The debate in the House of Lords on Lord Cecil's motion regretting the end, under nationalisation, of the South Metropolitan Gas Company's co-partnership scheme raised questions far wider than that with which it was ostensibly concerned. The scheme in question comprised not only the profit-sharing arrangements common in the gas industry but an active participation, by the election of three directors out of nine on the Board, of workers in managerial responsibility. The question of its possible continuance was left open at nationalisation, two years being allowed for discussion between the area board and the unions concerned. The two years having elapsed, the scheme has been terminated; the present workers, but not newcomers, will receive for the next fifteen years a bonus on wages equivalent to receipts under the last year of profit sharing, and workers' representation on the Board is being replaced by the usual system of consultation committees at works level.

There is obviously no room for profit sharing in an industry whose governing directive is to break even, taking one year with another. The workers' claim to a share in increased prosperity becomes merely one among the data determining the break-even point. Economically, they may be no worse off as a result. Nor, on paper, is there any reason why less sense of participation, less individual responsibility and common solidarity with the concern, should be elicited by an ideal system of consultative committees than by the knowledge that workers' representatives are helping to shape policy at the top. Paper constitutions, however, are not the whole story. The sense of participation is a tender growth. Where a system of consultation, a co-partnership scheme, or any other means of fostering it, are the genuine expression of a will to co-operate and of an appreciation of the human needs and dignity of labour, it will flourish. Where either is a mere piece of decoration, a façade on the solid structure of private or official autocracy, it will certainly be lacking. There is plenty of evidence that the elaborate consultative apparatus of the other nationalised industries is generally regarded, justly or unjustly, as such a façade. The gas industry, with its better traditions, may well do better; but it remains paradoxical that nationalisation, so much of whose moral impetus has been derived from a

desire to raise the worker's status from that of a mechanical cog, should in this instance have destroyed an institution more successful in raising that status than any yet devised under public enterprise. This is sacrificing the substance for the shadow.

Italy Votes

The first batch of Italian local government elections has produced results which will probably not give any great satisfaction to either of the two big parties, the Christian Democrats or the Communists. On the other hand, they have registered a sufficient check to the Communists to encourage both Italy's friends abroad and the central government. The Christian Democrats have lost votes but, by means of electoral alliances with the newly united right-wing Socialists and with the Republicans, have won more power. The Communists, in alliance with the left-wing Socialists, have slightly increased their poll compared with the general election of 1948, but have lost control of several of their main strongholds. For the smaller parties, the features of the voting so far have been the relative success of the Republicans and the sharp increase in the neo-Fascist MSI vote in the area of Milan.

None of these results was entirely unexpected. A Communist collapse was more than anyone could have seriously hoped for, and the moderate increase in the left-wing poll can be largely attributed to the growth in the size of the electorate; Communist figures are a good deal lower than at the last municipal elections in 1946. A fall in the Christian Democrat poll was to be anticipated, after the party's three years in power in the central government and the five and a half years premiership of its leader, Signor De Gasperi. In terms of actual local government control the Communists have suffered several remarkable defeats. The outstanding one is the loss of their majority in the great strategic port of Genoa, one of the main Communist areas in Italy and hitherto barred to the landing of American arms supplied under the Atlantic Pact for that reason. They have also barely retained a majority in Bologna, the capital of "red" Emilia, and have lost their grip on Milan, Venice, Ancona, Ravenna, Cremona, Novara, Forlì and several other sizeable towns.

It is clear that the electoral alliance of the anti-Communist, pro-government parties, about which there was a good deal of doubt and wrangling in the weeks before the election, has paid good dividends. The efforts to secure a high attendance at the polls have also been successful. The Communists had been hoping for a low poll; instead it has been over 80 per cent in most areas and in some over 90 per cent. The next batch of elections takes place on June 10th, and includes Turin, Florence and several towns in southern Italy; after that there is to be another batch later in the summer. It would therefore be wrong to count too many chickens at this stage. There is still, for instance, a real danger that the moderate anti-Communist parties may be more heavily eroded from the extreme right. But the Communist grip on Italian local government has certainly been loosened enough already to provide a welcome stimulant to Rome and a moral reinforcement of its known policies both abroad and at home.

End of a Polish Corridor

Less than six years after the establishment of the new Soviet-Polish frontier the Soviet Foreign Secretary Mr Vyshinsky and the Polish Vice Premier, Mr Zawadzki have recently signed an agreement for a small territorial readjustment between the two countries. The area involved is only 480 square kilometres on each side; it is shown on the accompanying map as it was before alteration. The population is to be repatriated and will be allowed to take away all movable property; only real estate, industrial equipment

Truly luxuriously!

Australia and New Zealand are so close to England that you are there almost before you can say "truly luxuriously".

Try it for sound yourself—"truly luxuriously". Not because it's clever, but because it's worth remembering.

British Commonwealth Pacific Airlines operate a luxury sleeper service (no extra charge) across the Pacific from San Francisco and Vancouver to Sydney and Auckland via Honolulu and Fiji. (No need for even six-footers to curl their toes, hug their elbows or bump their heads!)

Excellent connections are available from London, Glasgow or Shannon via New York or Montreal. And the fare? The same as by any other air route.

FARES: Sydney *Life* single, £46 return. Auckland £279 single, £502.40 return. (Includes dollar allowance for transit expenses.) Book through any accredited Travel Agent or through B.O.A.C., our General Agents in the U.K. (telephone 1 Victoria 1313).

BRITISH COMMONWEALTH PACIFIC AIRLINES LIMITED
in co-operation with B.O.A.C., T.C.A., T.W.A.

and railway facilities are to be left on the spot. The agreement was disclosed last week and was immediately hailed by the Polish press as an example of co-operation as practised by the camp of "democracy and socialism" and contrasted with the "jungle law" of western diplomacy. It was Poland, the weaker brother, that asked for the transfer—Polish commentators assert—and Poland is also the main beneficiary, since it gets the oil-bearing strip from the Drohobych area

in exchange for the agricultural land to the south-east of Lublin. On closer scrutiny, however, the argument proves specious. True, Drohobych, ceded to the Soviet Union in 1945, was the main centre of oil production in prewar Poland. The total area now produces slightly more than 300,000 tons of crude oil per annum. The small strip now given back to Poland is unlikely to contain very large oil deposits and will certainly not reduce to any appreciable extent the shortage of petrol in present-day Poland, which produces only one-third of the oil it requires. On the other hand the railway linking the ex-Polish towns of Kovel and Lvov passes through the area now surrendered by Poland to the USSR. Thus, thanks to the present agreement, the whole of the railway line will lie in Soviet territory. Hence it appears that the Soviet rulers have asked the Polish Government to make the request so as to enable the Russians to show their generosity. Yet what seems even more interesting than this masquerade of magnanimity is Soviet suspiciousness. After several years of "close co-operation" it appears that Stalin is still so mistrustful of his postwar allies that he is willing to sign a special agreement so that Soviet trains do not have to pass through a few miles of Polish territory.

Malan versus Malan

Capetown was the scene of rioting and street fighting this week, when the spectacular demonstrations against the Cape Coloured Bill reached their climax in a torchlight procession to the Houses of Parliament of ten thousand marchers. The nation-wide protest of ex-Servicemen pledged to defend South Africa's constitution was started only a few weeks ago by Group Captain "Sailor" Malan, a Battle of Britain pilot, and rapidly gained thousands of adherents. Torchlight processions have paraded throughout the country, and from twelve towns "commandos," consisting of convoys of jeeps packed with uniformed ex-Servicemen and followed by scores of cars and lorries, converged on Capetown bearing their resolutions of protest. The Capetown demonstration ended in clashes with the police, causing some dozens of casualties. There were heated scenes in the South African Assembly when the Opposition called for, and was refused, a judicial inquiry into the riot.

In spite of this remarkable upsurge of feeling, there is little hope now that the Bill will not soon become law. It has passed to the Senate, where its validity was again challenged by the Opposition; but the President of the Senate ruled, in the same terms as the Speaker of the Assembly, that the Statute of Westminster had released the Union Parliament from the legal limitations of the South Africa Act, giving Parliament absolute sovereignty to ignore the entrenched clauses in the constitution. The agitation is now moving

beyond the particular issue of the Coloured Vote, in the fear that further threats to the constitution are bound to come.

At the Capetown demonstration Group Captain Malan accused the Nationalist Government of being composed of men "who had pinned their faith in a Nazi victory." This bitter expression of the deepening cleavage within the white population itself must be taken together with the recent statement of Dr Malan that he regarded the attainment of a South African Republic as the ultimate ideal of his party:

We shall never see the end of the divided loyalty among a section of our people until we have a form of government that is wholly ours and until we free ourselves from what is alien to us.

There is no suggestion that he intends an immediate intensification of the campaign for a republic, but this final struggle is only too likely to be brought closer in South Africa's present state of tumult and recrimination.

Old People in Work

A report of the Social Survey published last week gives some interesting information on the employment of people between the ages of 55 and 74. Fewer old people were at work than in 1945—a fact which reflects the end of wartime opportunities more than the higher pensions introduced in 1946. In 1950, older men formed a slightly higher proportion of the total employees in the textile industries, public utilities and miscellaneous services than they did of other industries, and the proportion of them in managerial posts and in unskilled work was also relatively high. Of the older women 40 per cent worked in miscellaneous and personal service industries—nearly twice the proportion of working women of all ages. This group will include part of the vast army of "chars," many of whom go on working until they are 60 or over.

More interesting still—if less reliable, for people are not good at analysing their own motives and feelings—is the account of the attitude of old people to their work. Sixty-two per cent of men in full-time employment said they did their work easily, whilst 36 per cent found it a strain; and approxi-

NUMBERS OF OLDER MEN AND WOMEN IN EMPLOYMENT
(As percentage in each Age Group)

mately the same proportion of women found their work a strain. Of those older people who actually were working, 49 per cent said that they were working because they must, although many said they preferred it, too; and of those who were entitled to a pension the proportion of those who said they must work was still as high as 32 per cent. "Must" does not, of course, mean "must work to live," since people's ideas of minimum standards vary. Of those who had given up work, 37 per cent of the men and 20 per cent of the women said they would like to have gone on working; and most of these, especially the women, would prefer part-time employment. Not all of them, however, had tried to get work.

Today's problem is to make the best use of those in our ageing population who are willing and able to work beyond retiring age. The report provides data for two relevant, if fairly obvious, conclusions. The first is that there should

be a more flexible approach to the fixed retiring age. About a third of the men between 55 and 74 said that their firms imposed a retiring age, and of these about half said that they would have liked or would like to stay on beyond it. The second conclusion is that while many people are willing to go on working because of financial necessity or because they like it, fewer would go on working solely for the sake of a bigger pension on retirement. Less than a third of those now below pensionable age said that they would do so for that reason. Even the raising of the addition to pension from 1s. to 1s. 6d. for every six months' extra work, now offered under the new National Insurance Bill, will be a very small incentive. To work and pay contributions will seem to many people a less attractive proposition than to draw a pension at the earliest possible moment and to earn up to £2 a week by part-time or casual work.

Management in Local Government

Much is heard about the decline of local government. It is important to remember, as Mr J. E. MacColl points out in a recent study,* that local government absorbs about 5 per cent of the national income and employs 6.3 per cent of the civilian population compared with 4.9 per cent in the central government service. Efficient management in local government is clearly important. Mr MacColl gives a shrewd analysis of the obstacles to efficiency, but he is less ready with suitable remedies.

A central problem is the relation between councillors and officers. Elected representatives are today drawn from all classes, and although the new pattern may be democratically more healthy than the old one of aristocratic leadership, friction is liable to arise through the blind assertiveness of councillors who are made to feel their intellectual inferiority. The very complexity of administrative issues today adds to the difficulty of securing a democratic control over local affairs which is other than prejudiced and sporadic. Mr MacColl's solution is to get local government regarded (presumably by the officials) "as an experiment in adult education." The danger of this is that it savours of that intellectual condescension which is part of the cause of the trouble.

Mr MacColl also puts in a strong plea for more effective co-ordination between the departments of a local authority than the present system makes possible. This, however, might involve drastic changes. It would be necessary for the chief officer to wield much stronger powers than are now exercised by most clerks to the council, and it might lead to the replacement of lawyers by a new cadre of general administrators in this crucial post. If, however, the work of policy-making continues to be transferred to Whitehall, there will be little cause for any big changes and the quality of both councillors and officers will certainly decline. To quote Mr MacColl,

There may still be interesting work for little men, but the days of the Joseph Chamberlains and Herbert Morrisons will be over.

The Tshekedi Affair

There is far more in the banishment of Tshekedi Khama than meets the eye. Two points arise. In the first place, an injustice is being meted out to a distinguished and honourable African ruler. Tshekedi was banished from his territory, the Bamangwato reserve of Bechuanaland, a year ago when he was alleged to have opposed the marriage of his nephew, Chief Seretse, to an English girl; the reason given was that his continued presence in the territory would cause disturbance. The report of the inquiry on which this decision was based has never been published, and Tshekedi has been given no opportunity to defend himself. He is now

* Some Management Problems in Local Government, by J. E. MacColl. British Institute of Management. 3s. 6d.

asking for a public inquiry, and states that there is no fundamental difference between him and Seretse. He has formally renounced all claims to the Chieftainship. The Commonwealth Relations Office shows no willingness to grant this inquiry, and six weeks of difficult negotiations have broken down.

Secondly, the whole question of the administration of Bechuanaland is at stake. There seems no doubt that this territory is being badly governed. After Tshekedi and Seretse were banished a vacuum was left; the policy of creating democratic tribal councils has not been pursued vigorously and has met with no success, the Government having failed to secure the co-operation of the tribesmen. There is no legislative body of any kind. Bechuanaland and the other two Protectorates of Basutoland and Swaziland are the only territories under the British Crown to be ruled by proclamation of a British High Commissioner. What makes matters worse is that the High Commissioner is resident in the Union, and has to combine his responsibility for the Protectorates with being the mouthpiece of Britain to the Union Government, a paradoxical combination of functions. Another admitted difficulty is the inadequate calibre of the officials in Bechuanaland; many are South Africans, who do not bring to the African's problem the sympathy which is characteristic of the British Colonial Service elsewhere in Africa.

Finally, there is the pressure from South Africa, which is never openly admitted, but which is generally believed to be the decisive factor. The Union has been claiming the incorporation of the three Protectorates; any overt disturbance or revelation of maladministration will be grist to its mill. It is owing to the Union's attitude that Seretse and his white wife have been excluded; and the argument is that if Seretse, the accepted chief, is out, Tshekedi, the potential rival, must be out too. Against this tricky background it is understandable that the Commonwealth Relations Office should fight shy of public inquiries, but Britain's reputation throughout Africa is bound to suffer.

Shorter Notes

The slackening of tension at Westminster was clearly reflected in this week's debate on the Colonial Development Corporation. One or two members of the Opposition were disposed to nose out scandal concerning the Gambia poultry scheme, which is being wound up. But the contrast between this debate and those on the Overseas Food Corporation could hardly be more marked. Members on both sides of the House showed themselves sympathetic to the Colonial Development Corporation and anxious to help it to be successful. On the other hand, in spite of the general good will, there were few concrete suggestions about the way the corporation should direct its activities in future. The criticisms were as much a collection of "bits and pieces" as are the schemes of the corporation itself.

The Government's reply to Lord Reading's motion in the House of Lords on Wednesday on the financing of hospitals was disappointing. Lord Reading asked for the appointment of a committee of inquiry into the present system, but the Government replied to the effect that hospital accounts are investigated by the Public Accounts Committee and by the Select Committee on Estimates. This, of course, is far from the point. The question is not whether the hospital boards and management committees make good or bad use of the money voted for them nor whether they have too much money voted for them. What one wants to know is whether they would give better service for the same or less money if they had more freedom in budgeting and were allowed to retain their unspent balances. It is widely held that the present method of Ministerial control is cumbersome and a direct incentive to overbudgeting. But of this the Government showed itself utterly unaware.

COLDER THAN CHARITY

KENT Health Committee deserves praise for wanting to rescue lonely old people from "living dead lives." That is something everybody should want to do, and the committee would do well for the whole community, old and young, if it simply provided a voluntary organisation to focus people's instincts to act like considerate neighbours.

But that is not how the committee is thinking. It wants a few score young women to go round and be friendly to old folk—and it talks of paying them for it. *The intention is good, but the mistake is colder than charity.* Since when has friendliness been something to buy?

What follows? Shall we get to the point when nothing is to be expected of the community except to pay for the doing of good by somebody else, like the collection of rubbish? Will private citizens be told that they mustn't blackleg?

A Duty and Privilege

There is too much of this tendency to regard society as something inert that officials do good works to. It isn't. It is a collection of living human beings who have each the duty and the privilege to preserve humaneness by active humanity. We do not believe that Kent or any other part of the British Isles has sunk into such heartlessness, with church communities so apathetic, and the spirit of voluntary service so dead that it cannot see for itself to needs of this sort.

Away with the payment principle and let the goodwill in the community be organised.

There is a footnote to this which all of us might ponder. Why are there so many isolated old people whom nobody seems to know about? Quite a few of them must have lived isolated from the community before they were old. Folk who have shared in sociable interests of any sort do not usually lack for friends.

We need to think of putting more than pound notes in the bank for old age. We shall need our bank of friends.

Letters to the Editor

Revaluing Sterling

Sir,—Mr Scammell, while giving general support in your issue of May 19th to my proposal for revaluing sterling, brings three stated objections—the probable opposition of the International Monetary Fund, the recency of the devaluation and the probable opposition of the Americans. I do not agree that one can assume such oppositions to be probable.

These three objections would be valid if the devaluation had been undertaken to correct an ordinary kind of fundamental disequilibrium. But in 1949 the position of the United Kingdom was altogether peculiar; her foreign trade was in overall balance; even her direct dollar deficit was smaller in commodity terms than it had been before the war and probably hardly greater than it is destined to be when world trade shall have settled into some fairly stable pattern. Thus devaluation could by no means be justified by the condition of Britain's own economy, but was due to her responsibilities as banker for the sterling area and countries beyond it; she was bearing the brunt of a sizeable proportion of the worldwide "dollar shortage."

Since 1949 the world position has changed radically, while Britain, with sterling undervalued in relation to its domestic purchasing power, has been horribly hit by the worsening in her terms of foreign trade, which has been partly due to devaluation. Before devaluation her terms of trade had already depreciated by 18 per cent compared with 1938; this was probably a sufficient adjustment to meet the post-war situation. But between devaluation and the outbreak of the Korean war they deteriorated by another 9 per cent. Since then the position has become much worse—a total deterioration of some 27 per cent since devaluation. The burden on her factory capacity, due to this, is probably heavier than that of re-armament. She would have to devote some 10 per cent of her total manufacturing capacity merely to produce the extra

exports required to buy the same quantity of imports as before devaluation. She cannot both do this and execute her arms programme.

The staff of the International Monetary Fund, a highly intelligent body, is aware of all this. Of course as a general rule it would be most undesirable to have a large change of parity reversed within two years. The status of sterling, however, is unique, and the devaluation of 1949 took place in complex and peculiar circumstances; quickly moving events necessitated a remedy which may not have been the ideal one. For these reasons the fund is not at all likely to take a rigid attitude about a reversal.

And as for our American friends—they realise that Britain is making by far the most important contribution to defence outside the United States. If it is well explained that her arms programme cannot go forward without revaluation, they are not likely to cavil.—Yours faithfully,

Christ Church,
Oxford

The Case for Monetary Policy

Sir,—In the article "The Case for Monetary Policy" in your issue of May 19th you rightly argue that, in any estimate of the Budget implications of higher interest rates, the correct comparison is not with the price level accompanying such rates but with the (higher) price level which might obtain in their absence. But the subsequent conclusion that short rates could rise to 3 per cent or so before the Budget effects were as great as those of a 5 per cent increase in the prices of goods and services (other than social outpayments) bought by the Government is surely illegitimate. For the extra burden of interest payments is calculated net of the resulting increment of tax receipts whereas that of higher prices is not. The argument can either be confined to Budget expenditure effects or it can allow for effects on

receipts as well; but one cannot take the first standard for one policy and the second for another.—Yours faithfully,

Christ's College,
Cambridge

Sir,—It is argued on page 1185 of *The Economist* of May 19th that the extra cost to the Exchequer of a rise in interest rates would be more than offset by a saving in Government expenditure on goods and services. This argument would carry more weight if the effects of inflation on revenue had been analysed as well as the effects on Government expenditure. It would also have reached a different conclusion.—Yours faithfully,

Queen's College, Oxford

Full Employment at Strasbourg

Sir,—Your note in your issue of May 19th does less than justice not only to the record of the British Labour Government but also to the achievements of those countries like Belgium, Italy or Portugal, to mention only a few, who have successfully followed sound liberal economic principles. It is simply not true to say that it is only "the long continuance of the world-wide post-war inflation" which *has kept* (your italics) unemployment in Britain (or in Holland or the Scandinavian countries) at negligible levels. It would have been open to the Government at any time during the last five years to abolish controls, rationing or food subsidies, and, through a tight control of credit, to generate sufficient unemployment to get rid of the last vestige of "inflationary pressure."

World-wide inflation or not, Belgium certainly managed to achieve as much. Following the precepts so frequently enunciated in *The Economist*, she relied on a tight money policy, rather than on budgetary controls or rationing, for holding down purchasing power, and she managed to keep unemployment at the rate of 10 per cent or more. But, as the analysis in the last ECE Survey shows,

she also managed (along with other liberal economies) to keep down the level of industrial production below the pre-war peak attained in 1929—whereas in Britain the pre-depression level was exceeded in 1950 by about 80 per cent, in Holland by 65 per cent, and in Sweden by as much as 140 per cent.

Again, when the American economy experienced a recession in production and employment in 1949, the liberal economies of Belgium, Luxembourg, France and Italy dutifully followed suit: in each of these countries there was a notable reduction in output and an increase in unemployment. In Britain, on the other hand, the incident was allowed to pass without a break in production or any noticeable increase in unemployment. Surely, in the light of this experience, it cannot be maintained that employment or unemployment are merely the outcome of world economic forces, and not of domestic economic policies.

Contrary to your note, the postwar experience of Britain, I submit, *does* provide evidence that unemployment can advantageously be "pushed as low as 2 or 3 per cent"; and that such a policy can be sustained not only without the danger of an economic collapse, but with a high degree of economic progress. I would admit that the policy involved the relaxation of some degree of inflationary pressure; and that the avoidance of a cost-inflation—secured partly through subsidies, partly through a voluntary

wage and dividend restraint—was an essential element in its success. I would also admit that whether one looks upon the postwar experience of Britain with pride or with horror ultimately depends on one's view as to aims of economic policy. Those who regard maximum production, full employment and a high rate of economic progress as the major ends of economic policy would have one view of the matter; those who regard "sound money" or "economic freedom" as the ultimate end, might have another.—Yours faithfully,

NICHOLAS KALDOR

King's College,
Cambridge

[Mr. Kaldor says the Government is entitled to the credit for keeping full employment because they have not deliberately destroyed it. Does he hold that it is his efforts that make his motor car go simply because he refrains from putting on the brake? The analogy is exact and the point is important. We were not concerned with imputing praise or blame to any government but with making the point that, if the experience of the past six years is taken as evidence that governments know how to make the level of employment what they choose, the world is being misled. If the road lies downhill, governments can control the speed of the car by putting on the brake or not doing so. But that proves nothing about their ability to determine the speed when the road lies uphill. Of that, it is necessary to go on repeating, there is as yet virtually no evidence at all.

And why must Mr Kaldor start imputing motives? Cannot he conceive that those

who disagree with him may do so because they believe that his ideas are not those that are best calculated, in the long run, to promote maximum production, full employment or a high rate of economic progress? Not that we see anything inherently wrong in economic freedom, or even in sound money.—EDITOR.]

Where are the Eggs?

Sir,—I am here on holiday from exporting eggs from Denmark to the United Kingdom and elsewhere. I was therefore surprised to read in your issue of May 19th that we in Denmark are receiving 2½d. an egg from Britain at the present time. I am afraid there is some mistake, as this is not so.

The contract price at which we are now shipping to the Ministry of Food is 19s. f.o.b. for 120 eggs of the middle weight. This price is a little under 2d. per egg and includes all the costs of collecting from the producer, grading and packing in new boxes and despatch to the port.

Consequently the producer only gets about 1½d. an egg compared with the British price of 3½d. which you mention, and this latter price, I presume, is for the unpacked eggs collected at his farm.—Yours faithfully,

Brighton POUL HALSTED

[The price of 2½d. to which Mr Halsted refers allows for the cost of shipping the eggs from Denmark and also for insurance and handling charges.—EDITOR.]

The typical citizen of Mr Oyler's happy future may be observed, ironically enough, in the Dordogne, farming a small, scattered holding with immemorial skill. Go thou, says Mr Oyler to the harassed and thinly nourished inhabitants of present-day Britain, and do likewise. Terrace the hillsides, plant fruit-trees by the high-ways, pasture geese on the verges, spin your own wool, fertilise the kitchen garden with your own night-soil, stop thinking about production per man and, learning from the Chinese, concentrate on production per acre; and better begin now, for Britain's international trade is doomed, and her urban civilisation with it, and a good thing too. Imports? Nonsense. Nettle fibre can replace cotton, horses and oxen can replace petrol, the whole fifty millions of us can live, and live well, off our own, and anyone who denies it is probably an agricultural scientist or an economist, and there is no health in him.

One would like to see a land utilisation survey of the British Isles, complete with waving fields of nettles, illustrating Mr Oyler's thesis. One would like to hear his views on the comparative health statistics (expectation of life, infant mortality, incidence of tuberculosis) of the peasantry of Central France and the degenerate suburbanites of modern Britain. One would like to refer him,

on his own chosen ground of nutrition, to such a record as Sir Jack Drummond's "The Englishman's Food." One would like to divest economics of its red-rag quality and induce him to look dispassionately at some of its elementary propositions. But one would also like to be quite sure that he has not, for all his absurdities, got hold of the right end of the stick; that mankind can with impunity relegate its relation with the good earth to the status of a minor piece of specialisation; that Fred Perley is really a happier and more desirable human figure, expectation of life and all, than his yeoman ancestor. Perhaps the last word had better rest with M. Fourastié: "Nothing is easier (for us men who live so briefly) and nothing more dangerous, than to take for a sense of history what is only the sense of certain years of history."

An American Prison

My Six Convicts. By Donald Powell Wilson. Hamish Hamilton. 334 pages. 15s.

This book contains the memories of an American psychologist who worked for three years in the Leavenworth Federal Penitentiary, Kansas. He was helped in his work by six convicts and he reports at length, and with obvious relish, the tricks they played on the authorities, their deplorable wisecracks and their views on ethics and penology. Their prison tricks are always successful and their talk always smart. The book, in fact, is Stalky and Co. translated from school to prison, Kipling at his worst, made far more vulgar and infinitely more difficult to swallow.

Whatever American readers may think of them, English readers will find the goings on at Leavenworth almost incredible. In the three years two murders were committed in the prison, in daylight, in the open, and under the eyes of the prison officials. Until one of them was killed in the prison prostitutes were smuggled in regularly on trucks, and (after they had plied their trade) were got out by the same route. For the drug addicts prisoners raised a fine crop of marihuana among the flowers and vegetables in the prison garden. A stolen refrigerator was brought in by stealth, fixed in secret, and used thereafter to keep the convicts' stolen beer at the right temperature. Mr Wilson needed a dictaphone, and his convict staff arranged for one to be stolen in a distant town, smuggled into the prison labelled catsup, and set up in his office as a delightful surprise for a popular psychologist. An Italian prisoner organised and controlled from his cell a race-course racket, working through touts and jockeys up and down the country. Girl students from the neighbouring University came in to do social science, and wrote letters imploring good-looking prisoners to get out and spend the night at their Sorority house.

Of these Federal Penitentiaries there are six in the United States, and in his latest report the Director of the Bureau of Prisons claims to have proved that

"open institutions can be widely substituted for the traditional prison." If Mr Wilson's memories are even approximately correct the difference in America between a prison closed and a prison open will not amount to much.

The Authentic Economist

Henry George, Citizen of the World. By Anna George de Mille. North Carolina University Press; London, Geoffrey Cumberlege. 276 pages. 28s.

There can be little dispute about Henry George's claim to be the most original American economist. Others may leave a deeper mark on economic theory—or even on economic practice—and so persist after Henry George has begun to bore or to amuse. But none is more authentic than he. He is the very Walt Whitman of economists. Not only does his thought, like Whitman's verse, owe nothing to European models—it was no use telling George that the Physiocrats had implied as much before him; he had never heard of them. It is also rooted entirely in American experiences and American needs. It grows out of the vanishing frontier of the 1870's as directly as Jefferson's grew out of the expanding frontier of the 1790's. All that has happened is that the optimism of the dawn has given way to the anxiety of a later hour.

This reliance [on the people] cannot deceive us as long as we remain virtuous; and I think we shall be so, as long as agriculture is our principal object, which will be the case while there remains vacant lands in any part of America. When we get piled upon one another in large cities, as in Europe, we shall become corrupt as in Europe, and go to eating one another as they do there.

The condition which seemed only a remote logical contingency to Jefferson in Virginia has become a pressing incubus to Henry George in California. The outmoded tyranny of primogeniture, which Jefferson had seen crumble before the onslaught of the Revolution, has returned mechanised and magnified, in the form of the railroad monopolies fattened on land grants equivalent to the whole state of Texas. To meet this challenge, free lands, the solution of Jeffersonian distributism, are no longer available. But to the author of "Progress and Poverty" a solution no more complex appears equally efficient: the taxation of land values. With this as his sword, and with a passion for civic virtue as his inspiration, Henry George gave battle to the Central Pacific Railroad, the Associated Press, Tammany Hall, the Catholic hierarchy, the Tariff and nearly every other ogre of the Gilded Age. Now, to a generation no longer bemused by the splendours or the terrors of the Single Tax, it is the struggles more than the theories of Henry George that seem of interest. That, and the passion for civic virtue.

This new biography does not, it must be admitted, tell us very much that is new about the struggles of its hero. Perhaps there is little more to tell; the heroic is not necessarily recondite, and the original biography by the son was

reasonably full. Nor does it stand back, as we might be tempted to do, and view its subject entirely afresh as a rediscovered figure. It is, in fact, a posthumous biography by a devoted daughter and what it holds of novelty is contributed out of her own youthful reminiscences. But it has an engaging simplicity and directness not unworthy of its subject. It tells its story well and with care. If it is not a Morley for America's Cobden, neither is it a Lytton Strachey. It gives us George the public man, with a few affectionate touches that illuminate the family circle, the whole agreeably written and carefully documented. To Georgians and non-Georgians alike it can be confidently recommended.

Law from the Left

The Reform of the Law. Edited by Professor Glanville Williams. *Gollancz*. 224 pages. 18s.

Critical studies by Left-wing writers are a little outmoded. So many of the contributors to the volumes of the 'thirties are the politicians of today and, naturally, where they have failed to carry through the reforms they once advocated they prefer to remain silent. This, too, is a composite volume, by Left-wing lawyers, written mainly between 1947 and 1949. It is well edited. It has considerable unity in arrangement, but something of this former atmosphere seems to cling to it; it comes so late in the day. It provokes the retort: if all these reforms are so needed, what has your party been doing these last six years? This is unfortunate, for, as the editor says in his postscript, lawyers suffer from an awful complacency.

The book covers a wide range, the Courts, industrial law, the law of property and leaseholds, marriage, divorce, inheritance and legitimacy, the criminal law and the legal profession itself, but there are some notable omissions. The whole section on constitutional law, delegated legislation and administrative tribunals is no more than seventeen pages; there is little on monopolies and restrictive practices and on public corporations, nothing on planning and, apparently, the authors think there is no need at all to discuss the position of trade unions, their members and non-members. The resulting compression adds to the unreality of some of the suggestions made, because reform is discussed in isolation from the wide variety of forces that resist it and from the factors on which that resistance is based. For instance, the authors recommend that standard rents of all controlled premises should be made uniform and all their landlords placed under statutory liability to repair, yet they avoid any definite statement on whether they believe these standard rents should be raised, a most relevant point in considering whether the landlords' liability to repair should be extended. Again, they urge, as so many have, a revision of the laws affecting prostitution, but from where does the effective opposition to that kind of social reform come—not apparently from the party managers of the government in power?

The struggle inside the book between

the ideas of the two decades, the 'thirties and the 'forties, extends even to its central theme—its advocacy for the appointment of a Minister of Justice. "The reason why so much . . . law is out of date . . . is that nobody has ever been entrusted with the job of looking after it." Yet "recent Lord Chancellors . . . have been converting what was . . . little better than a private secretariat into a great Department of State." There is the conflict between the theory that unless a vast and centralised new Ministry is established no good can ever come and the practical fact that an individual Lord Chancellor (overworked as he admittedly is) can, and does, bring into effect a very considerable total of useful reform. The present Lord Chancellor has indeed won a lasting reputation in this field; it is very doubtful if he would have been able to do as much if, in 1946, the Labour Government had converted him into a Minister of Justice. The most practical suggestion in the book is that the office of Lord Chancellor should be placed in Commission, which would both strengthen the Department and give the House of Commons a spokesman, other than the Law Officers, for all the matters for which the Lord Chancellor is now responsible. And that, *pace* the authors of this book, is something which the Labour Government could have done at any time during these last six years without the need even for a one-clause Act of Parliament.

Common Sense in Political Economy

A Course in Applied Economics. By E. H. Phelps Brown. *Pitman*. 434 pages. 25s.

Few bridges are harder to build than that between the ivory tower of the pure economic theorist and the terra firma (if firm is really the right word) of the business world. "We are far removed now," says Professor Phelps Brown in his introductory chapter, "from the days when general economic principles were thought to show of themselves what was the right thing to do." For purposes of pure analysis, the economic aspect of any human activity, or a single facet of that aspect, can be usefully isolated and studied; for purposes of policy and action, it must be put back again into its personal, social, institutional and political context. This is an activity by no means congenial either to the practical man of affairs, who distrusts the theorist, or to the theorist himself, who is apt to find practical affairs horribly messy and intellectually unsatisfactory.

Professor Phelps Brown unites to other virtues an unusual willingness to be explicit about methodology; and he builds a bridge which, though it lacks the majestic symmetry and mass of Marshall's "Industry and Trade," would, one feels, have been approved by that *pontifex maximus* of political economy. Assuming in his readers a fair familiarity with the general shape and characteristics of the economic scene, and a slightly more than elementary acquaintance with the tools of economic analysis, he demonstrates the use of

those tools on a selected range of current problems, their limitations, and their relationship to value judgments, thereby both illuminating his chosen topics and qualifying the reader to tackle others by similar methods. Everywhere he shows an impressive ability to combine intellectual penetration with horse sense, to set the findings of current speculation in perspective, and to illuminate difficulties with apt example and analogy. (His success here is inevitably uneven; his chapter on stabilisation policy is a triumph, that on devaluation is very sticky going.) This is a book on which students and their tutors will undoubtedly pounce, and which should occupy an accessible place on the shelves of anyone whose work leads him, from time to time, to lament that he has not kept abreast of modern economics.

The British Linen Bank, 1746-1946. By Charles A. Malcolm. Privately printed by T. and A. Constable, Limited. 253 pages.

In 1746 George II granted a Royal Charter to a group of Edinburgh petitioners empowering them "to carry on the Linen Manufactory in all its branches." Although it was born at the inauspicious moment of what one of its early directors called "a plaguey rebellion" in Scotland, the British Linen Company soon prospered. Within five years the promissory notes with which it paid its outlying workers had become well-known media of circulation (much to the annoyance of the Bank of Scotland which fell into the habit of collecting the company's notes and making runs on their cash). Within twenty years the company had started to lend to manufacturers and merchants who were engaged in industries other than the linen industry. And thus, by 1845, when Peel's "Bill to regulate the issue of Bank notes in Scotland" was introduced in Parliament, the British Linen Bank became one of the three leading banks in Scotland. From that date on, up to and through the date of the bank's affiliation with the Barclays group in 1919, this official history is little more than a parochial chronicle of the bank's achievements and leading personalities. But it is a chronicle that carries with it the whiff of romance attached to the story of a great institution that became a great bank in a fit of absence of mind.

Don Iddon's America. Edited by Charles Sutton. *Falcon Press*. 270 pages. 12s. 6d.

This is a vulgar and brassy collection of snippets from Mr Iddon's despatches to his home paper, arranged under topics such as What Price Peace?, Russophobia, Girth of a Nation and Video. A good deal of America is vulgar and brassy and, as such, can hardly complain of the reflection of itself which appears in these pages, while those of Mr Iddon's "ten million readers in 17 countries" whose appetite remains unsated after their breakfast reading of his column can continue their diet of two-sentence paragraphs for 270 pages. There is a great deal here of what I suspect Mr Iddon would call pun and games, mostly played with motes and beams, with "no great aim or theme except possibly a natural endeavour to aid Anglo-American relations by reporting everything with complete candour and frankness." The aim is most commendable. Unfortunately, of course, candour and frankness are not, in journalism, mere states of mind; to be realised they require a discipline at least as severe as that which is dedicated to dissimulation and deceit. Mr Iddon is still in the stage of good intentions.

HOTELS

personally and independently recommended by
Ashley Courtenay

"Listen to him who has four cars." Though I have only two cars they are attuned to almost every hotel problem, so whether it is for a honeymoon, a fishing or a golfing holiday, perhaps I can help you. A few of my personally recommended hotels are included in my "Shop Window" below. For further details, please write to me, enclosing stamped and addressed envelope. Ashley Courtenay, 25, St. James's Street, London, S.W.1.

HAWKHURST, Kent. COLLINGWOOD HOUSE HOTEL. In this historic and lovely Georgian home, the art of gracious living is still practised. Warmth, unswerving comfort and a high standard of catering will be your lot. For Brochure write: N. Allan-Smith. Tel.: 3250.

JERSEY, C.I. ST. BELLADE'S BAY HOTEL. (1st. Register). 11 bds. Right from London. Flowers, sunshine and an equable climate. Completely sheltered, facing the sea and the south. Early booking advisable. Details with pleasure from R. H. Colley. Tel.: St. Aubin 1. **LONDON, THE STAFFORD HOTEL, St. James's Place, S.W.1.** A first-class hotel quietly situated in the heart of St. James's. Convenient for shopping and theatres. Fully licensed. Cocktail Bar and Restaurant. Tel.: Regent 0111. (Under same direction: The Royal Norfolk Hotel, Bognor Regis.)

LYNN, Norfolk. TUGS HOTEL. "Stands by itself." Not only in a beautiful setting, but in personal service and comfort. As nearly perfect a base as you could wish, for all the recreational and sight-seeing attractions of North Devon. Write for Brochure G. Tel.: Lynton 3235.

MINESHEAD, Somerset. NORTHFIELD. Situated in 3 acres of grounds, aims at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A Honeymoon? Or just in holiday mood? Exmoor, the sea, and Northfield make a happy combination. Tel.: 864.

NEWQUAY, Cornwall. HEADLAND HOTEL. For your June honeymoon, Billiards, Bridge, Dancing, Tennis, Snuff, magnificent sands, 18-hole Golf Course adjoining. Good food, well-stocked cellar, attractive Cocktail Bar and Sun Lounge. Every room with a sea view. (Private bathrooms available.) Early booking advisable. Write W. Polglaze. Tel.: 2211.

NR. NEWQUAY, Cornwall. GLENDORGAL. Nigel Langye offers you the perfect holiday by the sea. Private steps to Atlantic surf-bathing and golden sands. 10 acres of private coastline ground. Own farm produce: cream, milk, Children's paradise? comfort and rest for adults. Fully booked August. Tel.: Newquay 2949.

SAUNTON SANDS HOTEL, Nr. BRAUNTON, N. Devon. Overlooking Bideford Bay. All that is best in a modern Hotel. Squash, Dancin', etc. Golf at Saunton Golf Club. Fully licensed. July terms from 36/- daily. Trains met by appointment. Tel.: Croyde 212.

SIDMOUTH, Devon. BELMONT HOTEL. A.A. Appointed. A first-class luxury hotel, noted for its excellent food, and occupying the finest position extending to the sea front. Through-coaches daily from Waterloo. Private Suites. Gas fires. Private bathrooms. Lift. Fully licensed. Tel.: Sidmouth 1261.

WATERVILLE, Co. Kerry, Eire. SOUTHERN LAKE HOTEL, for a superb family holiday. Lake, river and sea fishing; Bathing; Boating; Golf; Tennis. Famous for food. Write Mrs. A. Meldon. Tel.: Waterville 7.

MYTHE,

Kent.

HOTEL IMPERIAL

Holiday this year on the Kentish Coast, at this magnificently equipped hotel facing the sea. 50 acres garden, private Golf Course. A large number of rooms with private bath; some private suites. Fine Ballroom and Cocktail Lounge. A.A., R.A.C. Tel.: 67441.

RAVENSCAR,

Scarborough.

RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive terms 35/- to 47/6 per day. Tel.: Oughton 233.

TORQUAY'S

GRAND HOTEL

Grand in name, grand in position, grand in everything it offers.

With a view to a grand family holiday this year, write E. Paul for detailed brochure. Tel.: 2234.

Wining & Dining

SOON AFTER THE HOUR OF NOON, and again when the set time of dinner draws nigh, a tide of guests sets towards the Connaught Rooms. The Connaught Rooms is a peculiarly English institution—if, indeed, tradition be not the better word. No other capital city possesses a group of banqueting rooms, all housed under one roof, equipped to cope with anything from a dozen up to a thousand guests. A staff in a position to draw on a wealth of banqueting experience unequalled anywhere in the world ensures that food, wines, and, above all, service, is beyond reproach.

AMERICAN SURVEY

Point Nought Four

Washington, D.C.

THE message which the President sent to Congress last week on the Mutual Security Programme had considerable style; it appeared to exude confidence and to suggest that this was the best of all possible programmes, carefully designed to provide the most that the United States could afford and the least that the rest of the world needed. As Mr Truman said,

the amounts, the geographical areas, and the purposes of the aid have all been chosen in order to bring about the greatest possible increase in the security of the United States and the whole free world.

There is no reason for the rest of the free world to be anything but thankful—\$8.5 billion is no small sum—but those who have watched the programme develop over the last few months can hardly be expected to accept such a tidy explanation of how the sums being requested or the places they should go to were decided. There have been too many changes in the amounts and their destination, all of them caused by domestic, rather than international, developments, for anyone to accept unconditionally the sanctity of the final version.

No details accompanied the President's message, partly because the details were still being adjusted to the last cuts by the Bureau of the Budget, cuts made to conform with the latest view of what would be acceptable to Congress. But there is neither reason, nor evidence, for criticising the sum of \$6.25 billion in military assistance. How it was reached is almost impossible to discover and it may well represent the most that the United States can produce, and the rest of the world digest, in terms of military expansion. It may even represent more than many countries can comfortably use. Mr Truman pointed out that

the task of the free world is not only to build defences urgently in the immediate future but also to prepare for the long pull. We of the free countries must make preparations now so that when our armed forces have been built up we will be able to maintain them for years, if necessary, and at the same time grow in underlying economic strength more soundly and more rapidly than the Soviet dictatorship.

This extension of Mr Charles Wilson's slogan of "guns and the whole cow" to America's allies as well as to the United States itself was a refreshing example of the basic optimism of a country which has never yet found any problem insurmountable and which answers complaints that the United States is taking too much of the cake by baking a bigger one.

But the very size of the military aid section of the pro-

gramme, in proportion to the rest of it, and the statement that the economic section is "primarily to support expanded defence efforts abroad" shows where the reductions, thought to be unavoidable in the face of Congressional disaffection and MacArthurian circuses, were made. The "bold, new programme," which Mr Truman announced twenty-eight months ago in his Inaugural Address, "for the improvement and growth of under-developed areas" is still being watered with little more than fine phrases and lavish promises. This, in the present atmosphere, is no doubt inevitable; those

MUTUAL SECURITY FUNDS
(billion dollars)

countries most immediately threatened must be helped first and be helped militarily. The risk must be taken of postponing for the present the longer-term task of developing those areas whose soil is so arid that only the Communist cactus can flourish in it. But the pity is that this necessity is not openly faced; in the President's message there is an implicit attempt to pretend that great schemes are under way and that big money is being provided for them.

Under the heading of economic aid, in Mr Truman's long and persuasive statement, there is a sum of \$2.25 billion, \$1.65 billion of which is earmarked for Europe. In the larger sense, some of this will develop countries which have under-developed areas—as, indeed, has the United States itself. But they are countries which were being taken care of by the Marshall Plan before Mr Truman thought of Point Four. It is in the other \$600 million that one must look for signs of the bold new programme. Administrative expenses will take \$78 million of it and \$112.5 million is going to the United Nations Korean Reconstruction Agency—an admirable objective but unrelated to Point Four. There is left, when these have been subtracted, \$409.5 million.

Mr Gordon Gray's report, published last November and intended to be the guide to future foreign economic policies, decided that "efforts should be intensified to effect a rapid expansion of scarce materials" at the present time and recommended that, for the next few years, \$500 million a year should be provided in grants for development and technical assistance "apart from emergency requirements arising from military action." As none of the rest of the \$400 million-odd in the present programme has yet been publicly divided up, it is not possible to say how much would come into Mr Gray's category of "emergency requirements." But everything going to Formosa—and precedent does not suggest that it will be a negligible amount—could be put into it; so could the greater part of Indo-China's share. What goes to the Philippines can more

properly be charged against the special Bell report on that area than against the Gray one, but the care of Arab refugees from Palestine is another emergency, even if for a few years a continuing one, rather than a development programme. Mr Gray's \$500 million can, therefore, be written down to \$200 million or less. This may not be surprising; but it is unfortunate that the figures in the President's message suggest that it has not been written down at all.

*

Mr Truman paid a tribute to the Colombo Plan, but at the moment it is impossible to say how much more than a tribute it will get. It will certainly be lucky if it gets two-thirds of what was expected, of what was indeed promised, in so far as American officials, even those of Cabinet rank, can promise. And all these reductions in the programme of the United States will tend to be aggravated by their effect on the possibility of loans. Mr Gordon Gray suggested that between \$600 and \$800 million a year ought to be invested, half by the Export-Import Bank and half by the International Bank. The Export-Import Bank, since it is a purely American agency, can presumably be induced to lend without looking too hard at the base of grants which is the necessary cushion for such loans, though the President only recommended an increase of \$1 billion in its lending authority against the \$1.5 billion suggested by Mr Gray. But the International Bank may well decide that the risks it was prepared to take last November cannot be justified after the publication of the Mutual Security Programme.

In his message Mr Truman said:

If peace could be made secure, the American people would be glad to invest a part of the resources we must now allocate to defence to a large-scale programme of world-wide economic development. . . . With such a programme, we could, in co-operation with other peoples, inaugurate the most hopeful and fruitful period of peaceful development the world has ever seen.

And there is no doubt that, had there been no Korean war, no need to rearm the free world and build armies into the North Atlantic Treaty Organisation, and no rebellious Congress, the President would have been ready by now, the Marshall Plan having proved its worth and finished its job, to launch Point Four on a substantial scale. But the report of Mr Gordon Gray's committee was not written in a peaceful world. It was started before the Korean invasion but everything it had done before that date was thrown away. It was not recommending an ideal development programme—but the minimum necessary under the present conditions.

The Bureau of the Budget presumably decided that Congress, in its present mood, would stomach no more than what is now contemplated. It may be right; indeed, Congress may not even accept this programme without cutting it still further. But, when the methods of Soviet propaganda are taken into account, if \$250 million were transferred from the military programme to bring the economic one up to Mr Gray's requirements, the immediate results might be impressive. And those who were promised a bold, new programme in January, 1949, might begin to feel that Point Four would one day become a reality.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Balance of Military Power

Washington, D.C.

In the June number of the *Atlantic* magazine there is an anonymous article which, like the famous article by Mr "X" two or three years ago in *Foreign Affairs*, derives authenticity from its very anonymity. Had it not been written by somebody within, or very close to, the Department of Defence, there would have been no need to hide the identity of the author. The article discusses the balance of military power between East and West, how it has changed since the end of the war and how it is changing now.

From 1945 until the summer of 1949, the anonymous author says, a rough balance existed between the United States and the Soviet Union; both had a monopoly and the two monopolies tended to cancel each other out. The American monopoly was in atomic weapons and in long-range bombers to deliver them; the Russians, on the other hand, had a ground army so large that, when compared to other armies, it was, in effect, the equivalent of a monopoly—and it could certainly overrun the whole Eurasian land mass. Neither side could, during that period, conquer the other, but each had the capacity to injure the other seriously. And neither could be sure who would be hurt the most.

But the news that the Russians had exploded an atomic bomb upset the equilibrium, though the fact was not immediately admitted. Soothing public statements were made, statements with which Mr Walter Lippmann took issue even then. But, at the least, the atomic explosion had given warning of a time when the American monopoly would be lost. And it gave it at a moment when the Soviet ground strength was being, if anything, increased. Opposition to the Chinese Communists on the mainland had ceased and, as a result, there was a disturbing addition to the forces which might be (and since have been) put at the disposal of the Soviet Union.

The Department of Defence, the State Department and the National Security Resources Board at once began to re-examine together the problem of Soviet strength and of the relations of the United States to Russia. They produced a secret document, which was presented to the National Security Council, containing a long-term plan for re-establishing the equilibrium. This document, known as NSC 68, became famous and was referred to regularly by every columnist worth his salt, though there is little evidence that any of them had actually seen it.

*

Nothing much was done about NSC 68—this was the period of economy in the Defence Department—until after the outbreak of the Korean War. Then, says the article,

under the impact of that attack the Congress did authorise many, although not all, the projects contemplated in NSC 68 [and] the United States and its allies began in many ways to attempt to check the deterioration in the military balance.

Those steps which concerned the reduction of the Russian advantage in ground forces have been taken publicly, with an eye to their propaganda value. They are the establishment of the unified command of the North Atlantic nations and the programme of military aid to countries outside as well as inside Nato.

But, even more important than building the ground forces of the West to a point where they become at least a deterrent factor, was making sure that, as far as possible, the relative position of the two sides in the area of atomic war-

fare did not deteriorate to a dangerous point. The number of atomic bombs in the American stockpile is one of the few secrets left in the United States since the Senate started trying to discover why General MacArthur was dismissed. But a judicious blend of deduction and optimism can provide an answer within pretty wide limits. It is known, for instance, that there were no bombs left in stock when the one had been dropped on Nagasaki and that the invasion of Japan planned for three months later called for nine. At that pace, there would today be something over 200; but there have been a number of official statements about the improvement in the technique and speed of production in the intervening years, which have been variously interpreted. According to the writer in the *Atlantic*, "there is no reason to doubt the accuracy" of a statement made, and never contradicted, that the stockpile is now between 700 and 1,000 atomic bombs.

The same kind of calculation leaves the Russians with a stock of about 200, and the United States with an advantage in numbers of probably five to one. The next problem discussed is the ability to deliver the bombs and to destroy the enemy's industrial power. Guided missiles, the article admits, could be used against the outer territories of Russia, and would be in return effective against Britain and France unless the Russian army could be held deep in Germany. But the main industrial centres of East and West could be attacked only by air.

*

The American B-36 is the only known bomber—it is feared that the Russians may be building its equivalent somewhere in secret but, if so, there is no indication of it—which can fly from the United States to the Soviet Union and back. And the B-36 will start to give way, at the end of this year, to the B-52 which will be able to reach targets anywhere in the Soviet empire from bases in the United States and return. As far as is known, the Russians have nothing later than their TU-4, which is an imitation of the B-29, now classed as a medium bomber. They are estimated to have between 400 and 500 of these aircraft, which have a range of about 4,000 miles. They could reach any point in the United States from airfields in Eastern Germany or Siberia, but they could not get back. There is an uncomfortable feeling that they would come anyway, because the loss of the bomber would be unimportant and the crews would not necessarily treat it as a suicide mission.

But the United States would much prefer not to have to rely on intercontinental bombers, which are expensive and extravagant. General Vandenberg estimated this week that the strategic air force would have to be five or six times as large as that now needed if the United States were deprived of its present overseas bases. So long as it has them—and for that it needs allies who own the bases and are capable of defending them—it need not rely on intercontinental aircraft. It has three bombers already—the old B-29, its modern version, the B-50, and the jet B-47—which could deliver the bomb from the bases now available.

Another factor which has been studied is the number of targets which it is necessary to hit; and it is estimated that, owing to the diversity of American industry, the Russians would have to do three times as much bombing in the United States as the West would have to do in Russia to obtain the same ratio of damage. On the other side, however, it is admitted that American targets are known to everybody, while many of the more important Soviet ones are not known at all.

However, at this point, there is general agreement that the United States has a comfortable advantage in numbers of atomic bombs and probably in their effectiveness; it has better bombers to deliver them and, as long as it can use overseas bases, more bombers; and it has fewer targets to hit to do the equivalent amount of damage. The Soviet air force would, nevertheless, be able to inflict a heavy attack. The conclusion is that

if it came to an atomic war at the present time the United States would be able theoretically to deliver a blow from which the Russian industrial, transportation, and communication system could not recover. On the other hand, the United States probably could pick itself up off the floor after receiving the Russian blow.

For the future, the author of the article sees the possibility of gaining consistently over the Russians in all areas of military power except atomic striking power. But to convert these possibilities into realities, the United States must balance out Russia's ground strength at least as fast as Russia balances out American atomic strength. And

our diplomacy must hold all the allies we have today, and find us new ones.

The knowledge of this need perhaps explains the jaundiced eye with which the defence establishment views the long struggle between the State Department and the Congress, in which the Congress seems at present to be more successful in losing friends than the State Department is in influencing people.

American Notes

A Two-Faced Economy

The American economy at present offers the world a choice of two faces. The outstanding feature of one is the decline in retail sales of durable goods, while that of the other is the rise in manufacturers' unfilled orders for durable goods. They are not, of course, the same durable goods: television sets and refrigerators are piling up in retail showrooms, while in order books the accumulation is of machinery for new plants and defence requirements.

There are several factors behind the decline in retail sales. Last year's scare buying pulled this year's trade pattern out of shape; anticipatory purchases have now been discouraged by price controls and by the plentiful supplies of goods that still go on appearing in the shops. Credit restrictions have affected sales directly, by limiting instalment buying, and indirectly, by reducing the number of new houses that need to be furnished. Finally, the suspicion is growing that, for

the moment at least, the demand for such things as new vacuum cleaners and motor cars may at last be reaching saturation point.

The paradox of the present situation was illustrated last month when, within a few days, one automobile company announced that it was shutting down for three weeks because of lack of sales, and another began to turn off workers because of lack of materials. Restrictions on the use of steel and other metals for consumers' durable goods will become increasingly severe from now on, as the amounts needed for defence and "defence-supporting" industries increase. The rise in outstanding orders for durable goods in general is explained by the gathering momentum with which military contracts are now being let. By the beginning of next year, defence orders will be coming off the production lines at a rate of \$1 billion a week, twice as fast as at present. This increase in government spending inevitably means a rise in disposable personal income, already running at the record level of \$215 billion a year, and a fall in output of consumer goods, which makes nonsense of fears that today's pause for breadth will develop into tomorrow's recession.

But the pause has come just as the Defence Production Act must be renewed and Congressional ears are more attuned to business men's cries of "wolf" than to the Administration's pleas for the strengthening of the controls that are to some extent responsible for the cries. And unfortunately the check to the rise in the cost of living has silenced the housewives who egged Congress on last autumn. If to these and the many other pressures against effective controls is added a settlement in Korea, the forces of inflation may before long find themselves pushing against an open door.

*

Israel's Billion

Trailing clouds of ticker tape, Israel's Prime Minister has been touring the United States to celebrate his country's third birthday and to launch a \$500 million bond issue. This "Independence Issue" needs a publicity campaign if it is to prosper, for it takes the form of twelve-year savings bonds and of fifteen-year coupon bonds at 3½ per cent, which are not particularly attractive terms. Sales are being promoted by door-to-door solicitation and it will be interesting to see how the mixture of charity, religion and politics succeeds this time. It has certainly succeeded in the past, for the United Jewish Appeal has raised nearly \$700 million for Israel in the last thirteen years. But now that there is an established and autonomous government in Palestine, more Jews are coming to agree with the American Council for Judaism that their allegiance to the United States comes before their duty to their co-religionists, and to regret the over-riding Zionist influence in American Jewry. There is some resentment also at the way in which Israel appears to take its fairy god-mother's help for granted, as a right it has earned by its services to democracy in general and to Jews in particular. Nor has the recent bombing of the Syrian frontier been particularly pleasing to Americans.

For these reasons and because political pressure will not be as heavy as usual, since there is no election in 1951, Congress may decide to overlook the request for a grant-in-aid to Israel of \$150 million which has been put before it by a group of influential sponsors from both parties. This latest grant has not so far been backed by the Administration, and Israel's good friend in the White House, Mr David Niles, has just left his post as one of the President's administrative assistants; but help for Israel, to an amount not yet specified, is included in the new foreign aid Bill. The grant-in-aid is one of the ways by which it is proposed to raise a further \$500 million in the United States, in addition to the bond issue, in order that Israel may be established on a sound economic basis during the next three years. (The reasons why Israel needs this help were discussed in *The Economist* of

May 12th.) Some of the money will come from the United Jewish Appeal, which is now trying to raise another \$200 million, and the rest, it is hoped, from additional private investment in Israel. The American firms that have pioneered there, of which the best known is the Kaiser-Frazer Corporation, report that it is easy to make money, since the country is avid for goods, but that government restrictions make it as difficult to do business as it is in Britain.

*

All's Fair in Price War

New York's huge department stores lost no time in following up the Supreme Court's "body blow" to the so-called fair trade laws which prevent price reductions on branded goods in all but three states. R. H. Macy and Company, long a guerilla fighter against price fixing, began by cutting 6 per cent off the prices of about 1,000,000 such articles on its counters, from vacuum cleaners to books. Gimbel Brothers' boast that it always meets its competitors' prices drove it into the fight, Macy's replied with another cut of 6 per cent and from then on it was a free-for-all. Such well-known brands as Bayer aspirin, Underwood typewriters and Huntley and Palmer's biscuits were used as ammunition and some prices were down by as much as 30 per cent. These shops were evidently more concerned at the excessive inventories that had accumulated on their shelves recently than at the prospect of shortages to come, which manufacturers had hoped would make them hesitate to take advantage of the Court's decision.

