persians are willing to negotiate, who could undertake this. It is a grim situation in which the only hope appears to be in delay and the continued maintenance of such law and order as still exists in Teheran.

* * *

Britain and China

During the past few days the British have made three moves to meet the American Administration's point of view on China. On Friday of last week they put a full ban on the shipment of rubber to China, and in the House of Commons Mr Morrison deliberately introduced into his Far Eastern policy speech a statement that "it would be premature to discuss the future of Formosa" until a settlement is reached in Korea. Then, on Monday, in the Additional Measures Committee of the United Nations, Britain consented after weeks of doubt to vote for an American resolution putting an embargo on the shipment of arms and war materials to China. In all three respects the British argue that their action represents a shift in emphasis rather than a change of policy. Rubber shipments had already been restricted, the British point of view had long been that Formosa should form part of a general settlement in the Far East, and there has in fact been a ban on British supplies of war equipment to China since last year. What has happened is that the British Government has now given positive and public expression to attitudes which had previously been rather negative and private.

Unfortunately, while the British have thus been made to budge a little there is still no real alignment between their view and the American. Each Government remains suspicious of the other. Washington thinks the British con-

cessions were made under pressure and denote no real change of heart—which is true enough in that London is still unwilling to do anything that would provoke an extension of the war in the Far East. London is still doubtful where Washington's policy will stand when the dust of the MacArthur incident settles—though the testimony of Generals Marshall and Bradley ought to be sufficiently reassuring about the intentions of the Administration, and it does not seem likely that the opposition will be able to force a major change, though minor concessions will be necessary. So the gap, though it has been narrowed, still remains. Yet if suspicion could be allayed, and if the gloss that each government thinks it necessary to put on its policy for the conciliation of its domestic critics could be removed, it would be found that there is very little real difference between the positions at which the two governments have arrived in the light of events. It would be well worth while making an effort at the highest level to see how much real agreement could be achieved.

Meanwhile, there are two aspects of the problem which need thinking out now. Britain still runs the risk of undoing some of the good done in America this week if it continues to back Communist China for Uno membership; whatever the legalistic arguments, another statement, following Mr Morrison's on Formosa, should now be made putting Britain's support of China's candidature into cold storage. Sir Gladwyn Jebb appeared to do this in a speech in New York this week, but confirmation from London would be welcome. Lastly, having taken the plunge on a public United Nations embargo of arms shipments to China, Britain should do its utmost to ensure that it keeps in step with Washington over the almost inevitable consideration of further measures to be applied. For the cry will assuredly go up sooner or later for a complete suspension of trade with China and then a naval blockade to enforce the suspension—and that will certainly create a new risk of war with Soviet Russia. The best way to prevent this is to work in the closest partnership with the United States that can be contrived.

* * *

Washington Speaks

General Bradley's courteous but firm refusal to divulge the details of confidential discussions between himself and the President has led the US Senate Committee inquiring into General MacArthur's dismissal to suspend its cross-examination until Monday. While the Committee makes up its mind how far it should go in taking risks with the safety of the United States and its allies, the public—and this includes the Kremlin—has an opportunity to digest the testimony so far given.

For Europeans perhaps the most interesting aspect of the hearings is the way in which the Administration has been forced by General MacArthur's challenge to enunciate, haltingly but fully, its own fundamental policy in waging the cold war. As the Administration sees it, the fighting in Korea is merely another but somewhat fiercer instalment of Washington's post-1947 tactics of meeting Russian "guerrilla diplomacy" by what might be called pugnacious stonewalling. It was by similar tactics that the Kremlin was induced to hold its hand both in Greece and in Berlin. This is a policy which the Joint Chiefs of Staff have pursued for two reasons—because they are anxious to avoid a world war and because they do not feel prepared for one.

The second principle of American policy which emerges from the debate is that Russia must be regarded as the heart, brains and sinews of the enemy and that if an open conflict

is forced upon the west, then the bulk of its resources must be launched against that target. Getting embroiled in an all-out struggle with Communist China would, as General Bradley vividly put it, "involve us in the wrong war at the wrong place at the wrong time and with the wrong enemy." A third point is the clear recognition by the Defence as well as the State Department that the United States needs the full support of its allies in Europe and is prepared to give a high priority to the views and vulnerabilities of these partners. Neither General Marshall nor General Bradley has shown any patience with General MacArthur's neo-isolationist thesis that, if the European allies are reluctant to swallow his recipe, the United States should go it alone.

So far in the testimony offered by members of the Administration observers will note two omissions. On the one hand, apart from a passing reference by General Bradley, there has been no clear-cut refutation of General MacArthur's accusation that the European powers have to date provided only token forces in fighting the Chinese Communists. In fact, the number of British Commonwealth and French troops bearing arms throughout the Far East—in Malaya, Hong Kong and Indo-China—is roughly equivalent to the 200,000 American troops engaged on the Korean front. The second omission lies in the absence of any precise statement from the Administration of what it would regard as a satisfactory outcome of the Korean incident. Would it take the line that the military commitments of the United Nations were ended if there were no longer any threat of a further incursion south of the 38th parallel? And if so, how would the American Government deal with the inevitable outcry from General MacArthur's supporters that American lives had been wasted on something less than victory?

* * *

Preferences After Torquay

The results of the Torquay Conference (summarised in a Business Note in *The Economist* last week) are manifestly unsatisfactory to the unbending upholders of imperial preference; they are even more so to those who regard Britain's often-repeated pledge of liberalisation as something more than a pious gesture made under duress. To the imperial autarkists the most disheartening feature is that the whole impetus for reduction has come from the dominions; notably (the unkindest cut of all) from Canada. The margins guaranteed under the Ottawa and other trade agreements—the so-called "contractual preferences"—could only be modified by mutual agreement; these, apart from very minor concessions in Australia and New Zealand, remain intact. The preferences which have been reduced are mostly "non-contractual," part of the "normal structure and operation" of each dominion's tariff, and so modified as the dominion concerned thinks fit. Contractual rights as between Britain and Canada were mutually waived in 1947; and at Torquay Canada profited by this freedom of action to achieve, alone among the dominions, a new trade agreement with the United States.

Yet even if this Canadian defection is taken into account, the edifice of imperial preference was not greatly damaged at Torquay; only 2 per cent of Britain's export trade to the Commonwealth suffers a loss or narrowing of its fiscal advantage. Britain and the dominions other than Canada stood pat on their contractual rights; and the colonies, represented through the United Kingdom delegation, have perforce stood pat too.

Here is, indeed, what may prove the most regrettable feature of Torquay's meagre harvest. The discreet language of the White Paper conceals any divergence of views between London and the various colonial governments. "No concessions," it states, "were offered on colonial tariffs and consequently there were no changes in colonial tariffs." The reader is left to guess by whom, and to whom, concessions might have been (but were not) offered, who was responsible

for striking the complex balance between the conflicting interests of colonial exporters and consumers; of individual colonies, the United Kingdom, and the Commonwealth as a whole; of Commonwealth solidarity and freer world trade; and for deciding that "No Change" was everywhere the best policy. Co-ordination is doubtless necessary. The precarious equilibrium of the sterling area still supplies cogent argument for caution. But the older argument for a sacrosanct preferential system, the argument based on imperial unity, is growing more and more two-edged as colonial self-consciousness increases. Decisions taken over the colonies' heads must not only in fact be in their interest, but must also appear to be so if they are not to lead to trouble.

* * *

Weights and Measures

There is a strong case for a gradual transition to the metric system as recommended last week by the Committee on Weights and Measures Legislation.* Not only does the imperial system put undue strain on powers of memory and calculation but it is not really a system at all. It is a conglomeration of units linked together to form a rough whole; no internationally recognised body, comparable to the International Metric Conference, is responsible for it; and it is not even uniform in the countries which use it. The United States has its own ideas about the ton and the gallon, and defines its yard and pound in terms of the metre and kilogramme—with resulting minute discrepancies which could be important in the precision manufacture of to-day.

A change from the present weights and measures to the metric system would certainly involve great dislocation and confusion, even if, as the committee proposes, it were to take place in concert with the United States and the Commonwealth over a period of twenty years, the Governments setting the timetable trade by trade. It would be very costly, for industry would have to supply itself, not only with measuring equipment but with tools, gauges and so on, to make metric sizes; and during the period of transition it would create a certain competitive disadvantage. The greater part of the evidence taken by the Committee favoured the existing law, whereby, since 1897, both imperial and metric systems have been legal. (It is noteworthy that the use of the metric system has made very little progress since then.)

The President of the Board of Trade has shown less courage than the committee. He has not accepted the proposal even in principle, but he has promised to seek the views of the United States and Commonwealth. He was unnecessarily reserved, too, about the proposal that the Commonwealth yard and pound should be made strictly identical with the American by basing them on the metre and kilogramme, the international prototypes of which are more precisely defined than those of the imperial yard and pound. Sir Hartley saw no objection to most of the other recommendations. This implies, among other things, that the size of "a nip" may soon be no longer left to the publican's discretion; that it will become an offence to give short measure in things beside food, coal, coke, sand and ballast—the only ones at present covered by weights and measures legislation; and that in five years or so the schools will be able to celebrate the disappearance of apothecaries' troy and penny weights, as well as of that bunch of aliases almost unknown outside arithmetic books, the rod, pole or perch.

It remains for another official committee to recommend the decimalisation of the currency, which the Committee on Weights and Measures suggests should precede the transfer to the metric system, and which could probably be done with very much less disturbance than is commonly supposed.

Full Employment at Strasbourg

The report on full employment presented to the recent session of the Council of Europe at Strasbourg deserves more attention than it has yet received. It could be described as a continuation of the report presented to the United Nations by a group of experts in December, 1949, since it was a declared attempt to apply the principles there enunciated to the more compact European economy. There was some continuity of authorship in Mr Nicholas Kaldor; indeed, the new report, like the old, is definitely on the left in its presuppositions, and it will serve as useful evidence of the development of views among the more moderate socialists of this and other countries (Mr Anthony Crosland, MP, was another of the authors) on the central economic problem of the present age. The new report embodies several distinct advances on the old. There is an effort now to recognise the existence of other causes of mass unemployment as well as the lack of effective monetary demand on which the Keynesians concentrate—though these other causes, once mentioned, are rather waved away. An equal emphasis is now laid, as is only proper, on the risk of inflation and of deflation, and there is at least an attempt to meet the criticism that full employment plus free collective bargaining equals constant inflation (the answer is the rather unhelpful one that free collective bargaining must go).

These are considerable gains; there is an honest endeavour to reconcile the needs of Keynesian theory with the hard facts of political reality. But the new report still leaves the reader who wishes to be a realist as well as an idealist in the dilemma in which the original Uno report of eighteen months ago placed him. On the one hand, far too little thought has been given by governments to how they are to discharge the obligation to maintain full employment that they have all assumed, and it is right and proper that lively minds should be directed to the problem and should point out to governments the way they must go.

*

But on the other hand one cannot help feeling that these confident prescriptions of exactly what should be done and of exactly what will result from doing it are suffused with a degree of optimism that almost amounts to credulity. This appears both in the diagnosis of the problem and in the measures that are suggested to meet it. The Strasbourg report, for example, accepts apparently without question, the view that governments can control the level of employment if they make up their minds to do so. This is based on the belief that "since the war a number of European countries have kept (our italics) unemployment at negligible levels." But they have done nothing of the kind; unemployment has been kept at negligible levels for them by the long continuance of the world wide postwar inflation. Such positive measures as, for example, the British Government has taken have almost all been on the side of restraining this inflation, and there has really been no experience at all to show whether or not a democratic government can, by the new techniques, keep unemployment low when the economic weather turns unfavourable to the attempt. Or again, the report asserts that, while "the complete elimination of unemployment could only be achieved at the cost of creating considerable inflationary pressure," there is no danger in pushing unemployment as low as 2 or 3 per cent. How do they know? It is simply not true to say that there is "no evidence" of the dangers of such high level employment; what the authors mean is that they do not want to accept the evidence.

The same optimism appears in the prescriptions for action. The policy outlined assumes that governments can and will take prompt and effective action when economists—who themselves are assumed to be able to make precise and uncontested diagnoses—tell them to. It assumes that trade unions in democratic countries will accept a "national wages policy." It assumes that governments will accept the judicial

findings of bodies like EPU. It might be a useful test to ask Mr Crosland, who is an honest man, how many of the things the report says governments should do he can really see the Labour Government doing.

Granted that the problem of stabilising employment has got to be solved, does it do good or harm to tell the public that it is nearer to solution than there is, as yet, any warrant for believing? Granted that nobody yet knows whether governments can by any means discharge the obligations they have already accepted, is it right or wrong to invite them to commit themselves to precise methods?

Staff Talks in Singapore

This week at a staff conference in Singapore senior British, French and American officers have been discussing the technical aspects of South East Asian defence. The main initiative for this conference came from the French, who have long wanted to know how they would stand if the Chinese invaded Vietnam in force. The meeting has had no power to take decisions which are bound by their nature to be largely political, but it has certainly helped to clear the air on a technical level and was indeed overdue. Although for the last two years intermittent defence talks have taken place between the British and French, they have not been on as high a level nor as comprehensive as those this week, and the Americans have never previously been present except as observers. For this conference the French High Commissioner and Commander-in-Chief in Indo-China, General de Lattre de Tassigny, and the commander of the American First Fleet, Admiral Struble—from Hawaii—flew down to Singapore with a small staff of advisers. The Australians and New Zealanders also sent observers.

The two most pressing problems before the conference were the possibilities of co-ordinated action between the three powers if either Indo-China or Siam were to be invaded by the Chinese. Of these the more immediate though not necessarily the most serious was Indo-China. There, the present situation is that General de Lattre has consolidated his victory of last January, when he smashed the Vietminh's all-out drive to capture Hanoi, by beating off their second offensive in March and April. The rainy season, usually a period of stalemate lasting till October, is now beginning, and the Vietminh have acknowledged temporary defeat by issuing orders to abandon mass attacks in favour of guerrilla warfare.

The ultimate chances of a Chinese "volunteer" invasion must be reckoned about even, so long as Peking continues in its present course of blind hostility to the whole non-Communist world. As yet, however, although a force of several thousand Chinese is reliably reported to have crossed the frontier into Indo-China already, there is no immediate sign that the main army in Kwangsi and Yunnan, numbering perhaps 300,000 men, is about to march. General de Lattre can probably now handle the present forces opposing him. But he is holding a front of vital concern to everyone interested in the future of South East Asia, and if Indo-China is openly invaded it would be a serious mistake for Britain and America not to send troops and aircraft to his assistance; inaction would undo much of what has been achieved in Korea. The staff talks in Singapore should have seen to the technical problems and possibilities. It is now up to the governments concerned to prepare public opinion for the facts.

* * *

The Position of Siam

In Siam an impressive façade stands on crumbly foundations. The Prime Minister, Marshal Pibul Songgram, has chosen to base his foreign policy on the United Nations instead of adopting the traditional Siamese custom of playing off one great power against another. This is a courageous

action and one that has so far paid dividends. It has gained American military and economic aid and earned for Siam a good deal of international kudos. In recent months, one after another of the United Nations' subsidiary organisations has set up its eastern headquarters in Bangkok. This has meant an inflow of permanent tourists spending foreign currency, particularly dollars, and, since many of the people of Bangkok regard the United Nations and the United States as much the same thing, has helped to engender a feeling of security.

Although in Bangkok itself there is much talk of Siam being a bastion of democracy in South East Asia, no one outside the country sees Marshal Pibul's rule as anything but a dictatorship—benevolent or repressive according to the point of view. He came to power by a *coup d'état* in November, 1947, and has beaten off several subsequent attempts to unseat him by similar means. For the time being he has committed his own political prestige to alignment with the western powers; in return American military aid serves both to prepare Siam to some extent against minor external aggression and to strengthen the army and police on which the present regime depends.

How far this brittle political framework would stand up to the jolt of a serious change for the worse in the campaign against the Communists in neighbouring Vietnam, is hard to say. Siam is going through a period of great prosperity and a new moneyed class is growing up with a vested political interest in the present form of military government. But there is still a strong opposition group, sympathising with the former leftist ruler, Pridi Panamyong, who was last heard of in Canton and making Communist friends. The western defence chiefs in Singapore will have been bound to consider what action to take if Siam collapses; the safety of Malaya depends, for one thing, on holding the Kra isthmus at a narrow, defensible point with good lateral communications, which in war might mean moving up to 300 miles into a hostile Siam. For the present, however, the defence of Siam itself is a primary interest of the anti-Communist powers, and to achieve it requires the closest and most friendly political relations with the present sympathetic government in Bangkok.

* * *

Greece and Turkey for Nato?

After more than six months of hesitation, the western powers are at last making up their minds what formal protection they will afford to Greece and Turkey. The odds now are that they will be included, as full partners, in the Atlantic Pact. The delay has done great harm, and it should have been avoided, but it can be urged in extenuation that the two issues mainly involved are both very complex and difficult. First, should Greece and Turkey be given any more formal guarantees than they now enjoy? And secondly, if so, by what means?

On the first issue, the negative arguments are that it is foolish to add new commitments when the existing ones are already a burden, and that to bring the American-led alliance so closely under the soft under-belly of Soviet Russia would be dangerously provocative. But to these doubts it can be answered that there is already a commitment arising out of the facts of geography and strategy. The western powers could not, in fact, afford to let Greece and Turkey fall under Russian domination if they could possibly prevent it, so vital is the place they occupy on the map. If a commitment already in fact exists, no new burden is added by admitting it. As for the risk of provocation, that had to be taken, and has been taken, long ago. Western policy is based on building up enough strength to deter Russian aggression. The whole policy runs the risk of provocation and to pursue it energetically does not add to the risks.

But if Greece and Turkey are to be brought into the western system, it still does not follow that membership of

Nato is the most appropriate means. For reasons that were discussed in *The Economist* of April 28th, neither country is an ideal candidate for this particular alliance. The Atlantic organisation, it can well be argued, is already carrying more than it can hope to deliver safely, in terms of organisation, planning and resources. To add further burdens, radically different in kind and outlook, may well break its back. Once the Atlantic concept has been made to embrace the eastern Mediterranean, there will be immediate pressure to extend it still further east and south, until the original design has been distorted beyond recognition.

The British and most of the other Western Europeans have held this view strongly. It now appears that they have been convinced, partly by American preferences (and it is the Americans who will have to provide the additional resources) and partly by the insistence of the Greeks and the Turks themselves. They have, after all, between 35 and 40 divisions to bargain with and Dr Yalchin, the Turkish Foreign Minister, has insisted (with the aid of well-timed reports of neutralism and disillusion in Turkey) that nothing short of full membership of Nato is going to persuade Ankara that it is worth running the undoubted risks of accepting American bomber bases in Anatolia, or of promising to fight if Soviet Russia attacks elsewhere in Europe.

Pensions in Nationalised Industry

The Acton Society Trust has done a public service in publishing a pamphlet* on the new contributory pension scheme for coalminers, for it raises an issue of great importance to the community as a whole. The authors of the pamphlet trace the history of the miners' demand for a pensions scheme, which is more than fifty years old, and

* "The Miner's Pension." 2s.

A Watching Brief

An Investor who keeps his money active is running a complex, one-man business. His time is limited, and he is largely dependant on professional advice for his business decisions. Obviously it would be better if he himself were in close touch with market events. Fortunately, this is possible. By daily reading of THE FINANCIAL TIMES, the investor can keep a watching brief on market values as they change.

Read

THE FINANCIAL TIMES

every day

even if you have to borrow a copy

show how deeprooted it is in the industry, especially in the areas which were particularly badly hit by the depression. Here the old miner's chances of supplementing his national old-age pension by part-time earnings, or of postponing his retirement and thereby earning a higher old-age pension, are very small.

Yet the case for a miners' pension scheme cannot be granted simply out of sympathy for the hard lot of a certain section of miners. As is pointed out in the pamphlet, these should be provided for by some special *ad hoc* measure, especially since most of the miners concerned, having been out of work for some years, would not be eligible for the new pension. What has to be decided is whether a special pensions scheme should be adopted in a nationalised industry and, if so, on what conditions. The taxpayer will, in the future, have to bear a large part of the cost of the old-age pension. Must he also undertake to contribute towards a special pension scheme for a limited section of the community? The workers in nationalised industry will argue that it would be unfair for them to be excluded from special pension schemes simply because they work for the state instead of for private employers. The postman and the policeman have pension schemes, and the miners have an additional grievance in that a pension scheme has already been introduced for non-manual workers in the coalmining industry. Further, the principle of a flat rate of national old-age pension was adopted in the Beveridge report, and consequently in the ensuing legislation, in order to provide a national minimum above which people could rise by voluntary or special occupational schemes.

In private industry, however, the directors have to justify a staff pension scheme to the shareholders. In nationalised industry, the danger is that the board concerned will, as with higher wages, merely pass on the cost to the consumer by raising prices—with a consequent increase in the cost of living, which will deflate the value of the national pension (and other social insurance benefits) still further. The Acton Society Trust's pamphlet does well to bring out the circumstances in which the decision to agree to a scheme for the miners was taken—after the miners' leaders had met the Prime Minister at a time of fuel crisis and as part of a bargain to increase the output of coal. In this at least steps should be taken to see that a precedent has not been set for other nationalised industries. No similar decision should be taken without full and public discussion.

A Cancer Centenary

The Royal Cancer Hospital and its research offspring, the Chester Beatty Institute, have been celebrating the hospital's centenary. It was founded in February, 1851, by William Marsden, a Yorkshireman, with an inborn passion for doctoring and the imagination of a reformer, who helped to revolutionise our hospitals by starting the Royal Free in 1828 and later the Cancer Hospital—also free.

Seventy-five years earlier the eighteenth-century surgeon, Pott, had declared that a disease which attacked chimney sweeps was not venereal disease, as was commonly believed, but a malignant tumour, "induced by a lodgment of soot," which called not for the physician's mercury, but for the surgeon's knife. This observation was probably the first hint of chemical substances inducing cancer; but it was not followed up, and even after the cellular nature of the disease was demonstrated by Virchow, the German pathologist, in 1858, the English public continued to suffer from a mass of superstitions. People believed that cancer was caused by eating meat—and tomatoes. They believed that it was caused by living in the Caterham Valley. They believed that secret cures were handed down in certain families, and they would travel hundreds of miles to obtain treatment. And though doctors could operate and denounce

quack remedies, they could bring little comfort to the frightened heart.

At the end of the nineteenth century cancer research in England was born again. The Cancer Hospital, with its long clinical experience, was then in a good position to play a leading part. In 1910 a research institute was started in close connection with the hospital, and since then cancer research has branched out in many directions—pathologists, radiologists, nuclear physicists, biochemists, protein chemists, physical chemists, virus experts and geneticists all contributing their special services.

*

For the ordinary man, however, one thing stands out—there is still no one "cure for cancer." He is thus inclined to think that all this research is barren; and it cannot be too often brought home to him that, as a result of research, there are scores of people living and in good health today, who were in cancer wards more than ten years ago. More publicity should be given to a form of research which anyone can understand—the statistical work done in the hospitals, which shows clearly how good are the chances of survival from many forms of cancer, provided that it is diagnosed at an early stage. The greatest ally of cancer is still the fear which restrains the patient from consulting a doctor in time. To use Pott's eighteenth-century phrase, the growth should never be allowed to "get its head," for once it has "got its head" the patient's hope of recovery is reduced by 60 to 75 per cent.

* * *

A Punctured Housing List

Last week, the London County Council examined its scheme for assessing the needs and priorities of applicants for council houses. The huge lists in every local authority area of families in urgent need of new houses have so often been cited, especially for political purposes, that it is salutary to look at the London County Council's new figures.

The council has in all some 200,000 applications for houses. Since 1945 it has built nearly 43,000 dwellings, and at this rate, the end of the housing list would not be reached for more than twenty years. In order to get its building programme into perspective the council has, belatedly enough, had the waiting list analysed and the applications put into three categories. In category A are the urgent cases, the most important factors determining urgency being overcrowding and ill-health. Category B covers cases "with some housing need, but not of an urgent character"; it includes families where an extra bedroom is needed to separate brother and sister.

Category C covers those families with little or no basic housing need, but requiring separate or improved facilities. The figures in each category are as follows:—

Category	Number of Families	Percentage of Total
A	62,343	31.3
B	56,645	28.4
C	80,323	40.3
	199,311	100.0

That 62,000 families are in urgent need of housing is bad enough, but it is manageable by comparison with 200,000. That 40 per cent of the London County Council's applicants should have no basic need for housing shows both how popular council houses are and how unreal arguments about housing needs can be, if they are based on such inflated lists of applicants. This unreality is enhanced by the fact that many applicants will have their names on the housing lists of the metropolitan boroughs where they live or work, so that many of those in category A are no doubt being given priority by some other authority as well.

It's the wise man who knows that if you take care of your shoes your clothes will take care of themselves.

LOTUS shoes are made for such, having an eye to the fine points of appearance. Their leather, their lines, their workmanship and multiple measurements provide each with the perfect fit.

LOTUS SHOES

FOR ALL MEN AND MOST OCCASIONS

MADE BY LOTUS
43/44 NEW BOND ST. W.1

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But... have you ever stopped to ask yourself...

"Who are Britain's Craftsmen?"

Introducing Billy Mann. Fifty-three years a 'hand sewn maker'. He produces a special type of light fashion shoe for ladies. One of the reasons why Footwear ranks high as a special item in the Export List.*

But... does craftsmanship mean only handicraftsmanship? The production of the fine grade leather used by the 'hand sewn maker' is also the work of craftsmen... although one may be

unable to spotlight one man or one part of the process. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for tanning play a vital part in the preparation of fine leathers used by the 'hand sewn maker'

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture

NORTH STAR Skyliners

A TRIP TO CANADA by one of Trans-Canada Air Lines' giant "North Star" Skyliners means more than speed — there's comfort and convenience aboard. You step inside your Skyliner at London or Prestwick. Then — you're away — relaxing as luxuriously as in your favourite chair. Roomy, pressurised cabins, hot meals, snacks and drinks to order, newspapers and magazines at your elbow — all are yours on this 4-engined 40-passenger "North Star" Skyliner. In less than a day you're in Montreal — on time. Swift Skyliner services link you with every important Canadian and U.S. city.

TRANS-CANADA Air Lines

Full information and reservations from your Travel Agent, or from 27, Pall Mall, S.W.1. Tel: WHitehall 0851. Scotland—Prestwick Airport, Ayrshire. Tel: Glasgow Central 3428 or Prestwick 7272, Extensions 268/269.

IT'S ONLY A DAY BY **TCA**

Tussle for German Coal

The International Authority for the Ruhr has opened its discussions on German coal exports for the third quarter of this year. According to the Economic Commission for Europe, the shortage of coal exports in Europe for the third quarter will amount to no less than ten million tons. The estimate may be over-high; but the quarter is normally one for stocking, and other factors, including a tendency to reconvert from oil to coal, have swelled the deficit. Under these circumstances, the pressure on the Ruhr is greater than ever. The German officials, however, have refused to supply the 6.2 million tons which are again demanded of them for the quarter, though the coal trade is anxious not to lose future markets. Regardless of the fact that Britain has huge obligations for Atlantic defence, while Germany has not, the Germans complain that there is unfair discrimination against them. Their raw materials adviser, Dr Friedrich, ignoring British exports outside of Europe, has stressed that Britain was only responsible for 7 per cent of total European coal exports during the first quarter of this year, while Germany contributed 49 per cent.

The Germans further complain that they were forced to reduce the export price of Ruhr coal before the boom began, and have not been allowed to take advantage of the present demand. The Poles have raised coal prices by 100 per cent, and the Germans maintain that they, too, could secure an extra DM20 million a month. They would, furthermore, like to reduce the quantity of coking coal which they export. The steel industry argues that it has only been able to keep up its production because of an ingenious private deal whereby American coking coal was bought (to the extent of 1.9 million tons over twelve months) in exchange for semi-finished steel products, at a coal-steel rate of exchange which left a profit for Germany.

The French are, as hitherto, among the most urgent claimants for German coking coal. They now are basing their demands on "the spirit of the Schuman Plan" as well as their needs. They propose, since German exports cannot satisfy all requirements, they should be confined to countries which have signed the Schuman Plan. If this suggestion were to be accepted, it would hit, among others, Sweden, from whom the German steel industry draws its high-grade iron ore. The Germans, for their part, are anxious that Sweden should be drawn into the Schuman Plan in order to safeguard their ore supplies.

For the countries outside the Plan, the French suggestion is an ominous indication of the possibility that the single market set up by it may develop into a closed market which could exert strong pressure on outsiders.

* * *

Disturbances in Grenada

All civilian airliners were commandeered last week by the Trinidad Government in order to send troops to Grenada, where a recurrence of February's disturbances was feared. The three weeks' strike at that time resulted in six cases of injury, damage of £195,000 to 80 estates, and a further £18,000 damage by arson. By April 30th, 81 persons had been convicted and 123 were awaiting trial. Threats that a further public demonstration would be staged during the trial of Eric Gairy, the strike leader, have now caused reinforcements of troops to be flown in.

To grasp the real nature of these sudden disastrous outbreaks of violence to which the West Indies are prone, is by no means easy. The islands are poor enough, and workers' conditions are often sufficiently bad to breed a continuous undertone of revolt which, with the spread of education and political consciousness, may flare up into trouble under any special provocation. But the provocation frequently comes, not from any particular "oppression," or any new burden or act of injustice, but from the personality of leaders striving for power. In Grenada, a new "leader," in the person of Eric Gairy, has emerged. He

is in the tradition of the extraordinary Uriah Butler of Trinidad, and the equally extraordinary Alexander Bustamante of Jamaica. Gairy dresses in top hat, white gloves and spats, black coat and striped trousers. He carries a cane and—like Butler—a Bible. Religious fervour is evoked and when the crowd tires of political speeches it sings hymns. Relatively to some of the other West Indian islands, Grenada is prosperous. Two trade unions have existed for many years and have negotiated peacefully with employers, but they have been losing their hold over the broad ranks of agricultural workers. Gairy, with his brand of revivalism, has mobilised the people throughout the countryside into a new union of his own, the Mental and Manual Workers' Union, and the essence of the struggle has been for the recognition of this union and the consolidation of Gairy's personal power.

When the first strike broke out, the Colonial Office immediately dispatched its Labour Adviser, who set up a Wages Council with the aim of bringing Gairy's union as well as the existing unions into discussion with the employers. Two separate agreements were signed, in all but identical terms, with the two sets of unions. This did not solve

any fundamental problems but could at least give things time to settle down. There is no industrial issue at all in the new outbreak of unrest, which is more of a demonstration of loyalty to Gairy. It is a difficult situation for the Colonial Office to handle—the usual recipes for colonial trouble, "political advance" or "economic development," provide no solution. A new constitution for Grenada is, in fact, already on the stocks, but political demands have played no part in the present upset. This type of malaise seems curiously bound up with the West Indian temperament, but it has sharp dangers for peoples on the threshold of responsible nationhood.

* * *

Titoism in the French Elections

During the past few months there have been suggestions that the breakaway movement in the French Communist party is as serious as that in Italy. It is too early to say that a genuine French Titoist party has been born. The group of dissident Communists in the CGT under M. Charles Lemoine and M. Darius Le Corre will, however, be of nuisance-value against the orthodox party in the elections next month. M. Le Corre has already been assaulted by Stalinists at a press conference, a treatment which will almost certainly be given to any of the several probable Titoist candidates in the election campaign. The emergence of these deviationists is, it is reported, considerably riling M. Auguste Lecoeur, leading light of the younger French Communists, whose special responsibility is the Communist network of northern France. It is possible that M. Thorez, the invalid Secretary-General, will be re-exported from Russia as a last minute filip to the floating Communist vote.

The long series of circumstantial "revelations" in *Humanité* of American military installations in France points to an intensification of the anti-war drive during the elections. The current Communist slogan is: "National independence: liberty, bread, peace." The Third Force will be attacked as the American Party, the Gaullists as Fascists, the MRP as Papists, and the Socialists as traitors to the working-class. A sharp increase in world tension would provide a favourable setting to the Communist electoral bid, which relies on a combination of international escapism and domestic economic discontent. With General de Gaulle in the field, the Stalinists are making—as they must—one final effort to stand as the patriotic party.

* * *

Where are the Eggs?

This year the so-called "spring flush" of eggs has been not much more than a trickle, at least in the big towns. The weather, of course, is held to blame. But if Buchan's cold spell has prevented hens from laying their full spring quota of eggs, it cannot be held responsible—even by Mr Webb—for the maldistribution of supplies throughout the country. At towns as far apart as Shrewsbury and Horsham grocers have had to cope with large supplies of home-produced eggs as well as allocations of imported eggs from the Ministry of Food, and to get rid of them customers were allowed to buy as many as they liked. Grocers in the cities had to be content with their allocations of two eggs per registered customer—although eggs seem plentiful enough in London restaurants.

A Government trading department has two main tasks. The first is to procure an adequate supply, and the second to see that the supply is distributed fairly either according to a scale of rations or according to demand. The Ministry of Food has failed lamentably in both tasks as far as eggs are concerned. Admittedly it is now trying to buy what eggs it can from overseas suppliers, whereas a few months ago it was turning down offers, even though these foreign producers could have sold their eggs to the British public at a price below the subsidised retail price. The Ministry of Food is at present paying Denmark only 2½d. an egg compared with 3½d. paid to British producers. The excuse that the unseasonable weather could not have been foreseen is in itself an admission that Government trading is too inflexible to adapt itself to changing conditions.

This is not the first time the Ministry has failed to secure an equal distribution of eggs throughout the country. Its allocation system may be technically efficient, but it has not prevented the appearance of a "grey market" for eggs nor has it prevented a glut in one place and a scarcity in another. Perhaps the Ministry will learn one day that a perishable food is handled more efficiently by private traders than by a Government department.

* * *

Cricket in the Lords

The House of Lords has now disposed of the Cheetham Cricket Club case. On August 9, 1947, a batsman on this Manchester ground achieved such perfection of timing and effort that his stroke drove the ball bowled to him practically 100 yards and lifted it so that it cleared the top of a fence, seventeen feet above the level of the pitch, placed no less than 78 yards from the crease. Unfortunately the ball, at the end of this remarkable flight, hit and injured a Miss Stone, who was standing in the road, outside her own house. She sued the club committee, lost her action at the trial, won in the Court of Appeal and has now suffered a final reverse in the House of Lords. In the meantime she has, unwittingly, brought appreciable grist to insurance companies, in that, after the Court of Appeal's decision, a large number of clubs thought it advisable to insure against the risk that their batsmen, too, might on occasion be so

fortunate as to hit such a six and so unfortunate as also to hit another passer-by.

But the decision is of interest not only to cricket clubs and sports organisations, and their insurers. In their judgments the law lords examine a point of law of the widest importance. How far does liability for negligence extend? In other words, how far down the chain of possible consequences from his act is a man supposed to look before he carries out the act he contemplates? Is it, for instance, the duty of every motorist to assume that a vital part of his car may at any moment break and deprive him of control, to the detriment, again, of the innocent passer-by? Must the owner of a factory accept the same risk with his machinery every time his engineer switches on the power?

Had Miss Stone succeeded in the House of Lords, the answer to these questions might each have been "yes." Liability for negligence would have been immeasurably widened; in effect, every man would be guaranteeing to the whole world that no action of his could ever produce any injury to anyone else. The view the law lords took was that the mere possibility that injury may follow any particular action is not sufficient to found a claim for damages for negligence if injury does in fact follow. The existence of some risk is "an ordinary incident of life," even when every care has been taken. The real test is, would a reasonable man contemplate that injury to another might follow from what he did, and that question must be one for a judge to answer in each separate case. This decision is another example of the English courts' extreme distaste for any rule with absolute qualities; it is the absolute, the lawyers feel, that creates the hard case. The fact that this tendency also increases the opportunities for their potential clients to litigate is purely coincidental.

Success of the Exhibition

The Exhibition absorbs public attention. Other amusements and other means of passing the time agreeably are deserted for it. Politics are neglected. Business of some kinds—though not that of cabs, omnibuses, and coffee-house keepers—is slack and is given up for the Exhibition. Her Majesty and her guests have visited it frequently, and the court and the fashionable world follow her amiable example. The sale of season tickets continues, the influx of visitors is very great, and the receipts more than was anticipated. Considering the time of year, too early to ruralise or visit watering-places, and too late to remain at home, while the catching weather makes long walks or rides somewhat hazardous, a more delightful and appropriate promenade and lounge could not have been discovered. . . . The multifariousness and excellence of the show, the beauty of the scene, the genial temperature, the total absence of dust and flies, of scorching sunshine or cold gusts of wind, make it far superior to anything of the kind that has ever been seen in the world. Royalty, in its own gorgeous palaces or its gardens, can command nothing better. Accordingly Her Majesty and the court and the nobility visit the Exhibition, and are delighted with it. They can have no more refined enjoyment. But that enjoyment they now share with great multitudes of five-shilling, and soon will share with shilling, visitors. The five-shilling visitors, or the guinea visitors, or the holders of season tickets, may not choose to be present when the multitude are there, but all will drink in similar delight. . . . Her Majesty can view nothing more instructive and pleasing;—she may go oftener, may enjoy it far more from being better acquainted with it, but she will share the pleasure with the shilling visitors. Where she treads they will tread—what she beholds they will behold. . . . and the common enjoyment obviously tends to equalise the condition of all.

1851 And All That

Palace of Industry, 1851. By C. R. Fay. Cambridge University Press. 156 pages. 15s.
The Year is 1851. By Patrick Howarth. Collins. 256 pages. 18s.
The Story of Exhibitions. By Kenneth W. Luckhurst. Studio Limited. 224 pages. 30s.

There has been quite a crop of books about the 1851 Exhibition, and all are necessarily obliged to draw on much the same material—the official catalogue, the comments of *The Times*, the *Queen's Journal*, contemporary illustrations and reproductions of Punch cartoons. Dr Fay gives a pleasant selection of these, making good use also of the Royal Archives, and his account of how the Exhibition came into being is vivid and detailed. But the distinctive contribution of his book is in the final chapters, which put the Exhibition in its historical perspective and assess its results. There were the direct results—the site at South Kensington which was bought from its profits of £186,000 and which later became the home of four royal societies, four museums, the Imperial College of Science and the Royal College of Art. Among the indirect results, the movement of vast crowds up to London stimulated railway development; and it was the London Brighton and South Coast Railway that bought the Crystal Palace and moved it to Sydenham, afterwards building new lines to carry its visitors. A Mr Thomas Cook began his connection with travel by organising rail trips to Chatsworth to see Paxton's conservatory, the design of which, enlarged, he used for his Crystal Palace. From the Exhibition's long aisles of varied display a young draper's assistant called William Whiteley evolved the idea of the department store; and after that idea had become reality, the head of his provisions department, Richard Burbidge, left him to build up Harrods. Such are the threads from which Dr Fay weaves the cords binding 1851 to 1951.

As Mr Howarth calls his book "an experiment in the technique of the scrap book" it would be unfair to call it scrappy, but even within the limits of that technique a better form might have been achieved. He attempts "to make history stand still" in 1851, to show "stills," as it were, of the political, social and economic scene. In order to make it comprehensible Mr Howarth goes back to the beginning of the reign; and here his self-imposed limitations involve him in some difficulty. To those with a fair knowledge of the period this part of his study will seem insufficiently profound; and to those without such knowledge it will fail to give a clear exposition. The second part of his book, however, gives an interesting picture of the Britain of 1851—its awakening social conscience and its optimism, its entertainments and its religious movements; and in a succeeding chapter he glances briefly at what was happening in other countries. The story of the

Exhibition with which the book ends is now more familiar than the pleasant contemporary illustrations which fill its pages.

★

Mr Luckhurst's admirable treatise on exhibitions may conveniently be reviewed in three parts, of which the first, and perhaps the most interesting, deals with the origins of exhibitions. The growth of displays of works of art from the eighteenth century onwards — some organised by societies and others the one-man shows of dissidents and rebels — is a fascinating story. It was, and is, the privilege of the scorned and the scornful to belabour the "academicians," and the joke to the onlooker is the refusal of genius to take sides in the quarrel. Her favours are impartially bestowed, and Mr Luckhurst follows her example. He shows some signs of apprehension over the passing of patronage of the arts from mainly private to mainly public hands, and most readers will agree. Public bodies tend to be dreadfully conservative or self-consciously modern, whereas the arts truly flourish when every man has the courage of his convictions and buys accordingly. Nevertheless it is hard now to see the alternative to state patronage.

In dealing with industrial exhibitions Mr Luckhurst has a harder task than he had with the arts. His material is heavier. However the Royal Society of Arts, of which he is Secretary, has a fine record in this field, and the interest of the story is maintained in his description of the exhibitions at home and abroad which preceded the Great Exhibition of 1851.

Eighteen hundred and fifty-one itself forms the second section of the book, although it takes but two chapters. This story has been fully and recently told and Mr Luckhurst reasonably confines himself to an account which fits his general narrative. As an exhibition 1851 was epoch-making, and credit for its conception belongs to the Royal Society of Arts. Mr Luckhurst may overstress the part played in the actual execution of the project by the Society's versatile genius, Henry Cole, but historians must be allowed their favourites.

In the third section the book deals with the big post-1851 exhibitions which have followed each other in a monotonous and lavish procession up to the present day. It deals also with modern trade fairs, but throughout the book fairs are properly classed apart. Technically the modern exhibition is superb, but the pattern of the mammoth show is now set and lacks adventure, for the absence of which no amount of "trylons" (New York, 1939) nor "sky-

lons" (London, 1951) and no official rioting of the arts can truly compensate. Consequently the last part of Mr Luckhurst's book changes its character. It ceases to be a good story and becomes an interesting and well illustrated catalogue. This is no fault of the author's, and he is almost certainly right in hinting that the time has come for the monster project to give place to the small and specialised exhibition, of which there have been many successful examples in recent years.

A French View of America

Histoire Economique et Sociale des Etats Unis de 1919 à 1949. By Louis R. Franck. Aubier, Editions Montaigne. 304 pages. 480 francs.

This little history book ends with an exhortation to American "enlightened capitalism" to understand that world equilibrium depends not only on the Marshall Plan, but on equilibrium in America itself; and this, says the author, "implies continuous and profound reforms in all social domains." In the previous paragraph he describes this same "enlightened capitalism" as "living its most exultant dream" while it administers the Marshall Plan "as an agent of technical and even undefinable spiritual expansion, an agent for extending the American Way of Life on a world scale."

This is a common European vision of what the Americans are after, but it makes an odd ending to a book about the upheavals and transformation of America during the last three decades. In all but the final peroration, the author seems acutely aware that continuous and profound reforms are in fact going on all the time. It is hard to see why someone as well acquainted as he shows himself to be with the shattering and bewildering experiences of American "enlightened capitalism" should believe that in 1951 it dreams of imposing a particular stamp of its own on the rest of the world.

Movement, change and expansion are indeed the themes of this short survey, lavishly illustrated with facts and figures, showing the unsteady but giant growth of American wealth and power. In a brief excursion from economics to ethics, Professor Franck shows the mental disturbances which these changes have aroused, and the difficulties of adjustment of a Protestant society founded on the cult of individual initiative and personal effort, which was then faced with an excessive concentration of capital, the 1929 crisis, huge unemployment in the years 1930 to 1940, the growth of government controls and New Deal planning. These caused a tragic quandary. A few pages later Professor Franck shifts his ground and suggests that reformists in America do not require a universal creed, because in contrast to the European working class resistance movements modelled on humanitarian socialism or Marxism, American reformism "does not integrate into a universal perspective; it conserves a local or regional

character and a fondness for the soil which amazes foreigners."

Professor Franck lays emphasis on the shifts in power which have accompanied the economic transformation. He claims that industrial concentration has gone further than ever before and that the shareholders have become "poor relations" with the great companies dominated by the Management or the state. He devotes a considerable proportion of his space to the rise of the trade unions and claims that the governmental agricultural policy, which has kept up prices, collides with its social and international interests. He might usefully have extended his investigation into the current contradictions inside American economic planning to other sectors. Unfortunately his final analysis of present day problems is largely out of date, as the book was completed just before the North Koreans crossed the parallel.

Indian Balance-Sheet

Economic Consequences of Divided India. By C. N. Vakil. *Vora, Bombay.* 555 pages. Rs. 21.

Professor Vakil's book is not prophecy, as its title would suggest. The economic consequences of partition will take years to become clear, and Professor Vakil makes no guesses about the future. He has, perhaps more usefully, confined himself to drawing up an economic balance-sheet of the two new states, and of the assets and liabilities which each of them has inherited from the old, undivided, India. There is nothing very surprising about these balance-sheets; the temptation to be new and startling has been firmly resisted, and no statement is made which is not amply borne out by statistics. But in no other book is it possible to obtain so much recent and accurate information about every aspect of the economic life of the sub-continent. Every source has been drawn on, from the newspaper report to the official publication, and the result has a completeness made even more massive by the heaviness of the style, and marred only by the frequent misprints.

The expected points come out very clearly. India's major economic problem is the inadequacy of its agriculture. It can, on present techniques, produce neither enough food, nor enough cotton, or enough jute, for its needs. Pakistan's advantage is that its agriculture still produces a surplus, though there, too, the increase in population is gradually eating the surplus away. Before the war over 1,000,000 tons of wheat were available for export; now it is only half a million, and the production of jute has gone down from over 10 million bales (1940-41) to six. In the division, however, Pakistan got virtually none of the industrial resources of the old India. Coal, iron ore, business enterprise, skilled labour, factories, are all in India. Most of the new businesses which have sprung up in Pakistan since partition are run by Muslims who have come from Bombay or Calcutta, and the artisans for the new workshops are immigrants from the United Provinces. So far, moreover, Pakistan has been industrialising only very slowly. There is no

jute mill yet, though three have been begun, and the increase in cotton spindleage has been quite small. Meanwhile India has been entering on a higher stage of industrialisation and is beginning, for example, to make diesel engines and textile machinery. That India's average wellbeing is nevertheless, somewhat below Pakistan's is a reminder of how dominant agriculture still is in both economies.

All this is well enough known in general, though it is of great value to have it set down clearly, without bias, and in short compass. Not so widely known, and therefore particularly valuable, is the study of the refugee problem. Some 7,500,000 people have come to India, and nearly 7,000,000 have gone to Pakistan. It is a movement without precedent in modern times and Professor Vakil shows how superb an administrative feat has been the resettlement and rehabilitation of these millions, now almost complete. The achievement has been especially great in India because the Indian refugees left behind them in Pakistan property worth hundreds of millions more than that left behind by the Muslims in India, and the Indian Government has, therefore, both had to undertake very large expenditure, far greater than any involved in Kashmir, for example, and to try to allay the bitterness of those who found themselves paupers overnight through no fault of their own. But it has been done, and done so quietly that few realise how disastrous a failure might have been. In its administrative machine at least, India had an asset not even partition could destroy.

French Politics

Les Forces Politiques en France. By Jacques Fauvet. *Le Monde, Paris.* 346 pages. 350 francs.

With French elections on the horizon it is not surprising that M. Fauvet's able and intelligent book should have been much in demand in France. Certainly nobody in this country who hopes to follow the situation intelligently can afford to be without it. M. Fauvet has managed in a remarkably compact book to do several different things, and all of them well. In surveying the spectrum of the French parties and of their minor groupings, he begins in each case with a personal appreciation of their spirit and orientation in the manner of a latter-day Thibaudet. He goes on to indulge in electoral geography of the dynamic kind that M. Francois Goguel has based upon the pioneer work of André Siegfried; and he throws in for good measure purely factual information about party organisation, the names of the leading personalities, and of the related journals. For good measure there is not only a general essay on the present condition of French politics, but an appendix on the whole question of electoral reform and the significance of the various systems that have been opposed to one another in the recent debates.

A study of this work will not, however, support any of the facile generalisations that are made either about the parties or about the milieu within which

they work, and least of all the belief that the multiplicity of French parties is the product of the electoral system. Indeed, by an ingenious diagram in which the main parties are set off against the three possible solutions of each of the main questions of internal politics, M. Fauvet provides a convincing demonstration that a sixfold division is the minimum that allows for quite genuine differences of opinion and attitude. Certainly neither the fissiparous tendencies of the parties, nor the menace of Communism can be exorcised by altering the rules of the game. France's problems lie deeper than that; and M. Fauvet's conclusions, if not quite as pessimistic as those of M. Hubert Beuve-Méry in his preface, are certainly worth pondering, and are in many respects relevant to other countries besides the France he knows so well.

Trade Union Anachronism

Trade Union Law. By Norman A. Citrine. *Stevens and Sons, Limited.* 700 pages. £2 5s.

Four years ago Mr Citrine set himself to produce a fresh edition of the standard legal text book, "Slessor and Baker on Trade Unions." The actual performance is an immense improvement upon the design. This is not merely a work of reference although, of course, the statutes and orders are conveniently set out. It is also the most complete appreciation that anyone has yet attempted of the present legal position of trade unions and trade associations. In other words the author has accomplished a feat which is extremely rare: he has written a work which is of almost equal interest to the lawyer and the instructed layman.

Trade union law today presents a strange contradiction. Those unions which insist upon the closed shop exercise an extreme form of arbitrary power. By refusing to work with a particular individual—or by refusing to admit him to membership—they can, and sometimes do, deprive him of all opportunity to follow his own trade. Yet this power arises not from any legislative enactment but from the fact that the Courts have consistently upheld what might be called the doctrine of judicial non-interference. So long as a man does not actually commit, or threaten to commit, or induce someone else to commit, a crime or a civil wrong he may do what he pleases, no matter what harm he inflicts on someone else. He must not, it is true, combine with others wilfully to injure a man in his trade. But if the real purpose of the combination is not to injure another but to forward or defend the trade of those who enter into it, then no wrong is committed and no action will lie, although damage to another ensue.

This, as Mr Citrine clearly explains, is the present state of the law. In other words, provided that those concerned keep within the strict letter of the law they may take what individual or collective action they please, regardless of economic and social consequences and even of considerations of elementary justice. It is a glaring anomaly. Other branches of the law regulating personal

relations have entirely changed during the last thirty years. The legal relationships between husband and wife, master and servant and landlord and tenant have been altered almost out of recognition. It is only in the sphere of trade unions and trade associations that nineteenth century conceptions are maintained almost without alteration.

Germany and Spain

Documents on German Foreign Policy, 1918-45. Series D. Vol. III. Germany and Spain. State Department, Washington. *H.M. Stationery Office.* 951 pages. 25s.

A melancholy interest attaches to the record supplied by Volume III of the captured German documents (from the archives of the German Foreign Ministry) relating to the Spanish civil war; not so much that they reveal any facts not already known but as registering, in the guise of "collective non-intervention," the nadir of diplomacy in modern times.

This account of the various phases of German aid and intervention shows that there was no deep-laid plot. The documents do not disclose any evidence of German assistance to the rebel cause prior to the outbreak of hostilities, though there were indubitably unofficial contacts. What emerges clearly also is that there was at no time the intention on Germany's part to become embroiled in Spanish affairs any more than was necessary for the higher diplomatic strategy. Von Hassell wrote from Italy on December 18, 1936:

The entire Spanish operation has undoubtedly developed somewhat differently and more dangerously than was at first expected; above all the Spaniards themselves have proved to be very unsatisfactory political and military material.

General Franco, while committed up to the hilt to the Axis, was as early as the autumn of 1936 showing himself a difficult customer on whose gratitude the Germans could by no means count: they were, for example, distinctly piqued by his spontaneous declaration of neutrality at the time of the Czech crisis in September, 1938.

The first move was made on or about July 22, 1936, and five days after the outbreak of the revolt, when Franco arranged for the transport by air to Germany of Johannes Bernhardt, a German businessman in Morocco, with the local Nazi *Ortsgruppenführer* to request aircraft and economic facilities. The early German assistance was, however, on a commercial basis. Italy was from the beginning more deeply involved, and in the next phase the German Government agreed to step up its aid mainly in order to keep Mussolini sweet or, as Neurath put it, to ensure that Fascist Italy was brought more effectually into the German camp. Even so, the number of German ground troops never exceeded 6,000. There was a third phase of strengthening German-Spanish ties, particularly economic, marked by the Protocols of March and July, 1937. The final phase saw the somewhat tardy conclusion, in the very last days of the

Shorter Notices

And So It Goes On. By R. F. Harrod.

Rupert Hart-Davis. 192 pages. 6s.

Mr Harrod does not regard it as any part of an economist's duty to suffer fools gladly; and his views on the folly of British economic policy have not changed since he launched, in 1947, that splendid though vulnerable super-pamphlet, "Are These Hardships Necessary?" This collection of essays, published in a similar format, carries through the intervening years the themes which then engaged his especial indignation, and adds to them others; there is the folly of over-ambitious capital programmes, the folly of sterling-balance policy, the folly of unconvertibility, the folly of pseudo-planning, the folly of the Special Contribution, and plenty more. Written for periodical publication and reproduced unaltered (except for a very few footnotes, an addition to whose number would have been helpful to the reader) the essays stand the test of resurrection, on the whole, extremely well, and Mr Harrod's final postscript, cautiously evaluating the solidity of the 1950 recovery, shows him confident in the soundness of his original diagnosis.

Socialism. An Economic and Sociological Analysis. By Ludwig von Mises.

Jonathan Cape. 599 pages. 21s.

Professor Ludwig von Mises's "Socialism" is one of those books—like "Das Kapital" itself—on which numbers of people hold decided opinions without ever having read the actual text; a common fate of classics. Here is at once the purest, intellectually most powerful and most uncompromising statement of the extreme anti-collectivist case, supplemented in this its second English edition (the original German publication was in 1922) by an Epilogue relating the argument of the book to latter-day collectivist tyrannies and creeds. Up-to-date, however, is not an epithet to be applied to it. Its defence of the most complete *laissez-faire* ignores, where it does not beg, the whole question of any possible inherent instability in the dynamic price economy; no whiff of the welfare controversy penetrates its pages; an unbelievable complacency concerning the cash nexus and the social sufficiency of the acquisitive instinct betrays total ignorance of the findings, over the last thirty years, of sociological research. Professor von Mises punctures fallacies, deflates claims, confronts contradictions, attacks sheer intellectual muddle with the ruthlessness of a fire consuming rubbish; but he proves so much too much as to spoil his case.

Goering. By Willi Frischauer. *Odham's Press, Limited.* 303 pages. 12s. 6d.

Mr Frischauer's book is too sketchy and imprecise to offer much that is new to anyone seriously interested in the history of the Third Reich; at the same time it lacks the brilliance and irony to make it good journalism. Certainly, Mr Frischauer does not fall into the trap of writing up Goering as a hero, and he has taken the trouble to search out and talk to the people who knew him best—his wife, his valet, and two of his chief assistants, Generals Bodenschatz and Koller. The value of their testimony is reduced, however, by Mr Frischauer's habit of combining evidence, gossip and conjecture. As a result, his portrait of the onetime Nazi boss of Prussia and the creator of the Luftwaffe lacks authority as well as vitality.

civil war, of a Treaty of Friendship and Franco Spain's accession to the anti-Comintern Pact. The Caudillo was by then effectively grappled.

Hitler's considered opinion on the value of Axis aid to the Spanish Nationalists emerges from a discussion with Ciano on September 28, 1940, on Spain's role in the European war (which is recorded in an editorial note at the end of the volume under review): "Italy and Germany had done a great deal for Spain in 1936 . . . without the help of the two countries there would be no Franco today." That is the truth which no whitewashing, no amount of hindsight, can alter.

Cycles in New Zealand

The Instability of a Dependent Economy. Economic Fluctuations in New Zealand, 1840-1914. By C. G. F. Simkin. *Clarendon Press, Oxford.* 208 pages. 18s.

The main title of this book is seemingly an afterthought, and the author gives only one sentence to defining a dependent economy. Its principal features, he writes on page 5, "are that the external transactions account for a relatively large part of the social income, and that it is too small a consumer of the world's exports to have much influence upon the countries which provide its principal markets." This definition, though good enough so far as it goes, leaves some questions unanswered. Dependent on whom? New Zealand, like Tasmania, depended in the early days far more upon New South Wales than upon Great Britain. Dependent in what degree? An occupational table for 1858, which Professor Simkin prints on page 123, shows a precocious development of secondary and tertiary industry and suggests that New Zealanders were highly dependent upon each other, as well as upon outside suppliers and customers. An economic historian concentrating his attention on trends rather than cycles might write an equally stimulating book under the title, "The growth of economic independence in New Zealand."

Professor Simkin, however, is mainly concerned with cycles, and he handles them elegantly. The statistics do not permit him to employ income measurements; but by the judicious use of "substitute criteria" he identifies and measures the main fluctuations. He identifies some periods (for example 1884-1904) when the New Zealand economy did not conform to cycles in the United Kingdom; on the other hand, he is unable from New Zealand's experience to support Sir William Beveridge's suggestion that British cycles may have an "agricultural root" overseas. He concludes that banking policy is the main determinant of short-term instability in New Zealand, and from this point of view discusses the possibilities of counter-cycle policy.

Professor Simkin proposes to continue his studies into the period after 1914. Would he consider instead a larger task—a full dress history of the developing New Zealand economy from the beginning to the present time?

Letters to the Editor

The Terms of Trade

Sir,—Mr. Harrod in his letter in *The Economist* of April 28th suggests that sterling might be revalued in order to make our terms of trade more favourable. This is a timely suggestion and with import prices rising against us on all sides, and a return of the sellers' market for exports abroad, it is rather surprising that, as yet, few voices have been raised in favour of revaluation.

The devaluation of sterling in September, 1949, was made in order to restore a balance of payments which, at that time, was made passive by our inability to sell to the dollar area—the result of high production costs, over-employment in Britain and the end of the sellers' market for exports. But surely the most important cause of the decline in our exports prior to devaluation was the mild recession in the United States, which caused American imports in the second quarter of 1949 to decline by 15 per cent in value as compared with the last quarter of 1948. A decline of 15 per cent in import value in response to only a 5 per cent decline in United States income surely indicates that it is the income-elasticity of the United States for British exports which is important rather than the price-elasticity. If the American recession of 1949 had been prolonged and intensified the efficacy of devaluation as an adjuster of the balance of payments would have been tried to the full.

It is the essence of modern economic teaching that exchange rates should be stable but capable of variation to meet basic changes in international economic conditions. That changes of a major character have taken place since 1949 is fairly evident. We are being hustled forward on a wave of inflation driven largely by soaring import prices. We are faced with the prospect of a decline in export volume. But the goods which we send abroad might now sell in markets where high levels of income would prevent a dearer pound from causing a shrinkage of sales. Surely a pound of higher value would make a major contribution to our economic stability by reducing the inflationary effects of import prices, preventing the value of British

exports from falling proportionately to their volume, and giving relief to a balance of payments which promises to be strongly adverse by the end of 1951.

No doubt it is these fairly obvious advantages which Mr. Harrod has in mind. Unfortunately there are a number of non-economic impediments in the way of a change of parity at present. These are as follows:

(a) The International Monetary Fund would almost certainly not approve a revision now, on the ground that it is not required to correct a "fundamental disequilibrium"—whatever that may be.

(b) The change would come close upon the devaluation of 1949. Too frequent changes of parity are unwise unless they are taken for weighty reasons. It must be remembered that sterling is a focal currency and a change in its value would be followed by changes in the values of others.

(c) Our American friends would probably oppose revaluation. Their views on the current level of Sterling Area reserves are well known, and it is probable that they would insist that all capital should be spent before relief can be obtained.

Yours faithfully,

W. M. SCAMMELL
University College of North Wales,
Bangor

Penny on the Pint

Sir,—Your note on the increase in the price of beer in your issue of May 5th rightly points out that it may be only a short-term expedient for the brewing industry's difficulties.

Even if a falling market were not an odd time for an increase in price, it does not touch the really fundamental reasons for the hard times being experienced by the licensees and for the industry's falling profits. Many licensees may have good grounds for complaint, but not all licensees are efficient; nor do all brewers seem aware of the social changes which affect their business. In the words of the Chief Constable of Rochdale to his recent Brewster Sessions:

... social habits are changing. Whether it is the high price of beer... or the attraction of cinemas, television, dog racing or other "new sports," the public-house is hard put to it to retain and

attract customers. . . . The pleasure of drinking beer is not, *per se*, sufficient attraction to public-houses.

The rise in the price of beer will increase brewers' and licensees' profits, at least for some time. If it blinds the industry to its fundamental problem of adaptation to new market conditions it will be a bad thing; if it gives the industry a breathing space in which to think furiously it may be a good thing.

—Yours faithfully, E. B. SMITH

The Pakistan Budget

Sir,—Your comment on Pakistan's Budget, appearing in your issue of April 21st, was incorrect and less than just in implying that the Pakistan Government is taking advantage of the present boom in raw materials to pass the burden of taxation on to the shoulders of the foreign consumer. It is incorrect to state that the export duty on raw cotton has been increased by "over 1,000 per cent in the last few months": the duty has been raised from Rs. 40 per bale of "desi" cotton and Rs. 60 per bale of the American varieties to a flat Rs. 300 per bale for all varieties. The Government's principal intention in imposing increases in export duties was not to benefit revenue but to bring down prices in the local markets, so as to combat the inflationary effect of the high prices prevailing.

To state that "Karachi has appreciably reduced income tax and super tax" is an exaggeration. Working out the actual tax liabilities on the following earned incomes, we get the following percentage rates of taxation:—

Earned Income	Tax at 1950-51 Rates (Percentage on Total Income)	Tax at 1951-52 Rates (Percentage on Total Income)
Rs.12,000 per annum	6.62	5.55
Rs.36,000	25.30	23.98
Rs.2,50,000	68.68	60.57

In addition, assesses in Pakistan continue to pay the supplementary taxes, imposed in October, 1950, for refugee rehabilitation. The rate of taxation in Pakistan, both on personal incomes and on companies, is still higher in some cases than that applicable in India.

Yours faithfully, J. S. LOBO
Karachi

THE AGE OF RETIREMENT

THE concessions announced by the Government last night on old age pensions are handsome. Everyone sympathises with those who have to live on small fixed incomes, but anyone who thinks that the Government could have gone even further while they were at it should not overlook the objections.

It must be remembered that giving more money to old age pensioners means taking it from the rest of the community, either directly or indirectly. To a certain extent that is what should be done.

But it is time to face the important question of what should be the retiring age. People nowadays can expect ten years' longer life than was the case even in 1931 and many at sixty and sixty-five are and want to be useful workers.

Before we say that the sixty to sixty-five retiring age is still right, we should understand that there is one person of the present retiring age to every six people, including the fifteen-year-olds, who are of working age. And the proportion of old people will become greater.

The problem is going to grow. More will be heard about it and there will have to be more thinking about it. We believe that any government must encourage older people who are well to work a little longer to prevent the burden becoming too heavy on the rest of the community. Compulsory retirement at sixty-five is something that should be stopped.

HOTELS

personally and independently recommended by

Ashley Courtenay

"Hobson's Choice." Unlike Tobias Hobson, who obliges one to take the horse which stood next to the stable door, I can offer you a choice of some 500 hotels, a few of which are listed in my "Shop Window" below. If you are interested in some other district, please do not hesitate to write me, enclosing stamped-addressed envelope. Beyond that I charge no fee and do not accept commission. Ashley Courtenay, 68, St. James's Street, London, S.W.1.

HAWKHURST, Kent. COLLINGWOOD HOUSE HOTEL. In this historic and lovely Georgian home, the art of gracious living is still practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write: N. Allan-Smith, Tel.: 2320.

HYTHE, Kent. HOTEL IMPERIAL. Holiday this year on the Kentish Coast, at this magnificently equipped hotel facing the sea. 50 acres garden, private Golf Course. A large number of rooms with private bath; some private suites. Fine Ballroom and Cocktail Lounge A.A., R.A.C. Tel.: 67441.

LYNNMOUTH, TOES HOTEL. "Stand by itself." Not only in a beautiful setting, but in personal service and comfort. As nearly perfect a base as you could wish, for all the recreational and sight-seeing attractions of North Devon. Write for Brochure G. Tel.: Lynton 3236.

MINEHEAD, Somerset. NORTHFIELD HOUSE HOTEL. Situated in 3 acres of grounds, plus 14 high standards of culture and comfort. AT ANY TIME OF THE YEAR. Convalescence? A honeymoon? Or just in holiday mood? Enjoy the sea, and Northfield make a happy combination. Tel.: 844.

NEWQUAY, Cornwall. HEADLAND HOTEL. For your June honeymoon. Billiards, Bridge, Dancing, Tennis, Surfing, magnificent sands. 18-hole Golf Course adjoining. Good food, well-stocked cellar, attractive Cocktail Bar and Sun Lounge. Every room with a sea view. (Private bathrooms available). Early booking advisable. Write W. Folgate. Tel.: 2211.

NR. NEWQUAY, Cornwall. GLENBOROUGH. Nigel Tange offers you the perfect holiday by the sea. Private steps to Atlantic sun-bathing and golden sands. 10 acres of private coastline grounds. Own farm produce, cream, milk. Children's paradise; comfort and rest for adults. Fully booked August. Tel.: Newquay 2949.

ST. MAWES, Cornwall. HOTEL TRESANTON. Lovely Country House in sheltered bay. Beautifully furnished, every modern convenience. First-class cuisine; Club bar; terms from 20/- per day. Trains met Truro. Resident Manager, A. Miles Humbert. Tel.: 324.

SALCOMBE, S. Devon. TIDES REACH HOTEL. What a lovely address for a seaside holiday! Here, on the edge of a sandy beach with boats, fishing, safe bathing and fine walks, are added the finishing touches of comfortable accommodation, good fare and ample garage space. Tel.: 238.

SAUNTON SANDS HOTEL, Nr. BRAUNTON, N. Devon. Overlooking Bideford Bay. All that is best in a modern Hotel, Squash, Dancing, etc. Golf at Saunton Golf Club. Fully licensed. July terms from 86/- daily. Trains met by appointment. Tel.: Croyde 212.

SIDMOUTH, Devon. BELMONT HOTEL. A.A. Appointed. A first-class luxury hotel, noted for its excellent food, and occupying the finest position extending to the sea front. Through-coaches daily from Waterloo. Private Suites. Gas fires. Private bathrooms. Lift. Fully licensed. Tel.: Sidmouth 1961.

RAVENSCAR, Scarborough. RAVEN HALL HOTEL. A completely self-contained, fully licensed holiday hotel. Heated seawater Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive terms 25/- to 47/6 per day. Tel.: Oughton 233.

SCARBOROUGH, ROYAL HOTEL. Comfortable, Civilised, Stimulating. For all that it offers, the value is extraordinary. Terms 29/- to 39/- per day. Managing Director, T. Laughton.

TORQUAY'S GRAND HOTEL. Grand in name, grand in position, grand in everything it offers. With a view to a grand family holiday this year, write E. Paul for detailed brochure. Tel.: 2334.

Is any suit worth 40 guineas?

Admittedly, a good suit costs a lot of money today—too much money. We are the first to admit and regret it. But your 40-odd guineas* represents something more than a purchase. A good suit is an investment—admittedly a big one nowadays because fine cloth and craftsmanship have never been so dear. Yet what investment could be sounder—and what give so generous a return over the years!

*This price, with us, is at present inclusive of purchase tax

I SEE ENGLAND

not dispirited, not weak, but well remembering that she has seen dark days before; indeed with a kind of instinct that she sees a little better on a cloudy day, and that in storm of battle and calamity she has a secret vigour and a pulse like a cannon. I see her in old age not decrepit but young and still daring to believe in her power of endurance and expansion, with strength still equal to the time, still wise to entertain and swift to execute the policy which the heart and mind of mankind require at the present time.

EMERSON (1847)

WHEN EMERSON spoke this eulogy, Marshalls of Gainsborough and Fowlers of Leeds were within a year of foundation. The first generation of Marshall & Fowler Engineers lived through the days of the Crimean war and the Indian Mutiny. Their sons, grandsons, and great-grandsons were contemporaries of the Boer war and the first and second World Wars. Each one of these three or four generations saw "a little better on a cloudy day" and they also knew in their hearts that it is faith more than fear which has contributed to progress throughout the centuries.

Today in 1951, we in the Marshall Organisation fervently uphold this view. We know that penicillin has saved more lives than the atom bomb has destroyed. And we—in common with our fellow countrymen—face the future with that faith which will enable us to do our duty cheerfully and with confidence.

AMERICAN SURVEY

The Administration's Case

Washington, D.C.

EACH morning last week General George Catlett Marshall, the Secretary of Defence, was driven up Capitol Hill to the Senate Office Building to answer the next round of questions from the members of the Senate Joint Committee investigating General MacArthur's dismissal. The clerks, assistants and typists who work in the building did not stand in crowds waiting to see him and to applaud as he walked past, as they had the week before when General MacArthur was testifying. General MacArthur had worn his uniform with his gold-braided cap—his "scrambled eggs cap," as the newspapers fondly called it. But General Marshall was in an unglamorous civilian suit, being a member of the civilian Cabinet; and in any case there are plenty of opportunities to see him in Washington. So he walked into the caucus room with no gallery to speak of and with only thirty-three Senators present compared with the sixty-four who crowded in to hear General MacArthur begin his testimony.

General MacArthur had been oratorical, self-confident, brisk. For the most part, the questions addressed to him by the Senators had been put with deference and humility, and he had answered them with many a well-chosen word. General Marshall was methodical, careful, patient. Some of the Senators prefaced their questions to him with admonitory speeches. It was plain from what they said and from the manner in which they said it that the inquiry had lost its early pageantry.

This was not alone because General MacArthur, the fighting hero from the Far East, had been succeeded by General Marshall, the painstaking administrator. It was also because the story General Marshall had to tell and the case he had to argue were so much less attractive: so much duller, so much harder to follow, filled with so many more details, and above all demanding qualities so much more difficult for a red-blooded American to summon up and maintain.

General MacArthur had cried: Fight! Use energy and daring, take a chance, rely on yourselves, get it over quickly and finish with a victory that will ring around the world! But General Marshall argued: Think! Be careful and patient, consider your allies, discipline yourselves and aim at the gradual attainment of a favourable result through attrition and perhaps by compromise.

★

So congenial was the MacArthur programme for action that few of the Senators on the committee found it remarkable that its author offered opinions on the proper world strategy to defeat "Communism everywhere" (which he said was the real enemy) but, the next moment, declined to answer questions on global matters, on the ground that he was only an area commander and therefore not adequately informed on these points. So uncongenial was the Marshall programme for endurance that the same Senators felt no hesitation in challenging and often contradicting the opinions of a man who was an outstandingly successful Chief of Staff

throughout the most exacting and far-flung war the nation ever fought and who had served with distinction as Secretary of State before he had assumed his present responsibilities.

General Marshall and President Truman between them made the Administration's case pretty clear last week. It began with a reminder that this was not a political dogfight which could be used to introduce and influence an election campaign; it was an issue which might determine whether or not the United States and the rest of the world were to be scourged by atomic warfare. The first objective the Administration had set itself was to avoid this catastrophe. Because Russia was facing the possibility of a critical loss in the Far East—in effect the loss of its Chinese ally—there was a greater risk there than in Europe of events which might lead up to the catastrophe.

The Administration was not willing, as General MacArthur was, to assume that the Soviet Union either could not or would not intervene if the United States carried the Korean war to China. It did not believe that, even if the Soviet Union should refrain from attacks on Japan, the Philippines and Okinawa which would make world war inevitable, the conflict would be shortened by the air and naval hostilities General MacArthur would have the United States direct against Communist China (in conjunction with a ground war which General Chiang Kai-shek's "logistically supported" forces would open). The Administration believed that if such actions against China were taken the Chinese people, now increasingly restless and dissatisfied, would be united behind their Communist leaders. It feared that the United States would be sucked further and further in as the area of the fighting widened, so that before long the jubilant Russians would know that American resources were so deeply committed to Asia that the major hazards of an assault on Europe and the Middle East had been removed.

General MacArthur had treated the allies of the United States with disdain or scorn. He was for "going it alone" if these confused and misguided countries abroad did not respond to American "leadership." But, in the speech that unexpectedly came on the evening of the day when General Marshall opened his testimony, President Truman said: "I do not propose to strip this country of its allies in the face of the Soviet danger." And this difference is at the very centre of the controversy.

General MacArthur, the man who has not been home for fourteen years, has shown that, in spite of anything he may have to say about global considerations, he is wedded still to most of the basic American beliefs prevalent at the time when he left home. The self-sufficiency of the United States, the backwardness and moral inferiority of European

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

countries, the advantages of avoiding entangling alliances and encumbrances—glimpses of these and congruent ideas can be caught through the MacArthur testimony. His training, his exile and his kingly environment in the Far East must all have helped to insulate him against the newer ideology on which the United Nations is being so painfully built. The impression he leaves is that the prospect of a first successful experiment in collective security—a prospect that has kindled enthusiasm in other minds, and not the least in the minds of many of his own countrymen—has struck no spark in him.

All sorts of other considerations and issues are embraced by the Joint Committee's hearings. For instance, there is the important question of whether this unprecedented revelation and public discussion of war plans, estimates of enemy strength and other matters which are normally kept in the top-secret files may not yet have some quite appalling results. For emotion and politics are producing numerous manifestations of wrong-headedness, and it is now possible for a syndicated columnist to write such arrant nonsense as this:

Secrecy and suppression are the refuge of the incompetent and the blunderers in government. Publicity, with everything put on the table, is the enemy of scandal and abuse of power. These principles apply equally to military and civilian affairs. The Kefauver hearings proved the point conclusively.

But when all the interlocking issues have been described, it remains true that the biggest issue of all is the survival or failure of the new effort, led by the United States, to organise the free world into an effective brotherhood. The strains inherent in this effort are awful to bear: nations cry out against the sacrifices and disciplines to which they must submit. Yet in this alone their salvation lies. What in essence we now hear is the groaning and complaint of those Americans, millions of them, who find the sacrifices and disciplines harder as they go on and who now are being told by a confident hero and a frustrated political party that there is an easier way.

The Administration can conceivably win the contest in the end by perseverance; but it would win sooner and more promisingly if there were someone who could lift the controversy from the plane on which it has come to rest. The questioning in the Joint Committee proceeds as though there never had been any bigger ideas than those General MacArthur has propounded. There is a bigger idea, and Americans have responded to it before when they have been sufficiently reminded of it.

Drugs and Dollars

[FROM A CORRESPONDENT IN NEW YORK]

THAT fondness for dosing and being dosed which English travellers to the United States noted a century ago persists as one of the country's most profitable foibles. The drug business in 1950 is estimated to have sold \$1.5 billion worth of pills, injectable substances and nasty tasting fluids. This is four times as much as in 1937, when total sales were valued at \$344 million. Part of the increase must be credited to the current inflation, but most of it is due to the higher real cost of producing the vitamins, sulphanamides and antibiotics which have revolutionised the drug trade in the last two decades. In dollar terms, half this trade went to the makers of "ethicals," that is to say, drugs advertised only to the medical profession and intended for sale solely on prescription. The other half went to the firms manufacturing "proprietary" medicines—a polite term for the great range of headache pills, cough medicines and other nostrums sold by direct appeal to the sufferers themselves.

This division is the more notable in that the makers of "ethicals" constitute only about 10 per cent of the 1,300-odd companies in the drug business, an industry that is far from simple either in its structure or its processes. Therapeutic drugs and industrial chemicals may be made by the same company, so may "ethicals" and "proprietarys." Most of the "ethicals" are made by the bigger companies, a situation that arises out of the need for large amounts of capital to finance the research which has brought about the recent revolution in drugs. The industry is said to have spent \$20 million in the last six years on studying the antibiotics alone. The list of "ethical" houses is headed by a handful of well-known firms, running their own extensive laboratories, making grants to university research, co-operating with and helping support private foundations, walking the narrow line which will both make for scientific progress in general and at the same time improve their own competitive position in the industry.

That competitive position depends on research, on productive skill in large-scale manufacture, and on patents. Unlike the British system, which allows only the process of making drugs to be patented, the American system permits patents to be taken out on both process and product. Whether this double protection gives a benefit twice as valuable as that obtainable by the British method is a question that patent lawyers argue over, but it is responsible for certain misunderstandings between the two countries which American drug makers regret and are trying to erase.

★

The drug trade's customers are only in part the patients who take their remedies. These are the particular concern of the makers of proprietary medicines, who beg their favour with every device known to advertising. The makers of "ethicals," on the other hand, seek the goodwill of the doctors, whose word may make or break a new product. Meanwhile the position of the retail shop has changed. Few chemists now do much compounding of drugs in their back rooms. In the main they have become salesmen of goods prepared and packaged in factories under conditions of sterility they could never hope to attain. What mixing the chemist does is at the lunch counter, in the form of bacon sandwiches and MacArthur-Truman (formerly banana) splits.