That decision came because a New Orleans retailer had the initiative to contest a law which the government's anti-trust officials had always disliked but had never challenged. The full implications of the Court's decision are not yet clear, but it appears that a manufacturer cannot now insist on retailers in other states observing a minimum price on his product, unless he has signed a separate agreement with each of them. Previously it was believed that the Miller-Tydings amendment to the anti-trust laws, which made it legal to apply state fair trade laws to inter-state commerce, could be invoked against all retailers in a state if only one had signed an agreement. Fair trade laws have been applied to such widely distributed products as cigars, flour and toothpaste, for which it would be almost impossible to conclude individual agreements.

Apart from the manufacturers themselves, it is the small tradesmen who have favoured the fair trade laws which protect them from the competition, fair or unfair, of their larger rivals. The shopkeeper benefits from the manufacturers' nation-wide advertising and the margin of profit allowed has not as a rule been large. But it has been larger than that expected by department and chain stores, and by supermarkets, which spread their overhead costs thinly. Fair trading agreements have also violated another of the basic principles on which such shops operate, for they have prevented price reductions for the sake of a quick turnover. New York's price war is therefore likely to break out elsewhere, since the need to stimulate retail trade is felt all over the country. But such wars are not likely to be sustained, for under present conditions it cannot be long before demand is once again outstripping supply.

*

Networks in a Tangle

Last week the Columbia Broadcasting System hit what it hopes will be a pair of jackpots on the television fruit machine. Not only did the Supreme Court overrule the protests of CBS's rivals and authorise the company to put its colour telecasting on a commercial basis; but CBS is also at last well on the way to acquiring a television station in Chicago. This deal, an off-shoot of the merger which the American Broadcasting Company has finally achieved

213 an hour.

On April 15th

in **7½** hours

Schlumberger Overseas

Schlumberger
perforating service
saves you rig time

with United Paramount Pictures, will cost CBS the record sum of \$6,000,000, but it is probably worth it. For until now the network has owned only two television stations—in New York and Los Angeles—and part of a third in Washington, instead of the five that it is allowed and that its competitors have. CBS has been prevented from building more by the freeze on new television licences, but even when the thaw comes, as it will before long, there would probably not have been room for CBS in Chicago, one of the country's wealthiest markets.

CBS wants more television stations of its own because profits are at last being made on them, while television networks are still operated at a loss, and because only on its own stations can the company guarantee potential audiences of the size that advertisers expect. Revenue from telecasting, \$105.8 million in 1950, was three times as much as in 1949, and half the 107 stations made money. The four big companies made \$1,500,000 on their stations, but lost \$10.5 million on their networks. This is explained in part by the cost of the coaxial cables and micro-wave relays which carry programmes from the originating stations to the affiliates. Under their contracts, in return for carrying a network programme, these affiliated stations receive a proportion of the fee paid to the network by the advertiser who sponsors the programme. But the freeze on new stations has made it impossible for each network to have its own exclusive television affiliate, as it has its own radio affiliate, in every important centre, and local stations are in practice able at any given time to choose between various network programmes. In order to deliver the audiences promised to advertisers, the networks are therefore obliged to film programmes for later transmission by local stations. This expensive and unsatisfactory filming process is another reason why networks are still losing money on their television operations. More than 40 per cent of CBS's television time is broadcasting of recorded programmes by network affiliates.

What attracts the advertiser is cost per viewer and this goes down as the number of television sets goes up. The improvement in the financial position of television stations is directly due to the increase in the number of sets in use, which more than doubled in 1950. New York stations now charge over \$3,000 an hour at the peak viewing times, twice as much as for radio, and in addition a television programme may cost \$50,000 to put on the air. It is estimated that altogether sponsors spend about \$4 an hour per 1,000 viewers. They believe that this is a sound proposition, but they insist on making advertising economies elsewhere, and have forced the networks to reduce their radio rates. As a result revolution threatens amongst radio affiliates, whose contracts require them to share the cuts in revenue even though they may not be in areas where television competition has reduced the value of radio time.

* * *

Crime and Punishment

Mr Joe Adonis, a less lovely character than his name suggests, has been sentenced to jail for three years on gambling charges. The experience will be as new for him as will the "legal employment" which the judge directed him to seek when he is released. The sentence was stiffer than Mr Adonis had expected after the bargaining with the prosecution which ended when he agreed not to contest the charges. He played the businessman to the last, as became one who has prided himself on making crime respectable. For, according to the Kefauver Investigating Committee, Mr Adonis was, with Mr Frank Costello, joint managing director of the nation-wide gambling syndicate whose ramifications, political and criminal, the committee was so successful in tracing.

Mr Adonis's conviction may be the beginning of the breakup of the syndicate, but the credit for it goes to a New Jersey grand jury which had been studying his activities

before the committee brought them to the television screen. The US Attorney General believes that regular investigations of this type will curb inter-state crime more effectively than would the suggested Federal Crime Commission, and he has now directed that a grand jury be convened once a year in each of the country's 84 federal judicial districts. In Brooklyn another grand jury has accused 77 New York policemen, some of high rank, of conspiring to violate the gambling laws with a bookmaker who was arrested last autumn. He is alleged to have bribed the policemen with television sets and "bushel basket loads" of cash.

The testimony offered at least *prima facie* evidence that the city official charged with preventing corruption had been lax. When Mr O'Dwyer was Mayor of New York, the official was Mr John Murtagh, whom Mr O'Dwyer, just before he resigned, appointed to the post of Chief City Magistrate at \$15,000 a year. Judge Murtagh told the Kefauver Committee that, when he was Commissioner of Investigation, he had found no evidence of police corruption and that the gambling tycoons had not come under his jurisdiction, since they operated from New Jersey. He has now been charged with neglect of duty at that time, for knowing, but failing to report, that policemen were being bribed. Another of Mr O'Dwyer's companions, Mr James Moran, who also was rewarded with a lifetime appointment before the Mayor retired, has already been convicted of perjuring himself before the Kefauver Committee. Other of the committee's witnesses may be appearing in the dock before long, including perhaps Mr O'Dwyer himself. When that time comes, even the President may have to admit that the ex-Mayor of New York is not an entirely suitable American Ambassador to Mexico.

Shorter Notes

Mrs Oksana Kasenkina, the Russian schoolteacher who leaped from the third storey window of the Soviet Consulate in New York in 1948, to escape return to Russia, has been granted permission to remain in the United States. President Truman has signed a Bill which legalises her unorthodox entry into the country for permanent residence, and now the way lies open for her to obtain American citizenship.

*

On May 26th more than 170,000 college students took the draft deferment test which may determine whether they will finish their education or be conscripted for military service later in the year. This was the first of four tests to be given to 400,000 students in all, and comprised 150 questions to be answered in three hours. Opinion on the standard of the test varied, but most students said it was harder than college entrance and all agreed that it was fair. Those who obtain over 70 will be able to go on with their studies next year, and another 100,000 students, who did not apply for the test, will be eligible for deferment if they stand sufficiently high in their class. The results will be sent to the local draft boards, where the final decisions are made.

*

American housewives have recently made their first quarterly payment to the Government under the social security scheme for domestic workers which came into force at the beginning of the year. As they wrestle with a system that seems nearly as complex as the British PAYE, those who have lived in England think nostalgically of the days when they had only to buy and lick a stamp.

*

The Pittsburgh Consolidated Coal Company has reached the final stage in its experiments with the transportation of coal by pipeline. A full-scale demonstration system is now being built in Ohio, as a preliminary to commercial operation. The coal is crushed after mining, and then mixed with water to form "slurry"; special pumps push it through the pipe and on arrival it is dried.

ASSEMBLY

The TI Companies have been brought up on assembly problems. They make not only finished articles but component parts, great quantities of which are assembled in TI's own factories in Britain. Whatever they make, TI make it as if it were literally intended for their own use. This applies equally to precision steel tubes, electrical accessories, wrought aluminium sheet products, cycle parts, and a wide range of other components for most branches of industry.

THE WORLD OVERSEAS

How Much Does Persian Opinion Matter?

(By Our Special Correspondent Recently in Persia)

THERE are signs that the cares of office are awakening some of Dr Mossadegh's supporters to the fact that a large country cannot be run just on a cry of "nationalise oil." His position seems to be weakening. Therefore some people in Britain are calling the news "better" and hoping that "the storm may blow over." To think such thoughts is over-optimism. It is wholly to underestimate the volume and nature of the wave of opinion that carried Dr Mossadegh to office. That opinion will not be silenced simply because he, personally, falls from power; it is firmly held, and must be met or countered if any agreement worth having is even to be made with a Persian Government.

There was a time when Persian public opinion was a negligible factor. The country consisted of a small ruling class and a large and ignorant peasantry. Provided that the former could be satisfied that they were going to get more money, the foreigner found agreement was not difficult to reach. They might hold back for a while; but they came round when they needed funds. This simple situation is still enjoyed by the American Oil Company in Saudi Arabia. But it no longer applies in Persia. Ten years of novel experiences—foreign occupation, easier foreign travel, more opportunities for higher education—have altered the picture. The kernel of effective opposition to the British oil company now lies in a small white collar class—consisting largely of the civil servant, the employee in the bank, and the school-master—a few of whose members are really competent and feel that their competence is not appreciated, and the bulk of whom think (with the self-confidence, amounting to conceit, that is a national characteristic) that any child of Persia's great forebears can accomplish with grace and ease any job to which he sets his mind.

The case which these people make against the oil company is not new. It is not a development of the present crisis; it is an expression of feeling that can be picked out from many speeches in parliament over the last eighteen months. Broadly speaking it runs as follows: "This company calls itself Anglo-Iranian, but the title is a piece of window-dressing. It is in fact a British company. Its seat is in London. It has even removed the British director who used to live here. Why does a half-Iranian company pay to the British treasury, in tax, far more than it pays the Iranian treasury in royalty and tax together? Why does it sell oil to the British Navy at a price it never reveals? How do we know that it has told us exactly how much of our oil it is removing? Why has it for years been paying us less per ton than similar companies pay other governments, notably those of Saudi Arabia and Venezuela? Now that we are well informed about the rest of the world, we see that we have been cheated, and have suffered great losses at the hands of people who think we are children. What we want is a share in the management, or at the least a partnership which will guarantee us against exploitation by people who, for all we know, will have bled away our whole wealth by 1993."

This brief paraphrase of a considerable number of speeches and private conversations errs on the side of moderation. What detailed analysis shows is that the deepest wound hurting the speakers is the stand-offishness of a company that has no Persian director and too few senior Persian employees, and whose staff has next to no social contacts with Persians outside its employment. Just as in India, so in Persia, that tragic British capacity for betraying a sense of superiority

has nullified a splendid record for causing advancement and prosperity. The defect is an old one. James Bryce, travelling in western Asia in 1876, put his finger on essentials when he wrote:

The sort of good nature and susceptibility to impressions which is so marked a feature in the Russian character makes them get on far better with strange races than we have ever been able to do. It is not occasional acts of cruelty . . . that makes foreigners hated nearly so much as coldness, hauteur, contempt, an incapacity to appreciate or sympathise with a different set of customs and ideas.

The problem before the Englishman who works with Persians in the future—whether in business or in diplomacy—is how to live down this damaging reputation for aloofness and condescension. If the British oil company is ever again to operate in security in Persia it must work to cure this flaw in its personal relations. Many of its employees would welcome its encouragement to do so. Until it acts, one partner in the business will remain "we" and the other "they," no matter which of them is talking. It must recognise that the strength of the National Front party will survive the collapse of its elderly leader. This strength lies not in his leadership, but in the fact that it expresses what most educated Persians think of British manners. Its present members of parliament are all elected for Teheran, a place that sees these manners at first hand.

Focus in Teheran

Obviously the capital city is not the whole country. But this small group of people is the less negligible because it has at its back a much greater volume of opinion—ignorant, this time—which knows that there is something wrong because its misery, though much discussed, is never alleviated. "Do you not think," asks a chance acquaintance in the country bus, "that Communism might be good for us? Might it not be quicker than capitalism at making us richer and happier?" Immense numbers of ignorant but questioning Persians are now ready to shout for any change, on the grounds that change cannot be for the worse, and has a chance of bringing advantages. They are told by such educated men as they know that the oil company is responsible for their ills; they learn this not only from the middle-class group already described, but from the rich landlord politician class, which says so in order to deflect attention from the social scandal of his own way of life. The case of both is helped by the Persian character, which is—as its folk tales amply show—a compendium of envy at the success of another and of confidence in ability to do his job if given his shoes.

This analysis reveals a situation that is immensely difficult for anyone, Persian or foreign, to handle. It will not be met by a simple change of government to another of the old style. Even if Dr Mossadegh falls, there will still be people shouting on the sidelines for social change. No agreement with a foreigner will be lasting unless this requirement is met. The weakness of the educated middle-class critic of Persia's ills is that he will not step forward and meet it. He will carp and grumble, but he does not offer to shoulder the burden of office.

Whether social change can be produced by anything short of a Tudeh government and a Persian Gottwald, only the Persian middle-class can say. If they cannot work out their

own salvation, no one, British or American, can help them to do so. In any case, no foreign help can be effective if they persist in the attitude which has so far caused them to rebuff would-be helpers such as the International Bank, the Export-Import Bank, and the many individual British and American advisers whom they have first hired and then rejected.

Europe's Prospects for 1951

IN 1949 European nations were obsessed by the dollar famine and by the fear of surplus production. In 1950 these two problems disappeared and in their place there emerged an entirely new set of difficulties; growing inflation, a scarcity of raw materials and the cost of a great rearmament programme. These three threats to the stability of Europe—and indeed the whole world—form the theme of this year's Survey of the Economic Commission of Europe.

As is customary with these reports, there is a wealth of illuminating statistics accompanied by a no less enlightening analysis of recent economic developments. On the production side the authors note that progress was particularly encouraging. In 1950 Europe's industrial production rose 13 per cent above the 1949 level. The same percentage increase was recorded in the United States, while the figure for eastern Europe and the Soviet Union as a whole was 22 per cent.

This expansion in production, coupled with devaluation, rising dollar prices and American recovery from recession, more or less solved the dollar problem. Europe's balance of payments deficit with the United States fell from \$3.2 billion in 1949 to half that amount. This was accomplished in part by a 75 per cent increase in European exports to North America and a 30 per cent cut in imports from that area. Simultaneously Europe's gold and dollar reserves rose by \$2 billion, an increase which was due to a reversal of the outflow of capital from Europe and to the fact that in trade with countries outside North America, Europe began to acquire dollars instead of paying them out.

A great deal of the improvement in Europe's dollar position was accounted for by the United Kingdom and the overseas sterling countries. The latter, however, had to see many of their gains assume the form of mounting sterling balances. During 1950 these increased by \$1.1 billion to a point very near the limit which their holders will stand and the result has been a new unbalance in world trade.

Sterling balances, however, are but one part of the radically different troubles which began to pile up in 1950. The outbreak of war in Korea marked a new phase in the post-war economic scene. The United States embarked on a vast rearmament and stockpiling programme which led to an acute shortage of raw materials and a spectacular boom in their prices. Domestically there were startling increases in the prices of all commodities, and inflation appeared to be getting out of hand.

Inflation, in fact, is the central problem which the ECE foresees, not only for Europe but for the whole free world in the coming year. In the first place, there are bound to be further price rises in most commodities; the second half of 1950 had introduced only the first twist of the spiral. Even assuming that the prices of raw materials have reached their peak, reflected rises in the prices of manufactured goods and foodstuffs are inevitable.

At the same time, Europe will be subjected to further inflationary pressure through developments in the United States. On the calculations of ECE, the excess of total money demand over supply of goods in the United States—that is, the new inflationary gap—cannot be less than \$13 billion in 1951; even this assumes that Congress accepts speedily the proposed new taxation and that production increases by \$20 billion. One part of this gap, the report

forecasts, will be directly transmitted to the outside world; American imports may be expected to exceed the 1950 level by \$2 billion and at the same time its exports will decline still further. Another part of the gap will indirectly affect Europe through the rise in the cost of American exports, the sympathetic rise in world prices and the increased profits accruing to exporters to the United States both from Europe and the primary producing countries. Thus, quite apart from its own internal difficulties, Europe cannot, without taking special measures, escape from the consequences of

inflation in the primary producing countries and of increased American pressure on world markets.

Meanwhile, by the end of 1950, most European countries—with the exception of Norway, Sweden, Turkey, and possibly Spain whose exports are largely raw materials—had found that a given volume of their exports could buy 15 per cent less imports than was possible at the beginning of the year. For Europe as a whole the terms of trade with all other areas had deteriorated by 30 per cent. The greater part of this change took place after the outbreak of the Korean war, and only a comparatively small element represented the effects of devaluation. The report further estimates that, on the basis of raw material prices ruling at the end of last year, the primary producing countries may expect to earn an additional \$3.4 billion in 1951 for their 1950 volume of exports. In other words, there will be additional pressure on Europe and America to find \$3.4 billion of goods for export before they can begin to increase their imports.

This will mean not only a further drain on the already insufficient goods being chased by too much money, but a new and serious strain on Europe's convalescent balance of payments. Moreover, these burdens are being imposed on Europe at the moment when American grants must be expected to taper off and when Europe is undertaking a large rearmament programme. ECE estimates that an additional one or two per cent of Europe's national income will be required to make good the deterioration in terms of trade and that in many countries another three or four per cent of the national income will be spent on rearmament.

When it comes to consider the means of alleviating the inflationary situation, the ECE is no less pessimistic than in its analysis of the causes. The only painless way to stem inflation or to ease the balance of payments problems is to increase production. The report reckons that apart from the limit on raw material availabilities, production could rise by 7½ per cent in northern Europe (Scandinavia, UK and Netherlands), by 20 per cent in Germany, and 10 per cent in the rest of western Europe. While it acknowledges a considerable industrial recovery in the second half of 1950 in Germany, France and Belgium, it believes that there is still an unnecessarily large spare capacity in the heavy industries of these countries and also in Italy. Unfortunately the governments concerned have chosen or been forced by circum-

IS THE "DICTOREL"

This is the machine YOU have been waiting for—but you need wait no longer, because A.C.E.C. can supply you without delay. It is the last word in dictating machines, and has just the features every executive dreams of—unerring efficiency in "taking down" by a secretary who does not interrupt, catches every word and, by the flick of a switch, reads back exactly what you've said in the way you've said it! If you wish to correct your last sentence, you simply re-dictate the improvement you want, and the previous wording is automatically obliterated by recording the new.

And just one other thought—this "Secretary" is not "hard on the eyes"—in fact, it is a styled and elegant piece of office furniture, as you can see from the illustration.

The further details you will no doubt like to have can be obtained from the two addresses given below or from the London Office of A.C.E.C.

20 LINCOLN'S INN FIELDS, LONDON, W.C.2

Are we in a jam, Auntie?

It's the nearest thing to a traffic jam I've seen lately. Have they all run out of petrol? No—they're all trying to get to the same place. But that reminds me—I must fill up. Which pump shall I look for? You'd better get to know the BP shield—that's the pump we'll be using when brands are back. When will BP be back, Auntie? Touch wood, my dear nephew, I'm hoping it won't be long now!

BP is the trade mark of

ANGLO-IRANIAN OIL COMPANY, LTD., whose whole organisation is behind it.

He fights among the trees. It is on the constant war waged in the forests by entomologists like Walter Griswold, that world output of paper is greatly dependent. His enemies are the pests and parasites which attack the trees from which the wood pulp for newsprint is obtained. Thirty-two year old Griswold graduated in Forestry at the University of New Brunswick and had already carried out research in the forests before joining Bowaters' staff. He is officer in charge of the Newfoundland field workers who pry into the cracks in the bark and beat the boughs over extended sheets to collect specimens of the pests threatening the growing trees. Once these pests have been identified in the Dominion Entomological Laboratory it is Griswold's job, in co-operation with Canadian Government experts, to plan the appropriate counter-attack. One successful method is the introduction of species of parasites and virus disease as allies to prey on those already in possession. It is largely upon the success or failure of this silent struggle to protect the forests that the supply of paper to keep pace with the world-wide spread of literacy depends in the years to come.

The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper—the 'know-how' in short—is freely at your service.

stances to use only one of the possible weapons that can be employed to maintain monetary stability—the control of credit. This has meant that, in the inevitable absence of increased consumer goods, industrial expansion has usually led to inflationary pressures which have quickly been damped down again by credit restrictions; these in turn have discouraged increased production.

Turning to the question of supplies and availabilities, the report reaches the conclusion that the potential rise in industrial output will not, in fact, be realised. With the exception of rubber, there is little hope that world supplies of raw materials will increase by more than a slight margin. Crucial bottlenecks are foreseen in coal and steel and in all the secondary industries dependent on them. Of these, coal is the main commodity which is exclusively within Europe's own control. While the survey does not claim that a striking increase could be achieved in coal supplies, it does by its criticism suggest that British and German coal production could be raised.

For the most part, however, the solution of Europe's raw material difficulties lies outside its own immediate control. In general, the report takes the gloomy view that little can or will be done to expand the production of primary goods. Such development depends on heavy initial capital investment. At the moment the highly industrialised countries cannot provide the necessary capital goods, and furthermore the beneficiaries of high raw material prices seem to prefer to dissipate their gains in local inflation.

The conclusion of the report is that Europe, at least in the short run, cannot cope with its problems by purely domestic anti-inflationary measures but must resort to currency appreciation. The processes of September, 1949, should be reversed so that Europe's export prices rise in terms of dollars while import prices fall. The net effect of this operation should be to reduce American demand for other peoples' goods and thus lessen the pressure on the current limited supplies of raw materials. To be fully effective, however, appreciation must be directed by a flexible policy, prepared to adjust foreign exchange rates in both directions as world economic conditions fluctuate. It must also be accompanied in each country by a firm fiscal and investment policy, in turn supported by direct physical controls and a wage freeze until the new foreign exchange measures have had a chance to show what they can do toward stabilising world prices.

Poverty in Andalusia

[FROM A CORRESPONDENT RECENTLY IN SPAIN]

FOR almost the first time since General Franco seized power, murmurs of criticism have flared into open discontent. In March, workers in Barcelona and neighbouring towns came out on strike; in April, San Sebastian and Bilbao, and in May, Pamplona followed suit. 'So far it is only Catalonia and the Basque provinces which have been affected; both areas speak their own language, both are strongly conscious of a separatist tradition, and both march with France along a mountainous frontier which facilitates illegal traffic. This last gives a certain face-value to official Spanish explanations that the strikes are of Communist and foreign origin. To the foreign observer, however, as to the Frenchman looking detachedly over the Pyrenees, and even more to the Spaniard himself, such political explanations are a mockery. The fundamental cause is economic, and the question that now has to be asked is how widespread are the conditions which have given rise to these first outbreaks.

Paradoxically, the worst conditions are to be found in the fertile south. Here, among the orange and lemon orchards and the well-watered fields of bearded wheat, barley and vegetables, is the most marked poverty and hunger. The

British traveller, rich in his 110 pesetas to the pound sterling, can be deluded into oblivion of the economic ills of many parts of Spain, but in Andalusia the evidence of large-scale unemployment and near-starvation is overwhelmingly strong. The average daily wage of the agricultural worker is fifteen pesetas. During the harvest when labour is in demand this may rise to twenty, while workers harvesting sugar cane can earn twenty pesetas per ton despatched to the refinery; and it is possible to cut and strip about two tons a day. But

when work is scarce there is no guarantee of employment, and only very few are paid a fixed wage throughout the year. Fifteen pesetas will buy two kilos of black market bread (the ration is insignificant), or half a dozen eggs (when eggs are plentiful), or three-quarters of a litre of olive oil. Shoes and clothes—which seem so cheap to the tourist—are out of reach, and rags are an increasingly common sight. Small-holdings on the marginal land now left uncultivated could change the life of the agricultural labourer. But most of the land is divided into large estates whose owners do not need to cultivate every scrap of it; and countrymen complain with justice that if it were their own they would utilise much that is now left untouched.

But in the country a man can at least pocket a potato or two or take a few sticks of sugar cane home. In Malaga and other southern towns the situation is worse. Here the town centre is plagued with unemployed, some frankly begging, others showing a semblance of employment by selling American cigarettes, showering the tourist with the names and virtues of rival hotels, or waiting to offer guidance to any part of the town. Most of these are under thirty. In Malaga, the civil governor's method of dealing with the problem was to issue a decree forbidding these occupations to be carried on in the centre of the town because of the bad impression it would give to foreigners. Begging, which flourishes in both country and town, is similarly dealt with by notices prohibiting its practice.

Inevitably, one asks whether what happened in Barcelona and Bilbao will happen here also. The answer is usually that it would, were it not for the armed police whose weapons are the law and the secret police who make free conversation impossible. For here there is no second language in which to hide the expression of thought, and even the casual observer cannot miss the sub-machine guns and automatic rifles so clearly displayed, or fail to see the patrol of ten civil guards returning to a small village of a thousand inhabitants.

Official Spain does not pretend to be a democracy, or, as many foreign apologists maintain, to be "working towards democracy in its own way." The leaders of a regimented press compare the Spanish system of government favourably with those in western Europe, and frequently point to Greece as the primrose path, and to Britain as the bonfire, of the

democratic system. Newspapers, though providing a coverage of foreign news far wider than the bulk of the British press, relegate mention of the strikes to an inch on a back page. Whole columns, however, are devoted to official speeches making Korea and the world situation scapegoats for all the ills of Spain; and lack of capital and capital equipment can be demonstrated in roads maintained with earth, ancient rolling stock, and locomotives with the high funnel and lofty dome of the museum piece.

Marshal Tito's New Plans for Industry

[BY A CORRESPONDENT RECENTLY IN JUGOSLAVIA]

MR DJILAS, Yugoslav Minister without Portfolio, recently remarked that "what we are doing is not a cross between Russian Communism and western social democracy. It is something entirely new." In the economic field this claim that Yugoslavia has struck out on a line of its own is based on two things; first on the development of a new form of the control and management of factories and enterprises by the workers in them; and second, on the willingness to use, within a thoroughly "nationalised" framework, the machinery of capitalist free enterprise and the operation of the law of supply and demand in order to maintain incentives. This hybrid operation gives the impression of being evolved from day to day, and certainly from month to month.

Mr Kidric, the President of the Federal Economic Council, recently described at length the economic changes which are now taking place in Yugoslav industry and the lines along which it is proposed to extend them. He explained that the present economic developments had begun with the nationalisation programme, which set the basic form of property ownership as state ownership, and with the creation of a strict state planning organisation. This was beneficial during what Mr Kidric called the first phase, because it had made it possible to concentrate economic forces which had previously been scattered. But it was also true that the detailed planning had put a brake on initiative and "the state apparatus began to expand rather rapidly."

It had, therefore, been necessary to pass on to another phase as soon as circumstances made it possible. The prerequisite for this present phase was the establishment of the workers' councils and management boards in the factories. According to Mr Kidric, this was not just a demagogic measure, for the councils and boards were the foundation of a profound change. They were not advisory or subordinate, but were "the real managers of production." At the same time, they were not owners in the old capitalist sense. As yet they are still tied down by the remains of the old planning and financial systems. But in the next few months they are to be completely freed.

The essence of the new system is to leave under planning only those things "which, if they were not planned, would lead to anarchy and prevent the desired development of the country." The plan will stipulate how much of the capacity of the main industries is to be exploited during a given period. This will be governed by the availability of raw materials. For example the textile industry might be told to use 80 or 90 per cent of its total capacity; but the quantity and range of products to be made would be left to the industry itself to ascertain on the basis of demand.

The plan will no longer specify the number of people to be employed in individual factories. It will specify instead on the average wages and salaries in effect for the country as a whole and the average output per worker necessary to exploit the capacity of the industry. How the fund will be

distributed will depend on the workers' council for the industry, with the proviso that no increase over 500 dinars a month (approximately one-seventh of the average national wage) should be made in individual wages.

A large part, between 70 and 80 per cent, of the surpluses earned by factories or enterprises are in the near future to be left to the workers' councils to dispose of as they wish. Until now, the state had been taking all surpluses and redistributing them for capital construction, etc. In future only the prices of about 400 primary materials will be controlled. The old system of controlling about 10,000 prices had, according to Mr Kidric, "hindered the free operation of the law of supply and demand."

So far as capital construction is concerned, only basic factors, "forming the skeleton of the national economy," such as the iron and steel industry, will be controlled by central planning. All other capital construction will be left to free enterprise on the part of workers' councils. Industries unable to finance desired construction will be able to apply to the state for grants. The workers' councils will bargain with the Ministry of Finance, and if agreement cannot be reached the matter will be referred to arbitration. The net result will be that in future only about one-half of the capital construction in the country will be compulsory, whereas until now it has all been compulsory.

Powers of a Workers' Council

Among the enterprises now engaged in putting Mr Kidric's ideas into practice are two large factories in Zagreb, one making machine tools and the other electrical equipment. The system of control through workers' councils and management boards can perhaps, at this stage, be best summed up by saying that, in these two factories, it gives the impression of being simply a highly developed form of joint consultation. The director or manager is appointed from above and can only be removed from above. The works council is, however, free to complain to the authority responsible for his appointment and to ask for his removal. The director appoints his own departmental managers and technicians, subject to the approval of the works council. At the Rade Koncar electrical factory, the council actually reversed one of the director's decisions about two months ago. The director had wanted to dismiss some clerical staff in the accounts department as being redundant. The council disagreed with him and so a commission of three was appointed to look into the matter. It reported in favour of the council's view, which the director then accepted.

It was made clear by members of the management board that the director and departmental heads were regarded as their employees, but it was difficult to feel sure that this conception had yet been able to strike very deep roots. In the machine tool factory, where 1,300 are employed, the works council consisted of 64 elected members, and the management board, elected by the council, of 11 members. The latter were five workers from the factory floor, two foremen, two engineers, including the chief engineer, the head of the finance department and a director. Four of the members of the board and 300 in the whole factory, were members of the Communist Party.

Among the important industrial tasks allotted to the councils is the setting of "norms" and wage-rates for piece-work. These are now to be determined individually by each factory or unit. This system of workers' councils is arranged in pyramid fashion, with those of the individual factories or enterprises at the base, both territorially and by industries. As Mr Kidric pointed out, there has not yet been time for the new system to come fully into effect, but among much that is at present confusing in Yugoslavia it does at least seem clear that Marshal Tito and his associates are, for whatever reasons, making genuine efforts to move relatively towards greater freedom and away from the monolithic state.

Some Points from Poland's Census

[BY A CORRESPONDENT]

POLAND is being quickly transformed from a predominantly rural into a semi-agricultural, semi-industrial country. This is the most salient feature of the temporary report, published recently in Warsaw, on the one-day census carried out last December. According to this report, over 54 per cent of the total population lives now on "income derived from non-agricultural employment," while the corresponding prewar figure (in the 1931 census) was less than 39 per cent. True, both these figures are established in such a deceptive way as to give the impression of a rural population smaller than it in fact is. Still it can be estimated that urban population accounts now for roughly 40 per cent of the total, while in 1931 it was only 27 per cent, and even on the eve of the war accounted for substantially less than a third.

These structural changes are due to two main causes: the changed frontiers and the industrialisation drive. In the post-war settlement Poland lost its predominantly rural eastern areas in favour of the more industrialised former German territories in the West. Frontier changes, however, have been accompanied by wholesale shifts of population. The relative growth of urban population is even more remarkable, when it is remembered that the Jews, exterminated during the war, constituted an important part of Poland's prewar town population. Hence the growth must be explained mainly by the employment provided by the expanding industries. Between 1938 and 1950 the share of industrial workers in the total employment figure has approximately doubled, from 18 to nearly 36 per cent, and if the targets of the 6-Year Plan are fulfilled by 1956, an additional two million workers should be absorbed by industry and the population should then be almost evenly spread between town and country.

The postwar mass migrations of population render estimates of the natural rate of increase difficult. From 1945 to 1948 some 2,250,000 Germans and over 500,000 Ukrainians and Byelorussians left the present Polish territory, while approximately 1,500,000 were repatriated from the West and an equal number came back from the East. Total population rose from less than 24 million in the summary census of February, 1946, to nearly 25 million at the end of last year. The Polish authorities claim that during that period there was a net outflow of over 1,000,000 people and hence the real increase of population was substantially over 2,000,000, and not just over 1,000,000. This figure, however, seems exaggerated. It would mean an annual increase of over 2 per cent while other Polish statistics allow for a rise of only over 1 per cent. In

any case, with its 25 million inhabitants Poland has the largest population of all European countries within the Soviet orbit.

Ten-Acre Farms

The housing problem provides a headache for the authorities and undoubtedly hinders urban development. According even to official statistics there are now nearly two persons to every room including kitchens. In the countryside the worst problem is the small size of the holdings. The agrarian reform brought about a parcelling of the land and only recently has the number of farms been slightly reduced. Thus in 1950 there were still 3,250,000 private farms; allowing for State and collective land, they could not average much more than 10 acres each. The government considers that the obvious remedy for this land hunger is collectivisation with the absorption by industry of the surplus labour. Yet the great number of private farms is an indication that, hitherto at least, the Government has taken the mood of the peasants into account and proceeded cautiously with its collectivisation drive.

The report shows a substantial recovery in livestock, as can be seen in the following table:—

	LIVESTOCK (in Thousands)		
	1938*	1946†	1950‡
Horses.....	3,149	1,730	2,797
Horn cattle.....	9,924	3,910	7,164
Pigs.....	9,684	2,674	9,923
Sheep.....	1,940	727	2,194

* Present frontiers. † February census. ‡ December census.

The tremendous increase after 1946 may have been somewhat inflated by the inadequacy of the census taken that year. Besides, to get a clearer picture of the actual increase Unrra shipments—particularly of horses—and the cattle brought in by the immigrants from behind the Curzon Line should be discounted from the 1950 figure. For horses, the comparison with prewar is not as encouraging as it appears. In the formerly German territories agriculture was highly mechanised and there was not so much need for horses. Now, despite the considerable improvement, there is still an acute shortage of driving power and great need of mechanisation. The peasant, however, views the tractor with suspicion as the spearhead of collectivisation. For pigs, on the other hand, for which the rearing period is shorter, the recovery is nearly complete. In this sphere the government, keen on having large quantities of bacon available for export, has even abandoned its policy of "squeezing the kulak" and paid substantial premiums for pig-rearing.

Aspects of enterprise

No. 1

This series of announcements deals in a random way with some aspects of the Simon Engineering Group's activities, organisation and management.

Any resemblance to good advertising is purely coincidental. But perhaps an impression will emerge: the impression of many teams of engineers and scientists working with enthusiasm in the knowledge that they do a useful job—whose faith is that private enterprise must be enterprising, and that its justification is public service.

A word about deeds

"DEEDS NOT WORDS" is a good motto for business. Yet some words have great power to influence deeds.

The name of Laing stands for many fine structures—factories, power stations, steelworks, cement works, aerodromes and schools—completed efficiently and on time, and for a century-old tradition of team work and craftsmanship. The name sets a standard which the firm's employees are ambitious to live up to, and so it is a great getter of deeds.

Furthermore it guarantees that same high standard of work for those who entrust their construction to John Laing and Son Ltd.

For speed and efficiency in building and civil engineering

& REDUCE COSTS

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs. To assist YOU in adapting COLCLAD to YOUR products, our technical staff is at YOUR service.

THE BRITISH COLONIES

THE WORLD'S COLONIAL TERRITORIES have steadily gained in importance in recent years because the basic problems of colonial development are now closely bound up with world problems. The British colonies, in particular, in their transition from imperial rule to a working partnership, project economic, financial, constitutional, technological, cultural and human problems of the largest significance.

For this reason, and in the interest both of the colonial peoples and of world stability, full and informed discussion of colonial questions is an obvious necessity.

Owing to the shortage of newsprint, *The Times* has been unable in recent years to give as much space to colonial affairs as formerly. During 1950, therefore, it published as separate supplements three special Surveys of the British Colonies. These were the pilot projects for *The Times Review of the British Colonies*, which has been established as a regular quarterly publication, issued on the first Tuesday in March, June, September and December.

The Times Review of the British Colonies draws its principal contributors from special correspondents of *The Times* and from recognized authorities on colonial subjects. It upholds the policy that the colonial territories should be advanced progressively to self-government within the Commonwealth, and advocates the economic development of these territories in the interests of the inhabitants themselves and of a general increase in the world's wealth.

The March issue was widely read at home and abroad and as widely welcomed. The next issue, which resumes the commentary on colonial affairs during the preceding quarter and discusses a similar diversity of themes, will appear on June 5.

THE BUSINESS WORLD

Films and the Duty

IT takes a Chancellor of the Exchequer to provoke the British film industry into a measure of agreement—temporary and hedged with reservations though it is. Mr Gaitskell proposed in his Budget to increase the Entertainments Duty upon cinema receipts by £10 million, of which £2,500,000 would be passed on to the industry's various sections. For this, he is faced with opposition throughout the industry. The producers, who were intended to gain the larger part of this £2,500,000, have joined the distributors in support of the cinema owners' protest against the increase in duty. Mr O'Brien, MP, whose trade union is mainly composed of cinema employees, has made representations to the Treasury in support of the tripartite Films Council's suggestion that the industry should receive a sum larger than the Chancellor proposed. Mr Elvin, who speaks for those employed in film production, has deprecated the widening of the gap between the duty charged on cinemas admissions and the lower rate of tax on "live" entertainments, though he has still insisted that other sections of the industry should pass back into the production of films a larger share of net receipts. The industry's views command rather more consideration than is ordinarily given to the natural indignation of any group of taxpayers singled out for bloodletting. The method of tax remission, and the complex structure of the duty, make consultation between the authorities and the trade necessary; its representatives have recently been discussing the Chancellor's proposals and other suggestions with Sir Wilfrid Eady.

The cinema exhibitors' outbursts, and their contention that Mr Gaitskell is over-optimistic in his revenue estimate, are not based simply upon the argument that the proposed increases in price—an average of about twopence a seat—would be more than the traffic can bear. Receipts from Entertainments Duty have indeed fallen since the bountiful postwar years, but last year's drop was caused largely by the first "Eady" remissions; cinema audiences continued gradually to fall, but an increase in seat prices during the autumn brought total box-office receipts to just over the 1949 level. In the quarter following that increase, admissions did drop quite sharply, and cinema managers believe the decline has continued; but the effect of price changes upon cinema attendance is far from clear. Exhibitors suggest that the decline in attendances is more marked in large centres of "white-collar" population, such as London, than in industrial areas; this would be in line with past experience that cinema attendance closely reflects general economic conditions in the country—for example, the shortage of consumer goods in 1946-47, and the sharper effect of today's rising prices upon salary earners. Other influences are exerting an effect, particularly the spread of television; but few exhibitors would care to generalise about their result. The industry's apparent confidence that gross receipts have not reached the point of diminish-

ing returns was demonstrated in its first counter-proposals to the Chancellor: that cinema prices should be raised by an average of threepence, not of twopence, the "floating penny" to be wholly retained by the industry. They concede that such an increase may have some slight effect upon attendance, or may prompt patrons to switch to cheaper seats, which would have less effect upon takings; but they argue that their proposal would be more practicable than the Chancellor's.

This sounds paradoxical. How can it be argued that an increase of threepence in the average price of cinema seats, designed to bring in an extra £15 million a year, would be more likely to retain last year's level of audiences than an increase of twopence to bring in £10 million? Simply, say the exhibitors, because without more net revenue a substantial number of cinemas—up to a thousand—will have to close this year; some of those who would be willing to pay an extra twopence for a seat would not be able to find that seat to occupy. Throughout the country, admittedly, only 38 per cent of the 71 million "seat-performances" a week that make up the cinemas' total "capacity" are filled; but any wide-scale closing of cinemas, apart from the undesirability of driving the small man out of the business, would further limit the range of choice of a large proportion of patrons and would, therefore, further reduce the total receipts of the exhibitor, the distributor, and that now favoured pair who share in the proceeds—the Exchequer and the producer.

*

The validity of this argument is obviously not easy to assess. In negotiations of this kind, no party can be expected to understate his case: and the possibility that cinemas might have to close is conceded in some quarters only in terms of the marginal and inefficient few. The Cinema Exhibitors' Association has, however, produced at the request of the Treasury certain sample figures, the validity of which has not been seriously attacked—in fact they illustrate a trend in the cinema business that has been attested by independent scrutiny since the war. Last year's operating results for a sample of cinemas with gross takings of £7,500 are given as an average profit of £148; of cinemas with £7,500 to £10,000 gross takings, a loss of £75; of cinemas with £10,000 to £15,000 gross takings, a loss of £20; of cinemas with £15,000 to £20,000 gross takings, a profit of £620; and of cinemas taking over £20,000 a year, a profit of £2,269. In 1939, gross box-office receipts were roughly £45-50 million, from which Entertainments Duty took £5,500,000, leaving the industry about £42 million. Last year, from box-office receipts of £105 million, duty took nearly £37 million, leaving the industry as a whole £68 million. Net receipts at cinemas, therefore, have risen by perhaps 60 per cent compared with prewar years. The exhibitors claim that their costs

have risen disproportionately during the same period—film hire by 80 per cent, wages and salaries by more than 100 per cent, and consumable stocks such as carpets, seats, heating and ventilating equipment by 300 per cent or more. Such cost increases are inherently probable and it seems reasonable, therefore, to assume that the exhibitors' profits have suffered. The CEA's postwar figures suggest a sharp decline in profitability since the busy days of 1947. Whether the composition of the CEA's sample of cinemas from which profit figures are derived is entirely representative is hard to assess. But the lean margins of profit for some classes of hall and the losses reported by others suggest that film exhibition may be tending towards that state of constant unprofitability usually associated with film production.

On the production side of the industry, the state of business is in very low water. The employees' unions report that a large proportion of their members are unemployed; one-third of the industry's sound-stages are idle; and the spring of Government finance that has kept British film production going in the past three years, the National Film Finance Corporation, will dry up by the end of the summer, when nearly all of its allotted £6,000,000 will have been loaned to independent or "group" producers. It is proper to point out that comparisons of employment in the industry tend to be based on the highly inflated period of film production in 1948; there seems little doubt that the present level of employment and production is much closer to what the cinema industry, and the taxpayer, can support, given the present compressed revenue of the industry as a whole. British film production, indeed, is showing faint signs of recovery; of the first feature films backed by the NFFC that have been out long enough to offer a reasonable estimate of ultimate takings, nearly half seem likely to make profits, though the profits will be well short of the losses on the failures. Some of the proceeds of the "Eady levy" (the first tax remission, which took the form of a "voluntary" levy upon exhibitors for film production) are about to be distributed, and these will help to swell the takings of films shown since the scheme was introduced in the autumn. But it is far too early to suggest that British film production is about to become profitable and self-supporting.

In assessing the prospects for the several sections of the trade, it is fair to ask what measures each has taken towards setting its own house in order, and how far they have been ready to comply with the recommendations of the Plant and the Gater reports. In distribution, not much has been done. The trade welcomed the Plant

report with praise, seized upon and has quoted ever since its conclusion that the burden of Entertainments Duty was too great, and has presented plausible explanations why the measures suggested in the report could not, in any particular case, be carried out in practice. These explanations, however, seem to have carried a hint of bargaining terms; and there is some recent evidence that, given the state of business today, many exhibitors might look more favourably upon at least some of the report's recommendations for increasing profitability by restoring more competitive trading. In production, there has been a considerable elimination of waste, partly by more careful budgeting and costing, and partly by the old-fashioned method of penny-pinching; here, too, the NFFC has had considerable influence.

*

Whatever may be the results of the consultations between the Treasury and the trade—and it seems too soon to assume that no compromise will emerge—there is good reason to ask whether the whole purpose and incidence of Entertainments Duty should not be re-examined. Beyond its obvious purpose as a useful source of revenue, the duty as at present constituted has a number of effects, some designed, some perhaps complacently accepted. It serves certain rather ill-defined purposes of cultural discrimination between different entertainments; it has recently been adapted to redistribute the proceeds of film exhibition; and it acts as an indirect, and sometimes peculiarly irksome, method of price control. Discrimination between "live" entertainment such as the theatre, the music-hall, circuses and menageries, and various forms of sport, on the one hand, as deserving the encouragement of considerably reduced rates of duty (and sometimes of no duty at all), and cinemas and racing, on the other hand, which pay the full rate, is of long standing; but it would not be easy to demonstrate the relation that the duty bears to the present profitability of operation of different entertainments within the two classes. There is probably reason for such discrimination in certain cases; but it is hard to believe that the present pattern is nicely calculated to denote cultural virtue, financial standing, or public esteem. Remissions of duty on the cinema according to a dictated pattern, as against that which would follow naturally from the ordinary flow of revenue within the industry, raise major questions of film policy. But should it be for the Treasury to decide or administer that policy?

This summer Parliament will have to consider

the clauses in the Finance Bill on the new duties, the report of the National Film Finance Corporation, the question whether further public money should be adventured in British film production, and, possibly, a bill amending the Quota Act. Film policy, it seems, will proceed piecemeal as before, and confused by a division of authority that stems directly from the third function of the Entertainments Duty—its efficacy as a price control. By setting the duty upon each individual price, and graduating it in a series of most awkward steps, the Treasury operates a very effective price control over the industry. It has never had to justify such a control, and there is no price regulation committee to review

New Basis for Wool?

EVENTS in the wool market during the past two months have raised considerable doubts about its future stability. Since the war ended, wool prices have risen almost continuously; interruptions to the rise seldom lasted more than a month and were often reversed in a week or two. This time the fall has been sharp and recovery slow. The first setback occurred in South Africa in the closing days of March. Then in the first week of April, wool prices in Australia fell by as much as 30 per cent in a single day—the sharpest fall since 1921—and lower grade wools suffered more than better grades. This brought wool prices to a general level slightly above that of last December, when they were still some 40 per cent higher than in June, 1950. Since this big fall two months ago, prices have see-sawed about the lower level. Last week, wool was trying to recover in the dominion markets; then the London sales opened ten days ago and prices fell by 5 to 10 per cent, to be followed this week by further falls in the dominion and London markets. On the average, wool prices are still no lower than they were at the end of 1950, but they wear an uneasy look.

The immediate cause of the market's present weakness is the absence of buyers from the United States and the Continent; Bradford has been virtually the market's sole support. American manufacturers bought heavily between September and March and in the first three months of this year their purchases were mainly to meet defence contracts and prices soared to peak levels. The United States Government imposed ceiling prices on raw wool for civilian goods at the end of January, but the rise in the cost of living in the United States had already outpaced the rise in incomes, and a large section of the public was heavily committed to repayments of instalment credit. In consequence, sales of textiles declined sharply. The ceiling prices certainly prevented

its operation from time to time. These steps in duty, which tend to magnify changes in price very sharply, act as an effective deterrent upon the exhibitor's desire to pass on his increased costs, as many other industries that are subject to formal price control are able to do. Whether some simpler form of gradation would be preferable or whether some different form of collection, perhaps on an *ad valorem* basis, might bring in the required revenue and leave the exhibitor more able to exercise his commercial freedom are questions for examination. These matters and the better co-ordination of Government policy towards films deserve fuller study than the authorities have yet been disposed to give.

American manufacturers from buying wool for civilian purposes and where their commitments had been met at the end of March, they withdrew from the market. Recently the American Government raised the ceiling prices so that they are now above current market prices. But American manufacturers have preferred to use up their existing stocks rather than buy new supplies. In Europe, too, manufacturers are anxious about the reaction of consumers to the higher prices that will have to be paid for textiles in the coming months, and are unwilling to increase their stocks.

The influence that the United States exerts on the wool market follows from the simple fact that since the war the United States has displaced Britain as the world's largest consumer; last year it accounted for almost a quarter of the world's total consumption of wool whereas Britain used less than a fifth. Moreover, last year the United States displaced Britain as the world's largest importer of raw wool, taking 467 million lb (clean) against Britain's 357 million lb. World production of raw wool has expanded almost continuously since the end of the war, and output in the current season is estimated at about 10 per cent above the average for 1934-38, despite a 5 per cent fall in numbers of sheep compared with prewar years. An increase in the average weight of fleece and a higher yield of clean wool have made an important contribution to the rise in world production, and numbers of sheep are now increasing. But since the war, consumption of raw wool has regularly exceeded output and the gap has been bridged from stocks held by the Joint Organisation, the United States Commodity Credit Corporation and South American exporters. These stocks, accumulated during the war years, will be exhausted by the end of this season; from July onwards consumption will have to be matched to each year's production. Supplies of raw

wool during the current season are estimated at 2,360 million lb (clean); the clip is provisionally put at 2,270 million lb and the small balance comes from stocks. First estimates of world production for 1951-52 will not be known for two or three months. But if output again increases by $3\frac{1}{2}$ per cent, as it did last season, it will total 2,350 million lb. In that case, available supplies will barely match those in 1950-51, and this assumed output depends very much on the weather.

World consumption in 1950 reached a record level of 2,650 million lb (clean), 9 per cent larger than in 1949 and nearly 30 per cent larger than immediately before the war. Consumption of materials other than wool by the wool textile industry increased more sharply by about $17\frac{1}{2}$ per cent, though these mixing materials probably accounted for no more than a quarter of the total consumption of fibres by the industry. Production of tops last year rose by 14 per cent, production of yarn by 15 per cent and output of tissues by 10 per cent. Such increases in wool textile production are of no mean size; it would certainly seem that by the end of 1950 the restocking of wardrobes had been completed and some hoards had been built up against future shortages. A certain reduction in civilian demand this year would thus seem inevitable, apart from the fact of rising prices. In fact, world consumption of raw wool declined quite sharply in the first quarter of 1951 to an annual rate of between 2,375 and 2,400 million lb, representing a fall of 10 per cent from last year's record figure. Consumption declined in all the main countries, but the biggest fall was registered by the United States and the smallest by Belgium and the Netherlands. The steep rise in wool prices in the last quarter of 1950 apparently went a long way towards reducing consumption to the level of available supplies, and the further rise in the first quarter of this year has yet to show its full consequences.

These consumption figures, however, do not include purchases for government stocks. If the American and British authorities intend to put raw wool into stock, consumption will have to be cut still further. The American Government announced recently that it would not pursue its programme of buying raw wool for stock. In present circumstances, that is a reasonable decision, though no doubt there would be pressure to rescind it if the international situation were to take a turn for the worse. But the supply of textiles for civilian use will in any case be reduced as contracts for service cloth are placed. The scope for increasing the use of materials other than wool is limited. Output of rayon and synthetic fibres is unlikely to expand sufficiently to help the wool textile industry to any significant extent and even supplies of re-processed wool are unlikely to increase sharply. Military requirements for wool cloth have not been disclosed. A recent American estimate puts American army needs at 110 million lb. (clean) a year; the total of all countries for military needs might perhaps be 150-200 million lb or about 5 per cent of last year's total consumption of wool. But these are guesses, and other estimates have run much higher. Even the lower figure of 150 million lb, however, would reduce the supplies of raw wool available for civilian purposes next season from 2,350 million lb to 2,200 million lb, which would imply a fall of 8 per cent in the

current level of consumption and of 17 per cent compared with last year.

One problem for the wool market is to decide whether prices of finished textiles are already high enough to curtail civilian demand. World stocks of wool are known to be small, though stocks of tops, yarns and tissues have increased, and so have stocks of piece-goods and clothes both in shops and homes. The frantic buying of textiles which lasted from September to March has died down and consumers are showing reluctance to pay the higher prices. There may be little reason for fearing that wool prices will fall below the level of last December, at least more than temporarily, but the future course of wool prices depends ultimately upon the decisions of governments. Discussions about a possible scheme for the international allocation of wool continue in Washington. They have made little headway and it would be surprising if a definite plan were to emerge from the negotiations; the recent sag in wool prices has at least damped American interest in allocation. But whatever happens in Washington a scheme for a permanent Commonwealth marketing organisation to protect wool growers from a drastic fall in price seems to be taking shape. Details of the proposals, which were submitted to the International Wool Study Group last October, were published last week in London. The partners in the proposed scheme would be Australia, South Africa, New Zealand and Britain; Australia was particularly insistent on British participation. Under the provisional agreement reached between the four countries, Britain would contribute £12 million to a central stabilisation fund of £66 million. Reserve prices would be fixed each season and if the market fell below the reserve levels, the wool would be bought in by the organisation and re-sold at some later date. The mechanism of the scheme resembles that used by the Joint Organisation in the disposal of wartime stocks. The main difference is that whereas this country had a major voice in the policy of the Joint Organisation, it would have only a minor voice in the new organisation. Whether the new organisation will come into operation or not depends on the result of a referendum in Australia. The Australian Government has agreed to the proposals provided that the majority of the woolgrowers vote in their favour.

The proposed scheme is essentially a producer's marketing agreement with one consuming country which can be outvoted on all issues. It rejects all the principles of international commodity control laid down in Chapter VI of the Havana charter, even though certain of its features are more acceptable than those of prewar commodity restriction schemes. It is one thing to ensure that primary producers are not reduced to penury, as they were in the early 'twenties and again in the earlier 'thirties. But it has to be asked whether this country should take part in an organisation which is in conflict with the principles of international co-operation to which the present Government has subscribed or whether this country's financial contribution is compensated by a sufficient say in policy. It must be remembered that the three southern dominions have in recent years earned fabulous profits from selling raw wool. That they are still enjoying high prosperity makes their insistence on the proposed scheme, and on the generous support of the British Government, the more remarkable.

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Two Voices on Exchange Policy

By a wry coincidence the Economic Commission for Europe's unexpected plea for appreciation of Western European currencies was released in Geneva last Sunday night—just as the managing director of the International Monetary Fund was releasing in Washington his second annual report on exchange restrictions, which announced that the removal of "inappropriate exchange rates" since September, 1949, should make it possible for much greater progress to be made towards multilateral and unrestricted world trade. These two contradictory counsels are based on careful statistical studies of two very different backcloths—the ECE has its eye on the short term prospect that has been facing Europe since the Korean crisis started and the IMF has its eye on the long term prospect that has been facing world trade since the dollar crisis passed its peak.

For the ECE, as is explained in a summary of its report on a previous page, the salient fact of the present situation is that European countries are "faced with additional armaments expenditure in 1951 amounting, in several cases, to 3 or 4 per cent or more of national income. In some of them, too, the adverse effects of the changed price relationships in foreign trade may amount to another 1 or 2 per cent of national income." In most countries, the ECE believes, these increased claims on the national product could be offset by increased production if raw materials were forthcoming. Since raw materials are unlikely to be forthcoming in adequate quantities, however, demand is likely to increase faster than supply and prices of manufactured goods will thus, in the absence of positive disinflationary steps, move up to the level appropriate to their scarcity value—a level that raw material prices have already attained. The ECE believes that this process of "letting internal inflation run its course" would be "vastly more disturbing" than the alternative method of "cutting short" the process of adjustment between manufactured and raw material prices by currency appreciation in the manufacturing countries of Western Europe. It recognises that some countries—especially the United Kingdom—have based their plans for making way for rearmament on the assumption that consumption can be cut by allowing retail prices to rise and hoping that wages will lag behind them. Revaluation would lower the internal prices of imported goods, and thus run counter to this policy, but the ECE plainly does not think much of the policy of relying on price inflation in any case. It stigmatises the British Economic Survey's assumptions about likely rises in import prices and wages this year as "optimistic" and considers that there is "small doubt, even should import prices rise no further" that the British cost of living index will rise much further in 1951 than the authors of the Survey assumed.

The ECE's recommended line of policy, in short, is to counter the excess of demand over supply by fiscal policy, together with direct and indirect controls on investment; and to counter cost inflation by a flexible exchange rate policy and a wage moratorium. This is a call for sudden stopgap tactics in the middle of a storm. The IMF report, on the other hand, is a strategic assessment of world trade prospects now that the winter of acute dollar shortage has apparently passed. The IMF believes, admittedly, that removal of trade restrictions would have a short-run anti-inflationary effect by increasing the quantity of goods available for domestic consumption, but its main theme is clearly that a more economic use of the world's resources "would have benefits outlasting the present emergency." Under the IMF's articles of agreement, any member that still retains discriminatory exchange restrictions (including, of course, special restrictions on dollar imports) after the Fund's fifth anniversary in March, 1952,

must enter into consultations about their continued retention. Last week's report by the Fund's managing director really did little more than sum up the exchange restrictions existing in more than forty countries and give notice that the process of "consultation" was about to begin.

* * *

Report on Rearmament

Perhaps the only official body that is capable of forming a comprehensive view of the progress of the rearmament programme is the Select Committee on Estimates. Its first report, and the evidence that accompanies it, throw most valuable light on general rearmament policy (to which reference is made in a note on page 1282); but its detailed examination of certain special aspects of the programme, such as the provision of machine tools and electronic components, and the expansion of capacity for producing aero-engines, may be of equal importance. Certain of the sixteen recommendations made in the report would inevitably have ensued as the programme developed from planning to production; but the fact that the Committee directed timely attention to them when it was taking evidence may not have been without effect.

The Select Committee's investigation of machine tool requirements and the steps that are being taken to meet them revealed what had already become known—that the Ministry of Supply's decision to rely primarily upon imported tools was backed up by quick work in placing orders in America. But it also revealed the somewhat divided views of British machine tool manufacturers about the contribution that the home industry might be expected to make. Its adoption of a suggestion, first put forward by spokesmen for the machine tool industry, that a considerable reserve of under-used machine tools may exist within the engineering industries in general, and that a census should be taken of tools that could if necessary be requisitioned for defence production, might provide a useful remedy if delay in deliveries of particular machines began to affect the defence programme.

The Committee also pursued with some pertinacity a statement that the construction and installation of high-speed automatic machinery for producing special valves for electronic apparatus had been closed down in response to a campaign for economy in Government expenditure two or three years ago. Official evidence was given that these developments had been suspended in one case through slow progress and in another for security reasons; the Select Committee now recommends that steps should be taken to expedite the construction and installation of automatic plant of this kind.

* * *

Manpower for Defence

In due course manpower will probably become the most critical factor in the whole defence production programme; in certain industries that are now heavily engaged, the Select Committee was told, shortages already exist. Skilled manpower was scarce before the new scale of defence output was imposed upon the engineering industries; and in the aircraft industry, for example, leading industrialists are already convinced that direction of labour will soon be necessary. They do not believe that any significant transfer of manpower into rearmament work has yet occurred; nor do they expect one. Industries such as airframe manufacture and machine tool production are not especially highly-paid, in comparison, for example, with the motor industry (which,

according to official witnesses, will as far as possible not be burdened with defence orders that might seriously affect current civilian output). Last week, in a statement to Bristol Aeroplane shareholders, Sir William Verdon Smith repeated a view expressed before the Committee: that there was no incentive to transfer to armament production, with its tradition of fluctuating programmes, in conditions of full employment and rising prices.

Direction of labour, apart from being repugnant, would be an exceptionally clumsy instrument for achieving defence requirements of the dimensions at present envisaged. The last official estimate of the transfer of labour that might be necessary for the whole programme, given in the Economic Survey, was 500,000 workers, or just over 2 per cent of the working population, though admittedly a much higher proportion of certain specialised groups in it. Sir William complained that to rely on economic incentive might force "another dangerous round of inflation by the encouragement of competing earnings": it seems debatable whether the effect of higher wages in defence production—which may presently get some assistance from the delayed release of labour from certain light engineering firms deprived of materials or compelled to change their products—would be more dangerous in present circumstances than the reintroduction of powers of direction. It is probably too early even to judge the case fairly. Another point made before the Committee by representatives from nearly all the industries involved from the outset in rearmament may need swifter action. Their reserves of skilled labour are being adversely affected by the call-up. Deferment means that apprentices are lost to them just as they become fully skilled. The call-up may involve only 2½ to 5 per cent of the total manpower of such concerns, but, in aircraft production for example, such losses of skilled labour can have serious effects on output.

American Policy on Materials

A new American attitude towards the allocation of raw materials is to be discerned in the lengthy statement issued by the American Government last Tuesday. Like all government pronouncements on tender subjects, the new statement does not lack ambiguities and it leaves plenty of room for manoeuvre on principle and bargaining on detail. It is couched, too, in more than usually obscure "officialese." Its first guide to policy, for example, declares that "when there are competing requirements of similar high essentiality in terms of overall objective, allocations policy should attempt to satisfy such requirements according to the degree to which they will contribute" to six specified results.

Thus the statement is not in any sense a hard and fast programme; it amounts to nothing more than an administrative guide to the various government departments that may be concerned with sharing out scarce materials in their efforts to get the best return for the defence of the west. It marks the realisation by the United States that raw materials produced within its own territory must be made available to other countries engaged in the joint defence effort. Its broad purpose seems eminently sensible; its detailed fulfilment might involve each department in a major piece of research into the economies of friendly powers before making any allocation.

Scarce materials controlled by the United States will be allocated to other countries according to whether they are used for one or more of six specified purposes. The first is military production in the free world, including its expansion and improvement; the second is the increased supply of essential materials to help American and other countries' efforts in the defence of the free world—stockpiling is considered part of that defence; the third purpose is the maintenance and expansion of essential facilities and the maintenance of minimum civilian needs in the free world; the fourth is the reduction of the dependence of other countries upon

American military and economic assistance; fifth comes the reduction of their dependence on supplies from Iron Curtain countries; and last, the prevention of political deterioration in vital areas. These six purposes are not listed in order of relative importance. At any point of time one might be considered more important than the others.

The other directives state that, when all needs in the highest category have been met, any surplus of supplies should be allocated so as to achieve equal sacrifices among the countries of the free world. Foreign buyers must be given delivery before domestic buyers if their requirements are of "a higher essentiality"; but a recipient country must not export potential war material to the Soviet Union. There may be particular significance in a directive that calls attention to the need to encourage other countries to adopt similar policies for controlling supplies in their own areas. Does this mean that British requirements of American sulphur and molybdenum will get a lower priority rating on the ground that Britain is not allocating wool and rubber?

New Prices for House Coal

"Zone-delivered pricing" of house coals, which the National Coal Board has introduced this week, will cost it about 11½d. a ton in turnover on domestic coal (equivalent to about £1,500,000 a year) until the complementary "price structure" for industrial coals is introduced. The domestic coal scheme, which came into effect at the same time as a system of lower summer prices to induce householders to fill their cellars, is based upon a principle accepted by the Board in 1948: that within each of 60 zones covering the country, coals of similar grades will cost the same to the domestic consumer, and that he should not have to pay for better coal than he receives.

Transport costs are also to be "equalised" for each zone, if this were not done, a poor-quality coal carried a long way, and perhaps supplied to a consumer without option, might cost more than a better coal mined nearer. As a result, transport will be represented in the single zone price by the average of the freight costs of delivering coal in that area from all collieries that may send it there. Across the country as a whole, house coal prices will, as now, rise according to distance from the collieries: but within each zone there will be no distinction of price for the same quality coal irrespective of its source. At the same time, the many "qualities" of coal that a merchant may offer will be grouped into eight NCB quality grades, based partly upon scientific and partly upon commercial criteria; these grades will differ from each other by 3s. 4d. a ton (except those at the top and bottom of the range, where the difference will be 5s.). Retail prices for different grades will vary only by these margins, since the Ministry of Fuel is standardising merchants' retail margins.

There is no doubt that the average domestic consumer will agree with the NCB in accepting this system as a reasonable compromise between "one price for the whole country"—which might perhaps have cost consumers near the mines as much as 15s. more a ton—and the more strictly economic basis of pithead costs plus the actual cost of transport to market. The householder will almost certainly prefer a simple and manageable tariff, and the merchant may find the system less complex, though it may affect his own flexibility of operation. Both distributors and NCB ought to find that the scheme lessens complaints about quality. Since the zone prices will broadly reflect transport costs from the pit, the NCB should be able to supply coal from the source with the lowest costs. The improved system of grading coal—for a wider variety of uses—will no doubt provide the basic foundation of the industrial price structure on which the NCB is engaged in discussion with representatives of consumers. But the zone-delivered system may not be so welcome to industrial consumers, who can less afford to ignore or forego the advantages of economic location.

ZINC AND CHEMICALS

During the last 30 years a great industry has been built up in Britain. Imperial Smelting Corporation have produced annually substantial quantities of zinc, including high purity zinc (99.99+%)—Cadmium, Sulphuric Acid, Mazak, Orr's Zinc White Lithopone and Fricker's Zinc Oxide. The production of Anhydrous Hydrofluoric Acid, Fluorine and fluorine compounds are being actively developed from fluorspar mined by the Corporation in this country.

The Corporation employs a large research staff in order to keep abreast of modern technique and scientific progress and thus plays an indispensable part in the complex metallurgical and chemical industries of the country.

Steel for Rearmament

The British Iron and Steel Federation, having taken time to reflect upon its apparent disagreement with the Minister of Supply about the prospects for this year's steel output, is now prepared to commit itself more firmly to its known views:

These developments in the raw materials position should enable steel production to be maintained at the rate of 16 million tons a year in 1951-52, as envisaged in the original Development Plan, and the rate of 18 million tons, agreed with the official Committee under the chairmanship of Sir Edwin Plowden for the middle 1950's, to be reached by about 1954-55.

The developments on which the Federation is counting include the benefits in the second half of this year from new capacity, based on home ore, that is now being built. This includes new ore treatment equipment at the Appleby-Frodingham works of the United Steel Companies, new blast furnaces at Lysaghts' and Richard Thomas's Scunthorpe works, and also at Sheepbridge. These additions, together with the blowing-in of furnaces now being relined, should raise pig iron production by some 10,000 tons a week, or 500,000 tons a year, during the second half of 1951; if so, they may mean that the crucial raw material problem will be shifted to the supply of coke, of which greater quantities are used in smelting home ores.

Allowing for lower imports of steel this year than last, but also for some draft on producers' stocks of ingots and semi-finished steel, the Federation estimates in its latest *Statistical Bulletin* that current supplies of steel will be slightly reduced this year compared with 1950. Since exports have already been cut, the Federation believes that deliveries

STEEL SUPPLIES AND DISPOSALS 1950; AND ESTIMATES FOR 1951

Million Ingot Tons	1950	1951 (est.)
Production of ingots and castings	16.29	16.00
Producers' stock reduction	0.10	0.25
Imports	0.60	0.45
Second-hand and re-usable material	0.46	0.45
Total supplies	17.45	17.15
Exports	3.25	2.72
Deliveries to Home Market	14.20	14.43

of steel to the home market may be slightly larger this year than last. But last year's actual consumption, allowing for the reduction of consumers' and merchants' stocks, was probably higher than the figures for deliveries suggested; so supplies for use at home may differ little, the Federation concludes, from those in 1950.

In a further useful study of possible changes in the pattern of steel consumption as rearmament absorbs more resources and workers, the bulletin notes the wide variation in annual consumption of steel per worker between, for example, the 12.5 tons in drop forgings and the 1.4 tons of certain light engineering work. Shifts in the distribution of labour, therefore, may considerably affect the steel needs of the industries involved in rearmament; since some of the remaining industries (such as collieries) cannot be restricted, steel consumption by other industries will have to be reduced more than proportionately. The same considerations apply to the demand for individual products, and in the coming months to the demands of the new Margam strip mill for materials; the question whether expansion in motor output, which consumes also about two-fifths of the country's alloy steel, can be expected to continue, must greatly affect the demand for flat products. The Federation feels that "some form of allocation scheme for steel generally may be necessary"; but it urges, pending the working out of further control machinery, that broad decisions should be taken about the permissible scale of steel consumption for the main consuming industries of the country.

Fuel for Jet Aircraft

The supply of fuel for a jet-powered air force is a matter demanding urgent consideration. Kerosene is still the standard gas turbine fuel in this country and appears as such in the aviation turbine fuel specifications published by the Ministry of Supply. But only seven to ten per cent of crude oil consists of kerosene and, even though the maximum quantities are not at present extracted, the oil companies will not be able to supply the civilian market and at the same time meet military requirements when the aircraft now being built under the rearmament programme are in service. A gas turbine aero engine will run on motor or aviation spirit, and all military engines built in this country and in the United States now have to be cleared for operation on both types of fuel. Yet at best, the use of aviation spirit is an unsatisfactory expedient that can be justified only by the greater difficulties of supplying two separate fuels for jet and piston-engined aircraft. These difficulties may occur in forward fighting areas, and American carrier-based jet and piston-engined aircraft both operate on a high grade of aviation spirit. British carriers will probably store both types of fuel.

Both motor and aviation spirit are lighter oil fractions than kerosene and they boil at lower temperatures and atmospheric pressures. The rapid rate of climb and the high operating ceiling of jet aircraft leads to boiling which has to be overcome, either by pressurising the fuel tanks of the aircraft (so that the spirit is insulated from rapid atmospheric pressure changes) or by providing wide air vents in the fuel tanks through which the gases can escape. But both devices seriously curb the range of the aircraft; pressurising increases the structure weight and so reduces the weight of fuel that can be carried and the air vents may lead to a loss of as much as 30 per cent or more of fuel in the tanks. The use of aviation spirit also reintroduces the fire risks associated with fuels of very low flash point, a risk that was greatly reduced by the introduction of kerosene.

The problem is to develop a new turbine fuel that will be more plentiful than kerosene and more suited to the jet engine than motor or aviation spirit. Gas turbines will operate on a much wider range of fuels than reciprocating engines and the United States authorities have already published a specification for a wide range distillate turbine fuel. It consists of all the kerosene fractions, a large proportion of the motor spirit fractions and a considerable proportion of the heavier diesel fractions. The aircraft industry has since objected to the specification because of the practical disadvantages of using a distillate with too high a vapour pressure in turbine engined aircraft. Furthermore, the effect of producing large amounts of such fuel on the supply of other petroleum products has to be considered and some compromise will have to be reached between getting the most suitable operational fuel and meeting the demand for other refined products. Such a new fuel, when its composition is finally decided, might perhaps use some 25 to 30 per cent of the crude, omitting the lighter part of the motor spirit fractions and possibly taking a smaller toll of the heavier distillates.

* * *

The Provision of New Fuels

Whether this will represent an ideal solution will depend on the fuel requirements of a jet air force in wartime. In the last war aviation spirit represented ten to twelve per cent of the crude. It is reasonable to assume that, whereas the fuel consumption, measured in air miles a gallon, of the large-range jet bombers will be comparable with that of the same type of aircraft in the last war, the fuel consumption of the shorter-range bomber and of fighter aircraft will be substantially bigger. On the other hand, owing to the added cost and complicated production of the turbine-engined military aircraft, air forces are unlikely to be larger than those of the last war. Nevertheless, greater quantities of turbine

It is easy enough to boast about good teamwork. But it is a fact that at Hoover Limited the whole organisation does function as a well-knit team.

Relations between staff and management have always been particularly happy; there is excellent co-operation between one department and another; and most of those holding high positions in the Company today have worked

their way up together, and can look back over long years of fellowship in joint endeavour.

Hoover teamwork is, however, not only a source of gratification to members of the team itself. It is of considerable benefit to the public at large. For without it, Hoover products and Hoover service could not possibly be maintained at the present high level, or be raised to even higher standards in the future.

fuel will be required than can be met by kerosene; and a new turbine fuel is necessary.

The production of the type of wide-range distillate fuel suggested in the American specification would not be technically difficult, since modern refineries are flexible and could manufacture such a fuel without additional equipment. If the wide-range distillate came into general use, present handling facilities on the airfields for military aviation fuel would probably be adequate, since some of the lower octane aviation fuels are ceasing to be used and the present facilities for handling kerosene could also be employed.

If eventually a very high output of aviation turbine fuel should become necessary, then manufacture of the wide-range distillate would take practically all of the distillate fractions from the crude, leaving only heavy residues. The work of the Anglo-Saxon Petroleum Company and others in the utilisation of heavy residual oils in marine diesel engines will increase the consumption of these products, thus offsetting a resultant shortage of distillate fuels. But much more investigation is required to determine the best balance between the large scale production of turbine fuel and consumption of the residual oils and distillates.

Higher Acceptance Commissions

Another sign of the growth of overseas demand for financial facilities in the London market appeared this week, when it became known that the clearing banks are about to revise their schedule of minimum charges for operations or services performed on behalf of foreign customers or banks abroad. This schedule resulted from an agreement reached, after many false starts, between the clearing banks in 1948; it established the principle of concerted minimum rates for foreign business, imposed charges for some services that previously had been performed free, and raised the charges for some others. The Scottish and Irish banks formally adhered to the agreement, but the merchant banks and London offices of the overseas banks apparently did no more than give it their blessing in principle. Partly for this reason, it was widely expected that these cartel arrangements would not long remain intact—more particularly in the matter of acceptance commissions, which had been the major stumbling block in the earlier attempts to reach agreement. In fact, however, the plan has worked with surprising smoothness—partly, no doubt, because many of the minima were fixed at levels below the rates ruling in foreign markets, and partly because the past three years have been marked by a steady increase in demand for the facilities in question.

*

The revised schedule, it is understood, still awaits formal confirmation by the Committee of Clearing Bankers. But, as it now stands, it is unlikely to make major changes—except in the matter of acceptance commissions. The minimum charge for acceptances, which was fixed in 1948 at 15s. per cent per annum (compared with the 10s. per cent that had been generally charged before that), is to be raised to 24s. per cent per annum—or 6s. per cent flat on a three months' bill. This will still leave the cost of bill finance at a very moderate level, for, despite its increase in recent years, the market discount rate for three months first-class bank acceptances is no more than 11/16ths per cent—to which has to be added the United Kingdom bill stamp of 1s. per cent flat. These scheduled rates, it should be emphasised, do not apply to home customers of the banks. Rates charged for acceptances for the domestic financing of stocks, for example, are a matter for negotiation; where this form of finance has to be regarded merely as an alternative to finance by way of bank advance, it is likely that the acceptance commission would be appreciably higher than the scheduled foreign minimum.

Imports From Canada

The continuing committee that examines financial and trade relations between Canada and the United Kingdom concluded its meeting in London last week. Since the committee met in June, 1950, a great improvement has occurred in the sterling area's holdings of dollars. The principal function of the committee has been to watch the sterling area's balance of payments with Canada and its consequences for Anglo-Canadian trade. Regained independence from dollar aid from North America has encouraged the British Government to increase British imports from Canada for the year from July, 1951, by about 50 per cent by value over the imports for the calendar year 1950, which totalled £179 million. Probably only a half of this increase by value will be reflected in an increase in the volume of imports, because of last year's rise in prices.

Nevertheless, the change is of significance, given the disheartening trend of Anglo-Canadian trade since 1947. Most of the additional imports are likely to be raw materials and food. Contracts for increased supplies of timber and aluminium have already been signed. Indeed, the contract for more than 300,000 standards of softwoods, announced this week, is the largest since the war; it is valued at \$50 million. Some extra newsprint, though probably little, may be available and there may be some increase in imports of woodpulp for paper-making compared with last year's low level.

It should be possible to increase imports of wheat, which in 1950 were decidedly lower than in the two previous years, and of eggs and bacon. Imports of cheese, however, were appreciably higher in 1950 than in 1949 or 1948. There is a wide field for increased imports of these basic materials and foods, which are purchased on Government account; hence, there would seem to be little prospect of any substantial increase in imports of other items by private traders.

Fall in Bank Deposits

The clearing banks' statement for mid-May fully confirms the conclusion, reached in these columns four weeks ago, that the unexpected movements disclosed by the April statement ought to be regarded as a temporary aberration from the underlying banking trends that began to be discernible early this year. For April, it will be recalled, the published statement disclosed an increase in net bank deposits by nearly £111 million, the biggest increase ever shown for the month of April. Equally unexpectedly, this movement appeared to be largely attributable to very heavy borrowings from the banking system by the central Government, despite the fact that the deterioration in the external balance of payments from last year's large surplus into deficit had removed a major source of strain upon the Treasury's cash position. On the other hand, despite the increasing pressure that is being put upon the working capital of industry by the need to finance higher-priced stocks, bank advances rose in April by only £12 million, in contrast with over £36 million in the corresponding month of 1950. Each of these three oddities in the April statement is corrected by an opposite movement disclosed by the statement for May. In the four weeks to May 16th, net bank deposits declined by just over £70 million, compared with a fall of only £14½ million in May, 1950. This decline has occurred, moreover, despite the fact that advances have risen much more sharply than is usual at this time of the year; their increase over the four weeks amounted to £27 million, a movement that is appreciably larger than last year's even if allowance is made for the fact that advances were then being repaid from the proceeds of the application moneys on the BEA loan.

If a further small increase in the banks' investment portfolios is regarded as also affording finance for the private sector, its total demands rose during the month by nearly

£29½ million. This increase, when related to the sharp decline in deposits, implies that Governmental demands upon the banking system were reduced by no less than £100 million, or actually by a little more than they seemed to have expanded in the previous month. In the past two months taken together, therefore, deposits have risen less rapidly than in the similar period in 1950, and the main cause of the expansion has been the growth of bank advances. Since January, indeed, these have risen by £152 million, or by £30 million more than they rose during the whole of 1950. Hence the ratio of advances to deposits has risen to 29.2 per cent, its highest level for a decade.

Molybdenum and Tungsten

When he returned from the United States last week, Mr Richard Stokes was reported to have said that he spent most of the time in discussions on molybdenum. It is not yet known how much molybdenum will be allocated to Britain for the current quarter, but a quota for total exports of 1,250,000 lbs. has been announced from Washington. This amount would represent more than the amount allocated for export in the first quarter, but less than the average quarterly exports of last year. It would also seem that only part of this quota is likely to be available for shipment before the end of June. Even if it were completely filled during the current quarter it would not meet the full demands of Western Europe; but the resumption of large-scale shipments is a recognition by the United States of European needs. The United Kingdom takes a large part of American exports of molybdenum, but France, Western Germany, Italy and Sweden are also big European importers. British imports of molybdenum have recently been drawn entirely from the United States and Chile, although at an earlier date small quantities had been obtainable from Norway and Canada. It is not known whether the United States allocation excludes exports from Chile; production in that country is American controlled. British imports of molybdenum were lower in the first four months of this year than in the corresponding periods of 1950 and 1949 and during this year about 40 per cent of imports have come from Chile.

Imports of wolfram, which fell in March because of the decline in shipments from Portugal, were correspondingly high in April. Shipments from Portugal may be held up again because of the difficulty of securing export licences—a difficulty also experienced by Western Germany and Sweden. The Portuguese Government sets quarterly export quotas which seem to have been used up, but the recent recovery in the price of wolfram may overcome this reluctance to export. The recovery was expected partly because the market strength of wolfram shows no diminution and partly because the ceiling price imposed in the United States would not seem to apply to all purchases—indeed American buyers are again active in Portugal. Portuguese output rises and falls with price because much of it is from small marginal mines which require a high price to produce at a profit; but this reserve of production in Portugal is probably more significant than recently reported finds of scheelite in various parts of the world. On the other hand, if supplies were forthcoming from the Mawchi mines in Burma the whole prospect for this critical alloy material would be transformed.

* * *

Copper Price Up

The long-awaited rise in the price of copper was announced at the end of last week. The American export price was raised 3 cents to 27½ cents a lb. (equivalent to £220 a ton), and the Ministry of Supply raised its selling price by a corresponding amount of £24 to £234 a ton. Even now it is doubtful whether the official price is sufficiently high to equate supply and demand. The "free" market price in

New York is still around 50 cents a lb. and in Europe the price is nearer £450 a ton. The rise in the official quotation had little effect on these prices, and supplies remain as tight as ever.

Copper is likely to remain scarce both this year and next. Consumption in the United States has been reduced by government order, and the American Government has now ordered metal fabricators to set aside 75 per cent of their copper supplies for defence contracts as from July 1st. German demand has declined because of import restrictions, but Japan, which twelve months ago was exporting copper, is now beginning to import sizeable quantities. If Rhodesia has adequate fuel and no labour trouble Britain can count on some 350,000 tons this year, and the increased Rhodesian electrolytic refining capacity will be coming into operation in a few months' time. But civilian consumption in this country may still have to be reduced more drastically as defence requirements expand. Supplies of scrap are disappointing and show no signs of expansion. The experience of other markets has revealed that the most effective way of reducing consumption and of preventing hoarding is to make both operations expensive, and in order of values copper has still quite a long way to go.

Reply about Plasterboard

Mr R. S. Jukes, joint managing director of British Plaster Board, Ltd., has now given the views of his group about the three Orders by which the Minister of Works imposes price control upon gypsum rock, building plasters and plasterboard made by British Plaster Board, but not on the prices of the same products made by its competitors. These Orders were referred to in last week's issue of *The Economist*. Mr Jukes's statement shows that prices for plaster and plasterboard had been set by a voluntary arrangement for the industry as a whole; British Plaster Board recently decided in the interests of its shareholders to withdraw from this arrangement, on the ground that the Ministry had abandoned the industry-wide pricing method and had attempted to discriminate against British Plaster Board, Ltd., alone. During protracted negotiations, Mr Jukes claims, officials of the Ministry consistently refused to have regard for the need for a fair return upon the real capital invested in the British Plaster Board group—in particular, to the desirability of an adequate return on £1,000,000 of capital raised from 13,000 shareholders to finance postwar expansion demanded by the Ministry, on which the shareholders have since received an annual return of only 4½ per cent gross. The Ministry was prepared to allow for replacement of plant and machinery built since the war at postwar values, but not for the replacement at postwar values of similar plant built before the war.

Mr Jukes argues that the prices for plaster and plasterboard now laid down for the group's products are not only unfair but are also below those at which existing competitors in the industry could make a fair return: through the strictness of voluntary price control, he argues, two of the small number of competitors in the gypsum industry have already been eliminated. The difference between the prices set by the company after withdrawing from the voluntary price control arrangements, and those now imposed, would represent, it is stated, approximately 13s. for a £1,400 traditional house using average quantities of these materials; in practice such economies might remain theoretical, owing to the difficulty of segregating the competing products in the hands of distributors.

The imposition of price control upon the products of one company alone in an industry is an unusual step that needs more justification than the Ministry of Works has yet been prepared to offer; and without entering into the merits of the case, official insistence upon historical cost in calculating

A MARKET

of over 148,000
progressive people

There is no doubt at all that The Listener readership offers a first-class market for a wide range of goods and services. Here you have an A.B.C. Certified Circulation of 148,217—a market of educated men and women from trade, industry and commerce, from the professions and the arts, from public services and private life. They include some of the most influential people in almost every

sphere of activity. Listener readers are, naturally, people of more than average discrimination and taste, and their confidence in the journal extends to the very sound advertisements it carries and the products they offer.

If you have a first-class product or service appealing to substantial people, you will do well to consider advertising in The Listener.

the size of provisions for re-equipment is of doubtful merit. Mr Brown will no doubt find it advisable to explain his decision more fully; and perhaps to answer Mr Juke's assertion that in the case of gypsum a price control order was imposed although the group had not withdrawn from voluntary control of prices.

* * *

Jute Prices Up

The Jute Control has raised the selling prices of all grades of raw jute, other than cuttings, by an average of £50 10s. a ton with effect from May 30th; and the selling price of imported Calcutta hessian has been raised from 141s. 6d. to 175s. 3d. per standard length. These increases result from the Control's policy of adjusting the selling prices of raw jute and imported hessian in such a way that prices of home-produced and imported hessian of equivalent weight and quality to the British consumer are about the same. They are, therefore, affected only indirectly by the price of raw jute at Chittagong, which after rising to a peak of £240 a ton towards the end of April fell to £225 in the second week of May and has now recovered to £232. The earlier and steadier rise in the price of Pakistan raw jute and the conclusion of the Indo-Pakistan trade agreement in February made it essential for the Indian Government to remove the control on prices of raw jute and jute manufactures in March (the alternative was revaluation) if Indian mills were to use Pakistan jute economically; 3,500,000 bales were promised to India under the agreement although it has only been arriving slowly.

Since prices of raw jute and of manufactures began to rise sharply in Calcutta a substantial increase in prices in this country was inevitable. In January, prices had already been increased by about 28 per cent, largely as a reaction to the imposition of an export tax by the Indian Government on hessian. The present increase takes the price level to about 60 per cent above that at the end of last year. Nevertheless British prices are still well below those in most other countries; in India hessian cloth is about 25 per cent dearer than in this country. The averaging of prices by the Jute Control has to some extent shielded consumers. In consequence of the increased raw jute price, maximum prices chargeable by spinners for jute yarn have been increased by about a quarter; and the Dundee cloth manufacturers are about to issue a new price-list of home-made cloths. A fair increase in yield of raw jute is expected both in India, in spite of the need to grow as much food as possible, and in Pakistan. India still aims at independence in raw jute and may produce some 3,500,000 bales; Pakistan is likely to increase the jute acreage by a quarter. The new crop will not be reaped and marketed till much later in the year and its effect on prices cannot yet be foreseen.

Will Supplies Improve?

Supplies of raw jute are sufficient to maintain the present level of output in Dundee, which is basically limited by the seeming impossibility of adding to the labour force. On the other hand, supplies of the cloth and sacks normally imported from India remain insufficient. Essential users have had supplies cut by about a third; and Dundee has been forced to cut supplies to the linoleum and carpet industries in order to try to fill the gap. As a result of the Indo-Pakistan agreement, however, the allocation of Calcutta cloth and sacks has recently been increased for the first six months of the year by 12,000 tons, making a total from January to June of 34,000 tons. Shipments have often been held up in the past or directed to other makers and Dundee manufacturers prefer not to count on these supplies until they are in fact shipped. Stocks of cloth are now very low, so that an improvement of supplies would first replenish stocks and might not perceptibly relieve the shortage till next year.

Nevertheless the worst in the jute trade should now be over. The inadequate supply of new hessian bags has led to a brisk trade in used bags which are collected, reconditioned and then resold. The possibility of being able to sell used bags at prices that have risen twice this year has relieved consumers of part of the big outlay now needed for new bags. But, as the president of the United Kingdom Jute Goods Association suggested at its annual general meeting on Thursday, "only a similar shortage" (and he might have added similar high prices) "of other materials has prevented a wholesale desertion of jute." The expected increased harvests of jute in India and Pakistan should make hessians progressively less scarce, particularly since the Pakistan Government, in spite of the recent agreement with India, seems to be continuing its plans to manufacture jute goods; the setting up of four additional jute mills of 500 looms each has recently been recommended to the Pakistan Economic Council.

Shorter Notes

The price of nickel has been raised 6c a lb. (US currency) by the International Nickel Company of Canada and by £48 a ton in this country, making the price delivered works £454 a ton. The Falconbridge Company has raised its prices both in Canada and here by the same amounts.

*

At the forthcoming annual meeting on July 3rd of Anglo-Egyptian Oilfields a proposal to move the head office and management of the company to Cairo will be put to the shareholders.

Company Notes

Morris Motors.—The full impact of re-armament has not yet been felt by the motor industry, but the cut in sheet steel supplies early this year has already brought, in Lord Nuffield's words, a "depressing change" to the prospects facing Morris Motors this year. The past year was one of impressive records in output; income from sales jumped from £40,740,000 to £60,980,000 and gross earnings more than doubled, from £4,607,146 to £9,838,456. If sheet steel had been available in unrestricted quantity, even these impressive figures would have been surpassed. Exports also reached new peak levels, with sales amounting to nearly £39 million, and orders in hand would absorb a full output at last year's rate; but shortages of materials and limitations on shipping space are hindering the export effort.

	Years to Dec. 31	1949	1950
Consolidated earnings:—			
Gross earnings.....	£	4,607,146	9,838,456
Total profit.....		4,660,873	9,885,129

Reserves.....		8,265,681	12,752,897
Ordinary capital.....		2,650,090	2,650,090

* Tax free.

5s. ordinary stock at 40s. x1 yields 6s. 6s. per cent.

The decision to raise the tax free dividend from 24½ to 27 per cent, with the full knowledge of difficulties to come, suggests that the maintenance of the higher rate is a reasonable expectation. Lord Nuffield's statement emphasises the difficulties that may arise in the future. To the shortage of sheet steel must be added the prospects of a growing scarcity of other materials as re-armament gathers way. Moreover, the cost of tooling for new models has risen more than threefold compared with prewar costs, a factor that needs to be borne in mind when the motor industry comes to re-tool to fulfil defence orders.

The considerable appropriations to reserves from the latest year's excellent profits must, therefore, be considered in relation both to the costs of replacement and re-tooling and to the increasingly heavy burden

of providing working capital; the book value of stocks, for example, has risen from £13,644,171 to £16,400,675. In view of these responsibilities, the rise in net current assets from £7,663,436 to £11,183,755 and in cash from £556,190 to £3,495,096 is welcome. The modest level of cash resources at the end of 1949 led the company to obtain accommodation in the form of acceptance credits, which appear at £3,384,741; these new funds have been used primarily to finance "the vast volume of business" with Australia and Canada. In addition, Nuffield House in Piccadilly has been sold "at a satisfactory profit" and the proceeds devoted to strengthening the group's liquid resources.

Two separate references in Lord Nuffield's statement to increased costs and keener competition from Continental motor manufacturers reinforce the rather cautious tone of his remarks. The group has done much, so far as it is able, to meet the difficulties of finance and industrial organisation that have arisen in the past year or so. But the gross yield of £6 9s. on the 5s. ordinary units at the current price of 40s. is in itself a reflection of their formidable character.

*

Guest, Keen and Nettlefolds.—There have been suggestions that a greater proportion of the compensation received by Guest, Keen and Nettlefolds for its holdings in companies now vested in the Iron and Steel Corporation should have been passed on to shareholders. The tax free distribution actually made of 5s. per £1 ordinary share, absorbed some £3,400,000. The chairman answers this criticism by arguing that the company must keep adequate resources to take advantage of any opportunity to expand its business; taxation at crippling levels prevents the accumulation of sufficient profits for this purpose and it is not safe to count on being able to raise new risk capital at the exact moment when it is needed.

The justification for this case may be found in the fact that in the last five years over £14 million has been spent on capital development and that in recent years two issues of risk capital have been needed to finance these projects. Moreover, the company has already sanctioned the expenditure of £12 million on development schemes; inflation will inevitably swell this figure and the values of stocks and debtors, making additional finances necessary.

Ordinary capital.....		11,283,150	11,301,337

(a) Excludes capital reserve retentions (1949: £64,108; 1950: £256,629).

£1 ordinary stock at 50s. 6d. x1 yields £4 14s. per cent.

Compensation was actually satisfied by the issue of £18,537,774 steel stock resulting in a capital surplus of £8,438,663 over the book value of investments in subsidiaries now publicly owned. At no time, however, has it been possible to realise steel stock at par, and to safeguard against any further capital depreciation the company has switched its holding of steel stock into shorter dated gilt edged stocks. To date, the company has

sold £15,500,000 steel stock at an average price of 98½ to produce £15,224,675 and has reinvested £13,752,508 in £14 million 2½ per cent Funding 1956-61 at the same average price.

Excluding exceptional items of income and dividends from subsidiaries now in public ownership, distributable earnings appear to give an ample cover on the higher ordinary dividend of 14 per cent, against 12½ per cent. The trading surplus of the group has risen from £6,237,465 to £7,682,098 while most of the company's manufacturing subsidiaries report higher output and profits; although raw material shortages may raise difficult problems, the immediate outlook appears promising. Ultimately, much will depend on the success of the ambitious capital development programme, for which, at this stage, the retention of a good part of the compensation moneys remains an essential foundation.

*

British Insulated.—The marked effect of the Korean war on the trading experience of a representative industrial concern is clearly illustrated in the latest accounts of British Insulated. In the opening months of 1950 conditions had become highly competitive, and trading was returning to something of its prewar aspect.

The Korean war, however, completely reversed the situation and for the second half of 1950 production facilities were stretched almost to the limit; but for this fact, the fall in trading profits might have been far sharper than the actual fall of £607,622 to £6,130,642. Re-armament, however, has intensified the problem of raw material shortages, especially as stocks of scarce materials as copper were used early in 1951 to complete orders accepted before these metals were rationed.

Reserves.....		10,586,377	12,225,028
Ordinary capital.....		9,240,366	9,240,366

£1 ordinary stock at 27s. yields £4 1s. 10d. cent.

The raising of British Insulated's ordinary dividend from 6½ to 7½ per cent may leak modest enough to some equity holders, but considerable appropriations to reserves have been required to provide working capital and to replace fixed assets. Higher prices have led to substantial increases in stocks from £14,128,646 to £16,222,960 and in debtors from £14,277,845 to £16,070,438 and despite last year's profit retentions bank balances have been reduced from £2,530,077 to £1,516,778. To replace the parent company's fixed assets, shown at a net book value of £4,235,384, would cost about £16,000,000. And, of course, additions to new plant and machinery, which totalled £909,036 in 1950, have to be made at inflated prices.

The promise of a full order book this year, which the chairman claims could easily be doubled, presents something of a contrast to the markedly cautious tone of the chairman's statement. This reveals that the company has already been forced by material shortages to lengthen its delivery dates; to keep the plant balanced on the present allocation of copper and other materials has become "more and more difficult" and any further deterioration in supplies will bring about "a serious position."

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 26, 1951, total ordinary revenue was £54,310,000, against ordinary expenditure of £53,516,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £1,550,000 the surplus accrued since April 1, 1951, is £23,105,000 compared with a surplus of £48,356,000 for the corresponding period of the previous year.

BRITISH BANKING SURVEY

The following three articles, surveying current banking trends in Britain and the British Commonwealth, are intended to be read in conjunction with the special 16-page selection of British Banking Statistics that appears in this week's issue of the RECORDS AND STATISTICS supplement. A complementary editorial survey of Foreign and International Banking, with an associated statistical selection, will be published in the autumn. These half-yearly features together comprise the new form of THE ECONOMIST BANKING SUPPLEMENT, which has been published for many years.

Bank Deposits and Rearmament

THE western world's plunge into rearmament finance, and the inflationary influences to which this has given rise, have been very clearly reflected in the trends of British banking. Some of the effects upon banking in countries of the British Commonwealth that have experienced the full force of the boom in commodities are discussed in a later article in this Survey. This article and the immediately following one are concerned with the effects upon banking in Britain, considering first the broader trends from the standpoint of monetary policy and then the policies of the banks themselves, notably their lending policies, in face of the steep rise in prices.

Twelve months ago the banks could look back upon two years of virtual stability in the level of their deposits—two years, dating approximately from the first Crippsian "disinflationary" budget, that seemed to have decisively ended the long phase of credit expansion. In the first of these years "net" deposits of the London clearing banks rose slightly, by £47 million; in the second year they dropped by £40 million. Now in this past year (taking the figures to May) this stability has been abruptly interrupted: net deposits, as Table I shows, have risen by nearly £200 million—an annual movement comparable to that of 1947-48, though still, of course, much smaller than the extravagant credit expansion of the Daltonian phase. The whole of this deterioration occurred in the months after Korea: at end-June last the total of deposits was actually £47 million below the corresponding 1949 level, and even at end-July it still showed a small net decline. Over the eleven months to last May the volume of deposits expanded by £108 million, whereas in the corresponding period of 1949-50 it had contracted by £138 million; of this aggregate divergence of £246 million, nearly nine-tenths occurred in the five months to November last.

The origin of this renewed credit expansion is at first glance more surprising even than the abruptness of the change of trend. At this time last year it seemed that, if the stability of deposits was to be impaired, the threat would come from the rising demands of industry for advances to finance the rise in prices, especially of imported raw materials, that was resulting from the devaluation of sterling. In the six months to May, 1950, as last year's Survey pointed out, bank advances had been rising faster than at any previous period of British banking history. Yet in the ensuing six months, although world commodity prices responded violently to the wave of anticipatory buying that followed Korea, the advances

of the clearing banks actually dropped by £28 million (compared with a rise of £165 million in the previous six months and one of £46 million in the corresponding period of 1949). Hence the phase of most rapid credit expansion was marked by a decline in the demands for bank finance from the private sector of the economy (including in that sector, however, such public boards as borrow from the banks, e.g., the British Electricity Authority, whose bank indebtedness was sharply reduced last summer out of the proceeds of the £150 million loan floated in May, 1950). This conclusion still holds good even if bank purchases of gilt-edged securities are treated as non-Governmental finance, for in this period the additions to investment portfolios were appreciably smaller than the decline in advances.

In other words, last year's burst of credit expansion was wholly attributable to a spectacular increase in Governmental demands upon the banks. In the five months to last November, net bank deposits rose by no less than £290 million, or by £213 million more than they rose in the similar period of 1949; a rate of growth comparable to that of the Daltonian phase. Yet in these five months the banks' advances and investments, taken together, declined by £21 million (in contrast to an increase of £40 million in 1949). Hence the apparent requirements of the central Government rose by £311 million—a rate of borrowing averaging over £60 million a month, compared with a mere £7,500,000 a month in the corresponding period a year earlier.

This reversal of the distinctive trends of the earlier phase of stability, during which the public sector was

Cash	+26	-48	+28	-1	-5	+22

reducing indebtedness at roughly the same rate as the private sector was borrowing, was not, however, characteristic of the year 1950-51 as a whole. In the past six months, the secular upward trend of deposits has con-

tinued—in the sense that the decline has been smaller than in the similar period a year earlier—but the deterioration has been small by comparison with the violent movement of last summer and autumn. Moreover, it has been wholly due to a strong revival of demands from the private sector. Bank advances have risen during the six months by £183 million, rather faster even than in the comparable period after devaluation, while, in addition, the banks have continued to expand their investment portfolios. Large though these demands have been, their effects on the total volume of credit would in any case have been more than offset by the Government's repayments of indebtedness out of its cash surplus in the final quarter of the fiscal year; but this year the net repayments in the four months to March were larger than in 1949-50, and even in the first two months of the new fiscal year the Government has reduced its indebtedness slightly.

Over the full twelve-month period, therefore, the central Government was not a net borrower from the banking system, though the change in its cash position was the direct cause of the change in the trend of deposits. Although bank advances rose less rapidly over the year as a whole than they had done in 1949-50, the difference was approximately offset by the renewed rise in investment portfolios: the increase in these two items together, at £208 million, was only £4,000,000 less than in the previous year, and was £9,000,000 more than the year's net growth in deposits. In other words, in 1950-51 the Government presumptively reduced its debt to the banking system by this small amount, whereas in 1949-50 it had reduced it by no less than £252 million—a difference that may appear, at first glance, hard to reconcile with the fact that in the fiscal year 1950-51 the Exchequer's "overall" surplus, at £247 million, was £185 million larger than in 1949-50.

The key to these seemingly paradoxical movements, and to the way in which the plunge into defence economics has affected the credit situation, may be found by scrutinising the contrasting experiences of the several

phases of the year—a contrast that also has its lessons for the future. Plainly, the rise in Governmental defence expenditure as such has not yet become the operative factor in credit expansion, for in recent months the Government has been leaning on the banks less heavily

than it was doing before Korea. The two major sources of credit expansion in Britain since Korea—the very heavy Governmental borrowing in the first five months and the heavy private borrowing in the past six months—reflect the external repercussions of world rearmament rather than the direct effects of Britain's own arms outlays. The rise and fall of Government demands for bank finance, superimposed on the normal seasonal fluctuation, reflect the violent changes that have been occurring in Britain's external balance of payments.

The first effect of the post-Korea rush of forestalling purchases in world markets was to speed up the rise in Britain's export surplus that had already been set in motion by devaluation and by restocking in the United

TABLE III
TRENDS IN BANK ADVANCES

November to May.....	+135	+129	+85	+165	+183

States. At this stage the expansion of export income—especially from "invisibles"—outdistanced the effects of rising import costs. The Government therefore had to find funds to finance this surplus—by way of credits through EPU, repayments of some sterling balances and purchases of gold. In addition, it was acquiring gold as a result of the mounting dollar earnings of the overseas sterling area; but most of these gold purchases will have been self-financing, since the overseas sterling balances created against them will have been automatically re-lent to the British Treasury. Indirectly, however, the pace of the gold inflow did tend to create a strain upon Governmental finance, since it led to the autumn's rumours about sterling revaluation and provoked a flow of funds to London; much of the sterling that foreigners acquired had to be provided by the British authorities, either against further purchases of gold or by way of further repayments of Treasury bills held by overseas monetary authorities. When the force of this movement is recalled, it is easy to see why the pace of credit expansion reached its peak in October last; in that month net deposits rose by £150 million, wholly on Governmental account. During this period of mounting external surplus and inflowing foreign funds the authorities did, however, make some effort to cushion the impact upon the credit situation. During the second half of 1950 they were undoubtedly net sellers of securities—though not on the scale implied by the £250 million issue of 3 per cent Funding Loan offered for cash in November, since the terms of this issue were pitched at a level that ensured that the "departments" had to take up a large proportion themselves, in the first instance.

In the second major phase, the six months since end-November, the dominant influence upon the credit situation appears to have been the rise in commodity prices, which has been affecting the cash needs of the public and private sectors in opposite directions. Since the increase in import costs has wiped out the heavy export surplus and, recently, has even turned the balance of payments into deficit, the special source of strain upon Exchequer finances has been removed. On the other hand, the strain upon industry's working capital has been intensi-

fied, and repayments of bank advances from the proceeds of new issues have fallen far short of new demands.

For the future, it seems inevitable that the upward trend of deposits will continue, though there is perhaps some reason to hope that the pace of the advance will resemble the trend of the past six months rather than the feverish movement of last summer and autumn. The budget for 1951-52 envisages an overall deficit of £457 million, and although a substantial part of this is likely to be financed from extra-budgetary receipts and net sales of tax reserve certificates, it is most unlikely that the Government will be able to avoid appreciable net borrowings from the banking system—unless the external balance of payments runs into heavy deficit. At the same time, the pressure on industry's working capital is bound to become more acute. Although the current buoyancy of the equity share market, combined with

increasing caution on the part of the banks in their lending policies, will perhaps ensure that a substantial part of industry's needs is met through the new issue market, bank advances are likely to continue to rise. If, therefore, both the public sector and the private sector will be seeking additional bank finance, the only way of preventing a further credit expansion would be to pursue a tougher monetary policy—with the object of either curtailing demands for advances or of forcing the banks to meet part of the demands upon them by selling gilt-edged securities. There is no sign, however, that the authorities are contemplating any such return towards orthodox policy. Though they may be prepared to leave the gilt-edged market to cope with "natural" pressures, it seems unlikely that they will be prepared to aggravate them by deliberately creating stringency in the banking position.

The Finance of Stocks and Commodities

THERE is no doubt that the steep rise in commodity prices that has occurred since the devaluations of 1949 and especially since Korea has sharply intensified the already considerable strain upon the working capital of industry, particularly of those concerns, whether merchants or manufacturers, whose business requires them to carry substantial stocks of primary or processed materials. This strain upon stockholders, and the sharply increased cost of goods in transit, has naturally exerted a pressure upon demand for financing facilities, and many of the smaller businesses concerned have lately found their need for floating finance out of all normal proportion to their own resources, posing new problems for their financiers as well as for the businesses themselves.

Necessarily, a rise in primary commodity prices takes some time to work through the domestic economy, and it can hardly be questioned that the full financial effects of the rise that has already occurred have not yet been felt. At all events, the impact upon the joint stock banks, as distinct from the acceptance and discount markets, has so far been more moderate than might, perhaps, have been expected, though it has become much more marked in the past four months. Over the past twelve months as a whole, as the table on page 1329 shows, the growth of bank advances has been appreciably smaller than it was in the preceding year. The Chancellor, in his Budget speech, referred to the year's increase as "inevitable . . . in view of the rise in the cost of raw materials and the resultant increase in the cost of financing stocks." But in the twelve months to last April, the advances of the clearing banks rose by less than 8½ per cent, and even in the year to last May their rise was no more than 9½ per cent, whereas the rise in the index of wholesale prices was roughly three times as steep. Moreover, the moderate growth over the past year could be attributed to causes quite distinct from price movements: the expansion in industrial production to February, 1951, was itself at almost the same percentage rate as the rise in advances. Last year, however, was the first in the whole postwar period in which the pace of the rise in bank advances fell behind that of wholesale prices—and this was still true even if the figures are adjusted to allow for the distorting effects of

the large repayments of bank advances made last year by the British Electricity Authority out of the proceeds of its new issue.

The quarterly classifications of bank advances (regularly reproduced in the *Records and Statistics* supplement) confirm the impression that the rise over the past year is to be associated, to a large extent, with the upward movement in prices—but they also indicate that substantial additional finance must have been found from other sources. The latest available analysis, relating to February last, showed that total advances made in Great Britain by all banks that are members of the British Bankers' Association were higher by £161 million on the year, a rise of about ten per cent. Of this increase, a substantial proportion occurred in those classified groups that had been particularly exposed to the steep rise in commodity prices. Thus about one-quarter of the additional advances were made to borrowers in the following five industrial categories—cotton, wool, other textiles, leather and rubber, and non-ferrous metals; while over a third were for those in agriculture and fishing, food, drink and tobacco, and retail trade. Wool is an outstanding example; the total advances for wool and wool manufactures more than doubled during the year, reaching £38½ million; while stocks of raw wool declined by about a third, the wholesale price index for wool and wool manufactures stood at two-and-a-half times the level of a year before. The official analysis of advances is too broad to provide a basis for any precise conclusion; but it does seem reasonable to deduce from it that at least half the rise in advances over the year to last February was directly or indirectly attributable to the rise in prices of raw materials and stocks. This estimate does not take into account the £54 million of additional advances made in the category described as "other financial," of which a substantial part represents bank lending to industry at one remove, through funds provided by the banks for the Finance Corporation for Industry and the Industrial and Commercial Finance Corporation, whose operations in turn were no doubt expanding partly as a result of higher prices.

It is evident, however, that the additional finance required by the upward swing in prices has been much greater than could have been covered by this modest

application of bank credit. During 1950 the physical increase in stocks and work in progress was officially estimated at £115 million, compared with £215 million in the previous year; but as Government stocks were running down fast last year, the holdings of private industry must have risen by substantially more than the aggregate figure suggests. In addition, it was officially estimated that the appreciation in the value of stocks in 1950 amounted to £285 million, excluding stocks held by government trading departments, local authorities, some harbour boards and the United Kingdom Wool Disposal organisation. Although both estimates are described as "highly precarious," the total finance involved was plainly far in excess of additions to bank advances for this purpose—especially as the appreciation must have been substantially greater in the past twelve months than in the calendar year 1950. At an earlier stage in the chain of production, the enlarged demands for finance of goods in transit will have been met partly by acceptances and credits extended by the joint stock banks and merchant banks. In the collective figures for the clearing banks, acceptances and credits cannot be distinguished from engagements, and in any event these items merely reflect the position on the day the banks' accounts were struck. But, to judge from the rise over the calendar year in the aggregate figure, and from the results of those of the large banks that show acceptances and confirmed credits separately, credit from the joint stock banks in this form probably nearly doubled during the year.

*

Among other methods of finance, the increase in the volume of commercial bills handled by the discount market indicates that this source of funds is being drawn upon more and more extensively. Last January the chairman of the National Discount Company referred to an increase of two-fifths in the volume of commercial bills bought by his company during 1950, and in the following month the chairman of Gillett Brothers mentioned that commercial bills discounted had reached nearly double the figures for the previous year. To judge from published balance sheets alone, the discount houses' total of bills under re-discount was running at around £100 million at the end of last year; but the total of commercial bills handled, comprising also those dealt with by the three houses that do not publish figures, must have been considerably larger, and it is probably still increasing. Discount rates for trade bills were lifted slightly last February, and, although no corresponding rise occurred for the much larger volume of bank bills, the hardening reflects the market's response to an enlargement in the demand for bill finance. Here again, however, other influences are at work besides rising prices. The reopening of commodity markets and restoration of trade from government to private hands, with the general growth in the use of sterling in international transactions and the relative cheapness of finance through London, have all contributed to the expansion in the volume of bills reaching the market. In the home trade, too, commercial undertakings, including some large enterprises, have been using bill finance, partly to assist in carrying stocks, as an addition to bank advances or in substitution for them.

The expanding turnover of the merchant banks—which to some extent is of course the counterpart of the activity in commercial paper in the discount market—is

also attributable in part to the high level of prices, especially for raw materials. But, as the recently published accounts of Hambros Bank have demonstrated, the rising demand for merchant banking facilities has by no means been confined to acceptance credits. This case is of particular interest, since Hambros Bank's decision to bring its capital into line with the increasing demands sets an example that may be followed by other houses. More generally it may be noted that arrangements for commodity credits have involved substantial sums; the amounts of some of the revolving credits, particularly for wool, arranged by merchant banks and joint stock banks on account of various continental countries, were increased last year.

Other types of financial facilities have also been in demand. Despite the official discouragement of the extension of hire purchase facilities, this form of trading seems to be increasing, not only in retail trade, but also to meet industrial needs. New finance companies have been formed and in a variety of ways hire purchase arrangements have been adapted to furnish additional working capital, partly in response to the need to carry stocks at higher prices. Last December a jointly-owned undertaking was established by Tube Investments and Olds Discount Company to deal with the hire purchase business of companies controlled by the manufacturing business. A rather different type of finance was made available last March, when the Ship Mortgage Finance Company was formed to assist in the financing of new ships, for which costs of construction are running at high levels. Then, too, substantial amounts have been raised outside the Stock Exchange by unsecured notes or loan stock. This method of obtaining additional resources has advantages in savings in costs and in respect of taxation, but in many of these instances the funds were required to supplement working capital, partly for financing stocks.

These diverse methods of seeking additional floating finance all reflect the way in which higher prices are contributing to the strain on the liquid resources of industry, but it is hardly possible to isolate this particular influence from the many others that are at work. One tentative conclusion can perhaps be drawn from the rather incomplete evidence that is available. There is no *prima facie* reason to suppose that credit-granting by the banks has been a primary cause of the rise in prices. On the one hand, borrowing for speculative holding of commodities, has long been proscribed by directives to the Capital Issues Committee, a prohibition reiterated in the latest revision of directives; on the other hand, banks and lenders can generally be depended upon to act with caution—from motives of ordinary business prudence—while prices are running at unusually high levels. But, if these considerations relieve the commercial banks from blame for the steepness of the rise in prices, they still beg the fundamental question, which is whether financial policy in the wider sense could not exercise a valuable restraint. The Chancellor has observed: "I cannot see that if we were to tighten credit further we should have any perceptible effect on the price of wool, on the price of rubber, on the price of tin." Yet in recent weeks a change in civilian buying activities in the United States, with the application of stricter regulations to borrowing and higher interest rates, has been followed by a tendency for prices of some commodities to fall on world markets.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Inflation in the Sterling Commonwealth

ALMOST all the countries of the sterling Commonwealth, except the United Kingdom, are now enjoying a sizeable external surplus on current account. In most of them, indeed, the addition to money incomes from higher export prices in 1951 seems likely to lead to a substantial increase in their national incomes as a whole. This is happening at a time when supplies of capital equipment and of some consumer goods from the United States and Britain are being increasingly restricted by rearmament's pre-emption. In other words, most of these countries are now faced by the prospect of a yawning internal inflationary gap.

An estimate of the possible extent of additions to money incomes in primary producing countries this year was given in the recent *Economic Survey of Europe* for 1950, published by the Economic Commission for Europe. This suggested that the value of exports from the primary producing countries to Europe and North America would rise by between 20 and 25 per cent in 1951 if prices remained at their end-1950 level throughout the whole year. On this assumption, Malaya, where exports generate by far the larger part of gross money incomes, would experience a rise of between 80 and 100 per cent in export values in 1951; Australia (where even in 1949 exports generated nearly 30 per cent of gross national income), South Africa (where non-gold exports generate about 15 per cent of national income), Pakistan and Ceylon would all enjoy an appreciation in export values of between 20 and 40 per cent above 1950 levels; and India, which is being left somewhat behind in the race towards more favourable terms of trade, would enjoy an appreciation in export incomes of rather less than 10 per cent. The additions to money incomes would, of course, be greater still if the volume of exports increased.

The main financial problem before all these countries is therefore that of preventing the (probably temporary) good fortune of their exporters from souring the long-term prospects of their economies as a whole. This is not an easy problem to tackle. If internal inflation is left to work itself out uncontrolled, it will cause grave hardship among non-exporting interests, an undesirable shift of resources away from uses that are essential for long-term development (though not immediately lucrative in the short-term of the export boom), a mushroom growth of luxury industries and services that might founder under the weight of their high capital charges once exporters' internal demands were reduced, speculative bidding up of the prices of real estate and of scarce material stocks, and a long list of other economic distortions. If attempts are made to check inflation by orthodox "non-discriminatory" measures—higher taxation all round, revaluation or tighter control over credit—those who do not draw advantages from the current export boom are hit as hard as those who do; while if discriminatory taxes are imposed on those who are enjoying boom-time prosperity at the moment, they always meet with great political resistance (especially as the prosperous exporters of today are often those who were most badly hit in the depression of the 1930s). In addition, discriminatory tax imposts sometimes lessen the incentive to long-term increases in production of

export goods—long-term increases of which the world stands in dire need in many commodities.

The Commonwealth countries have therefore been left with an economic problem to which it would be extraordinarily difficult to find an adequate answer—even if they had adequate statistical material on which to draw up their plans and adequate administrative and financial machinery through which to put those plans into effect. And in most overseas sterling area countries, statistics, administrative resources and financial machinery are all sadly lacking. It is not surprising, therefore, that in many of them inflation seems dangerously near to running away out of hand.

★

The obvious starting point for a regional survey of the problem of Commonwealth inflation is in the dependent territories, where there is no central banking machinery for damping down inflation at all. The sterling balances of the Colonial Empire ran up by £106 million in the second half of 1950; they are probably rising even more swiftly now. The inflationary effects of the current export surplus differ widely between those countries, such as West Africa, where the main exporters are peasants whose marginal propensity to consume is necessarily high, and those countries, such as Malaya, where the exporters are largely plantation interests, and where some at least of the booming proceeds of export sales tend to stick in profits (which, even if they are distributed, add to personal incomes in Britain rather than in the Colonies). In West Africa, Produce Marketing Boards have been interposed between the peasants and world markets, with the wise object of storing up foreign exchange derived from exports in a boom for use in time of slump. Unfortunately, these Boards have been looking forward continuously to a slump ever since the war ended, with the result that the vast funds that they have accumulated have deteriorated in real value each year as prices have obstinately continued to rise. The new Nkrumah Government in the Gold Coast has now demanded that the £53 million accumulated in the Cocoa Marketing Board's hands should be handed over to local control and devoted to local development; whether this means that this money will be spent just when saving should really start remains to be seen. In plantation countries such as Malaya recourse has been had to export taxes—though only to that level of export taxes that can be forced through against bitter local political opposition.

In Ceylon, which emerged from colonial status only a short time ago, recourse has also been had to export taxes. But Ceylon now has also a Central Bank, operating under American Governorship and on deliberately anti-inflationary lines. In 1950, according to the recent Central Bank report, Ceylon's foreign assets rose by Rs. 141 million (approximately £11 million), commercial bank credit to the private sector of the economy rose by Rs. 60 million, and commercial bank credit to the Government rose by Rs. 17 million; after making certain marginal adjustments for other banking operations, total money supply in the hands of the public rose by Rs. 261 million—or by no less than 40 per cent in one year. In order to damp down internal inflation the Central

Bank has asked the commercial banks not to repatriate their external reserves and not to extend loans for speculative purposes (there is apparently surprisingly little of this at the moment). The Central Bank has also increased reserve requirements from 10 to 14 per cent of demand deposits, and has started open market sales of securities (to the very limited extent that Ceylon's capital market conditions allow). Since the Government's budget is in overall deficit, however, it seems optimistic to suppose that these measures can really damp down the inflation deriving from the external surplus.