This puts the responsibility for quality on the shoulders of the drug manufacturers who make such things as penicillin by machine processes in enormous vats and package it in vials two inches high. The government exerts a watchful eye. The first federal Pure Food and Drugs Act, passed in 1909, was intended to do away with misrepresentation, dubious quality, and such romantic remedies as Indian snake oil. It was followed in 1938 by a Pure Food, Drug and Cosmetic Act, framed to take account of the changes wrought by three decades of rapid development in chemical knowledge and manufacturing methods. The Act might have been delayed longer by a busy Congress had not a hundred people been killed by a widely advertised "Elixir" exploiting the then new interest in sulpha drugs. The 1938 Act stiffened the standards of purity set by the old law, and made possible the questioning of certain claims supported by generations of advertising. It also gave the Food and Drug Administration power to insist that a new drug must prove its case before being allowed to put on a label and enter the medical market.

It is commonly said that 60 per cent of today's drug sales are of products not more than ten years old, and that fifteen

years ago 90 per cent of the prescriptions which doctors now write could not have been filled. This may be the industry's exaggeration but, in view of the importance of vitamins, sulpha drugs, antibiotics and hormones, it seems not impossible. It was only in 1936 that sulpha drugs first reached the United States, and in 1941 that the first penicillin was put into that London policeman. The war, of course, stimulated both research and trade in drugs, and the Korean affair has done the same. Captured German discoveries were also a help, although not to as great an extent as after the first world war.

Sir Alexander Fleming's discovery is now so familiar to Americans that it has made its way into a penicillin chewing gum prescribed for certain mouth infections. More important, it has stimulated a search for earth-mould drugs which has brought fortunes to the winners and made it possible to combat a wide range of stubborn diseases. So magical are these antibiotics in their effect that enthusiasts believe them capable of treating half the ailments which enter doctors' surgeries. The effect on the drug trade has been to intensify competition to such a point that speed in production becomes as important as luck in research. Streptomycin, the first American wide-spectrum antibiotic, sprang to fame as the first drug to have any success in the treatment of tuberculous meningitis, which until then had been invariably fatal. Chloromycetin, whose first success was in the treatment of typhoid fever, followed in 1947; made from a mould picked up in Venezuela, it is now being refined in Britain. Aureomycin, sprung from a clod of Missouri earth, was introduced in 1948. Since it has been found effective in a wide range of virus diseases, especially virus pneumonia, it is not surprising that by 1949 its sales almost equalled those of all the other products of its lucky maker.

These last two antibiotics, like the newest on the list, the Pfizer Company's terramycin, appear to be interchangeable in treating a wide range of diseases; the differences between them are more a question of their effects on individual patients than on individual diseases. Terramycin holds a record in speed of production. Two and a half years of work, 55 scientists, \$4,000,000 and 100,000 soil samples went into its discovery. Nine months later production problems had been solved, complete tests made, the Food and Drug Administration satisfied, and terramycin was on the market. It is in use or in test all over the world, including some 85 British clinics.

The latest hope is the prospect of synthesizing the hormone cortisone, announced in Washington the day before its difficulties were modestly described in London. It is backed by Merck and Company, which recently took a full newspaper page to tell the world that they had not enough cortisone to go around.

Meanwhile the results of this new research are felt by the makers of proprietary medicines which can be sold over the counter. Anti-histamines made quick fortunes for companies able to turn them out fast, but are now declared to be of little value, and possibly hazardous. "Hadacol," with an alcoholic content of some 18 per cent (which perhaps explains its tonic effect), delights salesmen trained in the old medicine show techniques and has thus far managed to fend off the Food and Drug Administration. A green pill containing chlorophyll is said to inhibit bodily odours so successfully that one may go unreproved from an onion sandwich and a stiff game of tennis to the most polite of tea tables without stopping for a bath. These products on the lunatic fringe testify to the persistence of human optimism untainted by scientific caution. They make money, too.

Wherever business takes you... your bank
is just round the corner

THE NATIONAL CITY BANK OF NEW YORK

ESTABLISHED 1812

(Incorporated with limited liability under the National Bank Act of the U.S.A.)

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES: 117 OLD BROAD STREET, E.C.2 · 11 WATERLOO PLACE, S.W.1

THROUGH its 53 branches in 19 countries and banking correspondents in every commercially important city throughout the world, The National City Bank of New York is uniquely equipped to give you complete world-wide banking facilities.

Your bank is just round the corner wherever your foreign business or travel interests lie. Banking experts to handle your financial problems are always at your disposal.

In London, as in other centres, you command the services of a staff widely trained and experienced, not only in British banking, but in the conduct of every type of international banking business; with special emphasis on the important two-way trade between the sterling and the dollar areas.

American Notes

Leading Congress to Controls

The spotlight on the MacArthur hearings has thrown into shadow the struggle the Administration is having to induce other committees to take seriously the threat of inflation during the next twelve months. It is now clear that even the first instalment of higher taxes which the President requested will not be forthcoming in full. The House Ways and Means Committee has nearly completed its tentative proposals; they will bring in about \$6.5 billion in a full year, compared with the \$10 billion requested. This itself was scaled down by the President from his original \$16 billion. Congressmen excuse their tax shortcomings on the ground that their experts believe the Treasury has underestimated tax revenues for next year by \$2.4 billion. This may be, but no one can even guess what increases in spending may be required by the international situation. The new levies, at all events, will probably not go into effect until October and the Senate may well be even less austere than the House.

It is unlikely that the Administration will secure as much—nearly three quarters of what it asked—from the committees now considering the extension of the Defence Production Act. This is the source of most mobilisation controls and incentives. Senator Maybank, the chairman of the Banking Committee, has announced that his group will not even consider the proposal to regulate commercial rents; his own opposition to any attempt, however modest, to bring more farm prices under control is well known. Mr Wilson, the defence mobiliser and first witness, has had a hard time trying to justify the need for new powers—such as that to build defence plants which have no attraction for private industry—as well as the exercise of old ones, such as the tax incentive programme for expansion. Controls have never been any more popular with conservative Democrats than with Republicans, and much of the Administration's prestige has seeped away in the crime hearings and the MacArthur crisis.

The real threat to the whole framework of controls comes, however, from the Price Administrator's courageous attempt to take beef by the horns and roll back prices to their January levels. Cattle, like cotton, are selling far above parity—roughly a “just price”—and hence are subject to control, but a horde of cattlemen has descended on Washington, breathing fire and threatening a meat famine if the controls are not rescinded. Deliberate withholding of meat animals produced such a famine in 1946 and undermined price control. Withholding on such a scale may not be possible this summer, but Mr DiSalle and the President, who supports him, will be hard put to it to prevent a stampede of Congressmen at the mere threat. Their main hope lies, not so much in the support of business, which has been assiduously sought and reluctantly given to temporary controls, but in the risk that Congress, if it throws over food price controls, may be blamed at the next election for the high cost of living.

Trading in Tariffs

In theory, the tariff reductions which the United States negotiated with 17 countries at Torquay do not require ratification in Washington, but in practice Congress will have an opportunity of expressing its views on them, since the Reciprocal Trade Agreements Act, under which they were negotiated, is now up for renewal. The 1,325 items affected by the concessions came to about 16 per cent of American purchases abroad in 1949 and include many things—clocks, for example—also made by those manufacturers at home who are notably allergic to foreign competition.

But Congress is not likely to feel any irresistible pressure to oppose the concessions at a time when domestic businessmen foresee no serious difficulty in selling all they can produce. However, those who like to argue that the United States is not getting as good as it gives under the trade agreements programme have been given a cue by the State Department's regret that Britain refused to modify the imperial preference system.

While Britain clings to protectionism, the House of Representatives has also been reaching back for the helping hand of trade restrictions. The Senate Finance Committee has, however, rejected the most objectionable of the House's amendments to the Reciprocal Trade Agreements Act, one that was supposed to benefit the country's farmers, but which would probably have hurt their exports more than it protected them from imports. The Senate Committee has also made some changes in the confusing escape clause which the House inserted in the Act, and the famous “peril point” provision, while undesirable in principle, will not be a serious handicap for the moment, since it is not at present proposed to negotiate any more tariff reductions. Under this provision, the President is required to notify Congress if he proposes to reduce any duty below the point which the Tariff Commission considers to be safe.

The House's fourth major amendment to the Act would withdraw the advantages of trade agreements, which now go to everyone under the most-favoured-nation policy, from countries under Communist domination. The Senate Committee amended the clause so that concessions could be continued to countries such as Yugoslavia, and in this form the amendment seems to be acceptable to the Administration. In actual fact trade with Russia and its satellites is now almost negligible, as the result of export controls. These are also in the process of being renewed, but it is as a rider to an appropriation Bill that the attempt is being made to cut off economic aid to any country sending war materials behind the iron curtain. This move is avowedly directed against Britain, but since that country is now receiving little economic aid, it will hardly be affected unless the prohibition is extended to cover military aid as well. There is, however, talk of doing this in the House where, as in the Senate, the prohibition has bipartisan support.

Chicago in 1952

The Republican National Committee, meeting for the first time, symbolically, it hoped, in Democratic territory below the Mason-Dixon line, has chosen Chicago and the week of July 7, 1952, for the convention at which the party will choose its candidates. This means a late start in the campaign for the Republicans, and a later one still for the Democrats, who traditionally hold their convention afterwards—and in recent years in the same city. (The cost of setting the stage for a convention is now so high that the parties try to share it.) But the Republicans remember the confusion caused in 1948 when the log-jam of appropriation Bills at the end of the fiscal year was broken only a few hours before the convention met. Chicago is almost home ground for Senator Taft, but it was chosen for its wealth of hotel accommodation and the size of its hall—and the \$250,000 offered toward expenses. In 1944, when Chicago also edged out its competitors, the prize cost only \$175,000.

The Republicans now have the time and the place; they are convinced, too, and with reason, that with scandals at home in the past year, and all the doubts which have been created about the Administration's foreign policy, they have the best chance in twenty years of winning the election. All they lack is the man, but it is significant that no member of the committee took issue with General MacArthur's determination not to seek public office. Already, a public opinion poll shows that, given the choice between General MacArthur and General Eisenhower, the vote would run two to one in

TRANS WORLD AIRLINES

the latter's favour. By next year the party strategists suspect that the MacArthur boom will not only be deflated and forgotten, but also that if the Administration brings the Korean war to an honourable end, it may be a great disadvantage to a party to have tied itself too closely to General MacArthur's coat-tails. His self-denial, on the rather ironic line that a civilian should wield the supreme authority, might, however, be exploited to make it embarrassing for General Eisenhower to accept a Democratic draft if one were offered.

The Republicans' difficulty is that most of the horses in their own stable have worn themselves out in fruitless attempts to nose out President Roosevelt and Mr Truman; there was little enthusiasm at the three-day meeting for Governor Dewey, Governor Warren or Mr Stassen. Senator Taft, to whom most of the committee are loyal, arouses no certainty of victory in the hearts of his supporters, and he cannot fail to suffer from having been out in front too soon. General Eisenhower could win, but will he run? And for which side? In fact, the Republicans are united only on the Democratic candidate; they are convinced, though they have counted their chickens too early before, that if Mr Truman is renominated, he can be soundly beaten. Whether Mr Truman will choose to run again is doubtful, but the way in which the Democrats in Congress have closed their ranks under the MacArthur challenge is a warning that the Republicans cannot count on Democratic disintegration, as they did to their cost in 1948.

Bankers Tighten Their Belts

The Treasury's decision not to redeem some \$8 billion of 2 per cent bonds callable in September, the first such decision since 1933, is a reflection of the tighter money and higher rates prevailing in the market since the Federal Reserve System won the right to relax its support of government bond prices. Direct controls on consumer credit are also showing results, too many for the liking of television and automobile salesmen and their friends in Congress; instalment credit outstanding in March was \$500 million below the peak reached in December. New housing also is beginning to shrink, though less rapidly than was expected. Bank loans, however, as the chart shows, have risen without interruption since January, 1950, though more recent weekly statistics, for a smaller number of banks, suggest that with the liquidation of inventories the peak may have been reached, for the moment at least.

Federal Reserve officials would like bankers not to expand their loans beyond the figure reached in January and, where restriction is necessary, to tighten their belts at the expense of unnecessary and inflationary projects, not at the expense of the defence programme. To help lenders draw the line, and to prevent shopping around for loans, a Voluntary Credit

Restraint Committee has been created, on which life insurance and home loan companies are represented as well as commercial and investment banks. The committee, which began with a drive against inventory loans and credits for unnecessary capital expansion, has now appealed to the states and cities to exercise self-denial; their indebtedness is now nearly \$22 billion. Last year they raised more than \$3 billion in new funds. Some projects, such as building war memorials or granting bonuses to ex-servicemen, plainly should be postponed until deflation, rather than inflation, is the enemy. West Virginia has already had the shock of having one underwriting group refuse to bid on its \$67 million bonus issue, in the name of self-restraint. But most of the money is wanted for new schools, hospitals, roads and sewers, and some of these projects are directly attributable to the defence programme. Not many will be abandoned unless the government backs up the reserve authorities by refusing permits for the steel required.

Bankers hope, if they tighten their own belts, that they may escape more drastic compulsory measures. One of

these, under consideration by a committee headed by Mr Wilson, the defence mobiliser, and said to be favoured by the Federal Reserve Board, would require banks expanding their loans above a base figure to post heavy additional reserves. Such a formula would have to guard against penalising conservative bankers, and to be effective should apply to all banks; banks which are members of the reserve system would resent being singled out for new restraints, although they make nearly three-quarters of all loans. But non-member banks exercise great influence in the Senate Banking Committee. Congress will be reluctant to give the Reserve Board such controversial new powers if there are any signs that loans are dropping or that voluntary restraint is doing the job. The real test of the whole anti-inflation programme will not come, however, until the autumn, when defence spending gets into its stride.

THE WORLD OVERSEAS

Egypt's Uncertain Future

A GRAVE situation is fast developing in Egypt, where a virtual though undeclared deadlock has been reached between the British and Egyptian Governments in their negotiations for a new Treaty to replace that of 1936. Failure on the part of the two Governments to reach an agreement would not be dangerous were it not for the rapidly growing instability inside Egypt where corruption has increased with the ever-growing unpopularity of the Wafdist Government and the Palace. In January, 1950, when the Wafd were returned to power with a strong majority, it was hoped both in London and Cairo that, having the overwhelming support of the country, the new Government would pursue a realist policy, ignore the small opposition and sign a new Treaty with Britain (see *The Economist* of May 13, 1950). Within a few months it was apparent that Wafdist policy was not marching that way and that the Government of Nahas Pasha was determined to obtain better terms from the British than its predecessors. Mr Bevin had promised Sidky Pasha in 1946 that British troops would evacuate Egyptian soil by

1949, so, without making any allowances for the changed international situation since 1946, the Wafdist Government demanded the "immediate and complete evacuation and the unity of Egypt and the Sudan under the Egyptian Crown."

Fouad Serag el Din Pasha, who is both Minister of Finance and the Interior and the most influential member of the Cabinet, is not stupid. He doubtless believed that weakened postwar Britain would eventually give in to Egyptian demands because Britain had received neither moral support nor sympathy from the United States. The Egyptian Cabinet appeared to be sure that it would achieve its oft repeated "national aspirations," and the man in the café would then throw his tarboosh into the air and forget his troubles in his joy that the British were, at last, leaving the country. Today, despite events in Persia, the Egyptian Cabinet is not so certain that Britain will give way either over the immediate "evacuation" of troops or the Sudan. Fouad Pasha is deeply worried, for although he has given new life to the police state established by his predecessors of the Saadist Party, the Wafd no longer, as in the past, have control of the Egyptian mob, to use when the occasion demands riots. By corruption on a scale that is shocking even to the Egyptians themselves, the Government has managed so far to buy off opposition, but this becomes more difficult as the number of people to be bribed increases week by week.

The able and the rich Wafdist do little to help those two men in the Cabinet—the Ministers for Education and Social Affairs—who realise that the only way of maintaining internal stability is by the immediate introduction of social reforms coupled with an attempt to improve the standard of

living. Egyptian millionaires are fantastically shortsighted and it is truly amazing that they have managed for so long to pay so little and provide so few amenities for their diseased and unhappy workers and tenants. It is apparent to the *effendi*, or white collar class of the towns, that the recent cotton boom has increased the number of large cars; but the *fellah* who grows the cotton has not received an extra millime and he still subsists on from 1s. 9d. to 2s. 6d. per day.

The Moslem Brotherhood

Nahas Pasha has made his peace with the King because he is old and often ill and he wishes to ensure that the monarch will not again use his rights under the constitution to dismiss his Prime Minister. Co-operation with its traditional enemies in the Palace has, however, lost the Government much support in the country, largely because the King is generally unpopular. The publication of reports of the

recent arms trial has caused keen dissatisfaction in the army, which was previously loyal to the Crown.

A new and serious menace which has re-emerged on the Egyptian political scene is the Moslem Brotherhood, *Ikwan Musulmeen*. At present this powerful political and religious movement is uneasily controlled by the Government, but at any moment, should the Brothers disagree with the Wafd, they may pursue a policy of their own and attempt to achieve their ends

by acts of violence.

This important movement began in the early 'thirties as a religious organisation which later developed xenophobic and strongly anti-Jewish tendencies. Doubtless inspired by the uniform-loving Nazis, the younger members formed themselves into para-military units and gave some assistance to the Palestine Arab terrorists just before the war. But it was not until around 1944 that the Brotherhood became a serious political force and there is no doubt that funds were contributed by the Palace in the hope that this right-wing organisation might succeed in becoming more powerful than the Wafd, or at least a serious rival to it. Branches were formed in all the larger towns, club houses established and a really active membership of over half a million was built up. There is no doubt that during this period the terrorist groups were infiltrated by Moslem Communists, some of whom had been trained in Beirut. The Palace was alarmed because the movement had grown too strong and it was no longer willing to take orders, so subsidies were cut off, with the result that threats and acts of violence began. The bands

were well armed with weapons and ammunition stolen from the Allied forces.

The Saadist Government then in power was relieved when it could send units of the Brotherhood off to Palestine to fight against the Jews. Apparently they fought well, but the Brothers who stayed behind were a real menace in the country. Nokrashi Pasha, the Prime Minister, declared the Moslem Brotherhood illegal and although he was assassinated by a member of the Brotherhood a month later, the force of the movement was broken. Hundreds of local leaders were arrested, funds and property were confiscated and the founder and leader, Hassan el Banna, was shot by an unknown (or at least unpunished) assassin in the spring of 1948. For the next few months the Saadist Government of Abdul Hady Pasha devoted itself to rounding up Brotherhood cells and caches of weapons whilst other departments of the administration were neglected. Then the Brotherhood remained underground, first waiting for an election, and then, after January, 1950, waiting to see what the Wafd would do.

By last autumn the poor *effendi* classes of the towns had accepted the fact that the Wafd were working with the Palace and that there was now no hope for the implementation of electoral promises for social reform and the abolition of the inksome restrictions of martial law. The Brotherhood then began seriously to reorganise their movement underground. About five thousand former members who had maintained contact with one another were willing and anxious to begin illegal work. The Brothers were joined by many disillusioned Wafdist of the left, whilst para-military bands reformed and restocked their secret dumps. Soon the illegal movement grew strong enough to organise public demonstrations. However, before the Brotherhood was formally legalised on May 1st, Fouad Pasha passed a Bill through the Chamber which restricted its activities to religious and social affairs and attempted to prevent it from playing a political role. While the Deputies were discussing this Bill the Brothers organised a lightning demonstration outside the Parliament building. Fouad Pasha, instead of ordering the organisers to be thrown into prison as everyone expected, received the new leader, Saleh Ashmawy.

Bitterness Towards Britain

The revival of the Brotherhood decreases the possibility of a new Treaty with Britain as it is strongly encouraging the Government to abrogate the 1936 Treaty and to "throw out" the British. It is a little difficult to see what difference this would make to the position of the British Army in the Canal Zone. Certainly the Egyptian Army would not attempt to drive the British out by force and any measures taken to deprive the residents of the Suez Canal area of labour, food or water would cause far more discomfort to the million odd Egyptians resident in the area than to the British.

The Egyptian Government has cause for alarm. Nahas Pasha believes he has a charmed life because he has escaped three attempted assassinations. But other members of the Cabinet are not so confident; they remember that two Egyptian Prime Ministers have been assassinated since the war. The intelligent observer must wonder why, in view of the delicate internal position, the Egyptian Government does all in its power to deepen the gulf with the British Government. The Egyptians are bitter because the British refused to supply them with arms whilst they were fighting in Palestine and even now will not sell to the Egyptian Army outmoded armoured cars which are advertised in English magazines. The Egyptian insists that the British are breaking their Treaty pledges and in addition have shown no sympathy to them in their dispute with Israel. These real or imaginary grievances must be discussed and, if possible, remedied. They do not, however, excuse the Egyptian Cabinet for their unrealistic attitude. While they play, the few Communists in their midst are working hard.

The Franco-German Saar

[FROM OUR SPECIAL CORRESPONDENT]

"Auf die Bäume, die Pfälzer kommen!" ("Get up into the trees, the men from the Palatinate are coming!"). This old Saarland saying is being revived half ironically in Saarbrücken today as the waves of German nationalism lap against the eastern frontier of the autonomous provisional state. It was Hitler who brought in the *Pfälzer* and put them in all the good jobs from *gauleiter* downwards. (The Kaiser on the whole had preferred Prussians, who made an excellent thing out of it too). The Palatinate is poor and the Saar is rich. Hence the former's desire to do a little *péréquation* with the latter. For the moment the Saar is governed by Saarlanders, of whom all opposed the Nazis and almost all left the Saar after the plebiscite of 1935. How long this regime will last depends upon the firmness of France, which, in virtue of several agreements, is responsible for the fate of the Saar; upon the good faith of the United States and Great Britain, which have explicitly supported the present regime until the peace treaty with Germany is signed; and upon the virulence of German feeling and the degree of pressure which German politicians can bring to bear on the Allies.

All that is now certain is that the German Social-Democrat party under Dr Schumacher and the neo-Nazi rally of ex-General Remer are giving their energetic backing to the recently-formed Saarlander party of Herr Richard Becker (DPS) which under the omnibus slogan "*Christlich-Sozial-Deutsch*" is trying to build up a kind of German front within the country. The Saar government banned one of the meetings of the DPS at the beginning of this month in defence of the Saar constitution of 1947, which proclaims the political separation of the Saar territory from the German Reich. This rally was to have been supported by prominent Bundestag deputies belonging to Dr Adenauer's Christian Democratic Union. In April a European Socialist Congress held in the Saar at Sulzbach was attended by a delegation of German Socialists led by Herr Eichler (also German delegate at Strasbourg). When in his opening speech Herr Eichler greeted his colleagues, the Saar Socialists, with commiserations upon their separation from the Federal Republic, he was soundly booed and had to change his tune. Eichler's performance drew reproaches from French delegates at Strasbourg last week.

It is probable that these German attacks on the detachment of the Saar will come to nothing and that the Germans stand no chance of getting the Saar back except as a *quid pro quo* in some high political deal. The attitude of M. Schuman (most conciliatory of French Foreign Ministers towards Germany) seems to be stiffening. When the Saar government was not allowed to participate in the signature of the Schuman Plan, Colonel Gilbert Grandval, French High Commissioner, offered his resignation as a gesture of personal solidarity with the Saarlanders. It was not accepted. The fact, therefore, that M. Grandval remains at Saarbrücken is evidence of the determination of the French Government to maintain the interests both of France in the Saar and of the Saar *vis-à-vis* Germany. M. Grandval's great personal prestige in the Saar is in itself a guarantee that the continued relationship between the Saar and France will be firm and friendly. The French High Commission is shortly to be changed into a body of a more diplomatic type, and in return the Saarlanders will appoint a minister to Paris.

What is the economic situation of the Saar within the framework of the customs union with France? The original benefit which the Saarlanders gained from the political detachment from Germany and the economic attachment to France was, of course, exemption from dismantling and from occupation costs on the German scale. At the same time essential consumption goods could be imported into the

Daguerre was lucky...

Daguerre knew he could never use silver iodide photographic plates for portraiture because they needed an exposure of several hours to change colour. One day in 1831, a discarded set of very much underexposed plates was put in a cupboard in which there was also a dish of mercury. Looking at them later, by chance, he saw that a strong image had developed. From this came the portrait 'daguerrotypes', exposed for only a few minutes and developed by fuming with mercury vapour.

... But we don't rely on accidents

Discovering facts which enable better materials and processes to be developed is more often a matter of patient investigation and extended trials than of luck. We do not rely on the happy accident. We have a well-equipped Research Laboratory and a staff of experienced metallurgists and engineers. Their approach is scientific and their object is to overcome difficulties in fabrication and to develop improved materials to do a practical job.

If you have a problem affecting the choice of a material, write to us about it—our services are freely at your disposal.

The MEMOBELT has revolutionised office dictation!

FIFTEEN LETTERS or more on a little plastic belt! That is only one of the amazing developments in office dictation made possible by the Memobelt, the new recording medium of the Dictaphone Time-Master.

MORE DICTATION

Fifteen minutes of solid dictation goes on to each Memobelt; fifteen minutes of notes, letters or memoranda for your secretary to type when it is most convenient. Memobelts fold flat for compact filing and up to ten can be posted for 2½d. in a standard envelope.

EASIER DICTATION

The Time-Master is extremely simple to operate—there are no time-wasting controls to set or adjustments to make. It is designed to achieve the maximum efficiency with the minimum of effort both when you dictate and when your secretary transcribes.

BETTER RECORDING AND REPRODUCTION

Time-Master recording on Memobelts is crystal-clear from beginning to end. The sensitive microphone catches every word you say—even a whisper: this makes transcription both easy and accurate for secretaries.

Write for TIME-MASTER literature to Dictaphone Co., Ltd.

territory. Since out of a population of 935,500 the severely wounded, the widows and the orphans amounted to 77,000, one of the main tasks of the Saar government was to establish an insurance system (Hitler had pillaged the old social insurance reserves to build up the war industry). This the present authorities have succeeded in doing, so that at the present time Saar pensions are more than double those obtained by Federal Germans. The Saar towns were seriously damaged (nearly half Saarbrücken was destroyed one afternoon in the autumn of 1944), but now, in 1951, a great many new houses have been built—more quickly than in Germany or France. Above all, there is almost no unemployment. The Saarlanders will know that reunification with Germany would entail three evils: the loss of the markets in the franc zone which have been secured not without great effort during the last four years; an influx of East German refugees settled by the Bonn government; and subjection to the Federal German levy for the equalisation of war damages (*Lastenausgleich*). None of these prospects is attractive. There is also the historical fact that, after the return to the Reich in 1935, Hitler had to levy a special tax on German industry (*Saarpfennig*) with which to subsidise the heavy industry of the Saar. One natural market for Saar coal and steel is, it is true, South Germany. But better business can be done elsewhere. Since the Korean war French heavy industrialists, who were reluctant to facilitate the business connections of Saar producers, find that there are markets enough for all. The *Comptoir des Produits Sidérurgiques* in Paris is happy to sell Saar steel at the same astronomical price as French.

Fiscal Unity with France

The integration of the Saar into the French economy has necessitated harmonising its fiscal system with that of France. This is confirmed by certain measures in the Convention of March, 1950. The Saarlanders are required to impose the French indirect taxes—production tax (14½ per cent), the transactions tax and consumption tax (on petrol, alcohol, *apéritifs*). This revenue is sent to Paris, and in return Paris grants the Saar 1/46th of the total revenue of France under this head. (The Saar contains 1/46th of the population of France-Saar.) The Saarlanders gain considerably on this deal for the reason that the production tax on coal and electricity—two of the principal products of the territory—is not 14½ per cent but 5.5 per cent. Neither do they care for *apéritifs*. Direct taxation, in order to compensate the increase in the indirect taxes, is much reduced in the Saar in comparison with the prewar level.

The Saar is well on its way to becoming the link between Federal Germany and Western Europe—the kind of *trait-d'union* on which pre-1914 Germany used to thrive in Eastern Europe and which was obliterated by National Socialism with its policy of turning German economic settlers outside the Reich into agents of Nazi domination. When Dr Schumacher storms against the alliance of heavy industry and the Vatican, of which he imagines the Saar (betrayed by Dr Adenauer) to be the victim, he seems to overlook the fact that his internal allies are not the Saar Socialists, who in coalition with the Christian-Democratic Party have reconstructed the country, but elements deriving from the reactionary wing of the old *Zentrum* of imperial Germany. The party of Herr Becker is really the party which objects to the present social security system of the Saar and wishes a renewal of the freer economy of pre-1914 Germany. This return, not indeed to Nazism, but to the heyday of German industrialism, would be symbolised by the Mercedes for the businessman and the braid uniform for the railway porter. (In France-Saar only the stationmaster has a smart hat.)

The Saarlanders are Germans who have no intention of becoming French. They may visit Germany showing simply their identity card at the frontier and any federal German who has a passport may visit them. If left with administrative autonomy the Saar will certainly be the nucleus of the European activity which France and Germany both acclaim.

The Gold Coast Since the Elections

THE honeymoon period in the Gold Coast is not yet over, and no one dares to predict with confidence how the country will settle down to its new status. At the moment, British officialdom is assisting the new African Ministers with exemplary correctness and decorum, and the Africans are responding with a pleasing sense of public responsibility. Mr Nkrumah's Convention People's Party is not tied by any sharply-defined domestic programme which it feels called upon to rush into legislation, and until this week no big controversial issue had blurred the CPP's election triumph of last February.

But the first serious clouds are now on the horizon. The Cocoa Control Board has built up a reserve of £53 million and many covetous eyes are cast on this fund. A Bill has

been introduced into the Assembly giving the Government power over the expenditure of these funds, the intention being that they should be used to carry out Mr Nkrumah's political programme. This has evoked furious protests from the cocoa-farmers, who have cabled the Secretary of State pleading that the Ordinance be disallowed by the King and complaining that Mr Nkrumah and the Governor have completely ignored their representations. The Governor is flying immediately to London to consult the Colonial Office, and the CPP is swallowing the first dose of unpopularity which is inseparable from the exercise of power.

A slight skirmish with danger occurred earlier over the highly-emotional issue of cutting out diseased cocoa-trees. This has always been a matter for hatred among the farmers, and was used by the CPP in its election campaign as a good example of the cold-blooded British indifference to the destruction of the livelihood of African peasants. The Government has consistently claimed that it knows no alternative to cutting out the trees, if the industry is to be saved. When Mr Nkrumah took office as Leader of Government Business, he and the new Minister of Agriculture visited the research stations and consulted the scientists. As a result, the cutting-out campaign was suspended for a month while a special committee studied the methods by which it was organised. This was a reasonable thing to do, as the methods were by no means perfect and had inspired such deep hostility. But Nkrumah has shown a readiness to accept necessary, if unpleasant facts, which bodes well for the future. There is no longer any talk of abolishing cutting-out altogether, unless new methods of pest control, now being tried, should prove successful.

Thus trouble signs are emerging not from irresponsibility on the part of African Ministers or from differences between them and the Europeans, but from a difficult peasantry. This is leading to uneasiness on the CPP back benches and also giving a lever to the Opposition in the form of Dr Danquah. Danquah, at one time the leading politician on the Gold Coast, was the spirit behind the Gold Coast Convention, which first gave Mr Nkrumah his chance as its Secretary. Danquah now sits in relative isolation in the House of Assembly; his only feasible method of recapturing popular support is by proving to be more revolutionary, more daring, more a man of the people, than is Mr Nkrumah himself. To this end, when the new Assembly was formally opened and an address of thanks to the King for the new constitution was loyally moved by the CPP leaders, it was Danquah who refused to support the motion. He spoke bitterly against the inadequacies of the constitution, called for "immediate self-government," and taunted Mr Nkrumah for working a constitution which he had publicly dubbed as "bogus." On April 24th Danquah moved a resolution calling for the appointment of a commission to draft yet a further new constitution giving the Gold Coast full Dominion status. Thousands of people gathered round the Assembly building to hear the debate, and to think their own thoughts when a CPP minister, replying for the Government, condemned the motion as a political stunt. "What would the world think of us, if, without giving the new constitution a trial, we embarked on another one?" he asked.

Nevertheless, the back-benchers, with their erstwhile thunder stolen, and confronted with a turbulent array of cocoa-farmers, feel a little disturbed. Everything now depends on what practical results the Government can show in terms of domestic betterment. What *proof* can be given the people that now, under their own freely-chosen Government, they will enjoy more of the good things of the earth? It is extraordinarily unfortunate that this testing period coincides with the new austerities inherent in world rearmament. There are bound to be supply shortages which will retard the many development projects which are being planned, and it will bear hardly on the Colonial Office to ensure, for the sake of the success of this particular political experiment, that the Gold Coast is given what will amount to a privileged position, in future allocations of equipment and materials.

The Volta Scheme

But to balance the misfortune of the new tightness in the supplies position, there is the good fortune that the plans for the Volta scheme, heartily supported by Gold Coast politicians, is reaching maturity just at this time. This is a scheme which is expected to cost at least £100 million. Its fulcrum is an impressively large hydro-electric project, the main outlet for the electric power being the manufacture of aluminium from the nearby bauxite deposits. Subsidiary to this would be a new railway line and a new seaport—the coast has been surveyed for a site for the port, and dam sites for the power project have been proposed. Furthermore, it is intended to irrigate an area of 500,000 acres in the Accra plains by means of a canal from the proposed reservoir.

Every sort of expert advice has been brought in to the preparation of this scheme. A London firm of consulting engineers has carried out the main survey, and has worked in conjunction with Government geologists, soil scientists, topographical surveyors and medical experts. Aerial photography is being done by the RAF; drilling operations are in the hands of Aluminium, Ltd. of Canada, which is working the bauxite deposits. The great problem is, of course, finance. Some capital will have to be raised in London, and special legislation may be required. There has been talk of using some of the Cocoa Fund, but, apart from the farmers' opposition, this will not be easy. This money cannot be lightheartedly tied up in long-term investment; £35 million are, for instance, allocated to a special price

stabilisation reserve, to provide security for the cocoa-growers if prices should fall.

It is reckoned that a scheme of this sort would take six to seven years to carry through; it would provide handsomely for new employment, and the improved electricity supply would encourage new industries. The better road and rail facilities would open up new areas, as would the inland waterway. Understandably enough, there will be powerful political pressure in the Gold Coast to proceed with this ambitious project; if it is successful Mr Nkrumah and his friends will be firmly established in public esteem and the new constitution will be considered to have justified itself.

For there is this tricky feature in the Gold Coast situation—the present political experiment will stand or fall, not on its own merits, but on what is done on the economic front. The less impressive the economic achievement, the louder will be the cry not for less but for more self-government. All setbacks will be attributed—at least, by the politicians—to the simple fact that the Gold Coast is not yet a full Dominion. Give it Dominion status, so it will be argued, and all problems will be solved overnight. But whichever way the tide of fortune turns, many observers doubt whether the present constitution—which gives so much but not quite everything—will satisfy African nationalism for even as long as a decade.

Singapore and the Rubber Embargo

[FROM OUR CORRESPONDENT IN MALAYA]

THE banning of rubber exports to China hardly took Malaya by surprise. It had been felt that destination control, announced in Singapore on April 9th was only the prelude to embargo, for if the intention was to reduce Chinese purchases of rubber to a level approximating to normal civilian consumption then there could be no more sales for the rest of the year. Direct shipments to China in the first quarter of the year totalled 22,672 tons, roughly the 1947-49 average. Another 31,819 tons had been shipped to Hongkong, and it was to be assumed that all of this also would find its way eventually to China. Hongkong retains next to nothing of its rubber imports. In the first quarter, therefore, China acquired over 46,000 tons of rubber, making 123,000 tons since the Korean war began. In the preceding six months sales to China and Hongkong together came to less than 6,000 tons.

There was some hard thinking between the enforcement of destination control and the announcement in London of the British ban and the request to Malaya to act. It would be untrue to say that Malayan opinion was ahead of British, but there was certainly an uneasy feeling that it was morally indefensible to continue sending rubber to the Communists while America, shouldering the main burden in Korea, was having to restrict the use of natural rubber and while Malaya itself was fighting its own war against Communist Chinese. At any rate, the embargo on exports has been accepted without criticism, whereas destination control on the whole was opposed. In both Legislative Councils, Singapore and the Federation, European unofficials were among those who questioned Whitehall's directive to Malaya to restrict exports to China. But no one yet, either in the rubber trade or out of it, has publicly objected to the ban.

The swing in opinion is explained by several factors, including the great American debate which has been given wide publicity in Malaya, and which has found the Chinese press leaning towards MacArthur. Destination control also had a poor reception because it was presented not as a strategic necessity in the sense of depriving China of war supplies, but as a measure that would assist the United States

Tradition

When in 1485, King Richard the Third cried:—"A horse! a horse! my kingdom for a horse!" a Catesby was there to serve his need.

Successive Generations of the House of Catesby offer the same tradition of service to the Leaders of Commerce and Industry of to-day in Catesbys Office Furnishing—for a complete new office or a single item we invite your enquiry to our Director of Contracts.

"South African Sherry" for me every time

So I've converted you, too, then?

You certainly have! Do you remember you told me to look specially for the fine South African sherries. Since then I've found some which are just exactly to my taste. And don't you find them easy on the pocket, too? That means something these days!

Yes, how is it they can send us such remarkably good wines at such a reasonable price?

Well, there are two reasons: that amazing climate of theirs at the Cape, and then the Preferential Duty.

No wonder South African Sherry is becoming so popular, then.

It deserves to be. Do you know they've been making wine in South Africa for nearly 300 years. With all that experience behind them and the splendid organization they have now built up, they're able to produce the very highest quality. Their really fine wines are matured for many years before they're shipped to this country.

I suppose we can now say, then, that South Africa is one of the leading wine producing countries?

Well, wouldn't you say it was, from the taste of this sherry? Let me fill your glass!"

to build up its stockpile. In Singapore the Colonial Secretary injudiciously coupled the problem of stockpiling with the inflationary results of prices stimulated by competitive buying, an unsympathetic comment at a moment when the General Services Administration (GSA), the sole American buyer, was preparing to hammer the price. Between April 9th and May 10th, when the ban was announced, rubber fell by 70 cents (approx. 1s. 7d.) a pound, or nearly 80 per cent more than rubber was worth before sterling was devalued.

There was also the comfortable feeling that if there were any objection to sales to China on strategic grounds, it would be for Britain to say so. As recently as February, the Secretary of State for the Colonies, Mr James Griffiths, told Parliament he thought that heavy Chinese purchases could be explained by the wish to buy quickly before the price rose still further. There has been British control of strategic materials for some months, and if Britain was satisfied there seemed no reason for doubts in Malaya. The rubber industry could hardly be expected to take the Singapore Government's view of the dangers of price stimulation.

It is too early yet to judge what will be the final effect of the ban on the price of rubber. It really depends on the Americans, and whether the GSA seizes the chance for a little more hammering. The industry has not approved the Administration's recent activities, and fears that now that there is no Chinese competition in the Singapore market the Americans will let the extra 17,000 tons a month drag down the price. But it must be expected that China will now turn to Indonesia and possibly Ceylon, and Singapore's immediate anxiety is the threat this represents to the entrepot trade in Indonesian rubber. Last year 361,357 tons of Indonesian rubber came to Malaya for marketing in Singapore. A great deal of it is processed by Chinese mills in Singapore, and it is a profitable business both for Malaya and Britain. Although Indonesia gets American dollars for any rubber sold to the United States, the processing adds to the Commonwealth's dollar pool.

It will be difficult for China to buy what it wants in Indonesia, but it will not be impossible, and the chances are that some Chinese millers will consider transferring operations to Indonesia. This possibility has been suggested whenever restrictions on trade with Communist China have appeared likely, and if Indonesia's first reactions to news of the British ban are also its last, then invitations to Singapore Chinese millers to operate in Indonesia must be expected. The flow of Indonesian rubber has recently been greater than ever. Malayan imports for the first quarter of this year totalled 130,000 tons.

The question of unfulfilled contracts to China is not regarded as a serious problem. It has been the practice for sellers to wait for the cash before concluding contracts, a circumstance which finds market opinion in general opposed to any idea that the British Government should feel itself obliged to take up any rubber allegedly sold, but now banned from export. About 20,000 tons was bought in April and 9,000 tons was shipped.

New Zealand's Waterfront

[FROM OUR WELLINGTON CORRESPONDENT]

It is easy to exaggerate the extent of violence and intimidation in the New Zealand waterfront dispute. New Zealanders who are unused to these demonstrations—the last of them occurred during the depression riots in the 'thirties—are apt to exaggerate the importance of what has occurred. New Zealand politicians, who have less reason to be surprised, cannot be blamed for giving the demonstrations their full value in anti-strike publicity; and Australian newspapermen, who have bustled across the Tasman Sea with raised blood pressures after their own elections, have found New Zealand's difficulties headline-provoking.

The extent of the violence and intimidation can be briefly summarised. It began with an unsuccessful attempt to dynamite a bridge giving access to opencast coal workings in the Waikato. The attempt was only discovered after an early morning workmen's train had safely negotiated the bridge. Repairs were quickly made and the bridge, like all others of importance, is now under guard. There were three vicious attacks upon two officials of the newly registered Auckland Waterside Workers' Union. Two of them were against the then president of the union, Mr R. S. Belsham, who was beaten up in his own home and on his own doorstep. The third concerned a member of his executive who was lashed across the face with a length of bicycle chain. Both officials have since resigned and been replaced. Then there were three street demonstrations by strikers, one in Auckland and two in Wellington. In these, several hundred men took part, but in all three the police had full command of the situation. There was also a reported attempt to intimidate a member of the emergency volunteer corps in Wellington by beating him up just after he had enlisted, and in the South Island two amateurish attempts were made at sabotage.

Civil Emergency Corps

In addition to these overt acts, there has been an intensification of the flow of anonymous leaflets and pamphlets issued in support of the strikers. Some of these vilify individuals; some purport to give the strikers' side of the dispute. The majority are highly inflammatory. There has been a number of instances in which the word "scab"—much in use in this dispute—has been painted or chalked on the houses of men who have taken leading parts in forming new unions. In at least two cases, the epithets were placed on the wrong houses. There has also been a good deal of finger-pointing, whispering and anonymous scandalmongering. In the sum total, all these incidents, though they are disturbing, do not justify some of the language used to describe them. There is a reckless and lawless element among the strikers which will stop at nothing; but there is no indication that this element has control and no indication that the New Zealand police, backed by the services, are not well able to control it.

The Government's move in calling for the recruitment of a volunteer civil emergency corps is largely precautionary and admonitory. The response has been immediate and is an indication that the public only needs to be told what to do to back the forces of law and order and it will do it. It is unlikely, however, that more than a small number of the volunteers will be used. Some are already being employed in Auckland to guard the homes of new unionists. But the chief effect of the volunteer guard is as a moral deterrent. The Government by acting promptly has now a force of over 12,000 men available for use if required.

Apart from this move, which is in no way an indication that it has lost control of the situation, the Government has done little more than ensure that adequate numbers of police are available where they are likely to be needed and make an impressive display of force in protecting the operations of the new waterside union in Auckland. Strikers who tried to march on the Auckland wharves last week, when the new union began work, were confronted by several hundred police backed by servicemen in war kit and unlimbered fire hoses. After the strikers' scouts had reported this reception committee, the march dispersed.

The Government's use of the emergency regulations has been strongly attacked by the leader of the Labour opposition, Mr Walter Nash. He maintains that the refusal of the Auckland City Council to allow him to address a public meeting on May 22nd in the Auckland Town Hall was really dictated by the police; and that the Government is using the regulations and the present situation to upset the British traditions of freedom and free speech. In fact the council's decision was made entirely by itself. Mr Nash also complained that the Government has refused to allow members of the Opposition to use the State owned radio service to discuss

Has nobody told you, Mr. Grigson?

Most drivers take the underneath of a car for granted, but industry cannot leave protection from rust to chance. Among the most effective methods of rust removal and rust prevention are those calling for phosphoric acid. Albright and Wilson's phosphate products in many different ways, often anonymously, are giving manufacturers what they want—to provide the better goods which the public needs.

the strike, and that Cabinet Ministers have used the radio to give the public a one-sided picture.

It would be misleading to pretend that there are not misgivings in New Zealand about the employment of arbitrary regulations which, if they were fully applied, would have all the effect of martial law. Nevertheless these criticisms are mainly on the score of principle rather than that of practice, for the regulations have so far been very moderately interpreted and sparingly enforced. The strikers are still, for instance, quite openly receiving and distributing supplies from relief depots and are well known to be receiving monetary help from sympathisers both inside and outside the country. The Prime Minister has said that he has no intention of employing OGPU or Gestapo methods to stop this, and so far he has been as good as his word.

“Hoggenheimer” Rides Again

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE South African Nationalists play a complicated game of politics with only three well-thumbed cards. These are the black bogey, the British connection, and “Hoggenheimer.” This three-card trick has, however, had surprising successes. It put the late General Hertzog into power in 1924 and kept a Nationalist Government going from that date until 1933; and it put the Nationalists under Dr Malan back in power three years ago, just as if there had been no fusion, no war, and no General Smuts.

The black bogey and the British connection are never in discard, but it is sometimes advisable to hold them in reserve for a time. Then it becomes the turn of “Hoggenheimer.” The name is the creation of a brilliant political cartoonist called Boonzaier, who in the mid-twenties attached it to a paunchy, cigar-smoking capitalist obviously purloined from the Labour Press. “Hoggenheimer” represented “money power,” which in South Africa has traditionally meant the gold and diamond mines. It is no accident that “Hoggenheimer” rhymes with Oppenheimer.

The first hint that “Hoggenheimer” was about to reappear on the political stage came some months ago in the form of some ambiguous phrases from the Nationalist Minister of Economic Affairs, Mr Eric Louw, an indefatigable smeller out of United Party plots and stratagems. Mr Louw, in the midst of a discourse on import control, rambled into a tirade against business men who bit the Ministerial hand that fed them. Well used to Mr Louw's grumbles about his constantly nibbled hands, the general public, and even most business men, detected no cause for undue alarm, even though Mr Louw warned that those who deliberately tried to harm the Government could expect no great favours from it. The real eruption came in Parliament, when Dr J. H. Looock, a former Smuts supporter who has joined the Nationalists, darkly described a mysterious dinner (held either in Johannesburg or in Cape Town: Nationalist versions vary) at which sinister mining magnates decided to contribute £1,000,000 (“what is a million to them?” asked Dr Looock scornfully) towards the overthrow of the Nationalist Government. Dr Looock explained that one part of the plot was to buy over “outstanding Afrikaner intellectuals,” and added modestly that he himself had been offered a good slice of the £1,000,000, but had rejected it with contempt.

The Nationalist campaign then began in earnest. Dr Malan's paper, the *Burger*, protested in the sacred name of democracy against the United Party becoming the “chosen instrument of the money-power.” The *Volksblad* (Bloemfontein) spoke, in the same breath, of “sinister money-power” and “£1,000,000 for spreading the doctrine of

liberalism.” The *Transvaler* went better than either, disclosing to its presumably horror-stricken readers a “dastardly plot” whereby the mining and industrial magnates would dismiss workers, while simultaneously the rich merchants would “withhold scarce commodities and goods essential to the home,” the aim being chaos, misery and the climbing back into power of the United Party. “This plan,” said the *Transvaler*, “has been framed in close co-operation with the United South Africa Trust Fund.”

The villain of the piece then replied. Mr Harry Oppenheimer, MP for Kimberley and son of Sir Ernest Oppenheimer, explained in Parliament that he had indeed, some eighteen months ago and in consultation with General Smuts, formed a body called the United South Africa Trust Fund, the aims of which were to promote racial tolerance, uphold democracy and defend the Constitution. For these aims, Mr Oppenheimer at first refused to apologise. He did not deny that as the United Party's programme seemed to fit in with the Trust's aims, it would very likely be eligible for support from the Fund. He did not conceal his personal view that, judged by its present political programme, the Nationalist Party was unlikely to qualify for a share of the £1,000,000 (which incidentally is merely a target and one which is very far from having been achieved by the Fund).

Warning to Businessmen

It was not to be expected that Mr Oppenheimer's explanation would cut much ice with the Nationalists. The Minister of Native Affairs, Dr H. F. Verwoerd, warned businessmen that they had no right to “mix up their duties with politics.” That was what, in South America, produced bloody revolutions. Dr Albert van Rhyn said if this sort of thing went on, the Nationalists might seriously consider nationalising the gold mines. History was repeating itself with a vengeance. In 1929, the MR for Kimberley had faced an identical tumult. Kimberley at that time was represented by Sir Ernest Oppenheimer. He then declared: “We mining and industrial people are told that if we meddle in politics—which means if we support the Smuts party—we shall be punished. We are part of South Africa, and an important part. We have every right to be heard. We will not be underdogs.”

Last year, speaking at a banquet in honour of Sir Ernest's 70th birthday, the Nationalist Minister of the Interior, Dr T. E. Dinges, said: “He (Sir Ernest) has always shown an unwavering faith in and an unswerving loyalty to South Africa. That faith . . . attracted capital from overseas and helped us to develop this country.” Despite these tributes to capitalism and a great capitalist, the opportunity given by the creation of the United South Africa Trust Fund, to parade “Hoggenheimer” once more, has proved too good to miss. The Nationalists' campaign is not going badly. Mr Oppenheimer has already been forced on the defensive. In a speech to his constituents at Kimberley, he was obliged to deny either that his Trust Fund wished to destroy the colour bar in industry (as alleged by the Nationalists), or even that it upheld the United Nations Declaration of Human Rights. Mr Louw, himself a former South African delegate to the United Nations, quickly pointed out that “the Trust upholds ‘the fundamental rights of man as recognised by the member-States of the United Nations’; this concluding phrase in the Trust Fund's objectives is clearly intended to refer to the whole Declaration of Human Rights and Freedoms.”

Most outside observers will think this a not very damaging point for Mr Louw to score. It is symptomatic of the present state of affairs in South Africa that so apparently innocent an objective may prove very damaging indeed to its sponsors. This state of mind goes far to explain how the Nationalists can talk about “capitalism” and “liberalism” as synonymous terms, one as objectionable as the other, and proceed, not unsuccessfully, to force their opponents to half-deny that they support either of these obnoxious things.

Aspects of enterprise

No. 15.

An important development in flour mill design is a pneumatic method of sucking the mill products through pipes instead of using mechanical conveyors and elevators. This gives a cleaner layout, and because it needs less space it reduces the building costs; it has many other technical advantages. The Simon patented pneumatic system uses about one-third of the power consumed by other pneumatic methods. Many new Simon mills are being designed on this system and many others converted to it. This is an example of the Simon principle of doing things better and more cheaply.

The Case for Monetary Policy—III

An All-round Rise in Rates

A TIGHTER monetary policy needs to be brought to the aid of the Chancellor's budgetary effort at disinflation if the degree of inflation in Britain is to be kept within reasonable bounds in the next few years. This does not mean that there must be a sudden swing from cheap to dear money; monetary weapons can be very sensitive and much could be achieved by quite moderate tactics. The full advantages of using monetary techniques to reduce the pressure of excessive demand would not be reaped, however, merely by operations designed to reinforce the rising tendency of rates in the gilt-edged market. The real need is for a more comprehensive and flexible policy than this; and for this purpose the first essential step is to drop the present abnormal system whereby bank "cash" is in effect created automatically to meet any demand that the commercial banks put upon the discount market. The Bank of England should reaffirm the traditional rule, invariably followed before 1939, that any releases of credit to the market or the banks at rates below Bank rate are made solely upon its own initiative. This termination of the unnatural system of "automatic" creation of cash would give a salutary warning to the banking system, and might have powerful effects even though the Bank remained quite liberal in its releases of credit. It was argued last week that these two lines of policy, acting in conjunction with budgetary disinflation, might exert a sufficient restraint (or at least as great a restraint as the Government was prepared to countenance) without provoking more than a moderate rise in short-term rates.

It is not certain, however, that this would be so; the policy has to feel its way, and much would depend upon the skill of the authorities. If the degree of inflation was still disturbing and if the authorities were determined to combat it, they might have to reconcile themselves to a temporary rise in transitional unemployment somewhat beyond the levels they are willing to contemplate now. But whether or not that were so, they would need a still tighter monetary policy—more particularly if they were not prepared to meet the second and third instalments of arms outlays by budgetary retrenchment, notably in social services.

At this point the policy of gradually tightening the rein upon the short loan market would inevitably provoke a more general advance in rates, and this would also become desirable in itself. Tradition might suggest that the right step then would be to raise Bank rate; on the other hand, it is commonly argued that Bank rate has long been deprived of all significance—because, except for the few weeks following the outbreak of war, it has not been changed since 1932, and especially because Dr Dalton moved the whole structure of short rates in 1945 without altering it. In fact, neither of these arguments is reasonable. Bank rate, even now, is still

the minimum rate at which the Bank of England, as the lender of last resort, is obliged to buy (or lend against) approved securities from those who have access to its facilities. The reason why Bank rate has exerted no effect for so many years is simply because the discount houses have always felt sure that they would never be obliged to go cap in hand to seek aid on these terms. Since this assurance rests upon their present virtually automatic right to sell bills to the "special buyer" at the market rate, the withdrawal of this right, unless very carefully staged and accompanied by liberal behaviour by the special buyer, would at once make the level of Bank rate a real contingent factor in their calculations. On the other hand, the margin between the present Treasury bill rate of a shade over $\frac{1}{2}$ per cent and Bank rate of 2 per cent is so wide that the authorities, if they operated skilfully, would find that a large measure of credit restraint could be exerted before it became necessary to raise Bank rate.

★

Necessarily, these first steps towards restoring conventional relationships that have been distorted for so long could not follow any precedent; the nearest parallel would be the Daltonian move of 1945. On that occasion, the originating move was the Chancellor's decision to reduce by $\frac{1}{2}$ per cent (to $\frac{3}{8}$ per cent) the rate paid to the banks on Treasury deposit receipts. But in the circumstances now envisaged, the gradual advance in market discount rates, bank call money charges and Treasury bill tender rates in response to tighter short loan conditions would presumably have been accompanied by roughly parallel adjustments in the TDR rate. This advance in rates could not surpass $\frac{1}{2}$ per cent (and conceivably could not much exceed $\frac{1}{4}$ per cent) without logically requiring an increase in rates allowed by the banks on deposit accounts; in the unlikely event that the banks did not voluntarily raise these rates by $\frac{1}{2}$ per cent as soon as the Treasury bill tender rate reached 1 per cent, the authorities should use their powers to direct them to do so. This would ensure that the movement of rates began to extend to charges for ordinary bank advances, thereby providing a specific deterrent to marginal borrowings and preventing switching of borrowings from acceptance credits to bank advances.

It is not suggested that a rise in rates of the order of $\frac{1}{2}$ to $\frac{3}{4}$ per cent would of itself have decisive effects; within limits such as these, the policy would be likely to exert itself much more powerfully through the caution it induced among lenders than by its direct discouragement of borrowers. In any approach such as this, where the object is to get maximum results from the least increase in rates, the essential precept should be "gradualness"—which means that the emphasis should

be upon the quantity of credit rather than upon the rate. The advance in rates should be regarded as consequential upon the slow tightening of credit supplies rather than as the purpose in view (even though the two processes are in fact only different facets of the same object). This is in contra-distinction to the old technique of raising rates abruptly, and then of seeking to make the new level effective by deliberately reducing the volume of credit if public demand did not fall far enough automatically.

It would of course be idle to suppose that a cautious and gradual policy of this kind, even when pursued also through the gilt-edged market, would be strong enough perceptibly to damp down an inflation fed by reckless budgeting. What is proposed here is a supplementary policy, one that presupposes a budget that does not fall hopelessly short of its disinflationary target and also presupposes a continuance of other methods of restraint—such as present physical controls of investment and of scarce materials. It is suggested, however, that, given reasonable policies in these other directions, quite a moderate degree of monetary restraint would make all the difference. Needless to say, its efficacy would be powerfully and desirably enhanced if its implications were accepted throughout the Government sector of the economy—if the new level of rates were given due weight in the planning of Government-sponsored investment, and if it was followed by the Public Works Loan Board and translated thereby into the level of rents for local authority houses. Indeed, the logical accompaniment (though not a necessary consequence) of a tighter money policy would be a substantial revision of the system of rent restriction. The interest rate policy of Government lending agencies should be akin to that followed by the Agricultural Mortgage Corporation, which last week announced an increase from 4 to $4\frac{1}{4}$ per cent in its rates for new lendings—thus re-establishing its margins as it did with its previous increase in 1949, over the higher yield basis already established in the gilt-edged market.

★

The more obstinately the Government clings to arbitrary interest rate policies, and to high levels of welfare and other non-defence expenditure despite the rise in arms outlays, the stronger would be the resistance needed from monetary policy. If that policy were required to take the main strain of resisting inflation, then, indeed, it would be necessary to envisage a rise in Bank rate to levels beyond the range associated with "cheap" money.

Even so, the cutting edge of the policy would not be the increase in Bank rate as such, but the measures of credit contraction required to make Bank rate effective—in the sense that rates in the market and banking system were appropriately related to it.

There remains to consider the familiar contention that the Chancellor dare not contemplate a rise in interest rates—especially short term rates—because of the dire repercussions that would have upon the budget. A major flaw in this reasoning is its implicit assumption that, by avoiding a rise in the interest charges he has to pay on re-borrowings and new finance, the Chancellor will to that extent avoid a rise in his budgetary expenditure. In fact, the very opposite is likely to be true. Given that a tighter money policy would have exercised a potent restraint upon inflation, a refusal to accept a rise in interest costs is tantamount to a deliberate choice to accept instead an avoidable rise in the money cost of at least the greater part of all other budget expenditures. A rise of $\frac{1}{2}$ to $\frac{3}{4}$ per cent in rates payable on the present floating debt would mean that Exchequer payments to holders other than Government agencies and the Bank of England would rise by roughly £20 to £30 million in rather more than twelve months—if domestic payments are estimated after deduction of tax at the standard rate and external payments are estimated gross. On the other hand, an increase of no more than 5 per cent in the prices paid by the Government for its expenditure on goods and services—not to mention its large social payments—would cost the Chancellor £100 million a year. In other words, short term rates would have to rise above 3 per cent before they would add to the Government's expenditures as large a sum as would be added by a 5 per cent rise in the average price of the goods and services it consumes. This calculation ignores the repercussions on other Government debt, because none of this is compulsorily redeemable before 1953; but if the cost of refinancing compulsory maturities were also raised by $\frac{1}{2}$ to $\frac{3}{4}$ per cent, and if this increase endured for the next five years or so, the net annual cost of the refinanced debt would thereafter be raised by about £5,000,000 to £8,000,000.

These pro forma calculations, rough though they are, are sufficient to show the emptiness of the contention that a tighter money policy of the kind that is needed now would have awkward repercussions upon the budget. The increase in Government expenditures that is threatened by the inflationary rise in prices is at present incomparably greater than the small rise in interest costs likely to be involved in the monetary measures necessary

to supplement other counter-inflationary policies. In other words, a tighter money policy would actually be the means of keeping down Government expenditure. But, even if this were not so, the case for monetary policy would not be any less strong. The overriding consideration is the health and strength of the national economy as a whole, not the level of Government expenditure as

Textiles and Rearmament

IT is some months since the Government first warned the textile industries that they would have to expand their exports considerably during the next three years to compensate for the coming inroad of defence orders into the exports of the metal industries. More than half the country's total exports in 1950 came from the metal-using group of industries: during the coming year, defence contracts will absorb output from these industries of a value equivalent to about one-third of their exports last year. In rough and ready terms, exports of consumer goods would need to expand by £350 million this year to make good the fall in exports of metal manufactures. When the first draft of the re-armament programme was drawn up last autumn, it seemed reasonable to expect the textile industry to meet relatively small defence orders (£50 million during 1951) and at the same time to make a sizeable contribution to the necessary increase in exports of "soft goods." Since then, the conditions under which the textile industry is working have deteriorated in such a way that the task, although not impossible, is no longer straightforward.

Output of cotton, wool and rayon goods expanded during 1950; it has done so every year since the war; but this year a simultaneous scarcity of the raw materials used by each industry suggests that total output is certain to fall. Its effect is already being felt in rayon production, where the shortage of sulphuric acid will reduce output during the first half of the year by 10 per cent compared with the last quarter of 1950.

This fall in rayon production has serious implications for the cotton and wool industries, since both have been hoping to increase their consumption of rayon to offset shortages of their primary fibres. A 10 per cent cut in rayon deliveries to the cotton weavers might mean a drop of more than two per cent in the cotton industry's total output of cloth. It is not strictly correct to say that Lancashire is also experiencing a shortage of cotton; but deliveries of raw cotton have been dislocated in such a way that the effect is the same. Supplies of American cotton have fallen, and although the Raw Cotton Commission bought enough cotton in other countries to make up for the cut in American supplies, some of it is a poor substitute for American cotton and cannot be spun into the same type of yarn. The difference may mean adaptation of the production schedule of both spinners and weavers, but individual managements are unlikely to do this until forced to by continual failure of their suppliers to deliver the types of raw cotton or yarn ordered. Yarn deliveries will be made all the more problematic by increased competition for yarn from the hosiery and knitting industry; this was leading to something approaching shortage even before raw materials became scarce. There is a danger that lower activity in the industry might cause it to lose some

such; and that health is being progressively sapped by inflation. The more reluctant the Government is to curtail its expenditure by a general retrenchment, which is the one means by which the budgetary effort at disinflation might be made effective, the more imperative is it to reinforce that effort by the only other method that is likely to suffice—the method of monetary policy.

of the labour that with great efforts it has been able to attract in recent years. Cotton output since the war has been limited only by the supply of labour. By the end of 1950, the labour force had been built up to more than 312,000 and it is still growing, workers having been attracted not only by better conditions but by the prospect of steadier employment than neighbouring light industries could offer. Any lost in coming months may be lost for good to the rearmament industries; and redundancy could encourage resistance among the rest of the workers to redeployment in the mills, a process that has been gradually accepted only because it caused no visible displacement of labour.

Unemployment might also develop in the wool industry. Its supplies of rayon have been cut and cotton deliveries may also fall, but since the industry's monthly consumption of these two fibres is about 3,500,000

pounds compared with from 43 to 50 million pounds of raw and reused wool, the effect on total output, as distinct from that of individual mills, should not be noticeable. The fall in wool consumption during the six months up to last March—from 44 to 37 million lb—shows how purchases of raw wool have declined; output has been prevented from falling to the same extent only by substituting reused for virgin wool. Naturally there are exceptions to this state of affairs. Some of the bigger companies bought large quantities of wool in December and so have sufficient stocks for many months' consumption—stocks, moreover, that were bought at prices that are even now below current market levels. To some extent this offsets the effect of the recent reduction in purchases by many merchants.

During the three-year defence programme, the textile industries will be required to supply £200 million worth of goods. Orders to be met this year amount to about £50 million and are concentrated on one or two sections of the industries. Only a small proportion of defence

requirements are for wool cloth, mainly blankets and outer clothing for temperate climates. The majority are for cotton goods, a little more than half of them for clothing materials. The remainder consists of heavy cotton cloth for tents, gun covers and tarpaulins. These proportions will be reversed when clothing stocks have been built up; the larger part of the orders will then be for heavy cotton products. Defence orders, with the exception of Admiralty orders, are the responsibility of the Ministry of Supply: but it was the Board of Trade that decided what increases in textile exports will be necessary in this coming year. To the extent to which priority for an individual defence order may limit a company's ability to export, there will be a division of interests between the two ministries. Where defence orders for textiles fall upon the canvas-making sections, no conflict arises, because these do little export business. But these sections have not the capacity to meet the Ministry of Supply's requirements—they have been unable to meet normal peacetime industrial demand. Every effort is being made to place the orders abroad, but it is almost as difficult to find overseas suppliers. Of about 15 million yards of canvas that will be needed this year, less than 7,000,000 yards have yet been ordered.

Those sections of the cotton industry making clothing fabrics are fully booked until the end of the summer, and a large proportion of their orders are for export. The annual report of the Master Spinners' Federation shows that by December, when discussions took place between the industry and the Government about the priority to be given to defence, orders for 35 million yards of drill, canvas and cellular cloths had been accepted from the Ministry of Supply, but orders for a further 10 million yards to be delivered in June could not be placed. Mr Wilson then told the Federation that defence orders would as far as possible be placed abroad: of those already booked, about 20 per cent have gone to foreign suppliers in Europe and Japan. Negotiations still in progress, especially with German mills, may eventually involve the placing of a far higher proportion of the total defence orders outside this country.

Behind such a policy lies the fact that the cotton industry will have to bear almost all the responsibility for expanding textile exports. Rayon piece goods exports last year amounted to 122.5 million yards; but falling production will make it hard for this industry to reach the same figure this year. Last year's wool piece goods exports were 117 million yards and in January exports rose to 13.4 million yards, but in many ways this was an exceptional month, and its high export level has not been maintained in succeeding months. If wool exports can continue to be maintained at something like the present level of nearly 10 million yards, it will be a creditable achievement. There is no immediate lack of demand for British wool cloth abroad, but the world shortage of raw wool means that world wool cloth output can be expected to fall appreciably in the coming year. Even if the British industry's activity does not fall in the same proportion, Governments in importing countries may find it politically inadvisable to permit an increase of imports from Britain at a time when their national wool industries are partially unemployed. No reliance, therefore, is being placed upon any marked expansion in British wool exports.

Cotton exports, however, promise to be buoyant. During 1950, admittedly, cotton piece goods exports had totalled only 822 million yards compared with 904 million in the previous year. A slump in cotton export orders preceded devaluation, and in 1950, when foreign buyers were again willing to take goods from Lancashire, British weavers became more interested in supplying the home market, where restrictions had been lifted for the first time since the war. There are no indications yet of opposition abroad to the recently-increased British cotton exports, particularly since there is a tendency to answer high wool prices by increasing consumption of cotton goods. There is also likely to be less competition from Japan, since many Japanese mills will be working on defence orders for the American forces. British exports in January reached 92 million square yards and were 23 per cent higher than in December, a month in which exports were already nearly 7,000,000 yards higher than the monthly average for 1950. These high shipments were largely the result of heavy orders that were placed in Lancashire at the start of fighting in Korea. These orders alone are big enough to maintain export deliveries at approximately the same rate for some months even though the February and March shipments were well below those for January. If the rate could be maintained throughout the year—and it is more than 30 per cent higher than the average for 1949—it would represent at January prices an increase of about £50 million in cotton piece goods exports.

★

If these industries are to increase exports to such an extent out of a reduced total output, and at the same time to meet the defence orders that are placed in this country, it is clear that deliveries to the home market will have to be cut, though so far increased cotton exports have been achieved without doing this. The President of the Board of Trade assured Parliament and the industry that there would be no return to clothes rationing, but many people in the industry, particularly those using wool, think rising prices will be a sufficient restraint—a belief that does not appear to be borne out by trends so far. These suggest that consumers will go on buying so long as they think prices will go on rising, the more so when the supply of other consumer goods becomes scarce. When rising prices finally begin to affect consumer choice they are likely to direct it from wool cloth to rayon and cotton goods, thus increasing home demand for just those products that can more easily be sold abroad. Alternatively, the Board of Trade may be relying, as it has relied in the past, on keeping the domestic utility price ceilings below average export prices in order to make the home market less attractive to manufacturers. This makes the big and questionable assumption that home sales will fall automatically with each reduction in utility deliveries.

It is hard to believe, after weighing these many conflicting factors, that cotton exports can be increased this year by more than, say, £50 million and wool exports by about £10 million. Textile exports might, on this assumption, close between one-third and two-fifths of the gap that defence requirements may open; but only if steps are taken to check the flow to the home market. It is surely high time that the Board of Trade gave the industry a clear lead to what is expected of it.

Business Notes

World Bank Comes to London

The negotiations for the launching of a loan for the International Bank, discussed in these columns last week after the visit of the Bank's President, Mr Eugene Black, to London, were concluded shortly after the holiday. As expected, the operation is taking place under the highest auspices. A consortium of the six leading London merchant banks has acquired £5,000,000 of World Bank stock and is offering it for sale on the market on Wednesday next. The stock, which bears interest at $3\frac{1}{2}$ per cent and is redeemable between 1966 and 1971, will be offered at a price of 97. The gross redemption yield to latest date would thus work out at £3.14s. 4d. per cent; the nearest comparable British Government security, 3 per cent Savings Bonds 1960-70, showed a gross redemption yield of £3 8s. 5d. per cent at the close of business on Tuesday. World Bank bonds carry the joint and several guarantee of all member governments up to the amount of the uncalled portion of each country's capital subscription; the total of these uncalled subscriptions amounts to \$6,671 million, of which the United States share is \$2,540 million and the British share \$1,040 million. At the moment there are only \$311 million of World Bank bonds outstanding, in the United States and Switzerland. The security behind the new bonds is therefore impressively massive—and it would remain so even if the Bank were not currently running at a profit (Mr Eugene Black estimated last week that the net profit for 1950-51 should come out at about \$15 million). Although the issue will not be a trustee security, transfers of the stock will be freed from United Kingdom stamp duty by a clause in the current Finance Bill. Moreover, it has the distinctive attraction that interest will be paid without reduction of United Kingdom income-tax. The excess of about 0.3 per cent over existing gilt-edged yields therefore seems distinctly generous, and unless there is a sharp down-turn in the market between now and next Wednesday the issue seems likely to be oversubscribed. On strict investment principles, indeed, there is no reason why World Bank securities should not rank equally in status with those of the British or US Governments in their several markets. In New York, however, that has not so far been true—though the gap between the yield on World Bank bonds and American Government securities (recently about 0.4 per cent) seems to be narrowing appreciably now that the Federal Reserve has removed its peg on Government stock.

Mr Black stated at a Press conference on Wednesday that this issue should provide the World Bank with sufficient sterling resources to meet its immediate prospective sterling lending needs. There is therefore not likely to be any need to ask for the early release of any more of Britain's £82 million paid-up sterling subscription to the Bank—beyond the very small (less than £1,000,000) call already made. In the rather longer run, however, the Bank hopes to extend its lending of non-dollar currencies considerably. Mr Black indicated that the Bank is not considering issuing bonds in other capital markets yet awhile (except possibly in those of Canada and Switzerland); it has apparently been deterred from floating issues in some other European centres by the high interest rates there obtaining.

No Rubber for China

The ban on the shipment of rubber to China announced by the President of the Board of Trade ten days ago was inevitable once it was known that China had secured nearly 50,000 tons of rubber from Malaya in the first four months of this year, compared with its normal requirements of per-

haps 30,000 tons a year. For that reason, the ban has had less effect on the London market than might perhaps have been expected. The market had anticipated the announcement, and the price had fallen by $4\frac{1}{2}$ d. to 3s. 7 $\frac{1}{2}$ d. a lb. before it was made. Subsequently, indeed, the market recovered, though towards the end of the week it weakened to 3s. 7d. The British Government's decision, announced at the same time as the ban, to buy any rubber sold to China under firm contracts concluded before export licensing was imposed on April 9th, clearly had a steadying effect.

The present price is by no means unprofitable for producers. It is still substantially above their present costs of production, and seven months ago it was generally thought that the price would settle at this level in 1951. In February rubber was selling at a peak price of 6s. 2d. a lb., despite the severe restrictions on American civilian consumption of natural rubber and the expansion in American production of synthetic rubber. But since then the price has fallen very

sharply and a fortnight ago it was around 4s. 5d. a lb. The most notable feature of this decline has been the underlying firmness of the market in spite of the shocks it has had to absorb. At the beginning of the year American competition was curtailed when the United States Government became the sole importer for natural rubber, and in March American buying for the stockpile was considerably reduced. At the beginning of April both Britain and Malaya introduced licensing control on exports of rubber to China, and in that month they were limited to 2,500 tons. Now they have been stopped altogether.

Finally, this week, the United States reduced its maximum buying price from 148 Malay cents (3s. 5 $\frac{1}{2}$ d.) a lb. to 145 Malay cents (3s. 5d.), and the spot price in London fell by a corresponding amount. If speculation had been as rife as many American observers have imagined, the movements in price since the beginning of the year would have been much sharper. Admittedly the price has almost halved in a period of three months, but the decline, with a few exceptions, has been orderly.

Surplus This Year?

The recent high price of rubber has certainly encouraged an expansion in world output. The total for the first three months of the year was 480,000 tons compared with 374,000 tons in the first quarter of 1950—when, however, output was abnormally low, as Indonesian producers were holding back supplies. The Rubber Study Group at its meeting in Rome last month estimated world production of natural rubber this year at 1,870,000 tons, or only 20,000 tons more than in 1950, but the annual rate for the first quarter was 1,920,000 tons, 50,000 tons higher than this estimate. This

high output, however, has been achieved only by drastic tapping by smallholders, particularly in Indonesia. The present decline in price may stop this practice, and it will also remove the recent deterrent to replanting.

In contrast to the trend of rubber output, consumption has declined sharply. The world total for the first three months of this year amounted to 362,500 tons, against 387,500 tons in the first quarter of last year. This figure represents an annual rate of 1,450,000 tons, compared with the Study Group's estimate for 1951 of 1,530,000 tons. The main reduction has occurred in the United States, where consumption is restricted by governmental control; in the first quarter it totalled only 114,500 tons, against 177,500 tons twelve months earlier. In other countries, however, consumption has either been maintained or has increased.

From these figures it would seem that production of natural rubber this year might exceed actual consumption by anything between 340,000 tons and 470,000 tons. The Study Group considered that defence requirements and purchases for stock this year might absorb 340,000 tons. But such outlets are hardly likely to absorb nearly 500,000 tons, particularly as shipments to Russia will be regulated, unless Britain and other countries of Western Europe decide to accumulate large stockpiles within a short time. Perhaps, before the end of the year, the United States will have reconsidered its drastic cut in civilian consumption.

Policy for Fuel?

Power cuts in May have once again reminded both sides of industry that the country's fuel output capacity is still inadequate to cope with cold weather. The immediate reasons for the cuts are familiar and unavoidable. More electricity generating plant than usual is taken out of commission for overhaul during the summer months (of which, in fuel terms at least, May is one) to ensure that as much plant as possible is available throughout the winter. Apart from this, the British Electricity Authority is suffering both from the excessive age of its older plant and from teething troubles with its younger. Demand for electricity in the past eighteen months has been increasing at the rate of some 12-14 per cent a year, running ahead not only of BEA's limited rate of installing generating plant but even of the installation programmes it would until recently have considered desirable.

The latest load-shedding added point to the renewed requests from industry, at recent meetings of the National Production Advisory Council, for closer co-ordination of national fuel supplies. This issue was raised at the beginning of the year by the TUC, with the support of the FBI; it suggested that a committee should be set up to report upon "the fuel situation"—and by implication to act as a continuing central source of national fuel policy. The re-constitution by the Minister of Fuel and Power of his expert fuel efficiency committee does not fill the need argued by the industrial members of the production council, who are concerned more with the co-ordination of the nationalised fuel and power industries' separate—and not necessarily complementary—policies than with the necessary but narrower details of fuel efficiency.

Devising "a national fuel policy" is a favourite spare-time preoccupation of some executives and senior civil servants in the nationalised industries and the Ministry; but many who have surveyed the extent of the problem tend to feel that it would demand such a concentration of expertise and intelligence from those top ranks as would seriously hamper the day-to-day operating efficiency of their industries. This is a strong argument, and may for the present be conclusive: the shortage of high-grade trained ability in the fuel and power industries will continue for a long time to be one of their most damaging weaknesses. Adequate study of the need for such a policy, its practicability, and its poten-

tial framework—and of the conceivable authority with which it might have to be formulated—would certainly need expert advice and judgment of the first rank: as a subject for desultory discussion by yet another committee or "working party" drawn from the fuel industries on a "representative" basis, it would probably receive neither. The nationalised industries, in any case, would probably display great caution in approaching a subject that might involve stricter supervision of their policies than the Minister now exercises. The question will no doubt continue to be raised as fuel stringency presses upon the economy in coming years; but, for the present, the Government seems likely to continue in the comfortable conviction that the most realistic long-term national fuel policy is not to have one.

Capital for Merchant Banks

A good deal of interest has been aroused in the City by the decision of Hambros Bank to expand its capital resources—and by the fact that the Capital Issues Committee has proved sympathetic to this project. The bank is raising £2,250,000 by a "rights" issue of £1 fully paid shares offered at 45s., and thereby will increase its paid-up capital to £3,000,000 and its published reserve to over £2,000,000. This news was conveyed in the advertised version of the chairman's speech attached to the report and accounts for 1950-51. In the circumstances it is regrettable that the report itself is not yet available, but it appears that the accounts will show an increase of no less than 45 per cent in deposits (which rose from £30.7 to £34.0 million in the previous year) and one of 19 per cent in acceptances (which then rose from £11.9 to £16.1 million).

This large expansion, and the decision to meet it by enlarging the capital, is an interesting demonstration of a trend that has long been discussed in the City—the big demands that are now being put upon the merchant banks and their need for additional resources if the London market is to seize the opportunities now opening up. The expansion of business arising from the finance of external trade reflects not only the effects of the steep rise in commodity prices and the growth of British exports in volume as well as value, but also a revival of purely international demand. It is reasonable to assume that the private merchant banking houses have particularly been feeling the need for more capital, because the impact of taxation upon internal accumulation of capital falls with especial severity upon them. In the circumstances it does not seem fanciful to envisage tendencies in the merchant banking world analogous to those that occurred in the discount market a few years ago—when the need to bring capital into line with postwar demands led to the conversion of old-established private houses into public companies with securities quoted on the Stock Exchange.

The Floating Penny

Shortly before the Budget the film industry was proposing to put up cinema prices—and to take the extra proceeds, largely free of tax, for itself. When Mr Gaitskell agreed that seat prices could go up by £10 million a year—but decided to take three-quarters of this in Entertainment Tax—the industry recoiled in dismay, declared that audiences should not and would not pay higher admission prices, and began a campaign on cinema screens pointing out the unfair tax burden that this form of entertainment has to bear. By last week, however, it had had second thoughts. Its representatives then convinced the Films Council, the tripartite group that advises the Board of Trade in its dealings with films, that cinema prices should go up even further than the Chancellor proposes—by an average of 3d. a seat, instead of 2d.—and that the third "floating" penny, as well as the

halfpenny a seat the Budget would allow, should go untaxed to the cinema industry.

There is something in this proposal besides the characteristic and engaging disregard of ordinary logic that alternately attracts and irritates outside observers of the film business. The burden of Entertainment Tax certainly has meant that the industry as a whole, out of box-office takings rather more than double prewar, is receiving a net income only about 40 per cent higher than before the war, though its costs have also probably more than doubled. The industry held in the proposals it put before the Films Council that "public demand may not sustain such increases." This might be too pessimistic, but the promoters of the recent campaign against higher tax may find it somewhat difficult to reverse tactics and persuade the customer in the one-and-tenpennies that 2s. 1d. is easier to pay than two shillings—whoever gets his extra pennies.

* * *

Steel for Cars

The motor industry produced 41,592 cars in March, 31,067 of which were exported. This, like production of tractors and commercial vehicles, was slightly higher than total output in February, but it was calculated over a five-week period; the average weekly output during March was down to 8,318 cars compared with the February average of 10,095. Car production is, therefore, beginning to show the effects of the steel cuts, although manufacturers' ingenuity will probably always prevent output from falling by the full extent of those cuts. This same ingenuity—and in some cases the expectation of defence orders—has also prevented the lower rate of output from leading to any noticeable degree of unemployment. Present steel allocations are between 15 and 20 per cent lower than individual companies were receiving in the last quarter of 1950, while actual deliveries of sheet are probably nearer 85 per cent of that figure. Similar allocations are expected for the third quarter of this year, even though some mills have expressed doubt about the possibility of meeting them. On this basis, the industry's output may not fall below the March level and might in the fourth quarter of the year improve upon it when supplies of sheet steel increase. By that time, however, sheet may no longer be the limiting factor on production. The scarcity of zinc, which shows no sign of alleviation, would have cut the industry's output this year by 10 to 15 per cent without any shortage of sheet steel, while both general steel and iron castings are now becoming increasingly difficult to obtain.

* * *

More Consequences of the Ring Fence

In his address to stockholders of the British-American Tobacco Company last week, Mr D. M. Oppenheim made

some pointed criticisms of Section 32 of the new Finance Bill which, in his words, "seeks to make it unlawful for a company to move its residence outside the United Kingdom or to form its overseas branches into subsidiary companies, and even seeks to control the capitalisation of overseas companies within the jurisdiction of colonial, dominion and foreign governments." Throughout the 49 years of its history the B.A.T. company has followed the wise policy of incorporating its subsidiaries abroad; subsidiaries of this sort are able to take over and carry on the business of the parent company under the management of local directors, in sympathy with local sentiment, in touch with local capital markets and unhampered by the discriminatory tax legislation that many developing countries now impose upon foreigners. Mr Oppenheim judged that "this has undoubtedly proved to be the right policy politically and economically"—and the growth of nationalist sentiment abroad is going to make it even more obviously the right policy for the future, especially if sterling continues its present course towards becoming a hard currency for underdeveloped countries. Unless British companies abroad are going to be allowed to run at their own discretion and at their own chosen pace with the tide of nationalist sentiment abroad, they may increasingly find themselves being forced into a position where local Governments, greedy for the sterling remitted to meet administrative expenses as well as dividends, will be reaching out for the blunderbuss of expropriation. To put the matter bluntly, a by-product of Section 32, unless the Treasury exercises its veto power under it with quite unusual care, may be either a diminution of the value of British investments abroad or a future crop of crises of the Anglo-Iranian kind. If Mr Gaitskill does not see the light economically before the Finance Bill is bludgeoned through, Mr Morrison would be well advised on political grounds to ask him to think again.

* * *

Trade in April

Provisional trade returns for April, issued at the end of last week, show that United Kingdom goods to the value of £230,100,000 were exported in that month and that re-exports were valued at £11 million—making a total of £241,100,000; while imports were valued at £311,500,000. Both of these were record figures; the highest previous export figure was £214,400,000 in January. The value of imports has been steadily increasing month after month and was in April about £100 million higher than a year before, but the figure for exports showed a decided increase over the low figures for February and March. The early date of Easter partly explains April's improvement over the previous month, which is not the normal seasonal trend; but an improvement in shipping is also reflected in the figures.

Since some of the April exports were delayed from March, the first quarter's figures perhaps did not justify as much

Martins Bank will be pleased to give advice and help on financial problems arising out of home and overseas trade, through the undermentioned Foreign Branches, or at any branch of the bank.

BLICKLING HALL

Situated some twelve miles north of Norwich, Blickling Hall is one of the most remarkable of English country houses.

The first sight of it satisfies the most romantic conception of an historic English house—expansive lawns, yew hedges and, at the end of a straight vista, the rose-bricked hall, crowned by the fantastic tiers of a clock tower. A bridge and moat complete this picture of a great house built in the grandest manner of its period.

Spotlight on Australia

In the business world today attention has been focussed on the remarkable industrial development in Australia. The Union Bank of Australia has therefore published two Booklets: "Industrial Australia" containing authoritative information on industrial resources, markets, labour and finance, "Company Formation in Australia" providing a general guide to Company Law with notes on current taxation and the establishment of a business in the Commonwealth. Anyone contemplating business in Australia, will find in these Booklets the preliminary information they require. Copies of these Booklets will be sent on request.

dismal prognostication as they aroused; likewise the April figures themselves do not represent the sharp recovery that they superficially suggest—indeed the visible trade deficit is running much higher than a year ago. The size of the deficit at the end of the first six months of the year will depend largely upon two factors: whether world raw material prices continue the tendency to decline and the terms of trade improve (at present prices the total import bill for 1951 is not likely to be below the assessment of the Economic Survey); and whether textiles and other consumer goods industries can take over much of the burden from the backs of the machinery and motor industries. In the first quarter textile exports did show a small increase; but if the brave show of textiles and clothing at Earls Court were to be reflected in export returns, then the doubts of Britain's ability to avoid a serious trade deficit this year would be completely dispelled. During the first four months taken together, the annual rate of exports and re-exports was nearly £2,565 million, whereas the rate specified as necessary in the Economic Survey was £2,750 million. To fulfil the Survey's aim the April rate of exports would need to be maintained throughout the rest of the year.

Exports to North America

Exports to both the United States and Canada in April were greater in value than the rate for the first quarter of this year. To the United States total British exports were valued at £13.9 million, which was £2,700,000 above the monthly average for the first quarter and £1,100,000 above the average for the last quarter of 1950. To Canada exports were £14.2 million, £4,700,000 above the first quarter's average and £1,900,000 above the October to December average. These results are especially encouraging, since the big decline in the value of exports to Canada during the first three months has been more than made up.

BRITISH EXPORTS TO NORTH AMERICA
(Monthly Averages in £ thousand)

	To United States	To Canada	Total N. America
1950, 1st quarter.....	£'000 6,700	£'000 8,500	£'000 15,200
2nd ".....	7,300	10,200	17,500
3rd ".....	10,900	10,900	21,800
4th ".....	12,800	12,300	25,100
1951, 1st ".....	11,200	9,500	20,700
April.....	13,900	14,200	28,100

The increase in trade to Canada from 1948 to 1950 was principally in iron and steel products, non-ferrous metals and manufactures, machinery (particularly machine tools and electrical machinery) and vehicles (especially new cars). For textile yarns and manufactures 1950 was a better year than 1949, but not than 1948. The export switch from the metal-using-industries' products to textiles and consumer goods may, therefore, be considerably more difficult in Britain's trade with Canada than in trade with the United States, in which British exports include more winners.

Coal Price Structure.

It seems probable that by the beginning of June the National Coal Board will be ready to bring into force the next instalment of its "price structure" for coal in the home market. This will consist of a wide range of upward and downward adjustments of the prices of coal for domestic consumers, and may be brought in at the same time as a scheme for preferential summer prices to encourage the home fuel user to fill his cellar and swell the distributed stocks in hand for next winter. A similar series of adjustments in

industrial coal prices is still being discussed with industry's representatives, and may take rather longer to bring into force.

These changes in price—complementing similar changes affecting a smaller range of coals in 1948 and 1949—are designed to bring coal prices throughout the industry towards a more rational basis. In 1948 the Board decided upon a complete reclassification of the 8,000 differently-priced grades of coal then being sold, in terms of nature, size, mode of preparation, heat content, ash content, and other properties affecting commercial saleability; and it decided also to base its prices for different grades upon their "zone-delivered" cost. Each of these policy decisions set in train a lengthy and complex process of administrative work; the number of differently-priced grades of coal, for example, will probably have been reduced to some 2,000 by the time the scheme is in full operation, and the fixing of delivered prices that take into account the average transport costs of coals from different coalfields supplying the same markets has involved some considerable experiment and analysis. For the consumer the change will at least go some way towards relating the price he has to pay for coal to the quality he receives for it; a welcome progress that has unfortunately been interrupted once again this year by the flat rate increase that the NCB made in order to meet suddenly accentuated rises in costs.

Industry's Finances

The accompanying table provides the usual quarterly summary of balance sheets, published in the first quarter of this year, of which details were given in the issue of *Records and Statistics* dated May 5th. In many of its features, the analysis reveals the continued strain on industry's finances. Stocks have increased by 13 per cent from £375 million to £424 million—an increase that probably does little more than mark the rise in prices during the past twelve months. There has been further resort to bank borrowing, and a further

agreeable feature, in the expansion of debenture and other permanent debt capital from £157 million to no less than £195 million. The arbitrary effects of the Profits Tax in encouraging companies to resort to an increase in their fixed charges, rather than to expand their equity capital, could not be clearer. It is not a development that can be regarded as desirable in the long-term interests of British industry.

Engineering in Europe

Engineering output in all European countries (with the massive exception of Western Germany) has increased since the war, but in Western Europe at least, perhaps not fast enough. This expansion has considerably altered the pattern of output by countries—not only because of the sharp decline and slow recovery of German production, but perhaps more seriously because of the dispersion of output of certain engineering products more widely than may be justified in the interests of efficiency. Current rearmament programmes will accelerate the continuing expansion, but they are also masking potential weaknesses in demand that were already apparent for certain products early last year and would probably have been accentuated but for the emergence of new defence demands.

That, in sum, is the conclusion reached in a study of engineering in Europe published this week by the Economic Commission for Europe. Preparation of this paper began in 1949 when prospects of a buyers' market for certain engineering products were discernible; it was handicapped by lack of adequate data from most member countries about

the stock and age of installed equipment, costs, and productivity; and since its inception rearmament has restored a sellers' market for certain types of capital goods. The "European engineering industry," a concept that the study attempts not altogether convincingly to justify, is taken in this case to cover machinery and capital equipment (excluding aircraft and other armaments) and to exclude most consumer goods made by the engineering industries (though it includes passenger cars, motor and pedal cycles, radio and telephonic equipment). It does not examine in detail the production of all the types of equipment that its terms of reference encompass; its approach is deliberately confined to broad trends. These limitations, it may be said, do not noticeably modify the readiness of ECE to express uncompromising conclusions.

* * *

Over or Under-Production?

The Commission's prognosis, however, is less gloomy than that reached in an earlier study, on similar lines, of the steel industry in Europe. Certain developments, it considers, may prove unfortunate; among these are the excessive dispersion of machine tool production throughout Europe,

combined with an undue preoccupation of many producers upon general-purpose tools, and the potential over-production of tractors. These developments spring largely from economic nationalism and the division of Europe into two camps. ECE's hope that the present level of engineering output in Europe (and a much higher level in future) may be justified rests to some extent upon confidence in economic internationalism—that external aid may convert the immense unsatisfied needs for capital equipment in the under-developed countries into effective demand.

It is not easy to assess the Commission's fears and hopes in this matter from the descriptive data presented in the report. This varies in usefulness. Its statistics on trends in total engineering production and trade are informative: they show, for example, precisely how Britain's greatly increased share of European trade in such products immediately after the war has later been affected by the return of Germany

RELATIVE IMPORTANCE IN ENGINEERING PRODUCTION

as an important exporter. Its survey of the possible course of demand in certain markets for Western European engineering products is also useful: and its conclusion that Eastern Europe, having turned to manufacturing much of its own engineering equipment, may be permanently lost to Western European engineering exporters seems valid enough. But its shorter sections describing some sectors of the engineering industry, and the engineering industries of particular countries, are of necessity too slight to rank as a final place of reference. The Commission's recommendation that more attention should be devoted to measuring, and thence increasing, productivity is certainly right but not new. Given the present fact of shortages of engineering capacity for rearmament, warnings concerning the erosion of permanent demand hardly offer manufacturers—or even national planners—much guidance about practical policy; they are worth keeping in mind, for fuller study, at a later date.

Ups and Downs in Wool

While discussions on international allocation of wool are making little headway in Washington, prices in the Australian wool market are fluctuating erratically. Last week they fell sharply, by about 15 per cent; this week they have almost made good that loss, rising by 12½ per cent. In general, prices are still a little above their level of December but some 25 per cent below the peak of last March. This week the United States raised its ceiling price for raw wool to the equivalent in London of about 250d. a lb. for merino 64's combing wool, which is slightly above current levels.

American manufacturers will thus again be able to buy wool in the London and dominion markets if they want to; their sudden cessation of buying at the beginning of April caused the initial slump in prices. They are known to hold fairly large stocks of raw wool, which could carry them over to the beginning of next season, provided that they consume no more than they did in the first three months of this year. World consumption of virgin wool has, how-

ever, declined sharply; in the first quarter of this year it was some 10-12½ per cent smaller than in the last quarter of 1950 and some 15 per cent smaller than in the first quarter of 1950. According to the current issue of *Wool Intelligence* published by the Commonwealth Economic Committee, world consumption is now running at an annual rate of

2,400 million lb. (clean) compared with a revised total of 2,640 million lb. for 1950. The Joint Organisation has decided to market the remainder of its wartime stock this season, so that available supplies should total about 2,360 million lb. (clean). If governments intend to buy wool for stock, civilian consumption will clearly have to decline further during the coming months. But if no wool goes into government stocks, supplies should be almost sufficient to meet current consumption.

The trend in wool prices in the next few months will depend more on government decisions than on market considerations—even if international allocation is still-born. The United States is still the world's largest consumer of wool and its policy of fixing a ceiling price can play an important part in determining the level of wool prices. But at least its policy has so far enabled other countries to buy their much wanted raw wool more cheaply than would have been possible had they been forced to compete with American manufacturers.

Ten Years After

The aircraft industry celebrated this week the tenth anniversary of the first flight of a jet aircraft. In the subsequent decade the industry has concentrated its resources on developing the gas turbine to a point where appropriate power plants can be provided for all forms of military and civil aircraft. The change-over from piston engines on the military side is now almost complete; a similar transition in civil aviation should be completed by 1960. During these years production has been on a small scale and questions of the supply of materials and fuel and even of the methods of production for an appreciable number of gas turbine aero-engines have not arisen. Since details of the rearmament programme were worked out, these have become questions that need at least as earnest consideration as the industry has in the past given to development.

Turbine blades and some other components that operate under high temperatures and stresses must be made from nickel-chrome alloys containing 80 per cent of nickel or more. In time of crisis these might become the critical materials in an aircraft programme, but at present the tonnage of nickel going into the alloys is so small compared with the tonnage used for alloy steels that the requirements of the aircraft industry can easily be met. (Nevertheless, certain manufacturers starting engine production are having occasional

difficulty in placing orders for other materials, difficulties not experienced by engine producers with long-standing material contracts.)

Kerosene has so far been the standard jet fuel, but the oil companies expect that there will not be enough kerosene for both civilian and air force demands when deliveries of aircraft for the rearmament programme get under way some time next year. A new type of fuel is therefore being developed; this will demand modifications in refinery practice, but its supply presents no other problems. Only for the quantity production of the engines themselves is there no immediate solution in sight. The axial compressor engines that will probably be the standard military power unit contain upwards of 1,400 blades per engine, produced to fine dimensions in a complicated aerofoil shape. Many methods of mass-producing these blades have been put forward; each has its supporters but none has proved satisfactory enough to be adopted as a standard technique. Until such a technique can be found, the supply of blades may become at any time the limiting factor in jet engine production. These are the type of questions now facing aircraft engineers; but they cannot in any way compare in complexity with those that have been so successfully overcome in the first critical decade of the engines' development.

Flexibility in Utility

As a result of recommendations made by the committee that is still meeting at the Board of Trade, the utility schemes for cotton and rayon piece goods have become considerably more flexible. Specifications for utility rayon cloth were revised some months ago, permitting manufacturers to work within ceiling prices and minimum standards of quality rather than to detailed cloth specifications. The recent 10 per cent increase in maximum prices for utility cotton and linen cloth was taken as an opportunity to introduce a number of new and broader specifications into the range of utility cotton goods. Similar changes covering utility furnishing fabrics are expected within the next few weeks. Most household textiles, heavy drills and linings must still comply with the original detailed descriptions of cloth construction, but weavers may introduce almost any type of construction into such goods as dress fabrics and shirtings, where fashion plays an important part in sales.

The changes have a two-fold purpose; they make it possible for the same cloth to be woven for the home utility market as for export, thus giving the weavers an element of insurance against sudden changes in import regulations or demand abroad that have on occasion left them with quantities of unsaleable cloth. They also make it possible for the industry to use finer counts for utility cloth, and should relieve the pressure of demand for the coarser counts, from 24's downwards, that are urgently needed for industrial and service orders. The new prices allow for price increases in raw cotton but not for the recent wage awards; they appear to be designed to stimulate exports by maintaining the marked differential that now exists between home and export prices. Deliveries of utility cloth to the home market, which had risen from 51 per cent of all home deliveries of cotton materials in the first quarter of 1950 to 61 per cent in the third quarter, had fallen to about 58 per cent by the fourth quarter, and deliveries of utility rayon followed the same trend.

Discussions have also taken place on the possibility of including some nylon and silk fabrics in the utility ranges. There seems little prospect of utility nylon while supplies are so limited, but the silk industry should be able to make a stronger case. Consumption of raw silk, the only reliable index of activity, has risen from 130,000 pounds in January, 1950, to 183,000 pounds in January, 1951, while stocks rose in the same period from 289,000 pounds to 485,000 pounds and had reached 505,000 pounds by February. Only crepe-

We've solved some problems in our time!

WANTED—an unspillable aircraft battery. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manoeuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we

can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

GREATER PRODUCTION through British Skill

Building the factories is only part—perhaps the easiest part—of a plan for increased production. The most up-to-date equipment and the latest industrial methods are needed too. Is there any way of buying the equipment and the technique as well? The answer is to rely upon the resources of a firm—such as Vickers—that has had long experience of providing machinery and capital plant for a wide range of industries—mines and power stations, railways and air-routes, factories of all kinds, both light and heavy. Having been associated with the development of productive capacity in so many different spheres, Vickers can give advice on installation and operation, based not on theory but on actual experience. Some idea of what this means is given in an Exhibition now being held at Vickers House, Broadway, London, SW1.

de-Chine, georgette and satin are being considered; the bulk of silk dress fabrics are therefore excluded from the discussions.

Development in Plastics

The plastics industry is beginning to have some difficulty in obtaining raw materials. In several cases capacity to produce these has not been able to keep up with the growing output of plastics as well as meeting demand from other consumers. Phenol, to take one basic material, has been scarce for some years in spite of increased output; the scarcity of other important materials, including plasticisers, is of more recent date. These shortages are occurring at a time when industry has begun to use increasing quantities of plastics for highly specialised applications where satisfactory alternative materials do not always exist.

Deliveries of some raw materials should improve later in the year as the new coal and petroleum based chemical plants come into operation. Another new source of material for plastics is a plant that the British Oxygen Company, which has been expanding its chemicals division, will have in full production by the end of the year. This plant will produce melamine, with an annual output of between 2,000 and 3,000 tons, which makes it a development of some importance for the plastics industry. Melamine-formaldehyde resins, glues and moulding powders are plastics that have been used increasingly widely in the United States since the war, even though they are more expensive than older thermo-setting plastics based on phenol or urea. They have the great strength of the phenolic resins without the limitation of their dark colour; the wide colour range of the urea resins without their lack

of strength; excellent electrical properties; and, as a glue acid-free bonding properties hard to obtain with other thermo-setting plastics. In Britain melamine has been produced by two plastics manufacturers for some years; but the British Oxygen factory will be the first large-scale source of this material for the British plastics industry. The company will manufacture only the basic chemical, leaving it to the half dozen manufacturers of plastic resins to convert it into the various melamine-formaldehyde plastics, a process that can only be carried out in large-scale chemical plant. The method of melamine production developed by British Oxygen differs from that normally used in the plastics industry; it is based on dicyandiamide produced in the company's Norwegian calcium carbide factories. Without sources of cheap carbide, the cost of the process might well be prohibitive.

Shorter Notes

The United Kingdom's surplus at the April settlement in the European Payments Union amounted to £18.5 million, a recovery from the rather low surplus of £5,300,000 achieved in March. Half of the April surplus was met by a transfer of gold to Britain and the other half by an increase in Britain's net credit in the books of EPU; this credit now amounts to over £118 million.

The employment figures for March show an increase in the working population during that month of 11,000, all women, which brought the total to 23,225,000. The registered total of persons unemployed on April 16 was 253,000, a decline of 21,900 by comparison with the March count.

Company Notes

Bristol Aeroplane.—The latest report from Bristol Aeroplane suggests that the company will play an important part in meeting the considerable demands imposed on the aircraft industry by the rearmament programme. In a year when development work on the Brabazon II, the 175 airliner and on jet and piston engines proceeded apace, group trading profits rose from £1,225,663 to £1,488,073. Much of Bristol's productive capacity in 1950 was used in building Bristol Freighters, so that it appears that the cut in orders by Transport Command did not have any serious effect on the company's fortunes; in fact, no large-scale dismissals, as were once feared, took place. The decision to raise the ordinary dividend from 10 to 12½ per cent marks a break with the ultra-conservative policy of recent years. As the dividend was raised in the almost certain knowledge of the need to re-tool in the current year, the maintenance of the higher rate seems almost assured, and the more sanguine shareholders may expect more. Few will quarrel, however, with the further strengthening of the company's reserves, which now stand at £4,149,091, against £3,676,813.

	Years to December 31, 1949	1950
Consolidated earnings:—		
Trading profit	1,225,663	1,488,073
Total income	1,260,790	1,556,200
Depreciation	324,535	367,379
Taxation	491,000	694,571
Group earnings for ord. stock	407,008	410,265
Ordinary dividends	161,500	219,863
Ordinary dividends (per cent)	10	12½
Added to general reserves and carry forward	241,566	250,219
Cons. Balance sheet analysis:—		
Fixed assets, less depreciation	2,152,661	2,911,716
Net current assets	5,307,284	5,116,011
Stocks	5,251,384	4,287,249
Cash and T.R.C.'s	2,165,508	3,635,226
Reserves	3,676,813	4,149,091
Ordinary capital	3,300,000	3,300,000
10s. ordinary stock at 21s. 3d. yields 18s. per cent.		

The rise in net group fixed assets from £2,152,861 to £2,911,716 has imposed no

visible strain on the company's financial resources. Net current assets still total over £5,000,000, and cash has risen from £1,885,508 to £3,068,126. This strength is most welcome, for Bristol have production orders in hand for De Havilland Venoms and Rolls Royce Avon engines, which will almost certainly involve extensive retooling this year. The aircraft industry will undoubtedly receive priority for materials and machine tools, so that the extension and realignment of Bristol's productive capacity should not present impossible problems.

Brush ABOE.—Even before rearmament swelled the demand for its products, the Brush ABOE group was faced by a very full order book, and the expansion of manufacturing capacity to meet this has imposed some strain on financial resources. In addition to broadening the group's interests by the acquisition of new subsidiaries, Brush have embarked on a programme of capital expansion and development; in the year ended December 31, 1950, capital expenditure totalled £1,168,478 and outstanding capital commitments were estimated at £900,000. Despite the introduction of £800,000 of new ordinary capital and the retention of over £450,000 from net earnings, the calls on the company's finance have involved an increase in current liabilities; excluding amounts due to bankers, these total £6,509,440, against £4,914,496 last year. The amounts due to the banks at £2,103,584, against £2,195,082, are higher than the directors envisaged last July. At the same time, the directors had hoped to reduce the amounts tied up in stocks, but the rearmament drive made this impracticable; the actual rise in the book value of stocks from £4,968,369 to £5,610,392 is a reflection of both increased turnover and of substantial increases in the costs of certain important materials. With cash standing

at less than £650,000, and net current assets at under £2,000,000, the capital development programme, once bank indebtedness is taken into consideration, makes the need for new cash capital very clear indeed.

	Years to Dec. 31st, 1949	1950
Consolidated Earnings:—		
Total sales	15,570,803	19,995,431
Total income	2,057,252	2,544,762
Depreciation	420,704	653,562
Taxation	693,103	940,492
Group earnings for ord. stock	584,562	539,871
Ordinary dividends	88,000	132,000
Ordinary dividends (per cent) ..	11	10½
Retained by subsidiaries	33,635	15,829
General reserves	500,000	400,000
Added to carry forward	2,423	38,633
Cons. Balance Sheet Analysis:—		
Fixed assets, less depreciation	3,508,538	4,714,978
Net current assets	1,186,086	1,891,853
Stocks	4,968,369	5,610,392
Cash	83,953	640,094
Reserves	1,310,002	1,721,436
Ordinary capital	1,600,000	2,400,000

(a) Includes £85,000 subsidiary's additional depreciation.
(b) On increased capital £2,400,000 (£1,600,000). (c) Bank loans (1950: £2,103,584; 1949: £2,195,082) have been added to current liabilities in calculating these totals.
5s. Ordinary stock at 7s. 6d. yields 13s. per cent.

The rise in sales turnover from £15,570,803 to £19,995,431 is some measure of the expansion of Brush's business in 1950, but rather more than half of this increase of nearly £4,500,000 was accounted for by the turnover of newly purchased subsidiaries. Group profits have expanded from £2,057,252 to £2,544,762, and the company has been able to maintain the ordinary dividend at 10 per cent on the enlarged capital. Demand for this group's output should be high this year, but it seems clear that the company will have to retain a good proportion of current earnings in reserves to support the expansion of its activities. The more distant prospect depends, of course, on the success of the capital development programme.

Vickers.—The dividend policy of Vickers and the question of how the company will deal with the compensation it received for its English Steel holdings were discussed in a note in *The Economist* of April 28th. The factual summary of the group's many activities incorporated in the full accounts now published suggests that the company's profits and dividend prospects have not been seriously dimmed by the vesting of English Steel. Rearmament, although it will entail some diversion of productive capacity, should ensure a full order book for some time ahead. Some of the more optimistic shareholders may therefore consider that the doubling of the ordinary dividend from 6½ to 12½ per cent and the rise in group trading profits from £7,052,838 to £7,224,220 are merely pleasant foretastes of greater benefits to come.

	Years to Dec. 31st, 1949	1950
Consolidated Earnings:—		
Trading profits	7,052,838	7,224,220
Total income	8,125,028	9,055,675
Depreciation	1,121,342	1,174,469
Taxation	3,354,711	3,575,537
Group earnings for ord. stock	2,040,682	1,450,864
Ordinary dividends (per cent.)	423,345	815,901
Added to group general reserves and carry forward	1,899,874	1,578,662
Cons. Balance Sheet Analysis:—		
Fixed assets, less depreciation	13,293,919	13,806,050
Investments in English Steel	6,346,040	6,316,273
Net current assets	31,724,679	32,178,452
Stocks	42,447,779	46,588,901
"Quick" assets	14,229,023	15,903,962
Reserves	27,654,803	29,376,722
Ordinary capital	12,315,484	12,315,484
£1 ordinary stock at 53s. 6d. yields £4 13s. per cent.		

The group balance sheet does not include the figures of English Steel (except in so far as Vickers' investment in it is included at the written-down value of £6,316,273), and the comparative figures for 1949 have been correspondingly adjusted. The balance sheet total, however, shows an increase of over £6,000,000 to £97,109,074 in the year, £1,951,522 was spent on additions to fixed assets during the year and stocks rose from £42,447,779 to £46,588,901. Liquid resources at £15,903,962, against £14,229,023, appear to provide ample cover on immediate capital commitments of £2,140,441. The financial resources of the group have also been strengthened since the end of the financial year by the receipt of £15,267,081 of steel stock, issued at par, as compensation for Vickers' holdings in English Steel. The strength of liquid resources and reserves, at £29,376,722, against £27,654,803 last year, may suggest to some shareholders that it would be possible to disburse some of the compensation received. Although no hint of the directors' intentions is given in the latest accounts, the yield at the current price of 53s. 6d. is only £4 13s., which may suggest that some investors have already been counting their chickens in this respect.

P. and O.—The operating profits of the P. and O. group advanced by over £2,000,000 to £13,336,633 last year. This was due in some measure to the earnings of new ships brought into commission, such as the *Chusan*, and the return of reconditioned ships to normal commercial service following Government service. Both outward passenger and freight traffic showed considerable increases, but owing to dock delays in Australia it has been found impossible to cover the export demand fully. Profits are shown after setting aside sums for contingencies and the costs of reconditioning; it is hoped that full provision has now been made for this latter liability. The rise in the depreciation provision from £6,020,438 to £8,190,882 partly reflects the larger fleet now in operation, but it is also partly due to heavy capital expenditure during the year; the latter has brought correspondingly heavy tax reliefs on initial allowances, and these have been added to normal depreciation allowances. Indeed, higher operating profits have not brought any higher taxation pro-

visions with them, owing to this initial allowances relief. The appropriation to asset replacement reserves is £1,583,203, against £1,684,926 last year; large though these appropriations are, they still fall short of the difference between depreciation allowances based on original cost and actual replacement costs.

	Years to Sept. 30th, 1949	1950
Consolidated Earnings:—		
Operating profits	11,260,076	13,336,633
Total profits	12,445,418	14,408,480
Depreciation	6,020,438	8,190,882
Replacement reserves	1,684,926	1,583,203
Taxation	2,854,728	2,755,676
Ordinary dividends	551,102	734,802
Ordinary dividends (per cent.)	12	16
Retained by subsidiaries	474,814	707,870
Reserve account	275,000	
Added to carry forward	13,917	32,004

Cons. Balance Sheet Analysis:—
Fixed assets, less depreciation .. 84,280,827 86,271,642
Total current assets .. 64,660,278 63,758,537
Cash .. 8,793,841 8,830,496
Reserves .. 68,539,559 71,464,189
Deferred stock .. 4,592,518 4,592,518
(a) Includes the equivalent of taxation relief in respect of initial allowances.
£1 deferred stock at 64s. 6d. yield £4 19s. per cent.

The extension of P. and O.'s fleet is reflected in part in the rise in the net book value of ships in service or under construction from £78,433,270 to £80,102,919, together with the sum of £2,897,949 in outstanding commitments for capital expenditure. A new item shown in the group balance sheet is £3,892,000 of shipbuilding bills; certain subsidiaries of the P. and O. have found it convenient to finance construction of new ships by this means. The company's liquid resources, with cash at over £8,800,000 and quoted investments at £33,300,000, appear ample to cover immediate capital commitments. For the future the main problem would seem to be that presented by the Budget decision to suspend initial allowances. The Chancellor has already conceded the extension of this relief to ships "actually building" on April 10, 1951. The P. and O. have recently placed orders for two new ships of similar dimensions to the *Himalaya* to be laid down in June, 1951, and February, 1952; it is to be hoped that the Chancellor will make further concessions to cover such cases as these. The longer-term prospects must depend in part on the progress made in the modernisation and replacement of the present shipping fleet, and in this the P. and O. have at least made a good start.

Morris Motors.—Many investors had anticipated excellent trading results by Morris Motors in the year ended December 31, 1950, but the remarkable advance in net earnings from £2,631,426 to £7,136,038, and the raising of the tax-free ordinary dividend from 24½ to 27 per cent exceeded even the best expectations. British taxation took £4,216,466 against £1,480,147 last year, but the directors have still been able to add £1,906,960 to general reserves; no such appropriation was made in 1949. In addition, £27,927, against £260,917, has been added to the carry forward. These appropriations provide a very generous cover on the ordinary dividend, but it should be remembered that Lord Nuffield, in his statement accompanying the 1949 accounts, forecast heavy ploughing back of profits when he averred that the provision of finance for replacement will present a very real problem. In this year's preliminary profit statement, the directors cautiously point out that 1950 was a "year of uninterrupted and expanding production and can therefore scarcely be regarded as normal under present conditions." This is clearly a reference to the possibility of shortages of machine tools, sheet steel and other materials holding up production in 1951. Against this, however, demand will clearly absorb all that the company can produce, and despite raw material difficulties the gross yield of £6 1s. on the 5s. ordinary units at the current price of 42s. 6d. is still an attractive one.

EXCHEQUER RETURNS

For the week ended May 12, 1951, total ordinary revenue was £66,763,000 against ordinary expenditure of £59,021,000 and issues to sinking funds £510,000. Thus, including sinking fund allocations of £1,350,000 the surplus accrued since April 1, 1951, is £44,286,000 compared with a surplus of £50,118,000 for the corresponding period of the previous year.

PHOENIX ASSURANCE COMPANY

RECORD FIRE AND ACCIDENT PREMIUM INCOME

MR WILLIAM SHEARER ON THE ALL-ROUND PROGRESS

The one hundred and sixty-ninth annual general meeting of Phoenix Assurance Company, Limited, will be held on June 6th at Phoenix House, King William Street, London, E.C.

The following is an extract from the statement to the shareholders by the chairman, Mr William Shearer, on the directors' report and statement of accounts for the year 1950:

I must record, with profound regret, the heavy losses we have suffered since our last annual meeting, three highly esteemed members of our board having died during the past year—namely, Lord Hutchison of Montrose, Lord Royden, and Sir John Greenly.

Lord Hutchison of Montrose became a director of the "London Guarantee" in 1933, and of the "Phoenix" four years later; for a long period he was also chairman of our Scottish board, and in all these offices his energy, wisdom, and experience were actively employed in the development and protection of our affairs.

When we acquired the "Union Marine," Lord Royden succeeded his father as its chairman, and our good fortune was further increased soon after when he agreed to join the "Phoenix" board. He thus served our group for some 40 years, and the "Phoenix" company itself, as director, deputy chairman, and latterly finance chairman, for over 34 years. By his unfailing interest in all our activities, by his many great qualities, and particularly by his ability to inspire loyalty and affection, he occupied a unique place amongst us and it is gratifying to record that his sound judgment and wise counsel remained undiminished and were freely available to us right up to the end. I am glad to tell you that our association with the family continues through his nephew, Mr T. J. Royden, who is one of our directors in the U.S.A.

Sir John Greenly's association with us lasted for only some 20 months; yet in that short period he had already established himself as a most able and agreeable colleague from whom we had hoped to receive many years of valuable assistance.

This serious reduction in the membership of your board has been partially restored by the recent appointments of Mr Dingwall Latham Bateson, C.B.E., M.C., and Sir Alexander Cadogan, P.C., O.M., G.C.M.G., K.C.B.

There were two further changes during the past year that I feel I should record. The retirement of Mr G. L. Wagstaff, secretary of the company since 1935, took place on the completion of over 40 years' service. Mr James M. Haines, our general attorney and manager for the United States, has also retired. Both Mr Wagstaff and Mr Haines carry with them our warm appreciation of their loyal and efficient services. On Mr Wagstaff's retirement, Mr John G. Hill was appointed our secretary, and to succeed Mr Haines your board appointed Mr Henry Lloyd Jones as United States manager, with Mr John R. Robinson as his deputy.

We have established records in fire and accident premium income, increased our resources in all departments, declared an excellent bonus to our life policy-holders, and transferred over £1,500,000 from the revenue accounts to profit and loss account. Moreover, our investments and other assets now total over £67,000,000, an increase of £4,700,000 in the year.

Gratifying as these achievements are, it would be wrong to assume that the year was an easy one or free from serious problems. An active international insurance programme such as ours can never be immune from the stresses and strains of abnormal events. We must hope that the efforts we are making to maintain our underwriting principles and provide that service of which we have every reason to be proud will enable us to continue to report satisfactory progress.

FIRE DEPARTMENT

Our fire premiums at £9,250,000 show an advance of £1,543,000 on those for 1949.

There has been real expansion in almost every field of operation, and this has meant that the spread and balance of our worldwide portfolio has been well maintained. That is of vital importance if reasonable uniformity of results is to be achieved. Yet this stability is always threatened by catastrophes, and 1950 brought its full quota.

In point of time our Canadian operations were the first to be exposed to a succession of heavy blows, of which the conflagrations caused during severe windstorms at Rimouski and Cabano and the Manitoba floods were of marked importance.

A little later the United States began to suffer from a series of great windstorms which visited most parts of the country, the culmination being the storm in the eastern States at the end of November; the resulting loss is estimated at \$150,000,000.

In the United Kingdom we enjoyed a favourable loss experience.

With the claims ratio at 46.2 per cent. (being higher than in 1949) the record profit of £302,000, representing a ratio of 8.7 per cent. on premiums and an increase of £210,000 over that for 1949, was produced.

The account carries the unusual transfer of £925,000 from profit and loss account to increase our provision for unexpired risks, which the board has decided should now be calculated at 50 per cent. of the year's premiums. Calculation of this provision at 40 per cent. has been hallowed by long tradition, and periodical checks had shown it to be adequate. It has always been recognised, however, that for a world-wide business, embracing United States and Canadian policies, a considerable proportion of which are issued for three and five years for single premiums payable in advance, any increase in the weight of such business in our world-wide accounts might necessitate a higher provision than 40 per cent. The devaluation that has taken place and the consequent higher proportion of North American long-term business included in our sterling premiums now require that this important change should be made.

ACCIDENT DEPARTMENT

In the accident department premiums amount to the substantial figure of £12,657,000, an increase of no less than £2,988,000 on that for 1949. As in the fire account, devaluation of sterling in terms of dollars is largely responsible for the advance.

The loss ratio is very little different from that of 1949—54.2 per cent. against 54.0 per cent.—but there is a compensating reduction in the ratio of commission, expenses and dominion and foreign taxes, from 40.0 per cent. to 39.8 per cent. Although claims, commission, taxes and expenses of management are up in the aggregate by £2,316,000,

the combined ratio to premiums remains almost the same as in 1949.

The considerable increase in premium income calls for an additional provision on this basis of £413,000, leaving a balance of £341,000, being 2.7 per cent., to be transferred to the profit and loss account. Bearing in mind the adverse experience that accident insurance generally is suffering throughout the world, this result is not unsatisfactory.

LIFE DEPARTMENT

In the life department the funds show a further substantial advance of £1,055,000 to £27,251,000. The net new sums assured for the year were £6,296,000, as compared with £5,843,000 in 1949, and are a record for the company. The premium income has increased from £1,765,000 to £1,869,000 and the consideration for annuities from £792,000 to £822,000.

The rate on mortality experienced by the funds continues to be favourable.

The gross rate of interest earned on the fund has risen from £4 1s. 7d. per cent. to £4 2s. 4d. per cent., but owing to heavier taxation charges the net interest figures show a slight reduction.

The quinquennial valuation of the company's life participation fund was made as at December 31st last, and out of the surplus disclosed the board decided to declare a reversionary bonus on with-profit policies at the rate of 38s. per annum per £100 assured in respect of the period. This is an increase of 5s. 6d. per £100 on that declared five years ago.

In the company's life non-participation fund the surplus belongs to the shareholders. After increasing our reserves, it has been decided to declare the sum of £250,000 as divisible, and of that amount £100,000 has been transferred to profit and loss in the year of account.

MARINE DEPARTMENT

Our trading shows a very satisfactory result with a transfer of £250,000 to the profit and loss account. The marine fund carried forward is larger by £291,000 at £3,590,000, representing 154 per cent. of the premiums. This compares favourably with the fund of 151 per cent. reported a year ago, since our premium income has increased from £2,185,000 to £2,327,000.

PROFIT AND LOSS ACCOUNT

The main sources of revenue are interest, dividends, and rents, and the profits from our underwriting operations. In respect of the former, you will observe that the gross amount, at £1,211,000, has increased by £273,000, and that, after providing for United Kingdom income tax, the net amount earned is £668,000. Part of the net increase of £152,000 is due to devaluation and the consequent higher sterling value of our investment income in North America. The aggregate transfer of £1,543,000 from the underwriting accounts is a very successful outcome of the year's operations and a record for our company.

On the other side of the account we have made all the usual provisions, and it will be noted that United Kingdom taxation calls for £950,000 to be set aside in respect of the profits for the year. This amount, together with the tax on our interest earnings, is our estimate of what the Inland Revenue require from us in respect of our operations for the year to December 31st last. It is earned for the Treasury through the success of our business in all parts of the world.

Having made our usual transfer to pensions account and provided for expenses and foreign taxes not charged to the underwriting accounts, there is a net profit for the year of £931,000 which is available for appropriation.

We propose to transfer £500,000 from

investment inner reserve to profit and loss account. Bearing in mind that that reserve contains surpluses arising in the normal process of selling investments, it is, in the board's opinion, appropriate that this part of that substantial free fund should be released.

There remains the question of the dividend, and the shareholders at our annual general meeting will be invited to deal with the board's recommendation that an additional 2s. per share (less income tax) should be distributed. Our dividend remained at 12s. from 1933 until 1945, and from 1946 1s. was added following the special distribution granted as compensation to shareholders for the loss of the benefit of Dominion income tax relief then discontinued. Apart from this, it is almost 20 years since our 12,000 shareholders have received any increased participation in the company's prosperity. Companies have been requested to observe "due moderation and restraint" in dividend policy. Your directors maintain that they have followed this injunction, but nevertheless they have unanimously reached the conclusion that a modest increase in dividend was due and that the shareholders had waited long enough for the consideration which so many other sections of the community have been receiving.

When all these important adjustments and provisions have been made the balance carried to the consolidated balance sheet has been increased to £1,242,000.

I am happy to reiterate the statement I made last year, that despite the unsettled state of home and overseas investment prices, the total of the middle market values of our Stock Exchange securities is substantially above the values appearing in the statements now submitted. No change has been made in the book values of our North American investments, and they remain on our books at the equivalent sterling cost at the time of purchase.

Your board continues to do everything in its power to improve gross interest earnings, whilst keeping carefully in mind the security of the company's capital and funds, and, following this policy, mortgages show some increase.

Much of our business is written abroad and we have to compete with offices of all nationalities and under many local regulations. We engage in insurance transactions expressed in no fewer than 78 overseas currencies.

TRIBUTE TO EXECUTIVES AND STAFF

We again gratefully acknowledge the fine leadership and expert guidance of our general manager, Mr E. B. Ferguson, and the splendid support he receives from the other members of the executive and from the branch managers, staffs, and agents at home and overseas. To all of them, to the directors of our associated companies, and to the members on our local boards, we tender our gratitude and congratulations on the success of their work.

EAGLE STAR INSURANCE

EXPANSION IN ALL DEPARTMENTS

The annual general meeting of Eagle Star Insurance Company Limited will be held on Tuesday, June 5th, in London.

The following is a summary of the statement by the chairman and managing director, Sir Brian Mountain, Bt.

In the life department net new sums assured exceeded £43 million, over £2,250,000 higher than 1949, again constituting a record. The expense ratio was 7.9 per cent. and the net rate of interest £3 11s. 9d. per cent. The mortality experience was particularly favourable.

The fire account shows a substantial increase with profitable results. The claims experience was good; the premium income

exceeded £2,250,000 and £239,000 is transferred to profit and loss.

The accident account (including personal accident and motor) discloses an increase in premium income, now nearly £5,000,000, and £153,000 is transferred to profit and loss.

The motor department have experienced rising claim costs and increasing accident frequency. Increased premiums in motor insurance will apply from June 1st. After transferring £100,000 to profit and loss the marine fund at £1,723,966 is 127 per cent. of the increased premium income.

Net interest at £400,925 shows a small increase. Profits from the English and Scottish closed fund are £49,319 and contributions from other trading departments total £492,000.

After allowing for increased taxation, both at home and overseas, contributions to the staff pension funds and other outgo, the profit is £444,523. Dividends require £309,075. The profit and loss carry forward is £1,550,908, an increase of £147,215.

Total assets now exceed £61,250,000 and reserves and undistributed profits over £5,000,000.

NORTH BRITISH AND MERCANTILE INSURANCE

LORD BRAND ON DIVIDENDS AND RISK CAPITAL

The one hundred and forty-first annual general meeting of the North British and Mercantile Insurance Company, Limited, was held on May 10th in Edinburgh.

The Rt. Hon. Lord Brand, C.M.G., D.C.L. (chairman of the general court of directors), who presided, said:

The declaration of the increased dividend which we ask you to ratify today was made before the Budget, and as the Chancellor of the Exchequer, in addition to increasing very largely the profits tax on distributed dividends, also stated in his Budget speech that "the country simply could not afford the substantial increases of dividends, which were being paid by companies in general in 1951," I should perhaps say a word or two as to the reasons which guided the directors in recommending the particular increase in the case of your company. As my statement explained, the North British shareholders have received during the last 15 years one increase in dividend, which amounted in fact to 3d. per share. During the same period our company's strength, resources and income have very greatly increased, though our shares stand actually lower in the market than they did 15 years ago. There was no reason whatever, from the point of view of the company's income and reserves, why the dividend should not be increased. Moreover, during that period the general price level has doubled and the consequent great increase in the cost of living has hit shareholders large and small, just as it has hit the salaried class and wage-earners, and indeed, everyone in the community. But, while the North British shareholders have received an increased dividend an addition of about 4 per cent. over this long period, wages and salaries have increased by nearly 150 per cent. In these circumstances I believe that the directors of your company in recommending this increased dividend to you, have acted with moderation and restraint. I do not myself believe you can overcome inflation by a freezing process whether of wages, salaries or dividends. You can indeed see the disastrous effects of freezing over a long series of years when you examine the consequences on the upkeep of houses of freezing rents. Nor do I think that you can for instance apply some universal percentage by which all companies may increase dividends.

The declaration of the increased dividend which we ask you to ratify today was made before the Budget, and as the Chancellor of the Exchequer, in addition to increasing very largely the profits tax on distributed dividends, also stated in his Budget speech that "the country simply could not afford the substantial increases of dividends, which were being paid by companies in general in 1951," I should perhaps say a word or two as to the reasons which guided the directors in recommending the particular increase in the case of your company. As my statement explained, the North British shareholders have received during the last 15 years one increase in dividend, which amounted in fact to 3d. per share. During the same period our company's strength, resources and income have very greatly increased, though our shares stand actually lower in the market than they did 15 years ago. There was no reason whatever, from the point of view of the company's income and reserves, why the dividend should not be increased. Moreover, during that period the general price level has doubled and the consequent great increase in the cost of living has hit shareholders large and small, just as it has hit the salaried class and wage-earners, and indeed, everyone in the community. But, while the North British shareholders have received an increased dividend an addition of about 4 per cent. over this long period, wages and salaries have increased by nearly 150 per cent. In these circumstances I believe that the directors of your company in recommending this increased dividend to you, have acted with moderation and restraint. I do not myself believe you can overcome inflation by a freezing process whether of wages, salaries or dividends. You can indeed see the disastrous effects of freezing over a long series of years when you examine the consequences on the upkeep of houses of freezing rents. Nor do I think that you can for instance apply some universal percentage by which all companies may increase dividends.

Immensely heavy taxation and inflation are rapidly decreasing the liquid resources of British industry as a whole, and therefore making the future need for risk savings greater. Exactly the same causes are, however, also rapidly diminishing these savings themselves, and this tendency is greatly accentuated by the 50 per cent. tax on distributed profits. How this slide-down into a serious shortage of risk capital is to be averted presents a problem for which Socialism and the Welfare State have not yet provided a solution. It is certainly not to be found by unduly penalising the shareholder. The report was adopted.

The circumstances of companies are infinitely varied.

THE WIDER VIEWPOINT

In the recent White Paper on the National Income, the total of dividends and interest paid by all companies in the country are given for 1950 at £827 million. The interest component of this figure includes all company debenture interest, co-operative society dividends, interest paid by building societies, taxes paid by British companies to foreign governments, and also film royalties paid to foreign companies. What all this amounts to I cannot tell with any accuracy, but I can state with some confidence that the total is not less than £150 million. If, therefore, I deduct £150 million from the above figure of £827 million, in respect of all the above, so as to make the figure for dividends paid to persons £677 million, I think I am well within the mark. It should also be borne in mind that this figure includes profits earned abroad by British shipping, oil and insurance companies, in so far as they are paid out in dividends. These dividends must amount to a large sum. I cannot imagine anyone regarding them as a burden on the British salaried or wage-earning classes. This figure of £677 million compares with a total of personal income for the whole country of £10,279 million, and with a total for wages and salaries of £7,163 million. Gross dividends before tax or sur-tax on this estimate are thus less than 1/10th of wages and salaries, and about 6.7 per cent. of the total personal income of the country. Returning again to the figure of £827 million for both dividends and interest for 1950, I must ask you to note that it is almost exactly the same as the figure for 1947 and only £31 million greater than the figure for 1948 when the wage and dividend freeze started. On the other hand, since 1948 wages and salaries have risen by £785 million, or proportionally very much more. In these circumstances I think the small shareholder is justified in getting an increase from his company, if it can afford to pay it. If anyone is still nervous about shareholders with larger incomes getting too much from dividends, he need only bear in mind that, if they are in the sur-tax paying class, progressive taxation in the form both of income tax and sur-tax will see to it that only a very small proportion of any gross dividend remains in their net income.

RISK CAPITAL ESSENTIAL

I have already quoted the Chancellor's words that "the country simply could not afford substantial increases in dividends." I take it he was thinking in the main of its effect on demands for increased wages and salaries, since any likely increase in dividends itself would have a very small inflationary influence.

We all of us understand the difficulties which faced Mr Gaitskell, and, whatever we may think of the effects of the taxes he has imposed, we recognise he showed courage in facing a most intractable problem. But I think it necessary to add this rider to what he said. What the country simply cannot afford to do without is an ample supply of risk capital, and of the savings by which alone it can be provided.

Immensely heavy taxation and inflation are rapidly decreasing the liquid resources of British industry as a whole, and therefore making the future need for risk savings greater. Exactly the same causes are, however, also rapidly diminishing these savings themselves, and this tendency is greatly accentuated by the 50 per cent. tax on distributed profits. How this slide-down into a serious shortage of risk capital is to be averted presents a problem for which Socialism and the Welfare State have not yet provided a solution. It is certainly not to be found by unduly penalising the shareholder. The report was adopted.

ATLAS ASSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS IN ALL DEPARTMENTS

The annual general meeting of proprietors of the Atlas Assurance Company, Limited, will be held on June 1st, at the company's head office in London.

The following is an extract from the statement by the chairman, Mr Rudolph E. F. de Trafford, O.B.E., circulated with the report, accounts and balance sheets for the year ended December 31, 1950:

FIRE ACCOUNT

Our fire premium income has continued to expand and amounts to £5,101,072, an increase of £947,797 over the corresponding figure in 1949.

Our underwriting profit amounts to £524,691, or 10.3 per cent., as compared with £490,815, or 11.8 per cent., in 1949. In the United States severe windstorms cost something in the region of \$125 million. Naturally a share of these claims has come our way and these, though mostly small individually, represent in total a large figure. That, in spite of this, our operations in the United States resulted in a profit reflects great credit on Mr Gallagher, our United States manager, and all who serve the company there.

ACCIDENT ACCOUNT

Our premium income in 1950, at £1,775,874, exceeded that obtained in the previous year by £268,191. The underwriting profit amounts to £159,876, or 9 per cent., by comparison with £92,832, or 6.2 per cent., in 1949.

MARINE AVIATION AND TRANSIT ACCOUNT

On the marine side our premium income amounted to £680,195, as compared with £648,237 in 1949. Claims paid, at £392,105, exceeded the corresponding figure in 1949 by £26,356.

With regard to cargo business, the trend of rates, through force of competition, continues in a downward direction although in these days of high, and sometimes astronomical, values one might have expected the reverse to be the case.

Turning to hull business, it has been frequently pointed out that delayed claims are a cause of much concern to underwriters, and I am afraid that, with both the time and cost factors operating against us, the situation tends to worsen rather than to improve.

Having regard to what I have said, shareholders may possibly be surprised at the transfer of £100,000 from the marine account to the credit of the profit and loss account. It will be remembered, however, that, in order to conserve resources, nothing was drawn from the underwriting account in 1949. Today the marine fund, at £1,100,910, is sufficiently strong to withstand any eventualities that can humanly be foreseen and, therefore, it is felt that to carry, what I might call, the austerity programme further is not necessary.

CAPITAL REDEMPTION ACCOUNT

The capital redemption fund increased slightly during the year and amounted at December 31st last to £2,502,586. As in previous years, the surplus revealed by a valuation of the liabilities has been left in the fund.

LIFE DEPARTMENT

The life assurance and annuity fund continues to grow and amounted at the end of the year to £21,644,712, an increase of

nearly £620,000 over the previous year's figure.

The sums assured under new assurances issued in 1950 were £4,014,634 after deduction of re-assurances as compared with £4,642,012 in the previous year.

The gross rate of interest earned on the fund increased by 2s. 3d. to £4 0s. 9d. per cent. but the net rate declined by 4d. to £3 5s. 5d. per cent. on account of the further substantial increase in the liability for income tax.

Since January, 1950, there has been some recovery in Stock Exchange prices from the low level that obtained just after the devaluation of sterling. Consequently, the margin which existed at the end of 1949 between total market values of our Stock Exchange investments and the values at which they appeared in the balance sheet has been enhanced during the year.

The surplus revealed by the valuation as at December 31st last was £306,040, including £38,218 brought forward from 1949. Out of this sum £81,935 has been applied to strengthen reserves and £5,329 has been used to pay interim bonuses and to meet the cost of bonuses on re-assurances received from other companies. The balance of £218,776 has been carried forward.

In recent years the announcement of an increase in the price of some goods or services has unhappily become almost a daily event. It is, therefore, particularly pleasing to record that, during the year 1950, the directors were able to make a substantial reduction in the rates of premium for new life assurances in all the principal classes. Our new rates are very attractive and our policies contain many liberal privileges. It is our constant aim to provide, for all classes of the community, a wide range of life assurance and annuity contracts on generous terms and to maintain these high standards of service and security which, for so many years, have been associated in the minds of the public with free-enterprise insurance.

PROFIT AND LOSS ACCOUNT

On the income side of the profit and loss account there is an item of some magnitude which will not escape the notice of shareholders. I refer to the sum of £586,101, being profit on investments realised. This profit arises mainly out of our holdings of United States Government short-term bonds forming part of the dollar assets which, under United States laws, we need to maintain in that country so long as we carry on business there as, naturally, we have every intention of doing. The bonds were purchased at par when the dollar stood at 4.03 in relation to the £ sterling and were redeemed at par during the year, with the dollar standing at 2.80.

Shareholders will also observe that, by comparison with 1949, our gross interest earnings have increased by £98,462. Quite a large portion of this increase arises out of exchange, although as is to be expected, higher dividends on our investments—mainly overseas—and the investment of new money have played their part. Increased earnings naturally bring in their train an increase in United Kingdom taxation, with the result that our net earnings, including rent on our head office building—which is our own property—amount to £199,972, by comparison with £145,822 in 1949.

A dividend of 12s. 9d. per share has been declared. This compares with the 11s. 3d. per share which has prevailed since the last increase in the dividend, given effect to in relation to the year 1946.

HAMBROS BANK

PROPOSED CAPITAL INCREASE

MR R. OLAF HAMBRO'S STATEMENT

The thirty-ninth annual general meeting of Hambros Bank Limited, will be held on June 7th, at the offices of the bank, 41, Bishopsgate, London, E.C.

The following is an extract from the statement of the chairman, Mr R. Olaf Hambro, circulated with the report and accounts for the year to March 31, 1951:—

The year 1950-51 has been marked by increased activity and expansion in the business of the bank, which is clearly indicated by the total of the deposits and the acceptances which have risen during the year, in the case of deposits by 45.20 per cent., and acceptances by 19.40 per cent. On the other hand the liquidity is again very high, the cash, money at call, bills and Government stock amount to 76.38 per cent. of the deposits, and loans and advances represent 25.54 per cent. of the deposit figure.

DEMAND FOR CREDIT

The increased demand for finance by way of London credit from all over the world is partly due to the rise in commodities, but also it reflects the large increase in the world demand for British exports and services. This is a healthy sign, and indicates the still unequalled position of London as a financing centre and the renewed confidence in sterling as a sound currency. I would, however, venture to say it is becoming evident that the average cost at which such credit facilities are made available to bankers and traders abroad, in combination with the low discount rates which are still in operation here, is in the main too cheap, and as the demand intensifies it will of necessity give rise to greater discrimination in the matter of charges.

It is our policy, as in the past, to reserve a large proportion of our available facilities for our old customers in the Scandinavian countries, and in this respect Norway and Denmark have been particularly active in their demands for sterling facilities, and also to a less varied but by no means less active extent from Sweden, the demands of the last-mentioned being confined in the main to the timber trade and its ancillary products of pulp and paper, the rising cost of which in the postwar years having proportionately increased the shippers' demands upon us for seasonal accommodation. We also do what we can to help our good friends in Finland, within the limits imposed by the difficulties of their political situation. Our old-established connection with Italy has also been well maintained.

THE AMERICAN COMPANY

I referred in my last review to the increasing activities of our associated company, The Hambro Trading Company, of America, Inc., and this year the total of exports to the United States through the medium of the trading company has risen to nearly \$8,000,000 in the year. I would like to say a word of thanks and appreciation here to our good friends among the American banks.

An extraordinary general meeting has been called to follow the annual general meeting, for the purpose of giving effect to the recommendation of the board to increase the capital of the company by £1,000,000 by the issue of one million fully paid £1 shares in the form of an offer to the holders of the partly paid shares at the price of £2 5s. per share. This will have the effect of raising the capital paid up to £3,000,000, and the reserves to over £2,000,000.

I desire again to place on record my appreciation of the work of the officials and staff.

ANGLO-NEWFOUNDLAND DEVELOPMENT

SUSTAINED DEMAND FOR PRODUCTS

MR ELLIOTT M. LITTLE ON PROGRESS OF REHABILITATION

The ordinary general meeting of Anglo-Newfoundland Development Company, Limited, was held at the offices of the company, Grand Falls, Province of Newfoundland, on May 16th, Mr Elliott M. Little (the president) in the chair.

The following are extracts from the statement by the president which had been circulated with the report and accounts for the year ended December 31, 1950:—

The improvement in market conditions which began late in 1949 was sustained throughout 1950, the year now under review. The demand for newsprint paper, sulphite pulp and non-ferrous metals was strong and prices of all these products advanced during the year.

The forecasting of future prospects is unusually difficult at this time because there are so many abnormal factors to consider. The plans for defence spending will likely keep North American business operating in high gear for the predictable future, assuring good demand for the company's products. On the other hand, increased taxes to pay for defence preparation are a practical certainty. Also, labour and material shortages will develop and become more and more serious as the defence programme gains momentum.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

The profit of the company, excluding inter-company dividends, of \$2,290,967 was an improvement of \$674,219 over 1949, in which year we received certain tax benefits consequent upon Confederation of Newfoundland with Canada. Profit before taxation was \$1,324,219 higher in 1950, an increase of 56 per cent. over 1949.

Substantial progress was made on our rehabilitation programme. Conversion of the mill furnaces to use of oil in place of coal was completed early in the year with favourable effect upon our costs. The programme of machine speed-up neared completion. A major project in hand now and to be carried over the next two or three years is the conversion of the groundwood mill at Bishop's Falls to an expanded power generating unit and the concentration of wood handling and grinding at Grand Falls. Other improvements are planned. Capital expenditures during the year amounted to \$2,161,773 and it is estimated that some \$5,500,000 will be spent over the next three or four years to complete the programme. Other projects may arise and increased costs may necessitate upward revision of that figure, but it is considered that any such further expenditures found to be necessary will be adequately covered by normal depreciation for some years to come.

GASPESIA SULPHITE COMPANY

Last year I indicated that there were prospects of a firming in demand and price of unbleached sulphite pulp. That prophecy was fulfilled and a sharp recovery was made early in 1950 so that the mill was able to operate at full production with satisfactory sales returns. The net profit after depreciation and taxes amounted to \$368,871, as compared with a 1949 deficit of \$195,274. It is expected that the 1951 profit will be substantially higher than the 1950 profit.

This company has for some years been experimenting with a by-product from its manufacturing process and has operated a small production unit. It has now reached the stage where commercial operations on a larger scale seem warranted and the related assets and rights will be sold to a newly formed company called Lignosol Chemicals,

Limited, in which Anglo-Newfoundland Development Company, Limited, will hold a 50 per cent. interest.

TERRA NOVA PROPERTIES

Buchans Mine operated continuously throughout the year without any major delays. Crude ore milled was 328,000 tons—6,000 tons less than in 1949. The grade also was slightly lower, but the net income was substantially increased by the higher metal prices obtained.

Exploration and mapping continued throughout the outside Crown Lands concession of approximately 6,000 square miles by aerial methods and by field parties on foot, without discovery of important mineralisation.

In the vicinity of Buchans, additional geophysical surveys were completed without conclusive results. Diamond drilling totalled 24,910 ft. and resulted in the discovery of additional ore showings north of Old Buchans and north-west of the Rothermere shaft. These recently discovered ore-bodies may be small. Their actual extent can be determined only by further exploration.

Mining development consisted principally in the deepening of the Rothermere shaft 823 ft.—a total depth of 1,796 ft. A final depth of 2,500 ft. for this shaft is now contemplated, the ore-bodies last discovered having been found at about that depth.

In drifts, raises and winzes 6,260 ft. were driven, mostly in connection with the Rothermere ore-body, in which mining should begin about the middle of 1951.

Ore reserves at the end of the year amounted to 3,555,000 tons of assured and probable ore, an increase of 231,000 tons during the year. In addition, low grade ore, normally unprofitable, but profitable in most part at recent metal prices, amounted to 220,000 tons. These figures do not include the prospective or possible ore to which I referred last year.

MONTMORENCY SHIPPING

Net profit after taxes amounted to \$98,063 which, added to the amount brought forward in the previous year, gives a sum of \$120,330, which has been carried forward in the books of this company.

CONSOLIDATED POSITION

The consolidated profits, after depreciation and taxes, of \$5,844,133 compares with \$2,868,585 for the previous year and is equivalent to \$1.06 per stock unit outstanding.

The parent company will be able from its own resources to complete the re-equipment of its plant. Failing all-out war, there are many signs, which, in my opinion, portend an era of prosperous expansion for Canada and Canadian industry. Our group of companies should share fully in this rising tide of Canadian business.

The results achieved are due in no small measure to the loyalty of our employees and to the enterprise of our officers, superintendents and senior staff. To all these, I here record my appreciation and thanks.

The report and accounts were adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

BRITISH-AMERICAN TOBACCO COMPANY

INCREASED TRADING PROFITS

The forty-eighth annual general meeting of The British-American Tobacco Company, Limited, was held on May 11th in London.

Mr D. M. Oppenheim (vice-chairman), who presided in the absence through indisposition of the chairman, Mr T. F. Winnill, in the course of his speech, said: The fact that devaluation operated throughout the year under review but for only a few weeks of the previous year makes it difficult to express in sterling a true comparison of trading results in the two years. Thus, the increase in trading profits of some £4,600,000 is due to quite a material extent to the expression in sterling of profits earned by subsidiaries in territories whose currencies were not devalued in September, 1949.

MONETARY DEPRECIATION

The monetary depreciation which continues to develop generally throughout the world occasions artificially inflated profits which are subjected to taxation, despite the fact that they largely reflect a correspondingly inflated inventory valuation, as is strikingly illustrated in the accounts before you. Companies are being prevented by taxation from accumulating funds out of their own resources for the purpose of maintaining the necessary volume of stocks and to replace fixed assets.

The problem is urgent and will have to be solved before very long. It is regrettable that the Chancellor of the Exchequer has not only failed to deal with a serious situation, but has aggravated it by withdrawing the temporary alleviation afforded by initial allowances and by increasing the rate of distributed profits tax. These are, in my view, retrograde steps which are likely to have serious effects on productive industry in the future.

PROFITS TAX

Profits tax, in its present form, bears unfairly on the ordinary shareholder. The increase in distributed profits tax, whilst not, in my view, being a logical way of curbing excessive increases in dividends, merely aggravates the unfairness, and, as it falls upon companies' reserves, it also aggravates the drain from industry of its essential capital. The increase penalises not only a company which increases its dividend substantially, but also a company like yours which increases its dividend very moderately (and moderate increases are admittedly unexceptionable) and even a company which makes no increase at all. Those who support this discriminatory form of taxation do not always appear to understand that the distributed profits tax is not an additional direct charge on the ordinary shareholder. It is a charge which normally must be met from companies' savings and, as such, seems to me to be unsound not only in principle but as an expedient in today's exceptional economic conditions.

I feel impelled to refer to Section 32 of the Finance Bill now before Parliament, which seeks to make it unlawful for a company to move its residence outside the United Kingdom or to form its overseas branches into subsidiary companies, and even seeks to control the capitalisation of overseas companies within the jurisdiction of colonial, dominion and foreign governments. These prohibitions apply, even although the avoidance of liability to income tax or profits tax is only indirect and incidental, which virtually means, if the Bill becomes law, that in future no overseas branch can be converted into a company formed under the local laws and managed by local directors, save with the permission of the Treasury.

VALUE OF OVERSEA COMPANIES

Your company has continuously expanded during its forty-nine years of existence. This

steady growth has been due to many factors, not the least of which has been the policy adopted early on (when taxation was not an important consideration) of incorporating subsidiaries abroad to take over and carry on the business of the parent company. This has undoubtedly proved to be the right policy politically and economically, and would be the right policy for young, growing companies developing businesses abroad in the future. If the provisions of the Finance Bill become law, this process will be subject to the uncontrolled veto of the Treasury. There is grave danger, particularly under present conditions of high taxation, that proper weight will not be given to the broad reasons of policy which determine such developments, as against the short term loss of revenue.

The conversion of a developing overseas branch into a company managed by local directors is the result that the business has added opportunity for expansion, in sympathy with local sentiment, as a national of the country where it operates, and, moreover, it can accumulate the capital required to finance its growth, subject to paying any taxes locally imposed. Furthermore, such a company is not at a disadvantage, as compared with its local competitors. It does not, therefore, need much imagination to realise what a serious long term effect these restrictive provisions are likely to have upon the continued growth and prosperity of this country's invisible and visible exports.

As to the future prospects of your company, I can say that the demand for its products and those of its subsidiary and associated companies continues to show a satisfactory upward trend. Against this, there is also an upward trend in taxation and costs, this condition being worldwide, and another limiting factor for the future may be the increasing shortage or unavailability of certain essential raw materials.

The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

FURTHER EXPANSION

The twenty-second annual general meeting of The Agricultural Mortgage Corporation, Limited, was held on May 16th in London.

Mr. E. J. Bunbury, M.C., the chairman, said: I am glad to be able to report that our business has again shown substantial expansion during the past financial year, and considerable progress has been made.

The 1950 farming year was one of trial and tribulation for all farmers; for many it was disastrous and for others costly and disappointing. The difficulties of harvesting through weeks of bad weather and widespread storms, taxed to the full the resources and ingenuity of farmers throughout the country.

The present position of the horticulturist is regarded with anxiety. No section of the industry escaped the collapse of prices in a year of abundant crops. The outlook for the 1951 farming year is not bright. Owing to bad weather conditions the whole rhythm of seasonal cultivations was thrown out of gear, and this must have an adverse effect on the production of crops.

During the past financial year new loans of £4,120,788 were completed, an increase of 17 per cent. over the comparable figures for the previous year and the highest figure for any one year since the Corporation commenced business.

The demand for agricultural properties remains strong, and good agricultural land continues to be a first-class investment. Owners of farms are becoming increasingly aware of the necessity of modernising the fixed equipment.

The report was adopted.

BANK OF ATHENS

CONTINUED EXPANSION OF BUSINESS

INCREASED NET PROFIT

MR. COSTI J. ELIASCO'S REVIEW

In the course of his speech at the fifty-seventh annual general meeting of the Bank of Athens, held at its Head Office, Athens, on March 24th, the chairman and general manager, Mr Costi J. Eliascos, stated that the year 1950 was marked at first by a certain improvement in world conditions, which, however, was not maintained, for with the outbreak of hostilities in Korea all countries established defence programmes with resultant serious repercussions on world economy.

Greece, which was just emerging from a successful but long war against Communism, was hard hit by this sudden change, and the simultaneous curtailment of her share of Marshall Aid seriously affected her reconstruction programme. This has rendered precarious the progress already realised, and, owing to the modest resources of the country, devastated by the enemy and by outrageous Communist activities, many years of patient toil and aid will be required to maintain and develop this progress. The task would be impossible without the generous aid of the United States, on which Greece must yet depend for a long while.

In order to prevent inflation the Bank of Greece continued to offer gold sovereigns, through the sale of which bank notes were withdrawn from circulation at a pace which was hastened by the anxiety resulting from the international tension.

The chairman stressed that hoarded gold could become beneficial to the country's economy, but emphasised that for this purpose time alone and the application of sound economic principles can restore the confidence, so seriously impaired, in the national currency. Salaries and profits cannot continuously mount, he said. It is necessary to work more and spend less, and the example for this should be set by the Government; an increase in taxation will be borne with more courage if justified and equitable.

Exports still lag far behind owing to high home prices, and the deficit of the commercial balance has further increased, but a considerable effort was successful in resuming tobacco exports to Germany, with which country commercial relationship was re-established.

During the year under review the privilege held by one bank for accepting deposits of public institutions came to an end, and the distribution of such deposits amongst all banks in the country will henceforth be entrusted to the Bank of Greece.

These funds will have to be used in accordance with regulations established by the Currency Committee, which has increased its restrictions on bank credits. However, it remains to be seen whether the inflationary pressure should not primarily be checked by a wholesale reduction of Government expenditure. Without such a measure all controls might prove ineffective, as, for example, the recent compulsory change of bearer shares to registered shares.

The Bank's affairs were very active during 1950, marking a new record of expansion. The balance sheet submitted totalled Drs. 1,096,132,000,000, equivalent at the official rate of Drs. 42,000 to £26,098,381, as against Drs. 640,264,000,000 or £15,244,381 for the preceding year. Deposits show an increase of 63 per cent., corresponding to more than one-third of the total increase of all bank deposits in the country.

Net profits for the year amount to Drs. 7,552,293,223, and it is proposed to distribute a dividend of Drs. 35,000 net for each new share of Drs. 1,000 issued in exchange for ten old shares of Drs. 100. The

dividend for the previous year was Drs. 2,400 per old share.

During 1950 the Bank acquired the building housing its branch at Port Said and also several sites in Greece for enlarging and erecting local branches.

The branches in Egypt have contributed to an even greater extent to the profits and the affiliates in New York and Johannesburg continue to make satisfactory progress.

After paying tribute to the devotion and abilities of the staff, the chairman in conclusion said:

In looking to the future, it is necessary, despite the grave difficulties through which we are now passing, that we should not be influenced by the darker phases, such as the war in the Far East and the efforts of the Communist bloc to terrorise the world by the menace of local or general attack. As long as the spirit to remain a free nation prevails as a principle it will have the support, whatever the effort it may demand, of all those countries which, even though small, are nevertheless tenacious and determined in the struggle for the defence of their liberties.

MOSS' EMPIRES, LIMITED

MR PRINCE LITTLER'S SPEECH

The fifty-second annual general meeting of Moss' Empires, Limited, was held on May 17th in London.

Mr Prince Littler, the chairman, in the course of his speech, said: The parent company's trading profit shows a drop of just under £40,000. This is in part offset by an increase in the subsidiary companies' trading profit so that the consolidated profit and loss account shows a trading profit with a drop of less than £30,000. The diminution is mostly accounted for by decreased admissions but increased costs have contributed to the net result. The spending power of the public undoubtedly fell during the year 1950. Money was tighter.

The parent company's net profit for the year is £148,439, against the previous year's net profit of £155,629. The corresponding group net profit is £158,331 for 1950 and £160,110 for 1949. It is now recommended that a final dividend of 15 per cent., making 20 per cent. for the year, be paid on the ordinary stock.

The capital was increased by resolution of the members passed at the extra-ordinary general meeting held on March 14th last. A resolution was also passed to issue bonus shares. The result is that the capital at the present day is as follows: Five per Cent. Cumulative Preference stock (all issued) £500,000; issued Ordinary stock £904,050; unissued Ordinary shares of £1 each £95,950; a total of £1,500,000.

It has been my custom in the past to refer to the prospects of the current year, but it is difficult to visualise what effect the Festival will have on theatre attendances. It may be that London theatres will suffer during the period of the Festival if the weather is favourable to outdoor entertainment. Should it be unfavourable, then I believe that theatres will benefit. If I had to rely for my prophecy only upon the attractions which have been booked for the company's circuit of theatres, I would say that the prospects are favourable. There are, however, other factors to take into account and not the least is the prospect of a General Election, if what one reads in the Press is accurate.

I wish to express on your behalf and on behalf of the board an appreciation of the work of the staff at the company's head offices and the managers and staffs at the theatres for their loyal services during the year, and particularly I would like to convey to Mr Val Parnell, our managing director, the board's high appreciation of his efforts on your behalf.

The report was adopted.

MANGANESE BRONZE AND BRASS COMPANY

GRATIFYING MARINE DEVELOPMENT

GROWING DEMAND FOR "SCIMITAR" PROPELLERS

MR J. C. COLQUHOUN ON EFFECT OF INCREASED METAL PRICES

The fifty-second ordinary annual general meeting of The Manganese Bronze and Brass Company Limited was held on May 10th at 63, Grosvenor Street, London, W.1, Mr J. C. Colquhoun, M.B.E. (chairman and managing director) presiding.

The secretary (Mr. W. K. Gibb, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1950:

In comparing the year 1950 with the previous year, you will notice that the profit is almost identical, but it must be remembered that the 1949 figures included credits amounting to £24,906 in respect of previous periods. The main difference lies in the successive and substantial increases in metal prices. In the last nine months of the year the price of copper rose by 33 per cent. and the price of zinc by nearly 69 per cent. These metals are our principal raw materials and by the end of the year there was a large increase in the value of stocks and work in progress, with a corresponding diminution of cash resources. These rising prices were accompanied by growing material shortages which became acute in the case of zinc and also in the case of nickel—a raw material of growing importance to your business. Although the results shown for the year were not affected by these shortages, they did add considerably to the difficulties and complications of administration.

INCREASE OF CAPITAL

Turning to the accounts you will notice that the authorised capital of the company has been increased from £350,000 to £650,000. The issued preference capital remains the same but the issued ordinary capital has been increased threefold to £454,134. This is the result of capitalising free reserves and issuing two fully paid new ordinary shares of 5s. each in respect of each one ordinary share previously held. It brings the share capital into closer alignment with the capital employed in the business but still leaves £146,752 of uncapitalised free reserves. The effect of the issue on the share market was to reduce the price of the ordinary shares to approximately one-third their previous price.

The profit for the year before providing for taxation and dividends was £201,935 against £199,886 for the previous year. Depreciation charged before arriving at these figures was £69,598 and £65,917 respectively. Provision for taxation, including profits tax, amounted to £116,108. An interim dividend of 6d. per share has already been paid on the ordinary capital existing prior to the issue just mentioned. Your directors now recommend that a final dividend of 5d. per share be paid on the issued ordinary capital as it now stands. If approved the surplus for the year remaining after payment of preference and ordinary dividends, will amount to £54,598 against £62,231 for the previous year. Dividends are stated in pence per share and not as a percentage. The reason is that the nominal value of the equity shares is meaningless—as indeed must be the case with all old

businesses—and a percentage of this value is likewise meaningless and can be misleading.

EFFECT OF HIGHER METAL PRICES

The effect of higher metal prices will be noticed in the higher values shown for stocks (£545,541) and also for debtors (£313,238). Together these items show an increase of £250,655. Allowing for the offsetting increase in creditors of £28,373 to £181,136 an additional £222,282 of working capital had to be employed and was partly provided by bank overdraft. The overdraft at the close of the year amounted to £110,110. The value of "net current assets," representing working capital, now stands at £432,326.