In Ceylon's two great northern neighbours, inflation is also continuing at a great rate. Foreign assets held by the Reserve Bank of India expanded by only Rs. 80 million net in 1950, but they rose by no less than Rs. 540 million (£40 million) in the first quarter of 1951. Credits extended by the scheduled banks to the Government sector rose by Rs. 170 million, and to the non-Government sector by Rs. 340 million last year. Total money supply in India (i.e. private current deposits at all banks plus cash holdings) rose by Rs. 810 million—or only about 4 per cent—in the year, but it increased by Rs. 1,370 million in the first quarter of 1951. The recent Indian budget was drawn up with the express object of providing the internal financial resources necessary to meet the increased rate of public investment envisaged under the Colombo programme laid down last November. Last November's estimates, however, were drawn up on the assumption that nearly two-thirds of the Colombo investment programme would be financed from abroad. There seems to be a dangerous tendency in the Colombo Plan countries at the moment to assume that their unexpected conversion to balance of payments surpluses means that they can carry out their planned investment programmes even if the hoped-for finance is not forthcoming from abroad. In fact, of course, the conversion to a balance of payments surplus, especially in so far as it is due to the non-availability of goods abroad, means that each country is trying to finance out of its pitifully small domestic savings not only its whole internal investment programme but an unwanted quantum of foreign investment as well.

The situation in Pakistan is somewhat similar to that in India, except that the conversion to balance of payments equilibrium has been more recent (dating from Korea and the payments accord with India)—and that the current tendency for the surplus to rise is more marked. Foreign assets held by the State Bank of Pakistan, which fell by Pakistan Rs. 452 million (about £45 million) in the first nine months of 1950, rose by Pakistan Rs. 560 million in the next six months; in these six months (from end-September, 1950, to end-March, 1951) the total of privately-held currency and current deposits rose by Pakistan Rs. 523 million, or nearly 19 per cent. The recent Pakistan budget, drawn up in the boom mentality that exporters' prosperity has intensified, brought tax rates down.

It is not surprising that in the Asian dominions, with their vast agglomerations of population and limited administrative resources, anti-inflationary planning is not carried to such a high pitch of attempted statistical nicety as it is in Britain. But in the older dominions, too, budget and investment policy is not tied to any deliberate pattern of plans for bridging inflationary gaps. A recent analysis by the National Bank of Australasia, however, estimated that the "inflationary gap" in Australia in the current

fiscal year (that to June 30, 1951) might amount to as much as £A280 million. The bank estimated the year's external surplus at £100 million, net private investment at £470 million and the deficits of public authorities at £30 million; these three items together total £600 million, against which voluntary private savings were expected to amount to £320 million. In the first eight months of this fiscal year, foreign assets held by the Commonwealth Bank of Australia rose by £88 million, commercial bank loans to the private sector of the Australian economy rose by £82 million, and bank credit to the Government (including purchases of Government securities) expanded by £97 million; the total increase in currency and deposits was thus £267 million against £284 million in the whole of the previous fiscal year. Australia's total national income in 1949 was £1,915 million. The Government's anti-inflationary measures include directives to the commercial banks that they should follow a "selective credit policy," a pruning of the public works programme, fairly tight restrictions over new capital issues and the resort to export taxes (after much political wrangling); in addition, £80 million of potential commercial bank investible funds were sterilised in the Special Account at the Central Bank in the first eight months of the fiscal year 1950-51. But inflation in Australia is clearly proceeding apace.

In New Zealand the seasonal pattern of exports usually means that foreign exchange reserves run up at the beginning of the calendar year and run down at the end of it. The foreign assets held by the Reserve Bank and the main commercial banks rose by £26 million, to £90 million, in the first half of 1950; they fell to £82 million in the next six months but had risen to £103 million by the end of February. It would be unwise to read too much into these figures, however, for New Zealand's export and import trade is still paralysed by the water-front disturbances. South Africa's special position as a gold-producing country also makes it impossible to generalise about sterling area banking trends from observation of conditions in that country, but there again the foreign exchange reserve is mounting. Foreign assets held by the Reserve Bank, which amounted to only £54 million at the time of devaluation and to £105 million at the end of 1949, had risen to £153 million by the time of the Korean outbreak, since then they have gone on rising, to £166 million at the end of 1950 and to £172 million at the end of March, 1951.

To sum up therefore: Across the whole overseas sterling area, private liquid balances, especially those of exporters, are increasing at an unprecedented rate while goods are not coming forward in adequate supply to mop up the demand that is generated from them. Government efforts to damp down inflationary pressure so far seem to have met with singularly little success (and singularly effective political opposition). In consequence internal prices are mounting rapidly. If and when the exporting bubble is pricked, some of those whose business is keyed to present high levels of prices and demand may have some very rough weather to ride through. There is an evident danger that in such circumstances the sterling area Governments concerned would try to jack up their economies through ambitious public works programmes—financed by drafts on the sterling balances now mounting in all Commonwealth banks. This is a contingency that the British Government would do well to foresee and, as far as possible, forestall.

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

COMPANY MEETINGS

ROYAL EXCHANGE ASSURANCE

231st ANNUAL REPORT

EXCELLENT RESULTS FROM ALL DEPARTMENTS

GROUP PREMIUM INCOME REACHES £21,000,000

LORD BICESTER'S SURVEY

The Two Hundred and Thirty-first Annual General Court of the Royal Exchange Assurance was held on May 30th in London.

The Governor, the Right Hon. Lord Bicester, who presided, said: Gentlemen,—As the report and accounts of the Corporation and consolidated accounts of the Royal Exchange group of companies have already been sent to you, I have no doubt that it will be your wish that they should be taken as read. (Agreed.)

DIRECTORIAL CHANGES

In reporting the changes in the Court of Directors since I last addressed you, it is with infinite regret that I have to record the loss we sustained by the recent death of the Rt. Hon. Oliver Stanley, whose great qualities we appreciated so much, and whose unfailing kindness endeared him to us all.

I think we all agree that the death of Oliver Stanley was not only a great loss to the Royal Exchange but also a great loss to the country. He was a remarkable man. (Hear, hear.)

Next I want to mention the resignation of Sir Spencer Portal owing to his desire to reduce his business activities. Sir Spencer first joined our Court in 1902 and was therefore with us for close on fifty years. In addition, he was for over forty years Chairman of our associated company, the "National Provincial," and I am sure it would be your wish to place on record our great appreciation of his long and valuable services. I am happy to say that we have recently appointed his son, Mr Francis Portal, to our Court.

On your behalf I would also like to welcome the Rt. Hon. the Viscount Bruce of Melbourne as a member of our Court. Lord Bruce's long and distinguished career, both as Premier of one of our great Commonwealth nations and later as its High Commissioner, is well known and needs no commendation from me. Bearing in mind our ever-increasing interests in Australia, we are fortunate in having the benefit of his intimate knowledge of that great country's problems as well as his widespread business experience.

THE EXECUTIVE

I have also some changes to report in our principal executives. Mr J. S. Stear, our deputy general manager, retired on April 30th after 36 years' service. Prior to becoming one of our principal executives Mr Stear was for a number of years the manager of our accident department, to the success of which he made a notable contribution. His work has been very valuable to us and he will be greatly missed. We wish him much happiness in his retirement.

Mr R. R. Hilton, our home fire manager, has also retired after nearly 41 years of devoted and successful service with the Corporation, and to him also we extend our thanks and best wishes. We have appointed Mr W. A. Jackson to fill his place.

I would also like to mention a change in our marine department. As you know, we have for a number of years had a very close and happy relationship with the Sun Insurance Office, Limited, as regards our marine business, during which time Mr C. C.

Turner has been our joint underwriter. Mr Turner retired on December 31st last, and we wish him much happiness in his well-earned leisure. I feel it was largely through his sound underwriting and wide knowledge of the business that our marine account has been so satisfactory in recent times.

On January 1st last we, together with the Sun Insurance Office, Limited, concluded a similar arrangement for joint marine underwriting with the North British and Mercantile Insurance Company, Limited, as a result of which that company's underwriter, Mr A. W. Theobald, is now acting in a similar capacity for the "Sun" and ourselves. We are very happy to have the services of one of the outstanding underwriters in the market and are quite sure these arrangements will be mutually beneficial.

LIFE DEPARTMENT

I will now proceed with a review of the results of our individual departments. The life department issued 5,458 policies for net sums assured totalling £4,868,043, an appreciable increase over the figures attained last year. The total premium income has again risen and now stands at £1,912,288, which is approximately £106,000 above that for 1949. Claims were again on the normal scale, amounting in all to £1,340,989.

The overall rate of interest has shown an increase, being £4 4s. 9d. per cent., against £4 2s. 10d. per cent. for 1949. There has been, as you know, a very severe decline from the rate of interest prevailing 20 years ago: the steepest fall coinciding with the conversion of the old 5 per cent. War Loan to a 3½ per cent. basis. Some ten years later our average rate steadied at about 4½ per cent., around which it has since fluctuated.

In these days of high taxation it is obvious that net interest can very quickly become an inadequate compensation for a severe loss in capital values, so that your directors have held fast to the principle that capital security takes precedence over all other considerations.

It will be noted that the cash balances on our life fund have been reduced very considerably since the end of 1949. During the year increased opportunities were found to make further first-class long-term investments at satisfactory rates of interest so that the adoption of a delayed investment policy has brought this fund substantial advantage.

The necessity for the provision of considerable further capital faces industry today. This should give institutional investors like ourselves the opportunity of providing essential assistance to the country, as well as fulfilling our investment requirements on satisfactory terms. Our annuity business proceeds satisfactorily and needs no particular comment.

TRUSTEE AND EXECUTOR DEPARTMENT

The report from our trustee and executor department tells much the same story as last year. The profit of £5,279 is some £3,000 less than 1949, due to the unavoidable increase in the cost of conducting the business. To meet this increase a higher scale of fees was introduced in 1948, but some time must obviously elapse before these

revised charges have any appreciable effect on the departmental revenue.

The funds in hand and under the administration of the department at the end of the year exceeded £186,000,000.

FIRE DEPARTMENT

In our fire department, both at home and overseas, we have had a very excellent year, and at the new record figure of £4,018,868 our premium income is over £500,000 in excess of 1949.

The fact that this good experience has extended to our overseas business, which again shows a considerable increase, represents a highly desirable benefit to this country's economy. The underwriting profit of £505,783 from the fire department has been transferred to the profit and loss account.

MARINE DEPARTMENT

The results of our marine department were favourable, and we are again transferring £75,000 to our profit and loss account. In the early part of the year there was a tendency for hull values to fall, but this has now certainly been reversed.

While this means higher premiums, the market is faced with increased wage rates, and rising prices for raw materials, both of which will raise the cost of repairs to much higher levels. For this reason I feel that hull underwriting, at least in the near future, must remain very difficult. The steep rise in the values of raw materials naturally means more valuable cargoes, but fortunately the great international market that London provides enables the assured to obtain the increased coverage necessary.

ACCIDENT DEPARTMENT

Our accident department has again experienced a most successful year, the premium income having reached a new high level at £2,699,380, and I am glad to say that both the home and overseas sections of the business have made their contribution to this result.

The large amounts which are being awarded in settlement of common law claims are making the conduct of employers' liability insurance very difficult, and if this state of affairs continues the time cannot be far distant when there will have to be an upward revision of rates.

As regards our home motor business, the end of petrol rationing in June of last year has, of course, led to an increase in motoring and also an increased number of accidents. Coupled with this, the very small proportion of new vehicles available for the home market has meant that old cars are still in use, and the cumulative effect has been that claims costs have continued to rise.

In conducting our overseas motor business we have met with similar difficulties and the results have been unsatisfactory. This year the total transfer from the combined sections of the accident department to the profit and loss account is £243,778.

PROFIT AND LOSS ACCOUNT

I come now to the profit and loss account of the "Royal Exchange," and on this there is one preliminary remark I should like to make. You will, of course, remember that, with our world-wide commitments, the devaluation of sterling in September, 1949, presented us with a considerable problem, and I had to refer to this at some length in my report last year. However, I am happy to say that the provisions which we set up in 1949 in respect of our increased sterling liabilities, particularly in regard to America, have enabled us to present our 1950 accounts unaffected by any exchange fluctuations, with the exception of immaterial differences which have been absorbed in the underwriting results.

The total "Royal Exchange" departmental transfers to the profit and loss account add up to the record figure of £829,840, which, together with net interest received and the proprietors' one-third share of the life valuation surplus, makes a total of £1,133,803.

CONSOLIDATED FIGURES

I come now to the consolidated accounts of our group, and I am glad to report that our associated companies have also done very well.

The consolidated profit and loss account, as you will see, shows a total figure of £2,128,360, of which £1,631,852 represents departmental profits and £60,508 the proprietors' share of the life valuation surplus. With such excellent results from all departments it is difficult to single out any one feature to which special reference should be made.

It is, however, a matter for great satisfaction to see that the combined accident premium income of the Royal Exchange group of companies has, for the first time, exceeded the sum of £10,000,000.

TAXATION

On the other side of the consolidated account you will notice that United Kingdom taxation, including provision for income tax for 1951-52, amounts to £987,173. If in addition you take into account the sum of £316,667 which is the amount of tax that has been suffered by our income from investments, you will realise that altogether the Inland Revenue has shared in the results of our business endeavours to the extent of over one and a quarter million pounds. We finally carry to the profit and loss appropriation account £839,679.

Since I addressed you last we have been notified by the authorities that the group is not liable to excess profits tax and we are, therefore, in a position to release the reserves set up in the war years. This figure accounts for the bulk of the item of £754,500 credited to the profit and loss appropriation account.

In common with all other industrial and commercial undertakings, we have been faced with a considerable increase in salaries, and with a correspondingly heavy increase in liabilities in respect of pensions throughout the group. The directors have therefore felt it prudent to use these reserves to help to make the substantial contribution of £1,254,500 to the respective pension funds.

MODES' INCREASE IN DIVIDEND

Finally, you will see that the balance of last year's account is increased to £1,947,429 and this figure is carried to our consolidated balance sheet. Despite the above heavy transfer to pension funds at the end of this year's trading, the group has increased its carry forward to the extent of approximately £137,000.

From these figures you will realise that 1950 was one of the favourable years for insurance generally, although with the international situation so clouded it would be rash to prophesy a continuation of such prosperity. However, your Court of Directors feel that circumstances warrant their recommending to you a modest increase in the final dividend, and I shall ask you shortly to approve a final payment of 25 per cent., which, with the interim dividend of 15 per cent., will make 40 per cent. for the year.

The consolidated accounts show that the total premium income at home and overseas of the Royal Exchange group of companies, including our life business, amounts to £21,000,000, and I think you will agree that even in these days of big figures that is a very substantial sum.

TRIBUTE TO MANAGEMENT AND STAFF

It is in effect the tangible result of the good work done by everyone at our head

office and branches both at home and overseas. I am sure, therefore, you will wish me once again to convey on your behalf, as I do most wholeheartedly on behalf of the Court of Directors, my congratulations and thanks to our general manager, Mr A. E. Phelps, and his able assistants, to every member of our staff, and to our local directors and agents both here and abroad. As can be seen from our consolidated figures, our success arises from the combined efforts of the "Royal Exchange" and its many associated companies, and it is to the directors, management, staffs and agents of these companies also that this message of congratulation is sent. I trust that through this address I shall also reach all those who safeguard and work for our interests overseas and who have contributed in such full measure to the result placed before you.

This concludes my remarks on the report and accounts of the "Royal Exchange" and associated companies for the year 1950. My business career goes back over a long time and I have lived to see many and drastic changes.

I have learnt that in business, after a series of good years and rising profits, there is a temptation to take this continuance for granted. But we can never afford to relax in that respect, and I am confident that neither British insurance in general, nor our own group in particular, will be found wanting.

"RISKS ROUND THE WORLD"

The usefulness of the services given by British insurance throughout the world has never been more in evidence than now in this period of rising prices and increasing values. That it is playing its part worthily was very clearly indicated by the President of the Board of Trade when he recently opened the exhibition in connection with the Festival of Britain, entitled "Risks Round the World," arranged by the British Insurance Association, which is being held in the building of the Royal Exchange.

I am sure that the exhibition will afford the public remarkable insight into the great work British insurance is doing overseas and that it will be regarded in its true light as a monument to free enterprise.

I do not think it would be possible to find a better example of the advantage this country is reaping from private endeavour than the contribution British insurance is making towards our national economic survival in these difficult times.

The report and accounts were unanimously adopted.

THE MILFORD DOCKS COMPANY

CHAIRMAN'S STATEMENT

The annual general meeting of this Company was held in London on May 9th.

The following is an extract from the statement of the chairman, Sir Felix J. C. Pole.

At our last annual meeting I said that the year under review was one of the worst trading years we had experienced. The year 1950 did not show much change, as indicated by the fact that the quantity of fish landed during the year was 33,906 tons compared with 41,536 tons in 1949, and 49,361 for the year 1948. In recent months conditions have improved and I hope will continue to do so.

Our wages and working costs have continued to increase and we are, once again, faced with the problem of the level of rates and charges. The nationalised industries have continued their "Rake's Progress" and the cost of coal, electricity, gas, transport, etc., continue to mount upward. The voracity of the Coal Board is truly amazing.

Coal prices are now about £2 10s. higher per ton than in the year 1938. Applying that increase to a production of 200 million tons per annum, we have the staggering total of £500 million, which is now being poured into the coal industry every year over and above that of 1938. The docks company is not a large consumer, but the trawling industry is, and the docks company is dependent on the successful operations of that industry.

The report and accounts were adopted and a dividend of 2 per cent., less income tax, on the ordinary stock was approved.

STEWARTS AND LLOYDS, LIMITED

REPORT BY THE CHAIRMAN

The following is the report by the chairman, Mr A. G. Stewart, for the year ended December 31, 1950:—

It is with great pleasure that we are sending to those who were on the Company's registers on February 14, 1951, complimentary copies of the balance-sheets as at December 31, 1950, and the consolidated profit and loss account for the year 1950.

All former stockholders will be aware that as from February 15, 1951, the issued stocks of the Company were vested in the Iron and Steel Corporation of Great Britain. A letter was sent to all stockholders on January 30, 1951, explaining the position and pointing out the action which the stockholders should take. This letter also drew attention to the payment of a 6 per cent. interim dividend on the deferred stock on that date and pointed out that further dividends for the year and for the 45 days from January 1st to February 14, 1951, would be paid to stockholders who were on the registers at February 14, 1951.

At the annual general meeting on May 10th the following dividends were approved:—

For the half-year ended December 31, 1950, at the rate of: 6 per cent. per annum on the 6 per cent. cumulative first preference stock, 10 per cent. per annum on the 10 per cent. cumulative second preference stock, 5 per cent. per annum on the 5 per cent. cumulative third preference stock, all less income tax at 9s. 6d. in the £.

For the year ended December 31, 1950, at the rate of: 6½ per cent. per annum, making with the interim dividend of 6 per cent. paid in January, 1951, a total of 12½ per cent. for the year, on £8,172,720 deferred stock, and at the appropriate rate on 625 liaison deferred shares each of which carries the rights attaching to £1,000 deferred stock, less income tax at 9s. 6d. in the £.

These dividends will be paid on or about May 29th, together with the dividend for the 45 days from January 1st to February 14, 1951.

The allocations to reserves from the 1950 profits are set out in the statement below. In addition the specific reserves for "stock" and "maintenance and development of Export Trade" have been transferred to general reserve. A substantial amount was withdrawn during the year from the provision for obsolescence and applied in writing down further the older plants and also writing off recent capital expenditure to the extent that the directors considered the original cost had been increased due to installing new plant whilst existing and adjacent plant continued in production. It should be mentioned that the net balance-sheet values of fixed assets in the United Kingdom are, after deducting the provision for obsolescence, less than income-tax value after allowing for initial allowances.

The accounts would not appear to call for further comment. The strong position of the Company is apparent.

At the annual general meeting Mr I. A. R. Stedeford, Mr F. Le Neve-Foster, Mr J. C. Lloyd and Sir Walter Benton Jones were re-elected directors of the Company.

During 1950 the Company's development plans made further progress to the extent that general conditions permitted. Expenditure during the year on projects in the United Kingdom amounted to approximately £3,000,000, making a total of approximately £15,000,000 so spent since 1945.

A high rate of production was maintained in all departments. The production of steel tubes and of Stanton's spun iron pipes showed an improvement over 1949 and were consequently record figures. Steel production at 1,127,300 tons passed the million-ton mark for the first time.

Deliveries of steel tubes, also a record, amounted to 443,000 tons sold in the home trade and 306,000 tons in the export trade. Stanton exports remained steady, and it is satisfactory to record that the proportion of the group's exports supplied to dollar markets continued to increase. Earnings in terms of United States and Canadian dollars amounted to over £4,000,000.

In spite of increases in costs, prices of steel tubes in the home trade remained stable during the year, with the exception of galvanised tubes, which fluctuated in accordance with the price of spelter.

The work undertaken by the Company's training and education department continues to expand and to show good results. The examination successes of our young employees form an impressive illustration of the progress of this work.

We take pride in the splendid relations which exist, and have always existed, between our staff and workpeople and between the Company and the Trades Unions.

This joint trust between employees at all levels in the Company has played a great part in bringing our business to the position of eminence which it now holds in Great Britain and throughout the world.

I would like to pay tribute to all who have done so much—not only in the past year—but throughout the years, to bring about our success.

Financial results for 1950 and 1949, based on the consolidated profit and loss statement:—

	1950 £	1949 £
Consolidated Profit for year ...	8,648,662	7,803,994
U.K. Taxation ...	4,266,841	3,426,150
Consolidated Net Profit	4,381,821	4,377,844
Proportion due to Outside Shareholders of Subsidiaries ...	119,382	102,936
	4,262,439	4,274,908
Tax Reserves no longer required ...	500,000	—
Profit available ...	4,762,439	4,274,908
Deferred and preference Dividends—net	718,702	735,979
Obsolescence ...	1,000,000	1,500,000
General Reserve ...	1,500,000	1,000,000
Profit Unappropriated	1,150,793	688,106
	4,369,495	3,924,085
Company's proportion of profits retained in Subsidiaries ...	392,944	350,823
	4,762,439	4,274,908

JOHN SUMMERS AND SONS LIMITED

CENTENARY OF THE BUSINESS

MR R. F. SUMMERS'S STATEMENT

The annual general meeting of John Summers and Sons Limited was held on May 31st at Shotton, Chester, Mr R. F. Summers (chairman of the company) presiding.

The following is the chairman's statement circulated with the report and accounts:—

Before giving an account of our activities during the year 1950 I should like to mention the fact that we are this year celebrating the centenary of our business, which was founded in 1851 by my grandfather, the late John Summers. We are naturally very proud of the great progress that has been made since the very humble beginnings, when clog irons, manufactured in a small room in Stalybridge, were our only product. To mark this centenary we sent out a brochure to our employees and customers, which contained the following message from me:—

"One hundred years have now passed since the firm of John Summers and Sons came into being at Stalybridge. During this long period the firm's history has been one of steady progress, of happy relationships amongst those who work for it, and of honest trading and fair dealing with its customers—a record indeed of which we may well be proud.

"It fell to the lot of my grandfather and my father to lay the foundations, and it was they—especially my father—who by their unflagging energy and enterprise brought the firm through the first phase of its existence, the hand rolling of our sheet products. It has fallen to the lot of the younger generation to develop and make use of the great strides made in modern machinery, to install the hot and cold continuous strip mills with which you are all so familiar, and to plan the fully integrated steel plant which is now in course of erection at the Hawarden Bridge Steelworks."

PRODUCTION

It is very gratifying to me to be able to report that last year we again broke all our production records. The combined ingot production at Shotton and Shelton amounted to no less than 760,000 tons, which is 40,000 tons higher than the tonnage produced in 1949. On the hot mill we rolled 564,000 tons—almost 100,000 tons more than last year; 425,000 tons was cold reduced as against 350,000 tons in 1949, and deliveries of finished products to our customers attained the record figure of 564,000—an increase of 100,000 tons over the 1949 figure.

Turning now to the accounts—I do not think there is very much on which I need comment, as they have been drawn up on similar lines to last year. The gross profit is very much the same as last year, in spite of the record production to which I have just referred, but 1950 was a year of rising costs in almost every direction, with no corresponding increase in the selling price of our products, and I feel in the circumstances that it is very satisfactory that our greater production and increased efficiency enabled us to maintain approximately the same figure of gross profit.

INITIAL ALLOWANCES

In the directors' report for 1949 it was explained that it was proposed to transfer the initial allowances on the capital expenditure in connection with our large development scheme, comprising the installation of coke ovens, blast furnaces, and a new melting

shop, to a special reserve for deferred taxation, in order that the taxation charged in the profit and loss account each year would be more truly representative of the liability applicable to the trading profit that year. It will be noticed from the current accounts that the amount transferred to this special reserve amounts to no less than £600,000 with the result that the total amount charged against gross profit for taxation is very similar to the figure for 1949. We are satisfied that this is the most practical way of dealing with initial allowances, especially when they amount to such large sums. The announcement by the Chancellor of the Exchequer that these initial allowances are to be discontinued after April, 1952, will of course affect the company's cash position, but it is hoped that by that date approximately two-thirds of the cost will have been met.

The full dividend for the year 1950 was paid on the preference shares, together with the amount due from January 1 to February 15, 1951, and the maximum dividend allowed under the Iron and Steel Act was paid on the ordinary stock for the same period.

INCOME AND EXPENDITURE

Once again there is set out a table showing the distribution of the Group's income and expenditure, but on this occasion the 1949 figures have also been given for easier comparison. It will be noticed that "Gross proceeds of sales and income from investments, etc." is up by £4,500,000, demonstrating very clearly the larger volume of trading which I mentioned earlier:—

	1950 £	%	1949 £	%
Gross proceeds of sales and income from investments, etc.	24,070,139	100.0	19,533,194	100.0
Raw materials,	9,648,611	37.6	5,875,217	30.1
Wages, salaries, fees, pensions, State and workmen's compensation insurance ...	5,542,665	23.0	4,995,239	25.6
Maintenance materials, spares, miscellaneous supplies & expenses	2,477,029	10.3	2,320,901	11.9
Coal, fuel oil and electricity,	3,152,127	13.1	2,848,761	14.6
Carriage,	773,513	3.2	569,592	2.9
Taxation, incl. special reserve for deferred taxation,	1,556,431	6.5	1,424,151	7.3
Provision for depreciation,	581,858	2.4	510,970	2.6
Transfer to reserves, ..	560,717	2.3	611,175	3.1
Dividends, net,	377,188	1.6	377,188	1.9
	24,070,139	100.0	19,533,194	100.0

DEVELOPMENT SCHEME

Last year in referring to the development scheme I mentioned that expenditure to date on the scheme was £1,127,095; during 1950 a further £2,774,706 was expended. Whilst very considerable progress has been made, the rate at which such schemes as this can be carried out today is very much slower than before the war, and deliveries of all types of machinery and equipment are still very protracted. We are, however, pressing on with the scheme as energetically as we can, with a view to bringing the new plant into operation at the earliest moment. Every effort is being made to keep the cost as low as possible, but this is not easy in view of the continually rising prices with which we are at present faced.

The report and accounts were unanimously adopted.

PRESSED STEEL COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

MARKED PROGRESS OF ACTIVITIES

MAJOR ALBERT PAM'S SPEECH

The twenty-fourth annual general meeting of the Pressed Steel Company, Limited, was held on May 30 at Winchester House, Old Broad Street, London, E.C., Major Albert Pam, O.B.E. (the chairman), presiding.

The secretary (Mr F. E. Cairns, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the speech by the chairman which had been circulated with the report and accounts:

Ladies and gentlemen.—The directors' report and the accounts for the year ended December 31, 1950, are being circulated herewith, and I am glad to be able to tell you that your company has again had a successful year.

£1,000,000 IN RESERVE

The accounts which are before you are in very simple form and hardly need any explanations from me. In the directors' report you will have seen a reference to a new reserve, which has been created for the replacement of plant, machinery and equipment. This has become necessary as, in the past, the reserves for depreciation and obsolescence have been based on the historical cost of the plant and machinery, whereas the replacement values have now risen to many times the original cost. Unfortunately the Inland Revenue has not made provision for higher allowances out of untaxed profits; it is therefore necessary to build up reserves out of taxed profits for this purpose. You will see in the accounts that we now have over £1,000,000 in this reserve account.

The general reserve has been increased by £350,000 and provision is made for higher income-tax due 1951-52.

The heading "deferred repairs and contingencies" will now disappear from the balance sheet, as these repairs have been made good.

INCREASED DISTRIBUTION

The other items on the liability side are higher and for the first time our balance sheet reflects the payments of dividends on the higher capital brought about by the issues of new shares in 1949. The dividend recommended on the Ordinary share capital is raised to 20 per cent. and the directors are pleased to have been able this year to recommend an increase in this distribution.

On the asset side, you will see that freehold buildings are considerably higher, reflecting the purchase of a new factory, to which I shall refer later, and the item plant, machinery and equipment is up by over £300,000. The other items need no comment from me.

HIGHER BALANCE OF PROFIT

In the profit and loss account the balance of profit is higher at £1,023,809, after increasing various provisions; the balance from trading account is up by about £1,000,000, but the taxation item is nearly £600,000 higher than last year. The balance carried to the balance sheet for 1950 is £1,307,752, against £753,199 in 1949.

Last year I gave you some interesting figures about the distribution of your company's profit; for the year now under review the allocation is very similar. After paying a sum of £5,152,471 in wages, salaries, pensions and National Insurance

Fund contributions, the profit, before taxation, amounted to £2,669,349, and was absorbed as to:

61.65 per cent. by taxation,
30.14 per cent. retained in the business,
8.21 per cent. by dividends.

It will be seen from these figures what a small percentage was distributed to you as dividends. However, you know that it has been the policy of your Board to plough back as much of the profit as possible in order to build up the strength of your company. This policy has proved successful in the past and will, I hope, continue to prove so in the future, as it has enabled us greatly to increase our assets without having to call on you to provide fresh capital. In the past year, for example, we have bought a large and splendidly equipped factory in Theale, near Reading, which will be most useful to us for the further development of our refrigerator business, and thus leave more room at Cowley for extensions of our motor-car body business.

INCREASED PRODUCTION

The progress made by your company in the three fields of its activities has been very marked. Thus it is interesting to mention that the value in 1950 of our sales of refrigerators and of the production of our Linwood factory (including railway wagons) was greater by £1,000,000 than the total value of our motor-car business in 1938, and this in spite of the fact that these motor-car body sales are still by far the most important part of our activities.

As to Cowley, we sold in 1950 goods manufactured there to a value of nearly six times the corresponding value in 1938—that alone will show you how busy the plant has been and how efficiently it is worked. Although I am unable to give you the figure of our products exported, it is well known that 75 per cent. of the motor-car production of the country has been exported and well over 50 per cent. of our domestic refrigerators have also been sent abroad. We have therefore contributed substantially to the export drive.

DOMESTIC AND COMMERCIAL REFRIGERATORS

During 1950 the popular models of domestic refrigerators remained unchanged apart from minor refinements, but a new 7 cu. ft. refrigerator was brought into the range; this will be known as Model S.772 and is very moderately priced at £94 plus purchase tax. This, as well as our other popular models, is on view in our London showroom, 169, Regent Street, and at our distributors throughout the country.

Additions to our commercial refrigeration products included two new ice cream conservators, a frozen food cabinet, the new milk cooler designed to meet the needs of the smaller dairy farms, and an engine-driven version of the churn immersion milk cooler for areas where electricity is not available.

THE LINWOOD FACTORY

I am glad to be able to tell you that the Linwood factory has been producing very satisfactorily and efficiently. The railway wagon diversification is not progressing as rapidly as we had hoped, owing to the shortage of steel and other materials, but we have been complimented on the speed with which we have got under way and on the quality of the output. We are now using the capacity of Linwood almost to the full—we

may even have to consider extensions of factory space there in the near future.

The shortage of steel and of other materials is naturally affecting the output of the various products made by us; but it is also affecting, in other ways, the motor-car manufacturers to whom we supply bodies and parts, and industry throughout the country. Unless raw and other materials can be made more generally available to industry, it will be difficult to avoid a further slowing down which will greatly reduce production and will affect the whole country and its export trade.

VALUATION OF ASSETS

You will have heard that some companies, among them a few of the largest, are considering a revaluation of their fixed assets, in order that their shareholders may know the present value of their buildings, plant and machinery. In my opinion, it is too early yet for us to contemplate undertaking such a step. Neither costs nor financial conditions are yet sufficiently stable; we do not know how far the inflation of currency is going, nor the effects of rearmament. It would be inexpedient to go to the trouble and expense of a revaluation while so many fluctuations are still taking place—it might be necessary to undertake it again in a year or two's time because conditions had again changed. We are therefore retaining the historical cost of our buildings, plant and machinery, less depreciation, while we tell you that these assets, which have been maintained in an excellent state of repair, are today worth two or three times their book cost and that their replacement cost would be three times or more, if we were lucky enough to get delivery at all. It would probably take many years before we could replace these assets, but fortunately we really only need at present to undertake minor building operations and to order individual items of machinery to increase special production from time to time. We are moving machines and equipment from Cowley to our new factory at Theale, but we shall also require some extra plant, which is on order—this will take some time to obtain as the delivery dates are uncertain.

DEPRECIATION OF THE £

Last year in my speech I mentioned the effects of the depreciation of the purchasing value of the £ sterling. This is such a vital matter for the whole nation that I need make no excuse for mentioning it again, as the position has considerably deteriorated in the past year. In dealing with the accounts I have told you of the need for a large reserve fund for the replacement of machinery and equipment at a cost many times its original price. However, there is an advantage for your company in this state of affairs, for we are very favourably placed with our factories complete with very valuable plant and equipment. The funds necessary and the time required to duplicate these fixed assets would be very great—the capital expense would have to be so high that the charges on it, which would have to be met by profits, would cause such a rise in production costs as would make these too high and quite uncompetitive. By comparison your company's low capitalisation is a great help in this respect and incidentally of considerable benefit to our customers.

Finally, I should be glad if you would authorise me to express to our management, staff and all our employees your gratitude and appreciation for the good work they have done in the past year. It is due to their ability and efforts that we have been able to show such satisfactory results.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr Henry F. Marks and the Rt. Hon. Lord Ashburton, were re-elected and the proceedings then terminated.

CAMMELL LAIRD AND COMPANY LIMITED

ANOTHER SUCCESSFUL YEAR

INCREASED DIVIDEND

A VERY BUSY AND PROFITABLE YEAR IN THE SHIPYARD

SIR ROBERT S. JOHNSON'S REVIEW

PROFIT AND LOSS ACCOUNT

The eighty-seventh annual meeting of Cammell Laird and Company Limited, was held on May 25th, at the registered office of the company, New Chester Road, Birkenhead, Sir Robert S. Johnson, chairman and managing director, presiding.

The chairman, in moving the adoption of the report and accounts, said:

Ladies and Gentlemen.—This is the eighty-seventh annual meeting of our company, and before dealing with the business of the meeting, I would like to take the opportunity of welcoming our new director, Mr J. C. Mather, who was elected to the board during the year. Mr Mather has great experience in everything to do with ships, and in addition to a number of other activities, he is vice-chairman of the firm of Messrs. John Holt and Company, Liverpool. Later in the meeting we will ask you to re-elect him for a further term.

We have had a very busy and profitable year in our shipyard, and the results have been very much in line with those of last year, and I would like once again to congratulate the management, staff and workmen on the very fine effort they have made. I want to thank them for the success of their achievements.

I will now comment on the accounts of the company for the past year, a copy of which you will all have received.

BALANCE SHEET

Revenue Reserves.—You will notice that we propose adding £250,000 to our general reserve, bringing the total at the end of the year to £1,625,000.

Current Liabilities and Provisions.—Under this heading you will see an item "Installments received on account of work-in-progress." These instalments received are in excess of cost to the extent of £17,972.

Fixed Assets.—During the year we spent £84,196 on additions to our properties, but this was more than covered by the depreciation written off, with the result that the total book value of our properties at the end of 1950 was actually nearly £11,000 less than at the end of the previous year.

As is customary, all our buildings, machinery and plant have been maintained in first class condition, the whole of the cost being, as usual, charged to revenue.

CURRENT ASSETS

Sundry Debtors—show an increase of nearly £200,000 and at the same time the creditors show a reduction of £100,000.

Quoted Securities.—During the year we have purchased a further £407,800 of Government stocks. The other quoted securities at £115,967 show an increase of over £103,000 which is accounted for by purchase of certain industrial preference shares, stocks and debentures.

Bills Receivable—show a reduction of £169,000 consequent upon final retirement of certain instalments in accordance with our agreements.

The total of our current assets exceeds our current liabilities by nearly £4,500,000, which indicates the very healthy state of our finances. This is a very valuable feature in these difficult times.

Turning to the profit and loss account, you will see that our trading profit is £100,000 lower than last year, but when it is pointed out that nearly 20 per cent. of our output during the year was on the aircraft carrier "Ark Royal," which still appears in work-in-progress, the reduction in trading profit for the year is readily understandable.

Income from Investments—shows an increase of just over £40,000 on last year, making a total of £399,191, being due to an increased dividend by the Metropolitan-Cammell Carriage and Wagon Company, Limited.

The net balance carried to the appropriation account is £465,299, an increase of £28,323 on the 1949 figure, but I think it is important to point out here that in 1949 we reduced the net profit by transferring £60,000 as provision for depreciation in value of trading stocks whereas it is now considered that the total reserve for this purpose is sufficiently adequate to make a further addition from this year's profits unnecessary. When to the net profit of £465,299 is added £194,162 brought forward from 1949, and the interim dividend of £58,575 (net) paid in October last is deducted, a net balance of £600,886 is available for disposal, which your board recommend should be dealt with as follows:

In payment of a final dividend of 9 per cent., less tax at 9s. 6d. in the £ on ordinary stock ...	£167,738
Transferred to general reserve	£250,000
Carried forward to 1951 ...	£183,148
	£600,886

BOARD'S DIVIDEND POLICY

In regard to the proposed increase in dividend, your board have given long and earnest consideration to this matter before finally arriving at their recommendation, their chief concern being to restrict the dividend to one which they might hope to maintain without weakening the company's financial structure, and I hope that our final decision is one that will meet with the approval of our stockholders. In suggesting this increased distribution to the stockholders the board have not been unmindful of the Government's appeal for restraint in dividend payments, and our considered opinion is that, bearing in mind that for many years the company has ploughed back into the business more than one-half of their profits, the stockholders are entitled to some small return on the additional resources employed.

ENGLISH STEEL CORPORATION LIMITED

You will notice that this year we have omitted the accounts of the English Steel Corporation, and I have no doubt the stockholders are aware of the fact that the corporation was nationalised on February 15th last, and has been taken over by the Iron and Steel Corporation of Great Britain. This has been a source of great disappointment to us, as the corporation was doing extremely well and was spending large sums of money on development not only at Sheffield, but at Taylor Bros., Manchester, and at the Darlington

Forge, Darlington. Great progress was being made, and with the help of Vickers and ourselves the business was developing in every direction in a very satisfactory way.

The English Steel Corporation was a very important contributor to the dividends we have declared in past years, but as a result of nationalisation, we shall no longer have this contribution, and in place of holding English Steel Corporation shares as heretofore, we have received payment of compensation amounting to £6,827,396 15s. in 3½ per cent. steel stock. What we are going to do with this money is a problem we are at present unable to solve. Whether there will be an opportunity afforded the old shareholders to buy back their holdings in the corporation is difficult to foresee. This would be the solution we would most earnestly desire. It may be a considerable time before any finality is reached in this connection, but in the meantime the interest on the money will be used to assist in providing dividends which we hope will be more or less the same as they were in the year 1950.

METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY, LIMITED

With regard to the Metropolitan-Cammell Carriage and Wagon Company, Limited, their small steel works at Wednesbury has been nationalised, and the company has received the sum of 35s. per share in 3½ per cent. steel stock for the 510,000 shares which belonged to them. The money received has been absorbed by the company as owners. They very much regret this change as the steel works of the Patent Shaft and Axletree Company, Limited, supplied the company with a large portion of its raw material.

In June, 1950, the Metropolitan-Cammell Company increased its issued share capital from £1,000,308 to £2,000,000 by a bonus issue. We hold half of these shares and the Metropolitan-Cammell Company recently declared a dividend of 8 per cent., free of tax, for the year 1950 on the total increased capital instead of 10 per cent. on the old capital as before.

A copy of the Metropolitan-Cammell Carriage and Wagon Company, Limited, balance sheet is attached to the accounts.

The company has had another very successful year, the deliveries being the highest in its history, and you will be interested to note that exports accounted for nearly 60 per cent. of the total. This was in spite of a number of export orders being held up by lack of shipping space, which has become a very serious problem. The company has obtained a further number of export orders against keen Continental competition, and the orders have very nearly kept pace with deliveries, so that they will be fully occupied for some considerable time. The programme planned for this year includes passenger coaches for India, Rhodesia, Egypt, Ceylon, Australia, Colonial and other overseas railways, in addition to light alloy coaches for the London Transport Executive and new standard steel coaches for British Railways, for which undertaking also a considerable number of wagons will be built.

The company is developing a very important business in the manufacture of buses, and the output is increasing. They hope that this part of their business will become a very profitable one.

Respecting both the English Steel Corporation and the Metropolitan-Cammell Carriage and Wagon Company, Limited, I would like to place on record, our appreciation of the efforts of the managements and staffs of these companies. The managing director of the English Steel Corporation is Mr F. Pickworth, and in the case of the Metropolitan-Cammell Carriage and Wagon Company, Limited, Sir A. J. Boyd. These two gentlemen have taken the greatest pains to organise their respective concerns to the highest degree of efficiency. They have very fine support from their young co-directors and from the

managers and executives under them. I have the opportunity of seeing them in action once a month only, but I have noticed with the greatest pleasure the excellent organisation both companies have developed. This is undoubtedly the chief reason that such fine results are being produced.

BIRKENHEAD

At our shipyard at Birkenhead we had another extremely busy year. We completed and delivered six ships including one of the largest tankers ever to be built in the British Isles, namely the 28,000 tons "Volsella" for the Anglo-Saxon Petroleum Company Limited. Nine ships were launched during the year.

The highlight of 1950 was undoubtedly the launching of the aircraft carrier "Ark Royal" for the British Navy, at which Her Majesty the Queen so kindly performed the christening ceremony. She remained with us for over five hours, and during that time there was not a dull moment. When speaking at the luncheon Her Majesty expressed herself in the most delightful terms, as being deeply touched at everything she had seen.

Our repair department has had another very successful year, and it has had the distinction of not only converting the former aircraft carrier "Campania" into a travelling exhibition ship for the Festival of Britain, but has also secured the order for the fitting up of the Shaw Savill liner "Gothic" for the forthcoming tour of Their Majesties to Australia and New Zealand.

NEW VESSELS BUILDING OR ON ORDER

We have at present building or on order, new vessels which will keep our yard fully occupied for the next three or four years, and our anticipations in regard to repair work are also very promising. These prospects indicate continuous activity for a long period, but the outlook is not without its anxieties, as it is becoming increasingly difficult to obtain the materials with which to construct our ships. Steel and non-ferrous metals are particularly difficult to obtain in sufficient quantities at the present time. In view of these inevitable difficulties it is particularly unfortunate that we should have had to contend with the unofficial banning of overtime and night-shifts on Merseyside. This has been a great hardship to a large number of our employees.

If we, and the country in general, are to keep faith with our commitments, and contribute an all-out effort to the defence programme, it will be absolutely necessary for everyone of us to exert the utmost effort and give of our best. Our interests are common interests and there should be mutual understanding and sympathy. We must not forget that our efforts benefit not only ourselves, but the community we live amongst and our country as a whole.

The report was adopted.

ILLUSTRATED NEWSPAPERS LIMITED

MAJOR H. DAVENPORT PRICE'S SPEECH

The twenty-fifth annual general meeting of Illustrated Newspapers Limited was held on May 29th in London.

Major H. Davenport Price, M.C., J.P. (the chairman), in the course of his speech, said: The profit on trading of the company and its subsidiaries amounts to £590,580, compared with £640,699. After adding dividends and interest on securities, bank deposits, etc., the profit is increased to £598,003. The net profit attributable to Illustrated Newspapers Limited of £290,842 compared with £265,841.

There has been retained in the accounts of the subsidiary companies the sum of £133,796, leaving the net profit for the year dealt with in the company's accounts of £157,046. To this has to be added the balance brought forward from last year of £82,342, making the amount available for appropriation £239,388.

During the year we had to contend with a dispute in the printing trade, and this has had its effect on the year's results.

Apart from that labour problem, which I hope is a thing of the past, we have other problems which I am afraid are more lasting. Amongst these are the extremely high cost of paper and other printing materials, and general increases of costs and expenses. I am afraid that these will tell their tale in the next accounts.

Our revenue from sales and advertisements has been well maintained and our standard of production remains as high as ever.

The report was adopted, and a dividend of 3 per cent. and 1 per cent. bonus was approved.

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

MANUFACTURERS OF DRY BATTERIES
PORTABLE ELECTRIC LAMPS
ALLDRY RADIO

The annual general meeting of The Ever Ready Company (Great Britain) Limited was held on May 31, 1951, in London. The following are the comments of the chairman, Mr E. N. Rowbotham, on the report and accounts for the year ended February 28, 1951.

JUBILEE YEAR—RECORD SALES AND NET PROFIT

This is the Jubilee Year of the business and I am therefore more than pleased to be able to tell you that the sales and net profit before taxation constitute a record in the company's history.

The result is due to the spread of the company's activities and in particular to the rapid development of its export trade through its wholly owned subsidiary, The Berek Battery Export Company Limited. In consequence the accounts are now drawn up in the form of consolidated accounts and the figures shown for last year have been adjusted to enable stockholders to make an easy comparison.

Apart from the main business of the company which, as you know, is the manufacture and supply of dry batteries and all forms of portable electric light and Alldry Radio, we are interested either directly or through our subsidiaries and associated companies in the manufacture of chemicals for batteries and other important industrial uses, carbon rod, miniature motors and toys. All these products are sold on the export market as well as on the home market.

THE "SAUCEPAN SPECIAL"

Sales of radio receivers using the company's Alldry Radio Batteries have increased, and a considerable success has been achieved by the "Saucepan Special"—a short-wave receiver specially designed for use in Central Africa. Sales of miniature electric motors and toys using dry batteries which were introduced last year have progressed satisfactorily.

The consolidated balance sheet shows that fixed assets have increased by £175,000. This figure includes the purchase of the freehold of our factory at Walthamstow referred to in the directors' report, and stockholders will be

glad to learn that for all practical purposes the manufacturing premises of the company are now all freehold property.

The value of trade investments (the book value of which shown in the balance sheet is £194,043) has increased during the year from £599,277 to £714,171, due almost entirely to an increase of £107,945 in the market value of the quoted investments.

Reserves and carry forward have increased from £1,718,117 to £1,866,825. The balance of current assets over liabilities and provisions is lower than last year, due to the special expenditure on the purchase of the freehold of our Walthamstow factory.

Stock at £1,452,583 is only £28,000 higher than last year, mainly due to the control of material supplies.

The consolidated profit and loss account shows depreciation the same as last year, namely £80,000, and your directors recommend the allocation of £108,705 to reserve account; £50,000 of this sum to be added to contingencies (including taxation equalisation) reserve, which is expected to be sufficient to deal with inequalities in taxation from year to year arising out of the effect of initial allowances, etc.

On the acquisition of the entire shareholding of a company which deals with battery and other chemicals a payment of £38,705 was involved for the goodwill of the business and, in accordance with the long-established policy of the company, this sum has been written off, as shown in the reserve account. This company was acquired so late in the financial year that its results are not included in the present consolidated accounts.

TAXATION AGREED

I am happy to be able to report to you that since the end of our financial year we have agreed with the Inland Revenue the whole of liability for wartime taxation.

Your directors have appointed three joint general managers of our business. They have each of them served the company for over fourteen years, and I am sure they will assist in maintaining for the company the tradition upon which the success of the business has been built up.

During the year a comprehensive non-contributory pension scheme benefiting the whole of the staff has been introduced. Your directors have frequently placed on record their appreciation of the service given by the staff to the company, and they feel sure that stockholders will concur in giving this practical encouragement to those men and women who have taken up the company's service as their career and on whose continuance in our service depends, to a large degree, the future of the company.

FUTURE PROSPECTS

In October last the company was compelled to increase a number of selling prices to offset partly the rise in the cost of raw materials. Increased costs and shortages of raw materials are probably the greatest difficulties facing the company in the coming year. Your directors are actively pursuing their long-standing policy of securing greater efficiency in manufacture, but any further substantial increase in basic raw materials or wages must inevitably cause further increase in selling prices.

I would like again to record the board's high valuation of the efficient service given to the company by both staff and workpeople.

The report and accounts were adopted and final dividends of 5 per cent. on 200,000 preference stock units of £1 each, making 10 per cent. for the year, and 20 per cent. on 4,041,609 ordinary stock units of 5s. each, making 35 per cent. for the year, were approved.

H. LEDGARD (SILMYRA FABRICS) LIMITED

INCREASED TURNOVER AND PROFITS

MR HERBERT LEDGARD'S REVIEW

The third annual general meeting of H. Ledgard (Silmyra Fabrics), Limited, was held on May 31st at Park Suite, Grosvenor House, Park Lane, London, W.1, Mr Herbert Ledgard, chairman and managing director, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1950:

You will be glad to know that your company has again experienced a satisfactory year's trading and will see from the directors' report that the profits, after charging all expenses including directors' remuneration and depreciation but before taxation, were £231,077, compared with £188,612 in 1949 and £124,028 in 1948. The higher profits are again attributable to increased output and sales and in no small measure to the good work put in by the management, staff and operatives.

PROFITS AND TAXATION

The 1950 profits, before taxation, show an increase of £42,465 on 1949 but unfortunately the higher taxation charge shown in the accounts has absorbed the whole of this increase, leaving a net profit of approximately the same amount as last year. It was inevitable that over half of the increased profit would be swallowed up in taxation but, in addition, in view of the recent Budget, we have made provision for the higher rate of income tax payable in 1952 on the whole of the group profits. We have also thought it desirable to add to the taxation charge and include in the amount set aside for future taxation £12,000, the approximate amount by which the tax liability on the profits of the year has been reduced by initial allowances on capital expenditure.

A further element in the apparently disproportionate tax charge is the fact that in arriving at the trading profits a deduction of £12,500, which is not deductible in computing taxable profits, has been made to eliminate unrealised inter-company profits, bringing the amount set aside in this connection up to £37,500, as shown in the balance-sheet.

BALANCE-SHEET FIGURES

The amount of £85,546 has been written off the cost of "Shares in wholly-owned subsidiary companies," which, together with an adjustment of £5,591 in the tax liabilities of the pre-acquisition period, has had the effect of reducing the item "Excess of cost of shares in subsidiaries over book value of net assets at date of acquisition," shown in the consolidated balance-sheet, to £115,500, a sum equal to the balance of the share premium account. The present-day value of the group's net assets is, in fact, considerably in excess of their book value and the fixed assets are valued for insurance purposes at approximately £600,000 in excess of their book value.

NEW MILL

The building of the new mill to which I referred last year has been completed. A large part of the new plant, including a number of automatic looms, is already in production and it is hoped that the whole of the additional plant will be installed by the end of the present year. The capital expenditure on this project is reflected, in the consolidated balance-sheet, in the increase in fixed assets from £88,475 to £173,054 and in the capital commitments of £82,000.

INCREASED POPULARITY

The popularity of Silmyra Fabrics is greater than ever and, even with our increased production, we are still unable to satisfy all the home and export demands made on us. Nevertheless, I am happy to be able to state that our sales so far this year are considerably higher than those for the corresponding period of 1950 and, although I hesitate to predict the future, which will not be without its difficulties, I feel that we have a reasonably good prospect of again having a satisfactory year in 1951.

The directors recommend to the shareholders that a final dividend of 15 per cent., less tax at 9s. 6d. in the £, should be paid on the Ordinary share capital making, with the interim dividend of 10 per cent. (less tax) already paid, a total of 25 per cent. (less tax) for the year to December 31, 1950. This is the same rate as for 1949 and absorbs about a quarter of the net profits of the year available for ordinary dividend, leaving the sum of £61,456 to be carried forward to next year. The report and accounts were adopted.

UNITED SUA BETONG RUBBER ESTATES

"FREEZE" SCHEME EXAMINED

SUPPLIES TO CHINA

SIR JOHN HAY ON THE PRICE OF RUBBER

The forty-second annual general meeting of The United Sua Betong Rubber Estates, Limited, was held on May 30th in the Council Room of the Rubber Growers' Association, 19, Fenchurch Street, London, E.C.3.

The following is the statement circulated by the chairman, Sir John Hay:—

In contrast to the meagre rewards which are the more normal lot of the rubber plantation industry, producers have for nearly a year enjoyed an exceptional prosperity which in our case is reflected in the accounts now presented to you. Before deduction of tax, profits amounting to £1,637,726 were disposed of as follows:—

	% of profits
(a) Malayan income tax and export duty	
United Kingdom income tax and profits tax	£976,476=60%
(b) Dividends to stockholders	236,250=14%
(c) Ploughed back into the business	425,000=26%

As is customary, our dividend is expressed in terms of a percentage of the nominal capital. If, however, it were calculated on the real capital employed in the business, the gross rate would be less than 17 per cent. and the net rate less than 9 per cent. The average dividend paid over the last two decades—that is, 1930-49 inclusive—was 7.50 per cent. on the nominal capital. Calculated on the real capital it would probably be less than half that—a return so modest as to surely satisfy even the most grudging critic, and hardly an adequate reward for an enterprise which involves in the initial stages a wait of some years before the first harvest is gathered and in its continuing life accepts all the risks inseparable from the conduct of tropical agriculture, carried out in a country peculiarly vulnerable to attack from within and without.

From the figures I have quoted it is very evident that the main beneficiaries of our prosperity are the Governments of Malaya and the United Kingdom, who receive more than four times as much as stockholders. The new rate of export duty levied by the Malayan Government only operated for a part of the year under review and amounted on our crop to £143,000. This year it may be as much as £600,000 or more. The sum left for distribution to stockholders and for the necessary provision for reserves will be correspondingly reduced.

THREATS OF FURTHER IMPOSTS

One would have imagined that the rate of duty combined with the United Kingdom and Eastern taxes now levied would be sufficient to satisfy the most rapacious of governments, and that there would be some recognition of the fact that taxation has reached such a level

that it is no longer profitable to engage fresh capital from this country in long-term enterprises in Malaya. But the Malayan Government, apparently indifferent to such considerations, and with a seeming disregard for the future development of their country, have recently put forward proposals for adding to the rubber industry's existing burdens. They propose to "freeze" part of the proceeds of rubber and for that purpose they invite the industry to commit itself to a scheme which has been tried out in other territories in respect of other products and, after examination, has quite recently been roundly condemned by two economists appointed by the Colonial Office. At the very best, this out-moded scheme could only be made applicable to a primitive community which has not direct access to world markets and which is content to sell its product through one single agency. In no respects is it applicable to the rubber industry as a whole in Malaya and, if attempted, will prove administratively impracticable and seriously damaging to an industry upon which the economy of Malaya rests so heavily. It is fair to say that the proposal is put forward under the guise of being helpful to the industry as a means of stabilising its income, but since it is proposed that the proceeds should be placed in a fund to be applied by Government to a wide variety of vaguely specified purposes, without any guarantee that it will be returned to the producers from whom it has been taken, it becomes fairly evident that the one certain purpose it will achieve will be to reduce further the already heavily taxed income of the rubber producer.

The scheme starts from the premise that the high price of rubber is a contributing cause to inflation in Malaya. That premise, of course, in its application to a company such as this, is unsound, as would be evident from an examination of our accounts. Our total proceeds from rubber and tea in 1950 amounted to £2,600,000. Of that, only about one-third was spent in Malaya, mainly on wages. The rest goes in taxation, dividends to stockholders, mostly registered in this country, and to reserves which for the time being will be held in England or invested in gilt-edged securities. No substantial reduction of expenditure in Malaya could be made except by means of a reduction in wages or in the taxes paid to the Malayan Government. Which of these two items is to be reduced? Surely not the latter, which has always been represented as disinflationary. Are we left to suppose that Government wish wages to be reduced and are seeking this indirect method of achieving a purpose which they are afraid to avow openly?

In Malaya there are two distinct classes of producers—namely, the estates owners

and the smallholders. Their marketing methods are quite dissimilar. They operate under quite distinct and contrasting financial systems. Treatment for the one cannot be suited to the other. This company is typical of the former; it pays heavy taxes to the United Kingdom and Malayan Governments, it puts money to reserve for replanting and equipment, etc., and in good years distributes only a modest proportion of its profits. The smallholders consist of simple and primitive people who pay no taxes, spend their income as it is received and make no provision against adversity or for the betterment of their holdings. They stand in need of instruction, guidance and protection from their own happy improvidence. They are the special responsibility of the Malayan Government, a responsibility which has been too long neglected and which is not discharged by the advancement of ill-contrived proposals which can be of no benefit to either class of producer. There are other and well-tried means by which Government can check inflation: they are less disruptive, more practical, and more equitable in their application to the community as a whole.

RUBBER TO CHINA

That abnormal shipments of rubber went to China from June, 1950, to March, 1951, was never a secret and the figures were never difficult of exact ascertainment. The delay that occurred in checking this undesirable trade must be ascribed to a strange lack of single-mindedness on the part of the governments concerned. Reasons of security would have carried conviction and ready co-operation. To explain control by reference to the need for checking inflation and reducing the price of rubber, as was done by the Colonial Secretary at Singapore, was an unnecessary introduction of irrelevant and disputable matter. Despite recent drama on the high seas involving the "Nancy Moller" and the "Cossack," we deceive ourselves if we imagine that, in consequence of stopping shipments from Malaya and adjacent Colonial territories, China cannot now get rubber. From other countries, processed rubber ready for market is exported at a rate of over 500,000 tons per annum and is available by purchase for shipment to any destination.