Freehold land and buildings, plant and machinery, are stated gross at £732,466 against £614,095 a year ago. A great deal has been done in recent years to equip your works with the most efficient means of production and to improve the facilities for research. Outstanding commitments for new buildings, plant and replacements at the end of the year amounted to £89,132.

Before leaving the accounts I should perhaps mention that, in the past, we have always quoted our customers firm prices, on acceptance of their orders, and then eliminated any market risk by buying raw materials against the orders booked. With the limited amount of future buying which has been possible since the war the ratio of stocks in relation to output became high and a considerable amount of money was tied up in this way. The rise in metal prices, of course, accentuated this position but at the moment it is no longer possible to buy raw materials against the entire order book and we should therefore see a gradual reduction in the tonnage of stocks requiring finance. We continue to quote firm prices, however, to the extent that raw material is available.

MARINE DEPARTMENT

On the marine side of your business there are two developments which are particularly gratifying. The first is the increasing number of orders we are receiving for propellers of our own design known by the trade mark name of "Scimitar." The proportion of these to total output last year reached the figure of 77 per cent. Progress on our design side will now have the benefit of the cavitation tunnel at Durham University, to which I referred last year, where the period of calibration tests is now completed and testing of model propellers is beginning. The other development I refer to is the use of an alloy to which we have given the name "Nikalium" and which, I believe, I can now say is superior to manganese bronze for ship's propellers. In view of the continued success of the smaller size propellers which we have made in this alloy up to 4 tons in weight we are now accepting orders for progressively larger sizes. It is here that nickel as a raw material is becoming of great importance.

ELTON PARK WORKS

At Ipswich the great event of the year was the completion of the new Elton Park Works which is now in full production. This new factory is entirely devoted to the manufacture of "Oilite" self-lubricating bearings and an infinite variety of other parts all made from metal powders. It was designed and equipped solely for that purpose and for production under the best possible working conditions.

On the other side of your Ipswich business, which is largely extruding and rolling, continuous progress and much success is resulting from our investigations into the most suitable special alloys for modern requirements and the best means of producing these. A typical example is an alloy which is proving successful for compressor blades in jet engines. This side of your business has had another successful year but at the moment is the more likely to feel the effects of material shortages.

CURRENT YEAR'S PROSPECTS

As regards the prospects for the current year, there is every indication that the demand for all of your company's products will be no less than in the past year. The main consideration, therefore, is the extent to which raw material shortages will restrict output. As just mentioned, supplies may not be sufficient to meet the requirements of the extruding and rolling mills and some reduction in output must be anticipated. On the other sides of your business I am more optimistic. We are justified, at least, in hoping that the Government will allocate sufficient material for the manufacture of ships' propellers rather than have ships idle for want of a propeller. In the new Elton Park factory also, which takes its raw material in powdered form only and is economical in the use of metals, there is good reason for hoping that the supplies required will be obtainable.

In conclusion I am sure you would wish me once again to convey to all employees our thanks for their co-operation and our appreciation of their work.

The report and accounts were adopted and the final dividend of 5d. per share on the ordinary shares (making 7d. per share for the year if calculated on the increased ordinary share capital) was approved.

The retiring directors, Mr W. Mure and Mr A. T. Thorne, were re-elected and the proceedings then terminated.

CRYSTALATE LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of Crystalate Limited was held on May 10th in London.

Sir Herbert Morgan, K.B.E., the chairman, in the course of his speech, said: The results of the year show, before taxation, a considerably reduced loss of £3,055, as compared with £7,166 last year. This improvement has been achieved in spite of the reduced dividend received from The British Homophone Company Limited, it having fallen from £10,235 to £5,479.

The liquid position of the company remains strong; a part of our total assets of £415,310 is represented by an excess of current assets over liabilities amounting to £79,170.

The major portion of the loss shown in the consolidated balance sheet arises out of the operations of Mica Products Limited. The Mica business was transferred from Dalston to Tonbridge. After the removal, the benefits of the transfer became appreciable. The improvement has been maintained and the immediate future can be visualised with optimism.

Last year I told you that the figures given up to that time by Ebonestos Industries Limited showed a decrease. This year the reverse is the case. The available internal figures of that company in respect of the year to March 31, 1951, show a satisfactory improvement.

In regard to the parent company, Crystalate Limited, the internal figures for the period from October, 1950, to date show that the position is definitely brighter and the business appears to be on the up grade. Order books of all the companies in the group are now again really satisfactory.

The report was adopted.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The twenty-seventh ordinary general meeting of Kemsley Newspapers Limited, will be held on Tuesday, May 22, 1951, at Kemsley House, London. The following is an extract from the statement of the chairman, the Viscount Kemsley, circulated with the report and accounts for the year ended December 31, 1950:

PROFIT AND LOSS ACCOUNT

The trading profits and sundry income of Kemsley Newspapers Limited, and its subsidiaries for the year to December 31, 1950, were £1,992,421, an increase of £9,981 on the previous year. Wages, salaries and general costs again show substantial increases, to some extent offset by the benefit received during the year from writing down the stocks of newsprint at December 31, 1949, to the controlled price of £32 a ton.

After bringing in dividends and interest and profits on sales of assets and investments the profit amounts to £1,972,613 compared with £1,976,278 last year. Debenture interest £119,260 shows a saving of £1,953 as a result of the purchase of debenture stock for redemption. The provision for taxation based on the current year's profits, including profits tax at 30 per cent. on distributed profits and income tax at 9s. 6d. in the £ requires £1,069,942 compared with £1,004,450 provided last year, leaving the group profit for the year at £783,411, a decrease of £67,204 on 1949. The profits retained in subsidiaries are £27,950 compared with £52,769 for 1949. Adding the balance brought forward from the previous year of £305,416, the amount available for distribution is £1,051,189. The payment of the dividends on the two classes of preference stock and the interim dividend of 5 per cent. on the ordinary stock absorbs £349,250. We are now recommending a transfer of £300,000 to general reserve making that fund £4,300,000 in the parent company's balance sheet, and the payment of a final dividend on the ordinary stock of 7 per cent. less income tax at 9s. 6d. in the £, making 12 per cent. for the year, being the same as for 1949. Last year we provided £60,000 to write down the book value of investments to the then market value, and out of the profits of the subsidiaries £26,319 was transferred to contingency reserve. No such provisions are required this year so that there remains a balance to be carried forward in Kemsley Newspapers Limited, of £310,064, which together with the balance of undistributed profits in the subsidiaries of £278,386 makes the total of £588,450 to be carried forward in the consolidated balance sheet, being £32,598 more than was brought in.

CONSOLIDATED BALANCE SHEET

Turning to the consolidated balance sheet the interest of minority shareholders in subsidiaries has been reduced by the purchase of the outstanding ordinary shares of the Western Mail and Echo Limited. Current liabilities at £2,890,242 shows a decrease of £108,472 on 1949, mainly due to the payment during the year of the income tax on the considerably higher profits of 1948. The increase of £84,919 in fixed assets, after allowing for depreciation was in respect of replacement of plant and alterations to buildings. Current assets at £4,976,244 compare with £4,918,534 for 1949. Stock-in-trade is down owing to the smaller stock of newsprint held. The main contributory factor to the increase in debtors was the fact that the last day of the year fell on a Sunday, so

that the revenue arising from our large interest in Sunday newspapers had not been received at the year end. The appreciation of the market value of the investments over their book value shows an improvement compared with that at December 31, 1949.

The remarks I have made on the consolidated balance sheet cover any matters calling for comment in the parent company's balance sheet.

THE BUDGET

The further outlook is once more adversely affected by the recent Budget proposals. While, from the point of view of the individual taxpayers the Budget was more favourable than some had feared, the sharp increase in the profits tax, as a result of which tax payable in respect of distributed profits is now 50 per cent., imposes another severe burden on industry, and in particular, on those undertakings whose profits are not likely to be increased by the rearmament programme. In the case of your company, the additional profits tax on the dividends distributed on the two classes of our preference stock amounted at the old rate to £102,000 or £56,100 after allowing for income tax. At the new rates the corresponding amounts are £204,000 or £107,100 after allowing for income tax.

THE SUNDAY TIMES

It has been my practice to say a special word about the *Sunday Times*, a newspaper of which we are justly proud, and which takes its place in the very front rank of the press of the world. We had for long sought, without success, to establish a correspondent in Moscow. Late in the year a unique opportunity presented itself to make such an appointment and Mr Cyril Ray was entrusted with this important assignment. He is the only staff representative of a British newspaper in Moscow. His dispatches have, as might be expected, excited the keenest interest, not least among those with expert knowledge of the USSR.

The literary reputation of the *Sunday Times*, always so high, has gained new lustre by the conferment of a Knighthood on Mr Desmond MacCarthy, whose name has stood at the head of our literary pages for so long. This honour, bestowed upon the doyen of literary critics is a worthy recognition of Sir Desmond's great services to the world of letters, not least of course through our columns. The award of the *Sunday Times* Book Prize for 1950 to Mr T. S. Eliot, O.M., has been greeted as a judgment of distinction and merit. The contribution of this eminent poet and playwright to the revival of poetic drama is recognised and acclaimed both here and throughout the English-speaking world.

CONCLUSION

At the conclusion of my statement last year I used guarded words about the future, as I then saw it. I am glad that the results I have been able to present to you this year are, in the circumstances, so satisfactory. At the present time, uncertainties both in the supply and in the price of newsprint, and as to the selling prices of newspapers themselves, make me reluctant to commit myself to any prophecy. I can do no more, therefore, than assure you that the problems ahead will engage our continuous and earnest attention and that we shall meet such difficulties as confront us with that same determination and resolve as have enabled us to achieve success in the past.

H.P. SAUCE LIMITED

The twenty-sixth annual general meeting of H.P. Sauce Limited was held on May 16, 1951, at the Queen's Hotel, Birmingham.

Sir Patrick Hannon, the chairman, presided, and in the course of his speech said:

The results of our trading in 1950 present us with our highest level of profits. The trading profit of our group of companies as shown in the consolidated profit and loss statement amounts to £974,413, an increase of over £203,000. This achievement is mainly attributable to a substantially increased turnover on the part of the parent company, notwithstanding smaller profit margins occasioned by the continued rise in costs and the maintenance of selling prices of our goods at popular levels, and is in partial measure due to the higher sterling value of our proportion of the profits of our American company.

Our production has been maintained on the highest standard of quality, and our efficient management has minimised the effect of increasing costs, whilst our exceptional turnover is due to continually increasing public demand for our various products. This is a feature typical of the experience of manufacturers selling first-class proprietary goods at reasonable prices. This emphasises consumer preference for well-known, reliable, high-quality articles, after a period of shortage when little-known, sometimes less-dependable, products were often the only ones available.

The heavy burden of United Kingdom taxation must again be borne by stockholders with that patience and complacency which have become the test of loyal citizenship in a community subordinate to the expanding demands of the tax collector. The provision made by the group to satisfy these demands, shows large increases. After retaining earned profits of £56,404 in the subsidiary companies, and after the necessary tax deductions, the net profit of the parent company amounts to £313,532, an increase of over £73,000 on the results of the preceding year.

We propose that an amount of £100,000 be transferred to general reserve, and that a modest increase of 3d. per stock unit should be made in our final dividend.

I am confident that our stockholders will appreciate and approve the policy pursued by the directors in the provision of a large percentage of the profits of past years to strengthen and extend our working capital. Since the commencement of the war, over £1,000,000 has been ploughed back into our enterprise, but for which our business could not be carried on at its present scale.

Examination of the consolidated balance sheet and the parent company's balance sheet reveals a wholesome increase in current assets. The most important of these assets is our stock-in-trade. The foresight of the managing director in making long-distance provision in our stock has placed our company in a very favourable situation vis-a-vis increasing production and the constant enlargement of our sales.

The Canadian sales have again improved, and I would like to place on record our cordial relationship with Messrs E. D. Smith and Sons, Limited, Winona, Ontario, who manufacture our products under licence.

It is also satisfactory to report that notwithstanding the considerable reimposition of import licence regulations in many overseas countries, the export of a full range of our products is still expanding.

At home, without exception, our operating subsidiaries, Lea and Perrins, Limited, Macks (Walsall) Limited, Fletchers Sauce Company, Limited, and Albion Bottle Company, Limited, have extended their productive capacity, with consequent improved results.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

MIR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held at Johannesburg on May 9, 1951, said:

The improved supply of native labour during most of the year and a full year's operation of the rod mill in the primary grinding section of the reduction plant enabled the tonnage milled in 1950 to be increased by 50,500 tons to 725,500 tons, which is the highest figure yet recorded. The average yield was reduced by 0.61 dwt. to 5.03 dwt. per ton milled in conformity with the lower average grade of ore reserves brought about by the reduction in the pay limit following devaluation. As the increased price of gold of 248s. 3d. per ounce fine was received over the full year, the working revenue rose by £407,926 or 7s. 4d. per ton milled, to £2,307,142. Included in the working revenue is the sum of £34,069, being your company's share of additional revenue which accrued to the industry during the year from sales of gold at enhanced prices for industrial and artistic purposes. In spite of increases in the cost of labour and stores, working costs were reduced by 4d. per ton and absorbed £1,322,527, leaving a working profit of £984,615.

HIGHER GROSS PROFIT

He stated that the gross profit was £981,274, or £338,668 more than for the previous year. As provision for taxation increased to £432,101 and had absorbed nearly two-thirds of the increased profit, the net profit at £544,800 was only £124,040 more than for 1949. Two dividends totalling £412,500 or 1s. 10d. per share, being an increase of 7d. per share, were declared, and after making provision for the other items detailed in the appropriation account, including £37,697 for capital expenditure, the carry forward was increased by £87,999 to £473,158.

The development footage driven during the year totalled 34,366 feet. Of the 21,679 feet driven on the Main Reef Horizon, 12,690 feet were on reef and sampled, of which 43 per cent. was payable, averaging 12.2 dwt. over 17 inches. 12,687 feet were driven on the Kimberley Reef Horizon and 9,325 feet were sampled, disclosing 25 per cent. payable, averaging 11.5 dwt. over 22 inches. Three diamond drill holes were put down during the year on the portion of the adjoining farm Bloemendal No. 19 under option to the company, but disclosed no values. The drive on 6 level from No. 5 shaft was being continued eastwards to prospect this area further.

The ore reserve, recalculated as at December 31st last, increased by 200,000 tons to 3,000,000, averaging 5.6 dwt. over an estimated stoping width of 45 inches. The value was 0.2 dwt. lower and the estimated stoping width one inch more than in 1949. Included in the ore reserve tonnage was 179,000 tons from the Kimberley Reef Horizon, averaging 5.4 dwt. over an estimated stoping width of 44 inches.

The Minister of Finance had restored the formula tax to the 1948 level, the effect being to increase the rate of taxation by approximately 5 per cent. as from January 1, 1951.

The ore milled during the first quarter of 1951 amounted to 180,000 tons and the working profit was £226,679. In addition £34,528 accrued to the company from premium gold sales. During the period 5,403 feet were driven on Main Reef, of which 2,510 feet were on reef and sampled, disclosing 55 per cent. payable, averaging

13.6 dwt. over 19 inches. 2,938 feet were driven on the Kimberley Reef Horizon, of which 2,010 feet were on reef and sampled, disclosing 37 per cent. payable, averaging 11.2 dwt. over 21 inches.

The motion for the adoption of the report and accounts was carried unanimously, and the retiring directors, Messrs P. M. Anderson, C. B. Anderson and J. S. Walker, were re-elected.

VAN DYK CONSOLIDATED MINES, LIMITED

INCREASED WORKING PROFIT

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held in Johannesburg on May 9, 1951, said:

The ore milled during 1950 was 1,197,000 tons, which is slightly lower than in 1949, and as the grade of ore mined from reserves was reduced to correspond with the lower pay limit made possible by the increased gold price, the yield fell by 0.46 dwt. to 3.0 dwt. per ton. Including the sum of £32,591 which your company received from sales of gold at a premium, the working revenue increased by £255,418, or 4s. 3d. per ton, but this was largely absorbed by higher working costs which rose by 3s. 9d. per ton, so that the working profit at £340,264 was only £30,395 more than in 1949.

He stated that the increase in working costs was largely due to increased labour costs and also to higher prices for stores.

The net profit was £331,322 and £29,000 had been transferred from renewals, development and other provisions. Capital expenditure, mostly on work in the No. 5 shaft area, absorbed £342,227, and after providing for other items specified in the appropriation account, the carry forward was £2,615.

The total development footage on Main Reef was 42,891 feet, which was 12,475 feet more than in 1949, and of the 28,650 feet on reef and sampled, 6,820 feet, or 24 per cent. were payable, averaging 8.9 dwt. over 20 inches.

ORE RESERVES

The ore reserve recalculated as at the year-end, was 1,800,000 tons, or 200,000 tons less than the previous year, the grade and estimated stoping width remaining unchanged at 3.6 dwt. and 40 inches respectively.

The work of equipping the new No. 5 vertical and sub-vertical shafts was proceeding satisfactorily, and a small amount of development footage on the 48th level had been completed by the year-end but without disclosing payable values. Of the 1,594 feet driven in this area during the first quarter of 1951, 775 feet were on reef and sampled, disclosing 255 feet or 33 per cent. payable with an average value of 15.6 dwt. over 10 inches. The chairman mentioned that it would be unwise to draw any deductions from the small amount of development done so far in this area.

The ore milled during the first quarter of 1951 amounted to 299,000 tons and the working profit was £54,144. In addition, £32,088 had accrued to the company from premium gold sales. Development footage on Main Reef, including that in the No. 5 shaft area, was 9,805 feet and of 7,105 feet on reef and sampled, 1,910 feet or 27 per cent. were payable, averaging 9.1 dwt. over 20 inches, equivalent to 182 inch-dwt.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Messrs P. M. Anderson and G. V. R. Richdale, were re-elected.

EAST GEDULD MINES, LIMITED

RECORD WORKING REVENUE

Mr P. M. Anderson, the chairman of the company, in addressing stockholders at the annual general meeting held at Johannesburg on May 8, 1951, said:

The ore milled at 1,738,000 tons was 16,000 tons less than in 1949, and the yield was unchanged at 5.99 dwt., so that the output of gold at 520,952 fine ounces was slightly lower than in the previous year. As a result of receiving the increased price of gold over the full year, however, the working revenue rose by £1,440,312 to the record figure of £6,601,982. Included in the working revenue is an amount of £97,578, being your company's proportion of the additional revenue which was secured by the industry during the year from sales of gold at enhanced prices for industrial and artistic purposes. Working costs at £2,096,967 increased by 3s. 8d. per ton milled, and the working profit at £4,505,015 rose by £1,146,124.

He stated that dividend income from the holding of 537,600 stock units in the Groot-vlei Proprietary Mines, Limited, which remained unchanged, and the balance of sundry revenue over sundry expenditure brought the total profit to £4,593,286, being £1,201,616 more than for 1949. Provision for taxation increased by £718,997 to £2,330,350. The net profit was £2,254,458, or £480,102 higher than the 1949 figure. Dividends totalling 4s. 7½d. per unit of stock were declared as compared with 3s. 3½d. the previous year, and absorbed £2,081,250. After providing £112,320 for capital expenditure and setting aside the other amounts detailed in the appropriation account, the carry forward was increased by £51,615 to £493,380.

Of the increase in working costs of 3s. 8d. per ton, only 11d. had been brought about by the revised accounting procedure for dealing with various silicosis charges, the balance being due to the higher cost of labour and to the rise in prices of commodities.

DEVELOPMENT WORK

A total of 17,496 feet of development was accomplished on main reef, of which 10,440 feet were on reef and sampled, disclosing 6,750 feet, or 65 per cent., payable with an average value of 11.8 dwt. over 24 inches. In addition, 2,842 feet of development on the Kimberley Reef Horizon completed the cross-cut from No. 1 shaft to the position of the new sub-vertical shaft, and a start had been made on shaft-sinking. No payable values had been disclosed in the course of this Kimberley reef development.

The ore reserve recalculated at the year-end was unchanged at 12,500,000 tons. The value increased by 0.3 dwt. to 5.7 dwt., and the estimated stoping width at 51 inches was 3 inches less.

The Minister of Finance had restored the formula tax to the 1948 level, the effect being to increase the rate of taxation by approximately 5 per cent. as from January 1, 1951.

During the first quarter of 1951 the ore milled was 424,000 tons and the working profit was £1,034,888. In addition, £92,213 accrued to the company from premium gold sales. Development work on main reef totalled 1,734 feet, and of this 895 feet were sampled disclosing 450 feet, or 50 per cent., payable with an average value of 9.2 dwt. over 24 inches; 528 feet of development were accomplished on Kimberley Reef, but no payable values were disclosed.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Messrs J. MacG. Love and T. P. Stratten, were re-elected.

ST HELENA GOLD MINES, LIMITED

YEAR OF DEVELOPMENT OPERATIONS

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held at Johannesburg on May 8, 1951, said:

The work done on your company's property during the year under review of which full particulars appear in the reports of the directors and the consulting engineers, has consisted of the erection of the reduction plant and additional surface works and buildings, as well as the completion of sinking No. 4 Shaft and carrying on underground development.

He stated that early in 1950 No. 4 Vertical Shaft reached its final depth of 2,938 feet and the permanent shaft equipment had now been installed. Some work still remained to be done to complete station cutting, the ore pass system, and the main pump chamber and sumps.

From No. 3 Shaft 12,406 feet of development was accomplished during the year, of which 3,865 feet were on Basal Reef and sampled disclosing 2,595 feet or 67 per cent. payable, having an average value of 13.0 dwt. over a width of 25 inches. Development was again severely retarded by the intersection of water-bearing fissures necessitating repeated and some times prolonged stoppages for cementation.

As a result of these delays, development work had not progressed sufficiently to enable the reduction plant, capacity about 50,000 tons per month, to be supplied by the middle of this year with ore on the scale of approximately 50,000 tons per month as previously anticipated. Milling of ore from the surface dump and current development would start on a small scale within the next month or two to run in the plant. The scale of operations would be gradually increased and it was hoped to reach a rate of about 50,000 tons per month in October, by which time ore from stopes should begin to replace low-grade ore from dump, but much would depend on speeding up the development work. It was unlikely that there would be any output to publish before the end of October and it might take a considerable time before the mine reached full milling capacity.

NEED FOR FURTHER FINANCE

The delays to the development work and the delay in reaching a substantial scale of milling had increased the cost of bringing the mine to production. In addition St. Helena had felt the full impact of the steady rise in the cost of plant, equipment, stores and materials since devaluation. Expenditure to the year-end totalled £6,158,665 leaving a balance of cash and cash assets less liabilities of £1,383,835, of which a considerable sum was tied up in stores and materials. Capital expenditure during the first quarter of 1951 amounted to £627,132. It was clear that further finance would be required to cover the cost of bringing the mine to full production, of completing the necessary surface works and doing further development, and to tide the company over the period when, through absorption of gold and teething troubles, the plant could not be expected to show normal results.

The South African Mutual Life Assurance Society had agreed to make a second loan to the company amounting to £400,000 on the security of the additional houses built by the company since the former loan of £375,000 was granted in 1948. The new loan would bear interest at 5 per cent. per annum and would be repayable in equal annual instalments of £20,000.

In addition, however, the consulting

engineers estimated that further funds of the order of £1,000,000 were required and the chairman stated that he was pleased to announce that Union Corporation, Limited had offered to advance this sum as a temporary loan bearing interest at 5 per cent. per annum and subject to a raising fee of 1 per cent. The directors had accepted this offer as being the most appropriate way of financing the company at this stage.

During the first four months of 1951 the total footage driven was 6,878 feet. On the Basal Reef 3,285 feet were sampled and 1,380 feet or 42 per cent. proved payable, averaging 26.3 dwt. over 17 inches.

TOTAL DEVELOPMENT FOOTAGE

The chairman stated as a matter of interest to shareholders that from the commencement of operations to the end of April, 1951, the total development footage carried out by the company was 41,551 feet of which 15,330 feet were on Basal Reef and sampled disclosing 7,595 feet or 50 per cent. payable with an average value of 17.0 dwt. over 19 inches. He said that while the footage completed was not nearly as great as hoped for, the percentage payability and the value gave good grounds for encouragement.

The motion for the adoption of the reports and balance sheet was carried unanimously and the retiring directors, Messrs P. M. Anderson, J. Boyd, and S. R. Fleischer, C.B.E., D.S.O., M.C., were re-elected.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

RECORD TONNAGE MILLED

Mr P. M. Anderson, the chairman of the company, in addressing stockholders at the annual general meeting held at Johannesburg on May 8, 1951, said:

As a result of the completion of the extensions to the reduction works and an improved native labour supply during most of the year, the tonnage milled increased by 206,000 tons to the record figure of 2,267,000 tons. The yield per ton milled at 4.57 dwt. was lower by 0.43 dwt. to conform with the lower average grade of ore reserves arising from the reduction in the pay limit following currency devaluation.

He stated that owing to an increase in output and to the fact that the increased price of gold of 248s. 3d. per oz. fine was received for the full year, the working revenue at £6,538,977 was 8s. 6d. per ton milled higher than in 1949. Included in the working revenue was the sum of £98,043, which accrued to the company from premium gold sales. Despite the greater tonnage milled working costs rose by 1s. 6d. per ton milled to 24s. 2d. owing to increased costs of labour and stores and to a revision in the method of accounting for silicosis charges. This increase was more than covered by increased revenue, so that the working profit increased by £1,063,386 to £3,800,115.

Provision for taxation amounted to £1,917,028, an increase of £688,587 compared with 1949, and the net profit was £1,883,373. Two dividends totalling 3s. per unit of stock, an increase of 1s. 0½d. over 1949, were declared and absorbed £1,715,822. The amount carried forward was increased by £132,543 to £653,069.

Development footage at 60,535 feet had increased by 8,689 feet over 1949; 42,555 feet were sampled and 23,535 feet, or 55 per cent., were payable, averaging 226 inch-dwt.

DIAMOND DRILLING PROGRAMME

The programme of diamond drilling from surface to explore the May Reef Horizon of the Kimberley Reefs had been completed

during 1950, but none of the six boreholes revealed any values at the May Reef Horizon.

The recalculated ore reserves increased by 1,000,000 tons to 15 million tons, averaging 4.6 dwt. over an estimated stopping width of 46 inches. The value was 0.1 dwt. lower than in 1949, but the width remained unchanged.

The Minister of Finance had restored the formula tax to the 1948 level, the effect being to increase the rate of taxation by approximately 5 per cent. as from January 1, 1951.

During the first quarter of 1951 the ore milled was 582,000 tons and the working profit £905,299. In addition, £102,148 had accrued to the company from premium gold sales. Development work totalled 15,621 feet and 12,375 feet were sampled, of which 5,950 feet, or 48 per cent., were payable, with an average value of 14.1 dwt. over 19 inches.

The motion for the adoption of the reports and accounts was carried unanimously, and the retiring directors, Messrs P. M. Anderson and M. W. Richards, were re-elected.

GEDULD PROPRIETARY MINES, LIMITED

INCREASED PROFIT AND DIVIDEND

Mr P. M. Anderson, the chairman of the company, in addressing shareholders at the annual general meeting held at Johannesburg on May 8, 1951, said:—

As a result of the higher price of gold over the full year, the company's net profit was higher and permitted an increase of 4s. 9d. per share in dividends distributed.

The ore milled amounted to 1,279,000 tons, or 21,500 tons more than in 1949, but the average yield at 3.05 dwt. was lower by 0.53 dwt. due to the grade of ore mined from reserves being reduced to correspond with the lower pay limit made possible by the increased gold price. Working revenue at £2,466,590 was £263,109 higher than in the previous year and included an amount of £36,722 which accrued to the company as additional revenue from sales of gold at enhanced prices for industrial and artistic purposes. Working costs increased by £160,485 or 2s. 2d. per ton to £1,724,404, leaving a working profit of £742,186 which is £102,624 more than the 1949 figure.

He stated that dividend income from the company's holding of 3,308,425 stock units in East Geduld Mines, Limited, and 358,400 stock units in The Grootvlei Proprietary Mines, Limited, which remained unchanged, increased by £237,850 to £818,833 and for the first time exceeded the working profit derived from mining the company's own area.

After providing £317,570 for taxation and taking into account other items specified in the profit and loss account there was available for appropriation the sum of £1,251,489, or £282,754 more than in 1949. Two dividends totalling 16s. 6d. per share were declared, absorbing £1,205,207, so that after making provision for the various other items detailed in the appropriation account, including £32,488 for capital expenditure, the carry-forward rose by £22,904 to £366,570.

DEVELOPMENT WORK

Development work on Black Reef totalled 16,168 feet and of the 11,445 feet on reef and sampled, 1,865 feet or 16 per cent. was payable, averaging 4.8 dwt. over 47 inches. No development work was undertaken on the Kimberley or Main Reefs during the year.

The ore reserve recalculated at the year-end showed a decrease of 600,000 tons to 4,000,000 tons. The value at 3.40 dwt. and the estimated stopping width at 51 inches remained unchanged.

The Minister of Finance in the Budget proposals introduced in March of this year had increased the rate of taxation by approximately 5 per cent. from January 1, 1951.

During the first quarter of 1951 the ore milled amounted to 314,000 tons and the working profit was £147,492. In addition £34,538 accrued to the company from premium gold sales. Development work totalled 4,475 feet on Black Reef and 2,945 feet were on reef and sampled, of which 365 feet or 12 per cent. was payable, averaging 2.6 dwt. over 79 inches.

The motion for the adoption of the reports and accounts was carried unanimously and the retiring directors, Messrs P. M. Anderson and W. M. Frames, were re-elected.

FREDERICK LAWRENCE, LIMITED

SUBSTANTIAL INCREASE IN TRADE

The twenty-third ordinary annual general meeting of Frederick Lawrence, Ltd., was held in London on May 16th, Mr Frederick Lawrence, J.P., L.C.C. (chairman and managing director), presiding.

The chairman in the course of his speech said: It again gives me much pleasure to report that there was a substantial increase in trade during the year ended January 31, 1951. The profit on trading of the company and its subsidiaries amounted to £104,900.

Negotiations are in progress for the purchase of the freehold of shop premises in Bristol at present occupied on a long-term lease.

In my report last year I referred to a new subsidiary company which had been formed to take over the manufacturing and wholesale departments at Bristol. This company, known as Maggs Furniture Industries, Limited, is working very efficiently, and during the short time it has been in existence has brought about many improvements.

Now a word for the future. Last year the general increase in productivity would normally have indicated a cheapening of price and thus justified restriction of purchase. The international situation and the Government's decision to rearm has, however,

resulted in a trend in the opposite direction. There is every indication, moreover, that the increased demand will continue.

I am happy to record a further increase in trade during the first three months of the current year. It is difficult, nevertheless, to estimate the full impact of decreasing supplies of raw materials on future demands.

The report was adopted and the dividend of 30 per cent. was approved.

HIGHLANDS AND LOWLANDS PARA RUBBER

RECORD PROFIT

The forty-fifth annual general meeting of this company was held on May 10th at 49-51, Eastcheap, London. Mr T. B. Barlow, the chairman, presided, and in the course of his speech, said: The report and accounts for 1950 set out the largest profit the company has ever earned. It amounted to £332,571. The proposed final dividend of 20 per cent., added to the 7½ per cent. already paid, is a welcome return to a more equitable distribution on the capital involved.

The explanation for this improvement is that all commodities have risen in price and at last rubber has nearly come into line. For 1951 our palm oil continues to be delivered to the Ministry of Food and at £104 10s. a ton the price is £30 higher than for 1950. Of our rubber about 10 per cent. of the estimated crop has been sold forward at an average price of 2s. 3d. per lb.

A brief review of events since the last annual meeting brings out an astonishing sequence of events. But in order to appreciate them in their proper perspective it should be realised that from 1920 when rubber ceased to be a new luxury and became an essential commodity it assumed a fairly and constant ratio in price so that in 1939 1 lb. of rubber approximated the value of nearly 2 lb. of cotton or 12 lb. of rice.

Intrinsically the rubber position is good and Highlands Stockholders may congratulate themselves that they own a property which is prosperous and financially and agriculturally sound; it produces vegetable oil and rubber, two essential commodities with a world-wide

demand so that if essential work is fairly rewarded stockholders may in the current year hope to receive a reasonable return.

The report was adopted.

SAPONG RUBBER

The annual general meeting of The Sapong Rubber Estates, Limited, was held in London on May 16, 1951.

The chairman, in his statement, said:— A further deterioration in availability of labour resulted in production of 150,000 lb. less rubber in 1950 than in the previous year. We are not less than 350,000 lb. short of our possible crop, and our profits have suffered heavily, having regard to the price ruling for the last few months of the year. Shortage of labour is the predominant factor in North Borneo at present. It prevents us undertaking the planting of new land, of which Sapong has large reserves, and replanting some of our very old areas.

It is a pity that Government has not been able to bring the railway service up to date. It is now over five years since the Japanese were driven out of Borneo, but it becomes more difficult every day to get materials up to the estate and to get our rubber down, and the manager reports that he fears that a complete breakdown may occur at any moment.

1,650,000 lb. of rubber were collected, which realised an average price of 1s. 11d. per lb., London equivalent, giving us a profit of £70,145, to which sundry items relating to previous years add £807. Taxation will take £40,495, and your directors propose to put £4,000 to the reserve for future planting or replanting, to put £10,000 to general reserve, to pay a dividend of 25 per cent. (less tax at 9s. 6d. in the £), absorbing £15,750 and to carry forward £4,113 against £3,406 brought in from the previous year.

We hope to crop 1,700,000 lb. in 1951. In November last we sold forward 15 tons a month for delivery into godown Singapore throughout the year, 1951, at \$1.45 per lb., equivalent to about 3s. 6d. per lb. London, which should go a long way towards paying the cost of producing the whole crop.

The accounts were adopted unanimously.

NOTICES

SOUTH-EASTERN REGIONAL HOSPITAL BOARD, SCOTLAND

ASSISTANT TREASURER

Applications are invited for the post of Assistant Treasurer to the above Board.

Applicants should be qualified Accountants, and should have considerable experience of accountancy, budgetary control, auditing and committee procedure. Previous experience in the hospital service is not essential.

The salary for the post, which is superannuable, will be £800 per annum, rising by annual increments of £30 to £950.

Applications, stating age, qualifications, experience and salary scale in present post, together with the names and addresses of three referees, should be sent to the Secretary, South-Eastern Regional Hospital Board, Scotland, 11, Drumsheugh Gardens, Edinburgh, 3, not later than June 9, 1951.

THE Civil Service Commissioners invite applications for permanent appointments as *Senior Scientific Officer* and *Scientific Officer* to be filled by competitive interview during 1951. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1951, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree with first or second class honours in a scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or possess high professional attainments. Candidates for *Senior Scientific Officer* posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for *Scientific Officer* posts taking the degrees in 1951 may be admitted to compete before the result of their degree examination is known.

Age Limits: For *Senior Scientific Officers*, at least 26 and under 31 on August 1, 1951; for *Scientific Officers*, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1951. *Salary Scales* for men in London, *Senior Scientific Officers*, £700 x £25—£900; *Scientific Officers*, £400 x £25—£650. Rates for women are somewhat lower.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3399.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for two posts in the Department of Economics and Social Science.

(a) Assistant Lecturer in Economics at a starting salary of £450 per annum.

(b) Research Assistant in Economics for one year, with the possibility of renewal for a further one or two years. Salary £450 per annum.

Further particulars may be obtained from the Registrar, University College, Cathays Park, Cardiff, to whom six copies of application, together with the names and addresses of three referees, should be sent not later than June 23, 1951.

*This is additional to the post recently advertised.

(Signed) E. R. EVANS, Registrar.
Cathays Park, Cardiff. May, 1951.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

COLEG PRIFATHROFAOL DEHEUDIR CYMRU A MYNWY

The Council of the College invites applications for the MONTAGUE BURTON CHAIR OF INDUSTRIAL RELATIONS at a salary of £1,700 p.a.

Applicants should be of good academic standing, and should have special knowledge (by direct experience or through academic research) of Industrial Relations and/or Industrial Organisation. Graduates in subjects other than Economics may be considered, and lack of previous experience of University teaching will not be considered a disqualification.

Candidates should submit the names of three referees, and send on or before June 30, 1951, 12 copies of their applications to the undersigned from whom further particulars may be obtained.

(Signed) E. R. EVANS, Registrar.
Cathays Park, Cardiff. May, 1951.

GENERAL MANAGER, with administrative ability, is required to run a plywood factory, sawmills, drying kilns, wharves and storage yards in Home Counties, directly responsible to the Group's Managing Director and Assistant Managing Director. He must have experience of factory management and movement of material, and some engineering knowledge. Age 35-40. First-class prospects for outstanding applicant. — Write, giving qualifications, age and experience, to William Mallinson & Sons, Limited, 130-150, Hackney Road, London, E.2.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hong Kong)
The Liability of Members is limited to the extent and in manner prescribed by Ordinance No. 1 of 1929 of the Colony
CAPITAL ISSUED AND FULLY PAID UP £20,000,000
RESERVE FUNDS STERLING £5,000,000
RESERVE LIABILITY OF MEMBERS £20,000,000

BANKING BUSINESS OF EVERY KIND TRANSACTED
A comprehensive service as Trustees and Executors is also undertaken by the Bank's Trustee Company in
HONG KONG LONDON SINGAPORE

HIS MAJESTY'S COLONIAL SERVICE NIGERIA

A vacancy exists for Deputy Director (Industries) in the Department of Commerce and Industries. This department is responsible for the development of secondary industries in Nigeria. The Deputy Director (Industries) is in executive charge of the Industrial Branch of the Department and advises the Director on all industrial matters. He directs the work of the industrial planning staff at Headquarters and the programmes of schemes developed and in process of development, including general financial control. The principal schemes already operating are: Palm Oil Mills, Textiles, Fisheries and Dairies. Schemes awaiting development include Groundnut Oil Mills, Agricultural Schemes, Pottery, Brick and Tile Making and Wood-working. Numerous projects of potential economic importance to Nigeria are in the stage of investigation. The Department co-operates with the various Development Boards and one of its particularly important functions is to advise and assist Nigerian industrialists and would-be industrialists. The officer appointed will be stationed in Lagos, but will be required to tour extensively. Preference will be given to a candidate who has had broad experience in commerce, including experience of industrial management at a high level. Familiarity with industrial development in a tropical country would be an advantage.

For permanent and pensionable appointment a salary of £1,700, inclusive of expatriation pay, is offered. Alternatively, employment on contract terms would attract an inclusive salary of the order of £1,900 with a gratuity accruing at the rate of £37 10s. for each period of three months' satisfactory service. A temporary addition to salary (whether the appointment were pensionable or on contract) would be payable at the rate of £150 per annum.

Intending applicants should submit by June 5, 1951, brief particulars of age, education, qualifications and experience, to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1, quoting Reference 27319/22.

HIS MAJESTY'S COLONIAL SERVICE GOLD COAST

A vacancy exists in the Gold Coast for a Special Commissioner whose principal function will be to provide over certain statutory Boards and Corporations, such as the Industrial Development Corporation, the Cocoa Marketing Board, the Agricultural Produce Marketing Board, and, probably, the Agricultural Development Corporation, and the Agricultural Loans Board. He will be responsible to the Gold Coast Government and may be required to undertake special duties in the economic sphere, e.g., in connection with hydro-electric schemes. A high degree of administrative ability and experience combined with a wide range of economic knowledge is required.

Appointment will be on probation for permanent and pensionable employment. Basic salary £1,800 per annum. Expatriation pay £500 and cost-of-living allowance at 15 per cent of basic salary.

Intending applicants should submit brief particulars of age, qualifications and experience to the Director of Recruitment, Sanctuary Buildings, Great Smith Street, S.W.1, quoting 27459/51.

MARKET RESEARCH. Large organisation in London require an Assistant to the Manager of their Market Research Dept. Experience in economic or statistical analysis and market research desirable. Age not more than 35. Salary will be commensurate with experience and ability. Write, giving full details of age, experience, and qualifications, to Box 653.

UNIVERSITY OF ADELAIDE

There will be a vacancy in August next for a SENIOR LECTURER IN ECONOMICS.

Salary range £1,000 to £1,250 (Australian) a year. Terms of appointment and a leaflet about the post may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. The information to be supplied by applicants is specified in the terms of appointment. Applications in duplicate must reach the undersigned not later than June 30, 1951.

A. W. BAMPTON, Registrar,
University of Adelaide, Adelaide, South Australia.

DO YOU NEED REPRESENTATION IN BRAZIL?

Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro: Member of the: American Chamber of Commerce for Brazil—Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comércio do Rio de Janeiro, etc. Purchasing Agent for: Minerals, raw material, sugar, wood, etc. Selling Agent for: Iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

ASSISTANT to Production Control Manager is required by large mass production factory. Some administrative industrial experience and statistical background are essential and academic qualifications desirable. The age limits are 28-33 and commencing salary will be appropriate to the degree of responsibility. The selected candidate is able to assume immediately. The position offers considerable prospects for the right man. Apply to Personnel Manager, Harris, Lebus Ltd., Painsbury Works, Tottenham, N.17.

SLICK ideas can come to any one. Turning them into sales-compelling publicity calls for skill and experience. For advertising that brings results, consult **SAMSON CLARK & CO. LTD.**, 57/61, Mortimer Street, London, W.1. MUSEUM 5050.

CONNEMARA. Small furnished lodge to let short period, or lease. 6 bedrooms, bath, phone. Daily staff available. Preserved sea-trout fishing, grouse shooting.—Write Box 634.

THE Council of Ironfoundry Associations will shortly appoint an Assistant Secretary in London. Age preferably 28-35. Experience of iron, steel or engineering trades and/or trade association work will be an advantage. The post calls for a fully developed sense of personal responsibility and offers considerable scope to the right applicant over a wide range of duties, including committee and conference work, public relations, representations to Government Departments, etc. Salary according to qualifications, but minimum £850 p.a. The successful applicant will be required to join contributory pension scheme.—Written applications to the Secretary of the Council, 14, Pall Mall, London, S.W.1. Envelopes should be marked "Personal."

AMERICA—Transportation only from £79 return. Sailings r.s.s. *Charlton Star* chartered by The Open Road, Inc., Rotterdam, Southampton, Montreal from May to October.—Write, International Travel and Study Commission, 25, Pembroke Street, Oxford, for details.

CHAIRMEN and Managing Directors wishing to give their Staff an interesting evening on their own premises, without cost, are invited to write for fullest details of The Wine-Tasting Competition to The Friends of Wine, 1, Vintners' Place, London, E.C.4.

ECONOMISTS complete with indexes, 1945 and 1946 bound, 1947 on unbound. First reasonable offer whole or part.—Box 645.

ECONOMIST complete, unbound, July, 1931, to date; *Records and Statistics* from February, 1947—offers.—Box 644.

IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never embarrassed, a good loser, a good mixer, making friends without effort? If not, you need **RAPIDISM**, the fascinating new course, endorsed by leading psychologists. Write now for free booklet to: **THE RAPIDISM INSTITUTE**, G.666, TUITION HOUSE, London, S.W.19 (or call at 235 Grand Buildings, Trafalgar Square)

Labour's Self-Interest

SINCE the war, this country has enjoyed a comparative freedom from major industrial disputes that does credit to the solid qualities of the best trade union leadership and to the good sense of the employers' organisations. For a longer period than most observers thought conceivable, the unions gave effective support to the policy of wage stabilisation, and it was not until prices bounded upwards after devaluation and Korea that a general round of wage increases was demanded and secured. It would be easy to build up a misleading picture of union responsibility from these very broad facts. Damaging and grievous disputes have occurred, and some of them have been marked by extreme irritability and unreasonableness. It would be safer to assume that in coming months labour relations will be marked by a growing bad temper, if only because of the rapid and inevitable rise in prices of food and consumers' goods that is now in process.

These conditions will impose a test on the good sense of organised labour and its leaders. And it is about the quality of union leadership, perhaps, that the serious doubts arise. Without question, the influence of trade union leadership over the rank and file has lost much of its old effectiveness during recent years of full employment. The old giants and personalities have gone; the battles for recognition have long been fought and won; now the sense of struggle is in danger of being debased into ill-natured restiveness, and bitter inter-union fights are becoming more frequent. Many forces are playing a part in these changes, not least the efforts of Communists to provoke trouble by promoting unofficial strikes and by seizing control of particular unions. There is also the struggle between the general unions and the craft unions—the struggle between one side that believes in power through the mass and the other side that holds fast to the idea that a craft skill is worth its full price, and will fight to restrict the entry to the "mystery" and to maintain a differential over the wages of the unskilled.

These factors find their place in the recent report of the committee that has been inquiring into last year's unofficial stoppages at the London Docks. The report makes the valid point that the possibilities of trouble are multiplied by the character of dock work and its environment. But the perplexing thing to the general public is the motivating force that drives men who formerly suffered the degradation of casual employment but who now have a guaranteed wage, full employment in a prosperous port, and as much money to take home as any industrial workers, into the sheep-like stupidity of following false leaders. The older generation would never have forsaken Mr Bevin as so many of the younger generation seem ready to forsake Mr Deakin whenever an "unofficial portworkers' committee" starts to make trouble. A cynic might conclude that too high a level of prosperity attained too quickly has its dangers.

A real part of the blame for the restiveness that bursts out in the docks and in industry must be placed to the account of the quality of

trade union leadership. There are many types of union "boss," but in postwar years two have emerged of particular importance. The first is the statesman type, the leader whose simple ambitions of trade union strength have been overlaid by the influences of political power. This type of leader reckons himself not a mere agent of his members, but a force in debate at Transport House and in deputation to Whitehall. He forms part of a Fifth Estate ready to instruct the Government about what is palatable to organised labour in economic and social policy. These exercises in new statesmanship have diverted the attention of too many trade union leaders from their basic job—to strengthen the bargaining position of their members. Lacking any constitutional warrant, they go into committee on the Budget and argue about the course of prices; the slow-moving apparatus of Transport House labours to produce portentous edicts about the prices of rabbits and fish.

The second type is the demagogue, a contender for country-wide power rather than for the particular interests of his members. No doubt the pressure of Communist activity is something of a spur to men so dominated by political ambition; they can meet the Communist threat only by talking in an acceptable way to the left-wing elements in their union movement. Already this internecine struggle between opposed interests who claim an equal right to speak for "the workers" has promoted a series of utterly illogical "strikes"—not against employers but against the presence of a rival union within a given industry. The report on the strike of electricians in London, which has been going on for several months, clearly shows that some workers now think that they have a right to strike on this issue. No more disagreeable by-product of full employment could be imagined.

These two types of union leadership have their different dangers. The first, no doubt sincerely, believes that a Labour Government acting by and with the consent of its trade union masters promises eventually, if not now, the millennium for "the workers." The practical result is that the political independence of the Government is fettered and that the real job of leading and educating the trade union member about his true self-interest is forgotten. These preoccupations leave no time for new thinking about a Labour union policy that would produce maximum benefit for union members and for the country as a whole. The old philosophy of opposed

interests still prevails—what is good for "capital" must automatically be bad for labour. The notions that higher output, improved efficiency, a cheaper product, more effort and thought, a more receptive mind to innovation and change can together provide labour with a higher standard of living and improved real wages is not completely unfamiliar in trade union circles. Some trade unionists visit the United States in search of the clue to higher productivity and come home to spread the gospel that is to be found in a combination of these very things. But at the levels of economic statesmanship that prevail in Transport House, there seems to be little active support for the idea that labour's real interest lies in higher productivity and no apparent inclination to reshape union policy in such a way that industry is persuaded and kicked into securing greater efficiency. In a period of full employment and excessive demand, it is the unions who should be agitating for new methods in the plant, new tools to do more work, and new aids of every kind towards greater output.

To expect a movement that has concentrated for generations on the well-being of a particular section of the community to broaden its sweep and purpose in a short space of time would be quite unreasonable. They can remain a pressure group for a particular sector of the community, with most of their aims achieved, and encumbered by a stertorous bigness that will make them a prey to disruption from within. They can, if they wish, regard themselves as the Government's big brother and maintain the pretension of dominating economic policy. Or they can seek a positive philosophy of industrial progress and the role that the unions should play in it. To do this, they will have to move far beyond the partial prescriptions that they have imposed in the protection of "labour." There will be no place for restriction, no sense in swiping at "capital," no merit in formulas that seek to protect the wage-earner from the effects of rising prices at the expense of the rest of the community. There will be no room for the kind of neo-syndicalism that holds that industry should be run by and in the interests of "the workers." These conditions have only to be mentioned to prove how remote is the prospect of progress towards a society in which all classes are interested in producing and consuming, not in restricting, exploiting and wasting. But they lie at the centre of Labour's self-interest in the years to come, and they are the conditions of the country's economic survival.

Inquest on Agriculture

FOUR years after the passing of the Agriculture Act, the Government has at last produced a White Paper setting out the procedure followed at its annual review of farm prices and explaining the nature of the settlement reached at the 1951 review. This White Paper appears in accordance with a recommendation of the Public Accounts Committee, and no doubt it meets the committee's requirements. But those who had hoped for a full explanation of the Government's agricultural policy, in relation to the whole national economy, will get little satisfaction from it.

The point which must be kept in mind (and which the White Paper manages to obscure) is that Government fixing of agricultural prices is meant to serve both a social and an economic objective. The social objective is to

maintain British agriculture in reasonable prosperity and to prevent the sudden and violent fluctuations in price which caused such distress before the war. The economic objective is that of obtaining "such part of the nation's food . . . as in the national interest it is desirable to produce in the United Kingdom" at prices which the consumer (with or without the taxpayers' aid) can afford. The fact that, for most of the time since the war ended, the country has been short of foreign exchange with which to purchase food from overseas has led many people to assume that the social and economic objectives are more or less identical. By giving farmers high prices and assured markets (which is socially desirable), the nation will get an increasing quantity of food from home sources (which is economically necessary).

This line of argument has been buttressed, on its economic side, by two specific beliefs. One is that, in present economic circumstances, there is virtually no limit to the potential market for home-grown food. The other is that the only possible way of stepping up home food production is by offering strong price inducements to the farmers. Thus even those who think that some farmers at any rate are receiving rather more than their share of social justice believe that it is necessary to "featherbed" agriculture on economic grounds. The view has got around that there can be no possible antithesis between high prosperity for agriculture and the needs of the nation as a whole.

Government policy, at least since 1947, has been based on these beliefs. The result is that price fixing under the Agriculture Act has been highly successful in achieving its social objectives. Stability has been given to agriculture by the forward fixing of prices and by the determination of minimum prices for as long as four years in advance. Nobody can doubt that the schedule of guaranteed prices provides "proper remuneration for those engaged in the industry." Farmers' net income, as calculated by the Ministry, has risen from £59 million in 1937-38 to £184 million in 1946-47 and a forecast of £293½ million for the current year. Both the last figures relate to years of bad weather. Whether or not farming could be regarded as a depressed industry before the war, the significant point about these figures is the way in which farming profits have risen by something around 60 per cent during the four years of the expansion programme. Production has also risen during this period—but not by more than 25 per cent.

★

In terms of economic objectives, however, the Government's policy for agriculture is considerably less logical and consistent. The White Paper starts by explaining how economic factors enter into the price review. The first step is to decide (in consultation with the farmers' representatives) on the production objectives "for the next two or maybe three or four years." The next step is to arrive "at a provisional assessment of the total increase or decrease which should be made in farmers' gross receipts (treating the United Kingdom as one large farm) to enable the industry to achieve with the highest possible level of efficiency the production objectives set before it." The final step is to adjust commodity prices by reference to this hypothetical figure and in such a way as to encourage or discourage the production of particular commodities.

This procedure makes the very bald assumption that the quantities of food which it is desirable to secure from home sources can be settled independently of the prices which must be paid for them. This, in fact, was the Government's belief in 1947, when it established the maximisation of home food production as the sole economic criterion of its agricultural policy. In pursuit of this aim, it took the initial step of raising farm prices by a substantial amount. Thereafter, at the annual reviews, the farmers have been reimbursed by higher prices for the greater part of the increases in their costs and left to find only a minor part out of the additional profits that rising output has brought to them. The over-riding aim of getting more food has been quoted as sufficient justification for the high level of profits earned by efficient farmers.

This year, however, the Government has revised its production objectives. The phase of rapid expansion is certainly at an end. The White Paper points out that the output of certain products, notably milk, has surpassed the targets, and that further expansion needs to be concentrated on meat and feedingstuffs. On the basis of the Government's own logic, these alterations in production aims would seem to call for considerable changes in the price structure. For one thing, no good reason remains for continuing the special assistance of £40 million a year which was injected into the price schedule in 1947 to help finance capital expansion; and for another, there is little point in raising further the prices of products whose output is already adequate.

That in the issue neither of these things has been done illustrates the extent to which the present price review procedure has become insulated from economic realities. It is, of course, possible to raise farm prices for economic reasons (as was done, somewhat precipitately, in 1947); but to reduce prices, or even to prevent them from rising in line with costs, seems to be almost impossible under the present system. The result of this year's price review clearly shows that (contrary to the opening remarks of the White Paper) the established expectations of the farming community count for more in determining the result of the price review than do the economic objectives of the Government.

The farmers deny this conclusion. They claim that recent increases in their costs will reduce their profits

and may injuriously affect production. But the facts are against them. It is estimated that the aggregate of cost increases over the last year will raise the farmers' bill by £89½ million on an annual basis. But of this total, they have already absorbed £36½ million in 1950-51 without (in the Government's estimate) causing any reduction in net farm income beyond what may be attributed to the weather. Of the remaining £53½ million, £43½ million is to be made up to the farmers in higher prices (although it is true that £11½ million of this is secured by raiding the wool fund). The remaining £10 million represents a modest deduction from the special subsidy for capital expansion.

It is also interesting to note that this total of cost increases relates to all products, and not merely to those products (representing four-fifths of total output) whose prices are guaranteed. Evidently, then, the Government is interpreting its social obligation towards agriculture in a broad spirit, since the producers of fruit and vegetables (as present retail prices demonstrate) have other ways of

recouping their costs than Government subventions. Nor, finally, have the relative prices of different products been changed nearly so much as the changed production targets require.

That the annual price review has become, from an economic standpoint, so inflexible is largely the fault of the Minister of Agriculture. He deliberately primed the farming pump in the interest of securing quick returns. He has built up the convention of reaching agreement with the farmers' leaders over the main details of the price settlement. Too late he may now find that he is travelling up a one-way street. To fail now on any occasion in reaching a settlement with the farmers must cost him both his popularity and his position.

Personalities apart, it is becoming clear that the fixing of farm prices involves basic questions of economic policy which far transcend the competence of any Minister of Agriculture, placed as he is in a position where the contentment of the farming community must be his first and often his only concern. The belief that production must be the aim, irrespective of cost—and with it the assumption that there can be no clash between the material interests of agriculture and those of the community as a whole—cannot be seriously sustained today. (It never had any grounds in economic logic.) It is not the case (as the White Paper recognises) that there is a bottomless market for home-grown food at any cost. On the contrary the largest potential demand is for products like meat and butter, where the demand is sensitive to price and where a large part of the supply must be imported. Neither is it in the least proven that the method of price inducements is the best or the only way

of stimulating production—though there is ample evidence that it is the most costly way. In future, at any rate, production at the margin could be stimulated more cheaply and more effectively by a judicious application of direct subsidies. It is certain that a system which presents a large number of successful farmers with windfall profits in the interest of prodding the less fortunate or efficient ones into activity will not be tolerated indefinitely by the consuming public. It is odd that a government which so much dislikes the price mechanism should cling to it in one of its most wasteful manifestations.

The White Paper illustrates only too well (by its omissions) the economic vacuum within which British agriculture is being planned. Instead of agricultural policy being highly sensitive to the general needs of the economy, it has been driven straight forward towards a single objective. The result is that too often it is the rest of the economy which must be made to conform with the requirements (and the welfare) of agriculture, instead of the other way round. This point is illustrated by the way in which the Government has had to juggle with prices and subsidies so as to persuade the consumer to purchase what is available instead of what he really wants. It is reflected in the extent to which import programmes have to be adjusted in line with both the availability and the cost of home-grown food. Nobody need pretend that the basic economic factors which are relevant to the elaboration of a satisfactory agricultural policy are anything but complex. But it is time that they were thought out afresh in a much more comprehensive way than is possible for the Ministry of Agriculture.

The Schuman Community

THE Schuman Plan—which the world will have to begin to call by its official title, the plan for a European Coal and Steel Community—is now in its ultimate stage. The draft treaties and conventions that emerged from the long process of negotiation were put into final form and initialled at a conference of Ministers in April and they now await ratification. In France, ratification waits upon the results of next month's general election; in Germany, it is involved in the political struggle between Dr Adenauer and his Social Democratic opponents; the other four countries will wait to see what happens in the Big Two. There is, therefore, a useful pause while minds can be made up.

From its dramatic first announcement, it has been clear that the Schuman Plan was composed of two very different elements. On the one hand, it was an attempt to strike a blow for a political conception of the widest idealistic and emotional appeal—the unification of Western Europe. On the other hand, if it was to have real substance and avoid being a mere gesture, it needed the most careful working out amid the intricacies of European heavy industry, a region where emotion is seldom encountered and is capable of doing great harm. Is the Schuman Plan not only politically attuned to a popular mood, does it also make hard-headed industrial sense? How will it, in fact, work?

When the agreements (of which a summary appears on page 1236) are looked at from this angle, two things become clear. The first is that M. Jean Monnet, the

real father of the Plan, has achieved, on paper, far more than the pessimists thought possible when the negotiations began. This is not a vague agreement in principle, a promise to consult designed to cover a failure to agree in practice; there is a high degree of precision, even of complication, in the structure that is to be set up. There is to be a High Authority, and it is to have both powers and independence (though exactly how much of each remains to be seen). M. Monnet is to be quite specially congratulated on the success of his stubborn fight to prevent the advantages of the large supra-national market being snatched away by restrictionism within its borders. He has clearly seen, and has made others see, that what has made America rich and strong and united is not so much that it has a single large market for its heavy industry, but that the single large market has been kept free and competitive and supple.

But the second thing that is clear is that it is still quite impossible to say how the Community will work out when it begins to be translated from paper to action. The structure is most elaborate. There are to be nine members of the Authority to begin with, a Council of Ministers, an Assembly, a Court, a Consultative Committee. To every statement of general principle, there is a set of exceptions, intended to be temporary but which may turn out to be permanent. Many of the most important functions of the High Authority can be exercised only with the unanimous consent of the Council of Ministers—that is, of the governments. Everything depends upon the policies of the men who

will be appointed to the High Authority and the extent to which they succeed in carrying the governments and public opinions of all the participating countries with them.

There is something in the documents that can be quoted in justification by either of the two main schools of critics. There are some who think that the Community will turn out to be merely the old cartel writ large, armed with larger powers than the cartel ever had, and likely to use those powers for restriction more than for expansion. They say that the responsibility of the Authority to political organs does not mean that its policy will be more far-sighted but less; for the pressure of public opinion is always towards too much expansion at high cost in times of shortage and too much restriction and protection in times of slump. The provisions that enable the Community to be a monopoly buyer or a monopoly seller *vis-à-vis* the outside world, they say, are those that will be chiefly used, since they are those whose use will be most popular. All of which may be true; there is nothing to prevent it. And there has been a straw of evidence to support this view in the French suggestion to the Ruhr Authority last week that German coal should be reserved exclusively for Schuman Plan countries.

*

The other main line of criticism—and it is probably the majority one—takes the exactly opposite view: the danger is not that the High Authority will be too strong and aggressive but that it will accomplish very little. These critics point to the many opportunities embodied in the checks and balances of the scheme for vested interests to resist their own elimination. How far will the transitional provisions, protecting these special interests, prove to be permanent obstructions to the single market? For many of its actions the High Authority has to get the approval of the Council of Ministers, who will act in a spirit of political bargaining. Even where its power to act is, on paper, perfectly clear, how far will it have to bow to the force of public opinion—and, it may be, of local resentment? As is often the case with schemes of planning, its powers of prevention of what it does not like are far stronger than its powers of positive stimulation. Can competition and efficiency be enforced unless public opinion believes in them? These criticisms, too, it is impossible from the wording of the documents either to justify or to disprove.

In these circumstances, judgment must be suspended. The Community may fail in either of these ways. Or it may, as its supporters believe, not only succeed in its assigned sphere of raising the efficiency of European heavy industry, but in the wider purpose, which was never far from its authors' minds, of providing a functioning nucleus round which the unification of Europe can gradually take shape. All that can yet be said is that the preliminary stage of getting a legal framework down on paper has been accomplished more successfully than it might have been, and that the forcefulness and single-mindedness of M. Monnet are good auguries for the performance that the High Authority will put up—if the universal belief that he will be chosen to preside over it can be assumed to be correct.

For the British Government, however, it is not possible simply to wait and see. Decisions will have to be taken,

and though the most important of these—whether or not Britain shall accept the offer of full membership of the Community—can perhaps be put off, others cannot. British consent is required, under two separate heads, before the Plan can come into force even for the six prospective members who have taken part in the negotiations. Before the Community can come into existence, modifications in the Allied occupation of Germany will be needed. Some of these emerge from the essential nature of the Plan—if the heavy industry of Western Europe is to develop freely in accordance with purely economic considerations, the present limits on German steel production will clearly be absurd. But, in addition to these, the Germans have made it clear that ratification of the Plan is not to be expected unless the occupying powers are prepared to disband the Allied coal and steel groups, which are at present charged with the "decartelisation and deconcentration" of German heavy industry, and the Ruhr Authority, which controls German coal exports. For these relaxations of control, British consent is necessary. It is true that the new Community hardly yet provides as effective a guarantee as the present controls against the possibility of German industrial strength being once again used for intransigent nationalism. But to this the answer is that the present controls could not in any case, Community or no Community, be kept in force very much longer. Some people also suspect that British policy is influenced by the desire to keep German competition in check. Whether or not the suspicion is well founded, it should be clear that for the British Government to use its authority as a trustee for Germany for these purposes would be wholly wrong. British consent to the necessary changes in Germany should be given; and there is no good reason why it should not be given straight away.

The second need for British assent arises out of the fact that the arrangements that the Schuman countries propose to make for free trade among themselves in coal, iron and steel violate the most-favoured-nation principle. Is it right that the six signatories should be allowed to create a customs union in iron and steel without according the same benefits to their neighbours? The answer must surely turn on the policy that the Community proposes to follow towards its neighbours. There is a certain volume of exports of British steel products to Western Europe; are they to be fairly treated? Sweden sells iron ore to Germany and buys coal in return; is this exchange to be interfered with—as has already been suggested so far as the coal side of it is concerned? Britain buys large quantities of iron ore from French North Africa; and though North Africa is not included in the Community, will there be a tendency for these supplies to be diverted to the Continent? No doubt assurances can be given on all these points; and if they are, it would be a mistake for British consent to be withheld, particularly since refusal would be attacked both in Europe and America as further evidence of a dog-in-the-manger attitude on the part of Britain. But there has been considerable talk on the Schuman side of keeping powers in hand for bargaining with the British, and it would be foolish for Britain's bargaining counters to be thrown away too soon.

There remains the much larger question whether the United Kingdom should actually accept participation in the Community as a full member. It can be foreseen, with some certainty, that the invitation will in fact be refused. The Government, with its horror of supra-

national bodies on which it would not have a complete veto over anything that was proposed to be done in this country; the Iron and Steel Corporation, with the love of power that it is already exhibiting; and the steel firms themselves, with their traditional dislike of revealing their costs or having their selling prices and practices determined for them—all will for once be in agreement against membership.

This does not, however, absolve the public from making up its own mind whether the Government and the industry should not be pressed to forget their prejudices. The political arguments for membership are too familiar to require repetition. On the industrial side also it is important that there should at least be no hostility between the British and the west European industries. Apart from the questions of mutual trade that have already been mentioned, it is important that there should be no dumping or cut-throat competition in third markets—not a matter of any immediacy at the moment, but one which can be all-important when demand drops below supply.

Clearly the surest way of ensuring that these matters were all amicably settled would be for Britain to be a full member of the Community. But it is not the only way; and it would create some problems. British membership would not be simply the addition of one

more signatory to six existing ones. The western European heavy industry is, technically, a single complex; it is already in a fair way to being an industrial unity. The British coal and steel industries have never formed part of this complex and they serve different markets, with many of which (notably the Dominions and Colonies) they have special marketing arrangements that would inevitably be disturbed if Britain joined the European coal and steel customs union.

The wise course would seem to be to postpone the question of British membership in the Community until there is some solid evidence of how in fact it will work—say, until the end of the transitional period of five years. But it should be made very clear that this is not a final rejection and that it reflects a wholly friendly and co-operative attitude. The Foreign Office should not content itself with a few words of cool and formal welcome—which have a very depreciated value on the Continent by now. There might well be a British initiative in suggesting the creation of special machinery—say a Standing Joint Council—for the closest consultation, especially on matters of mutual trade and price policy in export markets. Full union with the Community is hardly practical politics at present; but there should be the closest possible *entente*, and it is in the British interest that it should be an *entente cordiale*.

Japan Under Ridgway

JAPAN is entering a new period of its national history. The dismissal of General MacArthur, for nearly six years the supreme symbol of the Occupation as well as a virtual dictator, has probably not preceded the signature of a Japanese peace treaty by more than a matter of weeks. This means that Japan is now emerging from the first political stage after the war and will soon be on its own. What sort of a country will it be? How will it pay its way? These are political and economic questions of very great importance to the rest of the world as well as to the people of Japan, and it is likely that their pattern for many years to come may be determined by what happens during the next twelve to eighteen critically formative months.

General Ridgway, the New Supreme Commander, has already managed to do more travelling than his predecessor did in five years. He has also changed the atmosphere in Tokyo from one of aloof infallibility—which had its own merits—to one of contact and friendly discussion both among the members of the Occupation authorities themselves and between them and the Japanese. At a time when, as in Germany, the lid is being taken off the Occupation, this is an essential development, for in neither Germany nor Japan is it now feasible for the victors of the second world war simply to give orders. They must learn to accomplish their aims by persuasion and agreement, however uncertain they may be that they have had time, or even made the best use of the time they have had, to equip the Germans and Japanese themselves to resist a revival of despotism—whether of the Right or of the Left. In Japan—until only the other day under the spell of General MacArthur—the transition from Occupation to independent rule is taking place more abruptly than in Germany, but in both the tender shoots of democracy

have been carefully planted. The free world is watching anxiously to see whether they will grow.

The Occupation authorities have taken three principal measures to plant democracy in Japanese soil. The first was the adoption of the new constitution three years ago this month; this abolished the old prerogatives of the emperor and the restrictions on parliamentary power laid down by the Constitution of 1889. Secondly, a law for agrarian reform was passed, breaking up large landed properties and giving ownership of land to some millions of former tenant farmers. Thirdly, there is the legislation which has enabled Japanese industrial workers to organise trade unions for the first time.

In the long run the survival of democracy as a living force in Japan will depend most on the second and third of these changes. The new constitution, largely drafted by Americans, and un-Japanese even in its wording, is unlikely in itself to evoke strong feelings of loyalty and devotion in the masses of the Japanese people. On the other hand, the transfer of land to the peasants and the material advantages which the workers have found in free collective bargaining have created new vested interests, which will make it none too easy for reactionary political forces to restore the old pattern of society. If the formal constitutional structure devised for Japan by American ingenuity looks somewhat fragile for withstanding the seismic disturbances of the “Japanese spirit” to which it may be subjected, peasant proprietors and free trade unions are new factors which should not be estimated too lightly in speculating on Japan's future.

The effect of the agrarian reform and of the new trade union rights could, however, be offset by a serious decline in the Japanese economy. As history has shown in other countries, the division of land among peasant cultivators

does not in itself provide for long a solution of the agrarian problem in conditions of rural over-population and poverty. Unless the peasants have the benefit of low-interest credit facilities, provided as a result of national policy, they are apt to lose their land and to slide back into the hands of the moneylender. Equally in the towns trade unionism is no answer to widespread unemployment; indeed, a high degree of trade union organisation may offer ready scope for extending Communist control, particularly if unemployment has made the workers ripe for revolutionary propaganda.

It is in fact far from certain how sincerely the Japanese have imbibed the teachings of the Occupation about democracy. All that can be said at present is that they have been adept pupils at learning enough of the jargon to please their American masters. As regards the rural population—which is now a prime Communist target in Asia—it is probably essential, if the recent land reforms are to blossom into producing a politically stable and independent peasantry, that external aid should continue to reach the Japanese countryside. This might mean that specific sums should be allotted in any future grant of foreign aid for providing agricultural machinery, fertilisers and rural capital construction. Japan does not figure, for instance, in the Colombo Plan except as a possible provider of technical experts for other countries.

Yet its own needs are great and, since the pressure groups of industry are politically predominant, the government in Tokyo is unlikely in the immediate future to give enough priority to agriculture in its already overburdened budgets.

On the question of Japanese industry, the direct interests of the British and Americans are seriously divergent. It is, however, undeniable that the American approach is reinforced by the vital need to enable Japan, like Germany, to pay its way if democracy is to flourish and Communism be held at bay. Since the war the United States has poured over two billion dollars into Japan, and it is natural that one of Washington's prime hopes is that the peace treaty will usher in an era in which the rate of subsidy can be rapidly and appreciably reduced, if not stopped altogether. To the Americans Japan has long appeared more as an importer of raw materials, such as oil and scrap metal, than as an export competitor. They have therefore been in favour of any expansion in Japanese exports which would bring Japan nearer balancing its overseas trade—last year the visible deficit was to the value of \$142 million. For the British, on the other hand, Japan is remembered from the decade before the war as an alarmingly powerful competitor in world markets, and the same danger is seen as a new Frankenstein monster in Manchester—Japan is already exporting about 1,000 million square yards of cloth per year compared with 2,700 million in the 1930s.

During the next few years Japan will be the key to eastern and southern Asia. If it is held against Com-

munist, there is great hope of containing the Sino-Soviet bloc on its present line and perhaps eventually of detaching China from Russia. But if Japan is lost, the effect will be catastrophic, militarily, industrially and psychologically, from the Western Pacific to the Indian Ocean. One essential requirement of victory is a healthy economy. To achieve it, Japan, the most industrialised country in Asia after the Soviet Union, must increase its non-Communist trade with South East Asia and indeed with any raw material producing countries which need the capital and consumer goods that its industries can supply—though these goods are not as relatively cheap as they were before the war. In particular, this must be done without Japan relying as heavily on Chinese raw materials as in the past, since this would give Peking too powerful a lever in the Japanese economy. There is some hope that the British and American Governments are moving closer together on the question of Japanese trade; last week, for instance, Major-General Marquat, in charge of economic affairs under SCAP, warned the Japanese that they must depend on their own efforts and that the United States would not “bail out” Japan if it receded from its post-war record of economic progress. But in this, as in other difficult questions of Far Eastern policy, a common front between London and Washington is necessary if the

allies are now to turn their Occupation into a successful partnership with the Japanese.

This indeed must be the aim. For provided that economic conditions do not deteriorate, there are certain favourable factors in the influence which Japan could bring to bear elsewhere in Asia. Homogeneous, hard-working, disciplined and stubbornly purposeful, the Japanese could yet be a strong

stabilising force. It is true that, as the recent local elections have shown, there has already been a political shift to the right, in reaction against the innovations of the Occupation period; and in many ways a reversion to traditional Japanese ways of life may be expected when General Ridgway hands over his powers. But even under the prewar regime in Japan the militarists did not have it all their own way; from 1918 to 1931 there was a marked swing away from military ascendancy. And while it would be quite wrong to expect history to repeat itself, in either its favourable or unfavourable aspects, the chances are that the Japanese will give their new-found system of democracy a fair trial. When authorising the progressive relaxation of many Occupation controls at the beginning of this month, General Ridgway spoke of Japan's “growing political maturity.” This process, however, will continue to require the most careful help even after the peace treaty is signed. And to provide this help will confront the great alliance between the western powers with its most perplexing, but also its most crucial and rewarding, task in the Far East during the next few years.

NOTES OF THE WEEK

Britain, America and Persia

The delays and hesitations over the terms of last week's British note to Persia now seem to have been worthwhile. Something was gained by yielding to American advice to tone down the draft, since the note, when it was finally delivered, was accompanied by an admirably firm and sensible American warning. Washington is resisting the temptation to pose as the neutral broker. This is wise—not merely because any such attitude would infuriate the British, but because it would be wholly ineffective in Persia. Since Korea, America is not regarded anywhere in Asia as a neutral, but rather as the head and front of the western alliance. Expressions of the solidarity of that alliance may annoy the Asian (as this one so clearly annoyed Dr Mossadegh) but they do not surprise him. And the American warning has served the valuable purposes of playing on the Persian's respect for strength, of giving notice that if one set of foreigners is driven out another set will not obligingly offer their services, and of baulking the Russian technique of driving a wedge between Britain and America.

Thus, though on the surface there is no sign of a break in the complete deadlock, underneath there is some slight improvement. For one thing, time is passing, and in time lies the great hope. For another, there are a few faint indications that the Persians are tiring of Dr Mossadegh and his extremism. For yet another week he has been all adjectives and no policy. He seems, even to the Persians, to be capable of nothing beyond denunciations. The United States has now been added to his list of criminals. The very vehemence of his language suggests that he is reduced to the devices of a man who is being noisy because he has so little to say. It is difficult to believe that he can last.

Unfortunately, it is still possible for him to be replaced by something even worse, in the shape of a government definitely subservient to Russia. But it is also still possible to hope that some of the basic facts are beginning to sink in. An engineer named Kazem Hassib, who is the only man in Dr Mossadegh's party who knows anything about the technical problems, is reported to have said that "we will close down anything we cannot manage"—but there are plenty of Persians who realise what shutting down would mean, and this admission that "nationalisation" is not simply the "taking over" of a going concern will have its effects. The news will also soon reach Persia that the western world is beginning to discuss seriously whether it could not do without Persian oil if it had to. The facts are set out in an article on page 1244, and they seem to show that though a stoppage of Persian oil would do incalculable damage in the short run, Persian oil could be replaced within a period far shorter than it would take Persia to recover from the loss of its earnings from the export of oil. If the Persians carry things to extremes, they can, for a time, inflict as much harm on the western world as on themselves. In the somewhat longer run they would be by far the biggest losers.

Mr Rusk on China

The sudden alarm provoked all over the world by the speech made in New York on May 18th by Mr Dean Rusk was very understandable. Mr Rusk is, after all, the Assistant Secretary of State, and when he suddenly attacks the Chinese Communists in much stronger language than the State Department has ever used before, praises Chiang Kai-shek and seems to promise him aid in re-invading the mainland of China, it sounds very much like a sharp change in the policy of the United States—just after Britain and America's allies had carried out the last day and night of the MacArthur—the transition from Occupation to Independent rule is taking place more abruptly than in Germany, but in both the tender shoots of democracy

Now it appears that it was all a private aberration of Mr Rusk's and that there is no change of policy. The reassurances have been sweeping, but they can hardly be completely effective, for there is no doubt that the Administration is under enormous pressure to shift its course towards MacArthurism, and there were already, before Mr Rusk's speech, indications that the wheel had been put over a point or two. The open pressure from Congress can no doubt be resisted, but there also seems to be pressure within the Administration from the Defence Department. The military strategists have all along emphasised the strategic importance of Formosa. The Defence Department nowadays has a very powerful voice in Washington, and it is over policy towards Chiang Kai-shek that the State Department appears to have accepted a shift in the American stand. There is certainly an elementary logic in the purely military argument that if Formosa must be defended indefinitely, its government will have to be supported—and it seems that the Defence Department is even now urging increased appropriations for assistance to Chiang Kai-shek in the next fiscal year.

There is, unfortunately, little doubt that London and Washington still hold significantly different views about long-term policy towards the Nationalists and the Communists—that is, about what should be done when the Korean War is over. But it is surely wrong to dwell on these differences and to ignore the essential point for the short run, which is that Mr Truman and Mr Acheson, General Marshall and General Bradley, are all of them doggedly defending, under very heavy pressure, the policy of avoiding an extension of the Korean war. Public opinion in Britain ought to be profoundly thankful for that basic fact and not to trouble itself unduly about differences that arise over the tactics of pursuing it. Those people in London—and there are far too many of them—who seize upon every opportunity of urging the pessimistic view of American policy should remember that the best way of avoiding MacArthurism is to help those who are in fact resisting it.

Hongkong versus Japan

It is becoming daily clearer that the United Nations' decision to ban the export of strategic materials to China has not really resolved any of the basic problems involved. Last week the British Ambassador in Washington, Sir Oliver Franks, was asked to explain British Far Eastern policy in a radio interview. After an admirably reasoned exposition by the Ambassador, the conversation suddenly touched on the heart of the matter with the following question: "Perhaps the basic suspicion, Mr Ambassador . . . of many Americans is—are you or are you not with us in the struggle against Communism?" To which the natural answer came: "That seems an odd question to put to an Englishman." This is the measure of the emotional misunderstanding which has been generated in the last few months by the fact that Hongkong has continued to trade with Communist China.

Yet the reasons for this continued trade are crude enough. It must first be repeated that, with the exception of rubber which has now been stopped, the export to China of oil, of arms and of other strategic goods has in fact been prohibited for the last ten months. For the rest, the British case is simply that Hongkong must trade with China, so long as China is prepared in return to provide what it needs to live. For Hongkong is not only traditionally dependent on the Chinese market for its food and many raw materials—imports from China were worth \$60 million during 1950 against exports to the value of \$91.5 million—it cannot physically get these commodities from anywhere else. The equation which therefore has to be balanced is this: is

Hongkong's trade with China, shorn of the strategic elements, likely to do more harm to the cause of the free world than the loss, or at least the internal disruption, of the "Berlin of Asia"—as Sir Oliver Franks agreed to call it.

The British case is that it will not. And, however unpalatable this may be for the relatives of the United States 8th Army in Korea, it is a case which is being maintained not only by Britain and not only about Hongkong. About a week ago, an official American spokesman explained that Japan must also continue to trade with China, because "the two nations have a historic trade pattern that would harm Japan's economy (and involve the United States in heavier expenditure) if trade were cut off." In 1950, Japan imported \$39 million worth of goods from China (about 4 per cent of its total imports) and—according to Washington—exported just over \$19½ million, of which \$17 million (85 per cent) represented iron and steel sheet, machinery, precision instruments and the like; the larger part of these strategic exports was shipped after the Chinese intervention in Korea. In the first quarter of 1951, Japan became subject to the general American embargo on the export of strategic goods to China, and its outgoing trade was in theory reduced to textiles, bicycles and sewing machines; these reached the surprising total of \$1,100,000 in March alone (\$2,400,000 for the quarter). In return Japan received approximately \$3,800,000 of essential materials from China in the first two months of this year (about half the 1950 rate). There are now signs that the Chinese may soon decide that sewing machines are not worth iron ore and coking coal, and a new problem will then arise. Is Japan to play its full part in the industrial potential of the West? And is it, as Mr Dulles hoped, to be able to stand on its own financial feet? A new equation will have to be worked out, and a solution will be no easier to find than that which the British have had on their hands in Hongkong.

The case of Japan has, perhaps naturally, only had a tithe of the publicity in America that General MacArthur gave to that of Hongkong. The British Government will be well within its rights in insisting that the two cases are on an equal footing.

Political Doldrums

When Parliament reassembles on Tuesday Members will come back from their constituencies with a better knowledge than they had before the Whitsun recess of how Mr Bevan's resignation has been accepted in the country. Yet even if Mr Bevan has more support for his championship of the social services in the constituencies than in the House of Commons, the Government is unlikely to have to face the same pressure from its own side that it faced before the adjournment. The charges for spectacles and false teeth are now actually in force, and the National Insurance Bill has passed its critical committee stage. Mr Bevan himself, though he may re-emphasise in *Tribune* his case for the inviolability of the social services, has not crystallised his opposition in the House. There may be general disgruntlement that the social services have had to give some ground to the needs of rearmament, but there is no focus on which this disgruntlement can settle and harden.

Mr Gaitskell can thus count on the full support of his party when the Conservatives launch their attack on the Finance Bill in committee. Once it is safely through, the Government can look forward to the haven of the long summer recess. In the meantime, with the date of the election still uncertain but with the chance of it coming at a moment's notice, the parties' leaders are trying to frame or freshen up their policy statements. The Conservatives, well aware that their opponents hold all the initiative in this matter, have their plans in a high state of readiness. Mr Butler's research department has a revised draft of an elec-

tion manifesto always in hand, and it would be the work of only a week or two to have this examined by the "Shadow Cabinet," Mr Churchill's final advisers on policy. Just before Whitsun Mr Butler assured the more impatient Tory backbenchers of the 1922 Committee that everything was in readiness for a new statement, but that none would be made public now because of the possibility of an autumn election.

Transport House, on the other hand, has nothing fresher in its pigeon-holes than last year's collection of platitudes, "Labour and the New Society." This document reflected the blunting rather than sharpening of ideas which followed last year's clashes in the Labour Party's Executive between the Bevanite Left and the Morrisonian Right. Now that the controversy has moved into the open, policymaking is all the more difficult. Even so, the Executive cannot shirk much longer the task of defining a new programme. Some sort of statement will have to be produced to put before the annual Labour Party conference in October.

Catering Unrealities

The annual report of the Catering Wages Commission (HMSO, 4d.) has nothing new to say about the largest matter within the Commission's purview, the general review of the working of the Catering Wages Act in the hotel industry which was asked for by the Minister of Labour "as a matter of urgency" in December, 1949, and is still "under active consideration" by the various organs of the industry. But though the present report is thus confined to minor matters, it still gives a strong reflection of the Wonderland atmosphere in which the Commission has operated from the start. For example, the report expresses concern "at the fact that the least organised section of the industry" (i.e. the unlicensed hotels and boarding houses) "is still unprotected by any form of wage regulation." Who would guess from this that there was any doubt about the feasibility, or indeed the desirability, of "organisation" for this "industry"? The fact is that the first two attempts to draw up a wage code for something so fundamentally unorganisable have been laughed out of court—not without some shudders of horror, too.

The same sublime disregard of reality is shown in the Commission's reference to the shortage of hotel accommodation, which "is already recognised as the biggest handicap to the country's dollar tourist drive" and which "every Government Department concerned" is pressed to "take urgent and effective action" to remove. Who could guess from this that by far the biggest obstruction to the expansion of the hotel industry—bigger by far than even the building regulations—is the complicated, rigid and almost unworkable code of wage regulations imposed under the auspices of the Catering Wages Commission itself? Except possibly for the luxury trade in the West End of London, where high prices can be charged all the year round, the annual cost per room of providing a new hotel is a long way above the probable annual profit per room from running it. The only "urgent and effective action" that Government Departments could take to provide any new hotel accommodation would be to close this gap—and that would involve treating "as a matter of urgency" the radical amendment of the Catering Wages Act itself.

Mr Morrison Meets the German Leaders

In speaking of a "new era in Anglo-German relations," the Germans are drawing much too far-reaching conclusions from the primarily informative visit of the British Foreign Secretary. That Anglo-German relations will benefit is certain, but for the simple reason which Mr Morrison himself gave, that "a Foreign Secretary who sits in his office and cuts

himself off from the ordinary life of the outside world is bound to be ineffective in the discharge of his duties."

In the same way, it will be helpful to mutual relations if Dr Adenauer pays a visit to London later in the summer in response to Mr Morrison's invitation. The Federal Chancellor has already been the guest of the French Government, but has not had an opportunity of seeing Britain since the war. He will be welcomed as an outstanding personality, who has combined German patriotism with genuine efforts towards western unity.

After meeting the Catholic, Conservative Chancellor, Mr Morrison had talks with the Protestant, Socialist leader of the main opposition party, Dr Schumacher. How successful he was in persuading this obstinate politician to place Western Europe above party tactics has still to be seen. It was probably somewhat tactless of Mr Morrison to make a public statement on the duty of Oppositions to be constructive. The German press took this implied rebuke to be directed to the Social-Democrats as well as the neo-Nazis. It would have been better said over the dinner table. Dr Schumacher is intent upon proving to the Germans that he does not truckle to foreigners, and that the present-day Social-Democratic Party, unlike its Weimar predecessor, champions German national interests. It remains one of the most important tasks of his colleagues to prove to him that he is mistaken.

* * *

Amending Italy's Peace Treaty

Count Sforza, the Italian Foreign Minister, has now made an outspoken appeal in a speech at Genoa last Sunday for revision of the Italian peace treaty. This has brought the question to a head. The subject was first raised at the Santa Margherita meeting between the Italian and French Prime Ministers last February. Then, just over a month ago, Count Sforza sent personal letters to the Foreign Office, the State Department and the Quai d'Orsay asking the three western powers to issue a statement acknowledging Italy's new status as an ally rather than an ex-enemy. Now, the Italian Foreign Minister seeks a full-scale review, cancelling the military clauses in the treaty, amending the economic clauses, and opening the way to Italy's admission to the United Nations. London's reaction has been cool, in the view that this is a most unsuitable moment to embark on something which Mr Gromyko would immediately want to exploit for the agenda of a Council of Foreign Ministers. Neither Washington nor Paris has so far shown any greater enthusiasm, although Count Sforza claims that, when the treaty was originally ratified, both President Truman and General Marshall, as Secretary of State, said that Italy could work towards a revision.

The present blank wall in the western capitals is not really good enough. It is true that, at law, any change in the Italian peace treaty must be made by agreement between Rome and the four ex-allied signatories—Britain, America, France and Russia. But there is no prospect whatever of that being achieved, either now or in the foreseeable future—and this is not just because Russia doubts western good faith. Hence the government in Rome is faced with the prospect of being saddled indefinitely with the millstone of the treaty. This is not what was intended when the treaty was drawn up; it is not even quite as good as the future that events may well hold in store for Western Germany or Japan. When the Italian peace treaty was being negotiated, the assumption was that Italy would soon become a member of the United Nations and, under Article 46 of the treaty, provision is made for adjustment of the vital rearmament clauses by agreement between Rome and the Security Council once Italy is a member of Uno. Now that Italy's entry into Uno has been banned by the Russians, there is no prospect of this either.

There are two arguments for meeting Count Sforza at least part way. As regards the Russians, Moscow has long ago allowed flagrant violation of the peace treaties with its East European satellites, in spite of protests from the western powers; it is therefore high time for the west to be realistic instead of legalistic about its ally. As regards Italy, a more positive attitude in this matter from Rome's Nato allies would greatly help Signor De Gasperi's government in its ceaseless struggle with the Italian Communist Party—lately making a special effort to secure an Italian withdrawal from the Atlantic Pact. This is a good moment to make some gesture—even just to say that Count Sforza's approach will be considered—in view of the critical municipal elections which begin this week-end and constitute the most important nation-wide poll to be held in Italy since the government was elected in April, 1948.

* * *

Delayed Aid to Yugoslavia

Western aid to Yugoslavia is being held up pending a decision in the talks still going on in London between representatives of the United States, Britain and France. The principle that aid shall be provided is not in dispute, but there are serious problems connected with the form in which it is to be given and the division of the burden between the three western powers. Indeed, a decision about the amount of money required to meet short-term economic needs is probably the least of the difficulties still facing the negotiators. Anglo-American experts—with valuable and increasing co-operation from the Yugoslavs—have made a thorough investigation into economic conditions in Yugoslavia in recent months, and figures for the country's trade deficit, as well as its anticipated requirements of raw materials and articles of common use, are known. A total figure for aid may have been difficult to arrive at since there are so many imponderables in the Yugoslav situation. But, once having reached it, the real stumbling-block has been to decide exactly where the money is to come from.

Since this is the first case of tripartite aid to any European country, the question of precedent has had to be watched very carefully. There are also the wider problems, both political and economic, created by the fact that America, Britain and France all have extensive commitments already; the Yugoslav case, though unique, cannot be considered in isolation. This is particularly true of military aid. Yugoslav needs compete with those of the Atlantic treaty powers as well as the world commitments of Britain, America and France. On the other hand, since the final details of military aid for the Yugoslavs may well take some while longer to settle, it would be wrong to hold up the whole economic programme on their account.

A further problem that has had to be considered is that Belgrade has simultaneously applied to the World Bank for a substantial long-term loan for industrial projects. As a business undertaking, the World Bank is not strictly concerned with political questions about the desirability of aid; any loan it is likely to make to Yugoslavia will therefore be calculated on capacity to repay. Accordingly, since it is certain that in its present economic condition Yugoslavia cannot simultaneously repay loans both from the western powers and from the World Bank, the London talks have had to give serious thought to the priorities of repayment. Yet, if Tito's Yugoslavia is to survive, it must have short-term aid and a long-term loan, and in many ways the two are interdependent. The sooner it gets both, the quicker can results—and repayment—be expected. The difficulties are great but not insuperable. Here, if anywhere, aid would be of double value if given quickly. The western powers will be cutting off their nose to spite their face, if they diminish the effect of their aid by delaying decision on the broad outlines because of the difficulties of settling the details between themselves.

Children in Care

The last report on the children's department of the Home Office was published in 1938. Ten years later the Children Act made big changes in the arrangements for the welfare of children brought up away from their homes, and the sixth report on the children's department, published* this week, is of especial importance because it tells how the provisions of the Act are working in practice.

The chief administrative changes were the concentration of central responsibility for the care of children, formerly divided between the Home Office, the Ministry of Education and the Ministry of Health, in the Home Office and the concentration of local responsibility in newly created children's committees of the local authorities. There was some criticism of both these changes when they were announced. It was thought that the Home Office would lack the insight and imagination needed for this particular social service, and that the appointment of yet another committee by the local authorities was unnecessary because the work could have been done by one of the existing committees. Neither criticism has been justified in the event. The report shows that the children's department of the Home Office is as well aware of the subjective needs of children deprived of a normal home life as of their objective needs for food, soap and sanitation. And the children's committees have a sense of direct responsibility for all the children in care which was so tragically lacking in the O'Neill case in 1945, when a boy, in the care of one local authority and boarded out in the area of another, was so cruelly treated by his foster-father that he eventually died.

Cases where boarding-out goes wrong are fortunately rare, and it is still the treatment of choice for children who have to be brought up away from their own parents. It is also fortunate that in this respect the treatment of choice for the child coincides with the need for economy. A child boarded out with foster-parents costs an average of £2 a week. In the "family group home," where about twelve children of all ages live in an ordinary house with a housemother, the cost may be twice as great.

Unfortunately, foster-parents, especially for boys, are hard to come by, and in the meantime the children's committees are faced with the difficult task of making their children's homes as uninstitutional as possible while at the same time they are faced with a shortage of suitable staff, a shortage of money and a growing number of children committed to their care. Progress consequently can only be slow; but the evidence suggests that it is on the right lines.

Money for Repairs

The Royal Institution of Chartered Surveyors has published, in the form of a memorandum, its remedy for the problem of rent restriction and repairs of privately-owned houses. The thesis is the familiar one that because of the Rent Restriction Acts, rents are inadequate to cover the cost of repairs, and that in consequence a valuable national asset is deteriorating rapidly. The institution's concern is to find an immediate solution to prevent further deterioration and to cover the time that will be required to work out a more elaborate scheme for the modification of the rent Acts.

The institution's proposal, which would require legislation, is that an increase in controlled rents should be related to the statutory deductions for rating purposes, and that the percentage increase should correspond to the increased cost of repairs between 1939 and the date of the enabling Act. For example, a house assessed at £25 gross value has at present a statutory deduction of £7 a year. With a 150 per cent rise in the cost of repairs it would thus be permissible to increase the rent by 150 per cent of £7, that is,

* His Majesty's Stationery Office, 4s.

by £10 10s a year, or 4s. a week. The institution claims that the advantages of this proposal over similar ones is that it by-passes the difficulties of the existing disparities in rents of similar houses and that the basis of the calculation on statutory deductions produces a much more constant figure than one based on rating assessments alone.

There is much to be said for these arguments which carry all the more weight because so expert a body has arrived at an agreed scheme for a very difficult problem. The technical difficulties are knotty enough. The political ones so far show every sign of immobilising the Government. As some counter to the political difficulties the memorandum gives diagrams, one of which is reproduced above, which show how much smaller a proportion of income is now spent on rent than in 1939 and how inadequate an amount is spent on repairs.

* * *

Hungary Revises Its Five-Year Plan

Last week it was the turn of the Hungarian Parliament to give its formal consent to the stepping-up of industrial production which seems to be under way in most East European countries. The upward revision of the Hungarian five-year plan (1950-54) was already foreshadowed at the congress of the Workers' Party last February. One reason given for this move is that the production of basic raw materials has not kept pace with the development of the various manufacturing industries. By 1954, therefore, mining production is to exceed the 1949 level by 142 per cent instead of by 55.2 per cent, as originally planned; foundry production is to go up by 162 per cent instead of by 95 per cent; and electric power by 175 per cent instead of by 94 per cent.

But this drastic upward revision of targets is not to be confined to the production of basic materials. It is to be extended throughout the Hungarian economy which is to receive investments amounting to 85 milliard forints instead of the 50.5 milliard originally planned. Heavy industrial production is to be increased by 280 instead of by 104 per cent, and light industrial production by 145 instead of by 73 per cent. It is said that the recent performance of the Hungarian workers has opened the eyes of the planners to Hungary's "immense latent reserves," and that the original five-year plan failed to make any adequate use of them. The planners have some excuse for their blindness, since it appears that these resources have only been laid bare by such means as constantly expanding socialist competitions and the Stakhanovite movement—in other words by applying as much stimulus as possible to the worker. His only reward at present is the promise that by 1954 living standards will be about twice as high as in 1938. But the unbalanced and over-hasty development of the heavy industries—which will be pressed ahead because of Soviet demands—will strain the country's resources, in both manpower and materials, to the utmost; there will be little left over for the consumer industries, however high their paper target may be. Mr Vas, the President of the Planning Commission, has, in fact, confessed that increased sacrifices will be required from the workers.

*

Agricultural, as well as industrial, targets are to be raised in the revised plan. The Communist leaders have not disguised the fact that the progress so far achieved on the

Progress in Electronics

IN THE world of the twentieth century, communications are of greater importance than ever before. That is why the development of communication systems for industry and for sea, air, and land transport is a major activity of Mullard research.

Many other subjects besides communications, however, are continually being investigated in the Mullard laboratories. Here the whole scope of electronics is under survey, from ultra-fast photography to television, from ultrasonics to nuclear physics. Here, too, research is undertaken for Government departments and for the Services, for professional establishments and individual companies.

The Mullard organisation is equally concerned in bringing the benefits of this research to industry and the community. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes, and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

land is far from satisfactory and that food supplies are far from adequate. Last year's drought and the export of foodstuffs have contributed to the food shortages; but it is admitted that opposition to the collectivisation programme has aggravated the situation. According to Mr Vas, the kulaks are still "a considerable economic force and exert a significant and harmful political influence on the country-side." They have illegally slaughtered their own cattle and have encouraged the poorer peasants to do likewise. Early in March it seemed that the Government was bowing before the storm by ordering a temporary suspension of further collectivisation. But now Mr Vas states that the peasants must be urged into the collective economy on a large scale, "gradually, patiently and on an absolutely voluntary basis, but without respite." Whether this statement represents more than a conciliatory gesture to Moscow remains to be seen.

Burma Plans Elections

There have recently been reports that a central executive committee of the Communist-run Peoples' Liberation Armies in the various countries of South East Asia has established its headquarters at the village of Mon Len just on the Burmese side of the Burma-Siam border. If this is true, as it well may be, the Communist movements in South East Asia are being directed from a very effective and well chosen centre, virtually immune from attack by any anti-Communist security forces and centrally situated. For Burma has now suffered so long from a general state of local political warfare and banditry that, after three years of these conditions, it is becoming increasingly hard to see how they can ever be brought to an end, in spite of some progress by the government forces during the last eighteen months.

Immediate uncertainty has also been further increased recently by the fact that the Burmese government is now getting into an awkward political situation—quite apart from the civil war which it has on its hands up-country. By exaggerating its successes against the rebels, the government has undermined much of its justification for continuing the life of the existing parliament, which is merely the Constituent Assembly formed just before independence and which should have been dissolved two years ago. If, on the other hand, the present leaders were once more to say that the country is not yet in a state to permit elections, one of their main boasts would have been proved false and popular opinion—which has been building up an increasingly coherent constitutional opposition during the past three or four months—would certainly react sharply against them. As it is, the Socialists, who form the bulk of the government, are increasingly unpopular owing to their arrogance, intolerance, nepotism and corruption—not to mention their inefficiency. In Rangoon, only Thakin Nu himself, the Prime Minister, is commonly excluded from these strictures.

In these circumstances, the government has embarked on a serious attempt to hold a general election by stages, beginning with 85 constituencies next month out of a total of some 250 and the rest by January 4, 1952. The assumption is that, as individual regions are pacified, elections will be held in them. This is a weird and unrealistic scheme, and most unlikely to be successful. However, it has prompted the formation of several new parties, among them the Union of Burma League, which has been formed by a group of elder statesmen from prewar days, including Sir Paw Tun, U Chit Hlaing, U Pu, and U Ba Pe. One of the great misfortunes of independence has been that men of this type have hitherto found no place in the new Burma's public life. They are desperately needed. It may be that one of the few good signs in all the confusion of today is that they are again to be looked to for sober leadership.

Conference of the Unforgetting

A conference is now taking place in Brussels which has a great, though grim, significance for the whole of the free world. It is a gathering organised by the *Commission Internationale contre le Régime Concentrationnaire*, which represents the principal associations of survivors of Nazi concentration camps in France, Germany, Holland and Belgium, and of the Spanish Republican emigration. Although the current inquiry is quite independent of any government action and has no official character, it is of far-reaching political and moral importance because of the special category of individuals by whom it is being carried out. They are men and women who, because they have had personal experience of the horrors of what David Rousset has called in the title of his book "*L'Univers concentrationnaire*," are aware of it as a supreme moral issue confronting humanity. They are at the same time better qualified than those who have never shared their experience for assessing the value of evidence about such conditions.

There is perhaps no respect in which British insularity and detachment from continental European thinking is so marked as in the happy lack of the experience which has left its indelible mark on countries formerly occupied by the Nazis. Britain suffered enough from the war, but only a few individuals were caught in the Gestapo dragnets and those were not taken from the streets or homes of Britain. But on the Continent the survivors of the concentration camps and the families of those who perished in them are so numerous as to form substantial groups in the populations of various countries. A whole literature of the concentration camps arose in the years following the war and the ex-prisoners banded themselves together in associations which included both Communists and non-Communists, former comrades in suffering. The best spirits in these associations, however, were not content with commemorating the past; they made it their aim to work for the exposure and abolition of "concentrationary" systems wherever they might be found, denouncing the institution as in itself a crime against humanity.

In pursuit of this end they considered it their duty to investigate the charges made about conditions in the Soviet Union. However, proposals for an inquiry were bitterly opposed by the Communists, who made it increasingly clear that they objected to the system only as applied against themselves. The conflict was brought to a head by the open letter of David Rousset to the *Figaro Littéraire* in November, 1949, and the libel action which followed. Intense feelings were aroused by the controversy and the largest of the French ex-prisoner associations was split; the non-Communist groups of the French Resistance, together with corresponding groups in other countries, then set up the International Commission. The records of the personalities serving on the Commission guarantee that the results of their work will deserve serious attention from the world at large.

* * *

The Old Vic

Dissensions at the Old Vic, which have come to a head with the resignation of three of its directors, had been going on for some time. Last year, after five remarkable years at the New Theatre, the Old Vic Theatre Company (director Hugh Hunt) returned to the Waterloo Road and was amalgamated with the Old Vic Centre, where previously Mr Michel Saint Denis, Mr George Devine and Mr Glen Byam Shaw had had a free hand and an Arts Council grant to develop an experimental theatre (with a company of young actors known as the Young Vic) and a school of drama. The style of acting that they taught was akin to the continental style, rather more intense and with more emphasis on movement than is usually seen on the English stage; and it won little sympathy from the West End side, so to speak,

of the amalgamated board of directors. A conflict developed between those who thought that the Old Vic Theatre Company should take its artists and its style from the Young Vic Company and the school, and those who thought that the school and the Young Vic were mere appendages of the principal company. In their anxiety about the future of these organisations the directors of the school and the Young Vic asked for an assurance that their part of the Arts Council's grant would be maintained. This assurance could not be given since the Arts Council depends on an annual grant from the Exchequer. It has escaped the axe this year, but with the growing cost of rearmament it may be less fortunate next year.

A further source of friction has been the separation of artistic and administrative control. The former directors complain that there was increasing interference in artistic matters by Mr Llewellyn Rees, the administrator, and they finally presented the governors with an implied ultimatum that either he went or they did. The governors had no choice but to accept their resignations immediately.

Two points are clear. First, without some "interference" the various activities of the Old Vic could not be administered and co-ordinated; and no one has hitherto had the requisite overriding authority. Second, it will be a great pity if so much talent is irrevocably lost to the Old Vic; but if financial stringency should make necessary some curtailment of its activities, it must not be the main theatre company which

Wine and Song

A PRACTICAL TREATISE ON THE CULTURE OF THE VINE, AS WELL UNDER GLASS AS IN THE OPEN AIR.
By John Sandars.

THE IMPORTANCE AND PROPRIETY OF A BETTER SYSTEM OF MUSICAL EDUCATION AS A MEDIUM FOR MORAL TRAINING. By S. T. Shearman.

The connection between cultivating the voice and cultivating the vine is not very apparent, but the two pamphlets having fallen into our hands at the same time, we place them together. We see at once that every kind of cultivation, whether of the vine or the voice, has a common tendency to improvement. . . . When John Sandars tells farmers and cottagers how they may grow grapes against barns and dwellings, so as to give a very neat appearance to the building, and secure a crop in a warm and favourable situation almost equal in size and flavour to the grapes grown under glass, he plates before them the results of his own observations, and teaches them how to obtain by exertion a benefit from Nature. So when Mr Shearman, quoting Sir James Clark, tells young persons standing to throw their arms and shoulders back, and while in that position to inhale as much air as they can, and repeat this exercise at short intervals several times in succession—if in the open air so much the better—as the only means by which the power of attaining breath for the long phrases that are required in the high order of song, he informs the reader of something which has been observed, and of a mode by which exertion can win from Nature an increase of power in the lungs. The end of music is to give enjoyment, and that, too, is the end of cultivating the grape. Whether the fruit be eaten or it be made into wine, it is an excellent accompaniment of song, and the two help to strew rosy pleasure on the path of life. Wine without the voice, either in conversation or in song, leads to mere sottishness; and the voice without wine gets dry, husky, and quarrelsome. Mingled together—the voice mellowed by the juice of the grape, and the juice benignantly spread through the frame, and its soothing effects carried off by the exertions of the voice—they have in all ages been the staple of festivity. They naturally belong together.

The Economist

May 24, 1951

suffers. The Old Vic is the nearest approach to a British national theatre, and the public looks to it for first-rate performances of the English classics. And it is the public which pays the piper.

* * *

Betting in Britain

The report on betting prepared by the Social Survey of the Central Office of Information supports many of the findings of the Royal Commission on gambling. A random sample of nearly 3,000 people was taken, and the results show that more than three-quarters of the adult population bet in one form or another. Horse racing is the most popular sport for betting purposes, and at least half the population have a bet on the Derby and the Grand National. On major races such as these, the total amount per person betting staked during the whole of 1949 was no more than 20s., but regular betters on dogs or horses are said to stake as much as £40 a year gross. The average amount staked on football pools was 2s. 6d. a week, the total turnover being less than in dog and horse racing. Of the three major sports on which bets are placed, dog racing attracts the smallest number of punters.

	Men	Women	Men & Women
Percentage of sample:—	%	%	%
taking part in football pools	51.0	28.0	39.0
betting on major horse races	51.0	38.0	44.0
betting on dog races	7.0	1.5	4.1
Size of sample	1350.0	1662.0	2912.0

The absurdity of the existing law on betting is shown by the report that 49 per cent of all off-course betting is done (by 29 per cent of the population) through street book-makers. If the percentage of those betting through friends or tradesmen is added, it becomes clear that 75 per cent of all off-course betting is illegal.

It is a moot point whether this fact justifies the Royal Commission's recommendation that legal cash betting shops should be established—the existence of so much illegal betting does not in itself mean that the law is bad—but there is obviously a case for revising either the law or the method of enforcing the law. In the light of the other principal fact which emerges from the survey—that for the vast majority in Britain betting is not a vicious habit—the Royal Commission's case for controlled off-course cash betting becomes much stronger. In spite of the fact that it is clearly a simple matter to defy the law and place a cash bet off the course, the volume of betting is neither unreasonable nor alarming; why not therefore legalise—and thus control more effectively—the existing situation?

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

in 1950-51 at Oxford and Cambridge universities. The figures (which refer only to the scholarships awarded in open competitive examinations by the Oxford and Cambridge colleges themselves, and do not cover the much larger number of scholarships awarded by the state, by local authorities and by other bodies) reveal two interesting signs of the changing pattern of higher education. At both universities the total number of awards has increased considerably—from 356 to 389 at Oxford and from 439 to 471 at Cambridge. It is clear that the willingness of the Ministry of Education to supplement open university and college scholarships up to a sum which will cover the full cost of maintenance has had its effect.

As the article in the *Oxford Magazine* says, it would be interesting to know how much was paid to the winners of awards in each university in the form of supplementary allowances from the Ministry. The figures would almost certainly reveal that, thanks largely to the taxpayer, the colleges now have actually more freedom to select the most brilliant students than they had in the past. The second sign of change, illustrated in the diagram, is the increase in number, and more modest increase in the proportion, of scholarship winners from direct grant and maintained schools, compared with the year in which the Butler Education Act was passed.

SCHOOLS WHICH WON TEN OR MORE SCHOLARSHIPS AT OXFORD AND CAMBRIDGE IN 1949-50

School	No. of Boys	Oxford	Cambridge	Total
Manchester Grammar (2)...	1,380	7	18	25
Winchester (1).....	500	15	10	25
Rugby (6).....	660	13	8	21

Eton (3).....	1,150	4	12	16
Bristol Grammar (8).....	1,037	7	8	15
King Edward's, Birmingham	700	8	4	12
Charterhouse (8).....	612	5	7	12
Merchant Taylors' (8).....	540	9	3	12
Shrewsbury.....	500	7	5	12
Harrow (12).....	534	6	5	11
King Edward VII, Sheffield.	689	7	4	11
Oundle.....	640	2	8	10
Sedburgh.....	403	7	3	10

The effect on the public schools of the larger number of scholarships awarded is shown in the table. Last year, 14 schools won 10 or more scholarships. This year the number has risen to seventeen. The figures in brackets show the rating of the schools last year according to the number of scholarships won.

Letters to the Editor

Outlook Uncertain

Sir,—I am in entire agreement with the gravamen of your article in your issue of May 19th. However, in the first paragraph of the article there is a suggestion that Conservatives were dissatisfied with the results of the recent municipal elections.

I can, of course, only speak for the Conservatives I have encountered, but up to date I have met not one who was dissatisfied with the results. Certainly there is no cause for disappointment. In fact these elections, as will be seen from a careful analysis, show a proportionately more pronounced Conservative trend than any similar set of elections since the war. The total number of seats contested in the borough councils was 3,403, out of which 1,893 Conservative-supported candidates, as opposed to 883 Socialists, were returned. In the urban district councils 2,497 seats were contested and 1,107 Conservative-supported candidates, compared with 642 Socialists, were returned. Total net gains by Conservatives in the two sets of elections were 230, included in which is the very significant figure of 65 Conservative net gains from Socialists.

Considering that the Conservatives were defending three out of four seats, the increase achieved must be considered very satisfactory and, according to our records, is without precedent in the history of these elections.

From a national point of view, the most pregnant feature of the poll was that Conservatives made some of their most substantial gains in Socialist strongholds. On the other hand it was very noticeable that Socialists gained seats from Independents in predominantly strong Conservative districts. Apathy and confusion of thought had a good deal to do with this and this is a development which should act as a deterrent to any Conservative complacency.—Yours faithfully,

M. CHAPMAN-WALKER,
Chief Publicity Officer
Conservative & Unionist Central
Office, S.W.1

Anglo-Persian Oil Dispute

Sir,—As a regular reader of your journal, I could not fail to notice the proposal put forward in your issue of April 28th as a means of settling the Anglo-Persian oil dispute, that is, the establishment of a Persian company for the exploitation of the wells and of a British concern for marketing the produce. I feel sure that the overwhelming majority of my own countrymen share my belief that this ought to be an acceptable compromise.

The great difficulty, as you point out, is Persian nationalism. Without condoning its exuberances, may I, as a fellow oriental and a citizen of a country which more or less shared Persia's fate in the course of the nineteenth century, point out that the plant of Eastern and Asiatic nationalism springs from a western, more specially

British and French, seed. The nationalistic teachings of western political literature fell into ground that had been fertilised by western arrogance, an attitude kept up as long as possible, as long as the "Great Powers" thought that eastern sovereigns and states were the heavenly appointed shepherds of ever-obedient flocks, and that there was no danger that these flocks would, one day, rise in revolt and overthrow the relations between east and west.

You point out, moreover, that nothing seems more desirable than the closest co-operation between Britain and the USA all over the world, and more especially in the threatened regions. Indeed, both countries and all peoples of good will and good faith could only gain from such a policy. One understands, however, why American interests do not see quite eye to eye with Britain in these specific difficulties, and why they do not feel that, in the Near Eastern oil business, they are in the same boat. As a matter of fact they are not. In contrast to Persia and Iraq, Saudi-Arabia, in whose territory most American oil wells are situated, still lives in the pre-nationalistic stage when it is sufficient to square the ruler in order to enjoy the unlimited pliability of the subjects. The fact that, outside the Hedjaz proper, nearly all the other subjects of Ibn-Saud are nomads, unreceptive to imported ideas, would seem to make the situation more secure for foreign interests, so long as they coincide with those of the monarch.—Yours faithfully,

SEBASTIAN ZEKI ÖRS,
Deputy for Sivas in the Turkish
National Assembly
Ankara

Full Employment

Sir,—In your note last week on the Strasbourg full employment report, you ask me, as one of the co-authors, how many of its recommendations I can really see the Labour Government carrying out. In fairness, I must point out that the preface makes it clear that none of the outside economists who assisted the Secretariat of the Council of Europe to draft the report was called upon to endorse every recommendation in it; the report is issued under the sole responsibility of the Secretary-General.

However, I have no wish to hide behind an official disclaimer. I would say that the Labour Government would certainly accept, and has already largely carried out in practice, the recommendations relating to full employment and the maintenance of monetary stability so far as world price movements permit; that it would also accept those relating to the stabilisation of trading relations within the group, the international code of behaviour, and the European Investment Bank; but that it would probably boggle a little at some of the suggestions for a stricter wages policy, the reform and increased power of EPU, and the establishment of an influential European Advisory Board.

I should certainly feel quite free to criticise the Government's actions where they departed seriously from the stability objectives laid down in the report. But I am bound to say that the Labour Government (together with the Social-Democratic regimes of Scandinavia) can claim to have the best record in Europe, and on the whole a very impressive one, so far as internal economic stability is concerned.

Lastly, I should like to emphasise that the report was certainly not prepared, as you hint it was, by a body of Socialists. Taking account both of the outside economists concerned and of Dr Browaldh, the distinguished Director of Research at Strasbourg, a wide variety of political opinions was represented. The emphasis on a considerable degree of planning and control stems not from any political ideology, but from the conviction that only thus can the required stability be maintained.—Yours faithfully,

ANTHONY CROSLAND
House of Commons

[We did not say—and did not wish to imply—that the report was exclusively the work of "a body of Socialists," and now that Mr Crosland has broken the anonymity that covered Dr Browaldh's name we gladly join in paying tribute to the work of one who was formerly our Stockholm correspondent. But it still seems to us fair to say that the report is "definitely on the left in its presuppositions." For the rest, we feel that Mr Crosland is still too ready to take a generalised willing of the end to mean a specific willing of the means.—EDITOR.]

The Wandering Coin

Sir,—The review of Dr Hans's monograph on the Maria Theresa dollar appearing on page 979 of *The Economist* of April 28th, does not make it clear whether the "wandering coin" is in circulation in any country of the world today. It may, therefore, be of interest to notice that this dollar is the *de facto* currency of the Sultanate of Muscat and Oman, except in the towns of Muscat, Matrah and Gwadar where the official currency (the Indian rupee) is used.—Yours faithfully,

HUBERT EVANS
British Residency, Bahrain

Charity and the Hospitals

Sir,—Your correspondent's article in your issue of April 28th is timely and raises a number of points of interest. While however he is primarily concerned with the legal aspects, there runs throughout his article a psychological thread which is of at least equal importance. He is of course right in his view that the nationalised hospital is not in itself a charity. He is equally right in his belief that in the development and expansion of hospital services for the community at large, as well as for the individual patient, there is much to be done that does not fall within the scope of statute; and he emphasises the importance of maintaining "a source of charitable expression" and "the link

between the charitable impulse and all the yet unexplored opportunities around the hospital."

He and others of your readers may therefore be interested to learn that this has been proved by the work of the National League of Hospital Friends, set up by the voluntarily formed local Leagues of Hospital Friends up and down the country since the introduction of the national health service. The local leagues—working in complete independence from, but in cordial co-operation with, the statutory hospital authorities—have found innumerable needs which can either best, or indeed only, be provided by voluntary effort and the impulse of compassion and good neighbourliness. For example, one does not appreciate the value of outings for patients until one of them is overheard to remark—after a day at the sea—that it was the first time he had been outside the hospital for 20 years! Nor indeed does it stop with the provision of many other much needed amenities. There are aids for the patient, not provided by statute, before and after admission to hospital. There are even urgent necessities which could properly be provided from public funds were these available in adequate amount, but which in the present financial stringency are being provided by some of the "Friends" of hospitals. And finally there are the inexhaustible demands of medical research.

Every care is taken by the National League to see that its affiliated member leagues have a properly and legally drawn constitution, and in more than

one case these bodies have already been entrusted with the administration of charitable trusts. Those who are confused by the legal niceties or ambiguities of the present position, may well find in the National League—or one of its affiliated local leagues—the means whereby to express the spirit of voluntary service and their desire to benefit their fellow men.—Yours faithfully,

J. P. WETENHALL, Chairman,
National League of Hospital
Friends, S.W.1

Breach of Banking Secrecy

Sir,—Your readers may be interested to know that for twenty-seven years trustee savings banks have been required to make a return similar to that mentioned in the present Finance Bill (that is, of the names and addresses of the recipients of interest amounting to £15 or more) in order that they may claim exemption from tax on the income applied in the payment of such interest (Section 24, Finance Act of 1924).—Yours faithfully,

PETER R. DAISH

Arborfield, Berks

Development by Corporation

Sir,—The searching questions asked of the Colonial Development Corporation in your article of May 5th reveal how few projects there are for which remote control of this sort is appropriate. *Mutatis mutandis*, the same can be said about the

International Bank. Professor Lewis, who knows from hard experience, has pointed out that any really fertile plan for undeveloped countries involves a great multiplicity of extremely small projects, a well and pump here, a blacksmith's workshop there, a doctor's dispensary in some other place. This means that control must be completely decentralised, perhaps to local authorities or small investment trusts. But this requirement must be reconciled with the need for responsible handling of the vast international capital movements which are going to be necessary if any development is to take place—indeed even to prevent retrogression. (Burma, Indonesia and China have already shown us how rapid a backward movement can be, and India has to struggle hard to stay where she is.)

If I may return to a proposal which I made in "Fortune" in July last, only a *banking mechanism* can meet these requirements. The assembling of funds in a lending country, their transfer internationally, their distribution in a borrowing country, will be in the first instance the responsibility of the country's central bank, devolving its powers as appropriate. Every country is perfectly free to decide, in accordance with its own political convictions, whether its central bank should be a Government Department, a public corporation, or a free private agency; they can still work quite well together.—Yours faithfully,

COLIN CLARK,

Director,

The Bureau of Industry, Brisbane

(but unfelt) interest in the success of industry as a whole, and their lack of interest in that of industry's constituent firms.

The arguments against any merging of the functions of worker and shareholder are well known. The worker puts all his economic eggs in one basket; the shareholder's return on risk capital is arbitrarily reduced; thus discouraging venture; and an economy of closely integrated concerns—each as much a social as an economic entity—becomes even more inflexible than it is today. Mr Goyder does not worry about the first—he sees the workers' "bonus" as a net surplus over the equilibrium wage—an analytically dubious view; as to the second, he oddly conceives of risk as ceasing once an enterprise is fully established; the third never occurs to him at all. Against all theoretical arguments, however, he can point to the facts; the fifty years of success of the eminently dynamic Carl Zeiss Trust, the vigour and expansion of certain British and American companies following a comparable policy, the vitality through good and bad times of that very significant little French concern, the Boimondeau watchcase-making factory. The thing demonstrably works. With legal encouragement, even if not by compulsion, it might demonstrate its much-needed merits over a wider field.

Enigma of Moscow Trials

Invitation to Moscow. By Z. Stypulkowski. *Thames and Hudson*. 360 pages. 15s.

The Moscow trials are an enigma of modern history. M. Stypulkowski, a Polish right-wing politician, had the unenviable distinction of standing in the very dock where these sinister trials take place. He leapt into the news in 1945, when together with 15 Polish resistance leaders he was tricked by an invitation to visit Marshal Zhukov, and was flown to Moscow, thrown into the notorious Lubianka jail and nearly 3 months after brought into the Moscow dock, where he alone pleaded not guilty. This experience, which is described in the book, is the best searchlight into the mystery.

Yet one puts the book down with a feeling of disappointment. The crucial episode in Moscow is dealt with only in the second and shorter part. In the first we follow the author's wartime odyssey: taken prisoner by the Russians; handed over to the Germans and released, he became a leader of the extreme right in the Polish underground. A lawyer by profession, M. Stypulkowski intersperses the heroic episodes of resistance with pleadings *pro domo sua*. Poland must be shown as the outpost of Western liberalism. Pleading sometimes leads to over-simplification: Russians are always deceitful; Communists are always criminals; nationalist Poles are always guided by moral principles.

Expectations are not, however, fulfilled even in the second half of the book. The trial of Polish leaders, though held in Moscow, was not a real Moscow trial. It had none of the frightening surrealist and Kafka-like atmosphere with confessions of incredible sins, which characterised the trials of the thirties or, say, Rajk's after the war. The author did not admit culpability; others pleaded guilty with reservations to acts which if not true remained at least plausible. Admissions of organising resistance against the Russians need not necessarily have been fantastic. M. Stypulkowski's own group, for example, had disapproved all along of General Sikorski's efforts, prompted by the Western Allies, to come to an understanding with the Soviet Union.

What means were used to sap the accused? M. Stypulkowski mentions: undernourishment, cold, too much light, too little sleep, endless interrogations—140 in less than 3 months—an adroit mixture of threats and promises. No physical violence was used. Despite the nightmare of quasi-permanent cross-examinations could this have been sufficient to break the seasoned Bolshevik fighters and force them to admit the impossible? The author's explanation of his own resistance and survival is strange: "he got the upper hand in dialectics" over his examiners and was helped by his experience as a barrister. Yet this dock had seen many a master-dialectician; while M. Vyshinsky would welcome as a compliment the assertion that legal competence wins in Russian courts.

There are other surprising passages. For example: the facility with which Russians revealed their criticisms of the regime to M. Stypulkowski during his short stay in Moscow after his release does not square with the usual picture of Russian freedom of speech. But this is a detail. The main point is that the trial of the Polish leaders differed intrinsically from its Moscow predecessors. It was staged in 1945. The wartime marriage between the USSR and the West was already breaking up, but not yet dissolved. The Soviet authorities wanted to show leniency. The book may be a testimony of the author's exploits and courage. It leaves the enigma of the Moscow trials untouched.

Renunciation of Success

War and Human Progress. By John U. Nef. *Routledge and Kegan Paul*. 464 pages. 35s.

It is impossible in a short review to do justice to this study of the interrelations of economic development and military history and the effect of war and peace on the genesis of industrialisation. The range of the inquiry stretches from mediaeval Europe which "at its best was an approach to unity in diversity" to modern civilisation which is "nearer disunity in standardization."

In examining the claims of scientific progress, Professor Nef distinguishes between the practical application of general knowledge and the attainment of knowledge itself. He believes that over-preoccupation with practical results retards insight into the nature of the physical universe, and questions whether advances in technology are evidence of the vitality of the creative mind.

The future of industrialism depends not upon states becoming more heavily industrialised than they already are. It depends upon the integration of industrialism—the fruits of which have been abundance, commodity and sanitation—with style, order and delight. The goals of ransacking the earth for its mineral treasures and harnessing new sources of physical energy will lead nowhere unless they are subordinated to the use of these resources for the benefit of a rich human existence, which our ancestors understood better than we do.

His profusely documented argument that the limitations imposed on warfare during the seventeenth century made possible the rise and triumph of industrialism, is followed by the corollary that the withdrawal of those limitations presages its downfall. Nevertheless, this is no jeremiad. While fully aware of the extreme danger of our situation, Professor Nef recalls that the discoveries and technical inventions which disrupted the pattern of the Middle Ages and early Renaissance later became the means of a new approach to the harmonious eighteenth century; and he maintains that a similar development is open to modern man if he will apply his mind and spirit to counter-balancing the universal concern for the special, the immediate and the material, which has helped to produce the weapons needed for total war and the will and means to use them. The remedy for the present dilemma lies with us, but it is no easy panacea. Revulsion from war, such as followed the

Wars of Religion and the Napoleonic struggle, is still within our power; but "the price of peace is the renunciation, in a large measure, of success as the guiding principle of thought, labour and even politics."

This is a valuable book, and if, at times, the encyclopaedic knowledge of the author seems to lead to discursiveness, his meanderings into the byways of history are, in reality, integrated into the framework of the study, and, at the end, one is reminded of Dr Johnson's dictum: "A man may turn over half a library to make one book!"

Entangled History

Clarendon. Politics, History and Religion, 1640-1660. By B. H. G. Wormald. *Cambridge University Press*. 331 pages. 25s.

Mr Wormald's book, the first of a series of volumes designed to reveal "the outstanding success and importance of Hyde's part in English affairs," is, despite its ambitious title, almost exclusively concerned with Hyde's constitutional views. It is a difficult and desiccated study of a man who had, as his own great "History" shows, an easy intellectual power and a vivid interest in men. In order to demonstrate the consistency and ultimate triumph of Hyde's constitutional views Mr Wormald has subjected the "History" to a minute scrutiny and criticism.

Gardiner attributed the formation of a royalist party and Hyde's own defec-

Books and Publications

A New Moral Order

The Future of Private Enterprise. By George Goyder. *Blackwell*. 179 pages. 9s. 6d.

With the decline of competition the Hidden Hand has grown decidedly arthritic; except over a comparatively narrow field, only the most naïve Socialist optimism can expect better results from state control. Mr Goyder sees salvation for the imperfectly competitive economy in a new moral order, imposing social responsibility on private enterprise from within each of its units. He proposes a reformed company law by which the memorandum of every public company, at least, should define its obligations not merely to its shareholders but also to workers, consumers and the community at large. The articles of association should, besides giving the workers "equivalent rights to those now held by shareholders," provide for their representation on the Board of Directors and for a ladder of advancement, should give representatives of consumers and of the community the right to attend annual meetings, and should impose on the directors the duty of reporting to these. The model for these proposals is the Carl Zeiss Trust, whose articles he reproduces *in extenso*; their compulsory legal imposition has much in common with the "co-owner-

ship" proposals of the Liberal Party, though going considerably beyond them.

There are some bees in Mr Goyder's bonnet. One is his conviction that the socially beneficent force of the profit motive vanishes, even given competitive conditions, once the profit ceases to be that of an identifiable owner-manager. Another is the widely held view that the workers in a concern are risk-bearers on the same footing as investors and therefore properly entitled to the same status. This view has some force in chronic depression, where the financial losses of shareholders in an unsuccessful company may be matched and outweighed by total loss of livelihood for discharged workers, but is wildly irrelevant to conditions where any but the most narrowly specialised worker can step off the sinking ship (which he may have helped to sink) into the comfortable certainty of a new job. The merits of Mr Goyder's proposals do not, however, rest on these arguments; indeed, the rebuttal of the second actually strengthens his case. To give the workers a *de lege* status as company "members" would diminish the contradiction between their overwhelming

tion to the split in the Long Parliament on ecclesiastical policy; and he found warrant for this view in Hyde's own writings. Mr Wormald contends, correctly, that Hyde's primary preoccupations were secular; and it is not difficult to show that Hyde, writing in the Civil War when anglicanism had become the ideology of the Royalist cause, exaggerated his own early devotion to the church. But Mr Wormald, who in an earlier article had dismissed religion as an explanation of the problem of Hyde's royalism, now asserts that the problem does not exist at all. Hyde, far from becoming a Royalist, was "an enthusiast for the Revolution, both before and after it happened" and so never changed sides at all. In view of Mr Wormald's own statement that "Hyde, in the literal and local sense of the word, was to abandon Parliament for the King" his claim that Hyde remained a Parliamentarian and never became a Royalist is highly casuistical. Certainly neither Hyde nor Pym wanted war in 1641. But Pym, with good reason, could not put his trust in princes and, to preserve the achievements of 1641, sought support on the left; while Hyde, as Mr Wormald unkindly puts it, "because of what this was to mean for Hyde's personal safety" made terms with the King. It is not surprising that contemporaries and later historians have called this changing sides.

Mr Wormald's further claim that Hyde's conception of the constitution finally triumphed, that "the man who succeeded, and in his own life time, at the Restoration, was not Pym but Hyde," is unconvincing. Pym rightly saw that the compromise of 1641 could not work while the King refused the corollary that his ministers should be acceptable to Parliament. That the King returned without conditions in 1660 was not a victory for Hyde's prescience but a result of the anarchy after Cromwell's death. The issue of the relations between Crown and Parliament remained undecided. It was Clarendon's refusal to recognise political realities which caused his fall in 1667. Lord Arlington, of whom Clarendon spitefully wrote that "he knew no more of the constitution and laws of England than he did of China," had the political sense to see, as Pym had seen in 1641, that an executive divorced from Parliament was unworkable.

The arrangement of the book is extremely awkward. The detailed analysis of events precedes the discussion of Hyde's ideas which supposedly explain his part in those events. A further and major defect of Mr Wormald's book lies in the evasiveness of his statements and his style. The cobwebs of thought are so intricately spun that the reader is easily entangled in his sentences. One great merit of the "History" is that it is at least a pleasure to read. Mr Wormald's history is not.

Vital Statistics

Demography. By Peter R. Cox. Cambridge University Press. 315 pages. 20s.

This is the first textbook entirely devoted to demography to be published in this country. Its appearance reflects both the increased importance of the subject in the training of actuaries and statisticians, and the greater complexity of the analytical methods used. Mr Cox writes primarily for the actuarial student and his book is designed to fit in with the syllabus of the Institute of Actuaries' examinations. This is a little unfortunate, for mortality investigations and life contingencies which are important parts of the subject matter of demography are covered by other papers in the Institute's examinations and will be dealt with in other textbooks which are to be published in the future. Thus no mention is made in Mr Cox's book of methods of constructing life tables and associated techniques, which are important not only in the study of mortality but in other branches of demography as well. This omission, which is due to the artificial division of the subject in the Institute's syllabus, will greatly lessen the value of the book for the non-actuarial student.

The bulk of the book was finished before the reports of the Royal Commission on Population and its scientific committees were published, and Mr Cox has had to summarise the main contributions made by these documents in a special supplementary chapter. The central problem, that of measuring the reproductivity of a population, is, however, dealt with earlier, and recent criticism of the net reproduction rate as a measure of replacement is fully taken into account.

Apart from these two blemishes, for

which the author cannot be held responsible, the book is an adequate introduction to the more formal side of demography. The subjects dealt with include censuses and vital registration, the analysis of statistics of births, marriages and deaths and a study of population projections. The part dealing with the population history of England and Wales is less satisfactory and suffers from undue compression.

One general criticism is that Mr Cox is rather too concerned with the applicability of the methods he describes to British statistics. In the recent past fairly general methods of demographic analysis have been developed, but the official statistics that are published are not always detailed enough to enable them to be applied. A concentration on problems of one particular country necessarily makes for lack of generality, and it is a pity that there is no mention of the special problems involved in the analysis of statistics of colonial and undeveloped territories, and of recent American work designed to measure fecundity.

Shorter Notices

Justice and Administrative Law. By W. A. Robson. Stevens. 674 pages. 30s.

This is the third edition of Professor Robson's book and the fact that the previous edition appeared only four years ago is some indication of the importance of the subject and the central position that this book holds in any consideration of it. None the less, this edition should be the last. Professor Robson is still intent on providing both a textbook on administrative law and its attendant tribunals and a commentary on their place in the government of the country. That task is now too heavy for a single book, and this edition shows some signs of collapsing under the strain.

The National Health Service. By R. Ormrod and H. Walker. Butterworth. 215 pages. 27s. 6d.

This book provides a comprehensive and convenient summary of the administrative machinery of the national health service. It includes the text of the National Health Service Acts, 1946 and 1949, and of statutory instruments made under the Acts. The general analysis in the first part of the book takes account of statutory instruments issued up to May, 1950.

AMERICAN SURVEY

Republicans' Blind Alley

Washington, D.C.

IT is not healthy for a country with a two-party system to undergo twenty years of uninterrupted rule by one of them. The party in power becomes debilitated and that in opposition exasperated. In the United States, where spoils are an important adjunct of office, the dangers of such a situation are multiplied. The opposition, in its frustration, adopts increasingly dubious tactics and the Administration, clinging for dear life to office—and the patronage which goes with it—becomes too timorous to meet the issues squarely. In such a political climate men like Senator McCarthy and General MacArthur flourish, and insinuations become truth and facts are suspect.

A month ago, with the elections only eighteen months away, the Democratic Party seemed to be disintegrating fast. The revelations of organised crime in the big cities and petty corruption reaching into the White House had reduced public confidence in Mr Truman and the men around him to the lowest point it had ever reached. And, with his prestige gone in the country, the President lost all pretence of control of Congress, which has been dividing its time between insulting its allies, making belligerent noises at the Russians and Chinese, and adding to the dangers of both these exercises by delaying the passage of every measure designed to increase the country's military and economic strength. "Congress is not," the *New Republic* magazine said last week, "going to raise enough taxes to pay as we go, authorise enough controls to halt inflation, or draft enough soldiers to make the country safe."

It was into this situation, which was developing so inexorably in the direction which suited them, that the Republicans threw General MacArthur, who would, they hoped, be able to administer the final blow to the groggy Administration. For a few days the Democrats behaved as if they had been hit by a blunt instrument; but first one—and the honour of being first belongs to Senator Kerr of Oklahoma, a state where such courage was unlikely to pay any political dividends—and then another began to wonder whether the General was such an unalloyed godsend to the opposition. One of the Republicans, Senator Wayne Morse, of Oregon, confirmed their judgment and told his own party that they would live to regret their impetuous challenge to the Constitution.

By the time the investigating committee began its hearings the tails of the Democrats had certainly reached the horizontal. Moreover, the Republican firebrands on the committee were weakened by the presence on it, in addition to Senator Morse, of Mr Lodge and Mr Saltonstall, both of whom were pessimistic about the value of the issue to their party. General MacArthur, though he may not have been as obsequious as Senate committees like their witnesses to be, was certainly more patient than many people had expected. But, encouraged by the chairman, Mr Russell, probably the ablest parliamentarian in the Senate, and Mr Morse, he talked rather too much. By the time he had

finished he had said everything thrice and, like the Bellman, therefore presumed that his audience would take it that "what I tell you three times is true."

It must be assumed that the General was relying on the Administration's concern for security. Probably he was confident that, although he had made public the Joint Chiefs' "study" of January 12th on his own authority, the Defence Department would keep the directive of the same date and the President's letter of January 13th locked in a safe at the Pentagon. It must have surprised him when both were produced. General Bradley began his testimony by a painfully clear analysis of the relationship of the three, and their connection with General MacArthur's own hysterical messages from Tokyo a few days earlier in January, when the tide of battle was flowing strongly against the United Nations. At this point General MacArthur's Republican supporters on the committee hastily created a diversion which successfully wasted two days in legal argument and postponed the rest of General Bradley's story for a week. Senator Wiley cried "whitewash," as Senator Fulbright had predicted he would, when it was decided that General Bradley need not disclose confidential conversations with the President, and the MacArthurites' chief spokesman in the press, Mr David Lawrence, went into a tantrum and started to bite the rug which had been pulled out from under their feet.

*

Before General Marshall, the Secretary of Defence, had been testifying for long, many of those around the country who had wanted to impeach Mr Truman a couple of weeks earlier had retreated to prepared positions. "MacArthur had to go, of course," they were saying, "but it was disgraceful the way it was done." Senator Wiley and Senator Alexander Smith became the spokesmen for this group, who concentrated on the circumstances of the dismissal and ignored, as far as possible, the policies which the General had been advocating. They did not, however, miss the opportunity to resurrect the details of American policy in China at the end of the war, which in no way concerned General MacArthur but did concern General Marshall, who had to defend his mission in 1945 and 1946 all over again. They found nothing new.

While all this was going on Mr Donald Dawson, one of the President's staff, quietly went, after six weeks' urging, before the committee investigating the Reconstruction Finance Corporation, the great government lending agency. It had accused him of something less than prudence in his

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

When in London . . .

relationship with the RFC; as Senator Fulbright said, Mr Dawson admitted all the facts and denied all the conclusions from them. His appearance, which would have collected every television camera in the United States six weeks ago, hardly caused a ripple. There were more exciting things abroad than mink coats. And, to plead the Administration's foreign and military policies, there were General Marshall and General Bradley and others like them to come—men who were above reproach and who gradually began to seem more genuinely American than the imperial figure issuing peremptory communiques from the "Little Pentagon" high up in the Waldorf-Astoria Hotel.

*

There are many Democrats who, once they had recovered from the shock of victory in November, 1948, began to regret it. Much good might have been done, they felt, by a cleansing period in opposition for their own party, and a sobering period in power for the Republicans. They feared that their unexpected triumph would, in the end, prove as costly as Mr Hoover's victory in 1928. For the last ten years, they argued, Democratic Presidents had had responsibility without, except during the war years, any real power. The Congressional coalition of Republicans and conservative Southern Democrats had seen to that. And until the Democrats had been defeated and the country had had a chance to see what the Taft-Wherry wing of the Republicans could do to Mr Dewey—or any progressive Republican President—there was no chance of the Democrats winning a sufficient majority to be independent of the South. Even Mr Roosevelt enjoyed such independence for only six of his twelve years in office.

Watching the recent deterioration of party morale, these Democrats had accepted defeat next year without too much misgiving. But some strange demon is loose among the right wing of the opposition who are not content to leave foreign affairs alone and concentrate their attacks on the more squalid aspects of the Administration's record. It sometimes seems that they are more interested in defeating the influence of Mr Willkie, Mr Dewey and Senator Vandenberg within their own party than in winning the election. They cannot forgive the delegates at the last three conventions for nominating the kind of men they did or the country for accepting Mr Vandenberg as a statesman and forgetting their claims. So they must fight against the policy of putting Europe before Asia within the party and then carry the issue to the country next year. They have chosen one of the few issues on which, even now, the country seems overwhelmingly behind Mr Truman.

For men committed to such a policy, the beatification of General Douglas MacArthur was entirely natural; there was no other patron saint suitable for the "Formosa-Firsters." They chose him without thought for the future—and a few days after the Gallup Poll had shown that a majority of both parties wanted General Eisenhower as the next President. As they would probably rather lose with Senator Taft than win with General Eisenhower, this indication of popular sentiment no doubt worried them not at all. If things go on as they are now going, General MacArthur may well be, by July, 1952, when the Republican Convention is held, more of a memory than an asset. By then, too, General Eisenhower may be more of a Democrat than a Republican—if the Republicans go on as they are now going. They have a reputation for being able to snatch defeat from the jaws of victory. It will not be easy for them in 1952; but nobody can deny that they are doing their best.

Natural Gas Moves Out

[FROM A CORRESPONDENT IN TEXAS]

UNTIL a few years ago, Texas and several other south-western and midcontinental states had such a prodigious supply of natural gas that the people of the area refused to take seriously occasional warnings that this easily exploited, highly desirable fuel might soon be exhausted. But with the building of high-pressure pipelines and the increasing export of gas from the region, the question has become a lively political issue. Texas alone has 51 per cent of the known natural gas reserves of the United States, 102 million-million cubic feet out of approximately 200 million-million in the entire country. In Texas and three other south-western and midcontinental states—Louisiana, Oklahoma and Kansas—about three-fourths of the nation's known reserves are found.

Natural gas first came into general use in the Appalachian region, centring round Pittsburgh, in the latter part of the last century, but supplies there were insufficient for more than local use. Beginning with the early part of the present century, discoveries of large gas reserves in Texas and other south-western states, in connection with petroleum exploration, provided a great new supply of the fuel, but a long way from a market with any considerable consuming capacity. As a result, this finest of all fuels became "dirt cheap" in Texas and there was enormous waste of the gas which came out of the ground with the oil.

In 1925, however, a large interstate pipeline was constructed out of the Monroe field in Louisiana. Shortly afterwards several lines were built from the Panhandle field in Texas. This was made possible by the discovery of new processes in pipeline construction and high-pressure pumping, making long-distance transportation of gas feasible. In a few years natural gas from Texas, Louisiana and Oklahoma was going to such widely scattered places as Denver in Colorado, Minneapolis in Minnesota, Chicago in Illinois, Birmingham in Alabama, and some cities in Northern Mexico. The depression of the nineteen-thirties, and then the war, restricted what was still a new field for business venture. But once the war was over the boom in pipeline building was soon in full swing again.

The first big postwar development was a pipeline from the Texas coastal fields to the Pittsburgh area. Shortly afterwards the two transcontinental pipelines, constructed under government sponsorship during the war to take oil and petrol from Texas to the Atlantic seaboard, in order to free the coastwise tankers for other duties, were converted to carry natural gas. Other lines were laid to the northern states from Texas, and later the West Texas field was tapped by a big line across the Rockies to the Pacific coast.

In 1945 Texas was exporting 420 billion cubic feet of natural gas; when the figure for 1950 is available it will probably be close to 2 million million. Last year the interstate firms took about 52 per cent of all the Texas gas sold to pipeline companies, and the percentage will be much larger in 1951. The rest goes to firms serving consumers within the state, or is used for drilling, pumping and other purposes in the oilfields themselves. Natural gas is now going from Texas fields to more than thirty other states and to Mexico, and is available to over 34 million people, from San Francisco to New York. While there has been some increase in pipeline building from fields in Louisiana, Oklahoma and Kansas, by far the greatest part of this development has been out of Texas.

South-westerners have now woken up to the possibility that their supply of natural gas may be exhausted in the not-too-distant future. Texans are especially concerned because their State has relatively poor resources of industrial fuel apart from natural gas and, of course, the petroleum which is in such demand for both petrol and fuel oil that the possibilities of using it for industry in the future are limited. Texas has a positive as well as a negative reason for its concern. Between the two most recent censuses of manufacturing, in 1939 and 1947, the output of the State's industries, measured by actual physical volume, increased as much as in its entire preceding history. The principal reason for this phenomenal growth, which has changed the State's whole economic status, was the availability of natural gas. In particular, the great chemical industries along the Gulf coast are based on gas which is not only highly adaptable as a fuel, but also has been used increasingly as a raw material.

But domestic consumers of gas are willing to pay much more for it than industry can afford to pay. And there are enough domestic fuel consumers in the United States to take the entire Texas supply of natural gas—and possibly to use it all up in the space of a few decades. Just how long that supply will last is problematical. New discoveries have brought about an increase in calculated reserves since the war, but the rate of consumption is increasing much more rapidly. Even though the Texas fields may have a fairly long life still ahead of them, the period during which their output can be sold at a price low enough to be economic for industry will be short, unless something is done to discourage the present growth in exports to other States. Gas that was selling at the well at an average of 3½ cents a thousand cubic feet four years ago has advanced to an average of 6.5 cents and some contracts are already being made at 8 or 10 cents. Furthermore, some of the local Texas companies are even now having difficulty in finding reserves that have not been pre-empted by the interstate companies.

There is, however, another side to the argument. Gas at 3½ cents a thousand cubic feet at the well was selling at a B.t.u. equivalent of about 55 or 60 cents a ton for bituminous coal at the mine. For this reason, the owners of natural gas reserves do not look at the matter in the same way as do other Texans. Advocates of the interstate pipelines also call attention to the fact that, even though the waste of gas has been, and continues to be, cut down, 500 million cubic feet a day are being "flared" in Texas alone. This burning

of gas at the wells makes a deep impression upon those who see, or hear about, it without appreciating the technical and economic difficulties of conserving gas when it is produced in conjunction with oil.

The big pipeline builders (and the consumers of the north and east) contend that since the south-west has three-fourths of the reserves of this fine fuel, it should share it with the rest of the country for the sake of a sound national economy. In answer to this, south-westerners point out that most of the gas is going to a region that has enough coal in reserve for the next 2,000 years, while they have only twenty-five or fifty years' reserve of gas, and no other fuel to fall back on. Public opinion in general in the south-west is overwhelmingly in favour of some steps to stop, or lessen, this export of natural gas, but there is sufficient pressure from owners of gas reserves,

looking to a higher price, to deter the authorities from taking decisive action actually to discourage these exports. The Texas Legislature has a Bill before it at present which would approximately triple the severance tax of a little more than 5 per cent of the value of gas at the well. But such a Bill would have to apply to both resident and out-of-state consumers, in order to stand up in the courts, because of the provision in the Federal Constitution against obstructing interstate commerce.

So far, therefore, the pipeline companies have been winning hands down. Some of the south-western people console themselves with the hope that atomic energy for industrial use will come to their rescue before the natural gas is all gone. And others suggest, with a wry smile, that, after Texas gas is exhausted, the people at the other end of the pipelines might utilise their coal reserves to manufacture artificial gas and pump it in reverse direction to consumers in the south-west.

American Notes

Trading with Communists

Congress, remembering with pride how the United Nations took its advice and branded Communist China as an aggressor, returned to its role of governance to the world last week. Both Houses raced to urge the United Nations Assembly to approve the resolution, put before it by its Additional Measures Committee, calling for an embargo on the shipment to Communist China and North Korea of arms and war materials. The Assembly had in fact no intention of rejecting the resolution, having been gradually led up to it by the patient work of Mr Ernest Gross, the US delegate. It may not be long before Congress is urging the United Nations to follow America's good example a step further and to stop exports of all kinds to Communist China, a move which Mr Gross also seems to favour.

Meanwhile, however, on another part of Capitol Hill, a Senate Committee had discovered that the United States and those who have been selling "things to the enemy to kill American boys" are very alike under the skin. For it found that Japan had been trading with the mainland of China while being administered by General MacArthur, whose ill-informed condemnation of Britain for doing the same thing through Hongkong is largely responsible for the present American interest in the whole question of exports to China. Perhaps more embarrassing, the committee also found that Western Germany, which is not only receiving Marshall aid but has its foreign trade supervised by the occupying authorities, has been steadily, although illegally, increasing

its exports of goods of actual military importance to "the Soviet orbit."

Steps are now being taken to deny Marshall dollars to any German firm which breaks the law in this way. But in practice it is difficult, if not impossible, to control such trade, especially when it is carried on through third countries. Other governments who are more experienced in these matters than the German and have more easily watched frontiers may find it less hard to comply with the wishes of Congress. It has just made these clear by sending a supplemental appropriations Bill to the President with a rider that prohibits economic assistance to countries that knowingly permit the export of strategic materials to the Soviet Union or its satellites in Europe and the Far East. Exceptions can be made by the National Security Council, but under conditions very much stricter than those which governed last year's similar Cannon amendment. Not all members of Congress will wish this ban to be enforced literally; some of them appreciate that, even if this could be done effectively, it would mean the loss of reciprocal imports from behind the iron curtain that are important to the democratic defence effort. But that they did not object when Congress decided to act like a maiden aunt, cutting her allies out of her will, is evidence of how general is American dissatisfaction with the behaviour of those allies.

Beef by the Horns

Since he came to Washington a few months ago, Mr DiSalle, the Price Administrator, has been winning all the prizes in the Congressional round-ups. But now he has come to the championship rodeo and must ride and throw the herd of cattlemen who have thundered into Washington to gore both him and his whole price control programme to death. Congressmen know how sharp the meat lobby's horns can be and remember how it trampled price control underfoot—and helped the Republicans to victory—in 1946. Those

Herblock in the Washington Post

who come from farm districts are naturally cheering for the cattlemen, while even Mr DiSalle's urban supporters seem to have quailed before the fierceness of the stampede.

It was set off by the new scheme for "rolling back" the price of the beef which makes up nearly half of the average American's meat consumption of 145 pounds a year. Since he spends about one-seventh of his food budget on beef, and since beef prices have risen faster and farther than anything else since Korea, a check for beef prices seems to be the master key to control of the cost of living. The first turn, which came into effect this week, was a 10 per cent cut in the amounts which slaughterers may pay for beef cattle. Further cuts of 4½ per cent each time are to be made in August and October and these should bring a drop of about 10 cents a pound in the average retail price of beef.

The speculative nature of the cattle industry, coupled with the fact that cattle feeders have already bought for fattening the steers that will be going to market after the "roll-back," means that Mr DiSalle's policy will cause some losses—losses that most cattlemen can well afford. But to hold back the record number of steers that are ready for market, as they threaten, and indeed appear to have begun, to do, would cause greater losses. These the cattlemen may, however, be prepared to take in the hope that if the pressure of consumers unable to buy beef is added to their own, Congress may refuse to renew Mr DiSalle's authority. Over the longer term it is quite possible that the combination of price controls, rising incomes and scarcity of other consumer goods may bring about a genuine shortage of meat, especially if this year's feed crops are poor.

Mr DiSalle believes that he has forestalled black markets by his licences and quotas for slaughterers, which are to be enforced with vigour. Price evasions at the wholesale and retail levels will be made more difficult by the specific regulations which have replaced the original ceilings that differed for every establishment. Now definite prices have been fixed, although this hardly brings uniformity, since they vary according to region, kind of shop, grade of beef and type of cut. There are about 40 of the latter, but they are "Chicago cuts," which do not allow for the "steamship roasts" and "tenderloin steaks" that sophisticated New Yorkers expect.

* * *

Economy Kills Two Birds

The Administration is said to be concerned at the snail's pace at which Congress is setting to work, compared even with the "do-nothing" sessions of 1947 and 1948 when the Republicans were in control. Only four Bills of any national importance have been passed in five weeks, but hardly any Congress rolls up much of a score so early, and the Administration itself is not entirely without blame. Its foreign aid Bill, the most controversial of the year, is only starting on its way this week. From the Administration's point of view, however, such energy as Congress has shown has been misplaced. The House has taken up with enthusiasm Mr Truman's "dare" to cut \$6 to \$9 billion from his \$71.6 billion budget; last year, he reminded them tartly, a similar economy drive came to nothing more than an order to the President to pare \$500 million from expenditures.

But this year the Republicans have a new strength, and the defence emergency and the size of the defence budget to stiffen their determination. So far, the House has pared nearly \$1 billion from five of the eleven major appropriation Bills; it has covered about a quarter of the budget (Mr Taber, chairman of the Appropriations Committee, put the total at \$4.9 billion, but only by setting to the credit of Congress Mr Truman's decision to ask some \$3.5 billion less for a supplementary military appropriation than had been expected.)

For many conservatives, the cuts are doubly satisfactory, for the economies, in great part, have been made at the

expense of public housing (\$400 million) and public electricity projects, including the transmission lines to take the electricity from the federal dams to the consumer. The Republicans forget, perhaps, that similar power cuts in 1947 aroused such indignation in the West that, even when they had been rescinded, President Truman was able to carry all the reclamation states on this issue. Senator Douglas, whose enthusiasm for economy is the equal of any Republican's, although he is a Democrat and a progressive, has different prescriptions to offer: squeezing the water out of the notorious rivers and harbours appropriations, drying up the extravagant streams of federal money being spent on reclaiming semi-arid land, and forcing users of the mails to pay their way.

Civil domestic spending, at \$9.8 billion, is at a peak, but really substantial economies can only be made if legislators can put their fingers on waste in the defence budget—something even Senator Douglas concedes is hard to do. Moreover, the enthusiasm for economy—false or real—cannot overcome the fact that nearly half this year's spending is already provided for under earlier laws; it is untouchable unless Congress takes the Draconian advice of the Committee on Federal Tax Policy and suspends all such laws, starting with a clean slate. And then additional drastic measures would be needed, such as cutting off the farm price support programme and transferring all social services to the states—a most retrograde step. Unless deep cuts are made in foreign aid, the prospect, whatever the economists do, is still for a deficit of at least \$3 or \$4 billion next year.

Wage Escalators for All?

The reconstituted Wage Stabilisation Board, back at work after two months in limbo, has begun to relax the 10 per cent limit on wage increases which provoked the trade unions' walk-out in February. Most of the 1,200 cases which have accumulated involve requests by employers as well as workers, for permission to raise wages above the general ceiling. The first to be granted is that of the meat packers, who may now pay their workers 14 per cent more than they did in January, 1950. The public and labour members of the board, with the representatives of industry vigorously dissenting, argued that cost-of-living increases could not be denied simply because the parties had not provided for their formal inclusion in a contract. The old board had approved so-called escalator clauses, which relate wages to the rise or fall in the cost of living, even though they resulted in increases of more than 10 per cent.

Once the principle of "escalation" has been extended to unions whose contracts provide merely for reopening, and not for automatic wage adjustments, it is difficult to see where the line can be drawn. The new chairman of the board, Mr Taylor, believes that wage control must be flexible (in an upward direction) and he is expected to take a liberal view of other problems of wage stabilisation. For example, is it permissible for the automobile workers to receive the automatic increase due them next month for increased productivity? To obtain it they gave up their right to object to technological innovations. Fringe concessions—holidays, pensions, benefits—also may be exempted from the 10 per cent limit, as they were under the wartime wage limit formula. And there are other means of tempering the freeze. Labour members of the board are particularly anxious to establish these exemptions quickly, in case wage controls are tightened when the Defence Production Act is extended next month.

Industry suspects that the board is about to let down all the bars to a rush of wage increases and even in more disinterested quarters there are fears that the sixth round of wage rises since the war is imminent. Other members of the board, however, have hopes that in the short run, at

least, it can give the unions the inevitable inch without their taking an ell. The rise in the cost of living slowed down in February and March and the figure for April, about to be published, is likely to reassure those who feel that, with prices levelling off, prospects are good for maintaining a slightly higher ceiling on wage increases. In the long run, of course, the real responsibility lies with the Price Administrator—and Congress—for few believe that wages can be held down if prices are not.

Shorter Notes

Admiral Nimitz and the other members of the President's Commission on Internal Security, who were appointed in January, have resigned without ever starting work, because the Senate Judiciary Committee has refused to exempt them from the "conflict-of-interest" laws, which prevent federal employees from engaging in business with the government. Mr Truman, however, is giving the committee one more chance to exempt the members before he accepts their resignations, since it seems to him that Congress should be as anxious as he is to make sure that there are no Communists or other subversives in government employment.

*

Mr John Kee, who was chairman of the House Foreign Affairs Committee from the beginning of 1949 until his sudden death last week, will be succeeded by Mr James Richards of South Carolina. It is to be hoped that he will prove to be as able and effective a chairman as Mr Kee, who was also little known when he took office. Mr Richards led last year's attempt to cut military aid for Europe in half, but there is no reason to suppose that he will do the same this year, for he has usually been a reliable, although not blind, follower of the Administration's foreign policy.

THE WORLD OVERSEAS

The Schuman Plan Treaty

AFTER nearly a year of ceaseless negotiation the Treaty which will provide the working basis for the Schuman Plan is completed and takes its place as one of the most remarkable documents yet produced in a world driven by anxiety to seek security in closer international association. The primary impetus for the Schuman Plan came, it is true, from the desire to anchor Germany firmly to the west; but an examination of the finished Treaty reveals also that it is potentially an economic and political experiment of very great scope. For all the taunts of the critics, who have greeted it as simply a greater cartel, nothing quite like the Plan has ever been seen or tried before.

Briefly, the aim of the six member nations (France, Germany, Belgium, Luxembourg, Holland and Italy) is to pool their coal and steel industries by eliminating among themselves all barriers to the free flow of coal and steel, and thus to establish a "single market." The purpose behind the creation of the single market—as expressed in Articles 1-5 of the Treaty—is to prevent restrictive practices, to give all consumers equal access to raw materials and goods produced within the area, to promote the rational development of resources and to stimulate expansion and modernisation of plant.

The remaining 90 Articles of the Treaty (there are also annexes and a special Convention) describe, often in bewildering detail, the machinery for translating these objectives into practice. Some observers claim that in the process idealistic principles have become buried in a mass of exceptions to them, others that the High Authority has acquired alarmingly wide powers—an indication that the final result is an ingenious three-cornered compromise between the governments, clinging jealously to their sovereign rights; cautious industrialists seeking refuge from competition in familiar and private devices for protecting themselves; and M. Monnet himself, the presiding genius of the Plan, determined throughout that the High Authority should retain enough powers to prevent the growth of special interests within the area.

Duration of Plan

The Treaty is to operate for fifty years. Approximately the first six months of its life is to be a "preparatory period" at the end of which a single market in coal, iron ore and scrap will come into being; two months later steel will follow. During this period the various institutions named in the Treaty will be set up and negotiations will be carried out first with Britain to explore the ways of associating it with the Schuman Plan and also with the signatories of the General Agreement or Tariffs and Trade (GATT) and OEEC to secure for the Plan the necessary exemption from the most-favoured-nations principle embodied in both these organisations.

After the single market is created, five years—known as the transition period—will elapse. At the end of this time, the intention is to wipe out most of the subsidies and special aids specifically agreed in the Treaty as measures needed to help the weaker members of the Community to adapt themselves to the rigours of the single market.