PRICE OF RUBBER

Within the space of a month or two the rubber market has undergone bewildering changes in sentiment and price which in their violence and rapidity surpass almost all former extremes of the many fluctuations which feature in the history of our notoriously variable commodity. In the early part of this year the London price of rubber rose to 6s. 2d. per lb. It has since fallen to 3s. 7d. And yet in that interval there has been no significant change in the statistical outlook in so far as it relates to production and consumption. The London Conference which met in February, with its imposing array of national representatives, its secrecy, its whispers of an acute shortage of rubber and the consequent need for international allocation, ministered to an excited and expectant market. Nevertheless, the sober fact was that the rate of rubber production then and in prospect was in excess of probable trade requirements. The excess was of an order sufficient to implement trade stocks and to add not inconsiderably to the U.S.A. strategic stockpile. Whether supply and demand for all purposes were to be brought into equilibrium depended primarily on the rate at which the U.S.A. was content to add to its stockpile and to what further extent she could increase her production of synthetic and so reduce her dependence on natural. The decision made early in April to impose destination control on all shipments of rubber from Malaya and adjacent Colonial territories, with its avowed purpose of reducing supplies to China, and the later deci-

sion to stop all shipments to that country, with its consequent promise of more for others, gave encouragement to the U.S.A., in particular, to follow a more cautious buying policy, and so a price that went up quickly has fallen more rapidly. In circumstances where the trend of prices is influenced not by supply and trade demand but by political strategic considerations overlaid by emotion, it would be imprudent to hazard an opinion regarding future prices, but what I can assert with confidence is that recent experiences confirm producers in their desire for a stable price at a moderately profitable level. That unhappily, is a choice that they are not given. To consent to a ceiling price in times of apparent shortage without any reciprocal undertakings in respect of price in times of surplus would be a foolish bargain. Without such rare spells of prosperity as the industry at present enjoys it would rapidly become obsolete through lack of funds for replanting and re-equipment. In previous addresses I have made the point that the price of rubber is not out of line with the prices of other commodities. In terms of American cotton values, the present price of rubber is substantially below the 1939 level. In that year we were able to barter 90,000 tons of rubber for 600,000 bales of cotton. The same quantity of rubber today is the equivalent of only 370,000 bales of cotton.

COSTS

Increased and increasing wages and the high rate of export duty are having a profound effect on costs which in the current period are likely to be double those of last year. Owing to competing demands for labour, which is in short supply, and to a continuance of conditions that make supervision difficult, endeavours to offset higher wages by the application of methods aimed at higher output per man have had only very partial success.

REPLANTING

In the postwar period we have replanted over 7,000 acres, bringing the area under high-yielding stock to over 60 per cent. of our total acreage. Your board have decided that in present circumstances we should go more slowly for a period, allowing our managers time for consolidating what has already been done. Our programme for this year is, therefore, limited to 560 acres and will probably be equally modest in the following year.

RE-EQUIPMENT

Plans for the replacement of the central factory on our main division have been passed and construction has commenced. We have been considering for some time the processing of some part of our crop in the form of latex suitable for shipment in bulk to overseas markets, and in conjunction with associated companies we have entered into a contract for the erection of the necessary processing installation.

CONDITION OF PROPERTIES

Despite the many difficulties that continue to be encountered reports on the condition of our rubber and tea properties are satisfactory.

SALES FOR CURRENT YEAR

Including all forward contracts outstanding at May 21st, out of this year's crop 6,458,024 lb. have been sold at an average price of 48.27d. per pound.

STAFF

The murder of two members of our staff, as recorded in the directors' report, is a grim reminder of the conditions under which our staff serve and the dangers which beset them in the course of their work. To their enduring courage we again pay tribute. For their services we are deeply grateful.

The report and accounts were adopted.

SCHWEPPES LIMITED

A YEAR OF PROGRESS

The 54th annual general meeting of Schweppes Limited was held on May 31st in London, the Hon. R. Hanning Philipps, M.B.E. (the chairman), presiding.

The following are extracts from the statement by the chairman circulated with the report and accounts:—

Your company has reason to look at the progress made last year with solid satisfaction. The developments undertaken in the principal aspects of management, namely, production, sales and personnel, have combined together to strengthen the efficiency of the company and to place its earning power upon a more stable basis than it has generally been considered possible to expect in our industry.

This success has only been possible as a result of a sales policy directly aimed at levelling up demand over the various seasons of the year. A consistent and resolute effort has been made by the sales forces of both Schweppes and Kia-Ora to increase the demand in what have hitherto been regarded as slack or off-peak periods.

So successful have the results been that in a year so cold and wet that the volume of business done by the industry as a whole has declined as against the previous year, the sterling sales for all our company's products have gone up by 25.12 per cent., although prices remained the same. Moreover, the whole of that increase has been put on in the off-peak periods.

Our modernisation programme at home has included the purchase of suitable premises at Fareham intended eventually to replace the present Southampton factory. We are also in process of building a modern factory at Fazakerley on the outskirts of Liverpool. This factory will, with its increased productive capacity, be a valuable aid to the development of our export trade, particularly to the dollar countries.

OVERSEAS BRANCHES

With the exception of France, where trading conditions have remained difficult, our overseas branches have had another good year.

In November I made a short visit to Australia, and was much impressed by the progress of our organisation and the improved productive facilities of our Sydney and Melbourne factories.

Looking at our business as a whole, the financial position is one of great strength. However, in common with all British industry in an inflationary period, the amount of capital required in the business is continually rising, and it is common prudence to provide for this situation by retaining a substantial part of the year's profits to meet the cost of future development. In the difficult times through which our country is passing, it has been our practice as leaders in our industry to conform in the matter of dividends to the spirit of the national needs as indicated by the Chancellor.

The proposed distribution to our ordinary stockholders represents the modest reward, after tax is deducted, of 2.34 per cent. on the real capital they have provided for our enterprise.

As regards the future, I can only say that so far our trading has remained satisfactory, though our margin of profit will inevitably decrease because of steeply rising costs; moreover, it would be idle to deny the risk of shortage of some of our raw materials. I feel, however, that, provided there is no national catastrophe, this Festival Year should be a reasonably good one for our company.

The report and accounts were adopted.

GALLAHER, LIMITED

(Incorporated in Northern Ireland)
Tobacco, Cigarette and Snuff Manufacturers)

INCREASED PROFITS DESPITE ADVERSE FACTORS

STRONG DEMAND FOR COMPANY'S BRANDS

CAPITAL INCREASED

SIR EDWARD DE STEIN'S STATEMENT

The fifty-fifth annual ordinary general meeting of Gallaher, Limited, was held on May 31st at Winchester House, Old Broad Street, London, E.C., Sir Edward De Stein (chairman of the company) presiding.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year ended December 31, 1950, and was taken as read:—

The year 1950 has not been an easy one as, among other adverse factors, we have had to deal with rising costs including the effects of devaluation, which, however, will not be fully reflected in our accounts until the year 1951. Having regard to the circumstances existing throughout the year 1950 I think it is satisfactory to be able to report in our consolidated profit and loss account an increase of £300,000 in profit for the year before providing for taxation. This figure is arrived at after charging depreciation on buildings, plant and machinery, etc., of £210,000 compared with £180,000 in the year 1949. The corresponding figure in the year 1948 was £129,000, so that in the two years we have borne an increase under this heading of £81,000—more than 60 per cent. of the 1948 figure. This is a measure of the thorough reconstruction and reorganisation of buildings and modernisation of plant which I reported last year as being then practically completed. Until the present restrictions are removed, which would enable us to increase our purchases of suitable types of cigarette tobaccos, we will be unable to reap the full benefits of this expenditure.

PROVISION FOR TAXATION

Regarding the provision for taxation, you will see that the amount set aside for income tax in the consolidated profit and loss account is less at £517,000 than the corresponding figure in the profit and loss account of Gallaher, Limited, only, which amounts to £530,000, although the consolidated profit exceeds the profit of Gallaher, Limited. The explanation of this is that in 1949 the income tax profits of one of our subsidiaries were not sufficient to absorb fully the deferred repairs and the initial allowances on plant and buildings; the surplus allowances were carried forward and set off against the 1950 profit, so reducing the provision for income tax in the 1950 accounts. Out of the profits for the year the sum of £172,554 has been set aside to general reserve account, rounding off the amount standing to the credit of this reserve at £750,000. We feel justified in appropriating this amount to general reserve as we already have a substantial amount standing to the credit of the company's reserve for contingencies—£1,047,000.

Turning to the consolidated balance sheet, the only figure which calls for special comment is stock in trade, which in 1950 amounts to £10,800,000 as compared with £9,200,000 in 1949. This increase is in part due to an increase in quantity, but mainly to the higher prices we have had to pay for suitable types of tobaccos including dollar tobaccos. This increase in value of stocks has been financed as to £1,200,000 by additional borrowings and the balance provided by profits retained in the business.

FINANCIAL ARRANGEMENTS

Since the date of the balance sheet we have reduced our short-term borrowings by issuing 160,000 ordinary shares at £5 each and £2,000,000 Four per Cent. Unsecured Loan stock 1960-65 at £99 per cent. We have at the same time converted the £2,000,000 Three and a-Half per Cent. Ten-Year Registered Notes 1953-57 shown in the balance sheet at December 31, 1950, into a corresponding amount of Four per Cent. Unsecured Loan stock 1960-65. In this way we have introduced into the business approximately £2,700,000 of new money after allowing for the expenses of the issues, and we have also deferred the latest redemption date of £2,000,000 of our Loan capital from 1957 to 1965. As a result of receiving this new money we shall be able to reduce our liability on acceptance credits and we shall also be in a better position to borrow from our bankers on a short-term basis to finance the purchase of additional leaf tobacco if the opportunity of doing so should arise. The company has now issued all of its authorised share capital and we will at the extraordinary general meeting to be held at the conclusion of the annual general meeting be asking you to pass a resolution increasing the authorised ordinary share capital from £2,250,000 to £3,500,000. It is not, however, intended that any of these new shares should be issued in the immediate future.

A particularly satisfactory feature of the company's operations during the year under review is an increase in our sales of roll and bar tobacco. All the company's brands of cigarettes continue to be in strong demand, in particular "Senior Service." At present we are unable to meet this demand because the restrictions now in force make it impossible for us to buy cigarette tobaccos in sufficient quantity—especially from dollar sources.

PROGRESS OF ENGINEERING BUSINESS

Our engineering business has shown satisfactory progress, has a full order book, and is making good profits. In previous years the profits which it earned were retained by the subsidiary, but we have in the year 1950 received our first dividend on the ordinary shares.

Notwithstanding the benefits we have received from economies which have been introduced, we are faced with still further and substantial rises in the cost of manufacture. Moreover, as I have indicated, the full effects of devaluation have not yet been felt as the stocks of tobacco bought before devaluation only became exhausted during the latter half of 1950. In addition the crop outlook in Rhodesia for the current season is very poor, so we shall have plenty of problems to face during the year 1951. Finally, we shall have the effect of the increased rate of profits tax on distributed profits which does not affect the accounts under review. Your directors, however, will continue to do the best they can within the limits imposed upon them by the strict allocation of the most important growths of cigarette tobacco and the enormous proportion which duty bears to the sale price of our products.

ALTERATION OF BORROWING POWERS

I have already referred to one item of special business to be dealt with at the extraordinary general meeting—namely, increasing the authorised ordinary share capital. We shall also then be asking you to authorise alterations in the provisions of the articles of association of the company relating to the borrowing powers of the directors, and to the appointment of proxies. An explanatory note on the proposed resolutions was circulated with the annual accounts. The alteration of the borrowing powers of the directors is designed to bring them into line with the arrangements made with the loan stockholders. The actual difference in amount is at present negligible. The new definition is,

however, more flexible as, on the one hand, it is based on a figure which includes profits ploughed back into the business and, on the other, acceptance credits are to be included as borrowings. The purpose of the resolution regarding proxies is to give members the right to appoint as proxies persons who are not members of the company. If the company were registered in Great Britain, this right would have been automatically extended to members by the Companies Act, 1948.

THE DIRECTORATE

During the year the Hon. J. M. W. North resigned from the board, much to the regret of his colleagues. He was appointed a director for special work in re-equipping and re-organising the company's factories as a result of the war. This special work was very well carried out and is now completed, and I am pleased to say that we still have the benefit of Mr North's services as a director of our engineering subsidiary.

In due course we shall be proposing the re-election of Mr Arthur Robinson, Mr A. V. Maunder and Mr E. J. Foord—the directors who retire under the articles of association. Mr Robinson has attained the age of 70, but as the company is registered in Northern Ireland the conditions of the 1948 Companies Act do not apply. Mr Robinson, who was so largely responsible for the creation of the well-known brand, "Senior Service," which the company acquired in 1936, has performed and continues to perform duties of incalculable value to the company. All his colleagues are thankful and gratified that he has agreed to offer himself for re-election. Mr Maunder, our leaf expert, is, of course, well known to you all. Mr Foord was appointed a director since the last annual general meeting. He has 16 years' service with the company, and has held a number of appointments which have given him a wide experience of all branches of the business.

CONTROLS REMOVE COMPETITIVE SPIRIT

One of the great difficulties and dangers which result from the present period of controls and restrictions is that the competitive spirit and a great deal of the zest of business has been removed. For this reason we particularly appreciate and value the keen and efficient co-operation of our management, staff and employees. We hope that one day it may be possible to restore to industry a greater measure of freedom, to individuals a greater opportunity to benefit from their own efforts, and to the public the opportunity of buying the goods they desire.

The report and accounts were adopted. At a subsequent extraordinary general meeting of the company resolutions were passed for the increase of the authorised capital of the company and for the alteration of the provisions of the articles of association relating to the borrowing powers of the directors and to the appointment of proxies.

HARTLEY FABRICS, LIMITED

INCREASED TURNOVER

The fifth annual general meeting of Hartley Fabrics, Limited, was held on May 25th, at Preston.

Mr. Edwin Leach Hartley, the chairman, presided.

The following is an extract from his statement, which was circulated with the report and accounts:—

The trading profit of the group was £234,605 against £191,888 last year. After deduction of depreciation, management salaries, and commissions, and directors' and registrars' fees, there is left £210,589, compared with £171,270 last year. Income-tax

and profits tax amounting to £11,355 (£86,716 last year) must then be deducted, leaving £99,234 for disposal, as compared with £84,554 last year.

During the year a bonus issue was made to shareholders of one ordinary share for every seven ordinary shares held, thus increasing the capital of the company by £25,000. The directors recommend a final dividend of 10 per cent. on the ordinary shares, making 15 per cent. for the year. The total turnover of the group has increased by 17 per cent. over last year's figure.

The policy of modernisation is continuing in the producing companies. Machinery is on order which will increase the blowroom capacity by 50 per cent., and the necessary building extension to house it is in course of erection. The weaving section at Darwen is also being extended and we anticipate a substantial increase in our production both of yarn and cloth during the coming years. We have a very good order book and unless unforeseen circumstances arise another successful year may be confidently anticipated. The report was adopted.

UNITED CANNERS

THE GOVERNMENT AND THE CANNING INDUSTRY

MR J. B. DRING'S SPEECH

The nineteenth annual general meeting of United Canners, Limited, was held on May 24 at Boston.

In the course of his remarks the chairman, Mr J. B. Dring, said:

It is proposed that there should be a final dividend of 20 per cent., less income tax at 9s. 6d. in the £, which, together with the interim dividend of 10 per cent., which has been paid, makes a total of 30 per cent. for the year.

In the combined accounts there was a net profit before taxation of £213,106, which, together with the balance brought forward from last year, made a total of £252,941. After reserve for taxation, directors' fees and dividend, and a transfer to general reserve of £30,000, there is a balance to be carried forward of £70,071.

We have for a period of three years, restricted our dividend to 25 per cent., but now that it has been indicated that some slight increase might be justified, it is proposed to pay a dividend of 30 per cent.

COMPANY'S ASSETS

It may be of interest to compare the position of your company to-day with its position the first year in which we paid a dividend of 25 per cent. That was for the year ended December 31, 1947. That year we had a disposable balance of £57,835. This year our disposable balance is £105,194. That year we placed £17,500 to reserve, making a total reserve of £30,000. This year we are placing £30,000 to reserve, making a total of £180,000. That year we carried forward, in our combined accounts, £11,517. This year we carry forward £70,000.

In the combined balance sheet current assets are £719,507, against current liabilities £483,425, a surplus of £234,000.

In reference to the fixed assets, which include a fruit-growing farm now worth very much more than we paid for it, it may be said that if our fixed assets were stated at current values rather than book values, there would be a surplus of assets over liabilities in excess of three-quarters of a million pounds. In regard to goodwill, if we take the actual cost of our goodwill, based on the

amount we have spent in advertising, in which we have made "Benedict" peas a household word, then the surplus of assets over liabilities would be well over a million pounds.

One might point out that the amount spent on advertising forms an invisible reserve which will be of great value when cans are freely available and there is again free competition.

GOVERNMENT POLICY

At present the canning industry is handicapped by an insufficient supply of cans, and this being a common experience in the trade, there is consequently an artificially created shortage of canned English fruits and vegetables.

Ever since the war, the Government has been opposed to the full development of the British canning industry. One would expect that in view of the extreme shortage of canned fruits, encouragement would be given to the production of a maximum pack of canned English fruits, but so far from that being the case, there is no prospect at the present time of there being an adequate supply of cans this summer, even for a small pack of canned English fruits.

Further, in view of the small ration of meat one would think that every facility would be given for the production of other foods which add protein to the diet. On the contrary, there is a further cut in the supply of cans for processed peas and beans in tomato sauce, both of which are not only extremely popular packs with the British public, but by their high protein content form a most valuable supplement to the meat ration.

So far as we are concerned, this has resulted in suspending operations in three of our canneries, one of them in a distressed area, but it is not a matter which affects us only. This policy of austerity is a burden imposed on those who can only afford to buy the food products which the canning industry can offer. It is not a consistent policy, as there are open general licences for the import of expensive out-of-season fresh fruits and vegetables and for the import of frozen fruits and vegetables, for the benefit of those who can afford to pay the high prices asked for them.

MISPLACED EXPORTS

In the first three months of this year 6,700 tons of tinsplate were sent to Europe, sufficient for 73½ million 1-lb. cans.

This policy is described as the liberalisation of trade. The effect of it is that Europe does not have to spend dollars in importing American tinsplate and sends us little in exchange for our tinsplate, but expensive luxuries. Such small supplies of canned meats as we receive from Europe are at prices which can only appeal to the higher income group.

No doubt tinsplate must be exported, but I respectfully suggest that the position requires re-examination.

It could be suggested that Europe should be left to spend the dollars it receives from Marshall Aid for the purchase of American tinsplate, and that tinsplate sent to Europe should be reserved for the British canning industry. If that is too much to ask, the British canning industry certainly needs half of it, and the other half could well be sent as an additional export allocation to South Africa, whose supplies of British tinsplate are so much less than its requirements that dollars have to be sent out of the sterling area to buy American tinsplate. South Africa already sends us a large range of canned foods and could send us good supplies of choice canned apricots and peaches, if permitted by the British Government to do so.

The report and accounts were adopted.

RANSOMES, SIMS AND JEFFERIES, LIMITED

IMPROVED RESULTS

The sixty-seventh annual ordinary general meeting of Ransomes, Sims and Jefferies Limited, was held on May 30th at Ipswich Mr J. H. W. Pawlyn (the chairman) presiding.

The following are extracts from the chairman's circulated comments on the report and accounts for 1950:—

I would like to give you some indication of the progress the company has achieved since the close of 1939-45 hostilities. In 1945, allowing for difference in price levels, the total volume of our normal trading products despatched was not appreciably greater than pre-war, but every year since has shown an increase, and now in terms of volume 1950 despatches are more than double pre-war.

For over a hundred and fifty years Ransomes has existed to serve the interests of home agriculture, and during 1939-45 hostilities this function was of such prime importance that although a large volume of war work was handled, this did not prevent the progressive increase in production of agricultural implements and machinery for the British farmer.

Our export trade is now three and a-half times as great as 1937-38, and perhaps what is even more gratifying, twice as great as in 1948.

The trading results of the parent company and its subsidiaries for 1950 show a considerable improvement over the 1949 figures. The net trading balance of Ransomes, Sims and Jefferies, Limited, and its subsidiaries amounts to £497,970 and the net available profit to £159,675. Your directors recommend a dividend on the company's ordinary stock at the same rate as last year (namely, 7½ per cent., less income tax).

NEW CAPITAL ISSUE

The chairman, addressing the meeting, said: You will see in my comment on the report and accounts which appeared with them when they were distributed that there is reference to the proposed construction of a new implement works at Nacton Heath and to the need for more working capital to finance the replacement of plant and to meet the rise in the price of raw materials and in other costs. It is proposed to raise some of the capital required to meet these expenses by issuing some of the new ordinary shares of £1 each which you are to be asked to create today.

The consent of the Treasury to the issue of 250,000 ordinary shares of £1 each has been obtained, and provided the resolution to increase the authorised capital is passed ordinary stockholders will shortly receive letters of rights entitling them to subscribe for these shares, which will be offered at par in the proportion of one new share for every £4 ordinary stock held. Ordinary stockholders will also be given the opportunity to apply for any of the shares to be offered which may be in excess of the requirements to meet acceptances.

In order to give stockholders who may find it inconvenient to provide at one time all the cash required to enable them to accept all the shares offered to them, arrangements have been made for payment to be made by instalments of 10s. on acceptance and the balance of 10s. on October 31, 1951. It is hoped by this means to enable stockholders to exercise in full their rights to accept the new shares.

The report was adopted and resolutions were passed increasing the company's authorised capital to £2,250,000 by the creation of 1,000,000 new ordinary shares of £1 each.

DAVIS AND TIMMINS

IMPROVED RESULTS

The annual general meeting of Davis and Timmins, Limited, was held on May 29th in London, Mr F. Le Neve Foster (chairman and joint managing director) presiding.

In the course of his speech the chairman said:

The results show a marked improvement over the figures for the previous year. The group gross trading profit is £153,944, as against £110,346 last year, while the net profit, after making provision for depreciation, taxation and directors' emoluments, amounts to the sum of £63,540, comparing with £45,047 for last year. I am sure you will agree that this is a satisfactory achievement. The results can be ascribed to increased production and to a marked improvement of efficiency.

Our total turnover for the year has increased by over 40 per cent. in value, compared with 1949. The weight of metal cut up and the output per man hour constitute records for the company since the war.

The directors recommend a final dividend of 15 per cent., making with the interim dividend of 10 per cent. already paid on the smaller capital, a total distribution equivalent to 20 per cent. for the year on the present issued ordinary share capital, as increased by the recent one for one share bonus. This is the same total dividend as for the previous year.

The appropriation for the dividends and other items leaves a sum of £122,196 to be carried forward to next year—an increase over last year of £22,140.

METAL SUPPLIES

At our last meeting, I told you that we were receiving all the raw material supplies of metal we required, with quick delivery dates. Under the impact of the rearmament programme on world economy this favourable situation has been completely changed and in the latter part of the year the industry was confronted, without warning, with the possibility of serious shortages in raw material supplies and in particular of brass. In the meantime, the price of brass rod has continued to rise during the year, reaching, in December, a price nearly double that which ruled in the previous January.

Active steps have been taken within our organisation to ensure that our machines and the limited supplies of metal at our disposal are used in the best and most economical way. I am glad to be able to inform you that during the first five months of the current year production has not been seriously curtailed.

The year 1950 has been one of great international tension with its inevitable repercussions on trade and industry. A rearmament programme has once more become a dominant factor in our national economy, as well as, indeed, in the economy of the whole western world.

With the resulting restrictions, rising prices and shortages, there is a tendency for traders and manufacturers to place orders in excess of current requirements. These conditions have led to a substantially increased demand for our products to an extent which has led us to introduce some degree of limitation on orders now being received. Despite this, we still have a very heavy order book, which commits our full capacity for a period ahead longer than we like.

Providing the restraint imposed by restrictions, metal shortages and other conditions does not become more acute, I should be able next year to place before you, once again, a satisfactory report.

The report was adopted.

E.N.V. ENGINEERING COMPANY

IMPROVED RESULTS

The annual general meeting of the E.N.V. Engineering Company Limited was held on May 25th in London.

Mr C. G. Twallin, C.B.E. (the chairman), in the course of his speech, said: The figures show an improvement on those submitted at this time last year. The turnover for the year is in excess of that for the previous year, in spite of the handicap occasioned by short supplies both of materials and component parts. We have endeavoured to keep prices down on a rising market compatible with maintenance of quality, advancing only in relation to increased costs.

We have a full order book and in order to deal with the pressure of work it was essential to increase the factory accommodation. We obtained permission for, and are erecting, an additional shop on our own land at Willesden, but this was not adequate to deal with our immediate and pressing needs. We therefore had to seek elsewhere and were fortunate in locating a building on the Aycliffe Trading Estate, which was equipped with all the essential services. A number of machines are already installed and working and the production of component parts is proceeding satisfactorily.

EXPORT SALES

We continue to produce a considerable amount of work for the export market, both by way of direct sales and also by way of component parts supplied to automobile manufacturers. In addition to this, we are contributing our share for the national defence programme.

We are happy to report good progress and continued increased demand for the Eaton two-speed axle which we produce in conjunction with the Rubery Owen Organisation and market through an associated company, Eaton Axles Limited. We are confident of the success of this venture and our plans to increase production are well advanced. The output of two-speed differential units is, however, handicapped to some extent by the very considerable delays and difficulties in obtaining regular and increasing supplies of raw materials.

The net profit is £80,764. The amount brought forward is £55,955, making a total of £136,719. We propose to pay a final dividend of 20 per cent., less tax. This will bring the amount of dividend for the year up to 27½ per cent.; comparing this with last year, a total distribution, including bonus, was made of 26½ per cent., less income tax; this will leave a carry forward of £60,157, against £55,955 last year.

I regret very much that the government has not seen its way to continue the allowance for initial depreciation at the figure which has prevailed for several years. The high cost of replacing equipment is indeed a very severe handicap to industry in general.

At the extraordinary general meeting proposals will be laid before you to capitalise £50,000 from reserves in the form of 200,000 5s. shares fully paid, bringing the total issued capital up to £300,000. These will be issued to the shareholders on the register today on the basis of one fully paid share for each five shares held.

The report and accounts were adopted.

At a subsequent extraordinary general meeting resolutions were passed approving the amendment to the Company's Articles regarding directors' pensions and authorising the issue of bonus shares.

CENTRAL MINING AND INVESTMENT

DEPLORABLE TREND OF U.K. TAXATION

The forty-sixth annual general meeting of The Central Mining and Investment Corporation Limited was held on May 29th in London. Sir Clive Baillieu, K.B.E., C.M.G. (the chairman), presiding.

The following is an extract from his statement:

Within our own group the results for 1950 have, as you know, been satisfactory. I should like again to draw your attention to the influences of the six great companies on the Central Rand all under our administration, which produce 23 per cent. of the total tonnage of the industry. These companies are not only contributing largely to present gold production but they are also affording valuable experience of deep level mining. The maximum depth of mining at the end of March last was 9,250 feet below surface at Crown Mines, 8,900 feet at City Deep, 8,400 feet at E.R.P.M., 8,000 feet at Consolidated Main Reef, and 7,900 feet at Durban Deep. These five mines, together with Rose Deep, paid out £4,230,000 in dividends last year, and it may reasonably be estimated that there remains to be recovered from them a total of some 250 million tons of ore for a yield of 45 million ounces of gold.

The operations of the group mines as a whole were substantially influenced by the results at the Blyvooruitzicht mine and, indeed, the increasing influence of the mines of the West Wits line on the results of the whole industry was again apparent in that the three producing mines in this area—namely, Blyvooruitzicht, Venterspost and Libanon—accounted for nearly 17 per cent. of the total working profit of the 43 major gold mines of the Transvaal.

In the Orange Free States operations on our Harmony mine are progressing satisfactorily.

Our principal interest in oil is our investments in Trinidad Leaseholds Limited, which made satisfactory progress for the year ended June 30, 1950.

I am glad to say, with regard to the distribution business in the United Kingdom, that the Regent Oil Company, Limited, is more than holding its own.

UNITED KINGDOM TAXATION

In common with, I imagine, all other British companies with overseas interests, we deplore the trend of United Kingdom taxation legislation as evinced by the Finance Bill recently laid before the House of Commons by the Chancellor of the Exchequer. The necessity for continued restraint in the payment of dividends which has been so widely observed as a voluntary measure is made the pretext for a substantial increase in the rate of profits tax on all distributed profits, not merely on such portion of them as represents an increase in the distribution.

The Finance Bill also makes provision to prevent British companies transferring their "residence" to places abroad or to raise capital for overseas subsidiaries without Treasury permission. Surely the proper way to deal with this problem, if problem there be, is to create the conditions which will remove the desire of some companies to change their residence. Even if we were unaffected by this legislation we could never approve it since it must clearly drive from this country potential enterprises to which, in other conditions, we might have given domicile.

The provisions are repugnant to those British traditions upon which our position as a world centre of trade and commerce has been built. I trust they will never be written into the statute law of this country.

The report and accounts were adopted.

THE ALEXANDRIA WATER COMPANY, LIMITED

PAYMENT OF DIVIDEND

NOTICE IS HEREBY GIVEN that a Dividend of Fifteen Shillings per £5 Share on Coupon No. 121 will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 2s. 4.29d., making 12s. 7.71d. net, on and after May 31, 1951, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4.

Net profits for the year ended December 31, 1950, £168,000 (last year £151,200).

Dated, Alexandria, Egypt, May 24, 1951.

By Order of the Board,

ROBERT WALTON,
Managing Director.

MINISTRY OF LABOUR AND NATIONAL SERVICE

Applications are invited for appointment as Personnel Management Adviser (Male) in Scotland. Candidates must have had extensive experience as Personnel Officers (whole time) in industrial undertakings. They should be able to advise firms on matters of personnel policy, on the organisation of personnel departments and the technique of personnel management. In particular, knowledge of modern employment and training methods, joint consultative procedure and industrial welfare is essential. A degree in sociology, economics or some cognate subject, or a social science diploma is desirable. Salary range: £855 x £25—£1,024. Starting salary according to qualifications and experience. This post does not carry any pension claim.

Written applications, giving date of birth, full particulars of education, qualifications and experience (including a chronological list of posts held), together with present salary, should be addressed to K.R.352, London Appointments Office, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, to be received not later than seven days after appearance of advertisement. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

UNIVERSITY OF BIRMINGHAM

DEPARTMENT OF PHILOSOPHY

Applications are invited for the post of Assistant Lecturer (Grade III) in Philosophy, vacant from October 1st. Salary within the range £100—£500 per annum. Knowledge of a natural science or of psychology would be a recommendation, but is not indispensable. The post is equally open to men and women.

Applications (6 copies), with names of not more than three referees, should be sent to the undersigned not later than June 11, 1951, from whom further particulars may be obtained. If applicants so desire, testimonials may be sent.

G. L. BARNES, Deputy Secretary.

The University, Birmingham, 3, May, 1951.

UNIVERSITY OF BRISTOL

DEPARTMENT OF ECONOMICS (AGRICULTURAL ECONOMICS)

Applications are invited for five appointments in the Grade of Assistant Agricultural Economist, three at Bristol and two at Newton Abbot. Candidates must be graduates in Economics and/or Agriculture. Salary in accordance with the Ministry's scales. Further particulars and conditions of appointment may be obtained from the Registrar, University of Bristol. The date for receipt of applications is June 30, 1951.

UNIVERSITY OF NOTTINGHAM

SCHOOL OF AGRICULTURE

ASSISTANT AGRICULTURAL ECONOMIST

The Council invites applications for the above appointment in the Department of Agricultural Economics.

Salary scale for candidates with 1st or 2nd Class Honours and at least two years postgraduate experience: Men £295 to £470, Women £235 to £400; scale for other candidates: Men £230 to £470, Women £230 to £400—plus cost of living bonus, Men £90, Women £72, per annum. Candidates should be graduates in Economics and/or Agriculture.

Form of application and conditions of appointment may be obtained from the undersigned.

H. PICKBOURNE, Registrar.

UNIVERSITY OF ABERDEEN

APPOINTMENT OF SECRETARY TO THE UNIVERSITY

The University Court will, in the Autumn, 1951, proceed to the appointment of a Secretary to the University which office will become vacant on September 30, 1952. It is intended that the person appointed should take up duty some months before the present Secretary departs office.

Salary at least £2,000 per annum with F.S.S.U. and Children's Allowance. The University pays a proportion of removal expenses. Further particulars and form of application may be obtained from the Secretary, with whom applications should be lodged not later than September 30, 1951.

H. J. BUTCHART, Secretary.

The University, Aberdeen.

LAKE DISTRICT. Private Secretary required for Insurance Company Managing Director. Essential training in secretarial offices of first class organisation. Suitable salary and pension. Age not exceeding 35.—Apply, Box 660.

COULD YOU ADDRESS

a public meeting to-night without notes? **RAPIDISM** will develop for you (1) mental alertness, (2) personal courage.

OTTOMAN BANK

(Incorporated in Turkey with Limited Liability)

NOTICE IS HEREBY GIVEN that in accordance with Article 29 of the Statutes, the Annual General Meeting of Shareholders will be held on Wednesday, the 29th June, 1951, at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m., to receive a Report from the Committee with the Accounts for the year ending December 31st, 1950; to propose a Dividend; to receive a statement regarding the renewal of the Convention between the Turkish Government and the Bank; and, in case of need, to authorise the General Committee to exercise all or any of the powers conferred on the General Meeting by the Statutes for the purpose of prolonging the existence of the Company and modifying the Statutes accordingly; and to replace the retiring Members of the General Committee.

By the 27th Article of the Statutes the General Meeting is composed of Shareholders possessing at least thirty shares, who, to be entitled to form part of the Meeting, must deposit their shares at the chief office of the Company, Istanbul, or at either of the several branches or agencies abroad (in London at 20/22, Abchurch Lane, E.C.4, and in Paris at 7, rue Meyerbeer, 9me), ten days at least before the day fixed for the Meeting.

J. VASSALL ADAMS, Secretary to the Committee.
London, 29th May, 1951.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

FIVE PER CENT CUMULATIVE PREFERENCE STOCK

SIX PER CENT SECOND CUMULATIVE PREFERENCE STOCK

NOTICE IS HEREBY GIVEN that the Transfer Registers in respect of the above Stocks will be closed from June 6 to June 12, 1951, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending June 30, 1951, to be paid on and after July 2, 1951.

By Order of the Board,

H. EAVES, Secretary.

Offices: Curard Building, Liverpool. May 31, 1951.

DO YOU NEED REPRESENTATION IN BRAZIL?

Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro; Member of the: American Chamber of Commerce for Brazil—Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comercio do Rio de Janeiro, etc. Purchasing Agent for: Minerals, raw material, sugar, wood, etc. Selling Agent for: Iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

WANTED—GENERAL SALES MANAGER

A well-known public company, with several large metal-ware factories, manufacturing nationally-advertised lines, needs an outstanding executive with experience in sales management, merchandising and advertising. General financial and administrative experience also desirable but not essential. Headquarters London. The position carries a substantial salary now and unlimited opportunities for the future. We are looking for a man who is at present successfully employed, but who seeks greater opportunities now and in the future than his present position offers.

Reply should cover such details concerning experience, education, present salary and scope of work as you yourself would require if engaging a man for so important a position.

Box No. 4239, Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

MULTIPLE Departmental Store Organisation of National Repute wishes to select a number of senior personnel, not exceeding 35 years of age, for accelerated development with a view to subsequent appointment to executive positions in its Retail Branches and with the future possibility, in certain instances, of appointment to its central organisation. Commencing salaries in the region of £750 per annum will be paid to men of proved ability and status. Successful candidates will be expected to accept assignments anywhere in the United Kingdom.—Full details, including age, education, experience, present occupation and salary, which will be treated in strict confidence, should be forwarded to Box No. M.D. 511, 10, Hertford Street, W.1.

SALES DIRECTOR requires personal Assistant for management internal sales organisation, including sales office, publicity, transport, of well-known manufacturers of arc welding equipment in Midlands. Age 30/45.—Apply, stating age, training and experience, to No. 41, Box 656.

it is clear that Soviet expansion has been stopped without a major war. In such a programme there cannot be decisive and positive results—certainly not in a short time.

Thirdly, the policy sometimes seems to be in danger of forgetting what its objectives are. Its very indecisiveness breeds impatience. The immense effort of argument and exhortation that has been needed to convince the democratic peoples of the need to be strong in peacetime is having effects that could have been foreseen. The more war-weary, bruised and sceptical Europeans have taken time to jump to the call. The Americans, shocked into indignation and alarm by Korea, leapt, as it were, from their beds into a cold bath, and now stand dressed wanting to do something. They perhaps feel—and who can blame them—something of that moral superiority which glows in the man who bathes before breakfast before May is out. There has been for some months now, on the other side of the Atlantic, a tendency to exaggerate risks, to rattle the sabre, to coin such phrases as “waging peace.” For this the fighting men and the commentators specialising in grand strategy must take some of the blame. When talking of the war the West is trying to avert they now tend to drop the cautious “would” for the resolute “will.” And the result is that General Marshall and Mr Acheson have to meet the charge of “appeasement” simply because they remember that the object of the policy is to contain Communism without war, not to defeat it in war.

A fourth qualification is that there is one large area of the world where conditions are definitely less favourable than they were four years ago. The fact that the whole of China has fallen to the Communists cannot be regarded as anything other than a defeat. But this could be counted as a black mark for Mr Truman and his lieutenants only if it could be shown that their policy had contributed to that result, or that some other policy could have prevented it. There is still a group of Republicans who believe that Chiang Kai-shek could have been propped up by more vigorous American aid; but each time the story is gone over again in public, the thesis sounds more wildly improbable.

These are the qualifications. But when they have been given their full weight, it is still true that the balance is strongly favourable. The world is, by several perceptible degrees, a safer place than it was in 1947. The fact that very few people think so shows only that they are less blind to the dangers than they were then, and that they have forgotten how shaky the structure then was. It is beyond doubt that the great majority of people in the free world are living better, earning more and producing more efficiently than they were four years ago. For anyone who remembers the moral and physical condition of the European continent and of war-damaged Asia in 1947 the improvement is astounding. To that result, many human efforts have contributed, as well as the *vis medicatrix naturae*. But the largest share of the credit belongs to the Marshall Plan, which the Russians determined, and failed, to break.

From these economic achievements, the emphasis is now shifting to the political and the military; and some of those critics who attack the Truman-Marshall-Acheson policy for being flabby and indecisive also contrive to

believe—or at least to say—that it is rash and reckless. It is true that any effort of rearmament by the weaker side runs the risk of provoking the strong. It is true that the risk of a Soviet preventive war cannot be written off—not yet, at least. But the risk has been clearly seen by the leaders of American policy and taken with open eyes. There is a long list since 1947 of risks taken and out-faced: the building up of Western Germany; the provocation of Tito's split with Moscow; the resistance to the Berlin blockade; Norway's adhesion to the Atlantic Pact in the face of Russian threats; the defeat of the Greek guerrillas by American intervention; the successful resistance of French and Italian governments to strikes and disorders fomented by the Communists against the Marshall Plan and rearmament; and finally the decision to take up the challenge offered in Korea. Can anybody reasonably doubt that, if similar courage had been shown in the years between 1933 and 1939, Hitler's war would never have happened? As an achievement in policy, the extent of the present rearmament is itself not the least remarkable; no one else in history has been able to persuade a group of peace-loving democracies to arm themselves betimes. The test of the policy, of course, will be whether it works, whether it succeeds in averting the war. For that the event must be awaited. But at least war no longer seems inevitable and, as we move through the critical period, every day gone is a day gained. Other governments, most notably the British, have played their parts in the policy; but the ideas, the money and the resolution have come from the Americans, and if the chances of avoiding war are greater today than they were in, say, 1938, it is to the American Administration that the major credit belongs.

For those who are not blinded by partisan spirit, whether they be European leftists who hate everything American or American rightists who hate everything Democratic, the record is plain and the comparison with 1947 is convincing. There have been spasms of weakness; but there have also been moments of high courage such as elected politicians rarely show. There have been waverings and hesitations; but a far more consistent line can be traced through the past four years than is usual with democratic governments. There have been moments of near-hysteria; but the testimony of the last few weeks has shown with what sober caution the policy has in general been pursued. There have been traces of arrogance; but there has also been a conspicuous loyalty to America's allies and a firm adherence to the strategic policy of defending Europe entrusted to General Eisenhower. There has been some self-seeking; but there has also been the vision and the generosity of the Marshall Plan.

The critics, both in America and in Europe, have been given too much of the stage. It is time that the central mass of sober opinion throughout the world took the trouble to say out loud to Mr Truman, to General Marshall and to Mr Acheson what we believe they are thinking. The policy is hardly yet in mid-course; the dangers are still pressing and enormous; mistakes have been made and will doubtless be made again. It may even be that, for mysterious reasons of domestic American politics, Mr Acheson may have to go. But for what has so far been achieved, we are truly thankful.

Burma off Balance

IT would be idle to pretend that the continued chaos in Burma does not evoke both disappointment and worry in the western world. Although the Burmese are now in the fourth year of their independence, there are few signs of their being able to bring peace or order or individual freedom to their country within the foreseeable future. In an age of communist imperialism, exploited for purposes of national aggrandisement by Russia, the instability of a strategically placed country like Burma represents a constant and indeed increasing threat to the security of its neighbours and the rest of the free world. Yet perhaps the most difficult thing for many Asians to grasp is that no responsible section of western public opinion wishes to reoccupy former colonial territories that have attained independence. Least of all do the British want to return to Burma. Most people in Britain desire only to be able to take pride in the thought that they have given tens of millions of Asians their national freedom since the war. Where there is objection it comes only from a very narrow section of public opinion and usually with special interests. For the rest, the view is well understood that history may record the granting of independence to India as the greatest single act of the Attlee government. In Britain, therefore, Burma can in effect count on the fundamental good will of all but those whom Rangoon's own policies and attitudes may alienate.

It is, however, one of the inevitable responsibilities of growing up, whether as a child into an adult or a people into a sovereign nation, that one's own words and actions come to need weighing with increasing care for their effect on others. And to the outsider, the Burmese seem to have given singularly little thought to anyone's point of view except their own, since the handing over of independence in January, 1948. They can therefore hardly blame the outside world if, at the same time as showing good will, it resents constant suspicion of its motives and is sometimes given to criticism and despair when calculating Burma's immediate prospects and their influence on neighbouring countries. For the Burmese, independence means the power to shut themselves up in a great rice plain, ringed by mountains and the sea, and to let the apparatus of a modern state run down—if they so desire. For the leaders of the great powers, on the other hand, locked in a desperate struggle across the face of the globe for peace, life and liberty, it is obvious that no individual country is free in practice to make a choice of this kind. Whatever the Burmese may desire, they are in reality only too likely to form the special target of communist ambition when the moment is ripe. Their rice plain is no Shangri-la. Instead, it stands, a particularly tempting prize, on the very frontiers of the Russo-Chinese empire; and if it falls, then the whole economic, political and strategic structure of southern Asia looks like changing radically with it. In these circumstances, Burma today represents a dangerous point of weakness for the free world and a matter of serious concern for its statesmen.

How far has the disintegration of Burma now gone? Will it go further? And what should or can be done about it? On the answers to these questions may depend a great deal more than the fate of Burma itself. To judge

by the Burmese Government's proclaimed intention of beginning a staggered general election this month—to be held in stages between now and next January wherever the local guerrilla war subsides enough to make polling possible—there might seem some hope that Burma was reaching calmer waters. But in reality this is hardly so.

It is true that the government, with its 30,000 troops and the outlay of a third of the Budget on internal security, achieved considerable successes last year. It broke up the bigger rebel groups and re-occupied many of the key communication centres. On the other hand, this has increased the number of small hit-and-run raids carried out by the 10,000 insurgents of varying political colours and racial groups still in the field; and the problem of security is made worse by the mere passage of time, since the Burmese countryside was last at peace as long ago as 1941.

*

Nor has last year's economic improvement been maintained. The figures for the whole year now show that, in spite of the tremendous prices obtainable for such raw materials as rubber, tin and wolfram, and the virtually unlimited market for rice, Burma's adverse balance of trade in 1950 was greater than in 1949. Inside the country communications are still only fair, and, although the Irrawaddy is open, convoys of vessels between the two primary centres of Rangoon and Mandalay are now only fortnightly instead of weekly—as they were at one time when the river was first reopened—owing to the lack of necessary escorts. The vital north-south rail link between these two cities of south and central Burma is not yet through, although the government had predicted its restoration by the end of last year; this is because the army cannot supply the protection required through the last 20-mile stretch round Pyinmana, which is the nucleus of the Moscow Communists' rebel activity. Most towns are in government hands, but many connecting roads are safe only in armed convoy. District administration, even where it exists at all, is very weak and lacks support from the centre, with the result that theft, murder, dacoity and smuggling are coming more and more to be accepted as perfectly normal. There is much corruption, and the few good officials have no means of combating it or of enforcing the law.

From a long-term point of view, many rubber estates are being systematically destroyed by slaughter tapping, much of it undoubtedly carried out with the knowledge and active encouragement of local government officials. The mining industry is in similar plight. Some mines still work after a fashion, but much of the ore is stolen, and damage is being done by completely haphazard exploitation of underground workings. The problem in oil is now reduced to the relatively trivial task of completing another small local refinery at Chauk, so that, with luck and better transport, Burma may be self-supporting by mid-1952. All hope of rebuilding the pipelines to Rangoon and of exporting oil in pre-war quantities within the next few years has had to be abandoned. Timber alone is undergoing an apparent improvement owing to the opening up of river communications and the conse-

quent dispatch of logs from up-country. However, most of this is the result of previous workings, and no work is being done in most of the forests except in the far north round Myitkyina and Bhamo; the outlook for the next year or two is therefore extremely black.

Politically, the fragmentation of Burmese life is still proceeding and the proposed elections hardly look like improving matters; they have already crystallised further latent divisions and produced a crop of new parties. Broadly speaking, Burma is divided into the government party, the Anti-Fascist People's Freedom League, whose policy is basically Socialist, the various rebels, and, midway between them, the government's vocal but not actively rebellious critics. The rebels include the orthodox White Flag and the independent Red Flag Communists, the heterogeneous, self-seeking People's Volunteer Organisation, the Karens—a tribal people numbering over two million in a total population of 17 million—the Mons and the Arakanese. The constitutional, non-violent opposition, which has grown enormously in the last nine months, ranges from Thakin Ba Sein's Burma Democratic party on the right to the Burma Workers' and Peasants' party (BWPP), formed by extreme Socialist discontents last December, on the left. It includes the Maha Bama party of Dr Ba Maw, who was Premier under the Japanese, and a clearly Communist-inspired electoral alliance, the People's Democratic Front, sponsored by the BWPP—which looks like being a force to be reckoned with, since it is led by the trade union boss, Thakin Lwin, and is whipping up emotion with rabid anti-western appeals.

★

What are the prospects? Although the long drawn out disorders are at last tending to bring back into public life some of Burma's elder statesmen, who gained their experience under prewar British rule—and have been suspect for that reason—there is almost no chance that they will achieve power. If the proposed elections are held, or even only part of them, the Socialists—that is, the AFPFL—will probably be returned to power, since they still have money, a reasonably effective party machine and control of the armed forces. They are, however, unpopular and divided among themselves, and there seems little reason to suppose that re-election will itself make any fundamental changes in their attitude to life. On the other hand, compared with the BWPP, which is widely suspected of being in part league with the insurgents and is certainly subject to Communist pressure—something that, for all their sins, the present Burmese leaders creditably resist—the men now in power are moderates. Moreover, they are beginning to learn from experience. And whereas Burma's problem

on the threshold of independence was the almost complete dearth of experienced politicians and administrators, this limitation is slowly being overcome.

The danger, therefore, is not so much what the Burmese under their present leadership may willingly do but what they may be pushed into doing by forces beyond their control. Thakin Nu, the Prime Minister, has so far resisted the anti-western bias of some of his own followers such as the formidable General Ne Win, and Rangoon's policy is one of neutrality in the cold war. Indeed, accompanying this policy is a courageous and growing willingness to turn for economic help wherever such help is offered. Even since independence, Burma has always been ready to look to Britain in an emergency—however little its words and actions have suggested that it would, or indeed have given it any cause to expect that Britain would respond. Now, not only are British technicians being welcomed back, but Burma is receiving American aid as well, under the auspices of last September's ECA grant of \$11 million.

The crucial factor for the western powers is Burma's relations with China. Whatever the government in Rangoon, it must be encouraged and supported in any move it may make—such as the recent ban on the export of petroleum to China—in standing up to pressure from Peking. This is exercised and can be increased in several ways. The Burmese Communists now look to China instead of to the Indian Communist Party for sustenance and guidance; Peking has laid claims to northern Burma; the Kachin rebel, Naw Seng, is being equipped with a trained force in Yunnan; and active Chinese Nationalist refugees in the Shan States provide Peking with a perpetual excuse for intervening. The British have rendered Burma great service in equipping its army and providing a military mission—however much the latter has been side-tracked by extremists inside the government. The vital need is not to lose heart now. In the last resort the Burmese would bitterly resent Chinese domination. If progress can be maintained in overcoming the inhibitions of relationship between a young, self-conscious and disorganised Asian state and the powerful chancelleries of the west, the reality of Burmese independence and internal stability may yet be secured by closer association with the rest of the free world.

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

The Economist Intelligence Unit

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

The Author's Reward

THE economic man has always been more prone to keep books, or perhaps to make them, than to write them. But the economic incentives to authorship are now less than ever. Not only is the burden of taxation on royalties peculiarly heavy, but also the chances of getting a first book published are now worse than they have been for many years. The prewar years were the heyday of new authors, for in those days too many publishers produced too many books in the effort to spread their risks and in the eternal quest for a best-seller. Recent years, on the other hand, have been the heyday of publishers, for paper rationing prevented the overproduction to which they were collectively prone, and the public, deprived during the war of other ways of spending its money and house-bound by the black-out, became voracious readers. But this year seems likely to be more difficult for both authors and publishers. The accompanying charts show that the slump in the book trade which has been thought to be round the corner ever since the end of the war is still round the corner. But the trade is catching up with it.

The situation that faces the author, the publisher and the bookseller is that of sharply rising costs against a background of stationary, if not falling, demand. Hitherto publishers have been able to absorb the greater part of the rise in costs because it was possible to extend the "run" of the average book and so to reduce unit cost. Hence the increase in retail prices of books is much less than the percentage rise in the constituents of cost. But there is little possibility of absorbing the continuing increase. Book paper which cost 3½d. per lb. in 1939 now costs 1s. 5½d., and a further increase of about 25 per cent is expected in July. Printing costs are about 110 per cent above the prewar level, and in three or four weeks' time will rise another 12 to 15 per cent. Cloth boards for binding are four times the prewar price. Meanwhile, the public no longer comes to the rescue by demanding more books, for there is not the wartime lack of other ways of spending money. There may be a long-term trend towards more book buying, as a result of the spread of education, but it is not a strong force in the short run.

In this situation the publishers must either find means of cutting other production costs to balance those which must rise, or they must raise their prices. But neither course will solve all the problems. The possibility of economies in production is very limited; paper covers instead of cloth boards, for example, would save about 1s. 6d. per copy. The public is prepared to accept an inferior presentation—poorer paper, narrower margins and so on—only if the difference in price is considerable; or if, as in wartime, there is no choice in the matter. In normal times it relates the price of a book to its appearance and, indeed, to its weight. It may ungrudgingly pay the price of a full-length novel for a short book printed on thick paper with wide margins, although the same work produced as a "slender volume" would be thought too dear. There is a danger that any practicable savings along these lines would defeat their own object.

Would it then be possible to make inroads into margins? The usual arrangement for novels is that the author gets between 10 and 20 per cent of the retail

price in royalties; the bookseller's discount is 33½ per cent; and the publisher gets what remains after paying for printing and overheads. On a book selling at 15s. the author will make between 1s. 6d. and 3s. compared with 5s. gross earned by the bookseller. Yet few booksellers make fortunes; like everyone else in the trade, they now bemoan their difficulties, as wages, carriage costs and other overheads rise. Like the publishers, they need more capital for the same volume of business and expect a return on that capital. More and more they turn to stationery and fancy goods to supplement their earnings. Some publishers are critical of their lack of enterprise and describe them as "book middlemen" rather than booksellers; but they play an indispensable part in the trade and cannot be made to accept a lower discount.

The suggestion that authors' royalties should be cut recently caused a great furore. A confidential circular from the Publishers' Association to its members, describing some recent successful attempts to reduce royalties, fell into the hands of an evening paper. This gave the impression that the publishers were grinding

† Returns of The Publishers' Association.

down the faces of the only unorganised section of the book trade. It was pointed out for the publishers that no one had suggested that the author should be paid less in pence per copy—merely that he might accept a lower proportion of a higher price, without any fall in his total income. But why, it was asked, should everyone else have his income adjusted to rising prices while the author's remains unchanged? The publishers' answer to that was that it might actually pay the author better to accept a lower royalty; to insist on its remaining unchanged might mean having to raise the retail price so high that sales would drop and the author lose by it in the end. But the author's royalty is still the smallest element in cost. A reduction from 20 to 17½ per cent on a novel priced at 10s. 6d. would save only just over 3d., while the increased cost of paper alone since the beginning of 1950 represents about 7½d. The author has not caused the rise in price; nor can any reasonable sacrifice on his part do much to moderate it. The publishers also argue that the best-selling novelist is not as valuable to them as he used to be. Now that paper—the cost of which, unlike that of printing, is exactly the same for the

last copy as for the first—represents such a large element in costs, the profits to be derived from long runs are much reduced; and it is on the profits from long runs that the whole business of publishing depends—the best-seller “carries” the new author whose publication may involve a loss. But if on these grounds there is a case for reducing the royalties paid to the best-selling author (he is already paid a lower rate than before the war—perhaps 17 or 20 per cent compared with 25 per cent then) it is he who is best able to resist the cut, for he can take his book to the firm across the street. The highly competitive nature of publishing is the author's best protection.

*

If economies are not worth making in the production processes, if the bookseller will not accept a cut in his discount nor the author a cut in his royalty, then there is no way of avoiding the sharp increase in the price of fiction that the publishers fear so much. Need they fear it? They have not been afraid to raise prices of books other than fiction, believing that the demand for such books is fairly inelastic. If one wishes to be informed about a particular subject one is unlikely to be deterred by a rise in price from, say, 15s. to 18s. But the demand for novels is thought to be much more vulnerable. Whereas an important biography is a permanent asset to a bookshelf, nothing is so dead as a dead novel. People are thought to be unwilling to spend more than fairly trifling sums on fiction.

So far as individuals are concerned, this may under-rate the desire to buy fiction, especially novels that are being talked about. After all, people do not set aside so much a year for the purchase of books and so buy fewer if prices rise. That, however, is precisely what libraries do, for the sum that they can spend is determined by the amount of their subscriptions, or, in the case of public libraries, by the subsidy from the rates. The libraries of all kinds, more than the private purchaser, are the important market for books; the four big subscription libraries—Boots, Harrods, W. H. Smith and the Times Book Club—underwrite the issues of any reputable publisher, simply on the strength of his imprint. A rise in book prices will not only cause all libraries, free and otherwise, to buy fewer books; it will make them less willing to spend their money on unknown authors. Pub-

lishers generally think that the subscription libraries should enlarge their purchasing funds by raising their rates. But the subscription libraries claim that, competing as they do with increasingly well-stocked free libraries, they would lose members if they raised their rates, as in fact happened when they were last raised in 1947.

In face of this attitude, the publishers' reluctance to raise fiction prices is understandable. But sooner or later they are bound to take the plunge. This will mean an uncomfortable time for some people. A few publishers—probably small firms which have sprung up since the war and which lack the capital to meet the new situation—may go out of business; and the new author will find it harder to get his book published, for publishers will be playing safe. They will be playing safe not only with their money, but with their paper. There is a severe shortage of esparto paper, and although books have theoretical priority over periodicals in a voluntary scheme operated by the paper trade, they have not been getting that priority in fact. The publisher is therefore reluctant to print, say, 3,000 copies of a first novel when only 500 may be sold and the wasted paper could have been used for a longer run of a best-seller.

This does not mean that mute inglorious Miltons will plod their weary way from agent to agent. The good author will still get into print. The sufferer will be the run-of-the-mill author. Unfortunately, the books which will not be published are not those which, in the best interests of English literature and contemporary culture, most require suppression. Those of the lurid jacket tribe are in great demand from the smaller and cheaper circulating libraries; they pay so well that one publisher is considering founding “the Toadstool Press” to subsidise the more serious side of his business without robbing it of its prestige. Financial difficulties may make publishers the more ready to accept this kind of book in preference to that which at any rate aspires to literary merit. It is a pity that the least worthy books should still enjoy prosperity while those which are merely undistinguished have a difficult time. But this is probably better for the health of the trade than that all types of output should continue in full spate, bringing a return of the over-production which was the chronic sickness of publishing before the war.

Marking Time in Eire

(By Our Dublin Correspondent)

EVEN when it was in progress, it was difficult to discern any true issue in the Irish General Election. Now that it is over it is still more difficult to find what, if anything, has been settled. Mr de Valera's appeal for a return to single-party government provided the nearest approach to an issue. It was decided against him. In a house of 147 members, his *Fianna Fail* required 74 seats for an over-all majority; in the event it gained only one seat to bring its numbers to 69. Nevertheless, the position of Mr Costello's Government has not been strengthened by this rebuff to Mr de Valera. Of its component parties, Labour lost three seats and now has 16 deputies; the Farmers' party lost one seat and now has six deputies. Mr MacBride's *Clann na Poblachta* was all but wiped out and now holds only

two seats one of which, Mr MacBride's own, was barely retained. Only *Fine Gael*, Mr Costello's own party, can look back on the election with satisfaction. Its vote increased by a third and its representation has grown from 31 deputies to 40.

Thus the balance of power rests with the independent deputies whose numbers have increased from 12 to 14. There is nothing new in this; in the last *Dail* the inter-party Government's majority rested on independent support. But things promise to be more difficult in the new house. It is unlikely that Dr Browne, the ex-Minister for Health, and his two followers will support the Government; while other independent deputies have been restive in the past on points of agricultural policy. It will be seen that Mr de Valera has only to secure the

aid of five independents to bring down the Government. Mr Costello's margin of safety looks all too narrow.