Institutions

The High Authority: This is the body chiefly responsible for carrying out the provisions of the Treaty. It will consist

of nine members, all nationals of the member countries. Eight will be nominated unanimously by the six governments, the ninth will be selected by the other eight. Voting within the High Authority will be by majority. The High Authority can procure funds by putting levies on the production of coal and steel (not to exceed one per cent) and by borrowing. It may also receive grants.

How far the High Authority possesses genuinely "supra-national" powers is hard to judge before the apparatus is set in motion. However, it appears to have virtually unlimited powers in three fields: (1) gathering information, for which it is to receive the same facilities as the tax officials of the six countries, (2) preventing the growth of private cartels, and (3) prohibiting and breaking up mergers which violate the non-discriminatory aims of the Treaty. Considerable powers are also granted to it for dealing with periods of shortage or of glut, for regulating prices and for supervising trade within the area. There is scarcely a field into which it cannot at least direct its inquiries.

Council of Ministers: This body is the link between governments and the High Authority and will consist of one representative from each of the six governments. A very complicated system of checks and balances governs relations between these two bodies. Measures taken by the High Authority often require the approval of the Council, and case by case the Treaty specifies when this approval shall be by two-thirds majority, when by unanimous vote and when by a "qualified majority" (one in which either France or Germany is among the majority voices). Generally speaking, the two domains in which governments, through the Council, have reserved the greatest powers for themselves are the development of industry and the regulation of foreign trade.

The Assembly: Individual governments may choose whether their representatives to the Assembly shall be elected by national vote or appointed by parliaments. It is to meet once a year and discuss a general report provided by the High Authority; it is empowered to force the resignation of the High Authority by a two-thirds vote. Germany, France and Italy are each to have 18 delegates to the Assembly, Belgium and Holland 10 each and Luxembourg 4.

Court: This is to be composed of seven judges appointed for six years by agreement among the governments. Appeals may be lodged with it by a member state, the Council, individual concerns or the High Authority. Its proceedings will be public and it will sit in continuous session.

The Court has responsibility for enforcing the Treaty both positively and negatively; if, for example, the High Authority has failed to take action which the Treaty permits or requires of it, any state or firm may appeal to the Court. One noteworthy feature of the constitution is that, in all matters which come under the jurisdiction of the Treaty, the Court is the final tribunal, even where the disputes are between nationals of the same country.

Consultative Committee: This will consist of from 30 to 51 members, with producers, workers and consumers represented in equal numbers. The members are to be appointed by the Council and are to be consulted chiefly on questions of production programmes and "readaptation"—the process of enabling industry to stand up to competition and creating new jobs for men thrown out of work.

Commercial Policy

One of the most significant provisions of the treaty—so far as the neighbours of the Schuman countries are concerned—is the section on trade relations with third countries. It is intended that, at latest by the end of the five-year transition period, all six will adopt a uniform tariff in coal and steel *vis-à-vis* non-member countries; the eventual level will be close to that of the low-tariff Benelux countries. The five-year leeway is given to higher tariff countries like France and Germany for the express purpose of strengthening their bargaining power with third countries, i.e., Britain. Their tariffs will be lowered before the transition period ends if similar concessions can be won from Britain; if not, in order to ensure that British steel does not slip into their markets through the low-tariff Benelux countries, the latter have agreed to charge higher duties on all imports over and above the amount usually consumed by themselves.

Negotiations will also have to be conducted with GATT and OEEC, since what amounts to a customs union in coal and steel runs counter to the most-favoured-nation clause of GATT and also to the non-discrimination agreement in the trade liberalisation programme of OEEC. Exemptions for the Schuman Plan will be sought on both scores.

All of these negotiations will be conducted by the High Authority, acting on instructions to be adopted unanimously by the Council.

Shortage and Surplus

Closely allied to commercial relations are the provisions which govern policy in times of threatened boom or bust. During a period of short supply the Council, acting unanimously and on the basis of proposals from the Authority, will allocate supplies of coal and steel between member states and also between the various sections of the coal and steel industries themselves, other consumers, and exports. Failing a unanimous Council agreement, the High Authority is given less sweeping powers in the same field. It will allocate as between states but must consult with individual governments over what proportions shall be assigned to exports and to internal consumers. The amounts of raw materials agreed on for the coal and steel industries themselves shall then be distributed among the separate concerns by the High Authority. With a "qualified majority" vote from the Council, the High Authority may also set up restrictions on exports to third countries. It can impose fines for any violations.

It is this article of the Treaty which the Schuman nations propose as a substitute for the Ruhr Authority, the six-Power group which now decides how much coal Germany shall export.

If, on the other hand, there is a decline in demand, a unanimous Council can order the High Authority to set up a system of quotas. After consulting with the industries concerned, the Authority "shall establish quotas on an equitable basis in accordance with" the non-discriminatory principles of the Plan. It may "regulate the rate of operation of the enterprises by appropriate levies on tonnages exceeding a reference level defined by a general decision. The sums thus obtained will be earmarked for the support of those enterprises whose production rate has dropped below the level envisaged, particularly to ensure . . . the maintenance of employment . . ." The High Authority will impose fines for violation.

If, in such a period of surplus, imports inflict serious damage on production within the Schuman area, quantitative restrictions may be used with the authorisation of the Authority backed by a qualified majority of the Council.

Cartels and Mergers

The restriction on private cartels and mergers are the provisions of the plan which led to prolonged negotiation

between the German Government and the Allied High Commission, since their object was much the same as that of Law 27—to decartelize and deconcentrate industry, especially that of the Ruhr. Article 60 forbids all private agreements within the industry where the object is (1) to fix prices, (2) to restrict production, or (3) to allocate markets or sources of supply. Heavy fines will be imposed for violation. Joint buying and selling agreements may be authorised by the High Authority—providing that they promote better marketing and production, and that the industries involved do not control "an appreciable part of the products in question." Only the Court has power to set aside a decision of the High Authority on the cartel issue.

Mergers of any kind will require the authorisation of the High Authority, which will grant permission only if the merged concern will not be so large as to violate any of the three principles noted above. In case of violations the High Authority may order the separation of such industries or assets or impose fines; it may also appoint a receiver-administrator for the assets in question and organise a forced sale. Appeals against such decisions can be made to the Court.

Prices and Transport Charges

The price scheme for coal and steel envisaged in the treaty appears to boil down to a modified "multiple basing point" system. This will allow producers to absorb freight charges and thus to compete in the markets of fellow members. However, a number of safeguards are ready to hand in case anyone gets badly hurt. No producer is permitted to cut prices simply in order to acquire a monopoly position, and it is also plain that the High Authority, in consultation with both the Consultative Committee and the Council, will exercise large regulatory powers. In periods of shortage, for example, it may fix maximum prices and where a "manifest crisis" exists it may establish minimum prices.

Price scales and conditions of sale are to be made public by all concerns. It will also be necessary to suppress all discrimination among the members in transport charges for coal and steel. The same rate scales must be applied to traffic with other member countries as prevail for internal transport.

Investment and Production

The High Authority will carry on a permanent study of markets and price tendencies, and all concerns and associations will provide it with information needed for this purpose. If, however, it divulges any data considered to be a professional secret (i.e., costs of production), the Authority may be sued for damages before the Court.

To "encourage co-ordinated development" the Authority may order all concerns to submit their investment programmes in advance and will publicly issue its opinion of the programmes. It can forbid any firm from using funds other than its own, if the investment requires subsidies or other discriminatory and protective measures.

The Authority may also grant loans or give its guarantee to loans raised elsewhere in order to aid in carrying out investment programmes. For these purposes the Authority may float loans on the markets of member states. When the introduction of new equipment, etc. throws men out of work it can create new jobs by financing investment programmes in the coal and steel industries or, with a "qualified majority" from the Council in any "new and economically sound activities."

During such periods of "readaptation," the High Authority will use the funds derived from its levy on production to pay unemployment indemnities and to finance retraining schemes for workers. These are non-reimbursable.

Special and Temporary Exceptions

During the transition period the High Authority can mitigate the effects of "sudden and harmful" threats to coal production in two ways—by using its regulatory powers over price and by authorising the creation of national compensation funds.

In addition, three very obvious uneconomic units in the area have been singled out for special treatment. Apart from the quantities used by the Belgian steel industry, Belgian coal will be left out of the single market for the five-year transition period; the Government will be allowed to maintain or establish, under the control of the High Authority, duties on coal imports from the rest of the area. A "peréquation levy" per ton of coal sold will be imposed on the more economic mines of the area (chiefly German) which will fall gradually at the rate of one-fifth a year. An equal sum will be furnished by the Belgian Government. The proceeds will be used to help modernise, shift and shut down production within Belgium; to lower the price of coal consumed by the Belgian steel industry to the average level paid throughout the single market; and to reduce the price of Belgian coal exports within the area. Belgian mines will not have to close down each year at a rate of more than three per cent of total annual production.

Similar provision is made for certain Italian and French coal mines; the uneconomic French mines will not be required to shut down at a rate of more than one million tons a year.

Numerous protective measures may also be sanctioned for the steel industry during the five-year transition period. They will be authorised in cases where, given more time, an industry is capable of adapting to competition or where the costs of unemployment would be greater than the funds allocated for the purpose. Under these conditions the High Authority can limit shipments from one region to another within the area; acting with a qualified majority from the Council it can also establish production quotas.

In particular the Italian steel industry can maintain customs duties on steel imports from the rest of the area, gradually reducing the duties throughout the five-year period.

Migration

There will be no restrictions on the movement between the six countries of coal and steel workers of "proven qualifications." A definition of these qualifications will be worked out by member nations.

Ireland in Search of an Issue

[FROM OUR DUBLIN CORRESPONDENT]

A PARLIAMENTARY dissolution usually succeeds in creating some issue on which the subsequent campaign may be fought. Nothing of the sort seems to have happened in the Irish General Election which, so far at least, must rank as the duller of modern times. There are still a few days to go before polling on May 30th, but it seems that the interest of the electorate in the proceedings will be of about the same degree, and of much the same kind, as its interest in that day's Derby.

The events preceding the dissolution are worthy of recall if only to illustrate the complicated character of Irish politics at present. Since the previous General Election of February, 1948, Mr Costello's government has held office with the support of its constituent parties—*Fine Gael* (of which Mr Costello is a member), Mr McBride's *Clann na Poblactha*, the Labour Party, and the Farmers' Party—and of the independent deputies in the *Dail*. Its survival for so long belied expectations, particularly the expectations of Mr de Valera's *Fianna Fail*, which after sixteen years of

office had come to regard an alternative administration as an impossibility. Nevertheless, the inter-party government showed no signs of instability until about six months ago. The rise in the cost of living and a number of minor disputes gave it an unhappy winter before the controversy over the mother and child welfare proposals gravely damaged its cohesion by destroying the unity of Mr McBride's party.

These proposals arose out of the implementation of the Health Act of 1947, which now appears as a kind of time-bomb left behind by the outgoing *Fianna Fail* government. The powers given to the state by this measure awakened alarm among a number of interests; among the doctors, who feared that their professional status would be destroyed, and among the Catholic hierarchy, who objected on the ground that state intervention would be pushed too far. When the new administration took office the Department of Health was given to Dr Browne, a member of Mr McBride's party. It is clear that his instructions were to prepare a scheme for mother and child welfare and to obtain the approval of the hierarchy to its principles and of the doctors to its practice. It also seems clear that, as regards the hierarchy, Dr Browne persuaded himself that he had obtained approval when in fact no approval had been given; while the doctors' fears were increased rather than allayed by what they heard of the draft scheme. It was probably felt in other sections of the government that a scheme on the scale contemplated by Dr Browne would be too costly for the community and would lead to too great an extension of administrative powers. These fears eventually came to a head. Dr Browne resigned and published the correspondence which had taken place between himself, Mr Costello and the hierarchy.

Objections to Welfare Plan

Although attention has been focused on the relationship of Church and State, Dr Browne's proposals would probably have been unacceptable on technical grounds had there been no episcopal intervention whatever. No one can be happy about the level of infantile mortality (though there has been a welcome decrease in recent years), but it seems that the main problem lies where the growth of population has outstripped the health services. A less ambitious scheme might well be as effective, and would not involve any extension of administrative power or the question of whether a means test should or should not be applied. A means test in Ireland has not the same connotation that it has had in Britain; and universal schemes that dispense with it are regarded with suspicion in many quarters here. In the circumstances, the intervention of the hierarchy powerfully reinforced objections which would have been decisive without it.

All this might have provided an electoral issue. But, on the contrary, very little has been said about it, principally because the hierarchy have in a way only voiced the general distrust, which appears to be shared by members of other churches here, of schemes which extend the functions of the state into family life. Dr Browne resigned from *Clann na Poblactha* after a blistering letter to Mr McBride, and now stands as an Independent candidate. The other parties have had remarkably little to talk about, and the campaign has been summarised by the opposing posters of "Put them in" and "Keep them out." In a sense, all parties are campaigning in an unfamiliar terrain. The landmark of the Republic which dominated so many electoral battles in the past has disappeared. Problems of defence have hardly been mentioned. Some drawbacks of Partition have now, it seems, been discussed by Unionist back-benchers in Belfast, and no candidate for the *Dail* wishes to intervene in their discussions. The issue boils down to whether the inter-party experiment is to be continued or whether a return should be made to single party government.

In a deeper sense, this absence of issues is symptomatic of the present state of Irish politics. Nothing in particular divides *Fianna Fail* and *Fine Gael*, the heirs of the *Sinn*

Fein movement—apart that is, from the personality of Mr de Valera. In a general way *Fine Gael* has been supported in the past by the professional classes and by the farmers. Equally generally, *Fianna Fail* has close connections with the new industrialists and it is popularly associated with the practice of government by ministerial orders which became necessary during the war. It has also espoused the cause of strict financing. There is a sense in which *Fianna Fail* has become the conservative, certainly the authoritarian, party while *Fine Gael* has sidestepped to the left and has regained a long-lost liberty of action. But "right" and "left" are only comparative terms in Irish politics. What is more important is that *Fianna Fail* depends on Mr de Valera's personality; and his rejection now would be a very heavy blow. The Labour party has benefited by the coalition; but it is handicapped by an undercurrent of distrust among the farmers and at least some city-dwellers who have suffered from disputes between rival trade unions. *Clann na Poblactha*, apart from Dr Browne's defection, is suffering the fate of all parties whose policy has been achieved. It came in to procure the Republic, and now that the Republic is there, it has some difficulty in explaining its own continued existence.

Mr de Valera must gain the initiative in order to return. So far it does not seem that he has created a sufficient reaction against the government. On the other hand, a number of inter-party seats appear to be vulnerable. A gain of eight seats would give Mr de Valera power; but such a gain would be a considerable achievement under proportional representation. A great deal may depend on the number and the personalities of the Independent candidates who may be elected. The dissolution was finally precipitated by a revolt of some Independents; and it seems probable that their power will be continued into the next *Dail*, whose expectation of life will not be improved thereby. If the inter-party government remains in office, the next couple of years may witness many changes in the Irish political parties.

Death in Bihar

[FROM OUR CORRESPONDENT IN INDIA]

BIHAR is on the brink of famine. In a land where subsoil is just beneath the surface, where thousands of rivers and rivulets keep geography fluid, alluvial loam makes Bihar the richest province in India as far as soil fertility is concerned. Yet a flood and a drought are endangering the lives of some 20 million people—half of Bihar's population.

In the spring of 1950 a flood washed away the maize belt of the Kosi river in Purnea district and, as the previous crop had been indifferent, the landless labourers and small cultivators starved almost at once; the government had to admit one starvation death although many more occurred. (To declare that deaths are due to famine means the enforcement of the Famine Code according to which the Government must provide food and employment for all, which it has never been able to do.) Already last year rice was 40 rupees per maund as against the rationed 19 rupees in Bombay. After the floods the total failure of the October rains affected the whole of North Bihar and parts of South Bihar; the bountiful paddy crop withered, the grain never formed and the soil was so hard that the 1951 spring crop could not be sown. Population density in North Bihar is 1,200 to the square mile and about 20 million are landless or cultivating uneconomic holdings. The average holding was already under half an acre in 1941 and there are now 4,000,000 more people according to the 1951 census, while river vagaries have reduced acreage. Further Bihar always imported 300,000 tons of rice from Nepal but the Nepalese border is closed because of the political situation and only some 40,000 tons have been smuggled out so far. It is estimated by the Bihar Government that they have lost 2,500,000 tons of food grains.

To appreciate the magnitude of the problem facing Bihar it must be remembered that Bihar, like Bengal, is a permanent settlement area with immense zamindaris and a very loose governmental control in the rural areas. Bihar not only lacks village administration, it also lacks roads and bridges. Roads are so bad that jeeps can only with luck average 8 miles per hour. Bridges are rare and uncertain, rivers are so capricious that they never flow twice in the same bed—they silt themselves out—and river crossing becomes quite impossible as soon as the rains set in. Bihar then becomes an amphibious land where river boats and elephants are the only means of locomotion except for the railways which are hopelessly inadequate and versatile in gauge.

Food must, therefore, be stored in the villages before the rains start in mid-June; later, even an air lift may not be workable. What little food the Bihar Government has been able to get from the centre—perhaps 300,000 tons—has been stocked in a comprehensive network of some 4,000 "fair price shops" which serve about 8,000,000 ration card holders. But the Government of Bihar has been too modest in its demands and too slow to raise alarm. Assam, for instance, which has no food deficit has been getting food from the centre even when Bihar got none. The stocks in Bihar are not nearly sufficient to last until after the rains—not to mention until mid-November when the autumn crop will be ready. Transport arrangements are equally

inadequate and there seems no excuse for the Government's reluctance to hand over the transport of food to the Army which has repeatedly offered to handle it; it has only accepted the loan of a few tarpaulins and asked for a few amphibious jeeps.

Unless 600,000 tons at least are rushed into North Bihar within the next few weeks and a million tons follow before the end of the year, there may be a repetition of the Bengal tragedy. The famine will not be spectacularly concentrated in the towns; everybody will not die at once. But within the next year, over the whole area, as many or more people will die of epidemics, or complications; hunger, just as death itself, is not a disease. Already conditions are very bad indeed. One of the Government's chief worries is the almost total loss of the cultivator's purchasing power; he must not only be fed, he must be given work (there has been no cultivation for a year), and pay with which to buy food.

A visible pattern is spreading over Bihar from the North to the industrial South and from the East to the West. In Muzaffarpur district people are hungry and even school teachers eat only one meal a day. There is little money and many landless labourers eat perhaps every other day; only a little rehabilitation work is done. In Sitamari district people are somewhat hungrier and thinner, while in Madhubani sub-

division whole villages, near the Nepal border, look as if they had just come out of Belsen; villagers kiss your feet and moan for food and cloth—cloth is so short that the average amount available is 4½ inches per capita. The old are withered and parched like the mud at the bottom of their dried tanks; the young look incongruously out of proportion with their infantile limbs, while the children are ricket-stricken, pot bellied and hungry eyed. People eat every other day when they can get sweet potatoes or milo—a very small grain with a rough, thick outer core which cannot be polished off since nothing would be left. In Purnea district, where the scarcity began, things are one degree worse although more food has been given for longer and jute cultivation does provide a measure of employment. There, people eat cooked jute leaves; they are not as thin as in Madhubani but they die of starvation; they suffer from diarrhoea, various pains or weaknesses, and smallpox is raging in a severe and often fatal form.

Hunger Delayed But Not Cured

To restore purchasing power the Government is moving earth on to roads out of dried tanks, and digging emergency wells. It has £4 million to spend where it needs £40 million, so that it can only give temporary employment, and when the road has progressed beyond a village its inhabitants, who ate all they earned while working, are just as badly off as before; hunger has only been delayed, not cured. After the rains the Government will be faced with numbers of grave problems, to which it does not seem to have given adequate thought. Many cultivators have eaten their seeds; very few have any grain with which to pay their labourers who are always paid in kind; plough bullocks are severely affected by the lack of fodder; the landless labourer who had no land to sell or mortgage has sold his work for months to come for a handful of rice; villagers have sold their wife's ornaments and borrow money at 70 per cent. The whole structure of the village is shaken.

The food supplied by "fair price" shops, whether on payment or on dole, varies from place to place in quantity and price. Rations are from 2½ to 8 ounces and prices from Rs. 18 to 27.8 for rice. Milo is uniformly 13 rupees per maund. The stocks are built from local procurements of Indian wheat which is good, Pakistan rice which is two years old and full of stones, Chinese rice which is worse, and American milo which is 40 per cent broken and 5 per cent dust. The outer core of milo when eaten, even ground, has such an abrasive effect that people get diarrhoea. In the case of rice eaters, who all suffer from chronic amoebic dysentery and whose stomach lining is weakened by malnutrition, the diarrhoea, which is general, is sometimes fatal. Rice eaters are bulk eaters, so that even when they get good wheat they overeat by habit and get severe gastric troubles yet still feel hungry. In Darbhanga and Purnea districts people must not only be fed, they must be nursed back to health, while all precautions against epidemics must be taken from the bleaching of wells to forcible inoculations—in one village no one got inoculated because of the inoculator's caste.

So far deaths are few, but it must be remembered that during the first six months of the Bengal famine in which 5,000,000 must have died, the death rate increased only by an imperceptible 1 per cent.

Resentment in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

HONGKONG has recently experienced a political typhoon. The vicious onslaughts made on Hongkong from America have met with rather confused and feeble answers from Whitehall. If the accused (the trading interest in Hongkong) had been able to speak for himself, he could have introduced a more accurate and factual perspective. However, in a recent public

speech the Governor of Hongkong remarked on the amount of "plain rubbish" that has been talked about the Colony; and Sir Gladwyn Jebb has described Hongkong as a show-place of democracy and a centre of legitimate trade, which is going to be maintained as such.

The prestige and reputation of the United States have suffered a cataclysmic decline in Hongkong, and perhaps in Asian opinion generally. What—think the Far Eastern peoples, who are often illiterate but rarely dull-witted—is to be thought of a power which treats Chiang Kai-shek as a better ally than Britain? Or of strategists who cannot see that Hongkong is of more value to the free world than to the Communists? In the local view, the difference between General MacArthur and the US Administration is one of degree rather than of kind. The General's is considered the more certain way to disaster, as it would throw everything into the melting pot and lead directly to world war. But from recent experience there is no confidence that the Administration's leadership will ensure the opposite results. Its continued sustenance of a discredited regime is, in local eyes, a bipartisan fallacy which compromises American policy altogether and gives Communist propaganda its main "handle" against America.

The "American embargo on Hongkong," as applied since last December, has been muddled in procedure, but the adverse effects are now becoming obvious. There is considerable unemployment in the Colony; this is fairly widely

diffused, but one of its concentrations is in the knitting industry, where about 7,500 persons have been displaced. One immediate result is that Communist China obtains a welcome number of technicians and skilled workers.

Now a more general embargo is to be established. Local people are astonished at the failure of the West to realise that any discouragement of Hongkong does more damage to its own side than to the Communist. It is instructive to classify Hongkong's trade figures by the four main groups of countries involved. The first is China. The second is Japan and Korea; for the rehabilitation of this area, peace and development in South East Asia, of which Hongkong is a main pivot, are absolutely essential. The third group comprises the whole major "development" area of Southern and South-Eastern Asia (Borneo, Philippines, Indonesia, Malaya, Siam, Indo-China, Burma, India, Pakistan, Ceylon). Militarily, economically and politically, this is now the key area in Asia for the defence and supply of the West. Hongkong is one of the linchpins of this area and its weakening would be a severe blow to western prospects. The fourth heading covers Hongkong's dealing with all the rest of the world; and its role in world trade is very far from being a purely local one.

Hongkong's trade with China, since the Communist victory, has consisted mainly of peacetime consumer goods. China's appetite for these, after fourteen years of warfare, is enormous. Britain and America have been receiving in exchange valuable supplies of tungsten, wood oil, bristles, tin and other scarce and essential materials. Controls locally

and at source have been stringent; it is the extreme of ignorance or unscrupulousness for General MacArthur to read out Hongkong's export list and in the "China" column to omit against such significant items as "oil," the simple entry, "nil."

A general stoppage of Hongkong's functions would undermine the prospects of East Asia's trade and development, while doing comparatively little damage to China. It is not, however, a question of trade alone. Hongkong is the largest banking centre in the Far East. It is the best harbour and naval base in the region, with first-class equipment and skill in the repair and building of both cargo vessels and warships. It is one of the world centres of the insurance business. It is a great airport, ranking third (after New York and London) for traffic. In education, and civic standards of every kind, it is now a demonstration place where 400 million Chinese get their only sight of the free world. It is a living disproof of Communist propaganda—a far more effective one than the devastation of Korea or China.

For such reasons as these, the Hongkong community had expected to receive positive support from the western capitals, and there is some resentment that it has not done so. This resentment is quite unlikely to lead to an increase in the internal influence of Communism, which is slight. Hongkong workers well know the conditions of their fellows on the mainland, and the superiority of their own. The main support for Communism came previously from the middle-class Chinese (chiefly some traders doing well in dealings with the north, and some professionals who could find good posts in China), but these have now been thoroughly disillusioned by the terrorism and conscription in China.

Norwegian Prices and Wages

[BY A CORRESPONDENT]

THE rising spiral of prices and wages was the dominant theme of the budget debate in the Norwegian Parliament last month. The debate culminated on April 14th outside the precincts of Parliament when the Central Statistical Office published the cost of living figure for March 15th. The automatic effect of the publication of that figure was an immediate increase of wage rates by 2.6 øre* an hour for adult workers for each point rise in the cost of living index since September 15th last year. As the total rise in the index from September to March was 6.7 points, wage earners were compensated by altogether 17 øre an hour.

This automatic coupling of wages to the cost of living has aroused widespread concern, as a chain reaction appears to have been started which cannot easily be stopped. During the first five years after the war the cost of living index in Norway moved scarcely at all, rising by only 2.9 per cent from April, 1945, to September, 1949, when devaluation was introduced. The effect of devaluation was not at first very apparent, and from September, 1949, to March, 1950, the cost of living index rose by only another 0.6 per cent. From March to October, 1950, however, the index jumped by no less than 7.9 per cent.

The immediate cause of this spectacular rise in the index was the Norwegian Government's decision, in spite of the rising cost of imports following devaluation, to reduce the amount of subsidies (which in the 1949-50 financial year amounted to no less than £39 million) to £30 million in the next financial year. It was recognised that the effect of devaluation on prices could not be counteracted completely without an impossibly high level of subsidies, and moreover the consumption of a number of home-produced foodstuffs such as butter and meat had increased to such an extent that prices could have been kept stable only by a very large increase in subsidies.

In March, 1950, the cost of living index stood at 159.4

* (100 øre=1 krone=1 shilling.)

(1938:100). In April, 1950, it was agreed between the workers' and employers' representatives that if the index reached or passed 165.6 on September 15, 1950, they should negotiate on the possibility of adjusting wages. In fact, on September 15th the index stood at 179.5, and the negotiations which followed resulted in an increase in wages of 18 øre an hour for adult workers. It was also agreed that if the cost of living index rose or fell by five points or more from September, 1950, to March, 1951, wages should be increased or decreased automatically at the rate of 2.6 øre per point per hour. It is that provision which was implemented last month. However, the agreement of last October also provides that if from March to September this year there is a rise or fall of yet another five points or more in the cost of living index, the workers' representatives in the event of a rise, or the employers' representatives in the event of a fall, can demand fresh negotiations with a view to another adjustment of wages.

Nobody doubts that by September there will in fact be a rise of at least another five points in the index. Since devaluation and the cut in subsidies, the Korean war and the subsequent stockpiling and rearmament in most western countries have brought about a further sharp rise in world prices, the consequences of which have been felt in Norway. Moreover, Norway's own rearmament programme is inevitably contributing to the rise in the internal price level, first by increasing the pressure of demand on the country's very fully employed resources of labour and materials, and secondly by increasing taxation to pay for the rearmament programme. The effect of increased taxation on prices was illustrated last month when the general rate of purchase tax was increased from 6 to 10 per cent. That in itself is expected to add another point or two to the cost of living index.

Cuts in Investment Programme

BETWEEN now and September this year when the next vital index figure will be published, the Norwegian Government intends to examine the whole question of prices and wages very thoroughly and to try to institute measures to check the present spiral movement. In the budget debate Opposition members urged the necessity of more saving, both public and private. A savings campaign of some sort is likely to be launched, although the low rate of interest sanctioned in Norway does not encourage voluntary saving. The inflationary pressure may be reduced to some extent by the cuts in the investment programme. Since the war investments have been at an exceptionally high level, representing about 35 per cent of the national income, the highest investment rate in Western Europe. The defence programme is partly responsible for the cuts now being made, but the coming reductions in Marshall aid also make it necessary to establish a level of investments more consistent with the country's own resources.

It is, of course, recognised that the ideal solution to combat the price and wage spiral is increased production, and the government is seeking to set up a broadly based productivity council to encourage greater output. So far the establishment of this council has been delayed by the reluctance of the employers' organisation to join a body on which the government as well as the trade unions will be represented. A proportion—estimated at £10 million—of the export tax levied on certain goods such as pulp and paper which at present are securing very high prices abroad, will be used to subsidise prices. The tax has been fixed on a sliding scale varying according to the prices obtained abroad for particular export products. This method of keeping down domestic prices by an export levy instead of by budgetary taxation may well be extended. On the surface it has obvious advantages, for the boom in world prices is at present resulting in record Norwegian exports, and the terms of trade have at long last veered in Norway's favour, so that import and export price indices are now equalised.

Do We Know Our Shot Tower?

"On your right," cries the man with the megaphone in the Greenwich bound pleasure steamer, "On your right is the celebrated Shot Tower! On your left . . ." As if we needed to be told! For the Shot Tower is...the Shot Tower was *our* Shot Tower. Not so many months ago our molten lead was falling* from its dizzy upper heights into our tank of water at the bottom. Not so many years ago our lookouts were watching uneasily from its balcony for somebody else's flying bombs. Pneumatic drills stammer and stutter. The South Bank changes. Trumpets tootle. The Festival of Britain arises. Transformation triumphant . . . total turnabout . . . but no! For there stands the Shot Tower, as tall as ever—though it looks rather more like a lighthouse now, and we have heard murmurs of radar messages to the moon. Well, what of that? In the respectability of its age, in the adaptability of its outlook, our Shot Tower is a true representative of

How Important is Persian Oil?

THE threat to the Anglo-Iranian Company's interests in Persia has loomed upon this country slowly like a thunderous cloud. The response to the latest despatch from the British Foreign Secretary is still awaited and it is uncertain what it will contain. There have been assurances that Britain would not be deprived of the use of Persian oil, and the Persian Government would be wise to think twice before it stopped the flow of its main source of income and threw into chaos the biggest employing unit in Persia; it knows that aid from American technicians will not be forthcoming, that Persians cannot staff the installations themselves, and it cannot count on sufficient European technicians to do so. All this is reasonable, but ardent nationalism does not trade in reason; to break free from Britain may seem more important than to conserve the country's real wealth. There is the Tudeh party in the background, gaining strength and ready to succeed Dr Moussadeq; and help from Russia or Roumania might be sought to replace the technical experience of the Anglo-Iranian Company. Even so, the exploitation of Persian oil would still depend on sea transport, in which Britain is dominant.

Issues of this kind of gravity cannot be decided by a mere counting of pips in the two opposing hands. But, in the end, each side will have to measure the damage to itself that inevitably follows damage to the other. If all ends in breakdowns and shambles, how much British nose must be cut off to spite Persian face? The economic importance of Persian oil to Britain, and to Western Europe and the world is twofold: first in supplying crude oil, and secondly in supplying products from the Abadan refinery. For Britain there would be the undeniably serious loss of trading and financial assets. Persia has 11 per cent of the proven and indicated petroleum reserves of the world and in 1950 produced 6 per cent of the world's crude oil. But it is now only one of the stars in the Middle East firmament. Before the war Persian output amounted to 10 million metric tons, or about two-thirds of the total crude oil production of the Middle East; output has since more than trebled, to 32 million tons, but it now represents little more than a third of the Middle East total.

As the chart shows, crude oil production in Saudi Arabia, negligible in 1938, now rivals that of Persia; and the output from Kuwait, which did not begin to pro-

duce until after the war, is not far behind. In this relative sense, the loss of Persian oil now would be less of a blow to oil supplies than would have been the case twelve years ago.

But it would be serious enough. More than a quarter of the United Kingdom's imports of crude oil in 1950 came from Persia and about a fifth of the oil imports of other countries of Western Europe. On the assumption of a total stoppage of Persian crude oil, about 6 million metric tons of crude would have to be found elsewhere for Western Europe. The Anglo-Iranian Company has a half share in the Kuwait Oil Company and nearly a quarter in the Iraq Petroleum Company—although by agreement it can market nearly a third of Iraq oil. Kuwait has expanded rapidly since the war and has not yet

reached full development; and output at Kirkuk (though reduced by the Iraqi refusal to send oil to Haifa through the 12-inch Kirkuk-Haifa pipelines) has been rising and will rise further. Moreover, the output of the Arabian American Oil Company in Saudi Arabia is steadily expanding and in the first quarter of this year was running a tenth higher than in 1950.

Iraq oil depends on pipeline capacity to the Mediterranean seaboard, for the Kirkuk field is landlocked.* The two existing pipelines, 12-inch and 16-inch, to Tripoli have a throughput of over 7,000,000 tons. This flow cannot be increased (since the Haifa pipelines are unlikely to be in use again) until the 30-inch pipe from Banias on the Mediterranean reaches the point on the Euphrates at which it can be linked with the two idle land sections of the Haifa pipe. This will happen during 1952 when total throughput capacity will at once jump to 13½ million tons a year. In the following year, when the 30-inch pipe is extended the whole way to Kirkuk, Iraq will export nearly 20 million tons, which would be equivalent to two-thirds of Persia's total output last year. But, whatever may happen in the future, supplies of Iraq oil cannot be increased this year. On the other hand, the opening of the trans-Arabian pipeline last December has cut down the tanker route to Europe from Ras Tanura by 3,500 miles. Its present capacity is 15 million tons a year, but it could be increased to 25

MIDDLE EAST CRUDE OIL PRODUCTION COMPARED WITH VENEZUELA AND WORLD

* A map showing the existing and planned pipelines in the Middle East was printed on page 865 of *The Economist* of April 14th.

million tons by the installation of extra pumping equipment. Oil exports from Kuwait at present depend wholly on tankers; a pipeline to Tartus had been projected, but is unlikely to be tackled for some time. There is also the new field at Zubair, which is expected to produce at least 2,500,000 tons by the end of next year and which would also depend on tankers. The world's tanker fleet at the beginning of this year was 29 million d.w. tons (including the American reserve tonnage), having increased during 1950 by nearly 4 per cent. Construction of tankers accounted for well over half of the British tonnage building last year and is still being increased. Moreover, if Persian oil exports were stopped, the Anglo-Iranian tanker fleet could be concentrated elsewhere; the company's tanker fleet consists of 1,716,000 tons deadweight, of which a considerable part works to Persia, and it has nearly as much on charter. There should be no lack of tankers to carry crude oil to Western Europe from other sources of supply if Persian oil were stopped. But it is quite impossible to calculate the costs and complications of providing the countries around the Indian Ocean with refined products if it became necessary to replace those now drawn from Abadan.

Thus the Middle East could probably make up the loss of Persian crude oil to Western Europe and elsewhere reasonably quickly without, it would seem, any special campaign of new drilling. The darkening clouds have given due warning of the possible storm and the various oil concerns are doubtless taking precautions. In addition to the prospective increase in Middle East supplies there is a large programme of drilling under way in Venezuela which is expected to raise output from about 76 million metric tons in 1950 to about 100 million tons during the coming twelve months; hence there is likely to be some support from Venezuelan output to back Middle East supplies, and conceivably to supply the Haifa refinery. But more serious even than the loss of crude oil would be the deprivation of the use of the Abadan refinery, which in 1950 had a refined output of nearly 25 million metric tons and is the largest refinery in the world. World refinery capacity has been barely keeping up with an annual increase of consumption in recent years of nearly a tenth, and some measure of what a major loss of refined products would mean at a time of rapidly increasing demand has already been felt as a result of last month's strikes at Abadan. Additional refinery capacity in the United States, either already planned or called for by the Petroleum Administration for Defence, is intended to meet only internal demand.

On the other hand, Western Europe since 1948 has undertaken a programme of large-scale refinery expansion specifically in order to limit purchases of refined petroleum products from overseas. By 1953, the member countries of OEEC aim at a refining capacity of about 62 million metric tons, which would make Western Europe almost completely self-supporting. By the spring of this year, the refining capacity of these countries had already been raised to about 40 million metric tons. About 19 million tons of the projected 1953 capacity is for Britain, an increase of some 12 million tons compared with 1948 and this programme is ahead of schedule. The main extensions now proceeding in Britain are by Anglo-Iranian at Shoreport, by Shell at Stanlow and by Esso at Fawley. The new Fawley and Stanlow refineries are expected to be on stream in the

autumn with an additional throughput of some 7,000,000 metric tons; Shoreport should be ready next year with an additional 1,300,000 metric tons; the completion of Fawley and Shoreport is planned for 1954, and should result in an addition of nearly 2,000,000 tons to the main plants. Imports into Britain from Persia of kerosene, motor spirit and fuel and diesel oil during the first four months of this year were at the rate of 1,742,000 metric tons a year compared with some 2,430,000 metric tons last year; to replace these supplies would absorb only a small part of the new refinery capacity, which is capable of furnishing all types of product now obtained from Abadan.

The loss of refined products from Abadan would similarly not be serious for Western Europe because of the increase in refinery capacity since the war. The main products imported by Western European countries from Iran since the war are fuel and diesel oils; consumption of diesel oil and fuel oil in Western Europe have increased from about 37 per cent of total oil consumption in 1938 to 60 per cent today. Indeed, world consumption of fuel and diesel oils has vastly increased in recent years and if there were a shortage arising from the loss of Abadan it would be in these items. The main refinery expansion in Western Europe, apart from Britain, is in France, Belgium, Holland, Western Germany and Italy. Crude oil processed in 1950 in these countries reached about 26 million metric tons. The present year should see an increase in refining capacity of about 7,000,000 tons—at Berre and Dunkirk in France, Antwerp in Belgium, and Venice in Italy, all in association with British companies. By 1953 a further 4,500,000 tons of capacity should be working, at Antwerp (the new Esso plant), at Holthausen, at Bari, Leghorn, Milan and

at Rotterdam. The increased refining capacity this year should, as in Britain, counterbalance the loss of Persian products. Nevertheless, since total Western European oil consumption, including bunkers, will be running at about 55 million tons in the current year, there would still be need of some imports of refined products during 1951.

It is beyond doubt east of Suez where the loss of Persian oil would be quickly felt, particularly in India and Pakistan. Apart from feeding the United Kingdom and Western Europe with important quantities of kerosene, motor spirit, fuel and diesel oils, the Abadan refinery supplies India and Pakistan, Egypt, South Africa, Australia and East Africa with their basic needs and also provides some 160 ports in Europe, Asia and Africa with tanker oil. Recent figures of exports from

Abadan are not available, but they would show that India is one of the biggest consumers. In 1950 total oil consumption in India was over 3,000,000 metric tons, of which some five-sixths came from Abadan. The main Indian imports from Abadan are fuel oil, diesel oil, motor spirit and kerosene. For India as for the other countries around the Indian Ocean there is no convenient alternative source of petroleum products, since present refining capacity in the Middle East is fully utilised, except at Haifa. The other main refineries in the Middle East are Ras Tanura with 7,000,000 metric tons throughput and Bahrain with 7,500,000 metric tons throughput. Haifa, with a potential 4,000,000 tons throughput, is working at only a quarter capacity, partly with Venezuelan oil; it could conceivably be set working at full capacity using Venezuelan crude, though at increased cost and not without political difficulties. There are refineries in Indonesia, especially in Sumatra, and in British Borneo and Japan. Two of the plants in Indonesia that were put out of action during the war are not yet in operation, and no expansion has been announced for British Borneo; in Japan an extra 500,000 tons capacity is planned to increase total refinery capacity to 2,500,000 tons. But the Far East can hardly have any spare capacity to meet new demands.

It is now possible to sum up the effects of a total breakdown in Persia. They would obviously be serious, but well short of fatal to the petroleum-based economies of the west. If total world refining capacity is considered (of which the United States has still about three-fifths) then the loss of 25 million tons of refined products from Persia might be made up by the diversion of perhaps 10 million tons from the United States (about 3 per cent of current consumption), by getting 3,000,000 tons more from Haifa and by running the European refineries

above their nominal capacities. This might not be impossible, but on the best estimate it would involve considerable disturbance in the steadily expanding world oil markets and would restrict supplies for many months at least. The loss of Persian crude oil could probably be met by Kuwait and Saudi Arabia this year and by Iraq also next year. The loss of Abadan might not be cruelly felt directly either in Britain or in Western Europe, but it would create most serious problems of supplying India, Pakistan, East Africa and South Africa. Except at Haifa, there is no spare refining capacity, and the provisioning of these countries from distant refineries would impose a desperate strain on tanker tonnage that is already stretched to the full. Moreover, world supplies of fuel oil barely meet demand, and since about half of the output at Abadan consists of fuel oil, a closure of the plant would have painful consequences.

In the long-term, the natural expansion of the oil industry at a time of rapidly increasing demand might take even such a loss as Persia in its stride. But other considerations remain to be mentioned. The loss to Britain would be something more than the disruption of oil supplies or the writing off of an investment in Persia that has cost well over £300 million; it would be a critical blow to Britain's trading and economic strength. The conflict of dollar and sterling interests in oil that was resolved early last year was capable of settlement without any surrender of Britain's bargaining power because of the increasing demand for oil products. The loss of Persia would mean the loss of the largest, and the only wholly British, investment in oil; and it would severely weaken this country. The dislocation in oil supplies might be completely overcome in the course of a year or so, but the loss of an investment of such prime strategic importance would be lasting.

ICI and Dunlop

FOR the many thousands of stockholders in leading British industrial concerns, this is (or should be) the busiest season of the year—a time when company reports drop heavily into letter boxes, when dividends appear on the credit side of the pass book, and the voice of the chairman is heard in the land. For the investor who takes his job seriously, there is no limit to the facts and figures that he should be studying; the average company report nowadays is an intelligence digest in itself. But the average stockholder finds it a formidable document and is often disinclined to forage too deeply so long as he finds a satisfactory story of rising profits and dividends. Judged by such a simple criterion, recent company reports give him full excuse for doing nothing; the profits boom has until the last week or so been the main prop of the continued advance in equity share prices, and with a few exceptions—J. and P. Coats is one of the outstanding disappointments—dividends have come well up to expectation.

The equity stockholder who pauses to reflect will wonder how it comes about that despite the publication of bumper "profits" and the general thawing of the dividend freeze, the *Financial Times* ordinary share index is still nearly five points below the January 1947 "high" of 140.6. A whole sermon could be written on

this text: the cheap money imbroglio which has resulted in a rise in yields both on fixed-interest and also equity securities; the deliberate choice of "profits" as a target of political and fiscal attack; the persistence of inflation at home and abroad which has added to paper "profits" what has been silently sheared off the substance of industrial capital through inadequate depreciation and pricing policies and excessive taxation. These lessons could be well filled out from examples culled from a random sample of recent industrial reports. Of this batch, there are two that virtually chose themselves—Imperial Chemical Industries and Dunlop. There are few concerns whose interests are more widely spread throughout industry, whose size is so impressive, and whose managements are more alert to problems of capital replenishment and industrial efficiency.

By the conventional standards of "accepted accounting principles" (in the words of the Tucker Report) stockholders in ICI and Dunlop should be well satisfied. In 1949, the trading profits of each company had shown a dip; there were difficulties in the export markets on which the solvent action of devaluation had barely a few months to work before the 1949 results were struck; and while the price of almost every commodity bounded further in 1950 to leave the 1949 levels completely in

the shade, there was evidently little of the price resistance that both companies experienced in 1949. ICI's total sales to customers jumped last year by more than 26 per cent from £174.6 million to £220.8 million; Dunlop's figures (including certain inter-group transactions) also reached a new record level at £197 million compared with £141 million in 1949. Part of these increases reflects higher prices, but the increase in the real volume of turnover has clearly been impressive; in the last quarter of 1950, the average increase in the prices of ICI products sold at home was only 8 per cent higher than for the corresponding quarter of 1949, and the increase in the group's export sales, by volume, is put at 19 per cent for the whole year. The detailed review of ICI's operating divisions reveals scarcely an instance in which output has failed to establish a new post-war record. Alkali output was 10 per cent up, and lime output 27 per cent up—in these cases and in others new plant is now making an important contribution to production. Billingham—that immense industrial nexus in its own right—achieved record outputs for ten major products, and many records were set up by the general chemicals division; both of these important branches of the ICI group have been affected by the shortage of sulphur and sulphuric acid—a shortage that the report labels as "serious" though it emphasises that it was "not altogether unforeseen" and describes the steps that are being taken to relieve it by the conversion of a large part of the acid plant to use materials other than elemental sulphur.

Shortages provide, indeed, a recurring theme in the ICI report, but the general impression remains that, in 1950 at any rate, these were not so dire that their effects could not be partially avoided by timely improvisation and ingenuity. Whether something of the same kind of success will be seen in the current year is perhaps more doubtful; many products could have been turned out in greater volume last year and there are frank warnings that outputs of dyestuffs, paints and metal products are likely to be lower this year than last. Nor is the problem merely confined to feeding the existing plants with an adequate flow of materials; there is hardly a branch of ICI's immense range of activities that will not this year have new plant to run in and supply with every conceivable kind of raw material—chemical, metal, textile—if supplies can be found. Last year's results showed the first major instalment of the benefits from new plant and extensions built since the war. They are part of the general story of increased national productivity in 1950. When it looks at the prospects for 1951, the ICI report lends support to the doubts that have been expressed in recent months whether a similar rate of advance can be achieved this year.

No doubt it would be a mistake to put the main emphasis on shortages, as though they presented an

abiding problem offering no hope of alleviation in the short-run or of more permanent solution later. Present difficulties, acute though they are, may seem less burdensome towards the end of this year. Some increases in output can be expected, and the economising force of higher prices will be salutary. But higher prices, increasing turnover and an ever-expanding range of technical operations invite attention to ICI's financial problems. Few major industrial concerns have taken a more unequivocal line in the controversy about historical versus replacement costs than has ICI. The present accounts show the effect of a major revaluation of the assets under the control of the manufacturing divisions of the group. These now appear at their value as at January 1, 1950, based on their present-day cost taking account of their remaining useful life. The figures thus shown do not, therefore, represent the full cost of replacing the assets, as they now stand, in new condition; to provide depreciation corresponding to the new book values will replace what now remains of the original assets when their working life expires, but it will not replace them in their pristine entirety.

This revision of asset values has produced striking changes in the balance sheet. For the parent company (the group figures are somewhat larger) a surplus of £96,120,273 has resulted from the revaluation, which represents the difference between the net values at which assets were entered in the 1949 balance sheet and the cost of replacing their unexpired substance at contemporary prices. As a result, a corresponding reserve has been set up on the other side of the balance sheet. This part of the operation, however, is primarily a matter of book-

keeping; its inner importance is that the revalued asset figures enable the directors more accurately to provide for depreciation of the physical assets in their partly-used condition, on a basis of current prices (though, to repeat, this change of practice will still not provide in full for their replacement in unused condition). Hence, the provision for the maintenance of manufacturing assets now falls into two parts—one part related directly to the current value of assets and another, less precise, part in the form of an additional reserve for obsolescence and replacement. In the consolidated accounts, depreciation (based on the new valuation) absorbs £8,694,823, against £6,660,622 in 1949—thus emphasising that the true character of revaluation is not a means of conjuring up large book reserves, but involves a new responsibility to make greater provision against assets from each year's revenue. The capital reserve for the obsolescence and replacement of assets receives an appropriation of a round £5,000,000 from the year's taxed profits.

The combination of these two elements of costing and judgment in the provision for replacement of fixed assets probably represents the best practical approach, given the state of the law and the rigid views of many

accountants. Similarly, the appropriation to revenue reserve for stock replacement of £4,000,000 recognises the need to maintain working capital intact, as far as may be, by setting aside sums for the replacement of stocks at higher price levels. It may be thought that these are large amounts, and so they are absolutely; but judged in relation to the group's financial needs they appear much more modest. To take one example, the value of the group's stocks of raw materials and finished goods increased from £55.1 million at the end of 1949 to £59.9 million at the end of last year; it would be surprising if this apparent increase did not mask, for many important materials, an actual fall in physical quantities. Almost certainly the rise in debtors from £27.7 million to £35.8 million states more vividly the effect of rising prices last year. Apart from the strain of current finance, there is the weight of capital expenditure on fixed assets which last year exceeded £25 million. The report acknowledges—what clearly emerges from the balance sheet—the need for further finance to complete the large capital programmes to which ICI is committed. But beyond admitting that the private placing of £20 million of loan stock last year does not constitute a precedent for any future issue, the report is silent about future intentions.

*

If the ICI report is a record of productive expansion, technical adventure, and financial awareness, the Dunlop report runs it a close second. To be responsible for group assets of £100 million is a burden shared by few, even though the ICI group total may be nearly three and a half times that of the Dunlop group. Evidently, the net book value of the Dunlop group assets of just over £24 million is a very long way short of the current values of the partly-used assets that the book figures represent. The gulf between the high cost of replacing fixed assets and the normal depreciation provisions that are available for that purpose is emphatically described in the Dunlop

report. But almost equal emphasis is laid upon the burden imposed on the group by violent fluctuations in the prices of rubber and cotton, its principal raw materials. It is an astonishing reflection of last year's upsurge of prices that although the group's inventories should have jumped in value from £28.3 million to £40.0 million, the physical quantities in stock were actually slightly lower. The increase in net working capital from £25 million to £40 million demanded by this prodigious rise in prices has been financed largely from the proceeds of last year's issue of ordinary capital at 100 per cent premium, together with total appropriations from profit and loss account of £1,915,000. Both Dunlop and ICI have followed the practice of specifically setting aside the equivalent of tax relief in respect of initial allowances—an example that other companies might with advantage have followed in the past, since the allowances are to be suspended from April next year.

*

What is the conclusion to be drawn by ordinary stockholders from the reports of these two industrial giants? Each is paying an increased ordinary dividend, though well within the bounds of moderation and restraint, as the accompanying chart clearly demonstrates. ICI's 12 per cent (against 10 per cent) and Dunlop's 17½ per cent (against 15 per cent paid since 1946) would seem modest indeed if they were calculated, not on issued ordinary capital, but on the effective equity resources of the undertakings. At 65s. Dunlop ordinary stock units yield 5.4 per cent, while ICI at 50s. give a return of 4.8 per cent. Both groups have their full share of problems, industrial and financial. Each would be pre-disposed to put financial strength above the demands of stockholders for increased dividends; consolidated progress rather than dynamism stands out from their record in the last decade. But among the "blue chips" there are few that rank higher or are likely to present holders with less cause for concern over the years.

ANALYSIS OF ACCOUNTS

IMPERIAL CHEMICAL INDUSTRIES

	1949	1950
Consolidated earnings :—

* 1949 and 1950 figures not strictly comparable as German and Japanese subsidiaries' assets and liabilities are included in latest year. (a) On increased capital. (b) Excludes capital reserve retentions (1950: £24,432; 1949: £5,345).

Business Notes

Gilts at 1949 Lows

The slide in gilt-edged has proceeded a notable stage further during the past week. By the standards of the market's behaviour in recent months, the falls in prices of the medium and longer stocks were not abnormally severe, but they sufficed to carry several of them below the nadir of the major slump of 1949—at least if prices are calculated net. Daltons have fallen to a net price of 64½ (after touching 64½) at which they yield £3 17s. 4d. per cent flat; 3 per cent Treasury stock (1966 or after) yields nearly 1/16 more than that; while 4 per cent Consols yield nearly 4 1/16 per cent flat and over 4½ per cent on the assumption of redemption at their optional date in 1957. This renewed weakness reflected not only the basic factors that had been depressing the market in previous weeks but also the caution induced by the Persian crisis—which has incidentally damped the exuberance of the industrial market, provoking some profit-taking by professionals and much more selectivity by investors in their search for inflation beneficiaries.

The gilt-edged market, especially the medium-dated stocks, has had to contend, too, with competition from the World Bank issue which, not surprisingly, has attracted an attention out of all proportion to its size. Given the bank's

desire to ensure that this issue should go, with a bang, the sponsors were well advised to pitch the terms at a level that

left a good margin for contingencies. By the time the lists opened on Wednesday, the redemption yield of this 15-20 year stock (£3 14s. 4d. per cent at the issue price of 97) looked a good deal less liberal than it had done at the time of the offer of underwriting, for in the meantime the redemption yield on Savings Bonds, 1960-70, had widened from £3 8s. 5d. to £3 10s. 7d. per cent to the latest date. It was still, however, sufficient—in conjunction with the privilege of a tax-free coupon—to ensure a strong response, with immediate closure of the lists. The £5,000,000 offered was covered 5½ times, and the stock opened at a premium of ½, later narrowing to 5/16. Another gilt-edged issue will be launched next week—a further £2,000,000 for the City of Nairobi, by way of 3½ per cent stock, 1968-70, offered at 99.

*

Weakness in the Shorts

In addition to these sources of pressure on gilt-edged, the market has been troubled this week by reflections upon the case for a more positive monetary policy as argued in these and other columns in recent weeks. As a result, the gilt-edged scene has presented one quite unusual feature—a sharp weakness in short bonds, the yields on which have actually risen more than have those of the longs. This is quite contrary to experience during the earlier phase of market malaise, in which apprehensions about the risks run on the longer dated and irredeemable stocks served to emphasise the attractions of the shorts. At the time the last issue of *The Economist* went to press, the short bonds were standing only fractionally below their pre-budget levels, despite the considerable fall that had occurred in the mediums and longs; but on the Friday the short market weakened sharply, the 2½ per cent Exchequer Stock, 1955 (which now has a life of just under 3½ years), dropping by 9/32. It has since eased further, so that over the week its yield has risen from 1 27/32 per cent to nearly 2 per cent, compared with 1 25/32 per cent on Budget eve. The spread between the yield on this stock and that on 2½ per cent Consols, which had widened from under 1 11/16 to nearly 2 per cent in the previous five months or so (almost wholly because of the fall in Consols), has therefore narrowed to 1½ per cent in a few days.

The market has argued that the relative immunity enjoyed by the shorts during the long phase of decline in the medium and long stocks is primarily attributable to the maintenance of the official peg for short money rates and Treasury bills. It is felt that if this peg were removed or reinserted at a higher level, the yields on short bonds would come into closer alignment with those on the medium and longer stocks. Since the decisive voice in this market is generally

that of the discount market, which runs its bond portfolios on short money borrowed from the banks, any substantial movement in short money rates would, no doubt, have this effect; but the argument in these columns has been that a tighter monetary policy could exert a considerable restraining force even though it did not provoke any large disturbance of the existing pattern of money market rates. Any change would obviously have strong psychological effects, and the initial repercussion on the shorts might be considerable; but if the increase in money rates were moderate (such, for example, as would approximately restore them to the levels ruling before Dr Dalton's arbitrary reduction in 1945), there would not necessarily be an equivalent change in the eventual yield basis for the short bonds—unless the discount market were apprehensive that the whole rate structure would be lifted still further. The margin between bond yields and money rates fluctuates within quite wide limits, and it is wider now than on many occasions in the past.

Stock Exchange Celebrations

The Stock Exchange is celebrating in festive mood the hundred and fiftieth anniversary of the laying of the foundation stone of the present House. Members gave a rousing welcome to the King and Queen when they graciously visited the building on Wednesday, and a commemoration banquet, which many City notables will attend, is being held on Monday next. On the all too rare occasions when the Stock Exchange basks in some share of the popular limelight—as has happened during the current festivities and, on a smaller scale, during its recent début on television—the House should take every opportunity to get to grips with the problem to which the King alluded in his speech when he told members that “the great majority of your fellow-citizens have only an extremely hazy idea of the complicated machinery revolving within these walls.”

It is worth pointing out, too, that Stock Exchange publicity should not be unduly on the defensive in its attitude towards the acquisitive instinct; there has perhaps been too much emphasis, in the television programme and in outside pronouncements in the House's support, on the fact that “the volume of speculation is unimportant in relation to the volume of genuine investment” and that “charities and pension and welfare funds are among the House's best customers.” The point that really needs to be got across to the public is, surely, almost precisely the opposite one. Britain now enjoys a higher standard of living than most of the rest of Western Europe largely because the machinery for linking ordinary people's acquisitive instincts with increases in production has worked better—or, perhaps one should say, used to work better—here than elsewhere. And in that machinery, which is the mainspring of a free economy, the expertise that the Stock Exchange has accumulated over more than two hundred and fifty years of its history in Change Alley and Capel Court plays a vital role. Unfortunately it also plays a mysterious role—and that mystery cannot easily be elucidated even by those whose job it is to analyse it without adequate statistics. It is singularly unfortunate, therefore, that at the anniversary meeting of the Proprietors of the

British Banking Survey

The annual survey of British Banking will appear next week. *The Economist* will contain a group of special articles on salient banking trends, and comprehensive statistical tables on banking in the United Kingdom, Eire and the British Commonwealth will be published in the *Records and Statistics Supplement*.

Stock Exchange last week the Council had to announce that it has withdrawn the form of questionnaire recently circulated to members about past turnover and other information that the Council hoped to publish; the chairman, Mr Braithwaite, hopes that it will be possible to work out a new basis for the publication of statistics and that the whole House will co-operate to that end. Some members had apparently felt that completion of the original questionnaire would have involved disclosure of trading secrets, while a good many others shrank from the volume of work involved. Members have still to learn how closely the need for better public understanding of the role of the Stock Exchange touches their own interests.

Mr Stokes and Mr Strauss

The demeanour of Mr Stokes—ebullient and confident—upon his return this week from discussions in the United States concerning his new responsibility of raw materials, was seemingly encouraging. His words, of necessity, were vague. Sulphur supplies in the second half of this year “would be better”—a statement could be expected in two weeks' time. Cotton prospects were much brighter. He was sure America appreciated Britain's shortage of shipping and would “come to our aid.” Molybdenum had taken up most of the time in his talks, but these had covered all the raw materials in short supply. He thought, in general, “we were going to be all right”: but he did not expect very early results from the work of the international commission on raw materials in Washington. Later in the week he reiterated his optimism, criticising “people who blare about shortages when they don't exist”—which would seem to be rather over-stating his case; and incidentally allied himself with the estimate of 16 million tons of steel output this year that some weeks ago the British Iron and Steel Federation upheld against the expressed doubts of the nationalised Iron and Steel Corporation and of the Minister of Supply.

Mr Strauss, at the same time, was equalling Mr Stokes in vagueness—if not necessarily in optimism. In two talks with the press during one day of a tour of arms factories in the North-West, he managed to skate around the subject of direction of labour in a way that gave some of the national newspapers the impression that he thought it was likely and others that he thought it was not. The same ambiguity of interpretation applied to his remarks concerning the possible diversion of cotton workers to munitions production. The official emphasis appears to be upon his statement that direction and diversion were not necessary or intended at the moment, and that possible reductions of activity in some industries through shortage of raw materials might be relied on to supply some of the labour for new or re-opened arms factories. The Minister of Supply's interest in manpower for defence production is natural. But in discussing the prickly subject of direction of labour—without, apparently, anything very new or useful to say about it—he was well advised to point out that such a decision would require the consent of Parliament. He might have been better advised to remember—and to point out—that it would not, in any case, be a decision taken by the Minister of Supply.

Europe and the Sulphur Shortage

How disproportionately the shortage of sulphur from America affects Britain, compared with other Western European countries, is illustrated in a survey of sulphuric acid production and raw materials issued by the Economic Co-operation Administration this week. Only six of the 14 OEEC countries manufacturing sulphuric acid make any from raw sulphur; and whereas Britain depends upon it for more than 50 per cent of the acid produced here, elemental

sulphur accounts for only about a third of Swiss acid and a fifth of that produced in Norway, France, and Belgium-Luxembourg.

The pattern of sulphuric acid production from different sulphur-bearing materials in the remainder of Western Europe, indeed, appears to be already not far removed from what Britain is striving to attain in two years' time. Pyrites, the main alternative raw material, accounts for about two-thirds of all sulphuric acid production in the OEEC countries: of the major producers, Italy, though a considerable sulphur producer, uses pyrites for 88 per cent of its acid production, France for 82 per cent, Western Germany for 80 per cent, and Belgium-Luxembourg for 52 per cent. The United Kingdom uses pyrites for only 17 per cent of its acid output. It is true that Britain makes more use than most other countries of other alternative raw materials, such as spent oxide from gasworks, anhydrite, and zinc blende. But its greater dependence upon a raw material of which it was able to discern limitations upon supplies some two years ago is somewhat striking.

The present comparison cannot entirely be taken as a measure of the foresight of Western Europe's different national planners and businessmen. It has a certain amount to do with wartime policy. In 1938 only 22 per cent of Britain's acid was made from crude sulphur, but during the war all new plant was based upon sulphur and some existing plant converted to burn it, partly because equipment for this process was cheaper, and partly because sulphur from the United States looked more secure than pyrites from Spain and Portugal. Across the Channel, of course, the reverse held good for materials, and major producers therefore naturally strengthened their dependence upon pyrites. That, however, is not the whole of the story. The ECA survey fairly points out that since 1949 use of pyrites for sulphuric acid has risen by 59 per cent in Germany, by 38 per cent in Belgium-Luxembourg, 22 per cent in France, and 12 per

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 38 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

cent in Italy (largely by bringing into use idle and war-damaged plant). War, in fact, left these countries better situated to withstand a sulphur shortage than was Britain; but they may have further improved their position. Last year, partly owing to abnormal breakdowns of overtaxed plant, Britain actually used less pyrites for sulphuric acid production than in 1949. No advantage can be gained by attempting to apportion blame for this inflexibility. In 1947 the Government began to encourage the use of pyrites in new acid plant—partly in view of the balance of payments—and since mid-1949 it has refused to approve licences for construction of sulphur-burning acid plant. Some acid producers, upon their own assessment of the materials prospect, had already begun construction of plant using pyrites. The difficulties of producers pressed to change—in some cases to change back, within a decade—to a process involving costlier equipment can be understood. But appreciation of this situation, and action to meet it, do appear to have been too slow: and British industry as a whole will be paying for this laggardliness in the next few years.

Steel Output and Scrap Prices

Current steel output presents an extremely patchy picture. Output in Scottish steelworks, which are particularly dependent upon supplies of scrap, has recently been cut sharply: Colvilles, for example, has reduced its output of all classes of steel product by 18 per cent. Steel Peech and Tozer at Sheffield has taken a fifth open-hearth furnace out of commission and is working its cogging and billet mill for only 12 shifts a week compared with the normal 17. Yet in other parts of the country steelmakers with satisfactory stocks of materials are producing at almost record levels: and taking the country as a whole, current output appears to be

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London and Branches

Founded 1771 Manchester, London and Branches

something approaching that in May last year—which might imply up to two per cent lower than last month. Imports of German scrap are low and dwindling: German pronouncements upon future exports appear to ignore the responsibilities assumed last year by Britain in the joint defence of Western Germany, which must eventually cost steel. British negotiators, from Government departments and the industry, are pressing for a larger share of the limited scrap exports (15 per cent of current German collections) than just under half, which Britain is receiving at present: but there is of course no prospects of scrap imports of an order approaching that of last year. Imports of iron ore are barely meeting current consumption, and nothing is being added to the industry's stocks: in this connection, the industry is looking with interest but with some reserve to Mr Stokes's remarks concerning shipping. Slightly improved collection of home scrap presents the one encouraging feature of the raw materials situation.

It is as yet impossible to judge the effect of the renewed home scrap drive, though the increases so far may well have arisen mainly from quicker "turn-round" within the steel industry itself. The question of price—concerning which the privately and publicly-owned central organisations of the industry alike preserve an impenetrable reticence—has this week been brought into the open by the National Federation of Scrap Iron, Steel and Metal Merchants, who deny that scrap merchants in general are satisfied with a level of scrap prices almost unchanged since prewar (slight adjustments for extra transport costs have been permitted). As regards the first owner of capital scrap, the price control does allow for a few grants in special cases such as the recovery of tramlines, and occasionally of agricultural scrap. But the scrap merchants, whose labour, power, oxy-acetylene and overhead costs have risen in accordance with the general price level, complain that the margin that the present price—roughly £4 10s. a ton—allows them makes collection, sorting and delivery to steel-works hardly worth while. They feel that the "tatters"—individual rag-and-bone merchants—who collect marginal supplies of small scrap will hardly bother about scrap iron when woollen rags, for example, fetch £950 a ton. Prices abroad vary from about £8 a ton in Holland to more than £20 a ton in Belgium and Italy; where these have not been allowed to rise, substantial amounts of scrap are traded through black markets. No black market in scrap exists here; but the feeling of the scrap merchants—and the lack of incentive for owners of odd items of scrap rusting in out of the way corners—may mean that in getting out that last million or half-million tons of scrap, the steel industry may need to consider price once again, despite its admitted successes in past years.

* * *

A Heavy Jet Bomber

The first flight of the first heavy jet bomber built in this country is an important event for the designers, Vickers-Armstrongs, Ltd., and an even more important one for Bomber Command, which can now look forward to deliveries of its first postwar long range bomber towards the end of next year. Even though orders for the Vickers bomber had been placed at the beginning of the year, the success of a design is never certain until the first flight. Large high-speed aircraft present greater difficulties than do fighters; this is the first proof that British designers can surmount them. Vickers now emerge as one of the leading airframe constructors in the rearmament programme. The company is busy on orders for naval fighters, trainers, troop transports and the Viscount airliner, and is tooling up for the new bomber and for the first swept-wing fighter to be ordered for the RAF. This second new aircraft also may be ready for delivery by the end of 1952.

However great may be the military advantages of standardisation, there is probably much wisdom in the decision

of the Ministry of Supply to encourage bomber design and production in this country as well as in the United States. The design of jet aircraft—and particularly of jet bombers—is still in a state of flux, and the adoption of the British-designed Canberra in preference to competing American designs suggests that builders have not yet accumulated sufficient experience of such aircraft for either country to specialise—as was once suggested—on certain classes of aircraft. Yet allowing for the importance of technical superiority, some concessions may have to be made to the needs of quantity production. The type of turbine in this bomber, and in nearly all new British and American aircraft, contains between 1,400 and 2,000 blades that are very difficult to make by modern production methods. Without downgrading the materials used for them, and thus shortening the engine's life, these blades cannot yet be mass-produced in the accepted meaning of that term; and their supply might, under certain conditions, impose a brake on engine production. Six years of work in both countries appears to have brought a solution no nearer; is it not time to ask engine designers to bear in mind the limitations of quantity production techniques?

Italian Labour

The National Coal Board has at length gained some practical results from its recruiting of Italian workers. Representatives of the board and of the Ministry of Labour have been examining applicants in Rome for some months and the first party of 24 has arrived this week. Medical examination and travel to Britain has been arranged by the Ministry; from the reception hostel the NCB is taking its Italian recruits to a centre at Maltby, near Rotherham, for about ten weeks' study of English. This first party, which is made up of untrained, "green" workers, then requires the statutory three weeks' training before going underground. The men will then be drafted to areas particularly needing manpower—provided that the local unions agree. The NCB divisions to which they are likely to be sent are the Scottish, North-Eastern, North-Western, South-Western, and West Midlands; most of the coalfields concerned have already had experience of Poles and European volunteers.

After the first arrivals, parties of about 30 are expected to arrive each week. The NCB's training centre could accommodate rather more than the 300 odd implied by this rate of arrival; but it is not by any means clear how many Italians will in fact be brought to Britain. The first figure, mentioned during negotiations with the union last year, was 6,000; later estimates of the numbers of recruits who might be available were as high as 14,000. These estimates, too, spoke of trained miners: but it seems clear that the number of trained men still to be had is very much smaller than seemed possible late last year. Belgium, during the winter, was also recruiting such men and it secured a large proportion of those available. It seems possible that by the end of the year some 2,000 to 3,000 Italians might actually be working in British mines (generally on haulage and other ancillary activities, allowing British miners to be upgraded to the coalface). By the end of the summer, when the pipeline is beginning to deliver recruits to the pits, the NCB should have a clearer idea of its home manpower prospects, and of the number of foreign miners it will need.

Trouble About Plasterboard

The Minister of Works has taken a most unusual step in issuing three orders imposing maximum prices for gypsum, plaster and plasterboard produced by companies belonging to the British Plaster Board group, and not upon other manufacturers of these three products. The action does not arise from any general considerations regarding the supply of these

COPPER:

Although copper was probably the first metal to be worked by man, it was not until the beginning of the 20th century that its existence in Northern Rhodesia

was finally confirmed. The presence of copper had long been suspected by Europeans, and Livingstone in his Journals relates how he himself used a native preparation of powdered green malachite as a salve for his tropical ulcers.

After intensive prospecting copper deposits were finally found on the borders of Rhodesia and the Congo in 1902. Although mining operations did not begin until 23 years later, such was the progress of the industry that in 1950 copper production in Northern Rhodesia was valued at £43,000,000.

Full and up-to-date information from our branches in Northern Rhodesia on market conditions and industrial trends in the territory is readily obtainable on request. Please write to our Intelligence Department at the address given below.

IODINE

THE element iodine, best-known in the form of the antiseptic solution "tincture of iodine", is found only in combination with other substances. Discovered in 1811, it was later identified as one of the elements by Sir Humphry Davy and by the French scientist Gay-Lussac. Iodine is present in minute quantities in sea water, and is recovered from kelp, the ash of certain kinds of seaweed. Small but valuable quantities of the element are also obtained from brine wells in America and Java, but by far the greater part of the world's supply is extracted from caliche—a natural form of sodium nitrate found in the desert region of Northern Chile. Because iodine is essential to health, it is sometimes added, in the form of potassium iodide, to table salt and animal feeding-stuffs. It is widely used as an antiseptic, and in the treatment of thyroid deficiency. Other iodine compounds play an important part in the sensitising of photographic films and plates, and in chemical analysis.

I.C.I. makes 'Salodine' iodised table salt, and iodised salt licks for livestock. It also uses iodine compounds in the manufacture of certain aniline dyes for the textile industry.

products. Gypsum and plaster, indeed, are relatively plentiful, though shortage of suitable paper has curtailed the production of plasterboard at a time when builders are using it in increasing quantities. The British Plaster Board group produced a large proportion of last year's total output—nearly 45 million square yards—but there are several other large manufacturers including Imperial Chemical Industries which has plant at Billingham capable of producing 9,000,000 square yards a year. Since last October output has fallen, and in March production was down to 3,200,000 square yards; stocks of plasterboard, moreover, have been falling steadily for eighteen months and by March were down to 741,000 square yards, less than a week's production.

The Minister's action has arisen out of a voluntary agreement by which the producers have undertaken not to increase prices without his consent. In recent months discussions have been held about the raising of prices to cover the higher cost of coal, transport, and paper. Talks with the British Plaster Board group on this matter ended in deadlock, and the Ministry states that the group has now withdrawn from the voluntary agreement. Some other producers, by agreement with the Ministry, are able to increase their selling prices by a higher margin than that allowed in the maximum price orders now made to cover British Plaster Board's products. These permit an increase of $\frac{1}{4}$ d. a square yard on the price of plasterboard, so that wallboard made by the group now sells at 2s. 2 $\frac{1}{4}$ d. a square yard—while the increases allowed to the other producers range from 1d. to 1 $\frac{1}{4}$ d. a square yard. The Ministry's explanation is that the costs of the other companies are higher than the costs of British Plaster Board, but the group has yet to publish its own comments on the dispute. It is, however, possible at this stage to question the desirability of singling out an individual producer for administrative action of this kind, particularly action which appears to deal less favourably with that producer by comparison with others.

Capital Security

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 2 $\frac{1}{4}$ % per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured

upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.

Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 • RESERVES £330,000

OPEN ACCOUNTS 16,000

A copy of the latest balance sheet, together with an explanatory booklet, may be obtained from the Secretary.

Power at the Pithead

Coal mining is not only the primary source of nearly all the electricity generated in the United Kingdom: it is also one of the most important industrial users of electric power, consuming perhaps 4,000 million units a year, equivalent to about eight per cent of the electricity generated annually by the British Electricity Authority. That consumption is certain to rise: the Reid Report advocated all-electric power for new mines and complete electrification of existing mines wherever possible, and the National Coal Board, slightly more cautiously, expects a total consumption of 7,500 to 10,000 million units a year by the time its long-term plan matures in 1965. More power at the coalface, indeed, is a technical prerequisite of the coal plan and of the new mining methods that may supplement it. The National Coal Board and the British Electricity Authority are now considering whether extra electric power should not only be available, but generated, at the pithead.

The coal industry already, in fact, buys only about half its electricity from the electricity supply industry. It owns and operates on its own account 379 power stations, containing 895 small steam-generating sets, nearly all no larger than 3,000 kW capacity. With this equipment—mostly old, obsolete and inefficient—it generates some 2,000 million units a year, handling a maximum demand of just under 500,000 kW. Its remaining demand is met by purchases of power from the Area Electricity Boards. The provision of perhaps 1,500,000 kW of additional capacity, to meet the industry's estimated maximum demand in fourteen years' time, will be no small task in itself. But it is further complicated by the Board's desire—justified in the interests of general fuel economy—to link the provision of power with the low-grade fuel problem of the coal industry.

For years the proportion of inferior coal in the total raised to the surface has been increasing, and modern methods of

mining and dust suppression will continue to increase this proportion. At the same time the consumer's demand for more consistent quality requires heavy investment in cleaning plant—of the order of £1,500 for each ton of hourly capacity. Some of these inferior fuels are burnt in the large power stations of the BEA, when quantities available, consistency of quality, and low transport costs permit. But the Coal Board believes these should be supplemented by power stations at the pithead, run in conjunction with the colliery cleaning plant, to burn further unsaleable fines and middlings; and by centrally-sited power stations serving a group of collieries with low transport costs on fuel. They have been encouraged by practice on the Continent: in Holland, Germany, Belgium and France low-grade fuels are burnt in special furnaces at "mine-mouth" power stations.

★

The first approach to the project in Britain has been a joint study, by the Coal Board and the BEA, of a specific case at one of the Board's collieries. The question of special equipment to burn the lowest grades of coal—with a lower thermal efficiency than normal but possibly, owing to their cheapness, with a satisfactory economic efficiency—has been studied in conjunction with the boiler plant manufacturers. The principle that the price of electricity supplied by such a pithead power station to the collieries should bear a relation to the price of coal supplied by them would seem to follow. But no decision has yet been reached upon a question that—in general if not in the specific case—may well become the most important: who is to run these power stations? The Board, inclining towards treating pithead-generated electricity as a by-product of coal production, may feel it should become one of their diverse "ancillary activities": the BEA, following the traditional policy of the electricity supply industry, may no doubt consider that if any advantages in fuel economy are to be gained by operating power stations on colliery sites, its engineers are the right people to do it. Other factors affect the discussion, such as the suitability—and readiness—of colliery sites, the supply of equipment and personnel; and the balance of financial advantage. It would be too early to prejudge an argument upon the principle: but it may well be one that the Minister—with such advice as he can muster upon national fuel policy—will eventually have to decide.

★ ★ ★

Canada's Balance of Payments

In 1950, according to official figures just published, Canada ran a current account deficit of \$316 million, compared with a current account surplus of \$187 million in 1949. But its gold and U.S. dollar reserve rose by \$625 million, in contrast with its increase of only \$119 million in 1949. The reconciling factor between these two at first sight contradictory statements of fact was, of course, the net inflow of \$941 million of capital into the Dominion last year; in 1949 there had been a net capital outflow of \$68 million. All this vast net inflow of capital came from the United States, but only about \$167 million of it represented direct United States participation in the development of Canadian resources (chiefly for petroleum development in western Canada and mining development in Quebec). The rest of the inflow from the United States, amounting to over \$780 million, was mainly motivated by American investors' expectation that the foreign exchange value of the Canadian dollar would be increased—an expectation that was particularly rife in the third quarter of the year. After the Canadian dollar was set free and allowed to float upwards on October 1st, the net inflow of capital stopped altogether—although it did not apparently go sharply into reverse.

In "normal" conditions of international trade, it might seem peculiar that a country whose external accounts were

swinging over from moderate surplus to moderate deficit should have enjoyed (or had to bear) an inflow of speculative capital on the scale of the inflow into Canada last year. But as the regional analysis in the latest Canadian foreign exchange report showed, the change to an overall deficit coincided with a striking movement towards better regional balance. Canada's current account deficit with the United States shrank from \$589 million in 1949 to \$394 million in 1950, and its current account surplus with the United Kingdom fell from \$439 million to only \$33 million (thanks to a 33 per cent increase in British exports to Canada, and a similar percentage decrease in British imports from it). As Canada ran a deficit of \$26 million with overseas sterling area countries last year (against a surplus of \$135 million in 1949), its accounts with the sterling area as a whole came very near to exact balance in 1950, after having shown a surplus of no less than \$574 million in 1949. Canada, in short, has now reached a position where its overall external accounts show a current deficit that is not inappropriate to its present state of development, but where those accounts are not jacked up by excess sales to customers that always seemed liable to be cut off from it by the exigencies of dollar supplies.