Nevertheless it is thought in Dublin that the Government will be confirmed in office when the new *Dail* meets on June 13th. The Irish practice is to begin proceedings, after the choice of a Speaker, by electing a *Taoiseach* (Premier). An immediate opportunity for a trial of voting strength is thus afforded. It is quite conceivable that some of the independents will not vote for Mr Costello's nomination; but it is thought unlikely that they will support Mr de Valera's. Three times in his period of office, Mr de Valera dissolved a newly elected *Dail* in order to obtain an over-all majority. Any independent deputy who votes him into office now must reckon with the probability of an early dissolution. No doubt the niceties of voting for, voting against and abstention will be carefully studied in a house so evenly divided; and the principles governing the granting or refusal of a dissolution may also come in for attention.

It seems that the Irish Government will need to sit very still in order to avoid upsetting the boat. This is probably the result that the electors desired to achieve. For the moment at least they have had enough of strong government. Mr de Valera is authoritarian by nature and, in the sixteen years of his administration, his ministers tended increasingly to extend the scope of their activities and to govern by ministerial orders. It is true that in Ireland a great number of things must be done by the state if they are to be done at all; but the growth of bureaucratic power was deeply resented. In the election campaign, *Fianna Fail* was gravely embarrassed by the memory of compulsory tillage orders and of threats to send inspectors on to the farms. These orders may have been justified by wartime conditions, but they were not acceptable as a permanent means of government. There is a traditional hostility to the extension of state power which is reinforced, perhaps too fully, by the political and social power of the professions and farmers in Ireland. It is noticeable that the inter-party Government has been most successful where, as in agriculture, it has worked through or in co-operation with the individual while it has been least convincing where, as in the case of price controls, it has been forced to govern by ministerial order. For the moment, the Irish elector wants to be let alone; he has had enough of being governed.

*

This attitude fits in very well with the present state of Irish politics. They have practically come to a full stop. The more that *Fianna Fail* and *Fine Gael* protest their differences, the more obvious it is that there is very little between them. It is no wonder that there have been many suggestions that these two parties should compose their differences, which date from the Civil War of 1922, and form a solid conservative bloc. If that

happened indeed, the combined parties would have two-thirds of the seats in the *Dail*; and Labour would be reduced to an insignificant minority. That is often the reason for these suggestions. A large proportion of the Irish electorate has never taken kindly to the spectacle of Labour in the government, and it is all the more ready to speculate on the prospects of an endless series of conservative administrations.

In the short run, it does not seem probable that anything of the sort will happen. There are still some personal antagonisms that are not likely to be reconciled. Nor is it easy to imagine any kind of reunion so long as Mr de Valera is in active politics. His character does not lend itself easily to co-operation with colleagues on equal terms. He might reasonably argue also that there is no reason why he should descend to equality. After all, he is still the leader of the party that has by far the greatest number of seats in the *Dail* and that secured the largest number of votes. That position, moreover, is due almost entirely to his own personality; *Fianna Fail* without Mr de Valera would be a very dubious electoral bet. Next year, as it happens, the term of office of the President expires; and there has been considerable talk in all parties, wishful thinking some of it, about the possibility of Mr de Valera's succession. But this view of his future may not commend itself at all to a man who is still young for his years. Whatever his opponents, perhaps even some of his supporters, may think, Mr de Valera is still in the ring.

In a longer run, it is difficult to think that *Fianna Fail* and *Fine Gael* can fit together so easily as is sometimes assumed. The first has become identified with the new protected industries; and though in the postwar years *Fine Gael* has acquired a certain record in that line also, it is now essentially the party of the farmers; the cleavage of interest between the rural producer and the urban consumer is growing too obvious to be papered over.

Moreover, a straight division into Right and Left would not commend itself to some sections that are far removed from the Labour Party. It is true that the Left would, to begin with at least, be extraordinarily conservative by British or continental standards. The Labour Party, for example, does not call itself a socialist party. But it is feared by some that the divisions would grow greater as time went on; and this prospect is the more unwelcome since the political division for the last thirty years has been vertical, not horizontal. In politics, as in economics, Ireland wants to stop in the nineteenth century as long as possible. It may not be up to date; but it is a comfortable century to live in.

The election gave little indication of issues that might serve as future lines of division. *Fianna Fail* made some play with the lack of defensive preparations; but it is doubtful if this did them much good with an electorate that feels itself to be comfortably down the list of

IRISH ELECTION 1948 AND 1951				
Political Party	Seats		First Preference Votes	
	1948	1951	1948	1951
Fianna Fail (de Valera)	68	69	553,917	616,722
Fine Gael (Costello) ...	31	40	262,202	343,823
Labour	19	16	149,089	151,831
Farmers' Party.....	7	6	71,686	38,872
Clann na Poblachta (MacBride)	10	2	173,166	54,260
Independents	12	14	112,816	127,529
	147	147	1,322,876	1,333,037

Russian priorities. Moreover, defence has rightly or wrongly got tangled up with partition; and on that subject everybody has the same ideas, or lack of them. One point that emerged was that the small farmers, once the backbone of *Fianna Fail*, have swung over to *Fine Gael*. There was a minor landslide from one party to the other in the west, which is generally attributed to the impression that Mr Dillon has made on the farmers. There is a sense in which Mr Dillon is the true victor of the election, a fact that may grow still more important in a period when personalities fill the political vacuum left by the disappearance of dividing principles. A further sign may have been furnished by the greatly increased vote of Dr Browne and the election of two of his supporters. It is difficult to know how much of this was due to public sympathy which will die away; and in any case it seems clear that Dr Browne is not the kind of man to give the co-operation with others that will be necessary if he is to increase his political standing. The issues that were raised by the episcopal intervention are present to most minds in Ireland, but the ex-Minister is not likely to be useful in their composition. For the rest, the election showed a revival of *Fianna Fail* strength

in the cities, at the expense of *Clann na Poblachta* and Labour. Nothing is more striking in Irish politics than the steady refusal of the workers to vote the Labour ticket. While that refusal lasts, it is difficult to think in terms of Right and Left.

It seems therefore that Irish politics will mark time for the moment. The old issues are gone; no new ones have yet come to take their place. It is probable that the historical justification of the inter-party Government will be that it was best fitted to tide over a period of readjustment while, by making it possible for Labour ministers to attain to office, it has corrected a dangerous lack of balance in the political structure. At present, the Irish elector feels that the country is reasonably prosperous, whatever the economist may say about the balance of payments. It is a time for getting on with the job, and leaving politics alone. The lull provides an opportunity for whatever Government will be elected on June 13th to turn to clearing up the arrears of administrative reform and revision of the statute book. Matters such as these were ignored in the past in favour of political issues; and they might well receive attention now that these issues are in temporary eclipse.

basis of their national independence. For 150 years the heavy paw of the Russian bear, pressing on their exposed northern frontier, has been warded off only thanks to the interests of the British in the Indian Ocean, including, in the last forty years, the oil interest. That the Persians are completely confident of their ability to keep on balancing in this position, come what may in the south, is no proof that there is no Russian danger.

Dr Mossadegh and his National Front have received no overt encouragement from Moscow because Russian dealings with Persia are in adept hands. Mr Sadchikov, the present Russian ambassador, has the advantage of having held his post for over five years. He signed the original Russo-Persian agreement in 1946; he pressed hard for its ratification. When this effort failed he knew how to fold his hands and wait. In 1950 he superintended the change of target for Tudeh's main propaganda which shifted from the "broad masses" to the schoolteacher and student class. He next organised the resumption of Russo-Persian trade relations. He also superintended the mysterious escape of the Tudeh leaders from Teheran's central prison in December, 1950. His dealings with the National Front have been circumspect and decorous. He called on Dr Mossadegh when the latter took office. (He had not called on his predecessor, Hussein Ala.) Otherwise he has given him no mark of favour. He holds a good hand, which he is playing excellently.

this would be a far more serious matter than a failure to stage it this summer.

It has to be remembered that the Russians originally wanted to discuss only Germany, and that it was the western governments that asked quite properly for wider-ranging talks as a test of Soviet goodwill. As that goodwill has not been manifested—at least not in any form that is easily recognisable—it might be better to suspend the deputies' talks and to restate the proposals for unity and free elections in Germany that were put forward in May last year and have remained unanswered by the Russians.

* * *

From Magna Carta to Erskine May

The Conservatives have had difficulty in rousing the Commons from their sudden summer torpor even in the debates on the committee stage of the Finance Bill, the last piece of controversial legislation in sight. The truth is that the greater part of the Finance Bill provides little to which they really take exception. Moreover they have to be wary even over the clauses they most dislike, those increasing the profits tax and imposing more stringent measures to check tax evasion. The Conservatives are well aware that any clumsy move on their part will lay them open to the charge of being the tools of big business and of tax evaders.

The Opposition also had a nasty knock at the outset of the committee stage of the Bill. Major Milner, the Chairman of Ways and Means, ruled out of order the main amendment, which called for the deletion from Clause 1 of the subsection increasing the petrol duty. This decision caused a whole sheaf of subsequent amendments to fall, and forced the issue to be debated on the motion that the clause stand part of the Bill. Major Milner's ruling was based on the principle laid down in Erskine May—if a subsection is a material part of a clause it cannot be debated separately because without it the clause would not make sense. Both the Tories and the Liberals made such protest against this decision as the rules of order would permit, but Major Milner remained adamant and the debate had to get under way on the general principle of the clause.

* * *

The first voting test of the debate came on Tuesday. The Government carried a closure motion by a majority of 10 and then Clause 1 itself by a majority of 18. The difference in its majority was due to the swing in the Liberal vote; it went against the Government on the closure but it came down for the Government on the oil and petrol tax. This trial of strength made it clear that the Government had a safe majority of 5 over the other parties put together. Thus, the Tory Whips, working no doubt on Mr Churchill's dictum after another recent division that "you can't beat arithmetic," allowed the next clause, on entertainments duty, to go through without a division, though they deployed some heavy arguments against it. It is still possible that trouble will suddenly break out during the rest of the committee and report stages, but at the time of going to press it looks as if the Government will escape further challenges just as they have escaped so many others in the past.

Meanwhile Mr Henry Strauss has enlivened the proceedings somewhat by his amendment to Clause 32 of the Finance Bill. This clause aims at restricting companies' overseas transactions which are made to avoid tax, and the amendment would add the words "The Statute of Magna Carta, anno 9, Hen III, cap xxx (which confirms Chapter 41 of Magna Carta) is hereby repealed." This gave the House of Commons Librarian a busy afternoon explaining to

NOTES OF THE WEEK

Mission to Teheran

The Anglo-Iranian Oil Company is still in great difficulty, since it has to deal with Persians who want to nationalise it but have made no practical proposals for performing such a complicated process. It has done its level best to meet Dr Mossadegh and his advisers halfway. It has agreed to send a mission of four of its directors to Teheran to discuss how to carry out the nationalisation law, and it has appointed to head that mission two of the best minds at its disposal. Its deputy-chairman, Mr Basil Jackson, has the great advantage of wide experience of oil practices in the Americas; he represented the AIOC in New York for many years. Sir Thomas Gardiner, one of the two directors appointed by the British Government, was a civil servant of distinction and has been chairman of the National Dock Labour Board.

Whether the mission will find at the other end any one group of men with whom it can deal is still in doubt. Dr Mossadegh's cabinet is talking with far too many voices. For example, the Minister of National Economy, Mr Amir Alaii—the first to leave Teheran for the oil province of Khuzistan—said on arrival there: "Is it not possible to keep the Anglo-Iranian Company organisation here in the *status quo ante* but with Persian management?" Looking round at the samples of Persian management available in the country, and notably at the management of the nation's finances, the obvious reply is: "Not at the present standard of efficiency, nor at the present rate of profit to Persia." Mixed management would be another matter; but, in Teheran other ministers, and the Majlis, will clearly consider themselves "duped" if the talks lead to any arrangement that includes even a measure of British control.

Three members of the temporary board of directors of the new National Iranian Oil Company, to be followed by three members of the Persian Parliamentary Liquidation Commission, are all due to leave for Khuzistan within a few days. None of them has any experience of the oil industry. All are nevertheless confident of their ability to run it. Being Persians, they will probably not be daunted even by their first sight of its immense machinery—not only of the huge technical apparatus but of the vast mixed bag of employees

of several nationalities. Among these thousands of workers as is described in an article on page 1380, contentment must be maintained at standards hitherto unknown in enterprises under Persian management. If there has been a welcome movement away from the deadlock of recent weeks, there must be no illusion about the many difficulties that will obstruct the mission in its work.

* * *

Moscow and the Oil Dispute

By all the propaganda channels to Persia that are open and above board, Moscow has maintained an aloof and guarded attitude to the Anglo-Persian dispute. Of course underground channels have been hard at work fomenting it; there is all the usual evidence of highly organised encouragement to strikers in the oilfields, and copies of Tudeh's instructions for taking over the refinery have been impounded by the police at Abadan. These, however, are messages to known sympathisers. To Persia at large the line has been cautious and unusual. Normally, any trouble between the west and the "broad masses" of Asia is played upon with every stop out. Over China, Indo-China, Hong-kong or Korea, the whole network of propaganda has been devoted to "European imperialism," "American war-mongering" and "ill feeling" between Britain and America. Over the oil dispute, only a few muted references to competition between American and British oil concerns have been broadcast, all of them before the American Notes to Persia began to flow in. Since then Persian resistance to foreign "interference" is the only theme that has been developed on any scale.

Reticence is explicable, for Russia's own attempts to get an oil concession with a majority foreign shareholding are only four years old. Reticence is also shrewd. Persian minds, once worked into their present fever of emotion, become obsessed and forgetful. Public encouragement from Moscow or offers to help oust the British would have given pause to many National Front supporters. For it would have brought home to them the great home truth that is the

Round to the Russians

It is a pity that the western deputies in Paris, after a display of patience and meticulous draughtsmanship that must have impressed even Mr Gromyko, find themselves out-maneuvred. Having put up for thirteen weeks a good technical performance, the professional diplomats in the three delegations must have been distressed to see their political masters—some reports say it was Mr Morrison who betrayed impatience—presenting Moscow with the opportunity to express its confidence in Mr Gromyko and to put his fellow deputies on the spot. For that is what the Soviet reply of last Monday to the western Notes of May 31st has done. These Notes proposed an end to the argument about whether or not the Atlantic Pact and American bases should appear on the agenda, and an agreement to bring the Foreign Ministers together in Washington on the basis of the "split agenda"; for this represents such a wide area of agreement about what should be discussed that almost no subject of importance is excluded. Moscow's reply insisted politely that the deputies should go on with their talks with the purpose of including the Atlantic Pact and American bases abroad on the agreed agenda. This put on the western deputies the onus of refusal and breakdown. The reply also described "American military bases and the Atlantic Pact" as "the main cause of the worsening" of relations—a complete change of front from the Soviet attitude of last March, which concentrated attention on the "remilitarisation of Germany."

This round goes to the Russians, and it will be for the seconds in the western corner to work out how the points lost are to be made up in the next round. It is worth going on sparring a little longer, but there must be no illusions about the realities. Neither side believes that the other has in mind concessions which would enable the Foreign Ministers to achieve important results by negotiation; and it was one of the purposes of this meeting in Paris to discover this. Mr Gromyko knows quite well that the west will not modify the Atlantic Pact against any concession his masters are likely to offer. And the western delegates know quite well that, if they give way now on this essential point, the whole of Mr Vyshinsky's attack would be directed against the Pact when the Foreign Ministers met. In other words the failure of the meeting would be foredoomed—and

Progress in Electronics

RESEARCH The great variety of subjects under continual investigation in the Mullard laboratories include some that are truly revolutionary. Ultrasonics is an example. This science, involving the use of sound waves far beyond the range of human hearing, is likely to find increasing applications in numerous industrial processes. Its development is typical of Mullard initiative in research.

PRODUCTION Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

Who makes 2 million records a day?

At least 2 million records on 16 mm. microfilm are processed in the Kodak laboratories every 24 hours. They are the records of business houses, banks, and manufacturers and are made on the users' own premises by fast working automatic machines supplied on rental by Kodak. In most instances the copies are processed overnight and are available for reference the following morning.

This highly successful system has been built up as the result of 20 years' experience of microfilm recording by Kodak—the pioneers and still the leaders in this field.

Microfilm recording safeguards vital records and saves up to 99% of storage space. No wonder its use is expanding rapidly. A Kodak representative will explain how it can help in your business.

are, to say the least, liable to revision. If Nato succeeds in its main purpose, which is to keep the peace, then political leadership in the eastern Mediterranean and the Middle East—apparently left to the British—will be just as important in the cold war as the functioning of the European Command. And if Nato does not succeed in keeping the peace, is it absolutely certain that Admiral Carney's carriers will be required in the Mediterranean rather than elsewhere?

It would surely be wise to recognise that if the strategist in war regards the Mediterranean as one area, the statesman in peace has to regard it as two: one is Europe and the other is Middle East. Until the Atlantic Pact is extended to cover the Middle East these divisions should be recognised in the command arrangements; and such an extension should be permitted only after the gravest consideration of the long-term consequences. To extend the military range of the Pact is to limit its political and economic possibilities as a new form of association between allies. And one had believed that it was British policy to develop those possibilities to the utmost.

* * *

London Taxi Fares

The new rise in London taxi-cab fares announced by the Home Secretary last week was made after an inquiry by an independent firm of accountants into the economics of the industry. A new cab costs £1,200 since the last budget, compared with £350 before the war; petrol is up by 211 per cent since then, and the cost of spare parts by 100 per cent; and drivers' commissions were raised last June, after a strike, from 33½ to 37½ per cent. Compared with these figures, the present increase of 66½ per cent over prewar fares is moderate, and seems sharp only because it has all taken place in the last fourteen months. It was possible to defer it so long by running ancient vehicles which must now be scrapped—or rather, sold to private buyers at about £90 each. But the Commissioner of Police, who licenses London taxis, has been trying for the last three years to make a gradual return to the maximum "life" of 10 years for taxis; this year those of vintage 1933-34 are being taken out of service. Replacement is thus a growing burden.

The 66½ per cent surcharge is less than the proprietors thought necessary to cover all these costs, but when the taximeters are altered, as progressively they are to be, the whole basis of fares will be altered too, so that they will in fact be rather more than 66½ per cent higher, and nearer to what the proprietors proposed. The fare stages, instead of rising in thirds of a mile, will rise in fifths of a mile, at 3d. per fifth, but starting at 1s. 3d. for the first three-fifths. It is at least a compensating advantage to the passenger that if he travels a mile and a yard he will pay for a mile and a fifth instead of a mile and a third, as he does now.

The public may agree that the rise in fares is justified, but will it pay the new prices? After the increase a year ago, which introduced the 33½ per cent surcharge, receipts fell, and have still not regained their former level. But this fact must be attributed partly—how far it is impossible to say—to the end of petrol rationing and the return to private motoring. The present sharp increase at a time of falling purchasing power will lead to well-filled taxi ranks, just after the Home Secretary has turned down a scheme worked out by owners and drivers for a limitation of taxi-drivers' and cab licences. The drivers' insistence on an extra 6d. for a second passenger (drivers get all the extras) may prove short-sighted.

The Railways in Trouble

Those ultra-liberal economists who maintain that public enterprise is incompatible with a "rational" use of

resources might well hail last week's revelations concerning the present plight of the British Railways as a resounding demonstration of their case. A combination of labour shortage, low pay, and labour-wasting practices; an accumulation of delayed freights matched by resolute opposition to the freer use of road transport; a mutual cost-raising partnership with the coal industry; a disregard for the customer's convenience unmatched by any merely private monopoly; these accompaniments of public control hardly point to the fulfilment of the nationalists' expectations of economy, coordination, and improved labour conditions and morale. In fact, however, the difficulties of the railways have little to do with their legal ownership. The unreality of railway charges is the unreality of any set of prices institutionally removed from the market process and readjusted only at long intervals and by jerks; and their removal long antedates nationalisation. The "poor bag of assets" inherited from the railway companies after the strains of war, and the competition offered to their services by road transport, would have constituted exactly the same problem to any executive. So would the maldistribution of those assets in unprofitable branch lines and under-used facilities. The well-known defects of railway management and promotion systems are those of any very large and ossified organisation, public or private. The labour shortage to which the chairman of the Railways Executive drew attention last week is, like that in the mines, the product of brimful employment in less strenuous and intrinsically less uncomfortable occupations.

It is indeed arguable—and has been argued even by firm believers in competitive private enterprises—that nationalisation and nationalisation alone could make possible the major overhaul, the logical integration of services and adjustment of rates, which the situation demanded. The public's case against the Transport Commission, and against the Government responsible for the general framework of economic conditions within which the Commission must carry out its duties, is that this major overhaul has been shirked; that the opportunities of nationalisation have been dissipated by tenderness to vested interests, timidity before trade union obstructiveness, and acquiescence in timidity-dishonoured defects of organisation. This is to make the worst of both worlds.

Seven who were Hanged

After prolonged delays, due not to any desire of the authorities to keep condemned men in suspense, but to their lawyers' persistent exploitation of the almost endless appeal facilities of American law, the seven men who were not reprieved from death sentences in the most recent revision of German war crimes verdicts have at last been hanged. Three of them belonged to the S.S. *Wirtschafts- und Verwaltungshauptamt*, the administrative organisation of the Nazi concentration camps; and the other four to the *Einsatzgruppen* or extermination squads, which operated in the rear of the German armies in Eastern Europe. Between them these organisations killed in cold blood, with every aggravation of cruelty, a total of victims which cannot be precisely ascertained, but probably amounts to between five and seven million men, women and children, including the mass exterminations of Jews in the camps of Auschwitz, Maidanek and Treblinka. The most prominent of the condemned men was S.S. General Pohl, who was in charge of all the concentration camps and bore a responsibility surpassed only by that of Hitler and Himmler themselves for the immense atrocities of the Nazi régime.

The seven death sentences which have now been carried out were the residue of 28, out of which 21 were recently commuted to terms of imprisonment by Mr McCloy, the American High Commissioner in Germany, or General

SULPHUR

"BRING me fire that I may purify the house with sulphur" wrote Homer in the Odyssey. From these ancient medicinal applications, sulphur, in the form of sulphuric acid and other chemicals, has so extended its uses that today this yellow rock, which burns to form choking fumes, is one of the most important elements used as a raw material in modern civilisation. In recent times most of the world's needs for elemental sulphur—amounting to 5-6 million tons annually—have been supplied from deposits in the U.S.A., but these are fast becoming exhausted as more and more sulphur is needed for industrial, agricultural and other purposes.

Since the early 1930s, I.C.I. has been developing methods of making sulphuric acid from anhydrite, which is found in large quantities in many parts of Great Britain. It is fortunate, now that the sulphur situation is critical, that I.C.I. is thus able not only to increase its own production of sulphuric acid from British sources, but also to place its accumulated research and production knowledge at the disposal of some of the principal British acid users. Plans are indeed now going forward to install new plants which will make sulphuric acid from this indigenous raw material and thus reduce the need to import sulphur from overseas. I.C.I. has also converted other plants to utilise the sulphur recovered as spent oxide made in the purification of town gas.

History TODAY

The most absorbing monthly magazine in England—2s. 6d.

FOR THE FIRST TIME a journal exists that brings together the best historical minds of the day to relate the problems of the past to the interests of today.

These experts write for the general reader: for the layman and the scholar, the enthusiast and the merely inquisitive.

JUNE CONTENTS INCLUDE:

Resisters After the Event by Professor L. B. Namier. A renowned authority on the history of modern Europe discusses recent attempts by former Nazi diplomats to prove, now the tyrant is dead, that they were always rebels at heart.

Marxism and China by Dixon Hoste. Has Marxism a natural affinity with Chinese political thought? A study that has a special relevance to the present crisis in the Far East.

Changing Britain by Jacquetta Hawkes. One of the planners of the British

Pavilions on the South Bank describes man's first conquest of the British Islands.

Flowers from Abroad by Wilfrid Blunt. A detailed account of foreign contributions to the growth of the English garden, with prints and drawings.

Other articles include a long survey of Dutch Art in the 17th century by W. R. Jeurwine, an account of the Ministerial Crisis of 1851 by G. H. Le May and an historical account of the City of York by John Rodgers, M.P.

Handy, the American Commander-in-Chief. These reprieves represented the extreme limits of clemency to which it was possible for the American authorities to go; the cases had been repeatedly reviewed by appeal tribunals and committees, including eminent American judges, which had considered all the evidence and pleas in extenuation advanced by defence counsel. There could be no question of summary jurisdiction or verdicts reached under the influence of wartime passions. Nevertheless, an intense agitation for the reprieve of General Pohl and his associates has developed in Germany, and every kind of irrelevancy has been dragged in to confuse the issue.

It has been held that because the German Federal Parliament has abolished capital punishment in Germany, this should apply to sentences imposed by Allied war crimes courts under their own system of law—a claim which has no basis either in law or common sense. More indicative of the political character of the agitation is the claim of a counsel for the condemned men that they were "heroes of anti-Communism." If Germans think that such pleas can arouse sympathy in the western democracies for men who made a business of putting little children into gas-chambers, they are very much mistaken. In resisting the menace of totalitarian Communism, as it formerly resisted that of Hitlerism, the west has set its face against the whole principle of organised inhumanity which the seven men of Landsberg represented; and the sympathy which has been shown for them in Germany can only make decent people everywhere wonder how far even now Germans realise the enormity of the régime in which Hitler made them his active or passive accomplices.

Party and Peasant in Poland

The recent trial of some Communist Party and other officials at Gryfice in the Szczecin province of Poland has been given a great deal of publicity by the Polish press and radio. They were charged with exceeding their authority during the compulsory grain-purchasing campaign last February. The accused have been found guilty, among other things, of conducting illegal searches of peasant farms and of stealing domestic property. They have been sent to prison and the Politburo of the Polish Workers' Party has expelled them from the Party and dissolved their district committee. This is not an isolated case. Only a few weeks ago an article in *Trybuna Ludu* spoke of reports that abuses of authority were taking place in the countryside, and that local officials were showing a "soulless, politically thoughtless and condescending attitude" to the peasants.

The publicity given to the disciplinary action just taken on behalf of seven—as one is led to believe—very ordinary peasants serves several useful purposes. On the one hand it enables the Party to act in the role of incorruptible champion of the poor and oppressed, and the implacable foe of the "fossilised bureaucrats and careerists." It also helps to deflect on to expendable minor officials the widespread discontent over the Government's agricultural policy. On the other hand, it serves notice on all local officials that they must behave circumspectly, and not make the Government's relations with the peasants any worse than they must. For, however many temporary retreats and sidesteppings the Government may execute, collectivisation remains its basic aim in the countryside, and it cannot hope to carry this out successfully and get food into the towns unless most of the peasants co-operate. Although it is the declared aim of the Government to eliminate the kulaks and isolate them from the "working peasants," even the treatment meted out to them has recently been condemned as "high-handed" and contrary to the Party line. In other words, they are to be eliminated by discreet and respectable means such as crushing taxation.

David Among the Hospitals

It is hard to decide who had more right on their side in the long dispute between the South-West Metropolitan Hospital Board and the general practitioners of Kingston. The board, after many months of argument and appeals, has closed the Kingston Victoria Hospital and is to transform it into a gynaecological unit for the Kingston general hospital. The Victoria Hospital was a general practitioner hospital, which, however, was run with the assistance and supervision of outside consultants. The general practitioners therefore assert that the hospital achieved two important aims: it preserved continuity of care for the patients, while providing them with consultant skills, and it preserved the status of the general practitioner, which is being whittled away under the national health service by his exclusion from the hospitals.

For the regional board it can be said that its chief function is to plan and co-ordinate the hospital services of its region. The whole point of setting up appointed regional authorities was to make it easier to override local loyalties where the interests of the whole area demanded it. The board has maintained that more gynaecological beds were urgently needed, and it offered the general practitioners alternative beds elsewhere, but the displaced doctors of the Victoria Hospital rejected them as unsuitable. It is perhaps worth pointing out that in the case of Paddington Green Children's Hospital and the London Lock Hospital, which were also threatened with extinction by regional boards, the Ministry of Health decided in favour of the threatened hospitals, showing that it is willing in some cases to make plans give way to tradition and local feelings. In the Kingston dispute it has upheld the regional board. This looks as if on balance the board has the better case; but one cannot help suspecting that its way of setting about it has been badly at fault.

All this is past history. The new and unexpected happening is the determination of the displaced doctors and the

Clogs Upon the Mind

If anything could make us forswear our faith in human progress and lend an ear to those prophets of evil who despair of the prospects of our race, it would be the late portentous resuscitation, in so many quarters, of the old demon of Religious oppression. Here, and here alone, retrogression is undeniable. While Science with all its grand discoveries, Art with all its splendid applications, Industry with all its tameless energy and all its magnificent achievements—are striding forward to their allotted goal with no faltering or languid steps, there is a class of men as busy as of old in hanging clogs upon the mind, and pressing back the tide of intelligence and inquiry whenever it endeavours to enter upon its highest field—that of religion and the wisdom of the soul. While Reason and Knowledge are carrying light into all the dark places of the earth, the Priests of darkness are resolute in insisting that no rays shall be allowed to penetrate the clouds in which they sit, and out of which they teach. While the efforts of the wise and good are directed towards the spread of freedom in every department and in every land,—while the unenfranchised is struggling for his rights,—while the slave is casting off his chains—while commerce is unbound, and industry exulting in its new-born liberty—while the Great Emancipator is everywhere issuing to every oppressor of every victim the high command—"Loose him, and let him go!"—those very men who ought to be by the nature of their calling—who would be if they had a just conception of their mission—the Leaders and Educators of Humanity, are striving to cast it back into a darker dungeon, and to bind it with heavier fetters than before.

The Economist

June 7, 1851

management committee of the Victoria Hospital to start a new hospital in Kingston to replace their old one. They are appealing for £50,000 to buy and equip the premises and to maintain the hospital for two years. The hospital will be tiny by present standards—15 to 20 beds—but the aim is to equip and staff it as well as any general hospital. Patients will be treated free, though private wards will be available if wanted. Whether the doctors will succeed in raising their £50,000 remains to be seen, but they will certainly win a great deal of sympathy. At the present time such a resolute display of individualism and voluntary effort, in the face of great odds, deserves ungrudging approval.

* * *

Halfpenny on Milk

The price of milk is to go up from 5d. to 5½d. a pint from July 1st because of the higher price to be paid to British farmers under the February price review. This simple statement issued by the Ministry of Food reveals a major change in the Government's policy on food subsidies. Milk has long been considered an essential nutritional food, whose price should be kept within the means of all classes of consumers. The higher prices that the Ministry of Food has now to pay for home-produced and imported foodstuffs made an increase in retail prices inevitable, given the limit of £410 million on the total cost of subsidies. But the

Ministry had ample scope to mask the increases on those foods considered nutritionally important and to exaggerate them on the other foods. It has, however, chosen the wiser course of reflecting its higher purchase prices for different foods in their retail prices, though not proportionately to the same extent. Milk is still one of the most subsidised foods and the real price to the consumer should be 8½d. a pint. But at last the British consumer is being made to feel the impact of higher food prices, and the distortion caused by the subsidies in the pattern of relative prices is being lessened. The price of 1½d. a pint for milk sold under the welfare schemes will be unchanged and free milk will still be given to school children. This part of the nutritional programme has quite rightly been kept intact.

Weekly expenditure on food will go up by another three halfpence since approximately three pints of milk are consumed by each adult. The higher prices for rationed foods announced a month ago added about fivepence halfpenny to weekly food bills, so that the total increase is now sevenpence. At the beginning of April the Minister of Food warned housewives that the weekly cost of basic food would increase by about eightpence this year. Another penny a week has still to be found unless Mr Webb was erring on the high side to allow for further increases when the annual price reviews of the various long-term contracts with other countries start next month.

Letters to the Editor

A Higher Pound?

Sir,—In your leading article on "A Higher Pound?" which appeared on June 2nd, you do something less than justice to the case for revaluing the pound. Your argument that revaluation would eliminate the rise in prices on which the Government is relying to free resources for rearmament, thus necessitating increased taxes or reduced subsidies, surely depends on the assumption that revaluation would be accompanied by no change in the export programme. Under present conditions of demand for our exports, revaluation would permit us to pay for our imports with a lower volume of exports, so that part of the needs of rearmament could be met from lower exports rather than from lower consumption; to that extent, the budgetary measures you suggest would not be necessary. Furthermore, since current price rises reflect rising costs and wage demands rather than excessive demand, the effects of revaluation on domestic prices would have a useful anti-inflationary effect, rather than the inflationary effect you predict.—Yours faithfully,
HARRY G. JOHNSON
King's College, Cambridge

Inquest on Farming

Sir,—The *Economist*, in its comment on the Government's White Paper on farm prices, compares £53½ million—which is part only of the increased costs for all commodities over a full year—with the £43½ million recoupment for review items only. You thus make the mistake that the Government, in drafting the White Paper, no doubt wished you to make. You imply that agriculture has suffered under-recoupment of only £10

million, which represents partial withdrawal of the capital injection. It may, therefore, seem that the industry has suffered no under-recoupment, but in fact has merely repaid part of a loan. The implication is clear that, other things being equal, farm income will be only £10 million less next year. The fallacy of this conclusion is obvious. The award for livestock products will come into farming receipts in the June to May year, 1951-52, but the award for arable crops will not be received by farmers until after the harvest of 1952, i.e., in 1952-53. Moreover, since no award was made for the 1951 arable crops at the 1950 review, the farmer will have to bear all the increased costs for crops of the 1951 harvest, with the exception of the special award to cover increased labour costs only, incurred from November, 1950, to March, 1951. In other words, recoupment based on a full year's receipts must be compared with a full year's increase in costs.

Since you have pointed directly to the £89½ million increased costs, which relates to all commodities, it is necessary to point out how the burden has, in fact, been distributed:

£13½ million applies to the higher costs of non-review commodities which receive no automatic recoupment;
£43½ million has been awarded as higher prices for review commodities;
£22½ million represents the proportion of increased costs absorbed by producers of review commodities;
£10 million has been withdrawn by the Government out of the £40 million capital injection.

You point to the fact that whereas the industry has increased the physical quantity of production by 25 per cent over the past four years (no small

achievement) farming profits have risen by approximately 60 per cent over the same period. In considering whether this increase in income is justified, it is necessary to have regard, not only to the conditions which existed in 1946-47, the base year of the agricultural expansion programme, but also to those in the following years. In 1946-47, the income of the industry had reached its lowest level since before the war. Moreover, the ratio of profit to net output in that year was the lowest in any year between 1940-41 and 1950-51. At that time, the industry was seriously concerned with the declining trend in farm income and pointed out to the Government that it could not accept the responsibility of maintaining, let alone increasing, food production unless the level of profitability was permanently raised. As *The Economist* well knows, the Government then decided to inject £40 million a year into farming incomes. Thus, starting from a base income of £184 million, which was the worst since before the war, it will be seen that if farming income had risen in proportion to the 25 per cent increase in the volume of physical output, it would have increased by £46 million between 1946-47 and 1950-51, i.e., to a level of £230 million, assuming of course that costs and prices remained at 1946-47 levels. When the £40 million capital injection is added to this sum, the "theoretical" farming income would be £270 million, leaving a gap of £23½ million between that figure and the present forecast of £293½ million—a calculation which makes no allowance for the fall in the value of the £ since 1946-47.

It is quite untrue that farmers have had to find "only a minor part" of their

increased costs. Over the last three reviews, producers of review commodities have absorbed £60½ million out of a total of £153½ million increased costs. Surely nobody could reasonably claim that farmers have borne only "a minor part" of this burden.

You suggest that the Government's food import programme is adjusted to the availability and the cost of home-grown food. In fact, the raising of the limit on coarse grain acreage and the stimulus given to livestock production are both reflections of the shortages of imported supplies.

You imply that overseas producers are straining to supply us with food at low prices. This must make strange reading for the Ministry of Food whose unwillingness to pay the increased prices now being asked by virtually all of our major food suppliers (which have themselves been necessitated by increased costs) has already resulted in a fall in our imports of several basic foodstuffs.—Yours faithfully,

H. COLE TINSLEY,
Vice-President,
National Farmers' Union

London, W.C.1

[That the farmers will have, this year as in recent years, to "absorb" some part (not, on our calculations, a large part) of their increased costs is no answer to our arguments. To recoup them 100 per cent would be a very poor bargain from the nation's standpoint, since it would allow nothing either for increased efficiency or for higher production on the part of farmers. Mr Tinsley's own figures show how successfully costs have been "absorbed" over the last four years.—EDITOR.]

Famine in India

Sir,—I am astonished to note that *The Economist* did not have the courage to set out the basic problem in the article in the issue of April 21st. The article states that the long-term problem is whether to grow more food or more cash crops and makes no reference to the basic problem of "growing" fewer children. Famine and disease are the only current checks on India's population. The more food that is poured into India the greater will its population grow.—Yours faithfully,
F. H. CARLSON
Victoria, Australia

Weights and Measures

Sir,—Your Note in your issue of May 19th refers to the need for the decimalisation of the British coinage. It is understood that the Government of South Africa favours a proposal based on the adoption of the unchanged crown as the principal coin of account.

The following table of coins and accompanying comments may therefore be of special interest:—

Denominations	Crowns and Cents	Equivalent
Paper:—		
100 Cents—Crown.....	1.00	s. d. 5 0
Silver:—		
50 Cents—Half-crown.....	0.50	2 6
20 Cents—Shilling.....	0.20	1 0
10 Cents—Sixpence.....	0.10	6
5 Cents—Threepence.....	0.05	3
Brass:—		
2 Cents—Decimal Penny.....	0.02	1.2
1 Cent — " Halfpenny.....	0.01	0.6

New notes could be issued, as required, in crowns and in its usual multiples at

the unaltered rate of 4 crowns to the pound. All the silver coins could be described in cents without change of value. The existing bronze coins could be used as cents representing twenty per cent higher values than pence, and exchangeable at the equality rate of 5 cents for 3 pence.—Yours faithfully,
Hale
HARRY ALLCOCK

Lebanon at the Polls

Sir,—It might interest you to learn that your article "Lebanon at the Polls" published during April has been published in one of the leading Arabic papers of Lebanon *An Nahar*. As a result, the poor editor and owner of the paper, Mr Ghassan Tuani, M.P., Harvard graduate in journalism, has been sued; his paper was subsequently suspended for eight consecutive months and he was condemned for £Lebanese 800 damages.

I want to proclaim here that we Lebanese welcome any criticism you make which would lead to the overthrow of our present dictator, who, unlike other dictators who sometimes try to benefit their country, through public works, etc., is only interested in his individual and family welfare. All that you said in your article represented the whole truth.—Yours faithfully,
A LEBANESE

Those Billions

Sir,—The possibilities of confusion between milliards, American billions and British billions, to which reference has been made in your correspondence columns, are exceptionally frequent in Germany, where statistics are issued daily by American, British, French and German authorities. Involuntary multiplication or division by one thousand is accomplished with fatal ease, especially in announcements which have been translated, teleprinted and duplicated.

You maintain, I notice, that the word "milliard" is not English, and no doubt you are right. But is it not time for some term denoting "one thousand million" to be internationally standardised, to eliminate ambiguity?

Confusion is deepened by the use of such abbreviations as M., m. and Md. In the British press, at least, these are no doubt only one more reflection of the newsprint shortage. But to many readers, including myself, the significance of very large figures is to a great extent visually appreciated. The statement, for example, buried in a long dissertation, that there are now "nearly 10m. refugees in Western Germany" has a far weaker impact than "nearly 10,000,000 refugees." And am I alone in finding "\$5 Md." a rather unimpressive sum of money?—Yours faithfully,
ANTHONY MANN

Bonn

Disturbances in Grenada

Sir,—It was with some surprise that I read a Note in your issue of May 19th. You state, "To grasp the real nature of these sudden disastrous outbreaks of violence to which the West Indies are prone is by no means easy," also, "There is no industrial issue at all in the new

outbreak of unrest, which is more of a demonstration of loyalty to Gairy."

To the average reader, the first quotation implies the existence of conditions in the island unparalleled in world history; it implies that the ordinary social and economic factors that have been the cause of unrest in different sections of the world from time to time fail to serve as a basis for explaining away the upheaval. On the contrary, you state that "provocation frequently comes, not from any particular 'oppression' or any new burden, or act of injustice, but from the personality of leaders striving for power." The end, ergo, explains the beginning.

Speaking generally, Grenada has not felt the sharp edge of the evils of monoculture. Her agriculture is more diversified than the other islands. But cocoa is the largest export crop, and much dissatisfaction has been felt because the sharp rise in the world price has not been reflected in the price to the planter from the merchant, far less in the purchasing power of the labourers. There were two trade unions on the register at the end of 1949, with a total membership of 2,039 out of an employable labour force of 28,239. It is not surprising to find that the basic daily wage of a labourer in the cocoa industry is 91 cents (3s. 9½d.) for a man and 76 cents (3s. 2d.) for a woman.

An outstanding feature of the island economy is the comparatively large number of smallholdings—about 20,000 smallholdings out of a total of arable land of 75,119 acres. The greatest number of holdings (19,592) are under ten acres. Unfortunately these holdings are too small to provide the means of an independent existence, and the holders have to supplement their casual employment on estates or elsewhere. The products of the tiny holdings are sold for cash, and the labourer exists as best he can on imported foodstuffs and clothing. Because of currency restrictions, purchases must be made in the mother country, and since devaluation the cost of living has soared.

Political demands have played no part in the present upset, because hungry and desperate people cannot think in terms of long-range political movements. Gairy's Manual and Mental Workers' Union was the natural answer to the ineffectiveness of the Trade Union Council to improve the basic wage; suspicion also deepened because of the links between the TUC and the employers themselves.

If Jamaica had not demonstrated symptoms of the "malaise" as represented by Alexander Bustamante, would it have achieved more representative government? Had Trinidad's "malaise" not produced Uriah Butler, would the new constitution of 1950, as recommended by the Commission of 1946, ever have been implemented? It is the peculiar fate of these islands that symptoms of "malaise" have to be exhibited before they qualify for constitutional reform.—Yours faithfully,
LYNNE BECKLES

Ruskin College,
Oxford

Books and Publications

Men and Morals

English Life and Leisure. By B. Seebohm Rowntree and G. R. Lavers. Longmans. 482 pages. 15s.

This book has all the appearance of being in the great tradition both of Mr Rowntree's own previous surveys of poverty and of the "London Life and Labour" surveys to which, from its title, it might have formed a happy complement. Thus one picks it up with a keen sense of anticipation which unhappily is not fulfilled. The disappointment is not altogether easy to explain. The book is attractively printed—and for these days cheap—and the style is as readable as the type.

To a certain extent disappointment may be felt because a large part of the material is not new. This is not a survey in the sense of a complete picture of the leisure time activities of a representative sample of the people. The authors have instead taken examples of such activities—gambling, drinking, the cinema, broadcasting are among them—and treated them at length or sketchily according to the amount of the material available to them. Thus gambling, on which much has been written in recent years, is given a fair amount of space; it is, however, unfortunate for the authors that the report of the Royal Commission on gambling has appeared since they completed their book, for it gives a much less gloomy picture of the nation's gambling habits, and their cost, than they do. Drinking is also covered fairly fully—though here too one has the impression of reading familiar matter. The stage, on the other hand, is inadequately dealt with, and surely the growing popularity of ballet deserved at least a mention.

As an introduction to these various leisure time activities, the authors give a selection of 220 case histories out of nearly a thousand which they collected in the course of compiling their material. Here again one is disappointed. Case histories, properly presented, put life into the bare facts of a social study. When they are woven into the general theme as illustration, their "human

touch" helps to drive the argument home. Mr Rowntree and Mr Lavers do indeed use this technique, with considerable effect, in their other chapters. But they made a mistake in starting the book with a chapter of 121 pages containing nothing but case histories. They are not intensive enough to be of real interest in themselves, and many readers will find that twenty or thirty of them are all they can manage on end.

Perhaps the main cause of disappointment in the book is the growing impression that the authors were not so objective as they claim to be. They themselves admit that once they had embarked on their study of leisure they found themselves embarking on "a study of the cultural and spiritual life of the nation." Unfortunately, this gives the whole book an impression of moralising, an impression which the authors were clearly anxious to avoid giving but which is inevitable from the leisure time pursuits that they select to treat at length. To allot whole chapters to gambling, drinking and the cinema, all activities widely held to be demoralising—although, to do them justice, the authors do not confirm this view in every case—and to treat summarily or omit altogether such activities as games, women's institutes, walking, gardening, allotments, music, and all the thousand and one hobbies that make up the brighter side of English life and leisure inevitably make the book seem biased. A chapter on sexual promiscuity and another on honesty, or rather dishonesty, and a too ready use of the phrase "moral fibre" confirm the impression of moralising before one is half-way through the book.

It is only towards the end that interest revives, with the chapter on religion, which is excellent and fulfils all expectations. Here the authors are able, by reference to an earlier survey by Mr Rowntree in York, to give some measure of the decline in churchgoing in this century; in the earlier chapters the

reader is left guessing whether people are better or worse than they were fifty years ago. The authors' discussion of the causes of this decline is wise and objective. What is especially striking is that, in spite of the decline in churchgoing it reveals, the chapter as a whole, by emphasising the persistence of the Christian ethic, does much to redress the unfavourable picture of English life produced by the other chapters. Extracts from the case histories are in this chapter particularly effective, and one sincerely wishes that the rest of the book were on the same level.

The Spy Ring

Chief of Intelligence. By Ian Colvin. Gollancz. 223 pages. 12s. 6d.

It is a great pity that, in writing this book, Mr Colvin allowed himself to be distracted by the red herring that Admiral Canaris, Chief of German Military Intelligence (*Abwehr*), might have been a British agent. Canaris was many things to many men, but there is no evidence, not even in this book, that he ever so much as pretended to owe allegiance to Britain. If he preferred any country to Germany, it was Spain and not England, which he barely knew. True, his plotting and intriguing, his occasional false evaluations of the intelligence reports he received, and his inability to make the *Abwehr* a really efficient organisation indirectly helped the Allies, but it is stretching logic too far to deduce from these facts that he was therefore employed by the British.

Apart from this irritating theme, however, the book gives a fascinating account of Canaris and the *Abwehr*. Mr Colvin has unearthed a number of good stories about intelligence work during the war. There is the case of the Dutch agent in The Hague who seems to have played not only the British and German secret services against each other but also the *Abwehr* against other German intelligence organisations. Intrigues in Spain, in the Vatican and in Turkey are all well described, and Mr Colvin has succeeded in re-creating the curious atmosphere which surrounds the work of secret agents.

Inevitably, however, much of the book is taken up with the part which Canaris played in the various revolts against Hitler. And here Mr Colvin is on uncertain ground. There is no doubt that Canaris had a finger in a large number of intrigues which aimed at the overthrow of Hitler, but it is quite impossible with so little evidence to say how important a conspirator he was. He might have been the ring-leader of the plotters, but even the Gestapo was sufficiently uncertain about him to have delayed his execution for six months after he was arrested for his alleged participation in the revolt of July 20, 1944. This could, of course, mean that he covered his tracks more cleverly than his fellow-conspirators, but the impression one gets both from this book and from other accounts of him that have been published is that he moved in the outer rather than in the inner ring of the plotters. Canaris was neither a very able chief of intelligence nor a very important figure in Germany; he was, however, an exceptionally interesting character, and Mr Colvin might have done better if he had attempted a more straightforward biography of his subject.

Introduction to War

The World at War. Edited by Geoffrey Dennis. Caxton. 4 Volumes. £4 10s. 3d.

Mr Jules Menken has contributed a long introduction—it is a full-length book in itself—to this new edition of "The World at War" (it was originally published in ten volumes under the title "The War of 1939"). In it he attempts the formidable task of explaining just how the war came about. He takes the reader from crisis to crisis down the long hopeless slope from the occupation of the Rhineland, through the Japanese invasion of Manchuria, the Spanish and the Abyssinian wars, Munich and Poland, to the final avalanche of the war itself.

It is not altogether Mr Menken's fault that the narrative—at any rate in its early stages—does not move forward very coherently but tends to run in circles. Indeed he drives all his horses before him with great skill; the difficulty is that he has so many horses to drive and so much ground to cover. It is only towards the end, in the Munich to Poland period, when the focus narrows down upon the rampaging figure of Hitler, that the events take on a clear and decisive movement.

Reading through these half-forgotten speeches of the dictators, the broken treaties and the planned lies, one is afflicted all over again with the feeling that none of it was inevitable and none of it represented what the masses of the people really wanted, whether they were German or Russian or British or anybody else. Somewhere, somehow, politics moved beyond human control and no one knew where or how to apply the brake and set things right again. The war itself bursts upon the scene with a sense of positive relief.

Inevitably Mr Menken's book evokes a comparison with things as they are now—and despite the atomic bomb there is a curious reassurance in this. When one is reminded here of the feebleness

of Britain's alliances right up to 1939, the wishful thinking and the pathetic unpreparedness, one looks at the year 1951 in a much more friendly light. Nothing like the United Nations campaign in Korea could have happened in the nineteen-thirties—the nearest parallel is the half-baked attempt of the League of Nations to impose sanctions on Italy over the Abyssinian war. Nothing like the North Atlantic Treaty Organisation was envisaged, let alone put into practice. America was in no way committed. Mr Chamberlain had not even read *Mein Kampf* until he returned from Munich and no complete translation was available in Britain until 1939.

There may still be people who believe that it is possible to make treaties with Moscow, but at least most of them are not quite so ignorant of the theory and practice of communism in Soviet Russia as they were of Hitler's Nazis in the nineteen-thirties. This perhaps is the most startling difference between then and now, and with it the indifference, the cynicism, perhaps even the fatalism with which the public almost expects treaties to be broken. Right up to Munich and even beyond most people still placed some trust in the signed word of governments.

Mr Menken has written a scholarly and able essay, and it makes an excellent springboard into the next three and a half volumes which tell the story of the war itself.

The Death Penalty

The Shadow of the Gallows. By Viscount Templewood. Victor Gollancz. 159 pages. 8s. 6d.

Lord Templewood gives this book the sub-title of "The Case Against Capital Punishment." It is not, therefore, a dispassionate review of the arguments for and against capital punishment but a frankly polemical work, which is, however, on the whole, written in a dispassionate though somewhat uninspiring style. There is no fire in it. Too often, Lord Templewood points out, capital punishment—and penal questions in general—are discussed in a highly charged atmosphere, and by treating the evidence unemotionally he presumably hopes to have it considered in a similarly unprejudiced way.

The evidence is indeed impressive. In Europe west of the iron curtain the death penalty has been abrogated by disuse or abolished in every democracy except Great Britain (but it has been considerably modified in Scotland), Ireland and France. It has been abolished in virtually all the South and Central American states, in six of the United States, in Queensland, in New Zealand, in Nepal and in Travancore. Since all the thirty-six states where there is no death penalty have suffered no increase in the rate of murder, and have had no difficulty in dealing with long-sentence murderers in prison, why should Britain cling to a penalty whose main drawback, to some people, is that it is quite irrevocable—Lord Templewood cites instances where innocent men have escaped hanging by the merest chance.

Yet one wonders whether all his evidence in favour of abolition will persuade the upholders of capital punishment to budge one inch. Abolitionists will be depressed by reading in this book that a Royal Commission was appointed in 1864, which reported in favour of reducing death sentences for murder to the very minimum. All that has been accomplished in the succeeding ninety years is the removal of infanticide from the law of murder, the end of public hangings—and the appointment of yet another Royal Commission. Is it possible, one asks, for capital punishment to be considered dispassionately? Do not people, whatever rational arguments they may voice, really make up their minds for or against capital punishment emotionally and intuitively?

The floating voters on this subject must be very few. But such as they are they will probably be moved in favour of abolition, not so much by Lord Templewood's evidence as by his confession that he is not sure whether he exercised his power of reprieve rightly when he was Home Secretary. They will be impressed, not by statistics, but by the cold factual account of an execution provided by the Home Office for the present Royal Commission and reprinted by Lord Templewood in this book.

Fission or Cohesion

The Multinational Empire: Nationalism and National Reform in the Habsburg Monarchy, 1848-1918. By Robert A. Kann. Columbia University Press. (London: Geoffrey Cumberlege.) 2 Vols. 444 and 423 pages. £4 2s.

The difficulties of writing the history of the Habsburg monarchy are proverbial. The mass of material is vast, the linguistic difficulties are formidable, and the passions generated violent. Professor Kann has many of the qualifications needed for the task. He has (to judge from his bibliography) a knowledge of the main languages of Austria-Hungary. He has (we learn from the publishers' announcement) a personal background that gives him an understanding of the mentality and values of Central Europeans. He has scholarship, insight, and a conspicuous impartiality. A book, therefore, on the scale of this one and with all these qualities ought to become the standard work on its subject. But it has one serious flaw, its style. We have become used, unfortunately, to stodgy and undistinguished writing in our history books, but "The Multinational Empire" is badly and obscurely written even by American standards.

This is unfortunate, for the book is full of valuable information and interesting judgments. It is an account of the ideas held about the relations between the nationalities in Austria-Hungary, rather than a history of the nationalities themselves. This means that attention is concentrated on legal and constitutional proposals rather than on economic and cultural development. This legalistic approach is a useful one because it enables one to study in detail the con-

ANTECEDENTS OF THE INTERNATIONAL LABOUR ORGANIZATION
By JOHN W. FOLLOWS. 18s. net
The International Labour Organization owes its origin to the idea that labour laws, to be effective, must be accepted by all nations. It was the logical answer to early industrialists who opposed a reduction of working hours because of foreign competition.
This study begins by examining and rejecting the widely accepted view that Robert Owen originated international labour legislation. It goes on to trace the origin of the idea to one Charles Hindley in 1833, and shows how other reformers—Villermé, Blanqui, Legrand, Ducpétiaux, Frey, and Mahaim in their turn espoused and developed the cause. By 1900 an unofficial international labour organization was formed. The final chapters describe how its efforts resulted in the first international labour law and set the stage for the constitution of an official International Labour Organization in 1919.
OXFORD UNIVERSITY PRESS

stitutional proposals that were made, and the forms of political organisation actually put into practice.

Professor Kann comes to the conclusion, like Mr A. J. P. Taylor, that after 1866 nothing could have been done to save the monarchy. Yet the framework within which all the discussions took place was that of an Empire that was expected somehow to hang together. R. W. Seton-Watson wrote in 1907: "The present writer disbelieves not merely in the probability but even in the possibility of a break-up of Austria-Hungary." "Even the severest critics of the Empire up to the last envisaged its survival in some form or other." However, each proposed solution of the problem of nationalities had consequences that would be intolerable to some section within the Monarchy. Even the most enlightened German liberal theorists never shed their tacit assumption that German culture was in fact superior to that of the other nationalities and would ultimately prevail. Even the most enlightened of aristocratic federalists were not prepared to give up their privileged position and accept a genuine democracy, so that their plans for reform lacked mass support.

Above all, the dynasty itself never produced the man capable of putting any serious reforms into practice. Francis Joseph in the last decade of his reign was too remote, weary and unimaginative to do so (or was it, as some writers suggest, that he saw how disastrous it would be to touch the creaking edifice?). And even if the dynasty had produced a

leader of genius, would he have been more successful? To the end the Magyar nobility and gentry opposed any reforms that in the slightest degree weakened their position, while the years 1849-66 had shown the difficulties of imposing a settlement on them by force.

Yet when the end came, it came with surprisingly little violence. Dr Kann suggests that this was due to the influence of a series of thinkers who had believed, from their different standpoints, in liberal solutions and peaceful change—Palacky, Eötvös, Lammasch, Masaryk, for example—and that their spirit offered the only hope for the Succession States. And as one looks at the attempts made since 1938, first by the Germans and then by the Russians to impose a unity on Central Europe, one can be excused a moment of regret, if not for the irrecoverable political organisation of the old Austria-Hungary, at least for the enlightenment that some of its subjects achieved.

Saskatchewan Experience

Agrarian Socialism. By S. M. Lipset.
University of California Press. Cambridge University Press. 315 pages. 37s. 6d.

This study of the rise to power of the Co-operative Commonwealth Federation party in the Canadian Province of Saskatchewan bears a paradoxical title. Professor Lipset's central conclusion is that the programme followed by the CCF Government has been one of bold, constructive reform rather than one of fundamental socialist change. Innovations have been conditioned by the attitudes and interests of the main groups in the province. Being democratic the government has not carried out sweeping changes of a doctrinaire character. Policies which seem radical as compared with policies advocated and implemented in eastern Canada are, in fact, conservative in their prairie context and certainly neither egalitarian nor likely to bring about wholesale nationalisation of resources and production.

The western wheatlands of Canada depend on a single crop. This crop is at the mercy of the incalculable vagaries of nature. It is subject to drought, hail, early frost, grasshoppers and rust. It must be exported at heavy cost to distant European markets where its price has, on occasion, dropped suddenly and catastrophically. The farmers who grow it face the twofold problems of a frontier and a rural community. This background welds them together with a common class interest which has created a "native pattern of organised discontent." They are concerned to secure a high, stable price for their wheat, low transport costs, cheap effective grain-elevator and other services, and generous financial facilities, together with protection against the effects of natural catastrophes. Their attempts to "resist the coercions of a fluctuating market economy" have given rise to a long series of radical farm movements, which has its counterpart among wheat farmers in the United States, and which reached its peak in the election in 1944 and re-election in 1948 of the present farmer-labour government in Saskatchewan.

Within the limits of its constitutional competence, this government has fought for the interests of the wheat farmers, notably by encouraging co-operative action and protecting farmers' title to their land against creditors. It has put into effect "one of the best social service programs in Canada" to meet the needs of its sparsely peopled rural communities, especially for improved health and educational services. It has passed progressive labour legislation in response to the demands of the small urban branch of the party.