★ ★ ★

Export Volume still rising

The detailed foreign trade figures for April confirm the importance of prices in Britain's present trading position. Since April last year the index of import prices has risen by over 41 per cent, whereas the export price index has risen by only a little over 17 per cent. Export prices have been rising steadily month by month, but far less than import prices. Thus the exporting industries of the country start at a disadvantage apart from physical difficulties such as shipping space, which improved in April, or raw material shortages and the switch to rearmament, which do not yet seem to have affected exports appreciably. The volume of exports for the first four months of 1951 compares well with last year. According to the Board of Trade index, the volume for January to April this year was about 3 per cent above the average of last year and over 8 per cent above the average of the first four months of 1950.

Compared with the corresponding period of 1950 the volume of exports of cotton woven piece goods was nearly 15 per cent higher in the first four months of this year; woollen and worsted manufactures increased by more, but rayon manufactures were less than last year. Exports of commercial vehicles, motor and pedal cycles were larger than last year; exports of new cars were about a tenth lower, but exports of chassis were a little higher. Exports of most types of machinery were about the same as last year, but exports of machine tools were slightly increased, as was the total for machinery and parts. Dollar exports would seem to compare well with those in the same period in 1950. Automobile exports were less to Canada, but in general greater to the United States; cotton and wool goods increased to both countries. Machine tool exports were greatly increased to Canada and the total exports of machinery and parts increased by over a quarter to Canada and also by over a third to the United States. Thus exports of manufactured goods have been running above their corresponding 1950 level, and at about the level of the last quarter of that year. It is still too early to gauge what the effect of steel and other shortages or of rearmament will be.

**NATIONAL BANK OF INDIA
LIMITED**

Head Office: 26 Bishopsgate, London, E.C.2.

the headquarters of one of the oldest insurance companies and used to house Lloyd's. The age and ubiquity of British insurance is effectively illustrated by tableaux flanking a large crystal globe in the centre of which appear a number of different pictures depicting the insurance aspect of recent scientific developments. There is also a machine that issues a personal accident insurance covering the purchaser for £1,000 against death and serious injury (other than from war or aviation) during the succeeding 24 hours, for a premium of 6d. There would seem to be scope here for racing motorists, steeplejacks and others who are not normally eligible for this type of insurance to profit from a visit to the exhibition; the annual rate of premium is, however, comfortably in excess of that normally charged for personal accident insurance of this type, and the insurers are thus well protected against adverse selection. A machine of similar type is to be installed at Heath Row Airport in the near future.

Until it was galvanised into activity by the threat of nationalisation, British insurance advertising was uninspired and uninformative. An active anti-nationalisation press advertising campaign was then initiated by the life offices; it has since developed into the collective advertising of the merits of life assurance. The British Insurance Association, too, has begun running a series of advertisements focused upon the more unusual types of overseas insurance. These efforts are a welcome sign that a great industry is not frightened of speaking for itself and the public it serves.

* * *

Hastening Coal Compensation

It is to be hoped that the former Durham coal owners' scheme to hasten agreement on valuation of all collieries in the district—and hence the eventual share-out of the district's £13 million compensation for assets with "coal industry value"—will be accepted. The proposal of the Durham Coal Owners' Association is that two independent assessors should determine the valuation of the collieries by April next; members of the association who accept, and coal owners outside the association who also enter the scheme, will be bound to accept the findings of these assessors. The assessors' findings will then go forward to the District Valuation Board, whose responsibility it is to fix the valuation of these assets in accordance with the district's share of the "global compensation" of £164.6 million originally fixed by the Greene tribunal—and of other assets of the former colliery companies that are paid for apart from the "global sum."

There is no guarantee that the District Valuation Board will accept the valuations determined by these assessors and voluntarily accepted by the coal owners; it may well vary some or all of them, since it cannot devolve its formal respon-

sibility in the matter. When such voluntary agreements were first put forward, indeed, the question was raised whether they accorded with the provisions of the nationalisation statute; but the Ministry commented that the valuation boards could obviously take note of these agreed valuations, and if they so judged could accept them in whole or part. In practice the inability of owners to agree on relative valuations—and hence upon eventual division of the compensation—has been one of the more protracted of the chain of delays that make up the process of compensation. Such agreements have already hastened the process in four smaller coal districts—Somerset, Leicester, Cannock Chase, and Kent—and some payments have been made to owners in these areas. Durham, and also Northumberland, which in January accepted a similar voluntary scheme, are the first of the larger valuation districts to follow their example—one that must be acceptable to the vast majority of colliery shareholders, whose share of the £164.6 million total has steadily declined in value during the four years of official and private delays over this settlement.

Shorter Notes

Shell's final ordinary dividend of 7½ per cent, tax free, brings the total payment to 12½ per cent net, much as the market had expected. After the announcement selling of Shell ordinary units by the inevitable optimists who had hoped for 15 per cent was quickly absorbed by strong investment buying and the price showed little change on balance at £4½.

* *

The Treasury has consented to a reorganisation of the capital of three leading Rhodesian copper companies by the capitalisation of reserves. Roan Antelope are to issue four new 5s. ordinary shares for every five stock units now in issue; Rhodesian Selection Trust are to make a one for one bonus issue; and Mufulira, which is controlled by RST, are to issue two new £1 ordinary shares for every three.

* *

The announcement by Standard Motor of a scrip bonus of five new 5s. ordinary shares for every two existing 5s. stock units, which will raise the issued ordinary capital from £1,465,000 to £5,127,500, warmed the stock market. This step has been taken to indicate a greater distribution to equity shareholders this year.

* *

Japan imported 75 million lb. of raw wool in 1950 compared with 41 million lb. in 1949. Australia supplied 60 million lb., New Zealand and South Africa together 7 million lb. and Argentina and Uruguay 8 million lb. Its consumption of raw wool last year amounted to 51 million lb. (clear basis) against 16 million lb. in 1949.

Company Notes

Royal Mail.—The Ministry of Food's muddle and mismanagement during the long course of its negotiations for a bulk-buying meat agreement with Argentina has had a serious effect on the trading fortunes of Royal Mail and other shipping companies that operate specially constructed refrigerated liners for the River Plate trade. After the cessation of meat imports in July, 1950, Royal Mail could not find full alternative employment for its refrigerated liners. Despite relatively satisfactory results from its other operations, therefore, the company's operating profits fell from £2,946,863 to £2,373,551. The shipowners consider they have a justifiable claim on the Government for protection against these losses, which were incurred through circumstances quite outside their control. Representations to secure compensation have been made, but so far with no success. Another special risk

attached to trading with South America today is that arising from the delay in remitting accumulated balances of freight and passenger money from Brazil and Argentina; as a result of this delay, the amounts due to the Royal Mail from subsidiary companies have risen in the latest balance sheet from £135,101 to £508,957. Although some remittances have been received since the end of the year, others are still piling up; this is giving rise to some concern lest there should be a repetition of the exchange losses that the company suffered last August, when Argentina devalued the "free" peso rate.

In view of the decline in profits, ordinary shareholders cannot feel dissatisfied with the maintenance of the ordinary dividend at 7½ per cent, to which must be added the additional tax-free 2 per cent distribution from capital profits. The financial position of the group appears to be sound; there has

been a fall in cash holdings from £6,174,152 to £3,833,149, but this has been balanced

ISSUE TO SHAREHOLDERS OF 1,000,000 4½% CUMULATIVE REDEEMABLE PREFERENCE SHARES OF £1 EACH AT PAR. (Dividend on the Preference Shares will be payable by equal half yearly instalments on the 30th June and 31st December in each year. The first payment will be payable on the 31st December, 1951, and will be 5.175d. per share less income tax.)

JOHNSON & PHILLIPS, LIMITED are well-known throughout the world as Electrical Engineers and Cable Makers.

The Directors have decided that it is desirable to raise further permanent capital and they have accordingly offered the Preference Shares referred to above to the Ordinary Shareholders by way of rights in proportion to their respective holdings.

The net assets of the Company as shown in the audited Balance Sheet at 31st December, 1950, together with estimated net proceeds of the present issue of Preference Shares, are sufficient to cover the capital of such Preference Shares more than 4 times.

The average of the profits for the three years ended on the 31st December, 1950, before charging Income Tax but after deducting Profits Tax thereon at the rate of 10 per cent. and an additional 40 per cent. on the dividend on the Preference Shares, is sufficient to cover the dividend on such Preference Shares more than eight times.

financial strength, however, must be considered in relation to what the chairman called "the high and increasing level of all shipping disbursements and the greatly increased cost of new tonnage."

The resumption of meat imports from Argentina will, of course, be of material benefit to the company this year, but increases in freight and passenger fares are lagging well behind the rise in operating costs; liner companies operating their ships in regular trades and at Shipping Conference rates benefit only indirectly and to a very limited extent from recent rises in the freight rates for bulk cargoes—rises that have been caused by increased demand for tramp tonnage. In view of the increase in general expenses and shipbuilding costs and of the need to maintain an adequate fleet under the heavy burden of taxation, it would seem to be wise to avoid excessive optimism about the prospects for much higher profits this year.

Monsanto Chemicals.—The two most important problems facing the chemical industry today are the acute shortages of such essential raw materials as sulphur and the prospect of having to switch productive capacity to meet the needs of the rearmament programme. Demand for the industry's products is likely to remain high for some years to come, and Monsanto Chemicals is well placed to meet it. Its extensive capital development programme has borne an early crop of fruit this year in a sharp rise in trading profits from £959,127 to £1,685,897. The bulk of the additional volume of business came from greater production at the newly constructed factory at Newport, although raw material shortages prevented the plant from working continuously at full capacity. Monsanto have not neglected to pass some of the benefits on to ordinary shareholders, as was noted in *The Economist* of March 24th; it has raised its dividend from 45 to 55 per cent.

Progress in the capital extension programme has been rapid in recent years; capital additions of £1,300,000 brought the total sum spent in the four years 1947-50 to over £5,250,000; in addition, capital works still in progress are shown at £841,044 and outstanding commitments at £740,000. A broadening of the basis of issued capital to support the expansion of the company's operations has therefore become advisable; permission has now been given by the Treasury for a further issue of £1,500,000

preference shares and for the two for one bonus issue of 7,200,000 5s. ordinary shares credited as fully paid from the share premium account. That the capital programme has imposed some strain on financial resources is reflected in the fall in net current assets from £1,709,447 to £1,422,001 and in cash from £567,370 to £224,775. The company had to borrow £500,000 from the banks in 1950, but the strain will be eased in the current year by the proceeds of the preference share issue. The chairman argues in his address that while "the state will no doubt provide the capital equipment required for direct armament production, it is apt to

rely on industry for the indirect requirements. He suggested, therefore, that "for capital projects of that indirect nature found to be necessary in the interests of the national economy during the rearmament period, the state should revise present initial and wear and tear allowances so as to allow capital expenditure to be written off in equal instalments over five years." In view of the Budget decision to scrap initial allowances altogether, this seems likely to be a vain hope, and Monsanto will probably have to push ahead with its capital programme without the benefit of taxation reliefs.

An appreciable increase in turnover is anticipated this year, but budgeted output has been set considerably below maximum capacity owing to the difficulties in obtaining sufficient supplies of raw materials. The chairman expects the shortage of sulphur to be of long duration, and estimated that the conversion to the use of pyrites and anhydrites to overcome this difficulty will take up to five years. Despite these raw material problems, however, the outlook for the company and its shareholders looks bright, both in the current year and in the more distant future.

Marks and Spencer.—The bonus issue and dividend policy of Marks and Spencer was discussed in *The Economist* when the preliminary statement of profits was published. The impressive rise in trading profits from £5,989,951 to £7,486,863, which enabled the company to raise its ordinary dividend from 60 to 75 per cent, is partly a reflection of the shopping trends of the year, which seem to have generally favoured multiple chain stores at the expense of single-branch departmental stores. Some of the explanation for Marks and Spencer's especially good results, however, is perhaps to be found in the fact that a good part of the company's business is in foodstuffs and utility clothing, both of which have rapid rates of turnover; total turnover almost certainly increased substantially in the latest financial year, when the sale of utility clothing may have been stimulated by consumers' eagerness to buy before prices rose even further. The centralised purchase of cloth used by the company's garment manufacturers may also have afforded some protection against sharp increases in costs.

Cash and T.R.C.'s	4,173,717	3,705,283
Reserves	7,810,932	9,332,217
Ordinary capital	2,165,409	2,212,571
5s. ordinary stock at 20s. 6d. yields £3 17s. per cent.		

The rise in the book value of stock-in-trade from £2,894,258 to £4,372,048 results from both increased turnover and higher prices. Although liquid resources have been drawn down from over £5,500,000 to just over £5,000,000, this sum still represents a high proportion of total assets. The already impressive revenue reserves have been further strengthened and now stand at £8,425,233, against £6,903,948. Additions to general reserves and the carry forward provide a generous cover on the ordinary dividend; and while the price of the 5s. "A" ordinary units has fallen slightly from the high level of £5 that was reached on the eve of the dividend announcement, the yield of some £3½ per cent at the current price of 97s. suggests that many investors believe that the prospects for further dividend increases and bonuses are far from being at an end.

EXCHEQUER RETURNS

For the week ended May 19, 1951, total ordinary revenue was £48,056,000 against ordinary expenditure of £59,831,000 and issues to sinking funds £200,000. Thus, including sinking fund allocations of £1,550,000 the surplus accrued since April 1, 1951, is £32,311,000 compared with a surplus of £40,329,000 for the corresponding period of the previous year.

THE UNION BANK OF SCOTLAND, LIMITED

SATISFACTORY RESULTS

LARGE INCREASE IN BALANCE SHEET FIGURES

LORD BILSLAND'S REVIEW

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held in Glasgow on May 23rd, The Right Honourable Lord Bilsland, M.C., D.L., LL.D., chairman of the board, in the chair. The chairman, in submitting the directors' report, said:—

"I have pleasure in submitting the report and accounts for the year ended April 2, 1951, which with your permission I propose to hold as read.

You will observe from the accounts that the balance sheet total is now £93,980,000, an increase of £9,822,000, compared with last year. This is accounted for chiefly by a substantial increase in our deposits, which at £77,884,000 are £7,496,000, or rather more than 10 per cent. higher than last year. Acceptances and guarantees on behalf of customers at £4,655,000 show an increase of £1,796,000. This is due to the expansion of foreign trade and represents facilities afforded to customers engaged in importing raw materials or exporting finished goods. Our note circulation continues to expand and at £7,743,000 shows an increase of £523,000.

BALANCE SHEET ITEMS

On the assets side of the balance sheet, cash and money at call and short notice amount to £24,506,000, an increase of £4,807,000. The Treasury policy of financing short-term borrowing by increasing the issue of Treasury bills and restricting the issue of Treasury deposit receipts to the joint stock banks, to which I referred last year, has been continued during the period under review. Our holding of Treasury deposit receipts now stands at £1,000,000, a reduction of £500,000. On the other hand our Treasury bills show an increase of £410,000. These liquid resources amount in all to £26,467,000, about 31 per cent. of our liability on deposits and notes in circulation. British Government securities, mostly short-dated, stand in the books at £38,659,000, an increase of £1,141,000 during the year. The market value of our investments is, in the aggregate, in excess of the amount at which they appear in the balance sheet.

QUESTION OF BANKING ADVANCES

The question of banking advances is one which in these days requires much consideration. The Chancellor of the Exchequer has the full co-operation of the banks in his efforts to ensure that facilities should not be granted for speculative or other purposes inconsistent with the national interest. It appears, however, that manufacturers and traders are in many cases unable to make regular purchases of stocks to meet their normal requirements, and temporary banking accommodation is required to assist them in acquiring goods at such irregular intervals as these may become available. On this account, and also because of the marked rise in prices the high level of taxation and the increase in the cost of overheads, it is becoming increasingly difficult for customers to meet their financial requirements out of their own resources. Our loans and advances at £20,873,000 show an increase of £1,819,000.

PROFIT AND DIVIDEND

The increased earnings arising from the employment of the larger funds at our dis-

posal during the year have been offset by the continued growth in all costs of administration, particularly those relating to salaries and other staff provisions. The profit for the year, after making full provision for taxation and for all bad and doubtful debts amounts to £245,000, about £750 less than last year. A sum of £80,000 has been set aside as a reserve for contingencies and the usual allocation of £40,000 has been made towards our liability for pensions and allowances. After giving effect to these allocations and providing for the dividend of 18 per cent. recommended by the board, the amount carried forward will be £184,600, an increase of £12,000.

INTERNATIONAL SITUATION

During the year under review there was a marked deterioration in international affairs, which increasingly dominate the economy of the world. The outbreak of war in Korea last summer, with its immediate effect on industrial activity and on stockpiling in the U.S.A., and, therefore, on the price of commodities, created many new problems and released fresh inflationary forces, the full effect of which has not yet been felt. The international situation must meanwhile continue to remain tense and not without anxiety.

Largely as the result of the changed situation in the United States there was a remarkable recovery in the latter part of last year in the position of our balance of payments, which led to the suspension of Marshall Aid and the termination of drawings on the 1946 Canadian Credit. The manner in which the U.S.A. has discharged the responsibilities of economic leadership, thrust upon her by the effect of the war, has not only earned our gratitude, but has indeed saved Europe from chaos. We acknowledge also the generous aid which Canada has given to us. While the recovery in our balance of payments and the revival of confidence in sterling was largely due to external factors, a very considerable contribution to our improved position was made by a gratifying increase in the volume of our dollar exports, and in our invisible earnings, and by a reduction in the volume of our dollar imports following devaluation.

EXTERNAL TRADE

In the early months of 1951, however, a disturbing deterioration in our external position occurred. The visible trade gap for the first quarter of 1951 was more than three times that of the first quarter of last year. This is due in large part to the fact that the prices we must pay for our imports have risen much faster and much further than the prices received for our exports and to some reduction in the volume of our export trade. For example, U.K. imports in March this year increased in value by £82 million compared with the same month last year, but exports increased by only £6,000,000. The April figures of overseas trade are more encouraging, showing a marked reduction in the adverse balance and a recovery in dollar exports, particularly to Canada. It is to be hoped that this trend may continue. A sound economy is the first line of defence, and it is imperative that every effort should be made to sustain our export trade at the highest possible level.

In the current year the official estimate

of the value of imports, assuming that supplies are available, is of the order of £3,200 million. It is hoped that our invisible earnings may amount to £450 million. This would leave a gap of £2,750 million to be filled by visible exports and re-exports in 1951—a figure about £500 million higher than the total of our export trade in 1950. That is the measure of the task before us. Part of the increase required in the value of exports will come from higher prices, but part must come from an increase in volume, particularly to the dollar markets. This task, in any circumstances, would present a serious problem. Today it is only one of the major problems that confront us.

REARMAMENT AND RAW MATERIALS

Our economy, already severely strained, must now shoulder the additional burden of a huge rearmament programme which, excluding stockpiling, is estimated to cost £4,700 million during the three years from April, 1951. This expenditure is essential, so that we may defend our freedom and play our part in the resistance of the free world to the aggression which threatens us. In the task to be laid upon it industry will rise to the occasion to the limit of its capacity as it has always done, but it is faced with serious difficulties beyond its control. The maintenance of a steady flow of production depends on the availability of the necessary raw materials. Unhappily there is cause for concern regarding the supply of certain raw materials, including those necessary to sustain the maximum production of steel in this country. The great manufacturing centres of the world today are suffering from the fact that, over the comparatively recent period of great development in manufacturing capacity, so much more thought has been given to the expansion of the means of production than to the provision on an adequate scale of the raw materials necessary to sustain an ever-increasing demand. Furthermore, the greatly increased demand for electric power has frequently been in excess of generating capacity and we are informed that peak demand is likely to remain in excess of maximum generating capacity for some years. Additional generating capacity will require additional coal, the supplies of which have proved insufficient to meet current demand. The need to import coal in large quantities at high cost during the past year, and the consequent diversion of shipping, had a most disturbing effect on supplies of raw materials for other industries, notably steel, and on the level of freights. In the present state of full employment there is an obvious danger, as the rearmament programme develops, of excessive competition for labour among industries essential to rearmament and to export trade, which, failing action to regulate the position, might well have the effect of inflating the cost of rearmament at the expense of the taxpayer, and of unduly raising the cost of our goods in the export market.

HIGHER STANDARD OF PRODUCTIVITY ESSENTIAL

It is obvious that we can only shoulder our additional burdens successfully, and maintain our export trade at, or near, the necessary level, by achieving a higher standard of productivity—to the utmost limit possible in the circumstances with which we have to deal. We must direct our attention more than ever before to competitive efficiency throughout our whole economy. This is a matter of organisation and equipment and the removal of restrictive practices, but it is mainly and essentially a question of attitude of mind. It is sincerely to be hoped that a strong influence towards a fresh attitude of mind on productivity will result from the series of reports by teams drawn from management and organised labour which have recently visited the U.S.A., under the auspices of the Anglo-American Council on

Productivity, to study American industry. These reports, recently published, which are worthy of the most careful study, are unanimous in declaring that what is basically required in this country is an attitude of mind towards productivity at least comparable with the attitude at all levels prevailing in the United States. The fact that the general standard of living depends entirely on the output of the individual is unhappily not yet widely realised or believed in this country.

CURBING INFLATION

The Budget opened by Mr Gaitskell on April 10th is interesting, chiefly in the measures proposed to curb inflation. It would appear doubtful whether they will in fact prove adequate to prevent the accelerating spiral tendencies which would be so dangerous to our economy. It is most regrettable that the Chancellor failed to use the safeguard against inflation of substantial retrenchment in Government expenditure. The difficulty in filling the gap by increased production, and the effect of the rearmament programme, together with the collapse of wage stabilisation policy, make our economy very vulnerable. The increased rates of income tax and of the tax on distributed profits have the very serious effect of still further reducing the formation of risk capital on which our progress and prosperity so greatly depend.

POSITION OF HEAVY INDUSTRIES IN SCOTLAND

A year ago most economic indicators in Scotland pointed to a slowing down in the heavy industries which are the mainstay of our economy, and in the rapid rate of post-war industrial development. Shipbuilding orders were being completed more quickly than new orders were being received. The effect of restriction on capital investment was also beginning to be felt, and the volume of new industrial proposals had slackened. Employment from new postwar developments was still rising at much the same rate as in previous years, but the fact that unemployment figures were not falling at the same rate as in the earlier postwar period showed that the employment created by fresh developments was doing little more than absorb workers who were being discharged in other directions. The engineering industry was less busy during the greater part of 1950 than in the previous year, except as regards the lighter sections, but an increase in output was recorded in all branches of the textile industry. Taking the overall position of Scottish industry there was evidence of a check in the postwar rate of advance.

By the end of 1950, however, a marked change had occurred. A substantial volume of new factory developments was initiated which was due only to a limited extent to the rearmament programme. But the most striking alteration in trend occurred in the shipbuilding industry. In the first quarter of 1951 Scottish shipbuilders booked orders representing 742,310 gross tonnage compared with 36,000 in the same period of 1949. In less than five months of 1951 Clyde Shipyards have booked two years' work.

UNEMPLOYMENT

Average unemployment in Scotland in the first four months of 1951 was just under 62,000 compared with over 72,000 in the same period in 1950. Unemployment in Scotland today, expressed as a percentage of the insured population, has fallen to the very low figure of 2.8 per cent., but for Great Britain as a whole it stands at the still lower figure of 1.3 per cent. The percentage unemployed in the development area of Scotland—which is the main industrial area—is 3.1 per cent., but in the Midlands of England it is .4 per cent. These figures illustrate the relative pressure on labour resources in industrial Scotland and the Midlands of England.

While much has been done to secure the additional sources of employment and the diversification of industry required in Scotland this movement is still at a stage of consolidation. Vigilance is, therefore, necessary to safeguard our interests in relation to the allocation of scarce materials and the distribution of orders in the rearmament programme to ensure the maintenance of the advance achieved.

TRIBUTE TO GENERAL MANAGER, BRANCH MANAGERS AND STAFF

I wish to express to the general manager, all our officials and the branch managers and staff in Scotland and London, our very sincere appreciation of the splendid service they have given to the bank during the past year. Our special thanks are due to Mr John A. Morrison, the general manager, who has borne the chief responsibility, for the manner in which he has conducted our affairs.

I now beg to move that the report and accounts of the bank for the year ended April 2, 1951, be approved, and that a dividend of 18 per cent. per annum be declared, payable, less income tax, in equal proportions on June 9th and December 10th next.

The Right Honourable the Earl of Selkirk, O.B.E., A.F.C., seconded the motion, which was approved.

Colonel Hugh B. Spens, C.B.E., D.S.O., T.D., D.L., Mr James T. Dowling, C.A., and Sir Samuel R. Beale, K.B.E., were re-elected ordinary directors of the bank.

The retiring auditors, Sir Ian F. C. Bolton, Bt., O.B.E., C.A., and Mr Francis G. More, C.A., were reappointed in terms of the Companies Act, 1948.

The thanks of the meeting were tendered to Lord Bilsland for his services in the chair.

YORKSHIRE INSURANCE COMPANY

PROGRESS IN ALL DEPARTMENTS

The annual general meeting of the Yorkshire Insurance Company, Limited, was held on May 22nd at York.

The Rt. Hon. Lord Middleton, M.C., the chairman, in the course of his speech, said: Once again I am happy to report on a year of marked progress in all departments.

Life Department: Our new life business in 1950 amounted to £10½ million, which far surpasses that for any previous year, and there is every sign that the flow will be fully maintained this year. The number of new policies issued rose from 3,711 in 1949 to 5,293 in 1950. Premium income has increased by over £300,000 to £1,655,950, while annuity considerations have increased by over £400,000 to £858,825. The fund at the end of the year was £19,270,452, representing an increase of over £1½ million.

Fire Account: Premium income rose by £720,137 to £3,076,090. After making provision for unexpired risks and augmenting the additional provision by £50,000, we are able to carry £309,707 to the profit and loss account, compared with £236,582 last year.

Accident and General Account: This account continues to expand satisfactorily, the overall premium income now totalling £4,358,600, an increase of £494,352 over 1949.

Marine account: The 1948 underwriting account showed a marked improvement. Premium income expanded by £104,904, and the fund at the end of the year amounts to £2,824,301, representing 161.8 per cent. of the 1950 premiums, compared with 155 per cent. of the 1949 premiums in the previous account.

The report was adopted.

THE LONDON ASSURANCE

EXPANSION IN ALL DEPARTMENTS

The annual general court of The London Assurance will be held at the office, No. 1, King William Street, E.C., on June 13th.

The following is an extract from the statement by the Governor, Mr R. Olaf Hambro, which has been circulated with the report and accounts for the year ended December 31, 1950:—

There has been a genuine expansion of business during the year in all departments. It is also very satisfactory to be able to record that the underwriting profits in the aggregate are greater than in 1949.

DEPARTMENTAL RESULTS

Of the individual accounts, the most important in volume is the fire account, of which the premium income amounts to £6,366,000, a figure slightly greater than the combined income of the marine and accident accounts. We have been able to transfer to the profit and loss account a profit of £400,000, which represents 6.3 per cent. of the premium income. In this department the successful outcome of the account was all the more satisfactory in that the year was notable for an extraordinary series of windstorms in the United States.

The accident department does not write business in the United States, and the year was comparatively uneventful and free from calamity, and left us with a profit of £275,000, representing 8.5 per cent. of our premium income.

In the marine department business continues to be hampered by the tendency of owners to delay putting in hand repairs to damaged vessels. Fortunately, the market has been spared serious casualties during the year, and we have in consequence been able to transfer to the profit and loss account the satisfactory sum of £300,000, which is approximately 10 per cent. of the premium income, while at the same time leaving the marine fund at £4,063,000, a figure which represents 138 per cent. of the premium income and is well up to the high standard of recent years.

In the life department it is, as you know, our custom to make a valuation of the fund, both liabilities and assets, every five years. Such a valuation was made by our actuary, Mr F. Stanley Brown, as at December 31, 1950, and I am happy to say that this resulted in our being able to declare a very satisfactory increase in the rate of bonus granted to policyholders. In all the circumstances I feel that Mr Brown is to be congratulated on the satisfactory results disclosed by this valuation, and on being able to pay to the policyholders a compound reversionary bonus at the rate of £1 10s. per cent. per annum.

CONSOLIDATED ACCOUNTS

We are left with a profit for the year of £609,970, as compared with £455,821 last year. For some time your directors have had under consideration the possibility of an increase in the dividend, but have refrained from taking action in deference to the views expressed by the then Chancellor of the Exchequer, Sir Stafford Cripps. Today, circumstances have changed. The directors no longer feel justified in withholding from shareholders their due share in the profits of the business, and have decided to recommend an increase in the final dividend from 6s. 3d. to 10s., making 16s. 3d. for the year against 12s. 6d. last year.

EQUITABLE LIFE ASSURANCE SOCIETY

STEADY PROGRESS

Sir William Elderton, the President, was in the chair at the one hundred and eighty ninth annual general meeting of this company held at 19, Coleman Street, London, E.C.2, on May 23rd. The following are extracts from his speech:—

Notwithstanding the payment of more than £1,000,000 from one of our pension schemes to a statutory scheme for a nationalised industry the funds increased by over £400,000 to £22 million. The total gross revenue from interest dividends and rents exceeded £1,000,000 for the first time in our history. On the other side of the account, claims by death appear at about £294,000, the lowest figure recorded during the last five years. Expenses are still less than 6 per cent. of our premium income.

There has been some improvement in the rate of interest earned on our funds, and for 1950 the net rate was £3 15s. 1d. per cent., compared with £3 12s. 3d. per cent. for 1949.

Our stock exchange securities represent about two-thirds of our total assets.

New sums assured amounted to £4,000,000, a figure which has not varied much over the last five years, but is about double the figure at the outbreak of the last war. The accounts portray a year of steady progress and justify my asking that members should continue to bring the benefits of the Society to the notice of their friends.

So far, matters have progressed well since the end of 1948, when our last valuation was made. If this state of affairs continues, it may be that we shall not have to wait as long as the end of 1953 before we consider a further distribution of profits.

The report was adopted.

KILLINGHALL TIN, LIMITED

INCREASED DIVIDEND

The twenty-first annual general meeting of Killinghall Tin, Limited, was held in London on May 17th.

Mr Jack Addinsell, the chairman, in his statement, said that he heartily endorsed the words of the general managers in admiration of the resolute manner in which the staff and their families had stood firm in the face of the bandit menace.

The year's profit of £85,440 was very satisfactory, though it was £27,800 below the previous year, when the dredge worked through a patch of rich ground. Taxation required £65,200. Before arriving at the profit the Malayan Government received £38,031 in royalty and tin duty. A second dividend of 17½ per cent. paid in April made 25 per cent. for the year—an increase of 5 per cent.—and £10,629 (against £9,415) was carried forward.

The Syndicate formed to investigate grab dredging had been re-formed and practical data of great value were expected.

Following maturity of an amortization policy a capital distribution of £32,500 had been made, property and buildings written down to £1, and £2,800 written off rehabilitation and reconstruction. Dredge account stood at £51,992 after writing off £6,000.

The Commissioners' assessment of war damage, £90,588, represented only a part of the company's losses. A first payment of £34,352 had been offset against Government advances of £81,543 for rehabilitation, on which £118,061 was expended up to September 30, 1950.

Prospects were favourable for the current year. The output was 259 tons of tin ore in the first six months, sold at a high price.

At the meeting the chairman announced an interim dividend of 15 per cent., less tax, on account of the year.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

QUINQUENNIAL SURPLUS EXCEEDS £1,000,000

RECORD FIRE INCOME OFFSET BY HEAVY WINDSTORM CLAIMS

MR ARTHUR W. BLAIR'S STATEMENT

FIRE DEPARTMENT

The year 1950 was not a profitable one for the fire department. The premium income reached a new record total of £4,365,884 but the claims paid and outstanding rose from £1,685,182 in 1949 to £2,373,634 in 1950. Towards the end of November, a windstorm of unusual severity occurred in the north-eastern States of America where the company has extensive interests. Over 16,000 claims for damage falling within the extended coverage of fire policies were received. Most of these claims were for relatively small amounts, but, in total, they added up to more than the company had paid for the historic San Francisco fire of 1906. The directors gave deep thought to the question of meeting these particular claims out of reserves which have been built up, over the years, to meet exceptional occurrences. They decided, however, to meet this admittedly heavy loss in the current year's accounts and, by making a transfer of £189,142 from profit and loss account, the company was able to make its usual ample provision of fifty per cent. of the increased premiums for unexpired risks and to maintain the additional reserve of £1,600,000 in the fire account. Results elsewhere than in North America were very satisfactory.

It has been desired for some years to broaden the general spread of the American business and a Pacific Coast department was established in 1946 capable of giving service to a wide area of territory in the Western U.S.A. Similarly our interests in Western Canada are being expanded by the opening of a branch office in Edmonton.

ACCIDENT DEPARTMENT

Motor vehicle insurance in certain overseas areas was deliberately reduced a year ago. This resulted in a reduction in the motor premiums in 1949. Still more of these cases ran off in 1950 but, in spite of this further reduction in overseas motor premiums, the accident account as a whole has expanded and the premiums for the year 1950 amounted to £946,129 compared with £855,019 in 1949. Motor business still produced an unduly high loss ratio in most parts of the world, and it has been evident that premium rates would have to be substantially increased to meet the continually rising cost of repairs and the heavier liability claims. All other sections of the accident account have shown a satisfactory profit and, after putting aside over £45,000 to increase the reserve for unexpired risks by fifty per cent. of the increase in the premiums, the sum of £34,943 has been transferred to profit and loss account.

MARINE DEPARTMENT

The marine business is mainly handled by the "Maritime" of Liverpool. In spite of the increasingly keen rates which continue to operate in the marine market, and the very careful selection of business which is exercised, premiums have increased from £1,314,922 in 1949 to £1,388,725 in 1950. The frequent long delays which occur before damaged vessels are brought in for repairs combined with continued rising costs of repairs and replacements necessitate a constant watch on the adequacy of early estimates of damage. The marine fund of

The one hundred and twenty-sixth annual general meeting of the Scottish Union and National Insurance Company was held in Edinburgh on May 23, 1951, the chairman, Mr Arthur W. Blair, W.S., presided.

The following is an extract from his circulated statement:—

During the course of the year Mr J. J. Barrie, a former head office director, found it necessary to retire from the board for health reasons. Unfortunately his health did not respond to treatment and I very deeply regret to say that he has since died. It is my sad duty also to record the deaths of Mr Hugh W. Brown, F.I.A., F.F.A., the consulting actuary, Mr J. W. Hobbs, a Canadian director, and Mr Alexander Cormack of the Glasgow board, and the resignation of Sir Lionel Fletcher from the London board on his retirement to Tanganyika.

Mr J. A. Lumsden, M.B.E., has been appointed to the head office board and Colonel Vere E. Cotton, C.B.E., T.D., of the head office and "Maritime" boards, has been elected Lord Mayor of Liverpool.

SEGREGATION OF LIFE ASSETS

The segregation of the assets of the life assurance and annuity fund from the general funds has been effected. While of particular interest and value to the life policyholders the completion of this work should be greatly to the advantage of the company as a whole in the years to come.

QUINQUENNIAL VALUATION

The quinquennial valuation of the life assurance and annuity fund has been carried out and shows a surplus of £1,178,813 after payment of interim bonuses amounting to £61,005. The surplus includes the sum of £401,454 brought forward from the 1945 valuation. A reversionary bonus at the rate of 30s. per cent. calculated on the sum assured for each year's premium paid or assumed paid during the preceding five years has been declared in respect of the current series of participating policies in force on December 31, 1950. Appropriate rates of bonus have also been declared in respect of participating policies in funds now closed to new business. Furthermore, subject to reconsideration at any time by the directors, interim bonuses at the rates now declared will be paid in respect of participating policies becoming claims before December 31, 1955.

After applying £300,000 of the surplus to strengthen the valuation basis and transferring £120,608 to shareholders' account, the sum of £68,261 has been carried forward.

LIFE DEPARTMENT ACCOUNTS

In the life assurance and annuity account the premiums have increased from £985,476 in 1949 to £1,049,154 in 1950. Considerations for annuities increased from £420,288 to £475,537. At the end of the year the life assurance and annuity fund stood at £14,691,452 compared with £14,150,714 at the end of 1949.

The chairman expressed the hope that the increased life bonus, the segregation of the life funds and the efficiency and security provided by the life department would assist the company in contributing to the national need for thrift by attracting additional life business.

£1,791,063 is more than 128 per cent. of the annual premiums and is considered fully adequate to cover outstanding liabilities. The sum of £125,000 has been transferred to profit and loss account.

CAPITAL REDEMPTION ACCOUNT

The quinquennial valuation of the capital redemption fund enables the sum of £20,000 to be transferred to the profit and loss account and the fund has increased to the sum of £679,445.

INVESTMENTS

The gross rate of interest earned by the company for the year was £4 8s. 7d. per cent. compared with £4 5s. per cent. in the previous year, and the policy of achieving both security and liquidity from investments of the highest standing is being maintained.

DIVIDEND

In a year when so many companies are increasing their dividends the board naturally gave much thought to this subject. While the resources of the company are strong enough to enable a higher dividend to be paid (particularly in view of the increased interest earnings), it was felt that an increased dividend should not be declared in a year when a heavy loss had been sustained in the fire account. Prudence and caution have always been, and will continue to be, the underlying policy of the company. The matter of increasing the dividend will be kept under constant review.

OVERSEAS VISITS

Many territories abroad were visited by officials of the company and of the "Maritime." The deputy chairman, Mr Watson, in company with the general manager, made a tour of the United States and Canada. Mr Younger, who had occasion to be in Canada, joined them during the latter part of the visit.

OFFICIAL CHANGES

Mr J. E. Emmison, the accident manager, who had stayed with the company beyond the normal age of retirement, retired on pension, and Mr D. S. Macpherson, who has been with the company for 38 years, was appointed in his stead.

STAFF PENSION FUND

A trustee staff pension fund has been established and a similar fund is being arranged in connection with the associated company, the "Maritime." To maintain the "Scottish Union" fund it is necessary that the directors should be given powers to make such additional payments to the fund as may be necessary and the meeting was asked to grant this authority.

Mr Blair concluded by saying:—

"It is right that I should mention the greatly increased and increasing cost not only of salaries and wages but of these additional provisions by way of pension rights and staff widows' benefits which members of our staff enjoy. We are glad to be able to provide these benefits for them and are confident that their loyalty and effort will continue to be given in full measure in the future."

"To all of them and to our officials both at home and overseas, to the staffs of our associated companies and to our local directors and agents throughout the world I, on your behalf, express our appreciation of their services and their valuable support."

"I also wish to make particular mention of our employees in Harford who, in addition to their normal work, had to undertake the task of handling over 16,000 extra windstorm claims at a time of the year when pressure on the staff was already very heavy."

"Tribute is also due to the investment,

the accountancy and the life actuarial departments at head office for their extra work arising from the segregation of the life department assets and the quinquennial valuation.

"Finally, may I say, on the termination of my three years' office as chairman, how grate-

ful I am to my colleagues on the board, to the executive and to all those connected with the company with whom I have come in contact for their unfailing loyalty and co-operation."

The report and accounts were adopted.

ANGLO-PORTUGUESE TELEPHONE COMPANY

AN IMPORTANT AND ACTIVE YEAR

BENEFICIAL UTILISATION OF FRESH CAPITAL

ADVANTAGES OF THE NEW ARRANGEMENTS

SIR ALEXANDER ROGER'S STATEMENT

The sixty-fourth annual general meeting of the Anglo-Portuguese Telephone Company, Limited, will be held on June 12th at Strouger House, 8, Arundel Street, London, W.C.2.

The following is the statement by the chairman and managing director, Sir Alexander Roger, K.C.I.E., which has been circulated with the report and accounts for the year ended December 31, 1950:—

You will recall that in my statement accompanying the accounts for the year 1949 I gave information and details concerning the mutually satisfactory outcome of the negotiations with the Portuguese Government regarding an increase in tariffs and the clarification of the contract under which the company operates in Portugal. I also referred to our plans for the provision of the fresh capital required to repay loans and to expand the telephone systems in Lisbon and Oporto.

The new tariffs became effective as from May 1, 1950, so that the revenue for 1950 contains eight months' results of the readjusted tariffs. In addition, new telephones have been added at an accelerated pace, and these two factors, together with the favourable effect of the rate of exchange, account for the total gross revenue increasing to £1,303,733, compared with £939,664.

The rate of exchange, which moved to Escs.80.50 to the £ from Escs.100 to the £ in September, 1949, remained constant at the former figure throughout 1950. All currency figures in 1950 have been converted at this rate, as against the average rate for the year 1949 of Escs.94.60.

After providing for royalties to the Portuguese Government, which as from May, 1950, became fixed at the flat rate of 7½ per cent. per annum of gross earnings, and after providing for renewals and taxation, debenture loan interest, debenture sinking fund instalments and all new issue expenses, less premium received, total expenses for 1950 amount to £1,213,590, compared with £878,632.

The variation in conversion rates accounts for more than half of this increase and the remainder is due to settlement of the wage and salary conditions of the personnel in Portugal involving arrears of payments which have been necessarily delayed until the tariff negotiations were completed.

NET PROFIT AND DIVIDENDS

Net profit amounts to £90,143, compared with £61,032. An interim dividend of 3 per cent. was again paid in November, 1950, on the increased ordinary stock of the company of £1,600,000 and a final dividend of 5 per cent. is proposed, making 8 per cent. in total, together with a dividend of 8 per cent. on the "A" ordinary stock. These dividends

absorb £72,600, leaving £17,543 to be added to carry-forward, bringing it to £67,436.

In June, 1950, 400,625 unissued ordinary shares of the company were offered to existing stockholders at a price of 21s. per share. Over 98 per cent. of the stockholders took up their rights and applications for excess shares, which largely exceeded the small number available, had to be severely scaled down. In June, 1950, also the company placed £1,000,000 Five per Cent. First debenture stock, 1962-67, at a price of £97½ per cent.

These successful capital issues served to repay the company's loan from Telephone and General Trust, Limited, purchase new equipment, and left a balance at the end of the year of £82,519 deposited with the Trust towards future requirements. The changes arising directly from the issues are shown in the balance sheet by reference to the comparative figures for 1949.

PROVISION FOR RENEWALS

In accordance with customary procedure, the consulting engineers have carefully examined the condition and age of all classes of the telephone plant and have once again recommended that, over and above the normal allocation from revenue for depreciation, the additional allocation for excessive wear and tear which has been set aside annually since 1944 should be continued. Your directors have accepted these recommendations and they are incorporated in the provision for renewals figure of £1,417,151 in the balance sheet. This provision is equivalent to 30 per cent. approximately of the cost price of installed plant as shown in the balance sheet and, in the opinion of the consulting engineers, is adequate. The whole of this provision, along with the company's other reserves, is invested in the business to its economic advantage.

The installed cost of all telephone plant operated by the company now totals over £4,700,000, an increase of almost £700,000 over the 1949 total. All this plant is being well maintained and is operating satisfactorily. The replacement cost of the plant at today's prices is very substantially higher than shown in the books.

We purchase in Portugal as much locally manufactured material as possible, and during 1950 our expenditure in this connection was £109,600. Shipments of telephone plant, principally from this country, for capital development and maintenance cost £500,912 in 1950, increasing the total since 1945 to over £1,500,000.

GENERAL PROGRESS

The company must be among the pioneers of telephone operating undertakings in Europe, and 1950, the sixty-fourth year of

its long history during which it has served as an important link in Anglo-Portuguese friendship and commerce, was of great interest, importance and activity. The conclusion of the negotiations with the Portuguese Government released the full productive energies of the company to the advantage of the telephone communities of Lisbon and Oporto.

During the year, 7,463 new stations, which is a substantial increase, were added to the system, bringing the total to 100,897.

In June, 1950, a new automatic exchange in Povo do Bispo was put into service and between then and the year end extensions to the existing Norte and Trindade exchanges were completed. New exchanges at Olivais and Oeiras were opened. In Oporto the Bonfim exchange was extended, a new exchange opened at Espinho and a start made with the conversion from manual to automatic working of the Picaria exchange, the main exchange in that important city. It is hoped that this will be completed early in 1952.

Some years have elapsed since an automatic telephone conversion was planned for Oporto, but owing to the war and other adverse conditions our hopes have been deferred. It is particularly pleasing, therefore, to record that within a few months Oporto will have an automatic system of the most modern type.

DEVELOPMENT AND EXPANSION

The total waiting list of applicants for service at December 31, 1950, was 23,182, as compared with 26,563 at the end of 1949. This is the first time a reduction in the waiting list has been recorded since 1942 when expansion of the system was compulsorily restricted because of the shortage of material.

The company's long-term development and expansion plans provide for further substantial annual additions to the plant with the object of eliminating the waiting list in the shortest time possible.

Orders for new equipment are being regularly placed to achieve this, and we have to acknowledge the co-operation of our associated manufacturing companies, which is so valuable in the smooth running of our business and of so much advantage to the service in Portugal. The equipment which is sent to Portugal is of the latest type and design and the wide range of manufacturing, commercial, operating and technical experience, which is available to us, is ensuring to Portugal a telephone undertaking of the most efficient character.

Sooner or later the rearmament drive and the scarcity of raw materials is likely to have a growing effect on ordinary commercial and industrial businesses, not only in Great Britain and the United States of America, but throughout the world. Every effort will be made to avoid any slowing up in the rate of deliveries, and we are assured by our manufacturing friends that they will use every endeavour to this end.

The financial support and guidance which has been assured to your company from Telephone and General Trust, Limited, since 1927 continues, and both here and in Portugal this association with the Trust and its connections creates an atmosphere of solidarity and confidence which is much appreciated.

PORTUGAL

It is with the utmost regret that I must refer to the loss which has been suffered by the Portuguese nation by the recent death of the President, H.E. Marshall Carmona. He had been head of the state since November, 1926, during which period he guided the destinies of his country with wisdom and courage, and brought it stability. Marshal

Carmona did much to strengthen and extend Portugal's ties with Britain, her oldest ally, and in his passing Portugal has lost an honoured son and great patriot and Britain a trusted friend.

1950 for Portugal also has proved a year of accomplishment. Its returns of foreign trade show a diminishing unfavourable balance and previous serious drains on its reserve of gold and foreign exchanges disclose a good recovery when compared with 1949. This has allowed Portugal to free from quota restrictions many important products received from abroad, and Great Britain has in turn freed almost all its imports from Portugal.

New trade agreements were signed by the Portuguese authorities and others renewed with several countries, all designed to increase reciprocal trading. Both Portugal and her Colonies benefited during the year from the substantial increased prices paid for such basic products as wolfram, tin, sisal and resin.

Since the middle of 1949 Portugal, like many other countries, has been assisted by Marshall aid which, among other things, has been used for the purchase of raw materials, consumer goods and machinery for capital requirements.

During the year work continued steadily on the various hydro-electric, road and bridge-building schemes. The "Castelo do Bode" power scheme, one of the largest in Europe, will be a saving to the national economy in importation of foreign coal.

The building of new schools, hospitals and particularly housing estates for working class people continues to go ahead. Great progress has been made with the latter plans and thousands of homes have become available to the people at reasonable rents, the reserve funds of the various Government provident societies being utilised for this purpose.

DIRECTORS

Lord Ramsden, who had been a director since 1939, decided in October, 1950, that he must lighten his many duties and tendered his resignation as a member of the Board. Your directors regretfully accepted this and, on their behalf, I would like to place on record their appreciation of the service he has rendered the company and the personal support he has given me over these years. I am sure you would wish to be associated with this.

Lord Ritchie of Dundee accepted our invitation to fill the vacancy and his knowledge and experience are valued by all his colleagues.

It is again my pleasant duty to acknowledge the constant attention to the affairs of the company which is so admirably and unstintingly given by Eng. Branco Cabral, the chairman of the board in Portugal, Sr Pinto Basto, Sr Calem, Dr de Castro and Mr Frick, his colleagues in Lisbon and Oporto, and the ever-valued advice and active assistance of Dr Bustorff Silva, the company's lawyer.

Our policy of frequent interchange of visits of directors and personnel between Portugal and London and the factories from which we procure supplies continues and with the expansion of the company is increasingly valuable.

STAFF

On your behalf, too, I would like to thank our general manager, Mr R. S. Thorp, and his colleagues, staff and workpeople in Lisbon and Oporto. We have ample evidence of the ability, efficiency and loyalty of all ranks, and in 1950 they again maintained the high standard which is so creditable to them and to the good name of the company.

LONDON AND THAMES HAVEN OIL WHARVES

INCREASED TRADING PROFIT

SIR VERNON THOMSON'S STATEMENT

The fifty-second annual general meeting of London and Thames Haven Oil Wharves Limited was held on May 24 in London, Sir F. Vernon Thomson, Bt., G.B.E., the chairman, presiding. The following is an extract from his circulated statement:—

The three British subsidiary companies previously held were sold or wound up during the year. The principal British subsidiary—the London Oil Storage Company Limited—was sold on advantageous terms; the proceeds of the sale would be employed to advantage in the development of this company's installation at Thames Haven.

The trading profit of London and Thames Haven Oil Wharves Limited is £246,748, as against £229,980 for the previous year, an increase of £16,768. Dividends from subsidiary companies, income from investments and interest received amounted to £29,422. After charging depreciation, directors' emoluments, auditors' remuneration and interest on loan, and making full provision for taxation on the profit for the year, there remains a net profit of £95,760, as against £97,474 for the previous year.

Adding to the net profit for the year of £95,760 referred to above, a special distribution from the London Oil Storage Company Limited of reserves accumulated in past years, amounting to £11,476 net, and the balance brought forward of £412,833, there is a total sum available of £520,069. After providing £22,000 net for the dividend on the preference shares, the directors recommend a dividend for the year on the ordinary shares at the rate of 15 per cent., less income tax, absorbing £61,425, leaving a balance to be carried forward of £436,644.

NEW REFINERY IN OPERATION

The new refinery constructed at Thames Haven by "Shell" Refining and Marketing Company Limited came into operation in November, 1950, and we are now handling the imported crude oil and resulting refined products under the terms of our contracts with that company and its associated distributing company, Shell-Mex and B.P. Limited. This new phase of our operations is proceeding satisfactorily. Our services continue to be used by the majority of the petroleum companies importing into the Thames. Accordingly, subject to the uncertainties and difficulties of present conditions, the board expect that the benefits from the long-term contracts entered into with the "Shell" companies and the other term contracts with the remainder of the trade should become evident in future accounts.

FRENCH COMPANY'S RESULTS

It will be seen from the balance sheet and profit and loss account of Compagnie Industrielle Maritime that the substantially increased trading results of 1949 were largely maintained during the year 1950—the gross trading profit being Fr. 220,624,653, as against Fr. 249,138,094. This fall in the results for 1950 was due to a temporary drop in imports during the first part of the year. However, in the latter part of the year, and since, imports have shown a marked increase, and in these circumstances the French board felt justified in paying the same rate of dividend as for last year of 10 per cent., but on the recently increased capital of 600,000 shares of Fr. 1,000 each.

To meet the requirements of the expanding French oil refining industry, and the increasing use of tankers of up to 30,000 tons and over, the French company has undertaken the construction of a new oil dock, which it is hoped will be completed in 1953.

The report was adopted.

TELEPHONE AND GENERAL TRUST LIMITED

TWENTY-FIVE YEARS' SATISFACTORY PROGRESS

SIR ALEXANDER ROGER ON GOVERNMENT EXPENDITURE

The twenty-fifth annual general meeting of the Telephone and General Trust Limited, was held on May 22nd in London.

Sir Alexander Roger, K.C.I.E. (chairman and managing director), in the course of his speech said: You will notice that this is our twenty-fifth annual general meeting and I think you will agree that our balance sheet demonstrates we have cause for satisfaction at our progress over the years. We have maintained an 8 per cent. dividend on the ordinary capital since 1930—an unbroken record of 21 years—and in addition to a capital reserve of £325,000 plus an appreciation of £469,837 over the book value of quoted investments, we have built up revenue reserves totalling £273,752. All this despite the acute world-wide depression of the early 1930s and six years of war and its aftermath.

PROFIT AND ALLOCATIONS

Turning to the 1950 accounts, the profit at £85,837 after charging profits tax and income tax shows a slight reduction of £2,797. Dividends and interest at £245,134 were up slightly, while sundry receipts were down by £4,520.

Management expenses decreased by £761. The reduction of £3,828 in interest paid on loans and deposits reflects the repayment of the bank loan. Profits tax and income tax at £87,400 is our contribution towards the Government's spending departments and swallows up more than half our gross profits.

We have transferred £10,000 to revenue reserve and £25,000 to contingencies reserve, bringing these to £100,000 and £75,000 respectively. After these transfers and providing for the usual seven per cent. preference and 8 per cent. ordinary dividends, £98,752 is carried forward, against £100,094 brought in.

BALANCE SHEET

Investments in our general portfolio at £1,118,024 show little change.

Loans and debentures in subsidiary companies have increased by £222,234 all by way of temporary loans to aid the telephone operating companies in their expansion.

The loan by the Trust to associated company—the Anglo-Portuguese Telephone Company—which amounted to £768,137 at the end of 1949, was repaid during 1950 from part of the proceeds of highly successful issues of further capital by that company referred to later.

The bank balances at December 31, 1950, amounting to £664,258, will be used during 1951 by the various operating companies connected with the Trust.

VALUATION OF INVESTMENTS

The valuation of £1,432,535 for quoted investments represents an appreciation of 49.8 per cent. on the net book cost of £962,698. The directors consider the valuation of unquoted investments at their net book cost of £155,326 to be fair and reasonable.

Of the Trust's total investments including interests in subsidiary companies, 23.44 per cent. are in loans and debentures, 10.67 per cent. in preference stocks and 65.89 per cent. in ordinary stocks (which includes 31.49 per cent. in subsidiaries). Geographically 83.46 per cent. are in the British Commonwealth and 16.54 per cent. in foreign countries.

GROUP ACCOUNTS

The group reserves—capital and revenue—total £913,794, an increase of £76,804 over 1949. This is equal to 71.5 per cent. of the issued preference and ordinary capital totalling £1,277,000 or 1½ times the amount of the issued ordinary stock of £727,000.

TELEPHONE OPERATING COMPANIES

Portugal.—The Trust has been directly associated with the Anglo-Portuguese Telephone Company, Limited, since 1927.

With the conclusion of the negotiations between the company and the Portuguese Government on a mutually satisfactory basis, resulting in an increase of tariffs as from May 1, 1950, together with a clarification of the contract, the company during the year was able to replace existing loans from the Trust by permanent financing in the form of an issue of 400,625 ordinary shares and the placing of £1,000,000 of five per cent. first debenture stock. Both issues, which were sponsored by the Trust, were highly successful.

Since the settlement of these outstanding political matters, the development and expansion programme of the company has been proceeding with great energy and during 1950 over 7,400 stations were added, bringing the total number to over 100,800 at December 31st last.

VENEZUELA

The Trust's association with Venezuela dates back to 1928. It has a substantial investment interest in the telephone operating service there through the British company, Telephone Properties, Limited, and the Venezuela company, Compania Anonima Nacional Telefonos de Venezuela.

In March last I returned together with Mr Hollier, chairman of our servicing company, and our consulting engineers from a visit to Venezuela and the British West Indies.

It is hard for the public services, including telephones, to keep pace with the new demands in Venezuela, particularly as all public services have suffered some disruption and disturbance by removals of plant necessitated by the Government's expansion plans.

A record number of stations—namely, 7,377—were added during 1950, bringing the total to 64,853, but this has not diminished demand and there is still a heavy and growing waiting list.

The company has important expansion plans to meet the situation which I discussed at length with His Excellency the President, Dr German Suarez Flamerich, and the Ministers of Development and Communications, with whom I also discussed the extent of the financial requirements for carrying out these plans. These discussions are proceeding actively.

WEST INDIES

During my visit to our associated telephone operating companies in the British West Indies I saw much that gives reason for satisfaction, and can confirm that every effort is being made to expand and improve the telephone services in Jamaica, Trinidad and Tobago, and Barbados. The boards and managements of these companies realise full well that harmonious public relations can only be maintained by a ceaseless and unremitting determination to render first-class service.

In Jamaica development has been well maintained with a gain of 1,433 stations to a total of 13,437 in service at the end of 1950. In Trinidad, 1,248 stations were added, making a total of 14,794 in service at the end of December, 1950. In Barbados the Telephone Company, which provides service, like all the companies in which we are interested, by the most modern type of automatic equipment, added 378 new stations during the year, making a total of 4,330 at the end of 1950. The sterling value of the gross telephone buildings and plant assets of the overseas companies in which the Trust is interested amounts to some £13 million.

EFFECT OF DEFENCE PROGRAMME

We are living in a time when the problems of the world call for statesmanship, foresight, faith and courage of the highest degree.

The need for the expenditure of vast sums on defence cannot be denied, and we as individuals and as a nation realise that we must shoulder the added burdens thus thrust upon us by events. At the same time, we are entitled to expect that the leaders of the nation will take every step to mitigate and avoid permanent damage to the whole machinery of industry and international commerce by which we as an island people live and to which we owe our entire strength.

The continuation of lavish and wasteful government expenditure by experiments and expedients added to the essential needs of the defence programme inevitably leads to constantly rising costs and prices with all the harmful results which flow therefrom.

BURDEN OF TAXATION

The imposition of excessively heavy burdens of taxation, preventing as they do the adequate provisions to meet the greatly increased costs of maintaining machinery and of its replacement by more modern and efficient plant, must inevitably damage the prospect of this country maintaining the volume of exports sufficient to buy the raw materials and food which we require.

As I have said on former occasions the need is to give full scope to hard-won experience and to the merchant adventuring spirit, to provide real incentives for increased production and efficiency and to encourage and protect savings which alone can supply the capital needed to maintain, improve and expand our industries.

THANKS TO STAFF

I am sure you would wish to join with the board of directors in expressing their thanks to the 5,500 men and women of the Trust and its associated companies overseas for their loyal and efficient service throughout the year. The report and accounts were adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

HIGH LEVEL OF OUTPUT

The annual general meeting of the Automatic Telephone and Electric Company Limited, will be held in Liverpool on June 13th.

The following is an extract from the circulated statement by the chairman, Sir Alexander Roger, K.C.I.E.:—

The group consolidated profit amounts to £1,526,689 and after charging taxation of £812,421 there is left £714,268 for the many purposes to which this could most profitably be applied. For the past 12 years the dividend on the ordinary and deferred stocks has remained unchanged at 12½ per cent. (10 per cent. plus 2½ per cent. bonus). The directors now recommend a final dividend of 12 per cent. on the ordinary stock, making a total of 15 per cent. for the year and 45 per cent. on the deferred stocks.

Although a high level of output has been maintained, it was not sufficient to absorb the full productive capacity of our factories. This was mainly due to a temporary recession in exports and reduced British Post Office orders for telephone plant and equipment. During the latter half of the year production was threatened by the growing shortage of raw materials. We hope to pull through, but it remains a charge against the Government that they failed to maintain proper stocks whilst preventing industry from looking after themselves.

As to the future, our order book is fairly comparable with the position a year ago, and provided no major crisis besets us, we can look forward with some confidence to the results of the current year.

DAILY NEWS LIMITED

CONTINUED SALES PROGRESS

LAMENTABLE REDUCTIONS IN NEWSPRINT SUPPLY

MR L. J. CADBURY ON THE EVER-RISING COSTS

The annual general meeting of the Daily News Limited was held on May 23rd in London.

Mr L. J. Cadbury, the chairman, who presided, said:—The increase in price to a penny-halfpenny on May 7th of the national penny press and the London evening papers is an event of major importance in our industry. As, however, it did not occur during the year under review, I will not refer to it in any detail until later in my remarks.

During 1950 the sales of the *News Chronicle* made steady progress, reaching the peak figure of 1,573,057 copies a day in September. Although the normal seasonal decline in sales was experienced during the last quarter of the year, it is interesting to note that the average sale for this period in 1950 was 10,363 copies higher than for the same period in 1949.

Since my last report the *Star* has continued its remarkable progress in circulation and influence. In 1950 it recorded an average daily net sale of over 1,236,000 copies, an increase of 29,000 copies a day more than in 1949—the largest increase of any London evening paper over the preceding year, and its steady progress has been maintained.

The demand on our advertising columns throughout the year clearly shows the importance which advertisers attach to our papers. Such has been the pressure on advertising space that unfortunately, with restricted newsprint, it has been impossible to meet all their requirements, but great care has been taken to allocate space as fairly as possible.

INTENSIVE READERSHIP STUDIES

During the past 12 months, through its own organisation and with the help of the Gallup Poll, the *News Chronicle* has made some intensive studies of its readership. The results have been both rewarding and encouraging.

The analysis has shown that the paper is read by a remarkably wide cross-section of the population. It reveals that the *News Chronicle* appeals not only to Liberals but to Conservatives, Socialists, and Independents. There is no other national newspaper which has such a representative following. We could ask for no more striking testimony to the integrity and independence of the *News Chronicle's* editorial policy.

From an income standpoint as well, this paper's readership is shown to range very widely. In recent years it has received increasing support from the middle and professional classes, including a high proportion of the nation's school teachers. According to the Gallup Poll, 39 per cent. of the *News Chronicle* readership is drawn from the well-to-do and middle income groups. The national figure for these same groups, it should be noted, is only 26 per cent. of the population.

In addition to factual information of this kind, the *News Chronicle* has attempted to ascertain the personal responses of its readers to a number of important editorial enterprises which have appeared in the paper for the last 12 months. In reply to these inquiries, thousands of letters have been received from all over the country, and by this method we have been able to test the popular interest in special features.

A preliminary analysis of this correspondence confirms what we had always believed to be true: that there exists a growing

demand for a newspaper which presents the great political and social issues of the day in a direct and attractive manner. It is certainly not true that the modern British newspaper reader wishes only to be "entertained," many seek to be informed as well.

GALLUP POLL

In this time of political uncertainty the "How would you vote?" questions of the *News Chronicle* Gallup Poll are followed with more intense interest than ever by members of all parties. The accuracy of its forecasting was vindicated by the results of the General Election of 1950, and it has now become a vital factor in political calculations. The *Economist* has remarked that the Gallup Poll is an index "which politicians watch the more closely the more they deride it." The poll does not only deal with the preference of the voters but with many other matters of topical concern and human interest.

NEWSPRINT SUPPLIES

May I now turn to the question of newsprint supplies? On previous occasions I have pointed out the regrettable effects that result from their restriction, especially in a parliamentary democracy such as our own.

Since 1939 there have been several methods of newsprint rationing and control, some by voluntary agreement and some by Government order. In January, 1949, the only control was that of the number of pages per issue. Otherwise circulations were free to move in response to public demand. This lasted until October last year. By that time stocks in this country had declined to a dangerous point and "tonnage" rationing was introduced—i.e., each paper was allowed a definite weight of newsprint based on its consumption between certain dates; but there were no restrictions on how this was to be used, the number of pages per issue could be sacrificed for sales and vice versa. With the rising demand for the *News Chronicle* and the *Star* this has meant during the last two months 4-page *News Chronicles* on Saturdays and for the *Star* small papers not only on Saturdays but on several Mondays as well.

I have here a diagram which illustrates clearly how pages of the *News Chronicle* have been restricted since the beginning of the war.

It is really lamentable that six years after the war the British Press should once again be reduced to printing papers of only four pages. How is it that we have reached this acute situation?

I mentioned at our last annual meeting that in January, 1950, the Government told us to cancel our imports from Canada in the second half of the year owing to the dollar situation. After strenuous representations to the Board of Trade this embargo was modified and we were told we could import 25,000 tons.

Unfortunately, the manufacturers had already sold the newsprint which should have been sent to Great Britain last year; for during the winter a famine had developed in newsprint which qualified it to rank as one of the world's "scarce materials." So, instead of the 300,000 tons which our contracts would have entitled us to receive in 1950 from Canada and Newfoundland, we actually received 12,000 tons! In that year the Government issued licences to British mills which increased their exports to figures substantially larger than before the war while British periodicals were released from control. These measures still further limited the supplies available for newspapers and, combined with the international situation, have put the British Press in one of the acutest crises it has experienced since the war. I am glad to say that Lord Layton is now in Canada negotiating for a renewal of our long-term agreement with the Canadian mills.

RIISING COSTS

Of recent months our paper supplies have presented us with another problem, that of the price of our newsprint. The second diagram (above) shows how the cost per ton has moved over the period since 1939. The last increase has been too much for us to swallow without a change in price.

There is very little the public can still get for a penny nowadays. Even the penny bus fare has gone with the wind, and we were proud of the penny paper. But economic facts have been too strong for us.

Paper used to be cheap and plentiful. Today it is scarce and dear, and is growing scarcer and dearer. At the beginning of 1950 it was £32 a ton; last month it was £47 a ton; now it is £60—six times the pre-war figure. Nor can we see the end of the movement. Newspapers cannot make ends meet at these prices. Not only is the cost of paper soaring to the skies; everything else that goes to the making of a newspaper has gone up—or is going up. Wages are one example, rail and road transport another.

Again, we get letters from readers appreciative of Robert Waithman's cables from America, of Stephen Barber's war dispatches from Korea, and such vivid examples of foreign correspondence as Norman Cliff's report on the famine in India. But since the devaluation of the £ these services cost far more than they used to.

In 1939 the *News Chronicle* was normally 20 pages daily. Today its maximum size is six pages. Yet we are paying a larger paper bill for six pages than we did for 20 before the war. Up to now part of the gap has been filled by increasing advertising rates. Advertising is part of the service a newspaper renders, and advertisers have been very understanding in these difficult times. But two points are clear: there is a limit to the advertising a six-page paper can carry, and there is a limit to what the advertisers can be asked to pay.

For the time being, we have reduced the amount of advertising, in both papers, to give more editorial matter, and our readers may be assured we shall strive in all ways to improve the service we give to our public.

The report and accounts were adopted.

BRITISH VACUUM CLEANER AND ENGINEERING COMPANY, LIMITED

GOLDEN JUBILEE OF MR H. CECIL BOOTH'S INVENTION OF THE VACUUM CLEANER

The forty-seventh ordinary general meeting of the British Vacuum Cleaner and Engineering Company, Limited, was held on May 22nd, at Goblin Works, Leatherhead, Surrey.

Mr H. Cecil Booth, F.C.G.I., M.Inst.C.E., the chairman of the company, presided, and in the course of his speech said:—

In presenting the accounts and balance sheet for the year ending 30th September, 1950, it is with pleasure that I am able to tell you that the trading results for that period have established a record in the history of the company as regards to both turnover and profits.

It is with added pleasure that I can make such an announcement this year for two reasons. First, this year marks the 50th anniversary of the granting of my patent for the first vacuum cleaner which resulted in the formation of our present company, and we can therefore claim without possibility of question that our company is the founder and pioneer of the vacuum cleaner industry throughout the world. And secondly, that the year under review is the 25th anniversary of the appointment of Mr J. J. Hambidge, our present senior managing director, as director and general manager of the company and it is with great pleasure I state on behalf of all his colleagues that it is through his able leadership, his initiative and selfless devotion to his work, with the loyal assistance of all those with and under him, that the great expansion and success of our company has been achieved.

FURTHER EXPANSION

During the year under review the sale of our well-known Goblin Electric Vacuum Cleaners shows a considerable increase, which testifies to their efficiency and popularity.

With regard to our Goblin Electric Washers, to which I referred in my speech last year, these have proved to be a great success. They are in great public demand and constitute a considerable item in our domestic turnover.

Our industrial clocks, time recorders, and public address equipment, handled by our subsidiary, The Magneta Time Company, also show a satisfactory increase. I am also pleased to report that orders for the installation of B.V.C. ash and dust handling plant for power stations have increased and continue to show a further expansion, both at home and abroad. This work is dealt with through our wholly owned subsidiary B.V.C. Industrial Constructors, Limited. Contracts at present in hand include B.V.C. ash and dust removal plant for the following power stations:—

BRITISH ELECTRICITY AUTHORITY

Deptford, Barking, West Ham, and Fulham in the London area, and at Kearsley, Bold and Roscote, Rye House at Hoddeston, Colne Valley at Rickmansworth, East Yelland, Devon.

Also in overseas power stations at:

AUSTRALIA
Fremantle, Pyrmont, Bunnerrong, and Yallourn.

SOUTH AFRICA
West Bank, East London.

SINGAPORE
Pasir Penjang.

I mentioned last year that we intended to expand our export endeavour, and I am pleased to tell you that a substantially increased turnover in this field was recorded. Our products have been on show at all the leading international exhibitions in the world, including Toronto, Chicago, Paris, Brussels, Utrecht, Sydney, Johannesburg, Istanbul, and, of course, the British Industries Fair.

Turning now to the group accounts, which I will with your permission take as read, seeing that they have been in your possession for the statutory period of 21 days, it will be seen that the general position of the company has been further improved during the year.

The group profit for the year after providing for bank interest, management remuneration, directors' fees, and depreciation, shows a balance of £129,427, which, after deducting provision for taxation £70,940 inclusive of liability for profits tax under the new Budget, leaves a balance of £58,487.

From this amount your directors have transferred to staff pensions reserve the sum of £10,000, bringing this reserve up to £62,500.

After bringing in the balance from 1949 amounting to £43,272 and deducting the dividend paid on the Preference capital during the year, there remains an undistributed profit of £87,221.

INCREASED DIVIDEND

In my speech to the shareholders last year I stated that, although we had fully subscribed to the principle of dividend limitation, it should not be overlooked that your company had for some years past been paying a substantially lower dividend than obtained in pre-war years, and my undertaking as to dividend limitation on your behalf had been qualified accordingly. I also said that if and when the profits of the company provided for an increased dividend your directors would not be unmindful of their duty to the shareholders in the matter, consideration first being given to the capital requirements of the company in the light of its current trading.

The profits for the year under review would have allowed your directors to revert to the pre-war dividend, but in view of the company's expanding trade and the need for the conservation of finance to meet this, and the heavy incidence of taxation, your directors have decided after careful consideration to propose a modest increase in dividend, and therefore recommend the payment of 25 per cent., less tax, as compared with 20 per cent. for the previous year. The figure thus absorbed, amounting to £19,688, will leave a balance of £67,533 to be carried forward as compared with £43,272 brought in.

CURRENT OUTLOOK

With regard to the current year, you will be pleased to learn that our turnover for the first six months again shows increase over that for the same period in the accounts under review, and we continue to have a very healthy home and overseas order-book in all sections of the business. You will, however, doubtless be aware that the rearmament programme has made the materials supplies position difficult, and I cannot at this stage forecast to what extent, if any, this will affect our results for the year. You may be assured that the management are exercising every diligence to ensure maintained pro-

duction, while at the same time placing major emphasis on essential production of national importance.

I cannot conclude without expressing appreciation of the work of the management and employees, and to express to them our thanks on your behalf.

The report and accounts were adopted.

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS

MR A. STUART ALLEN ON THE ESSENTIALS OF A HEALTHY AND PROGRESSIVE ECONOMY

In the course of his address at the annual general meeting held on May 23rd, Mr A. Stuart Allen, the President of the Society, said that last year he had presented the position of an established company which was concerned to maintain the volume of its production in the face of rapidly rising price-levels and persistently heavy taxation. The importance of the issues involved had led to the appointment of a Royal Commission.

The Commission's task had been made more difficult by the Budget proposals, the first instalment of the three-year rearmament programme.

The Society was preparing evidence for submission to the Commission, and their contribution would comprise the valuable experience of members of the Society in every field of industrial and commercial activity.

Today he was inviting attention to the effect of these same factors upon the "Germination and Growth of Business," a process which began because an individual believed that his abilities could be applied more constructively than was possible within the limits of an employment, however congenial. From such small beginnings many undertakings had developed which were now making important contributions to the total national product. He submitted that renewal by the constant process of birth and growth was essential to a healthy and progressive economy.

Mr Allen then gave comparative figures to show what it was feasible for an enterprising person to achieve in 1910, the corresponding figures in 1930 and, finally, equivalent figures at the present time, taking into account at each stage the relevant price-levels and the appropriate taxation.

The combined effect of these factors was to exaggerate the earnings which were necessary today, in order to permit accumulations of real capital equivalent to those of the past. For a small business earning £200 per annum in 1910 the comparable figure today was £800 per annum—four times as much—and this ratio increased rapidly, so that today's equivalent of £1,000 per annum 40 years ago was more than £8,000 per annum.

Mr Allen added that statistics proved that the activities of small businesses were of major importance in national affairs, but it was clear that the process of creating such a business was becoming increasingly arduous. In other words, the opportunities for rejuvenating the national economy were diminishing with frightening rapidity at a time when the need for expansion was greater than ever before. If restrictive influences were allowed to persist they must distort the whole economy.

TAXATION AND OVERSEA UNDERTAKINGS

For some years now the burden of taxation involved by the control in England of under-

takings operating oversea had led to repeated warnings that such concerns would be impelled to transfer control abroad. Clause 32 of the Finance Bill now imposed heavy penalties on persons concerned in unauthorised transfers of corporate residence. It was the function of the official to suggest remedies for losses of revenue, but it should be the constructive task of the statesman to create conditions which would foster all forms of economic expansion.

Referring to estate duties, Mr Allen pointed out that here also national resources were suffering because British subjects who had worked and prospered abroad were discouraged from coming home to retire because taxation made living here an undue expense and dying an extravagance. The country was the poorer in consequence.

ASHANTI GOLDFIELDS CORPORATION LIMITED

OUTLOOK ENCOURAGING

The fifty-fourth annual general meeting of the Ashanti Goldfields Corporation, Limited, was held in London on May 23rd. The chairman, Major-General Sir Edward L. Spears, K.B.E., C.B., M.C., presiding, said that in the period under review, progress and results had been satisfactory.

Earnings had increased by £470,794 to £1,138,426. Gold had realised more since devaluation, but costs had risen also and were still rising. While they had received the benefits of devaluation for a full year, its effect on the price of stores and services had not yet been fully felt.

Dividend.—A final dividend of 1s. 6d. per unit of stock less tax at 9s. in the £ made their total distribution for the year 2s. 6d. per unit.

WEST AFRICAN FINANCE CORPORATION

They had formed a new wholly-owned private company, and transferred to it their holdings in other West African Mining Companies as it had been felt that administration would be easier if they were owned by a separate finance company.

Development.—The full extent of the pay-shoots on the new Level, No. 33, had not yet been proved. Two further crosscuts were possible at the south end and had exposed good values. To the north a distance of 450 feet had been driven and payable ore had been recorded over 350 feet. Since the close of the financial year the shoot had been shown to extend over more than 500 feet, but in view of the restricted capacity for development, further work was being postponed in favour of the opening up of No. 35 Level.

Good values were reported over 200 feet on No. 27 Level. New ore developed during the year, 187,664 tons, averaging 17.5 dwts. per ton, maintained reserves at a satisfactory level.

Surface Prospecting.—Arrangements were made with Selection Trust, Limited, in 1948, to examine part of the company's mineral concession outside a reserved area with the object of seeking and, if encouragement had been forthcoming, of developing new mines. This work had been carried on for two years without producing results of any interest. Further search was discontinued and by mutual consent their agreement with Selection Trust, Limited, was terminated. The chairman recorded their appreciation of the excellent manner in which the work was carried out and their regret that the effort was unsuccessful. The lack of result from this venture in no way whatever affects the future prospects of the existing Ashanti Mine.

THE FINANCIAL TIMES LIMITED

EARNING POWER MAINTAINED

NEWSPAPER OWNERS' PROBLEMS

MR BRENDAN BRACKEN'S SPEECH

The twenty-third ordinary general meeting of The Financial Times, Limited, was held on May 22nd at Winchester House, Old Broad Street, London, E.C., The Rt. Hon. Brendan Bracken, M.P., the chairman, presiding.

The secretary, Mr A. E. Knock, having read the notice convening the meeting and the report of the auditors,

The chairman said: Ladies and gentlemen, the balance sheet of the company differs little from that which we considered at our last annual general meeting. You will observe that we have strengthened our reserves and increased our bank balances. The excess of current assets over current liabilities amounts to £463,871, while in the consolidated balance sheet the comparable figure is £819,031. Our resources should, therefore, be adequate to cover our considerable commitments for new plant and machinery, although it is extremely difficult in today's conditions to chart the cost of new machinery.

During the past year, our revenues from the two large printing firms in which your company has a controlling interest were diminished by a prolonged dispute between master printers and the London Society of Compositors. The consequences of this dispute are apparent in the decision of a number of customers to obtain printing facilities outside the London area, or to try out, as they have in some cases successfully, other methods of reproducing printed matter.

Despite the losses caused by this dispute in the printing industry your company's earning power was reasonably well maintained. The consolidated profit before tax amounted to £400,151, and, if you approve our recommendation about the distribution of profits, the company and its subsidiaries will increase their carry forward by rather more than seventy-five thousand pounds.

THE NEWSPRINT FAMINE

If growth be the only evidence of life, newspapers in Britain would long since have passed beyond redemption. Though it is a commonplace that everyone knows how to edit a newspaper, few save professional journalists at home and abroad fully understand the achievement of British journalists in producing so much news in a few overcrowded pages. The most of us in our youth have been unable to avoid reading Milton's blast against the tyranny of licensing printers. If Milton could have lived until this hour his blast would now be directed against the licensers of paper. Printers we have in plenty; paper, save for the purpose of producing bank notes, steadily diminishes. Governmental muddles in paper licensing, tinctured by malice, have greatly increased the difficulties of newspaper production.

AN UNFULFILLED DEMAND

Our problems in trying to cope with a famine in newsprint are small by comparison with those that must be solved by the owners of newspapers with vast circulations. Their problems are far beyond our knowing. Alas, we in our small way know all that need to be known about the consequences of this newsprint famine. We receive an ever-tolling stream of complaints from people who cannot obtain copies of the *Financial Times*.

In a vain endeavour to meet their needs we have reduced the size of the paper. We have

also tried through reducing the size of types to save every inch of space so that we may partly provide for the clamant demand for the *Financial Times*. I regret to say that our efforts are no more effective than the use of Mrs. Partington's broom.

APOLOGY TO ADVERTISERS

Advertisers and their agents have shown great patience in their dealings with the *Financial Times*. Through the lack of newsprint we have been forced to refuse many orders and to delay the publication of a great number of advertisements. It is an understatement to say that we are grateful for their understanding of our newsprint problems, not to say their forbearance.

FRUSTRATION

If I, on your behalf, apologise to those who seek in vain to become readers of the *Financial Times* and to our long and sure-set customers who wish to maintain or extend advertisements, I feel that we as shareholders should say a word of encouragement and sympathy to all who serve us so faithfully in editorial and managerial affairs. Were they given an adequate supply of newsprint their lively and well-considered ideas of adding new services and more features would greatly advantage our readers and shareholders.

I should like, on your behalf, to thank our managing director, Lord Moore, and his editorial and managerial colleagues, as well as those concerned with the management of our printing companies, for the eminent services they have rendered during the past year which abounded in difficulties for all concerned with printing and with the production of newspapers.

The report and accounts were unanimously adopted; the proposed final dividend of 12½ per cent., less tax, making 20 per cent., less tax, for the year, and a bonus of 5 per cent., less tax, on the ordinary stock, were approved; the retiring director, Colonel O. E. Crosthwaite-Eyre, M.P., was re-elected and the remuneration of the auditors, Messrs Price, Waterhouse & Company, was fixed.

OLDS DISCOUNT

At the annual meeting held on May 24th, Mr W. A. Olds (chairman) said that 1950 proved a year of further progress. Assets are now nearly £4,750,000 and reserves £521,000.

The provision of essential plant and equipment brought a constant flow of applications for our services. There again appears to be ample evidence that our resources can be fully used under almost any circumstances.

New developments include handling of hire purchase business for goods produced by the group of Tube Investments Limited, through jointly owned associated company.

RECORD OF PROGRESS

	Profit before Taxation	20 per cent. Ordinary Dividend Paid (Net)	Profit Retained after Taxation
1946	£ 77,398	£ 19,095	£ 20,491
1947	121,169	20,832	37,562
1948	138,579	27,509	24,951
1949	161,030	30,938	27,192
1950	185,317	32,062	31,955

The 20 per cent ordinary dividend paid for 1950 represents 7.3 per cent. on the ordinary stock and reserves.

G. & J. WEIR, LIMITED

INCREASED TURNOVER

The fifty-seventh annual general meeting of G. & J. Weir, Limited, will be held, on June 19th, at Cathcart, Glasgow.

The following is an extract from the circulated statement by the chairman, the Rt. Hon. Viscount Weir of Eastwood:

Under all the circumstances attending the year 1950, the trading results of the consolidated group can be regarded with satisfaction. The balance brought into the consolidated profit and loss account, together with other credits, has risen by £104,823 to £1,273,194, and after making provision for depreciation, taxation and all other charges, the net surplus has risen by £106,902 to £491,991. Of this net surplus, £165,267 has been retained by the subsidiary companies, as compared with £106,411 in 1949, and after deducting the amount written off the investment in a subsidiary, the remaining balance, viz., £295,375, represents the net profit of the parent company, this being £16,697 more than last year.

PROFIT AND ALLOCATIONS

Out of the net profit of the parent company an allocation of £125,000 to general reserve is proposed, which allocation is the same as last year and will bring the total of general reserve to £1,025,000. After payment of dividends totalling 40 per cent. for the year, with a bonus dividend of 5 per cent., the carry forward will be increased by £3,865 to £268,128.

The satisfactory results are due mainly to the increased turnover of the group as a whole. At Cathcart, once again, the previous year's record in output was surpassed. Our increase in exports was 16 per cent. over that of 1949, and this does not include the substantial deliveries of our machinery for foreign ships built in British shipyards. As regards input, export orders were more than maintained. Installations for power stations, and other land work, have been well above the figures for the previous year, while marine orders, particularly in the latter part of the year, exceeded all our expectations. Thus, although we had a record output for 1950, we started off in 1951 with an order-book considerably greater than at the beginning of 1950.

Two outstanding events in 1950 were the announcement in the autumn of the rearmament programme and the flood of new orders for merchant tonnage, which began towards the end of the year. Some of the requirements on new naval construction for the rearmament programme have become known to us and will, of course, call for Cathcart and Yoker to fulfil their usual responsibilities as suppliers of naval auxiliary machinery. These requirements are not likely to be reflected very substantially in our output until 1952, but thereafter their incidence will become increasingly felt.

CONTRIBUTION TO HOUSING PROGRAMME

With regard to the Weir Housing Corporation, the past year has proved a notable one. The number of houses handed over to local authorities was 1,372. These were almost entirely of the two new types to which I referred last year. In spite of the gap in production to which reference was then made, the results both as regards earnings and turnover have been considerably better than anticipated. The houses themselves have proved an outstanding success.

So far as 1951 is concerned, we look forward to a year of increased output and reasonable results, always subject to obtaining the materials we require, and looking further ahead we see our exceptionally full order-book spreading over a long period.

BEYER, PEACOCK AND COMPANY

(Locomotive Builders and General Engineers)

CONSIDERABLY INCREASED SALES

The annual general meeting of Beyer Peacock and Company, Limited, was held on May 23rd in London, Mr Harold Wilmot, C.B.E. (chairman and managing director), presiding.

The following is an extract from his review which had been circulated with the report and accounts for the year ended December 31, 1950:—

The net profit has again advanced—the result of a considerable increase in total sales. Profit rates have not been raised.

The larger turnover is occasioned by an improvement in factory efficiency plus a not inconsiderable amount of sub-contracting to make good in part the deficiencies in our domestic production possibilities. Your directors feel that the policy they have followed in this matter is the only satisfactory answer to current shortages of manpower and supplies in our heavily taxed industry. The demand for locomotives—especially of our Beyer-Garratt type—showed no decline during the year and our total order book stands at a new record high level.

Our overseas manufacturing competitors turn their eyes to the full order books of British firms and it is to be expected that competition will become keener in certain markets. To retain our dominating position demands constant care. Growing shortages in the British supply position constitute a menace of increasing gravity. If, as we understand, our export trade is a national asset of extreme importance, it follows that Government controls must regard the manpower, machine tools and materials and supplies requirements of our industry as matters of high priority.

GROWING POPULARITY OF PRODUCTS

The popularity of our special type of locomotive continues to grow, and we have evidence from users in many parts of the world of the excellent designs and high-grade workmanship of the products of our Gorton factory.

Our subsidiary companies have made further progress during the year under review and are in good shape for the current programme. The continued improvement in their combined technical capacity and financial strength is of increasing importance to the parent company. Further modest expansion is contemplated for the present year. Your board are of the opinion that the value of these assets far exceeds the figures by which they are represented in our balance sheet.

Our associated company, "Metropolitan-Vickers-Beyer Peacock, Limited," has commenced production in its new factory and has secured orders for electric and diesel electric locomotives sufficient to ensure full activity for some years. No profit has been taken in the accounts now submitted, but your directors have every confidence that the prospects for the future are of a nature to confirm their original opinion of this joint venture.

The results I have the privilege of presenting are in part some measure of the success which has attended our efforts at team-building. I believe that, though facing the prospect of difficult times, the nature of our unity and the excellence of our equipment make it possible for us to confront the future with reasonable confidence.

The report and accounts were adopted and the dividend of 7½ per cent. and bonus of 2½ per cent. on the ordinary shares were approved.

LONDON BRICK COMPANY, LIMITED

RECORD POSTWAR PRODUCTION

The fifty-first annual general meeting of the London Brick Company, Limited, was held on May 24th in London.

Mr A. T. Worboys, the chairman, in the course of his speech, said: Trading profit and sundry income amount to £1,042,650 compared with £849,115 for the previous year. The net profit is £268,401. The net dividend on the preference stock and the interim dividends of 15 per cent., less tax, paid on the ordinary stock leave a balance of £36,301 as against £6,272 a year ago. The directors do not recommend any further dividend for 1950.

Both production and deliveries of all the company's products again achieved record postwar figures during the year. Seeing that we are still short of our full labour requirements, this further increase in production reflects the continued and successful progress of the programme of increased mechanisation.

The demand for all the company's products continues to be much greater than the production which we can, as yet, achieve. The past year has been one of expansion in every part of the company and the additional financial resources for which we asked last year have been utilised to good and permanent advantage.

Unless major disturbances occur I hope that I may be able to report no less favourable progress and results at our next meeting. With the overlong delayed release from winter conditions, which can seldom have been worse or more protracted in the company's history, we have during the past few weeks achieved new postwar production records. The demand and forward enquiries for all our products show no sign of diminishing.

The report was adopted.

BRITISH ROPES, LIMITED

ALL-TIME SALES RECORD

The twenty-ninth annual general meeting of British Ropes, Limited, was held on May 24th in London.

Mr Herbert Smith (chairman and managing director) in the course of his speech, said: During the earlier months of the year there was a steady decline in sales tonnage, and there was every appearance that the results for the year would fall well below those of the previous year. However, towards the end of the year production and sales bounded to a very high level, and both in tonnage and value our sales exceeded the record high level of 1949.

The total trading profit for the year was £1,613,000, as against £1,162,000 for the previous year. The net dividends paid and proposed to be paid account for £196,000—that is, 31.36 per cent. of the net profit available for the year. No less than £429,000—68.64 per cent. of the net profits earned—has been ploughed back into your company, £250,000 by way of transfer to general reserve and £179,000 by an increase in the balance on profit and loss account, which brings the capital and revenue reserves of the group to a figure slightly below £2,000,000.

Present indications are that shortages of steel will hamper our activities during this year. It is too early to forecast how the company will be affected, but our products are needed in any rearmament programme, in addition to normal peacetime requirements.

Our total exports showed considerable progress. They were 20 per cent. greater in volume as compared with the previous year, chiefly owing to the increase in shipments of wire.

The report was adopted.

BRISTOL AEROPLANE COMPANY

INCREASED TRADING PROFIT

The forty-first annual general meeting of this company was held on May 24th at Bristol, Sir William G. Verdon Smith, C.B.E., the chairman, presiding.

The chairman, in the course of his address, said:—

We have added substantially to buildings, plant and equipment, including the purchase of almost all buildings erected at Government expense within the works. Further capital commitments amounted to £378,681.

There are certain changes in our interests in subsidiary and associated companies. The entire capital of British Aeroplane Engines Limited is now held by the Bristol Aeroplane Company of Canada Limited, formed by this company to concentrate upon development of our interests in Canada. We have transferred our interest in British Messier Limited to Rotol Limited. We have made a further purchase of shares in S.E.C.A., the overhaul business at Le Bourget, Paris.

Despite additions to fixed assets, current assets at £5,116,011 are only £191,273 less than the 1949 figure.

Capital, reserves and surplus have increased from £7,576,813 to £8,049,091. The excess profits tax postwar refund shows an increase of £212,731 at £1,030,000.

The resources at our disposal will be fully employed in supporting the defence programme, in the growth of our activities and in meeting rise in prices.

PROFIT AND LOSS ACCOUNT

The trading profit for the year, after charging depreciation, was £1,120,094, an increase of £218,966 over 1949.

Provision for depreciation of fixed assets amounts to £367,979 (compared with £324,535 for 1949). We have made allowance for the continually increasing cost of providing replacements in the amount (£200,000) transferred to general reserve.

We recommend a final dividend on ordinary stock of 8½ per cent., less income tax (£147,263), leaving a balance to be carried forward in the parent company of £248,335 or in the consolidated account, £359,663.

The proposed final dividend will result in a dividend of 12½ per cent for the year, an increase of 2½ per cent in the rate for the past eleven years. The distribution represents a return of just over 5 per cent. gross on the capital employed of £8,049,091. We regret that the reward of adherence to the policy of dividend limitation should have been the imposition of an even higher tax on distributed profits.

REVIEW OF 1950

Manufacture and further development of our various products were continued in all divisions throughout the year with efficiency and success and the aircraft and engine Divisions completed the year much more satisfactorily than we had reason to anticipate a year ago. On the Brabazon development continues as planned, the Olympus engine has become the subject of a licence agreement with the Wright Aeronautical Corporation of the U.S.A. and the French concern, S.N.E.C.M.A., will manufacture the Hercules engine under licence.

We have added to our engine division's programme—its own engine—increased demands for our own engines—the Rolls-Royce Avon and our aircraft division has undertaken the De Havilland Venom fighter. These projects on top of our existing programmes of military and civil aircraft and guided missiles, and their power units, will employ our aircraft and engine divisions to the limit of their capacity.

The report was adopted.

BRITISH INSULATED CALLENDER'S CABLES

YEAR OF GREAT CONTRAST

CRIPPLING TAXATION BURDEN

The sixth annual general meeting of British Insulated Callender's Cables Limited will be held on June 14th at Liverpool.

The following is an extract from the statement circulated by the chairman, Sir Alexander Reger, K.C.I.E.:—

1950 was a year of great contrast. Last June the immediate outlook was not so assured as it had been a year previously, mainly due to the cuts imposed by our Government on the capital expenditure of our principal customer groups in this country, and to the increasing, and in some cases fierce, international competition being experienced in certain overseas territories. These factors seriously affected certain of our activities during the first half of the year, but for the remainder of 1950 our production facilities in practically all divisions were stretched almost to the limit. The net result is that profit on trading fell by £255,250, although it still reached the satisfactory figure of £3,233,039.

The experience of several of the units in the group has been similar to that of the parent company, but in others operating in different fields a consistently high level of activity was maintained throughout the year and a further improvement was shown on the 1949 results.

TAXATION

In total, however, group profit on trading has fallen by £607,622 to £6,130,642. In spite of this, due to higher rates, taxation absorbs the wholly disproportionate and crippling figure of £2,945,201. It is clear beyond any doubt that the present crippling burden of taxation cannot be continued if industry in this country is to remain competitive in the world markets. There are able men in other countries planning and working all the time to improve their productivity and efficiency and they are not being penalised from doing so to anything like the extent we are by taxation or rules and regulations.

Since the amalgamation in the parent company we have had to pay or reserve out of profits no less than £9,000,000 for taxation.

The net assets of the group even on their balance sheet values now amount to over £26,000,000.

Turning now to the export market, whilst our volume of sales measured by weight or length shows some contraction from the records achieved in 1949, the higher prices for metals and the like have increased the monetary value, and the direct exports of the BICC group for 1950 amounted to over £18,000,000.

THE OUTLOOK

Sales for the early part of 1951 reached an exceptionally high level, but this involved drawing on the stocks of copper and certain other raw materials in our pipe-lines to execute orders accepted prior to any rationing. Subsequently, the full effect of the rationing of copper and the shortage of other materials has been increasingly felt, and our sales now, and as far as can at present be seen ahead, must of necessity be geared to the materials made available to us for production purposes. We do not believe, however, in accepting orders which we cannot fulfil, and we are endeavouring to be scrupulously fair to all our customers in the allocation of raw materials made available to us.

Any further deterioration in supplies will bring about a serious position. Any improvement would ensure us of a steady load factor for some time ahead.

EXPERT TOOL AND CASE HARDENING COMPANY

SATISFACTORY RESULTS

The thirtieth ordinary general meeting of the Expert Tool and Case Hardening Company Limited was held on May 23rd in London, Mr A. H. Redfern (the chairman) presiding.

The following is an extract from his circulated statement:—

The net profit for the year amounted to £110,527 as compared with £140,991 for the previous year. The net surplus, after providing for the heavy burden of taxation, amounted to £39,567, as against £56,691 for 1949. Due to the revaluation of fixed assets at December 31, 1949, additional depreciation of £11,000 was provided this year, which is not allowable for taxation purposes, and which, on a comparative basis with last year, would have been available as a free reserve.

In spite of full order books in all our subsidiary companies, and the growing demand for their goods, production did not reach the figure which could have been normally anticipated. This has been caused mainly through shortage and delays in deliveries of raw materials, which has naturally had an effect on the trading figures, but having regard to all the circumstances and the difficulties encountered I feel sure you will agree with me that the results are satisfactory.

A further issue of 400,000 ordinary shares by way of bonus was made during the year by capitalising reserves, the issued ordinary share capital now being £160,000. Your directors propose the payment of a final dividend of 15 per cent., less income tax, on the ordinary shares, making a total of 26½ per cent., for the year.

The report was adopted.

BRIXTON ESTATE

SATISFACTORY PROGRESS

The annual general meeting of Brixton Estate Limited was held on May 24th in London, Lieut-Col. Sir Francis Humphrys, G.C.M.G., G.C.V.O. (the chairman), presiding.

The following is an extract from his circulated statement:—

During the year the directors have decided to bring the properties into the balance sheet at cost to reduce the number of separate reserves and provisions and to introduce other minor changes in the account.

Properties, as a result of the above alterations, now stand at £573,917. Gross income shows an increase of £13,869 to £119,775. This figure includes a maiden dividend of 15 per cent. from our associated company. Net revenue, after taxation, has increased from £29,776 to £36,799.

During the year, a further bonus issue was made by capitalising the general reserve of £25,000 and by issuing 100,000 new 5s. ordinary shares in the proportion of one new share for every four shares held.

War damage repairs: A licence to re-instate a further portion of the Brixton property was received towards the end of the year, and it is hoped to complete the work during 1951.

With the maintained demand for space and full occupation of our properties, the periodical renewal of leases should secure continued expansion of income during the current year. Our associated company is also making satisfactory progress.

Two interim dividends amounting to 17½ per cent., less tax, on £100,000, and a third interim dividend of 11 per cent. on £125,000, have already been paid. It is not proposed to pay a final dividend. The total distribution is equivalent to 25 per cent. on the present capital of £125,000.

The report was adopted.

NEW BROKEN HILL CONSOLIDATED

YEAR OF STEADY PROGRESS

The fifteenth annual general meeting of New Broken Hill Consolidated Limited will be held on June 19, in London.

The following are extracts from the statement by the chairman, Mr John R. Govett, which has been circulated with the report and accounts:—

The net profit for the year 1950 after providing for taxation was £450,541, compared with £384,014.

In considering their recommendation as to the final dividend for the year, your board are strongly influenced by the substantial sum still required to be spent in order to complete the equipment and development of the mine. In the face of continuously rising costs, the board are of the opinion that cash resources should this year again be conserved to safeguard the completion of the programme initiated in 1945. They are therefore unable to propose any increase in dividend over and above that paid for the previous year, namely 30 per cent. I realise that this may prove a disappointment to some who may have anticipated a higher final dividend in view of the rise in metal prices, but equally I believe that they will endorse our determination to ensure full achievement of the success of their enterprise.

I have frequently had occasion in the past to stress the importance of an adequate supply of manpower to the successful achievement of our objectives. I am happy to be able to say that as a result of negotiations successfully concluded with the Workers' Industrial Union of Australia, arrangements have been made which provide a wider field for recruitment and, we hope, will ensure the manpower required for our expansion programmes and which at the same time safeguard the interests of those on whom the success of the industry has depended in the past.

The year has been one of steady progress towards our objective of developing and equipping our mine as a major and independent producer. Development work

carried out to date more than fulfils the earlier expectations on which our 10-year expansion programme was based and I have every confidence in the future of the property.

THE CONSOLIDATED ZINC CORPORATION

LARGER TRADING PROFIT

FUNDS CONSERVED TO MEET DEVELOPMENT EXPENDITURE

The annual general meeting of The Consolidated Zinc Corporation Limited will be held on June 19 in London.

The following are extracts from the statement by the Chairman, Mr John R. Govett, which has been circulated with the report and accounts:—

The market conditions are reflected in this year's financial results, in which the profits for the year, before taxation, amount to £4,570,800, compared with £3,453,429 for 1949, an increase of £1,117,371. The net profit for the year, after providing for taxation (£3,011,419) and deducting the interest of the minority shareholders in Subsidiary Companies (£129,701), amounts to £1,429,680, compared with £1,227,119 for the previous year, an increase of £202,561.

RIISING COSTS

I consider the results of the year to be satisfactory and that they are a fair indication both of the expanding nature of our activities and of the efforts of those who are in charge of our operations in this country and in Australia. It is nevertheless necessary to emphasise that these profits were earned during a period of high prices which are now subject to artificial support by emergency conditions which neither you nor I would willingly see prolonged. Costs have inevitably increased, due mainly to reasons outside the control of the company. In Australia, in particular, there has been a substantial advance in the basic wage (as well as in the lead bonus which fluctuates with

the price of lead) affecting the costs of development, mining, milling and smelting—in rail charges—in sea freights—in fact, under most headings of expenditure. Rising costs have also increased the amount of working capital required to finance stocks and constantly serve to reduce the margin of our resources available for the replacement of outworn plant and machinery at today's inflated prices, and to meet our development programme.

In view of this need to conserve funds to meet future requirements, I regret that we are unable to recommend an increase of dividend and are proposing to pay the same rate as that paid last year namely 2s. 6d. per share for the year.

In this connection I referred last year to the need of some relief from taxation to enable companies such as ours to make adequate provision for plant replacements. The report of the Millard Tucker Committee, which has been investigating this problem, has been a disappointment on this point and the problem with which industry is faced has been magnified by the measure proposed by the Chancellor of the Exchequer in his recent Budget to suspend from next year the initial allowances on capital expenditure on plant and buildings. Even on a basis where the present level of profits is maintained in the future, this measure, combined with the rise in income tax and the heavier taxation on profits distributed in dividend, must serve to reduce further the amount available for capital requirements.

MARKETS

Though the level of our prices must at all times depend on the fluctuations in the American economy, there are now superimposed on the normal civilian demand the requirements of rearmament. It is not in my power to judge the final effects of this additional influence on the world metal position. With this in mind, together with the financial problems I have briefly outlined above, I am compelled to emphasise the need of preserving, as far as it is possible to do so, adequate resources to meet the emergencies which must be anticipated in the critical time which lies ahead.

NOTICES

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Public Finance (tenable at the London School of Economics and Political Science) (salary £1,050—£1,250—£1,450 a year). Applications (10 copies) must be received not later than June 15, 1951, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

COLEG PRIFATHROPAOL DEHEUDIR CYMRU A MYNWY. Applications are invited for the post of Research Assistant in the Department of Industrial Relations. Applicants should have an Honours Degree in Economics, and previous research experience would be an advantage. Salary £150 p.a. The post is not permanent. Eight copies of application, with the names of three referees, should be sent to the Registrar, University College, Cathays Park, Cardiff, not later than June 30, 1951.

(Signed) E. R. EVANS, Registrar.

BUSINESS Economist with wide experience as Financial Adviser, Assistant to Managing Director, Personnel Officer, etc., seeks permanent position in industry where abilities can be fully used. Graduate in Economics—B.A., Cantab, with first class honours, and Law—LL.B., and with qualifications in Accountancy. Age 30.—Box 652.

FOR SALE, *The Economist*, Sept., 1931-Dec., 1936, complete. July, 1937-Dec., 1947, almost complete. Statistical tables 1834-1908. Blue books on trade, various 1885-1907. Offers.—Box 651.

SALES DIRECTOR requires personal Assistant for management of internal sales organisation, including sales office, publicity, transport, of well-known manufacturers of arc welding equipment in Midlands. Age 30/45.—Apply, stating age, training and experience, to No. 41, Box 656.

YOUNG WOMAN, 23, Honours Graduate, Economics, Statistics and related subjects, with nearly two years' varied experience in industry, seeks interesting post requiring intelligence and initiative. Suggestions welcomed.—Box 655.

FRENCH, German, Italian and all Scandinavian languages, including technical translations by expert native translators.—Write International Translations, 205, Conisborough Crescent, London, S.E.6.

CROWN AGENTS FOR THE COLONIES

Commercial Officer required by the Government of Nigeria for the Department of Commerce and Industry, for one tour of 18 to 24 months. Salary (including allowances) according to qualifications and experience in scale £711, rising to £1,290 a year, with prospect of permanency; or in scale £777, rising to £1,400 a year on temporary basis, with gratuity on satisfactory completion of service of £25 for each three months' service. Outfit allowance £60. Free passages for officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates under 35 should be educated to Matriculation standard and have had previous commercial experience with a firm of established reputation. A degree in Commerce or Economics would be an advantage.—Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M.28570.C, on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

CROWN AGENTS FOR THE COLONIES

PRODUCE OFFICER required by the Government of Nigeria for the Department of Marketing and Exports for one tour of 18 to 24 months with prospect of permanency. Commencing salary according to qualifications and experience in scale £711 rising to £1,290 a year, including allowances. Outfit allowance £60. Free passages for Officer and wife and assistance towards the cost of children's passages. Liberal leave on full salary. Candidates under 40 should have had a good education and preferably hold a University Degree in Commerce, Economics or Agriculture, or a Diploma of an approved Agricultural College. Experience in the inspection and grading of agricultural products an advantage. Apply at once by letter, stating age, full names in block letters and full particulars of qualifications and experience and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M.25572.C, on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

AMERICAN SOCIAL ANTHROPOLOGIST, 29, Ph.D., Journalism in background, 2½ years' independent research experience in Britain, seeks good research or editorial post in Britain or abroad.—Box 654.

OXFORD economist (27), successful in commercial application, seeks position on marketing side of industry. First-class references.—Box 658.

A Higher Pound?

THE world-wide rumour of last autumn that the pound sterling was about to be raised in value in relation to the dollar, and the devaluation of the previous year therefore in part reversed, died of its own sheer lack of substance. But it has lately been revived—not so much in the form of a rumour that sterling is in fact to be revalued as in the form of arguments that it ought to be. This advocacy has been heard at home and this week it has received powerful support from abroad in the annual economic Survey issued by the United Nations Economic Commission for Europe.

Had it been foreseen, when the pound sterling was lowered in value from \$4.03 to \$2.80 in September, 1949, that the Communist invasion of South Korea nine months later would initiate a new rearmament boom and completely upset the world markets for raw materials, it is quite possible that the devaluation would have been less severe. There appears to have been a debate, up to the last minute, between the rates of \$2.80 and \$3.00, and if the future could have been foreseen the choice might have fallen on \$3.00. Moreover, although Sir Stafford Cripps was anxious to make it clear that no further depreciation could reasonably be expected—this was the deciding reason for choosing a low rate—he went out of his way to mention the possibility of a subsequent rise. There is no reason, therefore, to cling to \$2.80 for reasons of pride or obstinacy or consistency alone. There need be no moral overtones in the debate; it is a straight question of economic expediency.

There is no doubt that the strength of sterling since the devaluation has surprised everyone, and it is only reasonable to ask whether this unexpected strength should not now be recognised by an increase in its price relatively to other currencies. If the new strength of sterling looked like being permanent, the change in rate should certainly be made. But does it? The sterling area outside the United Kingdom itself is profiting greatly from the sharp rise in the prices of some of the commodities it sells to the dollar area. This wholly abnormal state of the commodity markets cannot last for ever, and when it comes to an end, one of the main sources of sterling's strength will disappear. As for the United Kingdom itself, the gigantic task of balancing income and outgo has not been so quickly or so easily solved as the figures for 1950 might suggest. On the contrary, it remains as true as ever it was that this island has a very heavy task ahead of it in paying its way. One of the avoidable risks that must not be taken is that of permitting the pound to become over-valued. Any present rise in its value should be contemplated only if it is clearly regarded as temporary, to be reversed as soon as any evidence appears that the current strength of sterling is itself a passing phase.

If the strength of sterling is only transitory, are there any better purposes to which it can be put than a rise in the exchange rate? The question has only to be put to be answered. The reserves of

gold and dollars are still low by the standards of any previous period and the future demands upon them, from the rest of the sterling area as well as from the United Kingdom, are likely to be heavy. It is no bad policy to let them go on rising. Restrictions upon imports are still, in some directions, very tight; there are still foodstuffs, and even some industrial raw materials, to be bought if Britain will buy more freely; and larger stocks of imported goods can be regarded as even more valuable reserves than stocks of gold. The British Government has frequently pledged itself to relax its restrictions upon exchange payments and to move towards making sterling freely convertible, when these relaxations become possible. Some of them are possible now; and the International Monetary Fund has made its view clear that some moves in this direction are to be preferred to changes in exchange rates. If the frequently expressed desire to see sterling restored to the position of an international currency is a sincere one, this view should carry great weight.

*

There is another set of considerations which should give the revaluers pause. The foreign exchange market is still a free market in the sense that it is beyond the power of any one government, and conceivably of all governments combined, to control it. The standing of any currency in the market depends upon the view—in the best sense, the speculative view—held by the community of traders, and it is very greatly to the advantage of a country that its currency should attract, on balance, more bull sentiment than bear. One of the great disadvantages of a system in which exchange rates, though rigidly fixed for long periods, are known to be subject to alteration from time to time, is that all the speculation is one way. Before September, 1949, there was a chance that sterling would fall and none that it would rise; there were no bulls, and Britain's reserves and financial strength suffered accordingly. Since then the trend has been reversed, and all the world is a bull of sterling, since it may rise and is obviously not going to fall. A revaluation—a move to a higher fixed rate—would reverse the market again and put the reserves at the mercy of the bears—and the more it was declared to be temporary, the worse would be the consequences.

The report of the Economic Commission for Europe sees this point, and declares in favour not of a higher fixed rate but of flexible exchanges. Managed moving exchanges do not present the same golden opportunities to the speculator, since the managers, with their vastly greater resources, can keep him guessing and make him pay for guessing wrong. Many people (this journal among them) advocated flexible exchange rates in 1949, and everything that has happened since has served to strengthen the argument. If the Government and the Bank of England are now converted to that view (and there is no reason to suppose that they are), it would obviously be best to move to the flexible basis at a time, such as the present, when the change of system could be followed by a gently appreciating pound. This would be well worth doing, but even so the managers, if they were wise, would not permit a rise of more than a few points in the present rate.

What may be called the external currency arguments

thus seem on balance to be adverse to the revaluers' case. But the core of their argument lies on the other side of the fence, in the domestic economic field. The extent of the devaluation has had the effect of exaggerating the great rise in raw material prices that has occurred in the past year. This has not only given an unnecessary stimulus to the rise in the cost of living and an added push to inflation, it has turned the terms of trade sharply against this country and imposed on it the added burden of greatly increasing its exports in order simply to pay for the same volume of imports as before.

There is great force in this argument. These, undoubtedly, have been the consequences of devaluation and Korea combined, and if an appreciation of sterling would reverse them, without doing any further internal harm, there would be a strong case for overriding the currency arguments. But that is where the doubts enter in. Appreciation could be expected to have some effect in reversing the trend in the terms of trade. But the worst, in this respect, is perhaps already past: world commodity prices have shown signs of weakness while the price level of British exports is still steadily rising.

It is in its effect on domestic prices, however, that the revaluation argument reveals its weakness. Rise in prices is at present being deliberately used by the Government as a means of pursuing higher economic policy. The overriding need of the British economy in the current year is to set aside the resources of manpower and materials that are needed for rearmament. They can only come out of consumption or private capital expenditure, any retrenchment in government expenditure being ruled out by the politicians. Mr Gaitskell's Budget was based on the explicit assumption that the greater part of this necessary transfer of resources would be effected by means of rising prices reflecting the higher cost of imports, and on this assumption he imposed new taxation sufficient only to cover the smaller part of the total transfer. If now, by revaluation of sterling, the rise in prices is avoided, then the assumption falls to the ground. But the transfer of resources will still be necessary, and, to protect the rearmament programme, the Chancellor would either have to impose a sharp cut in the subsidies or else call for still higher taxes. If he did not take either course, then consumption would rise again above the level that can be afforded, and the only result would be to exchange one kind of inflation for another. It would in fact be worse than that; for the present rise in prices, which originates in the high cost of imports, though it is unpleasant, does at least serve the purposes of policy by directing resources out of consumption into rearmament, while a consumption inflation would have the opposite effect. It is, of course, deplorable that some form of inflation cannot be avoided; but if inflation there must be, let it at least be the kind that pushes the economy in the right direction.

One must beware of making the conclusion too dogmatic in a matter where differences of opinion are wholly reasonable. But this analysis gives a clear balance of argument on one side. From the currency point of view, the only appreciation of sterling that would be wise would be a very slight one undertaken as the lubricant of a change from fixed to flexible rates of exchange. And from the domestic point of view, an appreciation would do more harm than good except on the politically almost impossible condition that it was accompanied by sharp reductions in subsidies or further increases in taxation.

Three Forces in France

THE general election for which France is now preparing—the first in four and a half years—will be quite unlike anything that has happened, or could happen, in the United States or Britain. It is likely to be bitter, confused and indecisive. To try to fit the forces and parties that will come into play within the simpler categories of Congress and Parliament would be merely misleading; for the American Congressman, absorbed in strategic problems of tempting novelty, and the British Labour Minister, absorbed in election prospects of a quite different kind, are far removed in outlook and interests from the Popular Republican (MRP) whose election may depend entirely on his views about independent schools, or from the Socialist who will hold up a vital finance Bill rather than allow the state to help these same schools to survive. Nor is it easy for the outsider to understand that Gaullism—rooted in French history—is not identical with Fascism, or that the Communism of millions of Frenchmen—also rooted in French history—is something different from Bolshevism. He will be likewise baffled because the French political scene presents itself in colours that are not black and white but motley.

Some simplification of the aims of the French parties is, of course, possible, complex though the interests and motives of the French voter are. The Third Force combination—what has been the government group—of Socialists, Radicals and Popular Republicans is fighting extremists and enemies of the parliamentary system to the right and left of them. They are agreed on the defence of the Republic, on the need for their own return to power, and on very little else that is fundamental; that is why they will fight the election back to back rather than in line. The Communists also present a simple picture. They declare themselves for peace, bread, and houses; that is to say, they are against America, rearmament and inflation. For the moment they show the French and not the Stalinist profile, and talk more democratically than the Republican defenders of democracy. They fight on one front for they are against the rest. Indeed, they half expect to be banned and to take to an underground existence before the year is out.

The Rally of the French People, the followers of de Gaulle, are likewise simple in their public approach. First and foremost they are against the Communists, whom they regard as "separatists." They are against the parties that since 1947 have run France, with very fair success, on hand to mouth policies. They believe in men rather than measures, in the spirit rather than the programme; they want power and are contemptuous of parliamentary politics. Within the Third Force alliance, too, some simplification is possible. The Radicals, of several hues, are individualists, sceptics, liberals. The Socialists are more Marxist than British Labour but far less in tune with the working masses than with the mass of minor civil servants. They are planners, anti-clericals, and reluctant supporters of rearmament. Popular Republicans (MRP) put justice before liberty and religion before individualism and have provided a Foreign Minister with a fairly coherent policy. The Third Force is therefore united only in its belief in

moderation, in its opposition to both Thorez and de Gaulle, in the broad outlines of foreign policy, and in a general desire that France should respond as painlessly as possible to American pressure for rearmament and continue the remarkable convalescence which was begun by the venerable and Radical Prime Minister M. Queuille. But it has to be remembered that generalisations are dangerous about a country in which a village will vote for the left if it has an anti-clerical grievance and for the right if it has an economic grievance; and the floating vote of the "moderate mass" is both larger and more fickle than in this country.

If party lines were not so complex the issues of the election would be simple, perhaps reducible to two. First, if France is to play the role of great power and European leader, can it make up its mind to the sacrifices needed to rearm and restore national unity? Second, is that effort, or the decision against, to be made by a

ELECTION OF THE NATIONAL ASSEMBLY, November, 1946

Parties	Seats Received	Votes Received	Percentage of Votes
Communists	183	5,475,955	28.2
Popular Republicans MRP	164	5,033,430	26.0
Socialists	105	3,450,080	17.9
Radical Socialists	64	1,971,660	11.1
Right Wing: P.R.L. and Independent Republicans	72	3,136,630	11.8
Gaullist Union	10	...	...

government of the Right or one of the Centre? It is likely that these questions are in every Frenchman's mind in one form or another, but it is far from certain that they are everywhere the dominant ones. As things are there are numerous regional, sectional and traditional motives to be reckoned with, of the kind that make Liberalism survive in Wales and Cornwall. It is therefore most unlikely that the voting on June 17th will give to France's allies a clear answer to their questions about its power and will to be strong. For the political and moral leadership is still lacking that would express the essential vitality and health of a people whose will to live is shown in its birth rate and whose will to work is evident in its production figures. The election results may decide who is to govern France, or who is to make the attempt; but they will not show the will of the people about the future of the Fourth Republic.

A novel and misleading factor in this election is the new electoral law which provides for voting alliances (*apparentements*) of moderates to squeeze out the Communists and Gaullists. This arrangement is available to national groups or parties presenting candidates in at least 30 of the 90 departments. Where the alliance wins an absolute majority of votes in a department, it receives all the department's seats in the Assembly, whereas under the former system there would be a proportional distribution. No one pretends that this is anything but a barefaced piece of rigging, legislation so *ad hoc* that it provides for a special system of allocating

seats in the two departments which comprise Paris and its suburbs, where Gaullism and Communism are highly concentrated. The ruse—for such it is—is justified by the defenders of the Republic on the grounds that the old system of representation would have returned Third Force, Gaullists and Communists in equal numbers, and so made impossible a working majority in the Assembly. So little faith have the moderates either in their own capacity to put national interests first or in the electoral appeal of the Third Force idea. Now that public dislike of the measure has been fully renewed it is becoming doubtful whether it will achieve its purpose. It may even recoil on its authors.

Rassemblement de la Gauche Républicaine (inc. Radicals)

Speculation, even in France, about the election results is tentative and imprecise. There are two factors which are especially difficult to assess. First is the strength of the appeal to the electors of the Third Force idea, unknown in 1946, when the RPF did not exist and Communists were in the government. Voters may remember gratefully such past blessings as M. Queuille's check to inflation, the building up of a new social recovery system, and their benefits from the Monnet and Marshall Plans. They may on the other hand be more conscious of present discontents: of the new taxes that rearmament imposes, of the unpopular policy towards Germany and the dependence on America, of the *immobilisme* of moderate cabinets compared with the "dynamism" and disciplines of Gaullism and Communism. Second is the difficulty of deciding how strong is General de Gaulle's following when it comes to voting for men who will form a government. Many who are stirred by the call and *mystique* of leadership distrust a leader who is quite uninterested in vital economic and social questions.

If it is hard to predict that the Third Force will win at the expense of the two extremes, it is easy to see what it has to do to win. It has to do better than its constituent parties did in 1946. If, in round figures, it can win 350 seats in a Chamber of 620, there could be a reasonably independent and effective government of moderates, provided the partners held together. Any smaller majority would make it dependent on the Gaullists, who are as much against "the parties" as against Communism. Third Force proposals depend, in fact, on Communist losses not all going to the Gaullists and on Socialists, Radicals and Popular Republicans winning as many seats to their left as they lose to their right. But some good judges say that the Communists will lose few, if any, of their 180 seats, in spite of the fact that membership of

the party has fallen from nearly a million in 1946 to 500,000 now. If so the decisive factor will be the gains that de Gaulle's RPF can make from the Third Force. That, indeed, is one of the two main reasons for the new electoral law.

The past offers even less guidance to the prospects of the General. Some say his supporters in the Chamber will increase from 20 to 140; this would still leave the possibility of moderate government if his gains were offset by Communist losses. But if the Communists held their ground and the Gaullists gained more heavily, then stable government would be impossible and there would probably have to be a second election very soon; that is the worst of which the General hopes the best. The prospect for the moderate Third Force is therefore uncertain and the chances of a decisive verdict remote.

So closely are the fortunes of France now linked with those of the United States and this country that the foreigner has perhaps some claim to express a preference before the election takes place. For when it is over he must loyally accept the result. Those who think of France as the partner that is to take an increasing share of the burden of defending Western Europe and of leading it into new forms of association and co-operation, must ponder carefully before they choose. They may take a short view and reflect that individualism and self-interest have so run riot in the politics of Paris that, if France is to be powerful again, the time has come for one of those authoritarian spells characteristic of its history. They know that the advent of de Gaulle to power would divide the nation even more deeply, possibly to the point of civil war. They know, too, that the Communists would expect to profit by such a tragedy. Yet the foreigner who understands what several millions of Frenchmen are feeling about the Fourth Republic inevitably has some sympathy for the ardent and impatient over whom the forceful and rebarbative General has cast the spell of "leadership."

But those who take the longer view will reject this course. They will reflect that France still needs above all convalescence and rest; it needs time to forget the occupation and heal its moral wounds, to complete its economic reconstruction, to prepare its future for a younger generation given security by the presence of American and British forces in Europe. If so, they can argue, why not continue with the Third Force? Considering the difficulties it faced, its record is not unimpressive, particularly in foreign policy. Let France quietly organise itself and Europe for the years ahead. That is what many sagacious Frenchmen—not all neutralists—would like to happen. But then the foreigner has to ask himself whether either the British or American people are prepared for France to play a secondary role for more than a year or two; and it would take more than a year or two for the Third Force to become a group of national unity instead of an emergency combination. The question may be resolved by the elections. If it is not, then it will pose itself again within a few weeks; and the answer that is given in London and Washington might well affect the result of a second election. The question should therefore be put in the simplest possible form—far more simply than it can be put before the French voter. Is it better to have France convalesce under "Papa Queuille" or France in fever under General de Gaulle? The answer of the Western allies must be for M. Queuille.

The Poor Countries

POINT FOUR is lagging. The idea that there should be an organised attempt by the rich countries to help the poor countries to raise their standards of living derived the name by which it is now generally known and its major impetus from President Truman's inaugural address in January, 1949. But it is not by any means a specifically American idea. Indeed, the great practitioners of the export of capital and skill for the development of other lands have, in times past, been the British, and that the desire and the vision still remain was amply demonstrated at the Labour Party's Conference at Margate in October last. There is no doubt that there is something in this general idea which has a wide appeal, to the minds of the Right in politics as well as to those of the Left. It is given immediate point by the desire to make some answer to Communist propaganda in the poor countries and to show their peoples that the West can perform as well as promise. There is also a new realisation of an old fact, that the industrial progress of the rich countries in Europe and North America will be hampered if effective steps are not taken to develop the other continents of the world both as sources of raw materials and as markets. And finally there is the conviction, born partly of apprehension but mainly of genuine sympathy, that the world cannot expect to live in peace so long as the contrasts in human welfare are as sharp as they are today. Point Four appears to combine humanitarianism with sound business and good politics.

Yet it is lagging. In the United States itself, as an article from our Washington correspondent on page 1294 describes, much of the original impetus has vanished. Elsewhere in the world, the Colombo Plan is the only one of many paper projects that is beginning to take shape and, meritorious though it is, not even its most ardent supporters would describe the Colombo Plan as more than a small beginning. Why is it that a movement which was given so forceful a send-off, and which commands, at least in principle, so much support, should be making so little progress? Part of the explanation is no doubt to be found in what has happened since January, 1949. The argument that Point Four would make the poor countries proof against Communism was never a very strong one, and such validity as it possessed related entirely to the long term. But the need for defences against Soviet imperialism has become very urgent, and such money as can be spared can clearly be more effectively spent in the short run on military defence. Moreover, there has been a great shift in the past year in the world-wide terms of trade against the industrial and in favour of the raw material producing countries. This is not very likely to help the poor countries to finance their own development—as is pointed out by the annual survey of the Economic Commission for Europe, which is summarised on page 1302, these riches are very unequally distributed as between the primary producing countries and are all too likely to be dissipated in inflation—but it does *pro tanto* make it more difficult for the rich countries to provide assistance.

But the lagging cannot be explained simply by temporary difficulties; for if it were there would be efforts to draw up plans for putting into effect when the

emergency has passed. Some of the more permanent difficulties are faced in the report published last month by a group of experts nominated by the Secretary-General of the United Nations.* The experts came from Chile, India, Lebanon, the United States and the United Kingdom (Professor Arthur Lewis of Manchester); they have produced a study that is not only thorough and lucid but is also, on the whole, realistic and frank. There are, broadly speaking, three elements necessary for any far-ranging plan for international development. First, the willingness to provide assistance, in technical skill or in capital, must exist in the rich countries; secondly, there must be receptivity in the poor countries—that is, the willingness and the ability not merely to accept the assistance proffered but to use it in such a way that the object of raising the standard of living is in fact attained; and thirdly there must be institutions through which the assistance can be given and received. In which category are the obstructions to be found?

At the moment, money in the rich countries for overseas investment is short. But money for such purposes is not wholly non-existent. Both the American and British Governments are finding money for projects that they think worthwhile. Nor is it true that there is a complete lack of private capital. On the contrary, since the war, very large sums of private capital have been invested in the oil industry in under-developed countries or have found their way to developing countries such as Australia and South Africa. The western world is pre-occupied and suffering from shortages; but it is doubtful whether the major obstruction to the progress of Point Four is to be found on the side of those who would have to find the money and provide the assistance.

*

The experts make it clear that they share this view by devoting seven of their eleven chapters to the measures that they recommend to the receiving countries. The obstructions that they see to the fruitful reception of assistance by the under-developed countries amount to a long list; but they can usefully be summarised under two heads. The first of these consists of a number of doubts about the basic economic principle involved. Point Four is based on the assumption that the injection into an undeveloped country of capital and of the technical skill to use it will almost automatically raise the standards of production and therefore of welfare. It is true that the outstanding difference between the rich countries and the poor lies in their wealth and poverty of capital. It is further true that without capital, provided at home or from abroad, rapid economic progress is impossible. But it may turn out to be a quite naïvely erroneous deduction that therefore capital alone—or even capital plus technical skill—is needed. Quite remarkably little systematic inquiry has been made into the causes and conditions of economic progress, and nobody can claim to know what the factors are that must be present before the spiral can begin to revolve. Climate probably has something to do with it; human biology certainly does, as witness

* "Measures for the Economic Development of Under-Developed Countries." United Nations. 103 pages.

the way in which material progress may be eaten up by the growth of population. It is obviously easier to develop a country that has natural resources that the world wants, such as oil, than one that does not. Anyone who believes that capital and capital alone can always raise productivity might be invited to contemplate the position of, say, a small island in the West Indies and prescribe a diet of capital for it.

The other group of difficulties is made up of doubts whether, even in circumstances favourable to the investment of capital, capital provided from outside will be efficiently used or fairly treated. The most spectacular part of the problem is the case of the country that discriminates against foreign capital just because it is foreign. This can perhaps be cured by international agreement—though hardly so long as countries claim the sovereign right to repudiate their contracts. Much more difficult is the case of the country which does not provide the necessary assurances of security for any capital at all, its own or the foreigner's. In a sense, it is not nationalism, as the West has taught it to other parts of the world, so much as democracy, as the term is understood in the poor countries, that provides the greater obstacle to the useful investment and fair treatment of capital. The test is not so much "does this country believe in treating foreign capital fairly?" as "does it understand and believe in the investment of capital?" or, as Professor Hancock shrewdly remarked in his Marshall lectures last year, "what does it do with its own savings?" In the great majority of under-developed countries, those citizens who have savings hoard them, export them or put them into real estate. When those who should know best give this eloquent verdict, why should the foreigner, be he private citizen or international institution, feel any more confident that the capital he provides will be fruitfully invested and that he will get his fair share of the fruit?

★

This seemingly economic problem, in fact, like so many others, is really a political one. Where the political conditions are favourable, then capital investment can usefully proceed; where not, not. Favourable political conditions exist in the police states—that is to say, conditions favourable to the rulers of those states who decide on the investment. (And it is worth making the point that the rulers of Soviet Russia are the world's most fanatical believers in the capital process and its most rigorous practitioners.) They also exist in dependent territories, where some outside power still exercises enough authority or influence. But in colonies, as Tanganyika and the Overseas Food Corporation know, the other conditions may not be present; and in any event who can be sure that the government of any colony will still be willing and able to treat capital fairly in twenty or fifty years' time?

Point Four, however, does not primarily relate to colonies, and it does not relate to the police states at all. Its concern is with sovereign and independent, but under-developed, countries—that is to say, with Latin America, with the Middle East and with Southern and South-Eastern Asia. Of how many of these can it be honestly said that the political conditions exist, and are likely to continue for a generation ahead, in which the investment of capital will be worth while—even on the

broadest definition of the phrase? Some of these countries have ruling classes who positively dislike progress because it would break up their lands and subject them to direct taxation. In nearly all of them, anti-foreign feeling rejects any assistance that carries with it even a shadow of foreign supervision of what is done with it. In many of them, governments are unstable and arrangements made with one government will not be observed by its successor. Few of them have strong administrations and many of them are corrupt. The United Nations cannot say these things. But can anyone deny that they are broadly true? Is there a country where none of them is true and which yet has difficulty in getting capital for development? The best service that anyone can perform to Point Four is to say quite frankly that it is these political conditions in the poor countries which are the greatest obstacle in the way of a grandiose flow of capital or technical advice from the rich countries to the poor. Whether or not the rich countries can do anything to remove the obstacle is a very wide question indeed. But clearly it would require political rather than economic action.

Suggestions for new institutions should be looked at in the light of this analysis. Several recent inquiries have proposed that new institutions of an international kind should be set up for the specific purpose of canalising assistance for Point Four purposes. The Gordon Gray report, the report prepared under Rockefeller auspices and now the report of the United Nations experts have all come to this conclusion (the experts want an International Development Authority and an Economic Commission for Africa). This unanimity deserves respect. And yet it is impossible not to feel a certain scepticism. Most of the countries where the conditions exist for development to proceed already stand in a special relationship to one or other of the rich countries and new institutions could do comparatively little for them. And where, for the political reasons given above, little can in fact be done, it would be pure waste motion to set up new institutions. Indeed, some people who know the under-developed countries maintain that there are already too many international bodies concerned with providing assistance of one kind or another, that at best they create confusion and at worst succeed only in providing opportunities for the reactionary procrastinators among the local ruling classes, who dare not fail to give the appearance of activity but who wish for nothing less than for progress that might disturb their privileges. It would seem the path of wisdom to defer the creation of new institutions until there is more evidence than exists today that it is only institutions that are lacking.

To write in the vein of this article will no doubt be condemned as defeatist or even reactionary. It is therefore perhaps necessary to repeat, and in all sincerity, that the principle of Point Four is one of obvious wisdom and of urgent importance. Wherever it can be shown that there is an obstruction in the western countries—and the attitude of the British Treasury is as suspect to some as that of the American Congress is to others—then it is the duty of public opinion in those countries to strive to remove it. But no good purpose is served by covering up the decisive fact—that most of the under-developed countries are not well enough governed for large-scale development to be possible in them.

The Graduate Teacher

WITHIN the last six months three far-reaching proposals have come from the Minister of Education or from Committees set up under his ægis, which will profoundly affect the quality and quantity of teachers in the schools. Chronologically the order of their appearance was first the Report of the Burnham Committee, which made recommendations for the revision of teachers' salaries. Secondly came the Minister's decision to terminate the four-year teacher training grants tenable at the universities by those pledged to enter the teaching profession. The third report on the "Training and Supply of Teachers" * was published last week and deals with the demand and supply of teachers between 1950 and 1960. While the public has learned of these recommendations and decisions in sequence, the discussions which led up to them were concurrent, the membership of the committees overlapped and the advice tendered by the two main committees necessitated certain compromises between them.

In spite of its muted tone and its efforts to paper over the cracks of divergent interests, the Advisory Council's conclusions on the probable supply of graduate teachers make uncomfortable reading for the grammar schools—the generic term that is now used to cover all those general secondary schools, as distinct from technical and "modern" schools, which provide the base for the universities and the professions. The council has based its estimates on minimum requirements—a very modest improvement in the ratio of staff to pupils, no improvement in the proportion (now 77 per cent) of graduate as against non-graduate teachers in the grammar schools and a fall in the ratio of grammar school pupils to the total school population. Even on these austerity standards the maintained grammar schools will need at least 28,000 graduate teachers by 1960 compared with 21,000 in 1950. This will require an increase of 1,000 a year in the flow of graduates entering the teaching profession—and the total flow is now only some 2,300 a year.

Moreover, total numbers are only one of the three staffing problems that face the grammar schools. There is also the question of quality: at present the proportion of graduates taking a teachers' training who have first- or second-class degrees is substantially lower than it was before the war, 55 per cent instead of 65 per cent. Thirdly, there is the peculiar difficulty of the shortage of teachers of science and mathematics. This is already critical; in some schools science departments have already had to be closed for lack of teachers, and in others teachers of so poor a quality have been accepted that the next generation of pupils must be severely handicapped.

What chance is there of inducing another 1,000 graduates a year to take up teaching as a career? It cannot be said that the prospects are very favourable, and the decision to abolish the teacher training grants at the universities has done nothing to improve them. The teachers' organisations have for years been urging that these grants should be abolished; that young men and women should not be obliged to sign a

"pledge" at the age of eighteen to take up a teaching career four years later in return for grants to cover the cost of their university education, and that a choice made freely at 21 was far to be preferred to a bribe at the age of 18. This is perfectly correct in principle; but the grants undoubtedly persuaded many to go into teaching because they would not otherwise have reached the universities; in future these same people may either not be able to reach the universities because they have not the ability to win the more competitive state scholarships, or having got there will prefer to choose some other career. No doubt those who in future elect at the end of their university courses to go into teaching will be the better for having come to their decision freely. Unfortunately they may be many fewer.

★

Two further difficulties affect the girls at the stage of entry to the universities. The grammar schools are complaining that too many girls are leaving school at 15 or 16, instead of staying the course to the sixth form. This means that potential graduates drop out early and that those who could have gone straight into the non-graduate

training courses at 18 are lost to the profession. The causes of this loss are both social and economic—the high earning power of juveniles and the fact that many of the new generation of parents of grammar school children are unfamiliar with grammar school traditions and aims. The other difficulty is the very high degree of specialisation now required for entry to the science departments of universities, which the girls' schools are either unable or unwilling to give. As the result, relatively few girls enter university science departments and fewer still are available to teach science in the schools. This is a vicious circle which is difficult to break.

The next critical phase in the recruitment of teachers is the moment of departure from the universities, when graduates must make a decision about entering the teaching profession. At this point the student must weigh the relative attractions, financial and otherwise, of this and other callings. So far as women are concerned, alternative openings at equal or better rates of pay are less numerous than for men, and in the arts subjects there is a fair probability that the schools will secure an adequate supply of teachers. For a trained

* First Report of the National Advisory Council on the Training and Supply of Teachers. HMSO. 1s.

graduate woman assistant teacher, the basic scale is now £416 to £582. The difficulty of obtaining enough women mathematics and science teachers has already been mentioned. The advisory council considered that the probable annual recruitment of these teachers was not only insufficient for the programme, but insufficient even to offset wastage. Thus the prospects for mathematics and science teaching in girls' schools are very poor.

For men, the alternative openings for university graduates are much greater than before the war, and the competitive importance of salaries is proportionately increased. The basic salary for trained male graduate teachers rises to a maximum of £726 a year, and this is not attractive to men with ability. Industry is recruiting more graduates, mainly in the pure and applied sciences. The demand for arts graduates in other fields, however, is not unlimited, and it may soon be found that many arts graduates cannot find posts other than in teaching. In science and mathematics the demands from industry remain unsatisfied. But even in the arts it cannot be considered satisfactory that only the rejects of other professions should enter teaching. The grammar schools urgently need quality as well as quantity, and as the proportions of teachers with first-class or second-class degrees show, quality appears to be falling. With a demand for an extra 1,000 graduate teachers a year the quality is likely to drop still further.

*

The political climate has made it difficult to discriminate directly in favour of the grammar schools. Since 1945 all teachers in maintained schools have been on the same scales; this holds good for teachers of infants under seven as for teachers of university scholar-

ship candidates, except that, up to April 1st of this year, first-class graduates in England and Wales had a special allowance, and that since April 1, 1951, this has been merged into a single graduate allowance of £60 a year (£48 for women). There is in addition an elaborate system of special allowances for special responsibilities and experience, but these allowances are given relatively late in life, differ from authority to authority, and will not perhaps exert much influence on recruitment. It remains true that the assured maximum for a male graduate in an English maintained school is £726, whereas in Scotland and Northern Ireland, where there are special allowances for teachers with first-class and second-class degrees, the graduate can look forward to an assured maximum of £875 and £850 respectively.

In England and Wales the great hope of the new Burnham proposals was that generous use would be made of the extended powers conferred on the local education authority to grant large allowances to teachers with special qualifications; this scheme was designed primarily to meet the needs of the grammar schools. It is too early to say how successful it will be, but it is already apparent that, while some of the smaller education authorities, with perhaps one or two grammar schools in which there is intense local pride, are making full use of the allowances, some of the larger county authorities with dispersed interests have evolved a centralised and inelastic scheme which gives very little relief to the large grammar schools. Welcome, therefore, though these special allowances are and generous though some may be, they can have only a very limited effect on recruitment and in very many areas will be insufficient to retain staff.

Broadly speaking, therefore, it may be said that for the girls' schools the crux of the problem is at the age of 18. Having once secured enough entrants to the universities, particularly for science and mathematics, the schools may find that recruitment into teaching at 21 is relatively easy. For men the problem is reversed. The flow of entrants to the universities is adequate; the problem is to catch the men at 21. Without the anchor of the teacher training grants men graduates will be able to sweep the whole horizon for jobs. A few of the gifted will choose to teach at any price; for the rest the financial reward must be made more attractive. If trade union influence and political feeling continue to prevent any overt discrimination in favour of the grammar schools, the remedy will have to be an extension of the principle of special allowances. Higher salaries will have to be given to all graduates with first-class and second-class degrees, and if primary schools or secondary modern schools also benefit thereby, so much the better. The class of degree is not a perfect method of classification for reward, but it is difficult to think of a better which will serve to attract men and women of the needed quality.

The Report on the Training and Supply of Teachers has served to bring into the open the threat to the grammar schools. It makes no suggestions for remedies, because of the conflict of interests of the various parties concerned. Even its smothered warnings should, however, be taken very seriously. It is the best brains of the country which go into the grammar schools. If the quality of the education they receive should suffer, the consequences for the nation as a whole would be disastrous.

NOTES OF THE WEEK

Persia's "Exhausted Patience"

The one rueful advantage to be derived from the Persian Government's inconsequent behaviour is that world sympathy, which was a month ago with Persia, has shifted on to the side of Britain. It is worth making an inventory of the causes of this change. The principal one is the inability of Dr Mossadegh's team to do more than ordain successive time limits within which the oil company's present management must stand and deliver, coupling the injunction with the assumption that all company servants in Iran—the 3,000 British as well as the 55,000 Iranians—will quietly go on working the machine while inexperienced Persian directors decide what to do with it. But the British have made some contribution to the shift.

First, the British Government has become specific about what it can and cannot do. It has admitted the principle of nationalisation; it is a pity it did not do this earlier, and that Mr Morrison hedged his statement with brackets and qualifications that should go without saying. But there is virtue in being categorical and official. Simultaneously, the company has "out of respect to the Persian Government" fallen in with a request to meet its representatives and to hear their plans without commenting on them. Thirdly, the British Government has drawn world attention to what it believes to be the strength of its case in law by laying it before the International Court of Justice. This is, at the present pace of events, an academic gesture since the Court takes months to get into gear; but it at least challenges the Persian Government to state a rival case before impartial judges, or else to put itself further into the free world's bad books by refusing to do so.

There is now a discrepancy between what Dr Mossadegh says he is ready to do and what his lieutenants are ordaining. He has talked with the British and American ambassadors; now his followers are attacking him for doing so and even labelling him a "tool of Britain." That is the measure of their fanaticism. He is said to be prepared to discuss the method of taking over operations. His Finance Minister has ordered a three-man delegation to proceed to Abadan and, whether or no the company has "any suggestions to make that are not contrary to the nationalisation law," at once to exercise "all authority with respect to the exploitation production and marketing of oil." The Prime Minister, by contrast, has said something about accepting a mission to negotiate implementation of nationalisation, if it were to consist of the two directors of the Company who were appointed by the British Government.

The virtue of Dr Mossadegh's maligned conversations is that they have thrown some light on the element of cross-purpose which has hitherto marred all prospect of discussion. They reveal that Persia will discuss only supplies to customers and compensation to be paid to the British company. They do not narrow the gap between this attitude and the British view that a unilateral act, entailing taking over first and discussing afterwards, is neither a lawful nor a workable arrangement. They afford little or no more cause for optimism than there has been for a month past. The same sad conclusion is reached, from quite another angle, in an article on Persian opinion on page 1301.

The Baghdad Negotiations

Will the Persian fever spread to other oil areas of the Middle East? Only if the Mossadegh technique produces results. At present it has not done so, and negotiations for revision of the terms on which Iraq derives its oil revenue are proceeding smoothly, though slowly, next door. Its

Premier, Nuri Pasha, has announced that his government has agreed in principle with the Iraq Petroleum Company on a new level of royalty payment; but he has a weakness for premature announcements, and this is one of them. The foundation for it is the fact that most of the major oil companies in the Middle East are now keen to fix an overall rate of payment per ton extracted that will be the same for all concession-owners. They see that they will have no peace until they do so. Therefore every oil-producing state is on its way to getting payments at least as large as those secured by Ibn Saud in December, which work out at an overall average of about 30s. per ton.

The figure now being discussed in Baghdad is said to be ranging as high as 34s. What is not agreed, and is still in great debate on all sides, is how this total shall be reached. Shall it be made up of increased royalties alone—a method that would be simple, because it would involve no alteration of existing agreements or laws, and no ratifications by parliaments? Or shall it be made up of royalty plus tax? The latter method is popular with some operators as it enables them to secure exemption from taxation at home and so, as it were, to transfer some of the burden of increased costs on to the home taxpayer. American tax law is in this respect generous; British law is much less so, French law less so still. At present, the gravest handicap to speed of negotiation in Baghdad is the mixed nationality of the oil firms participating in the Iraq Petroleum Company, and the necessity of reconciling the interests of British, American, French and Dutch participants, not to mention tackling four different treasuries, before conclusions can be reached.

It might be disastrous if technicalities of this type were to retard agreement and if Persia, by lawless methods, were to get spectacular results before law-abiding Iraq. Yet there are risks that they will do so, for the Iraqi parliament disperses within a matter of days for its long summer recess. To reach an agreement that does not require its ratification—a simple gentleman's agreement with Nuri Pasha—would be unwise, for he is not always Prime Minister. Therefore final agreement before autumn does not look likely; the more is the pity. Work at speed to proffer Iraq a new agreement covering both money and partnership (and containing a most-favoured-nation clause for use in the event of better terms being agreed with Persia by Anglo-Iranian) would have presented two immense advantages. It would have shown the Persians the virtues of negotiation; and it would have observed the simplest principle known to nursemaids and statesmen—reward the sober, not the violent charge.

* * *

Stalemate at Westminster

Sluggishness has pervaded the atmosphere at Westminster, where Parliament has reassembled for the final eight weeks' work before the summer recess. The tensions which have been so apparent since the general election have suddenly slackened, if only for the time being. The Conservatives have run out of ideas for bringing the Government down in the House by harrying or by shock tactics, and are no longer hopeful of forcing an election before the autumn, if then. Mr Attlee's reorganised Ministry, having survived the first impact of Mr Bevan's revolt, is settling down to make the most of a further period of office, with only the committee stage of the Finance Bill as an immediate parliamentary problem. The other two issues that might have caused real difficulties—the Bill to nationalise the sugar beet processing industry and the Bill to overhaul the emergency legislation—have both been shelved, and will not appear at Westminster before the summer recess.

Enlightened Order

NOTHING seems to have more interested the foreigners who have visited us on this occasion than the absence on the opening day [of the Exhibition] of all military pomp, and of long files of soldiers, horse and foot, guarding every avenue to the approach of the Queen, and the order which they had not expected to be observed by our often-calumniated people. They have vividly learnt from the display the difference between a Sovereign who is guarded by the affections of her subjects, from attending to their wishes, and one who must be guarded and protected against his subjects, from always persisting in his own arbitrary and selfish will. They have learned to distinguish, too, between that enlightened order which results from circumstances and from conviction, as contrasted with that automaton order, the produce of gendarmes and soldiers that every now and then breaks out into rebellion. . . . The moral effects and the moral manifestations the Exhibition is calculated to call forth, seem to have most agreeably disappointed expectations. We heard of anticipated apprehensions of thronging crowds, of angry altercation, of preparations even for suppressing riot and sedition, before the opening of the Exhibition; but good humour, patience, kindness, have everywhere predominated. . . . All classes meeting and sharing a common enjoyment—indeed all nations—will be the better for the Exhibition. Only those are to be pitied whom a foolish, wanton, and timid tyranny prohibits from coming, and who will be soured by being denied a share in this new and general pleasure.

The Economist

May 31, 1951

Mr Attlee also appears surprisingly unperturbed about the prospects of Bevanism making any real progress in the Labour movement outside Parliament. It is still impossible to give an accurate estimate of the support which the Bevan-Wilson wing have secured, because the formulation of opinion inside the constituency parties takes place slowly. The first reliable indication will be the nature of the resolutions put forward in the next six weeks for the party conference at Scarborough. Meanwhile the Government is adopting a wait-and-see policy, and will make no move unless a real storm begins to brew on the Left. If that does occur, Mr Attlee, Mr Morrison and the other more moderate leaders will probably react by making a series of speeches in the country just before the party conference.

This same caution marks the appointment of Lord Pakenham as a successor to Lord Hall, who has resigned because of health and age. Mr Attlee has once again opted for an able administrator rather than for a political leader. The effect of this, and of the other recent appointments, is to strengthen the Government as an executive body, but to weaken it as the leader and formulator of opinion inside the party. This may lead to difficulties at Scarborough in October, when Mr Morrison and Mr Shinwell will have to carry the main burden of rallying support for the unpopular policy of rearmament.

The Tories for their part are groping anxiously for issues on which to keep controversy alive, but they have wisely desisted from making Persian oil one of these areas of battle. On the Finance Bill their backbenchers will do their utmost to keep the Government up and to wear it down, and a splutter of anger can be expected from the Liberals and the Labour backbenches over the renewed exiling of Tshekedi Khama. But the present political outlook otherwise bears a strong resemblance to the cold greyness of Festival weather.

Planning Defence

The report of the Select Committee on Estimates on rearmament, which is discussed in more detail on page 1315, reveals yet again that paradoxical defect of the planned economy—apparent unwillingness to plan effectively in those very fields where, by general consent, planning from the centre is indispensable. The rearmament programme raises problems of finance, of administration, of the allocation of real resources both between different Service needs and between defence and civilian production, while each of these problems in turn raises questions of phasing and balance. Historical evidence makes it clear that their solution, singly or as a complex, cannot be left to market processes, that it is not enough for governments to place their orders and let nature do the rest. Here, if anywhere, it is essential to have a clearly thought-out, internally consistent and externally realistic plan.

The report makes it clear that such a plan is far to seek. It should surely not be necessary at this date for the Select Committee to recommend

ordering the more readily available stores this year so as to ensure that the moneys provided in the current Estimates may be spent to the best advantage in preparation for the higher Estimates which must be expected next year,

Nor should it have to point out that the construction of new television transmitters generates a new civilian competition for the scarce materials required for Service electronic apparatus, nor to put its finger on the steel scrap shortage and suggest a revision of prices "as a matter of urgency." These are matters which the planners themselves, rather than their Parliamentary watchdogs, should have looked to long ago.

Doubtless some of the incoherence of the arms programme results less from inadequate appreciation of the need for consistent planning than from political and psychological

impediments now at least partly removed. The idea of painless rearmament has died hard and left a legacy of confusion. Even the most complete single-mindedness might well fail to avoid wastes and false starts; the evidence of the departmental witnesses before the committee is enough to dispel any illusions about the difficulties confronting the programme. But those difficulties have been gratuitously multiplied by the Government's predilection for taking three bites at a cherry—or three nibbles at a distasteful pill.

* * *

Lorry Drivers' Strike

The unofficial strike of lorry drivers employed by the Road Haulage Executive is yet another example of the opposition of workers in the nationalised parts of the transport industry to any attempt to improve efficiency. There had been complaints on the one hand from drivers themselves about the lack of repair and other services on the roads, and on the other hand from customers of delays in deliveries and irregularities in the running of British Road Services. The Executive therefore decided, with the concurrence of the unions concerned, to introduce uniformed patrols on the model of those of the Automobile Association to assist drivers in need of help and to supervise the lorries on the roads. The men chose to regard the patrols as "snoopers" and some 12,000 drivers, chiefly in the Midlands and the south of England, went on strike, refusing to return to work until the patrols are withdrawn.

The Road Haulage Executive has very properly stuck to its guns. The patrols are a sensible and necessary innovation. The fact that they are uniformed and that their cars or vans are clearly marked removes any question of undercover "snooping"; the unions were consulted and agreed to the scheme as long ago as last March, so there is also no question of the scheme being forced through against the wishes of the drivers' representatives. Indeed, it is difficult to make out any case at all for the strikers.

It may be that the scheme was not explained clearly enough by the union officials and the depot managers; several garbled versions were given at one meeting of the strikers. Or it may be that the men fear that the free and easy way in which they have been allowed to work hitherto will be brought to an end by the patrols. But neither explanation is an excuse for striking. Once again one is left to wonder just what failure in industrial relations has occurred that can lead to a senseless strike which may cause dislocation out of all proportion to the ostensible cause of it.

Tibet Capitulates

Tibet has now concluded an agreement with China which, while providing for its nominal autonomy under the rule of the Dalai Lama, gives Peking military control of the country and the exclusive right to conduct foreign relations. The Lhasa authorities have, in fact, accepted a Chinese protectorate as the only alternative to the outright conquest which—as the events of last year demonstrated—they were unable to resist without the military assistance that India was unwilling to give. The Communist press and radio are now jubilant over "the peaceful return of Tibet to the Chinese motherland." China is really the motherland of the Tibetans rather less than England is the motherland of the Irish, for the Tibetans are quite different from the Chinese in language, religion and culture, and have been independent for the greater part of their history, including the last 38 years. In Communist eyes, however, there can be no objection to the armed conquest of a weak and inoffensive nation, if its rulers are not of the Communist faith; it is not "imperialism," but "liberation." It must be admitted that the political system of Tibet—a country hitherto secluded

from the world by its mountain ramparts—is of an extremely archaic feudal-ecclesiastical type, and anyone who might have wished to help Tibet preserve its independence could not have talked about defending democracy there. But influences of the modern world were already penetrating Tibet; if left to itself, it would doubtless have made its first steps in modernity about as well as Afghanistan or Abyssinia.

In view of the hold which the lama priesthood has on the Tibetans, it is only prudent for the Chinese Communists to begin with a system of indirect rule and work through existing institutions. They have already exploited an opportunity for driving a wedge into the old order by taking over the Kuomintang policy of supporting the claims of the Panchen Lama against the Dalai Lama in the old feud between the two principal offices of the Tibetan religious organisation.

The new agreement guarantees the rights of the Panchen Lama and he will be under special Chinese protection. The agreement further gives Peking wide scope for interfering in Tibetan administration to promote "reforms," for although it is laid down that these are to be such as are demanded by the Tibetan "people," there can be no doubt that they will in fact be whatever is proposed by local Communist groups with the backing of the Chinese military and civil authorities.

The decisive factor will be the incorporation of the Tibetan forces in the Chinese army, as provided in the agreement, and China's responsibility for the defence of Tibet. This will mean Chinese Communist outposts on the frontiers (partly disputed) of Tibet with India, Bhutan, Nepal and Kashmir. No spectacular developments on these fronts are to be expected in the immediate future, but the capitulation of Tibet is likely to increase the political *malaise* due to recent events in Nepal and Kashmir. It may not be very long before India has cause to regret the failure to preserve an independent and friendly buffer state on its northern border.

* * *

Auto da fé in China

The revolutionary terror in China is now in full flood. Its close connection in propaganda with the "Aid Korea and Resist America!" campaign indicates that the heavy strain of the Korean war and the lack of victories during the last few weeks have made it expedient for the regime to resort to wholesale proscriptions, which at once intimidate opposition and stimulate the ardour of the faithful. The massacres are carried out with all the horrible apparatus of modern publicity. Batches of the accused are "tried" before mass meetings of many thousands of people, who are harangued for hours on end by Communist orators and then unanimously vote for the required death sentences.

The proceedings are broadcast by radio and it was proudly declared that an "accusation rally" in Canton had been broadcast to 700,000 listeners over 229 public loudspeakers and 40,000 private sets. In Hangchow 30 "counter-

revolutionaries" were condemned to death after mass trials said to have been attended by 110,000 people. Cities are being combed by "street teams" for locating "counter-revolutionaries," and factories and schools are being required to set up "extermination committees" for rooting out subversive elements. People are now being tried and punished, not merely for current offences, but for crimes of the remote past, including participation in the Kuomintang suppression of the Communists in 1927. Denunciations are encouraged, and even demanded, as proof of loyalty to the regime; and Hangchow radio holds up as a model for emulation a 14-year-old schoolboy who denounced a member of his own family and was rewarded by the Youth League with the gift of a fountain pen.

There can be little doubt that the victims of the present wave of revolutionary terror in China include many individuals who, in consequence of their part in past misrule and oppression, had become objects of popular hatred. The "counter-revolutionaries" so far are identified as Kuomintang agents, "bandits," former "despots" and leaders of "reactionary religious sects" (that is to say, the various secret societies of religious origin which have always been a feature of Chinese life). All revolutionary precedents suggest that sooner or later "counter-revolution" will be discovered in the most unexpected places. The terror of the French Revolution began with aristocrats and tax-farmers of the *ancien régime*, but it did not stop until it had devoured the popular champions of 1789, then Danton and Desmoulins, and finally Robespierre himself. The terror of the Russian Revolution was first directed against the bourgeoisie and White Guards, but in the end it destroyed also Zinoviev, Bukharin and Yagoda. It would be a bold insurance company which would speculate on the life of anyone now prominently associated with the "new China" at any level but the highest.

The Saar Menaces the Schuman Plan

M. Schuman and Dr Schumacher must share the blame for the fact that the Saar now threatens to prevent the Federal German Parliament from ratifying the Schuman Plan. The German Social-Democrat leader made the Saar the spearhead of his violent attacks on the Plan, but the French Foreign Minister appeared a few weeks ago to have successfully blunted Dr Schumacher's barbs. Now, however, he has placed the Federal German Chancellor in a position where it is very difficult for him to refute his bitter opponent, who has many adherents in the ranks of other parties.

M. Schuman has made the mistake of sending a letter to the Saar Premier, which led Herr Hoffmann to ban the Saar Democratic Party. Previously, a demonstration of this German nationalist opposition party had been banned, and Christian-Democrat representatives of the Bonn Parliament had been prevented from attending. Still earlier, feeling had been roused by Herr Hoffmann's action in expelling over two thousand Germans. All these undemocratic measures were recounted by Dr Adenauer in his speech to the Bundestag last Wednesday. No German Chancellor, with his strongest opponent challenging him to a contest in patriotism, could do less than denounce them. French policy has failed to live up to the principles of democracy, and will find it hard to recover the influence for good in Western Germany that it had at the time M. Schuman proposed his experiment in European unity.

Dr Adenauer dealt with the whole question of the status of the Saar. He sharply rejected the French idea of creating a second Luxemburg out of this territory and demanded that all restrictions must be removed which would prejudice a decision about its future when a peace treaty is negotiated. The weakness of this demand lies in the fact that a peace treaty is still a matter for the vague and distant

future, and the situation in the Saar cannot be expected to remain frozen in the meantime. The urgent need at the moment is to save the European Iron and Steel Community from being strangled at birth by the Saar contestants. One

outlet for tempers should be used: France's own creation, the Council of Europe. M. Spaak has visited Bonn and reminded the Germans that they now have a forum for their complaints. They should make full use of it. For the more remote future, it is evident that a satisfactory solution for the problem of the Saar can only come if the economic integration of France and Germany, envisaged in the Schuman Plan, not only comes to fruition, but leads on to some form of political union. Nothing will come of leaving a French policy confronted with a German policy. If history is not to repeat itself there will have to be a European policy for the Saar.

The Obsequies of Co-partnership