Professor Lipset's story of these developments is more rewarding to the general reader than his excursions into sociological theory, where the thread of his argument is sometimes lost in vague generalisations. It is none the less encouraging to find a sociologist trying to bring to bear the facts of an experiment such as this on the problem of the nature of political and social change.

Intelligent Investment

Investment Arithmetic. By M. S. Rix.
Pitman. 155 pages. 15s.

Arithmetical calculation is part and parcel of any investment decision, but the snares and pitfalls which await the unwary who trespass unguided into the realm of the specialist statistician are many. Miss Rix, in detailing the principles underlying these processes, has now provided a safe guide and is quick to point out when the specialist should be called in. The primary purpose of this textbook, which is admirably fulfilled, is to enable any investor readily to understand the reasoning of investment statisticians. These specialists themselves will also profit by reading this book for it unifies and clarifies the rule of thumb methods so often used.

As well as discussing yields and certain recognised calculations arising from company accounts in great detail, a good deal of descriptive matter is given, relating to securities, prices, dividends and new issues. This is as it should be, for once all the material is gathered together and fully understood, actual calculation is comparatively straightforward. One criticism of detail can, however, be made. In an otherwise exhaustive discussion on equity earnings it is not quite clear what is meant by free reserves; should replacement reserves, for example, be included in a distributable earnings calculation or not?

The exposition throughout, even on such an intricate subject as overseas taxation reliefs, is lucid and the style direct and simple. Well chosen arithmetical examples illustrates every principle of calculation and any qualification which has to be made. A well-compiled index and the subtitling of paragraphs make reference easy, an essential requirement in a textbook of this nature. "Investment Arithmetic" should become a standard book of reference not only in stockbrokers' offices but also on the shelves of anyone whose interest in investment goes beyond a cursory glance at a balance sheet or the passive acceptance of a broker's opinion.

THE BRITISH COLONIES

ALMOST EVERY ITEM of news nowadays from the British colonial territories in Africa, the Caribbean, and elsewhere in both hemispheres, bears witness to an accelerating tempo of economic and constitutional development. For that reason it is imperative that the character of the problems involved in colonial development to-day be fully and widely understood.

The Times Review of the British Colonies, which appears on the first Tuesday in March, June, September and December, is addressed to everybody directly connected with the affairs of the colonial territories and to all who seek to know more about them.

The first issue, published last March, was read by a large public at home and reached almost every part of the world. The June issue has just appeared. It resumes the commentary on colonial affairs during the preceding quarter and introduces an important series of contributions on the resources of the colonies with a special article on rubber. This reviews the growth of the rubber plantation industry, analyses problems of supply and demand, and discusses the outlook for the future.

Among the subjects of other articles by Special Correspondents of *The Times* and recognized authorities on colonial subjects are:

African Health Services

Gibraltar To-day

The Cameroons Development Corporation

Inter-Territorial Research in Africa

The Duties of a Colonial Governor's A.D.C.

Population and Communal Questions in Singapore and Malaya

The Modified Groundnuts Scheme and its part in Tanganyikan Development

The Exhibition of Traditional Art from the Colonies
at the Imperial Institute

EXPERIMENT IN FREEDOM

A REVIEW OF BRITISH
POLITICAL AND SOCIAL TRENDS

by
C. F. O. Clarke

In this book, which comprises the lectures delivered publicly, last autumn, at the invitation of the Lowell Institute, Boston, Mass., the author passes in review the political and social trends which have given British democracy its present aspect.

CHAPMAN & HALL

AMERICAN SURVEY

Washington in Two Minds

Washington, D.C.

THE internal tensions now to be discerned or deduced behind the Iron Curtain were mentioned in a recent speech by President Truman, and since then the legislative reference staff of the Library of Congress, in a report to the Senate Foreign Relations Committee, has examined "a number of soft spots (in the Russian structure) which are most uncomfortable to the Soviet leaders." As far as it goes, though there has been no conclusive demonstration that it goes very far, this is satisfactory to one and all. But it must have set some of the more perverse realists in Washington to wondering whether any comparable references are being made inside the Kremlin to the internal tensions of the conspicuously uncurtained area that stretches from the Ambrose Light to the Golden Gate.

If they have not been observed in Moscow, it can only be because all hands have been too busy lately with livelier documents analysing and assessing the military and political secrets that have flowed from the MacArthur inquiry as from a cornucopia. The American tensions are evident enough to anyone who reads the papers. To those who busy themselves in the general vicinity of the horse's mouth, they seem most often to spring from a deep-seated case of split personality. A curiously neat illustration of this condition has just been furnished, in two acts. The first act took place on a Friday when newspapermen were invited to the offices of the International Monetary Fund for a briefing on the impending second annual report on exchange restrictions; and this may be described as the day when the good Dr Jekyll was on top.

Since the Fund is dedicated to what the *Baltimore Sun* calls "nineteenth-century Manchester-type multilateral and fluid trading," it was no surprise to discover that the report was going to call the attention of the 49 member countries to the promise they had made at Bretton Woods in 1944. Each had agreed that if, five years after the Fund began operations, it should be still engaged in restrictive practices inconsistent with aims set forth in Article VIII of the Agreement, it would consult the Fund about their retention. The five years would elapse in March, 1952, the report pointed out. It went on to suggest in (for a work of this kind) quite forthright language that in view of the "remarkable" improvement in the world's payments situation, the increases in exchange reserves and the assurance that the United States, fully embarked upon a vast rearmament programme, would be maintaining its demand for imports for a long time to come, there was no good reason why many restrictions and controls should not now be relaxed. It was noted that the sterling area in particular had greatly improved its position, and

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

it was rather plainly hinted that the United Kingdom would be among the first of those invited for consultations, on the ground that among controllers Britain was a leading sinner.

The second act took place on the following Tuesday, when newspapermen were invited to a briefing conducted by Mr William C. Foster, the Economic Co-operation Administrator who is also chairman of the Office of Defence Mobilisation's Committee on Foreign Supplies and Requirements. The subject was a new set of "priority principles" laid down, after protracted inter-agency argument, by Mr Charles E. Wilson, the director of defence mobilisation. This could be called Hyde's day.

Having explained the logical, though by no means painless, rules Mr Wilson wanted to see observed in the allocation of scarce resources both in the United States and among America's allies, Mr. Foster rather sadly conceded that the present powers to enforce these rules in the United States were incomplete and divided; there would be undeniable difficulties in resisting domestic pressures. This was, he said, a beginning: an attempt to get things going in the right way. Now Britain, he told the newspapermen, had advanced much further towards centralised controls. Britain had great advantages. He indicated that the United States was moving further in the direction of the admirable British pattern.

★

It was only a few days later that General Marshall, the Secretary of Defence, gave the Senate Banking Committee the sombre news that of \$35 billion appropriated for military supplies in the current fiscal year \$7 billion had been eaten up by inflation. He said that the loss of guns, tanks and planes through creeping inflation was just as damaging as if they had been destroyed or captured by an invisible army. The question whether the United States has actually lost any guns, tanks and planes—whether, in fact, inflation has left the military without enough money to buy all that could be produced—might have been explored further; but nobody contradicted General Marshall. As soon as he had finished testifying, the procession before the committee was resumed of those who were denouncing the controls designed to hold inflation back.

From the mimeograph machines of the National Production Authority, meanwhile, there were pouring press releases, of which there are now considerable numbers almost every day, setting forth the current status of controls over materials. It cannot be recorded that they are showing any greater immunity from the prevailing confusion. There was one, NPA-765, which began sternly:

The US Government has not yet reached the natural rubber stockpile goal it considers essential for national security and until it does there can be no increase in the allocation of rubber for civilian use, the National Production Authority, US Department of Commerce, told the Rubber Industry Advisory Committee.

But NPA-765 grew noticeably less stern as it went on:

The May rubber order will be continued through the third quarter of this year, NPA said. . . . The May order, which increased civilian use by 8,000 long tons over April consumption. . . .

On Friday, June 1st, the Gallup Poll published the results of a survey it had just conducted among cross-sections of the American millions on two matters of topical interest, aid to Spain and Yugoslavia. It turned out that 65 per cent of those who could identify General Franco and Marshal Tito thought the United States should aid Spain (though that nation for some time has been regarded as a Fascist country) and 54 per cent thought the United States should send military equipment to Yugoslavia (though that nation for some time has been regarded as a Communist country).

But even the American desire for allies is (as Frank Sinatra sings, in another connection) not just a simple emotion. General MacArthur is by no means the only American who, from time to time, falls into a reverie in which the alternative of "going it alone" takes on the qualities of a beautiful ideal. Action instead of talk, crisp decisions crisply arrived at, no delays for complicated adjustments, no tiresome need for persuasion, no painful compromises. More than other nations—because the whole thing is so new to them—the Americans feel the tensions that are an inherent part of alliances.

The strains are felt by all, but there is no agreement on what is the main cause of them. Mr Harold Stassen speaks of a "counsel of fear" which is "alien to the heritage of America"; Senator Kefauver complains that the American people have not been given "an entire goal to strive for." But it may well be that Mr John Foster Dulles has provided the most accurate diagnosis. In Tucson, Arizona, last week he said—and the italics are his:

We are engaged in a gigantic sacrificial effort of a kind which, in the past, we have made only in the face of dire peril and only to force an early decision which would end the necessity for such sacrifice. Today, the peril to our homeland seems to many to be somewhat speculative, while continuance of our present measures could impair the very foundations of our American way of life without forcing an abandonment of Soviet strategy. . . . I have deliberately chosen to present the problem in terms of what, to the American temperament, is its most baffling aspect, namely, indecisiveness.

Recordings in Revolution

[FROM A CORRESPONDENT IN THE UNITED STATES]

IN 1941, in the United States, a sufficiently energetic, and sufficiently well-financed, devotee of recorded classical music could, if he would, listen to some 136,000 minutes of ten-inch and twelve-inch gramophone records, all turning at a speed of 78 revolutions per minute or thereabouts. During this 2,200-hour marathon he would have heard 11,900 twelve-inch and 4,800 ten-inch discs, some domestically produced and some imported, and they would have cost him over \$20,000. He would have had to listen to innumerable performances of such hackneyed pieces as Beethoven's Fifth Symphony—many of them curiously abridged—and would have been unable to secure any recording of many such slightly unusual works as J. S. Bach's "Christmas Oratorio" or Haydn's Symphony No. 1, even though the gramophone industry was, by 1941, more than 30 years old.

Ten years later, in 1951, this theoretical enthusiast would certainly confine his purchases chiefly to the so-called Long Playing records, although the first of them was only put on the market, by Columbia Records, Inc., as recently as July,

1948. In the scant three years since then, no less than 127,000 minutes of classical music have become available in this form, an amount almost identical with that which the gramophone industry took 30 years to pile up before 1941 and one which, in its new form, would cost over \$5,000 less than in its old. Many unusual musical works would also now be included and, perhaps best of all, the duration of an LP record is four to six times longer than that of its 78 r.p.m. predecessor; for this reason the discs, which in 1941 would have had to be turned over or changed 33,000 times, would today require such attention only 5,800 times.

The introduction of these long-lasting records, needing a special needle and revolving at the new speed of 33½ r.p.m., was hailed with almost universal enthusiasm by gramophone enthusiasts, and with as universal forecasts of financial disaster by everyone, outside the Columbia company, who was connected with the business side of recorded music. As it has turned out, the industry's gloomy prophecies could hardly have proved more false. The introduction of LP records, so far from having led to financial trouble, is largely credited with rescuing the record business from the low state in which it was ten years ago. Companies making gramophone records are reticent about annual sales, but figures for collections under the excise tax imposed in October, 1941, tell an unmistakable story: in 1942, a year of high prosperity in the United States, the 10 per cent tax yielded just over \$1,800,000; in 1950, the same tax, still 10 per cent, netted the Treasury no less than \$6,790,000. As a further indication, shops selling records, which were going bankrupt at a high rate in 1941, are now doing even better business than in the days before the wireless undermined profits from gramophones.

★

It is generally argued that an important reason for the high popularity of the LP record—remarkable in a country so surfeited with devices for home entertainment—lies in the lower cost of a musical work in this form, by comparison with its 78 r.p.m. equivalent. The eminent gramophone critic, Mr C. G. Burke, ran a series of articles in the *Saturday Review of Literature*, in which recordings were compared, amongst other ways, on a cents-per-minute basis, and these articles excited great interest. To Mr Burke, as to others, however, a greater advantage is the virtual absence of intra-movement breaks in the LP recording. (It is worth noting that the British Decca Company, whose products sell in the United States as London Records, recently twice violated this principle and broke a movement. It has been roundly criticised for doing so.) To avoid such breaks the Columbia company, for several years before the introduction of long players, had been transcribing performances on large diameter, long duration master records.

This foresight was generally held to have given it an overwhelming and lasting superiority in the new field. In a business which so often confounds the prophets, however, this again turned out to be a bad guess. Far from being alone in the field today, Columbia Records, Inc., which was one of only 34 manufacturers in 1942, had 87 fellow "music-cannery" on LP records alone, by April, 1951. Many of these are very small, and by no means all represent true competition; indeed, Columbia does the difficult processing of records for most of them and actively encouraged the entry of companies into the 33½ r.p.m. market, as part of its now successful attempt to stifle the development of 45 r.p.m. recordings sponsored by the rival RCA-Victor company. The invention which made it technically feasible for the independent operator to turn out recordings of superb

quality—at least as good as those of the larger companies—is the magnetic tape recorder.

Developed in Germany before and during the last war, the tape recorder arrived at the fidelity required by the wireless and by the recording industry only after further development in the United States. In its present form, the tape recorder (of which excellent examples sell for less than \$1,000) is by far the cheapest as well as by far the best method of making "masters," or recordings of original performances for later transference to disc. Ironically, the tape recorder's reputation was finally made when it was used by Mr Bing Crosby to "can" his radio programme for later broadcast, and for this purpose a recorder manufactured by his own Ampex Electric Corporation, part of Bing Crosby Enterprises, Inc., was used. This, or a similar device made by one of two or three competitors, is virtually all the capital equipment required by a small firm wishing to enter the long-playing field. Several such little companies are taking advantage of favourable exchange rates and the low salaries paid to non-union musicians in Europe, notably in Vienna, to make tape recordings abroad. Their records—the original tape transcription transferred to discs at cost by a huge company using several million dollars' worth of equipment—sell at a price (\$3.85 to \$5.95, depending on size and manufacture) which permits generous discounts to the gramophone shops and still nets the "manufacturer" a very substantial return on his time and his tiny investment.

Although prophecy has proved to be so dangerous in this connection, already there are heard voices proclaiming that the disc is on its way out, and that ultimately tape will be the form in which the musical American buys his records. During "live" broadcasts from those wireless stations using frequency modulation, which gives more accurate transmission and better reception than does the more usual amplitude modulation, dozens of the new tape recorders are turned on in homes and studios. And their products are being sold for fabulous sums in a new and exciting collectors' grey market. There seems little doubt that, when the question of royalties is clarified, and the technical problem of duplicating tape recordings is successfully solved, tape will offer serious competition to discs in the struggle for the "high fidelity" music dollar.

American Notes

Acheson on Trial

The Republicans have been waiting with ill-concealed impatience for Mr Acheson's appearance before the committee investigating General MacArthur's dismissal, an impatience all the greater since they burned their fingers on the Chiefs of Staff. Indeed, they would have been glad to dispense with some of the military testimony, which not only made it plain that General MacArthur was mistaken in assuming that the Joint Chiefs agreed, even on military grounds, with his proposals for finishing off the war in Korea, but also helped to explode the legend of his military infallibility. Reluctantly General Bradley and General Collins testified that General MacArthur had been warned in November of the risk of splitting the Eighth Army and the Tenth Corps, a warning only too well founded. General Vandenberg, Chief of the Air Staff, provided a greater surprise; he effectively demolished, from a purely professional point of view, the proposal to bomb the Manchurian bases. This he considered was unlikely to be conclusive even in the Far East, and could be done only by stripping the United States of the power to counter an aggressive move by Russia elsewhere.

But even Mr Acheson, so far, has not proved easy game, though he is being held accountable for Far Eastern policy as far back as Yalta and though the Republican National Committee has been busy accumulating ammunition for Senators Wiley, Hickenlooper and Knowland. The propaganda directive issued by the State Department in 1949, anticipating the fall of Formosa, of which Senator Knowland had such high hopes, has proved something of a dud: it was General Wedemeyer, one of the idols of the Asia-firsters, whose idea it was to minimise the importance of Formosa in order to lessen the blow to American prestige if the island fell.

On the witness stand Mr Acheson is well able to take care of himself, though he too readily falls into the mistake of displaying his intolerance for fools. Many observers believe, nevertheless, that however ably he acquits himself the verdict has gone against him. This is not because Republicans are once more howling for his blood, signing petitions, and threatening to cut the State Department off without a penny if he remains. Such moves only stiffen the President's determination not to give way. Some Republicans may even be exploiting this well-known trait, in the hope of preserving their most cherished target for the election campaign.

The real pressure on the President comes from his own party, from such well-known figures as Senator Connally, who fears for his own, and the party's, defeat if Mr Acheson is not dropped, and Senator Douglas, who regards the Secretary of State as a "casualty of war" prevented by his honourable wounds from any longer exercising effective leadership. Some of Mr Acheson's most faithful friends have been alienated by his alleged appeasement of his enemies. So far, however, there are no signs that either the baying of the enemy or the pleas of his own supporters have convinced Mr Truman that bi-partisanship could be restored by throwing his ablest cabinet officer to the wolves.

Communists Convicted

The Supreme Court, saving its most important decision to the last, wound up its session with a bang by confirming, by 6 to 2, the conviction of the eleven leaders of the Communist Party, who spent most of 1949 in a New York courtroom and who will now spend the next five years in jail. It might have been longer had not Congress seen fit to reduce the maximum sentence while they were on trial. The Court also pinned a final star on the shining legal crown of Judge Learned Hand, who has just retired from the Court of Appeals. In what may become his most famous opinion, he ruled that today the danger to the United States is sufficiently "clear and present"—the criterion set by Justice Holmes in 1919—to justify restrictions on the Communist leaders' constitutional right of free speech. In upholding Judge Hand's decision, the Chief Justice concluded that they had "intended to overthrow the government as speedily as circumstances would permit" and that they were properly and constitutionally convicted under the Smith Act of 1940.

It is not the Communist Party itself that has been found guilty, but only the leaders who sought to carry out the party's policy by conspiring to advocate the desirability of overthrowing the government by violence. Such activities were expressly prohibited by the Smith Act and the Supreme Court, by ruling on the constitutionality of that Act for the first time, has opened the way for the government to initiate further prosecutions under it. Regrettable as it may be that the dangers of today necessitate the abridgment of constitutional freedoms, at least the lengthy hearings under due process of law and the careful consideration for their democratic rights, which the eleven Communists received, endangers civil liberty much less than do the unsatisfactory laws and sensational hearings by which Congress has sought to save the country from Communism. It will no longer be so easy

for Senator McCarran and his friends to hide their search for political advantage under a cloak of patriotic necessity.

Congress Gets to Work

The first fruits of this Congressional session, which have been so long maturing as to cause some comment, appeared last week. To the relief and surprise of the State Department the House finally swept aside Mr Cox, who has been fighting a single-handed battle against grain for India, and passed a Bill authorising the \$190 million loan without the strategic material strings which disfigured the Senate version.

At the same time, two longer-term Bills finally dropped into Mr Truman's lap: the extension, until 1953, of the Reciprocal Trade Agreements Act, and the extension until 1955 of a strengthened conscription measure. Neither version is precisely the apple of the President's eye. The trade agreements draft is blighted by four amendments restricting the freedom of the executive to reduce tariffs: the "peril point" provision discarded by the last Congress is revived, escape clauses are made mandatory, and the Tariff Commission is required to make a study of any specific rate at the request of either House or any of its tax-writing committees. In addition, all concessions to Communist areas must be withdrawn, a step which will not affect trade in strategic materials, but will merely cut the few remaining economic links connecting the satellites with the free world. A complete ban is also to be placed on imports of seven kinds of furs from China and Russia; if White House stenographers must wear mink, it at least will not be Russian mink, but will provide a market for home industries.

The great disappointment in the military manpower Bill is that the Senate was unable to induce the House to accept the substance, as well as the shadow, of universal military training. The present need for universal military service has not been scamped: the Bill reduces the calling-up age to 18½ (when the pool of men 19-26 has been exhausted), extends the term of active service to 24 months, and requires six years to be spent in the reserves after this period of active duty. The Department of Defence has now prepared a plan for putting the whole chaotic reserve system in order, creating a class of ready reserves, prepared to serve in limited emergencies, such as the Korean war, another of stand-by reserves available only in total mobilisation, and a third of retired reserves. Once this plan is in effect, it will eliminate the injustices, anomalies, and wastefulness which have caused much indignation during the past year.

Universal military training, however, was proposed as an alternative to a large standing army once the present emergency is over. Under the present Bill, Congress does no more than promise to consider, within six months or so, the specific scheme submitted by a commission to be appointed by the President. For the first time, the groundwork of a universal training scheme has been approved, but whether it becomes a reality depends upon the mood of Congress next winter, and after that at the time when, the emergency being over, money must be found to finance it.

Materials Feel the Pinch

Promptly following up the announcement that the United States plans to share scarce raw materials with its allies, the National Production Authority has put sulphur, today the most notorious of all scarce materials, under the grip of complete allocation. A number of the scarcer steel alloys, such as cobalt, nickel and molybdenum, are already being squeezed by some form of allocation, with little or none available for civilian use. The rearmament programme has also been absorbing increasing quantities of other metals;

this month 75 per cent of most copper products, 20 per cent of high-grade slab zinc and 25 per cent of lead must all be set aside for defence and essential civilian orders.

In the third quarter of the year the other blade of the raw material controls will also be cutting non-defence consumption more sharply. Then only 70 per cent, instead of the present 80 per cent, of the zinc used in the 1950 base period may go into civilian goods, only 50, instead of 65, per cent of the aluminium, 60, instead of 65, per cent of the copper and 70, instead of 80, per cent of the steel. A special formula has been worked out for the automobile industry, the controllers' pet guinea-pig, which seems to go half-way towards regulation by the number of units produced instead of by the amounts of materials used. Steel, copper and aluminium will be divided among manufacturers, according to their relative standing in the industry, in sufficient quantities to produce 1,200,000 cars in the third quarter, or more if the makers choose to concentrate on lighter models; it is unlikely that they will, because profits are less on the cheaper cars.

OUTPUT OF CONSUMER GOODS - 1947-51

All of this is in preparation for July 1st and the controlled materials plan. Estimates of the exact amount of steel that will be allocated under it vary, but orders have been issued for the set-aside of 75 per cent, and in some cases more, of a number of steel and stainless steel products—ingots, shapes, plates, sheets and so on. This does not mean, however, that that amount of steel will be withdrawn from normal production. For many of the uses of steel which are classified as "defence-supporting" or "essential civilian"—railway equipment, oil pipes, farm machinery, for example—are those which take large quantities of steel at any time. The charts give an idea of the quantities of durable goods that will be available for civilians this year, in spite of the pinch on metals. They compare favourably with every year except 1950 and, as sales lag and inventories pile up, many manufacturers are wondering whether they would want to produce more even if they could.

Shorter Note

Mr Rudolph Halley, who has made a nation-wide reputation as counsel to the Senate Crime Investigating Committee, has been nominated by the Liberal Party as its candidate for President of the City Council of New York in next November's election. The responsibility of the people to destroy the links between crime and politics, and the strength of those links in New York, was brought home to Mr Halley by his work on the Senate Crime Investigating Committee. He is said to regard the nomination as a call to duty and public service.

THE WORLD OVERSEAS

Trade Union Struggle for Asia and Africa

EVER since the war, the Communists have been shrewdly aware of the importance of the young trade union movements in Asia and Africa. The World Federation of Trade Unions, since the western unions broke away in 1949 and formed the International Confederation of Free Trade Unions, has become an acknowledged arm of the Cominform. It publicly concerns itself with guerrilla warfare and military tactics in Asia, and it finds in the workers' organisations fostered under the traditions of western democracy a happy hunting-ground for its political intrigues. Isolated, without funds, and without a sense of international solidarity, the unions found this penetration difficult to resist. Now WFTU's challenge has been taken up by ICFTU.

One of the fruits of the rapidly-unfolding plan of work which ICFTU set itself at its foundation congress in London just eighteen months ago could be seen recently in Karachi. The free trade unions of Asia met there in conference for the first time. Thirty-one delegates, representing about 10 million organised workers, attended; they came from Ceylon, Formosa, Hongkong, India, Japan, Korea, Malaya, Pakistan, Persia and Siam with observers from other countries not formally represented. The purpose was to create a permanent Asian regional organisation of ICFTU.

From the outset the free unions have put a particular emphasis on help to workers in the so-called "backward areas." Point C of their aims reads

to provide assistance in the establishment, maintenance and development of trade union organisations, particularly in economically and socially under-developed countries.

This aim has been pursued with vigour. The formal shape which it is to take is the establishment of regional organisations in all the main areas of the world, for this—as the name indicates—is to be a confederation, and not a federation on the lines of WFTU. There is to be no domination from the International Centre in Brussels.

One of the first decisions taken was to send a delegation to investigate conditions in Asia. It consisted of an Englishman, two Americans, an Indian and a Belgian; it left for Asia in July, 1950, visited 15 Asian countries, met thousands of trade union leaders and spoke at almost a hundred workers' meetings. Its success was gratifying, even though WFTU was already set in the field. In 1949 WFTU had held a conference for Asian unions in Peking, which launched a campaign to capture the workers of south and east Asia. A liaison bureau was set up in Peking, from which propaganda material was distributed, and Peking radio was used for broadcasts in Asian languages. In spite of this, the ICFTU delegation was overwhelmed with requests for help and advice, on organisation and legislation problems, on how to deal with the anti-labour attitude of employers, on trade union education, and—not least—on "the constant threat from anti-democratic forces in the trade union movement."

That Asian workers should be looking for help is not surprising. Their trade union movement is still very young, for the most part a post-war phenomenon. Before 1939 the only unions existing in Asia, even on a small scale, were in India, Japan, Ceylon and the Philippines. The overwhelming majority of the workers, except in Japan, are peasants or landless labourers, and about 95 per cent are illiterate. Nevertheless, the greater education and organisational discipline of what industrial workers there are, has given them a crucial importance in the national independence movements, and

they have found themselves pushed into a key position in Asian political life. They have thus become vulnerable as pawns of political parties or individual politicians, and have failed to distinguish between political and industrial action.

Here was, indeed, a fertile field for communist activity. The ICFTU delegation was, therefore, pleased, and doubtless a little surprised, to find that the strength of the communist-dominated unions was on the decline. It attributed this partly to the courageous action of the free unions, and partly to an increasing awareness of the true nature of Communism. In its judgment, this awareness was bred by the communist attempts to exploit and distort the struggles for national independence, and by the decision at the 1948 Calcutta Conference of Asian communist parties, to launch campaigns of violence and sabotage in a number of countries—for instance, India and Malaya.

Centre in Singapore

After receiving the report on Asia, the ICFTU took a series of important decisions. It resolved immediately to open an information and advisory centre in Singapore, to be followed by three branch offices in other parts of Asia. An Indian trade unionist, Dhyani Mungat, was put in charge, with the function of co-ordinating the activities of democratic trade unions and helping to form new ones. A permanent regional organisation would be established later, and was the central subject of the recent conference at Karachi. It was also decided to step up ICFTU publications in Asian languages, to give help on organisational matters, and to open two residential Labour Colleges for training Asian trade union leaders.

In the meantime work has started in Africa. In December, 1950, a delegation of four visited French North Africa. In Morocco and Algeria, where the unions are affiliated to the French trade union centres, they found that communist penetration had gone a long way on the metropolitan pattern. In Tunisia, where there is now also an independent movement, a bitter struggle is being waged between communist and non-communist groupings. Unfortunately, the report of this delegation has not been published. No conference was held, but the intention is to help to build independent unions in these territories.

West Africa, on the other hand, is a less intractable problem. In February a delegation of eight—of generously mixed colour and nationality—travelled out to West Africa where they investigated conditions in ten countries, and met in conference at Douala in the French Cameroons, during March. Twenty-nine African trade unionists attended the conference. The delegation noted here that problems of political freedom were not so much to the fore, at least during the conference sessions, as the very serious economic and organisation difficulties—low productivity, lack of mechanical skill, illiteracy, non-payment of union dues—with which African trade unionists have to contend. Of the resolutions passed, the one of greatest immediate significance called for the formation of an ICFTU regional organisation for that area. There was also a resolution asking for the creation of an African office of the ILO and one calling for a rapid expansion of facilities for general and technical education, particularly as skilled artisans in industrial development. The territories represented at this conference were Senegal, Gambia, Sierra Leone, Ivory Coast, Gold Coast,

Dahomey, Nigeria, British Cameroons, French Cameroons and French Equatorial Africa. Nigeria, the largest of the Colonies, has its own internal problem in that one of the main trade union centres, the Nigerian Labour Congress, is affiliated to the WFTU, and known to be receiving communist support from overseas. But there is also a strong anti-communist trend; three Nigerian trade unionists attended the Douala Conference, and the Labour Congress shows the first signs of disintegration. Communist influence was not too apparent in the other territories.

Action to follow on this conference is now awaited. Decisions have already been taken to send a delegation to East and Central Africa—where trade unions are still in an embryonic state—and another to survey the situation in the Near and Middle East prior to calling a conference there.

Theory and Reality

This is a remarkable record of activity for an organisation not yet two years old. Under the slogan "Bread, Peace and Freedom" ICFTU claims to have rallied 53 million members in 60 different countries. In order to do this, it has ranged itself with the workers' stand against imperialism and for national independence, and has thrown its weight into the demands for economic help, on a large scale, from the west. But how strong loyalty to the new organisation is—particularly in Asia—is another matter. If ICFTU is to be ultimately successful, not only on paper but on the ground, there are two dangers which it will need to avoid. There is always the tendency in international organisations to proliferate paper and top-heavy office staff. But what is required here are men in the field who identify themselves with the workers' lot, and are willing to work side by side with them, selflessly and without patronage. Behind these skilled men must be funds and efficient organisation, but it is the field representative who will bear the brunt of the battle. The second danger is of operating on the negative line of extreme anti-communism. This will kindle no spark among backward workers, as experience throughout Asia shows. The support given to young and weak unions is something which should stand on its own merits; the less it is deliberately brought into the ideological conflict the more willingly it will be received.

Who Shall Own the Ruhr?

A CRITICAL point has now been reached in the long and complicated process of breaking up and reorganising Germany's heavy industry, which the western occupation powers undertook in 1947. The question has now to be answered: "Who is to own the Ruhr?"

The matter was brought to a head recently, when the Allied Steel Control Group issued regulations under Law 27 for setting up the first new steel companies to be formed out of the dismembered vertical trusts of the Ruhr. These regulations in practice amount to the sequestration of the old concerns. Moreover, although a German trustee is to be appointed for each new company, the Allied Group made it plain that it intended to go on controlling the implementation of Law 27 until the whole vast operation is completed.

It is not surprising that the Germans reacted strongly to this step, though it was inherent in the Law. The Bonn Government was in a particularly awkward position. It had assured the public that the Schuman Plan meant the end of both the Ruhr Authority and the Allied Steel and Coal Groups; and, for the sake of the Plan, it had put forward an unpopular scheme of its own for reorganising the Ruhr which had been accepted by the Allied Control Group. The Government has now officially complained that the regulations pushed responsibility for action on to it although they

had been issued without Dr Adenauer's knowledge and represented decisions "dictated to the Federal Government, who only agreed under extreme pressure."

The key to Dr Adenauer's concern lies in the fact that the steel concerns' property is being sequestered. With a revealing glimpse into the future, the Government has complained to the High Commission that to be party to the implementation of the regulations would lay it open, possibly in a few years' time, to trial before a German court for interference in the rights of private ownership. In view of Dr Adenauer's difficult political situation, the Allies have agreed to amend the text of the regulations in order to absolve the Government from responsibility. At the same time, the High Commission—with Mr McCloy in the lead—has given an assurance to Dr Adenauer, which he can pass on to the former shareholders of the trusts, that they will be compensated by receiving shares of the new unit companies. (This news caused a boom in the shares of Ruhr companies which are in an extremely strong financial position). Since one of the main purposes of breaking up the old trusts was to remove industrialists who supported Hitler, the High Commission's assurance must be read in conjunction with other measures which are intended to prevent a re-concentration of power in the hands of any of the "old gang" who remains.

Moves by the Trade Unions

At this point, the German trade unions and Social-Democrats entered the field. They saw that private ownership was being restored in the Ruhr. In fact Law 27 laid down that the question of final ownership rested with the German Government; but the more quickly the new companies are set up, and shares exchanged, the more certainly this issue will be prejudged in favour of private ownership. This is a point which was apparent to both the Americans and British, and accounted for certain differences over procedure between them. It is also obvious to the Germans.

Two swift moves were therefore made last week by the trade unions which aim to maintain the power they have been granted under the recent co-determination law in heavy industry, and by the Social-Democrats, who aim to ensure that the Government they hope soon to form will own the Ruhr. The Trade Union Federation has issued a demand that the old owners be expropriated and the reorganisation left to the German Steel Trustee Association and the German Coal Control—two bodies which are nominally responsible to the High Commission, but on which the trade unions are represented. If the matter is handed over to the Federal Government and the old owners, the trade union leaders threaten to resign from all the Federal economic advisory bodies, on to which Dr Adenauer has brought them in order to secure labour peace and weaken Dr Schumacher's position.

The Social-Democrats, for their part, have tabled a motion in Parliament demanding that the reorganisation of the Ruhr shall be solely a German responsibility and shall be completed as quickly as possible, and that the Government shall at once prepare a bill on future conditions of ownership. This move by the Opposition is an effort to force the issue on ownership before the new steel companies are formed and shares transferred to private holders. It is also intended to settle the matter in favour of a future Socialist German Government before the Schuman Community comes into existence.

In Paris, when the question of abolishing the Allied control groups was discussed a few weeks ago, the French made it clear that the Schuman High Authority will not be concerned with questions of ownership; but their objections to centralised power in Germany are well known. If they fail to believe that the Ruhr would be in safe-keeping for Europe should a Social-Democrat Governor become its owner, Dr Schumacher's savage attacks on the Schuman Plan are to blame.

Labour in the Middle Eastern Oilfields—I

[BY OUR SPECIAL CORRESPONDENT LATELY IN THE MIDDLE EAST]

SOCIAL discontent in the Middle Eastern oilfields is an easy theme on which to expatiate. It is seized upon by Teheran newspapers, Moscow radio and labour sympathisers in many western countries. There is plenty of material for all; this year alone there have been serious strikes at the Abadan refinery, in the Anglo-Iranian oil fields, and at Zubair, in the Iraq Petroleum Company's concession area. But strikes and discontent do not necessarily mean that labour conditions are bad. In underdeveloped countries the reverse is often true; improved social conditions waken backward peoples to the great truth that misery is not inevitable. Once awakened, they clamour for swifter improvements. Ironically but inevitably, the labour conditions offered by the oil companies in the Middle East—so superior to anything available under Persian or Arab management—have produced among some of the workers in every oilfield a mood that is highly receptive to propaganda by agitators.

There are five major oil companies employing labour in the Mesopotamian and Persian Gulf area. In order of seniority, they are the Anglo-Iranian Oil Company in Persia, the Iraq Petroleum Company at Kirkuk and Zubair, the Bahrein Petroleum Company (Bapco), the Arabian American Oil Company (Aramco) in the Dahrán area, and the Kuwait Oil Company. All have two main social problems with which to contend: that of keeping their irreplaceable western technicians contented and that of doing as well as they can by their local employees. The Persian Gulf is not a pleasure spot. The oilfields are in lonely places. Summer heat is often too much for wives and children. Only by supplying the indispensable westerners with the housing and amenities they would get at home can the companies get the right people for what they call their graded staff, and get them to stay. At the next—the non-graded level—which does the clerical and less technical jobs, good amenities must also be supplied. Even then, Persians of the right calibre do not want to leave their pleasant plateau for the hot coastal deserts where most of the oilfields lie. Indian, Pakistanis, Italian and Palestinian clerks have therefore in the past been taken on, much to local annoyance once they are engaged. Numbers for local employees are, however, going up, as is shown by Anglo-Iranian employment figures:—

Graded and Non-graded Staff		Percentage	
	1939	1950	
British	41.3	27.8	
Persian	48.2	62.7	
Indian and Pakistani	10.5	9.5	

By the end of 1950 the Anglo-Iranian labour force, as opposed to its technical and clerical staff, was wholly Persian except for 652 Indians and Pakistanis.

Bent on maintaining some sort of equity of social treatment as between skilled and unskilled grades, all the companies also provide their indigenous workers with many amenities. In fact working and living conditions, though they vary, are nowhere bad by local standards and are in some places good by any standard. The Anglo-Iranian—having made money for longer than any of its cousins or rivals—is well ahead of all the other companies in this respect. Last year, a request made by the Persian Government to the International Labour Office for an inquiry into labour conditions in the south Persian oil industry was fulfilled, and a mission of three ILO officials produced an interesting report on the subject. On the whole, these impartial ILO observers reached the conclusion that Persian Government complaints against the company were "mainly economic and financial"; as an employer of labour, the grievances against it were not grave.

Complaints against its social services were, of course, numerous; what worker does not grumble, all the world over? But after investigating them the mission concluded that "the working and living conditions of the oil workers appear as an encouraging example of what can be done." At the Geneva conference at which this report was discussed last November the Persian workers' delegate—a fitter in the Oil Company's service—attacked it and described labour conditions as "scandalous"; the speech in which he did so won him a splendid press in Teheran. But after a tour of Britain he was ready to recognise in private conversation that "they are getting about the same in Luton as I am myself." Certainly there are plenty of workers' homes in the industrial towns of the United Kingdom which compare unfavourably with those of Abadan.

The Anglo-Iranian Oil Company now houses 18,000 out of its 65,000 workers. Since it was, as far back as 1934, producing more oil per annum than Iraq has yet produced in any one year, it can be argued that it should have started its housing programme earlier and that this proportion is too low. But in the company's favour it must be remembered that its really big expansion of staff took place during and after World War II. Between 1943 and 1949 employment in its oil fields (as opposed to its refinery) rose from 5,088 to 17,158; during this time, building materials were in short supply everywhere.

Amenities of Abadan

In the matter of health services it has a better record than any other company since it caters not only for workers but for their families. Its superannuation scheme is far better than that in Persian Government service; a member of its labour force, recently retiring after 32 years' continuous service received 185,000 rials (about £2,000). It pays "dirty money" and money for hazards encountered while handling lead or sulphur. It provides ice and overalls, protective clothing for heavy workers, and cheap canteens. In the heat of Abadan, 3,000,000 gallons of chilled drinking water are served daily to 80 public points; its wastage of staff figures suggest contentment. According to the ILO, company efforts in the field of education "will produce their reward not only for the company but for the country generally." Also according to the ILO, its promotion of trade unions could bear improvement, but its arrangements for labour management relations are satisfactory (they are far and away the happiest in Persia). Probably its weakest feature as an employer is the amount of contract labour it is forced to use on building, roadmaking, etc., and its inability to stop the exploitation of this labour by rapacious Persian contractors.

The corresponding conditions in the other companies will be described in a second article. Meanwhile, with special reference to Persia, and to current Persian criticism of company labour policy, it is worth noting the ILO mission's pertinent comment that "the general population knows little of the industry or of the conditions of its workers, and is unable to compare its conditions with these in other industries." Undeterred, the Teheran editor or politician makes the comparison. Even if he has seen Abadan and the oilfields (which is very rare) the company can do nothing right; if they build good workers houses with the materials available, they go too slowly and it is "scandalous how many remain unhoused"; if they put up more houses of lesser quality, their standards are "disgraceful." If they provide a hostel for boy apprentices, in which a few rules, such as doing homework on certain evenings, must be observed they have shut the boys into "the Bastille of Abadan." Workers' wages are compared with those in the United States, regardless of the huge differences in what the same money will buy in the two places. They are never compared with the average in Isfahan or Teheran, to which they are greatly superior. People who are determined to find fault can always do so.

(To be concluded)

Malaya's Divided Loyalties

[BY A CORRESPONDENT]

EVEN slower than the war in the jungles of Malaya is the battle for the united loyalties of Malaysians. For, although attacks by the Communist guerrillas, or against them, dominate the news from Malaya, the inability of the Malayan Federation to win the loyalty of its energetic Chinese minority who comprise 38 per cent of its population (as against the Malays who make up 44 per cent) is as vital to retaining control as is the military effort. Precisely because the Chinese squatter feels little or no loyalty towards the Federation Government, it has been necessary to plan the transplantation of 500,000 of them in order to prevent their active or passive co-operation with the Communist guerrillas. Had the overwhelming bulk of the Chinese in Malaya not been neutral the task of cleaning up the Communist insurrection would long ago have been accomplished.

To win over a large section of the domiciled Chinese, the Malayan authorities have made a considerable effort during the past two years to secure agreement on a common nationality for all those permanently domiciled in Malaya. The bills calling for a uniform state nationality in each of the nine Malayan states as the foundation for common federal citizenship date back to the Communities Liaison Committee first convened in 1949 with the help and encouragement of the Commissioner-General, Mr Malcolm Macdonald. The definition of nationality is a compromise between the Malay fear of being swamped by the Chinese and the Chinese desire for equal status. The bills give automatic citizenship to a Malay born in Malaya, but a person born there of Chinese parentage has to prove his loyalty by taking an oath of allegiance to the Sultan, proving that he can speak Malay or English and conforming to an undefined "Malayan way of life."

This proposal represents a compromise between the most reconcilable elements now leading the three leading communal organisations (the United Malays National Organisation, the Malayan Chinese Association and the Malayan Indian Congress). They have other achievements to their credit. All decided earlier this year to admit members of other communities to at least associate membership.

Most significant of all is the conversion of Dato Onn bin Jafaar from a communal politician to a conservative nationalist of wider views. Under his leadership the UMNO has changed its slogan from "Hidup Melayu" (Long Live the Malays) to "Merdeka" (Freedom). It is also changing its name to the United Malaya National Organisation. Dato Onn, now the "Member" for Home Affairs in the semi-cabinet of the Federation, appears to consider himself candidate-premier of a Malayan Dominion. It has become clear that Britain cannot possibly transfer power in Malaya to a Malay communal organisation, but might eventually do so to a Malay-dominated national organisation. His decision to attempt to convert his organisation to a national one has been hastened by the threat of Singapore's Labour and Progressive (businessman's) Party to "invade" the Federation. In more political Singapore, the parties have already made the transition from communal to politico-economic platforms. In the April elections, candidates of Indian origin were elected from predominantly Chinese constituencies.

Despite the slow pace at which the modest nationality proposals have been introduced, they have met with considerable resistance from Malay Sultans and some of the more retrograde British business interests. Although the Sultans rule in name only, and are compelled to act on the suggestions of their British advisors except on Malay customs and religion, they have shown an ability to stall matters, and now four of the sultans are in Britain trying to enlist sympathy for their complaints that the High Commissioner,

Welcome
to the Inns
of Britain
beer is best

Issued by the Brewers' Society, 42 Portman Square, London, W.1

Sir Henry Gurney, and the Commissioner-General, Mr Malcolm Macdonald, bring pressure to bear on them. When the uniform state nationality bills were introduced earlier this year they were referred to select committees in most of the states. There the communally-minded Malays, with the aid of European business interests in states like Johore, attempted to amend the bills out of existence. In mid-May, Sir Henry Gurney felt it necessary at a secret meeting of the Conference of Rulers to urge upon those present the necessity and urgency of expediting the nationality bills as a means of providing a focus of loyalty for the many Malayan Chinese still on the fence. He apparently met with a very unenthusiastic response from at least four of the states represented. One of these four, the Sultan of Kedah, who recently earned notoriety by forbidding his niece to marry a British commoner, has been telling his intimates that he will "fight" with every resource if the British officials become too "high-handed" in putting pressure on him to admit Chinese to state nationality.

Progress of Italian Land Reform

[FROM OUR ROME CORRESPONDENT]

CHRISTIAN Democracy, or more accurately the De Gasperi Government, is getting the worst of both worlds from the commentators on its land reform programme. Some condemn it as precipitate, indiscriminate and subversive, others dismiss it as illusory and pettifogging; and there are yet other critics who blame it precisely for its middlingness, as being a programme which in present circumstances is powerful enough to shatter private agricultural credit, and too weak to precipitate a new moral concord.

The obligation to go forward with agrarian reform derives in the first place from the 1947 Constitution which was voted unanimously by all parties from Communists on the Left to Christian Democrats and beyond. This said:—

In order to promote rational exploitation of the soil and to establish equitable social relations the law subjects private land ownership to charges and obligations, fixes limits to the size of properties suitable to the regions . . . encourages and insists upon land redemption . . . assists small property.

The highly distinct purposes of rational exploitation of the soil and the establishment of equitable social relations are thus equally obligatory, but there is an unconditional though regionally flexible requirement to limit the size of landed property. The Governmental reform measure sets out to implement this by requiring the larger owners to "disincorporate" (that is, to make over against compensation based upon taxable values) a quota of land proportionate, though with many qualifications and elasticities, to their total land revenue. This land is to be put into a pool of land for resale to selected peasants. The scale of disincorporations was agreed between the parties entering into the Government coalition from which the Saragattian Socialists recently executed their queer half withdrawal.

Actually the Agrarian Reform Bill has not been introduced into Parliament. Propounded, in general outline, the year before last, after an intensive campaign of land invasions by the peasantry in remote southern districts (but also, for example, at the gates of Rome) it seemed to find a wide favour except in Cominformist quarters. In 1950, however, agrarian stresses were much less spectacular, and criticism of the Reform now looms much bigger in the large-circulation press.

The agrarian reform programme, originally represented as promising a pool of 3,500,000 acres of land for the setting up of 250,000 small owners, has not meanwhile been shelved, though the Bill itself is in cold storage. Alarming episodes

in 1949 called particular attention to the conditions of the Sila plateau in the toe of Italy, a poverty-stricken rural area of a third of a million inhabitants, living as tenants or wage earners for the most part on two or three huge and backward estates. A special "Sila Law" was rushed through Parliament, and an authority was established locally to determine expropriations and redistributions. The transference of legal ownership to selected peasants involved, however, the clearing out of squatters and the termination of tenancies wrested from the old proprietors under duress by groups describing themselves as co-operatives. The Communists mobilised their supporters to resist the carrying out of the reform, on the grounds that it was a device to split the peasantry by winning over to the "bourgeois" cause a selected minority, and that it was also a device for dispossessing the landless peasantry of lands which they had already "won."

A dense propaganda fog overhangs events in this remote tract, a dozen hours' journey south of Rome. Conscientious investigators have brought back the news that, while proceedings are very slow, peasants at certain centres are actually taking over land and have sometimes been able to see with their own eyes modern ploughs and other equipment which will go to them on favourable terms—for here, at all events, the commandment of "rational exploitation" is to be held as sacred as that of social justice. Yet reports also come back that the finance provided will meet only a bare fraction of the cost of modernising the agriculture of the area. And another significant report suggests that the longer the local land reform authorities last, the more do they fall into the toils of the socially dominant landlords. There is, indeed, an historic tendency, in southern Italy for the most sweeping reforms to end in a re-establishment of the powers which they purported to dethrone. Yet a few men of devoted energy and patriotism who have helped in the organisation of the reform in the far south (mostly northerners) stood guarantee that if the experiment miscarries Italy will know why.

Good and Bad Landowners

After launching the experiment in the Sila the Government, instead of plunging into the vast expanse of the general reform, decided to apply the Sila method to a number of other areas. This has roused strong remonstrances. The areas were not defined precisely in the "Sample Law," which passed Parliament late in 1950, as the list could be extended by decree. A number of Senators were under the impression, however, that the Government had morally pledged itself to apply the Sila type of reform only in districts exhibiting a Sila-like agricultural economy, namely the virtual monopolisation of land ownership by large and neglectful owners. The Government list proves, on the contrary, to include areas where, at least in the past, the owners have carried out great developments (the most striking example is the Fucino lake-bed drained by the ancestor of the present Prince Torlonia) and even, because of their being sandwiched among undeveloped lands, areas of extremely high current development (notably the Po delta, where as a particular and piquant feature, great co-operative properties flow providing an important economic backing for the Communist movement, are threatened with disintegration by the Reform). The Government's retort to the many and weighty protests against the mode of application of the Sample Law is that the general agrarian reform is to be nation wide, not limited to areas of outrageous backwardness like the Sila. It is clear, however, that a large part of the Government's parliamentary majority now considers that the requirement of agrarian reform will be amply met by concentration upon half-a-dozen minor "Silas." It seems indeed to be very likely that finance, in a world where American capital is increasingly difficult to come by except for purposes directly pertaining to the military effort, will drastically limit what can be done in the early future. Meanwhile the Damocles sword hangs over landed proprietors, doubtless with very adverse effects upon their will to develop the land.

*Now your bicycle's
all over my towel!*

Young men of every generation are slow to realise how difficult it is to remove grime by washing. The housewife looking at her towels, has needed little telling. Within recent years sodium phosphates have come to her help. New washing powders, anonymously containing Albright & Wilson's phosphate products—although hardly abolishing washdays—are making clothes cleaner and whiter with much less effort on the housewife's part.

The Next Coal Board

AT the time when the National Coal Board issued its annual report and accounts this week, no announcement had come from the Ministry of Fuel and Power about the composition of the Board after the middle of next month. The delay is remarkable and disquieting. Of the five full-time members, including the chairman, that remain to the Board, none (so far as is publicly known) holds a contract running beyond July 15th. It is no secret, indeed, that for three months the coal industry has been weaker in leadership than at any time since it came into being. The resignation of Sir Eric Young, the Board's only mining engineer, was shortly followed by the death of Sir Arthur Street, whose immense capacity and command of detail were attested by the gap he left in its administration. The Board, which last winter had come to realise the need for two deputy-chairmen, was suddenly left without one. Its balance between general and "functional" membership, in fact if not in title, was upset; and the undivided and continuous responsibility for broad questions of policy was thrown largely upon Lord Hyndley. The Board's five part-time members have played an important part; their contribution to the detailed consideration of major questions must of necessity be limited; but their influence at present, as the only continuing members of the Board, is of special importance. What is now required, however, is a radical strengthening of the full-time direction of the Board. The failure to make any announcement about its future composition has created within the NCB's administration that hampering uncertainty which too often attends impending change at the top of any large organisation.

Lord Hyndley and those members of the Board who were appointed on July 15, 1946, have been at the head of the coal industry throughout its four full years under public ownership. On taking over in 1947, the Board inherited a fuel crisis caused by the insufficiency of output and stocks in autumn 1946, and by the disorganisation of transport during an exceptionally hard winter. It spent the remainder of that year in safeguarding against a similar crisis and in slightly improving manpower and output; in 1948 it managed to begin measures of urgent re-equipment in the mines, to improve output considerably, to resume sizeable coal exports, and to earn a small surplus to reduce the £23 million deficit left from 1947. In 1949, though the improvement in productivity continued and for the first time the NCB was able to achieve a reduction in costs, manpower showed a considerable fall. The Board accepted this fall without alarm, in the interests of efficiency, and demonstrated its perhaps undue confidence by accepting the Government's decision to remove the "ring fence" of the Control of Engagement Order at the end of 1949. It had further reduced its outstanding financial deficit by a larger surplus in 1949, and it looked forward in 1950

to clearing off the remaining deficit from 1947 and to increasing its small reserves.

Its failure to achieve either of these hopes is the financial measure of the coal industry's disappointments in 1950. The report reflects some significant changes in the relative weight of its achievements and failures. In the mines, higher output per manshift would have contributed 5,600,000 tons more last year than in 1949, and extra shifts worked per man 2,100,000 tons more; but these potential gains in output were largely offset by the decline of 20,500 in manpower, which cost 6,300,000 tons. Deep-mined output was thus only 1,400,000 tons higher than in 1949, and opencast output was 300,000 tons lower. At the same time, inland consumption rose by 6,000,000 tons, and export and bunker supplies had to be cut by more than 1,000,000 tons. The coal equation was balanced only by unusually heavy drawings upon stocks, which placed the country's fuel supplies in jeopardy early in 1951. In November the Government instructed the NCB to import up to 1,200,000 tons of coal; by the end of the year, it had purchased almost all of this from the United States, at \$8.67 to \$10.00 a ton f.o.b., plus 50s. to 62s. 6d. a ton for freight.

★

Only 73,500 tons of that imported coal, involving a loss of £300,000, appears in the NCB's accounts for 1950: the remaining 1,080,000 tons has been shipped since the end of 1950, and the loss of £4,200,000 on it will fall into this year's accounts. A more important factor in reducing the NCB's financial surplus from £9,500,000 in 1949 to £8,300,000 last year was the sale at home of coal that it was hoped to export at premium prices. At the beginning of the year, exports of 19 to 22 million tons were contemplated. Only 17½ million tons were in fact exported; allowing for a differential of about £1 a ton between export and home prices, this presumably reduced the profits by some £3,000,000. As home pithead prices were not increased during the year, and more coal was sold inland, the collieries in 1950 received nearly 2d. a ton less than in 1949 for their total saleable output. At the same time costs rose by 4.6d. a ton, compared with a reduction of 6d. a ton in 1949; this resulted from higher prices for materials and stores and a larger provision for depreciation of newly-installed equipment. Miners' average earnings rose from 34s. 4d. a shift in 1949 to 35s. 6d. in 1950, but improved productivity held the rise in wage costs down to less than a halfpenny a ton. From the sale of coal the industry as a whole earned a profit of £24,150,617, compared with £29,418,332 in 1949; and considerably increased profits from carbonisation and other ancillary activities added £2,359,425. Out of a total

income of £26,794,292, the NCB provided £743,808 for compensation for loss of office, £300,000 for losses on American coal, and £2,500,000 for estimated profits tax (it has not yet become liable for income tax). Interest and interim income payable to the Ministry of Fuel and Power amounted to £14.5 million, leaving a surplus of £8,284,662. This has been applied in reducing the accumulated deficit with which the Board began the year, bringing it down to £4,000,000, against which may be set a reserve fund of roughly £3,000,000.

During the year—which saw the issue of the industry's 15-year development plan—the NCB spent £29 million on capital account, and at the end of the year had authorised but not incurred further capital expenditure amounting to £68 million, largely for major schemes that will be carried out over several years. Nearly two-thirds of the capital it spent was on plant and machinery, at rising prices and in face of growing supply difficulties. Further consideration of its depreciation policy is deferred until the District Valuation Boards have completed their revaluation of coal assets for compensation purposes; the board recognises that the provisions that have been made upon the basis of cost to the NCB will not cover replacement costs. A considerable proportion of the money spent on the industry is still going into "short-term development" such as the introduction to more mines of proved coal-cutting machinery, conveyors, and power loaders, and also the experimental operations of newly developed equipment such as scraper boxes, coal ploughs, and an American "continuous miner" for pillar and stall work. This type of

investment can earn coal quickly; moreover, it introduces techniques that may become most productive in future. But an increasing proportion of new investment is going into long-term development, and work in hand under this head is now beginning to include some projects put forward as integral parts of the long-term plan for the industry.

Between now and the nineteen-sixties, when that plan may begin to deliver results, there lies the prospect of years of continued fuel stringency for this country and for its coal customers abroad. There are signs in the report that this prospect, and the balance of emphasis between the pressure of requirements for fuel in the short term and the essential reconstruction of the industry that alone offers the chance of adequate supplies in the long term, are being considered more closely by the board. Manpower, which is the key to present output and the essential constituent on which the plan was based, is the first special aspect of the industry considered in the report. This reveals that a new and detailed examination of the chances of meeting the eventual manpower needs of each area was begun before the end of 1950. The conclusions are not over-sanguine about the prospects of offsetting the wastage of older men from the industry by continued recruitment. Technical development and certain experimental techniques that were not covered in the plan also appear to be receiving more attention: it may be asked whether any of them could be widely applied more quickly. Further attention to the medium-term fuel requirements of the country is indicated by a special chapter on the

efficient use of coal, upon the theme that "an irreplaceable asset on which the country's industrial future depends is too often being squandered." In this connection the board, for the first time, ventures into questions of wider—and competitive—fuel policy. It points out that domestic consumption of gas and electricity has risen considerably since the war years, while the demand for coal by these secondary fuel industries has restricted the amount of coal that could be supplied for domestic needs. The NCB does not elaborate this point; but it quotes significantly the Simon Report's conclusion that "the main winter space and water heating load should be taken by solid fuels." It has in mind, no doubt, the "promotional selling" of gas and electricity while coal remains rationed. But on this subject it may need to consider its own price policy. Colliery profits recorded before charging interest and interim income partly conceal the fact that coal prices at home last year did not suffice to cover all the charges upon coal sold here. Even with reduced exports the British consumer continued to enjoy a subvention from the consumer abroad.

A reconstituted board will need to devote more time to such questions of policy. If fuel economy becomes a constant preoccupation throughout the fifties, the points at which the interests of the nationalised fuel industries meet and may conflict will multiply. Already, such questions as the control of pithead power generation, and the co-ordination of carbonisation policy and prices, demand to be settled. Major questions of internal policy also remain unsettled. The report refers to experiments with standard costing systems by outside management consultants; but it makes no reference to the massive problem summarised in the 1948 report in the words: "The present wages structure of the industry as it has evolved is not conducive to economy or efficiency." Further attention is needed to the restiveness of colliery managers concerning the powers of specialist staffs that the board is committed to strengthening: and in particular of labour management, which may eventually involve reconsideration of the whole relation between the NCB and the industry's unions. Such problems, added to the task of attempting to supervise from the centre the day-to-day operations of the industry,

demand superhuman wisdom and skill. Even with the best will in the world and some of the best men the industry can furnish, the job of running as one giant concern, and now wholly reorganising the coal industry, far exceeds the scale of the biggest tasks that business management has ever been called upon to tackle. critics—including the party that may form the Government with which the next board may soon have to treat—have argued that it is beyond human talent; and there is no lack of proposals for further reorganisation within the NCB structure. But the present Government presumably believes that the job can be done effectively, even as it grows more difficult. If so, it is high time that the men who are to do it should be named.

The Paradox of Rubber

SINCE the war rubber has been a very jumpy commodity. The market has borne the brunt of all the changes of American government purchases and the impact of spasmodic buying by American manufacturers. Technically, it has stood up well to these tests in that day-to-day variations in prices have been less extreme than might have been expected, though the swing of prices over a period has been considerable. Last February, spot rubber reached a peak of 6s. 2d. a lb. in London. During the past three weeks it has hovered around 3s. 7d. Not even tin or wool has experienced such a sharp reversal of the fantastic rise that rubber, like other commodities, experienced after the invasion of Korea. The reaction has been sharp, but it has also been orderly; rubber is still rs. 3½d. a lb. higher than it was twelve months ago and still substantially above average costs of production in Malaya.

When the United States Government decided to expand the output of synthetic rubber and to curtail the civilian consumption of natural rubber it was obvious that the price was bound to fall. In the first quarter of this year, American consumption of natural rubber amounted to no more than 114,500 tons, compared with 177,500 tons in the first quarter of 1950. In addition, American purchases for stock have fallen, and now that shipments to China from Commonwealth sources have been prohibited, the stockpile authorities have adopted an even more cautious buying policy, since they are counting on adequate supplies later on. A revised estimate for world production of natural rubber in the first quarter now puts the total at 465,000 tons compared with 374,000 tons in the first quarter of 1950; at that time output was abnormally low because Indonesian smallholders were holding back supplies. The indicated

* As from January 1, 1950, the former Northern Division was divided into two: Northern Division (Northumberland and Cumberland) and Durham Division. Comparable figures for these new divisions are available for 1949; but not for earlier years.

annual rate this year, 1,860,000 tons, is in fact very close to the total of 1,850,000 tons for 1950 and below the Rubber Study Group's forecast of 1,870,000 tons.

Estimates of world consumption of natural rubber in both the first quarter of this and last year have recently been revised by the Secretariat of the Rubber Study Group. Hitherto the total included an estimate for Chinese consumption and any surplus of Chinese imports over this estimate was treated as an addition to stocks. Now Chinese imports are treated as being wholly consumed, and on this basis total consumption for the first three months of this year is put at 400,000 tons compared with 362,500 tons on the old basis. Consumption in the first quarter of last year amounted to 387,500 tons, on the new basis. Since China is now to be cut off from natural rubber from Commonwealth sources, world consumption in 1951 may not total much more than 1,500,000 tons, leaving a balance of perhaps 350,000 tons to be absorbed by government and private stocks; and the American stockpile of rubber is nearly full.

★

It is possible that output of rubber might fall this year, though that would imply a sharp change in the recent trend. World production rose in April to 172,500 tons, exceeding the first quarter's average by 11 per cent. The increase during the past twelve months has mainly come from smallholders, encouraged by the high price to tap as hard as they could. Estate production in South-east Asia actually fell last year to 605,000 tons, compared with 620,000 tons in 1949, while the smallholders' output increased from 593,000 tons to 914,000 tons. Given a lower level of prices, smallholders may perhaps produce less rubber this year. Most of the rubber produced by smallholders is not of No. 1 grade and while the price for this standard quality soared last year in response to large demands by the American authorities for stockpiling and also by China, prices for inferior rubber rose less sharply and the spread of prices between the highest and lowest grades widened. When the price of No. 1 sheet fell, prices for off-grades declined less sharply and the price spread narrowed.

One important effect of dear rubber, however, has been to retard replanting programmes. When rubber is very high, it is unprofitable to grub out old trees and replant them with high-yielding stock; at 5s. a lb. it is worth tapping almost any tree. Conversely, when rubber is very low, estates are reluctant to find funds to finance replanting because new trees cannot be tapped until their seventh year. The average annual yield for each acre of high-yielding stock in Malaya varies between 800 and 850 lb. compared with 400-450 lb. for ordinary stock. At the end of 1949 the rubber estates in Malaya covered 1,983,000 acres, of which 537,000 acres or 27 per cent were planted with high-yielding stock. Smallholdings under rubber covered 1,403,000 acres, of which a very small proportion was planted with high-yielding trees. Similar particulars for Indonesia are not available; before the war the proportion of estate acreage planted with high-yielding stock was 33 per cent, and little replanting has been done since the war. A large output of cheap rubber in the future depends on much more energetic replanting than that of recent years.

In this context the suggestion of the Malayan Govern-

ment to freeze part of the Colony's earnings from tin and rubber as a means of combating inflation must be examined with care. The idea is simple and has been adopted by other countries for other commodities. The Government would take part of the proceeds of these commodities and put them into a stabilisation fund, to be administered by trustees, who would use the fund to supplement the prices received by producers in Malaya when world prices fell. If the scheme were to be put into operation for rubber, it would be directed mainly against the estates, for it would be administra-

tively impossible to freeze part of the earnings of smallholders. But as Sir John Hay has pointed out to shareholders of United Sula Betong Rubber Estates, the part that the estates play in the internal inflation in Malaya is small, apart from payment of wages which absorb about a third of the company's proceeds. The rest goes in taxation, in dividends to shareholders, mostly registered in Britain, and to reserves. The only way in which estates generally could effect a major reduction in their expenditure in Malaya would be to reduce wages. Since that is presumably not the intention behind the proposed levy, its burden would in fact be met from the funds that the estates are using to meet their replanting programmes. Sir John showed that the rubber estates were already paying very large tax contributions both in Malaya and in the United Kingdom. The tax commitment of United Sula Betong Rubber Estates last year absorbed 60 per cent of the profits earned, and since then the Malayan export tax and British profits and income taxes have been increased. If a substantial part of estate earnings were frozen, little or no provision could be made for replacing capital or for replanting.

The rubber market is faced with a paradox. This year, and possibly next year, supplies are likely to exceed requirements, given continued restriction on civilian consumption of natural rubber in the United States. For the time being, any surplus output may be absorbed by government stocks. As rearmament gets into its stride the demand for rubber for defence purposes will certainly expand, but it is doubtful whether total consumption of natural rubber (including civilian consumption) in

the United States, Britain and Western Europe will exceed that of 1950. The more distant future, however, suggests that a distinct scarcity of rubber may arise. World output of natural rubber is unlikely to show any marked expansion much before 1960 owing to the delay in replanting with high-yielding stock, and the maximum annual output in the next few years might well be 2,000,000 tons. On the other hand, if and when rearmament has been completed and civilian production is again unrestricted, the consumption of rubber is likely to expand. Since 1900 world consumption of rubber has tended to double itself every decade, as can be seen from the accompanying chart, and there are those who expect the increased use of latex foam and crepe to push the total up to 3,000,000 tons a year by 1960. The gap could be bridged if synthetic output is maintained at 1,000,000 tons a year. But if synthetic production were to be kept at this rate during the next eight years, and consumption of natural rubber in the United States were correspondingly restricted, rubber-growers would experience very hard times, with serious political consequences in South-east Asia. The United States is one of the few large consumers of rubber that

Shell's Strength Displayed

AMONG the many impressive company reports of recent weeks, none surely has surpassed in economic importance, clarity of presentation, and world-ranging significance the picture of the Royal Dutch-Shell group that has been revealed this week in the "Shell" Transport and Trading Company's report. The Royal Dutch-Shell group is not in itself a legal entity; it is rather a partnership, headed by the Royal Dutch Petroleum Company and the "Shell" Transport and Trading Company as holding companies, which share in the joint investments in the group in the proportion of 60 for Royal Dutch and 40 for "Shell" Transport and Trading. The two holding companies participate in this ratio in the capital and income of three major operating companies—Bataafsche Petroleum, Anglo-Saxon Petroleum, and Shell Petroleum, which in turn own companies concerned with every aspect of oil development, refining, transport and marketing.

The strength of the group has never until this year been revealed. It proves to be as vast as the most fabulous guesses had suggested. Never has a set of consolidated accounts so dramatically revealed the real substance of a group as distinct from the legal barebones of the companies that control it. A holding of "Shell" ordinary stock gives a participation in a 40 per cent share in an organisation that straddles the world and counts, with all prudence, its total resources at between £500 and £600 million and its net income last year at little short of £200 million. Compared with these figures, the book value of the "Shell" investments in the group, appearing in its own balance sheet at £87 million, is a very modest reckoning of the 40 per cent interest that they represent.

The following tables are concerned solely with the Royal Dutch-Shell group, and with neither of the holding companies. They show that in a single year, net income from trading and other revenue, before taxation and depreciation, has jumped from £136.3 million to

can absorb large supplies of off-grade rubber, and a reduction of American consumption would particularly affect the smallholders. The paradox of rubber might

be solved if the United States, when it has completed its stockpiling of natural rubber, decides to allow natural and synthetic rubber to compete freely in the American market.

£184.4 million. One-third of this enormous sum has been transferred directly to depreciation, and not much less than a third (£55.4 million against £41.7 million in 1949)

World figures include estimates for certain countries for which accurate figures are at present unobtainable. According to the specific gravity of the crude oil, one metric ton varies from 6.7 to 7.5 barrels. * Share of production of group and associated companies. † Including production of Rumania, Hungary, Albania, Poland and Czechoslovakia.

has been provided for taxation. The operating companies themselves have retained £14.6 million compared with £6.1 million in 1949, to meet their own needs. In the result, the net profit available for group appropriation has risen from £35.8 million to £49.2 million, of which £33 million has been retained in the business,

£16.3 million (against £12.4 million) paid out in dividends by the two holding companies, leaving the balance of profits carried forward little changed at just over £40 million.

Figures of this magnitude almost defy conventional analysis. The "Shell" shareholder will retain his stock the more happily for knowing from the figures that his 12½ per cent tax free dividend was covered three times by last year's available profits. But as the account itself reveals, the group has the energy and earnings of a giant, and also the needs of a giant for continued expansion. The ploughing back process has absorbed £108 million out of last year's net income of £184.4 million, and moreover tax has been paid in respect of at least one-third of the net sum retained. Similarly, to work out from the group's statement of assets and liabilities the asset value for "Shell" ordinary is an agreeable exercise, but for a number of reasons the result would not do justice to the real strength that underlies the stock. For example, oil production rights and exploration costs appear in the books at £8,500,000 net; that is all that remains after writing down gross expenditures of £75½ million. The group's gross investment in fixed assets has reached the enormous total of £632.6 million, mainly valued at cost, and, against this, depreciation reserves stand at £330.9 million. The policy of the group in providing generously for depreciation is well illustrated by last year's changes; fixed assets increased by £85.3 million, and depreciation reserves by £45.1 million. The additional provision of £33 million to general reserve has been made with today's greatly increased costs of replacement in mind. The stockholder with his slide-rule must therefore first make up his mind about the real value to be put on the fixed assets standing in the books at £301.7 million net. Then there are investments valued in the books at £55.7 million.

These are mainly shareholdings in oil companies in which there is an outside public interest and which finance themselves independently ; they include holdings in Shell Oil, Shell Francaise, Canadian Eagle, El Aguila, United British Oilfields of Trinidad and others. This item includes the group's holdings in public companies which, a year ago, had a book value of £31.6 million and a market value of £146.1 million ; the chairman's statement draws attention to the fact that their market value is considerably higher today.

In sum, as the statement shows, £65 million of profits have been retained in the business, of which £40 million has been used for capital expenditure (this apart from depreciation provisions of £61.1 million) and £25 million used to swell the group's net current assets. It is clear that 1950 was a year in which the demand for the group's products was considerably greater than had been expected. But the results, expressed in accounting terms, also reflect the falling value of money, which has driven up costs in a startling way, while the basic price of petroleum products has shown a comparatively insignificant increase. It is for this reason that Sir Frederick Godber emphasises the marginal—and therefore vulnerable—nature of the profit per unit sold by the group. He also makes an emphatic contribution to the discussion on profits and the maintenance of assets:

The conditions under which industry in general has worked since the outbreak of the second world war have created such problems that they demand a fundamental change in the traditional attitude to those balances between income and expenditure which have technically been called "profits." . . . In recent years the rates of depreciation recognised by taxing authorities have been wholly inadequate to ensure that the value of the capital assets is maintained. . . . With the rising costs now current, "profits" must increasingly be used for the maintenance of the working value of the assets. . . .

It follows from this trouncing of the doctrine that profits are what normally accepted accounting principles say they are, that Sir Frederick is highly critical of the increased taxation on distributed profits and the suspension of the initial allowances. This year the group has ordered 46 large tankers, of which 31 are to be built in this country at a cost of more than £30 million. The orders were placed with no suspicion that the initial allowances might be withdrawn, and there is a justifiably touch of bitterness in the chairman's comment:

While I will not go so far as to say that had we known this the programme would have been modified, I do submit this case as an example of the severe impact these proposals must have upon necessary building programmes in particular and industry in general.

The fairness of this comment, from a group that last year was better able than most to finance itself from its own net revenues, can hardly be gainsaid.

The stockholder who wishes to clothe these gigantic figures with the realities of the group's operations last year will study with close interest the "Survey of Activities" that accompanies the report. This comprehensive and attractive document shows that the group maintained its position last year in helping to meet a 12 per cent increase in world demand for petroleum products. Figures for last year's world output, and the proportion produced by the Royal Dutch-Shell group are given in full in the accompanying table. As the survey points out, it was fortunate that the long-term plans of the industry for the provision of new sources of

Business Notes

Finance Bill in Committee

Up to the time at which this issue of *The Economist* went to press, the debate on the Committee stage of the Finance Bill had not progressed as far as the really contentious matters—notably, the objectionable clause that restricts the freedom of British companies to transfer their domicile overseas, and the proposal to violate the secrecy of a banker's relationship with his customer. In the first two days the debate was focused on the increases in the petrol and entertainment duties and in income tax. Only on this last issue was there scope for extension of discussion to matters of high policy, but it was neither a distinguished nor a particularly fruitful discussion. Mr Lyttelton, and other Opposition speakers, emphasised again the deadening effects of the weight of taxation, and, in particular, the dangers of a policy that bears so heavily upon industrial capital. The budget would accelerate the depletion of such capital "at an unpardonable rate at a time when we should be trying to build up further industrial capital to meet the necessary finance of higher prices." On this issue, Mr Gaitskell's retort hardly reached his usual standard of objectivity. He declared that the problem now is to restrain the recent "extraordinarily high rate of investment"; that this justified the suspension of the initial allowances; and that, in any case, the Tucker Committee had supported the Inland Revenue definition of profits. This last reference has an ominous ring; for there is no doubt that this obsolete definition is the major source of capital wastage, and, before the Tucker Committee reported, there had seemed some reason to hope that the Treasury mind was opening on this issue; now its attitude seems to have become inflexible once again.

There was prolonged discussion on the clauses relating to the petrol tax and entertainment duty, and at times the debate was lifted above the plane of party politics. Yet, to the plea that the increased petrol tax would speed up the

production, transport and refining capacity were so well advanced, for demand in the latter part of 1950 was running at a rate that was not expected to materialise until 1952 or even later. In the production of crude oil, the group seems to have maintained its contribution of about one-tenth to world supplies (excluding Russia and Eastern Europe) ; its most spectacular achievements have been in Venezuela, but the largest proportionate increase in output was recorded in Iraq, where the group holds nearly a quarter share in Iraq Petroleum. In Venezuela, drilling and development appear to have gone ahead at impressive speed. Elsewhere, there is equally purposeful expansion—of pipelines and pumping stations, refineries and manufacturing plants, of an enormous programme of enormous tankers (there will be 31 tankers of the 28,000 ton class in the group's service by 1955, fourteen owned and seventeen on charter), of new manufacturing plants tailor-making products to meet every requirement, of research looking towards a future that in this industry arrives with astonishing speed. All this is part of the impressive story that the oil industry and the Royal Dutch-Shell group has to tell. Its contribution to the sum of industrial achievement increases still at a geometric rate ; its responsibilities to its staffs, its customers, to the foreign countries in which it operates were never greater nor more readily acknowledged. A holding of " Shell " ordinary (at $4\frac{7}{8}$ to yield $4\frac{7}{8}$ per cent) provides the investor with an equity in expansion and technical achievement that would be difficult to match.

twisting spiral of prices and wages, the Government replied by the dubious argument that the effect would be very small, would be "thinly spread," and would be mitigated by the fact that the duty would be paid partly out of undistributed profits. On this clause, however, the Government did offer one tiny concession: Mr Jay promised to look afresh at the arrangements for allowing drawback of duty where light oil is used in the manufacture of exports. Similarly, when responding to the long debate on the effect of the increased entertainment tax on the cinema industry, he conceded that if there had last year been a binding undertaking, under the so-called Eady plan, not to raise the tax for a full twelve months, that arrangement ought to be sustained. What is in question here, however, is nothing more than a month's postponement of the date on which the tax increase will take effect.

Dollars for Defence Tools

Dollar aid for the British rearmament programme is a subject that appeared in the earliest statements about increased expenditure on defence last summer, but has been conspicuously omitted from later declarations. This display of transatlantic tact has this week been followed by the announcement from Washington that Britain has been authorised to use \$112 million for American-made machine tools needed for the defence production programme.

These dollars, which will be provided from funds appropriated by Congress for the Mutual Defence Assistance Programme, will buy rather more than half of the machine tools that this country hopes to obtain from American makers. Defence order priority ratings have been issued for these tools by the National Production Authority; according to ECA some have already been delivered, and the remainder will be delivered "as quickly as production permits." The

grants of finance and priority represent very material American assistance to British rearmament. In its calculations of needs and finance, the Ministry of Supply has for some months been discreetly relying upon such assistance; without it, the Ministry's policy of obtaining from abroad the bulk of the additional tools needed for defence production, and of disturbing home machine tool production and exports as little as possible, would have been impossible.

Argument about Steel Allocation

It fell to the Minister of Fuel and Power this week to drop a fairly heavy hint of the likelihood of steel allocation. Replying to a question about steel supplies for the coal industry, Mr Noel Baker said:

Urgent consideration is being given to the whole question of the arrangements to ensure that the supplies of general steel shall be distributed in such a way as to maintain a proper balance between the various needs of our national life. In the meantime the Minister of Supply has made arrangements designed to ensure that the coal industry shall receive the supplies necessary to meet its current needs.

Consideration of steel allocation had been mentioned to the House of Commons on several occasions; but no specific measures to provide steel for any one industry had been disclosed before.

It seems likely that allocation of general steel, as well as of strip and sheet, is imminent, and that the system adopted may be tighter than the pattern of general priorities between separate industries that has been suggested within the industry for some time past. Detailed control of steel distribution will be arduous and far from watertight, as past experience proves; nevertheless, the indications are that something comparable to the old "M form" system is firmly in the official mind, with certain modifications to avoid the grosser anomalies that became evident during its operation. Such a system could hardly be brought into operation before the autumn, whenever an announcement is made; it appears, in fact, that the Ministry may be attempting to elaborate its plans in complete detail before it makes any statement.

New Style for Steel Meetings

Even though shareholders' attendance at company meetings is traditionally sparse, the annual meeting of Colvilles in Glasgow last week may be noteworthy as marking a new departure. The company's directorate and officials presented its report and accounts in the normal fashion, and for once had the attention of 100 per cent of its corporate ownership—in the person of its one "shareholder" Mr Steven Hardie, chairman of the Iron and Steel Corporation of Great Britain. The directorate, indeed, no longer held a qualifying shareholding in Colvilles; the corporation over which Mr Hardie presides does not share its ownership with anybody. It was Mr Hardie's first appearance in this role, and presumably he or his representatives would have a fairly busy routine attending eighty such annual meetings during each year. The occasion provided the Steel Corporation's chairman with an opportunity to refer once more to the shortage of steel-making materials: this subject was the only aspect of the industry that Mr Hardie discussed in detail when the Corporation assumed control of publicly-owned steel in February, and it appears to remain his most engrossing interest.

More than three months of the "interim period" in taking over operational control of the industry of which Mr Hardie then spoke have passed. There are no signs of any specific move by the corporation to take over any of the functions of the British Iron and Steel Federation. When any such change is proposed, it is likely to be gradual: Mr

Hardie's special interest may indicate a desire to assume a more direct responsibility first for the industry's raw materials. Such a responsibility would seem to denote a positive appetite for an unpopular job; but even Mr Hardie's critics would probably not deny him that quality.

Weaker Canadian Dollar

The recent weakening of the Canadian dollar brought the London-Montreal rate to over \$3.00 to the pound at the end of last week; there were some signs of strengthening—possibly as a result of official support—at the beginning of this week but on Wednesday the middle rate quoted in London was still \$2.98½. When the Canadian dollar was unpegged from its old rate of \$3.08 last October, many observers expected it to move fairly rapidly towards parity with the US dollar at \$2.80; the rate did in fact strengthen to beyond \$2.90 at one time, but since the end of November it has gradually tended to fall back. Throughout the whole period the Canadian authorities are believed to have held the view that a "strong" rate would be a buttress to their anti-inflationary policy—and to have supported that view in the market as far as they could, though always with the proviso that the Foreign Exchange Control Board must not be allowed to make serious losses.

Why, then, has the relapse occurred? The answer seems to be that those Americans who sent nearly \$800 million of speculative capital into Canada last year in expectation of a change in the rate have recently been taking their profits. When the rate was unpegged last October much of this capital stayed in Canada in the hope that the free rate would appreciate to \$2.80; in fact the withdrawal of speculative capital from Canada in the last quarter of 1950 does not seem to have been much larger than the volume of genuine investment funds that was still flowing into the country. Since the end of the year, however, Canada's current external deficit has widened; in the first three months of this year the deficit on merchandise trade with the United States was \$140 million, compared with \$47 million in the whole of last year. This deterioration is partly seasonal and partly due to abnormal imports, but it has apparently been sufficient to send some capital out of the country. Some of it has no doubt been wagered on new favourites in the revaluation stakes. As the Canadian tourist season is now about to start and as forward purchases of Canadian dollars for next autumn's grain crop are soon expected, it seems possible that the rate may now start to strengthen again. But the pronounced see-sawing movement since last October shows how wise the Canadian authorities were not to decide on an arbitrary fixed rate at that time. This is a lesson that other countries would do well to ponder.

Entertainments Duty Review

In the debate on the entertainment duty this week, the Chancellor of the Exchequer declared that he was "perfectly prepared for a discussion with the [film] trade upon the present rates of duty and the way the incidence is felt," but added that it would not be easy to find a satisfactory solution. His assurance is welcome; but it will place on the trade the onus of devising something more than a simple reduction in duty. If such a discussion is to take place, it should be soon, for other questions of Government policy on films, including the future of the National Film Finance Corporation and amendments to the Quota Act, will soon have to be settled, and the Treasury's partial remissions of tax last year and increase-plus-remission this year bring it into the centre of films policy. The Films Council refers to these impending changes in its annual report, issued this week: the Council once more emphasises the agreement of its independent members with the trade

'What is their commercial standing?'

THE WESTMINSTER BANK can, in many cases, give you an immediate reply; or, if the required information is not already available in the extensive and up-to-date records of the Foreign Branch, it can very quickly be obtained. The provision of reliable confidential information as to the reputation of your prospective overseas customers is part of a comprehensive service which the Westminster Bank provides for those who trade abroad. This service is described in a booklet which can be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*.

WESTMINSTER BANK LIMITED

ASK THE MAN WHO KNOWS

Business men and bankers who have visited Australia or New Zealand will tell you that the best medium for facilitating trade with those countries is the Bank of New South Wales — largest commercial bank there.

You are invited to use our specialist services through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

GEORGE II WAS KING

The private bank of Glyn, Mills & Co. was founded in 1753. It withstood the vicissitudes of the uneasy 18th century. It grew strong in the expansion of the 19th, aiding many a small enterprise to rise to international prominence. Today it is still a private bank. It still acts as financial guide and mentor to many great industrial concerns. It has large resources, and a completely modern yet personal banking service available to those firms now planning expansion in the mid-20th century.

GLYN, MILLS & CO.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

about the undue burden of entertainment tax. Mr Gaitskell was referring to a general review during the coming year, not to negotiations upon the latest increases and remissions proposed in the Finance Bill. Mr Jay had referred at an earlier stage to negotiations with the trade on the current issue; these, he said, culminated in an offer that the producers had accepted, but the cinema exhibitors, had turned down.

The cinema exhibitors, in conference at Bournemouth last week, coupled defiance of the Chancellor with threats to refuse to continue the voluntary levy for film production machinery set up last year for passing a remission of duty to the producers. It is never easy to judge what the film trade will do by what it says; and it is worth noting that the interests of the exhibitors operating the smallest cinemas may not entirely coincide with those of the circuit owners. Whatever may be said in favour of siphoning off part of the revenue of the industry and passing it to the producer outside the industry's ordinary financial channels, it was this scheme that the exhibitors accepted last year; to refuse to co-operate in it would merely reopen the divisions in the industry without bringing any effective pressure on the other party in the present argument, the Treasury. But it would certainly invite stricter action by the Treasury to carry out its mission of redistributing the industry's income among its component parts. This aim appears to be undimmed, to judge from the readiness of Mr Jay to accept only such tax amendments as would pass the greater share of any remissions to the producing side of the industry, "where the main trouble is at present."

Egypt's Support for Cotton

The prospect of larger cotton supplies next season is distinctly favourable, though much still depends on the weather. The American crop this summer is expected to yield about 16 million bales compared with less than 10 million bales last year; if it is achieved, it will equal the 1949 crop which was the largest since the war. The smaller Egyptian crop last year was caused by a spell of hot, damp weather in the late summer; the yield fell from an average of 520 lb. to 427 lb. an acre. If average yields are obtained this year, production might well exceed 1,850,000 bales, which would be a record crop for the postwar period. On this basis, a world output in 1951-52 of 34 million bales is possible. If world consumption during the present season does not exceed 31 million bales—in the first half of the season it was running at an annual rate of over 32 million bales—the carryover stocks on August 1st will be reduced to 13 million bales, the lowest level for many years. Available supplies in 1951-52 might therefore total 47 million bales compared with 44 million bales in 1950-51—a modest but welcome increase.

The larger American crop will almost certainly mean

bigger export quotas; this is doubtless the reason for the Egyptian Government's decision to guarantee minimum prices for domestic grown cotton. These minimum prices are proclaimed for both old crop and new crop futures, but the Egyptian Government guarantees to buy only old-crop cotton at those prices. The medium Ashmouni grades (short staple Egyptian cotton) can be substituted for American middling and have been used for this purpose in Lancashire and elsewhere. Nine months ago when the United States restricted its export of cotton, the rush to buy Ashmouni forced prices up to an absurdly high level. Since the turn of the year prices have fallen somewhat, but Ashmouni is still dear and the Egyptian Government is trying to maintain current prices. With Ashmouni now selling at 75d. a lb. compared with American middling at 53d. a lb., buyers have been scarce and stocks are accumulating, though the trade suggests that a ready market would probably exist at 58d. a lb.

The increase in world supplies of cotton in 1951-52 suggests that the Egyptian Government may find itself heavily committed by its policy of fixing minimum prices—unless indeed it decides to bring them into line with those ruling on the New York market. This is not the first time that the Egyptian Government has shown itself interested in supporting the market, but in the past it has not always been an accurate judge of trends in supply and demand.

Plastics in Industry

Sir Ben Lockspeiser, secretary of the Department of Scientific and Industrial Research, remarked at a plastics exhibition in London this week that the plastics industry had expanded to a point where it was outrunning its supply of feed-stock. He added that crude oil would become an important source of new materials to the industry. Raw materials for plastics are drawn exclusively from the chemical industry, which is investing heavily in new plant designed solely to supply them. In several cases the chemical manufacturers are either producing and marketing their own plastic products, or have acquired an interest in some of the plastic producers to whom they supply raw materials.

Plastic exhibits have a similarity of appearance that belies the diversity of their properties; but it is on that diversity of properties that the future expansion of the industry will be based. Large sections of the exhibition were given up to the display of moulded containers, radio cabinets, light weight constructional materials, special laminates, gears and pinions, cups and saucers—all the industry's more familiar products in which plastics are competing with other materials on the basis of cost and performance. There are now, however, numbers of special-duty plastics with valuable characteristics that justify high cost. Sir Ben spoke of frictionless bearings, and of the possibility of replacing 2,000 tons of lead sheathing for underwater cables by light, corrosion

"Hi, there . . .
let me out of here!"

says JACK SCRAP

How many thousands of tons of iron and steel scrap are there locked up in factories and yards all over the country? Every ton of it reclaimed and sent to the steel furnaces may mean an extra ton of new steel for industry and defence.

The nation can't afford to waste this essential raw material. How much can you find?

Round it up — send it in.

LEVER BROTHERS & UNILEVER LIMITED AND LEVER BROTHERS & UNILEVER N.V.

The Boards of Lever Brothers & Unilever Limited and Lever Brothers & Unilever N.V. RESOLVED today to RECOMMEND to the Annual General Meetings of their respective Companies which will be held on 12th July, 1951, the DECLARATIONS OF DIVIDENDS on the Ordinary Capital in respect of the year 1950 payable on the 24th July, 1951, as set out below:—

In the case of Lever Brothers & Unilever Limited a DIVIDEND of 13½% (2/8.4 per £1 of Stock) less Income Tax at 9/6 in the £ (1949—10%) PAYABLE to Stockholders registered in the books of the Company on the 23rd June, 1951.

In the case of Lever Brothers & Unilever N.V. a corresponding DIVIDEND calculated in accordance with the Equalisation Agreement converted at the rate of exchange of Fl. 10.64 to £1 sterling of 12% (Fl. 120 per share of Fl. 1,000) less 15% dividend tax (1949—8.9%) PAYABLE on PRESENTATION of the appropriate DIVIDEND COUPON.

The combined trading profit before charging taxation on profits was £52,181,298 (1949—£31,947,465) after charging reserve for replacement of fixed assets £4,943,233 (1949—£4,247,744). The combined consolidated net profit, after taxation of £28,459,366 (1949—£17,569,024), was £19,226,875 (1949—£19,580,127). This net profit for 1950 is after setting aside reserves against stock values amounting to £2,629,699 whereas the net profit for 1949 included exceptional credits of £7,504,190 arising from exchange profits of £5,680,882 and £1,823,308 brought back from stock reserves.

The results for the groups separately were:

	Consolidated Net Profit	Profit of Parent Company
Lever Brothers & Unilever Limited	£10,998,350 (£11,727,509)	£5,853,188 (£5,501,287)
Lever Brothers & Unilever N.V.	£8,228,525 (£7,852,618)	£3,799,776 (£2,614,897)

The Reports and Accounts of both Companies will be issued on 19th June, 1951.

All of these schemes for American grants to overseas territories are intended directly or indirectly to assist the production of essential raw materials as well as to develop Africa and other areas. There is, however, another source of ECA finance potentially available for this purpose. It will be remembered that the original Marshall Aid agreement gave ECA the right to use 5 per cent of Marshall Aid counterpart sterling funds for the purchase of strategic materials or for

But delays in delivering the Ambassador have been caused by more far-reaching technical difficulties. They have arisen from the refusal of the Air Registration Board to grant the aircraft a certificate of airworthiness, without which it may not carry fare-paying passengers. The ARB has maintained that a certificate could only be granted to this aircraft on the condition that, when loaded, its centre of gravity (which determines the machine's stability and hence its safety) should not vary by more than a two-inch margin from a given point. For practical purposes it would be impossible

Copies of the full Report and Accounts can be obtained free of charge by anyone interested from N. M. Rothschild & Sons, New Court, St. Swithin's Lane, London, E.C.4.

for a commercial operator to load the Ambassador with such precision, and the certificate of airworthiness has therefore been withheld until the margin could be made more reasonable. This has now been done by fitting a new elevator to the aircraft. The modification appears to be entirely successful and a certificate of airworthiness may, therefore, be issued in July when flight trials have been completed. If so, the first Ambassador could be in service by the middle of August; five more are scheduled for delivery this year, and a further fourteen in 1952.

The Ambassadors were to have been used this summer on some of the Corporation's most heavily booked routes. Their failure to arrive has meant that aircraft from other services have had to be diverted to those routes, and has involved heavier calls for aircrews since Ambassador services would have been operated with fewer flying staff. BEA's consequent "sense of frustration" is understandable. In recent years the Corporation has reduced its annual deficit by impressive steps in the face of continually rising costs: this summer's cancellations will now offset much of this saving.

* * *

Softwood Supplies and Russian Negotiations

When early last year the United Kingdom Timber Control bargained with Sweden on the basis of £47 10s. a standard, it miscalculated the market and lost the timber—less than a third of the softwood hoped for in 1950 under the Anglo-Swedish trade agreement was eventually purchased. It also revealed the loss of British influence on softwood prices that used to be predominant before the war. After the outbreak of the Korean war, Britain had to turn to North America; with a more plentiful supply of dollars it was able to contract in the latter half of 1950 for about half a million standards both in British Columbia and the United States at high prices, which in their turn set a higher level for Scandinavian prices in 1951. Then the timber trade was partially freed in October and up to the end of April some 680,000 standards had been bought on private account. More recently the Timber Control has contracted with British Columbian firms for over 300,000 standards for shipment up to June, 1952. If the business recently done by the Timber Control in the United States and by private buyers during May is included, imports during 1951 should total about 1,500,000 standards, a figure that takes no account of the possibility of new agreements with Russia and allows for doubts about some of the contracts and the difficulties of freight.

Such a total suggests that, even after stockpiling by the Government and re-stocking by the trade, softwood supplies in this country should be adequate by the end of the summer—at least to meet the reduced consumption of the present time. It also provides a background for the negotiations that continue with Russia for softwoods both from the Kara Sea and from the White Sea or the Baltic. Agreement had been partially reached about a fortnight ago for 28,000 standards of Kara Sea softwoods at £106 a standard c.i.f. and for 122,000 standards of White Sea softwoods at £76 a standard f.o.b., but subject to certain Russian stipulations: first that half the tonnage to carry the Kara Sea timber should be supplied by this country and secondly that cargo ships for White Sea timber should be available at Archangel within three weeks after the timber is declared ready for shipment. It is unlikely, in present circumstances, that the Timber Control will accept such conditions, for it is difficult enough nowadays to man ships for Archangel, and will presumably be doubly difficult to get crews for the Kara Sea; moreover, the trip to Archangel takes about ten days and to charter the requisite tonnage and get the ships into position in a week would be almost impossible. On the other hand, White Sea timber is generally of better quality than Scandinavian, and Kara Sea timber is of the highest quality; whereas lower

quality wood is becoming comparatively plentiful, the higher quality required for joinery is still unlikely to meet the demand. The importance that Russia attaches to an agreement is not certain; the Russian negotiators originally hoped to secure some kind of a barter arrangement. For the first time since the war, the major problem for Britain is no longer that of sheer physical shortage of timber supplies; shortage of cargo tonnage and delays in handling at ports have been steadily assuming greater importance. Thus the trade, though requiring the Russian grades, would probably not be as greatly disturbed as this time last year by the loss of the Russian timber.

Shorter Notes

The Union Discount Company announces that Treasury consent has been given to the capitalisation of £1,283,333 from the share premium account and to the issue of 1,283,333 ordinary shares of £1 each, credited as fully paid; it is intended to distribute these shares (which will rank *pari passu* with the existing ordinary stock for the interim dividend to be declared next month) in the proportion of one new share for every £3 of stock held. Since 1937 the company has kept its dividend frozen at 10 per cent and has built up very substantial reserves, both published and hidden; there seems every reason to suppose, therefore, that the present rate of dividend will be maintained on the increased capital.

*

Sir William Crawford Currie, at the annual meeting on Wednesday of the Peninsular and Oriental Steam Navigation Company, illustrated the gravity for a shipping company of the suspension of initial allowances on expenditure to be incurred in the coming financial year. Seven companies in the group, with liabilities for ships under construction exceeding their assets by nearly £2,000,000, had received tax relief of over £4,500,000 in initial allowances. Thus without these allowances their deficiency would have been more than trebled. Apart from the loss of the initial allowance, the basic question of calculating depreciation to meet current replacement costs instead of initial costs demanded further consideration. For even in addition to very high prices for liner construction, the number of cargo liners now employed had to be greater in order to allow for loading and discharging delays at the ports of call.

*

The Ministry of Fuel and Power last week neatly contrived to nullify one effect of the National Coal Board's zone-delivered price scheme before it came into operation. To the Board's new system of graded coals and equalised transport charges, which would have had the effect of reducing domestic coal prices by 11½d. a ton, the Ministry attached a rise of 1s. 3d. a ton in distributors' margins. The consumer was thus promised his coal at an average of a shilling a ton cheaper, and finally offered it at threepence a ton dearer; for both changes, to increase perplexity, he was given the same explanation, "changes in transport charges." In reality, while the Board was reducing its prices, the distributors had satisfied the Ministry that their transport costs were rising. The Minister might perhaps have called his increase a matter of "delivery."

*

The Tin Research Institute has been working for some time on a tin-nickel alloy for electro-plating, consisting of 65 per cent tin and 35 per cent nickel. It is now being produced on a pilot scale by two firms in this country and by other firms abroad. Since less nickel is used than in nickel plating it is hoped that it might ease the nickel shortage; but its merits largely depend on price and it is too early yet to compare costs.

Company Notes

United Molasses.—The impressive improvement in United Molasses' group trading profits from £2,145,959 to £3,592,941 is partly due to the inclusion for the first time of earnings of Anchor Line, now wholly owned by United Molasses, but mainly to the increased earnings of the group's tanker fleet. The company did not immediately benefit from the sustained rise in freight rates in the latter half of 1950, but voyage accounts of recent months have begun to show their effect, and "a marked increase" in earnings is expected this year, when the tanker fleet will be restored in size to its prewar numbers and more than restored in annual carrying capacity.

As the company's issued capital had become completely out of line with the real capital employed—net worth, based on book values, of £12,500,000 represents at present replacement values no less than £18 million to £20 million—the company sought to broaden the basis of its capital. The Capital Issues Committee finally agreed to the capitalisation from reserves of £1,954,000, after the company had sought permission to capitalise double this amount, and in April one 6s. 8d. ordinary stock unit was issued for every unit held. The final tax-free ordinary capital of 6½ per cent is to be paid on the doubled capital, so that the year's total distribution is equivalent to 43.81 per cent on the original capital of £1,954,500, against 27½ per cent plus a tax-free cash distribution of 2½ per cent in 1949.

	Years to Dec. 31, 1949	1950
Consolidated Earnings:—		
Trading profit	2,145,959	3,592,941
Total income	2,286,609	3,855,090
Depreciation	799,975	1,203,358
Taxation	652,232	1,382,256
Group earnings for ord. stock	551,616	921,650
Ordinary dividends	295,619	459,308
Ordinary dividends (per cent) ..	27½	43.81
Retained by subsidiaries	150,000	205,000
Added to carry forward	205,997	414,994

Stocks	659,995	2,112,432
Cash	2,872,785	1,594,807
Reserves	9,829,146	10,514,745
Ordinary capital	1,954,500	1,954,500

6s. 8d. ordinary stock at 39s. 2d. yields 13 15s. per cent.

The replacement of tankers lost in the war is now almost completed; the book value of motor vessels at cost has increased by £2,088,672 to £9,638,970 with the purchase of new tankers in 1950 and payments of £1,132,065 have been made for four new tankers building at the end of the year. Capital expenditure of this nature has made some call on liquid resources, so that cash has fallen from £2,872,785 to £1,594,807 and British government securities from £791,213 to £69,480; when the tankers now under construction are delivered, no further capital commitments of any consequence are in prospect in the next few years and this should lead to a strengthening of liquid resources. When the Board of Trade gave up its control of molasses, the company acquired stocks previously held by the Board, so that the book value of molasses stocks has jumped from £134,770 to £1,542,666. Carrying stocks of molasses at high prices, however, imposed some strain on liquidity, and an American subsidiary had to sell some £450,000 of American government securities to finance its purchases.

The chairman is optimistic about the immediate future and says that "combined earnings for 1951 are likely to show a very substantial increase over 1950." Some concern, however, is expressed over the abnormally high prices for molasses, and it is feared that it will encourage greater production of synthetic alcohol, so that the fermentation industry might suffer when "the present inflated demand for industrial alcohol brought about by world-wide rearmament comes to an end." Despite this risk, the company has erected and equipped collecting stations in areas where it was uneconomical to collect and ship molasses at the lower prices prevailing at the beginning of 1950.

*

J. and P. Coats.—One of the biggest disappointments in the market since the dividend thaw began was the mere maintenance of Coats' ordinary dividend at 12½ per cent; immediately the announcement was made the £1 share units fell 5s. to 62s. 6d. but they have since recovered to 65s. 7½d. to yield 3.8 per cent. The report shows that group trading profits have risen from £13,133,612 to £15,546,151, but exchange gains following devaluation and the conversion to sterling of stocks carried by foreign subsidiaries have inflated the 1950 figure by £2,800,000 compared with £2,250,000 in 1949; allowing for these windfall gains the increase in profits is of the order of £1,700,000 and is said to arise "from higher values experienced under the general inflationary conditions operating during the year." The greater part of the 1950 exchange profits was retained by overseas subsidiaries and as the company does not provide for taxation on these gains until they are transferred, the provision for British taxation has actually fallen from £4,339,565 to £3,234,986. It is emphasised that retentions by subsidiaries, which total £6,394,488, against £2,924,285, and which include exchange gains of £2,795,121, against £566,970, are not freely available for distribution through the parent company's account; exchange controls restrict the transfer of cash and goods within the group and the capital needs of subsidiaries have to be met from profit retentions. The parent company's earnings cover on the ordinary dividend is, however, over £2,000,000, so that the company's dividend policy appears to be weighted on the side of caution.

	Years to Dec. 31, 1949	1950
Consolidated earnings:—		
Trading profit	13,133,612	15,546,151
Total income	13,426,858	15,933,292
Depreciation	741,620	823,268
UK Taxation	4,339,565	3,234,986
Group earnings for ord. stock	3,155,706	5,888,011
Ordinary dividends	1,014,062	986,406
Ordinary dividends (per cent) ..	12½	12½
Retained by subsidiaries	2,924,285	6,394,488
Added to general reserves and carry forward	1,631,303	1,654,982

Cons. balance sheet analysis:—

Fixed assets, less depreciation ..	7,885,906	8,819,471
Net current assets	36,410,920	42,560,939
Stocks	35,785,855	39,876,780
Cash	3,709,830	5,611,649
Reserves	25,437,947	32,628,628
Ordinary capital	14,750,000	14,750,000

£1 ordinary stock at 65s. 7½d. yields 13 16s. per cent.

The ploughing back of profits has, of course, strengthened an already impressive balance sheet. Reserves are up from £25,437,947 to £32,628,628, while subsidiary companies have reduced bank overdrafts from £1,109,848 to £953,485. Investment in current assets may partly explain the decision to buttress reserves, for stocks are higher at £39,876,780, against £35,785,855, rather as a result of a rise in raw cotton and yarn prices than of any increase in physical quantities, and trade debtors have risen from £5,157,118 to £7,275,899 as a result of higher sales turnover. The strength and comparative liquidity of the balance sheet and the good profit figures will not make ordinary shareholders in any way sceptical about the future profitability of the group, but they will hope—and the low yield suggests that these hopes are not dead—that the board will modify its ultra conservatism in the matter of dividends and distribute a slightly larger slice of the cake.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 2, 1951, total ordinary revenue was £67,122,000, against ordinary expenditure of £76,382,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £1,550,000 the surplus accrued since April 1, 1951, is £18,845,000 compared with a surplus of £27,606,000 for the corresponding period of the previous year.

COMPANY MEETINGS

UNION CORPORATION, LIMITED

SATISFACTORY FINANCIAL POSITION

REVIEW OF GOLD-MINING AND OTHER INTERESTS

The ordinary general meeting of shareholders in Union Corporation, Limited, was held in Johannesburg, Mr P. M. Anderson presiding. The chairman said:

Our gross profit for the year was £1,519,366. Revenue from dividends and interest rose by £318,714 to £1,408,706. This increase was more than offset by a fall of £348,345 to £110,660 in net realised profits on shareholdings, fees and sundry receipts, after charging expenses. These net realised profits fluctuate in accordance with market conditions and with the financial policy of the Corporation and it is satisfactory that the more stable dividend income now represents such a considerable proportion of the total revenue.

Largely as a result of unilateral relief which was accorded to the Corporation under the United Kingdom Finance Act, 1950, the amount of United Kingdom income-tax and profits tax charged on profits for the year was substantially less than for the previous year, and as a consequence the net profit after taxation increased by £96,249 to £927,319. Out of this profit your directors have considered it desirable to appropriate £300,000 to exploration reserve which, after deducting £193,930 actually spent on exploration during the year, now stands at £366,575. As will be seen from the report, the Corporation is still actively engaged on prospecting and substantial provision on this account is therefore required.

Dividends totalling 6s. per share free of United Kingdom income-tax, the same rate as last year, have been paid and absorbed £558,000, leaving £282,327 to be carried forward to the new account, compared with £213,008 brought forward from 1949.

The Corporation's financial position at the end of the year was satisfactory; the balance of debtors and cash assets after deducting current liabilities and provisions as shown in the balance-sheet was £1,666,650.

WITWATERSRAND

The tonnage milled in 1950 by the Witwatersrand gold mines increased by over 2,500,000 tons to 59,515,200 tons, and as the increased price of gold of 248s. 3d. per ounce fine was received for the output over the full year, the working revenue at £139,491,029 was £28,873,593 more than in 1949. Working costs totalled £87,956,643, so that the working profit was £51,534,386, which is £17,584,593 more than for the previous year. In addition, the sum of £2,123,547 accrued to the industry from sales of gold at enhanced prices for industrial and artistic purposes.

After appropriating over £6,000,000 for capital expenditure and other items and after providing for payments to the Government, dividends distributed to shareholders totalled £24,700,000, or an increase of just over £8,000,000 compared with the previous year. It is estimated that taxation and share of profits payable to the Government will amount to £22,500,000, an increase of £10,750,000. Notwithstanding the substantial share of the profit which the State already takes, in March of this year the Minister of Finance announced his intention of restoring the formula tax to the 1947 level. The effect of this is to increase the rate of the formula tax by 5 per cent. as from January 1, 1951.

The money value of the output, the work-

ing profit, and the total dividends distributed to shareholders in 1950 are the highest achieved in the history of the Witwatersrand goldfields. Unfortunately, it appears doubtful whether these records can be maintained for the present because of the contraction in the supply of native labour and the rising costs of goods and services. The

issue of Ordinary shares in which your Corporation will participate.

EXPLORATION

Particulars are given in the directors' report of the principal exploration ventures which are being carried out by your Corporation through its subsidiary companies, and I

CROWN MINES LIMITED

DEVALUATION BENEFITS OFFSET BY RISING COSTS

SATISFACTORY ORE RESERVE POSITION

MR W. H. A. LAWRENCE'S ADDRESS

The annual meeting of Crown Mines Limited, was held on May 30th in Johannesburg.

Mr W. H. A. Lawrence, the chairman, who presided, said, due mainly to the higher price received for gold since devaluation on September 19, 1949, and also to additional income received from sales of gold at enhanced prices for industrial and artistic purposes, the revenue of the gold-mining industry in the year 1950 had been the highest ever recorded in the history of gold-mining in South Africa.

Monthly working profits of the industry, although also totalling a record amount for the year, had declined seriously as the result of a steady and material increase in working costs. After averaging 26s. 3d. per ton milled for the quarter immediately prior to devaluation, working costs had increased to 28s. 6d. in the last quarter of 1949 to 30s. 5d. in the last quarter of 1950 and to 31s. 1d. in the first quarter of the current year.

Unless that upward trend of working costs could be halted, benefits resulting from devaluation would soon disappear and the industry might again experience the difficult conditions which had prevailed as recently as 21 months ago.

COST RISE CAUSING CONCERN

At the company's mine, revenue for the year had been the highest recorded with the exception of the years 1940 and 1941. Excluding results for the five years immediately prior to devaluation, working profit had, however, been the lowest since 1932.

Considering that the mine had been in production since 1897, and that the average depth of the present main workings was about 8,000 feet that was not entirely unexpected, but the rate at which, and the extent to which working costs had risen since devaluation was causing concern. One of the benefits of the higher price of gold was that it rendered economical the mining of certain ore previously below the pay limit. While the consequent increase in the quantity of ore available made it easier to maintain a high rate of milling and, therefore, to keep the cost per ton milled down, the lower value of ore mined resulted in an increase in the cost per ounce of gold produced depending on the extent of the fall in the grade of ore milled. At the company's mine, working costs per ounce of gold produced had since devaluation increased by about 29 per cent., of which 9 per cent. was due to the decrease in yield. Of the additional revenue of 75s. 9d. an ounce accruing to the company as a result of devaluation, 44s. 9d. had, therefore, already been absorbed by increased working costs.

ORE RESERVE POSITION

Last year, he had explained why it had not been possible to develop sufficient payable ore to replace that mined from reserves and he had stated that the ore reserve ton-

nage was likely to decline for the next two or three years. He had added that thereafter future prospects would be governed by the percentage payability of the Main Reef Leader in unexplored areas below the existing workings due to the improvement in the average numbers of both European and non-European employees. During 1950 it had been possible to increase reef development by 23,931 feet to a total of 72,752 feet. Although there had been a slight decline in the value and percentage of payability of the Main Reef Leader in the central section of the mine, disclosures generally had been satisfactory, particularly in the western section. Including small tonnages again opened up on the Main and South Reefs in the upper levels, total ore developed had been 436,700 tons more than in the previous year, but 386,300 tons less than the tonnage mined from payable reserves. After allowing for certain other adjustments, the available ore reserve at the end of the year had been estimated to be 9,212,000 tons valued at 4.5 dwt per ton. That represented a decline of 323,000 tons from the previous year's figure, which in all circumstances could be regarded as satisfactory.

EXPLORATORY OPERATIONS

As a result of intersection early in 1950 of a strike dyke at depths exceeding 9,000 ft. in the south-eastern portion of the mine, sinking operations had been suspended in R.1, 2 and 3 sub-incline shafts pending the outcome of investigations into the extent of intrusion and its effects on reef formation. In the latter part of 1950 a winze below R.2 incline shaft passed through the dyke, which had an apparent thickness of about 500 ft. As the ground to the south of the dyke had been badly broken, the crosscut had been advanced to less disturbed ground, where drilling had been undertaken to establish the position of the reef. In one of those boreholes a reef, believed to be the Main Reef Leader, had been intersected at a vertical depth of 250 ft. below the crosscut equal to about 9,500 ft. below the surface assaying 10.4 dwts. over a true width of 18 in. The reef had been thrown down several hundred feet and exploratory operations were continuing to determine more fully the displacement and value of the reef in the area.

During the first four months of the current year, working profit had amounted to £466,369 and additional revenue from sales of gold at enhanced prices to £131,404.

In regard to the item of special business mentioned in the notice convening the meeting, shareholders would be asked to pass a special resolution altering certain of the company's Articles of Association, the main purpose of which was to bring them into line with modern practice and Stock Exchange requirements. Those alterations had been approved by the Johannesburg and London Stock Exchanges.

The report and accounts were adopted and the special resolution passed.

LISBON ELECTRIC TRAMWAYS

SIR HUGH O'NEILL'S REVIEW

The annual general meeting of Lisbon Electric Tramways, Limited, will be held in London on June 27th.

The following is an extract from the statement of the chairman, The Rt. Hon. Sir Hugh O'Neill, Bt., P.C., M.P., circulated with the report and accounts for the year 1950:—

It is with deepest regret that I have to refer to the recent death of His Excellency Marshal Carmona, the President of the Portuguese Republic. He had been President for nearly 25 years and was held in the greatest affection by all his people. During this period Portugal enjoyed orderly Government and achieved stability. He did much to foster and extend the good relations which have always existed between his country and its oldest ally, Great Britain.

The number of fare-paying passengers carried by the company's services continues to increase and reached the record number of 308,007,979, an increase of nearly 14 million, or 4.7 per cent. compared with the year 1949. The company's vehicles carry each day more than the total population of Lisbon, a feat probably unique in public passenger service operation.

Besides contributing the sum of £198,447 to the Municipal Revenue of Lisbon and £109,467 in Portuguese State Tax, the company also provides free travel facilities for various uniformed services. These account for about 11 million journeys a year in addition to the figure mentioned above and converted into money would represent approximately £100,000.

PROFIT AND DIVIDEND

The final result of the year's operations is that the net profit of £70,390 shows an increase, compared with 1949, of £3,084. This profit, together with the balance of £41,197 brought forward from last year, gives a total of £111,587. The preference dividend and the ordinary dividend of 5 per cent. net for the year absorb £61,595, leaving to carry forward to 1951 a balance of £49,992. Capital expenditure during the year on six new double deck buses, 10 closed trailer tramcars and expenditure on general plant and equipment amounted to £66,456.

Last year reference was made to the project of an underground railway in Lisbon. The latest information regarding this is that technical studies by the underground company's engineers continue but the constructional work has not commenced.

It is only by planning well ahead that demands can be met as they arise. Mr J. P. Thomas, M.I.E.E., who visited Lisbon in 1949, to report on the Metropolitan project, has recently been to Lisbon at our request in order to study the traffic problem there and to report to the company on the best methods to be adopted to improve and extend our services.

A request for an increase in wages was received from our workpeople, and negotiations with the authorities have resulted in the increase being made effective as from January 1, 1951.

Our general manager, Mr James Ramsay, C.M.G., O.B.E., was taken seriously ill in the middle of the year and resigned from the positions of general manager and chairman of the board of the C.C.F.L., as at December 31, 1950. Mr Ramsay has been succeeded in these positions by Mr Reginald John Smith, who has had many years business experience in Portugal and South America.

CITY DEEP LIMITED

INCREASED WORKING PROFIT

HEAVY CAPITAL EXPENDITURE ENVISAGED

NEED FOR CONSERVING RESOURCES

MR W. M. FRAMES' REVIEW

The annual meeting of City Deep Limited, was held on May 30th, in Johannesburg.

Mr W. M. Frames, acting chairman, who presided, in moving the adoption of the report and accounts, said the price received for gold had remained unchanged throughout the year at 248s. 3d. per ounce fine. As a result of that higher price and of the greater efficiency and increased tonnage which had been attained since the acquisition of Nourse Mines property, there had been a net increase in the working profit of 4s. 11d. per ton milled, although working costs had risen by 3s. 4d. to 39s. 2d. per ton milled.

In spite of a continued shortage of both European and native labour, ore milled at 1,962,000 tons had represented an increase of 135,000 tons over the figure for 1949 the improvement being mainly accounted for by an increase of 95,038 in the tonnage which had been drawn from surface dumps. Increased revenue received as a result of the higher price of gold had made possible a reduction in the pay limit and there had been a consequent decrease of 0.298 dwt. to 4.269 dwt. in the average yield per ton milled.

UNAPPROPRIATED BALANCE

Working profit for the period under review, after placing £878 to abnormal costs reserve, had amounted to £1,455,203. To that figure had been added a net credit of £14,185 being the difference between sundry items detailed in the income and expenditure account, making a total profit of £1,469,388, which together with the unappropriated balance of £467,807 brought forward at the beginning of the year and £12,700 withdrawn from shareholders contingency reserve, had made a total of £1,949,895. From that sum appropriations of £562,635 for taxation, £12,748 for forfeited dividends refunded and £709,391 for two dividends of 3s. 6d. each had been made, leaving an unappropriated balance of £665,121 to be carried forward to the current year's accounts. That unappropriated balance had been represented by cash assets (including shares, stores, sundry debtors and payments in advance), deposits, cash and gold on consignment totalling £2,636,948 less current liabilities, provisions and abnormal costs reserve amounting to £1,971,827.

After allowing for sales of equipment and property totalling £4,617, net capital expenditure during the year, including an adjustment of £588 in respect of the cost of the acquisition of Nourse Mines property, had amounted to £92,798. That left capital funds totalling £181,924 to be carried forward to the current year.

POSSIBILITY OF LOWER DIVIDEND

At the annual meeting last year, shareholders had been informed that capital expenditure during 1950 might amount to £258,000. Due to delays in delivery of equipment and the consequent slowing up of the programme for sinking and equipping the sub-incline shafts, expenditure had been considerably less than anticipated and had been incurred mainly in respect of the construction of new buildings and of extensions and renovations of existing buildings and to two reduction plants; winding equipment, power supply and cutting of engine chambers

for K1, K2, K3 and 3E sub-incline shafts; pumping stations on the 45th and 48th at the 3D and 1E sub-incline shafts and a water column and power cables in the 3D sub-incline shaft between the 37th and 48th levels. Much of the equipment and material which was due for delivery during 1950 would, however, become available during the current year and it was now estimated that capital expenditure to be incurred during 1951 mainly on the equipping of the K sub-incline shafts would be of the order of £650,000. Appropriations from profits, together with funds on hand at the end of 1950, should be sufficient to enable the company to meet that heavy capital expenditure from its own resources without necessity for increasing the issued capital. Shareholders must expect, however, that dividends might be on a somewhat lower scale during the next year or two compared with the high level which had been attained during 1950.

INCREASED DEVELOPMENT

Footage developed during the year totalled 59,720 ft., which had represented an increase of 2,548 ft. over the figure for 1949, 24,785 ft. had been sampled, of which 11,925 ft., equivalent to 48.1 per cent., had been classed as payable with an average value of 15.9 dwt. over a channel width of 24 in. Increased development had been carried out on the lower-grade South and Main Reefs in the upper levels of the mine, and that work which would be continued during the current year would have the effect of further reducing the grade of ore developed. Meanwhile, new sub-incline shafts were being advanced below the 8,500 ft. horizon to permit of more extensive development in the lower levels of the western part of the mine. The Main Reef Leader had contributed 70.7 per cent. of payable disclosures, and only in the vicinity of the 1F incline shaft had exposures on that reef been generally poor. Exposures on pyritic quartzites had continued to be disappointing and virtually no payable tonnage had been disclosed. Estimated payable ore developed had amounted to 1,071,800 tons of an average value of 5.6 dwt., which was 28,800 tons and 0.4 dwt. less than the corresponding figures for the previous year.

The available ore reserve had been re-estimated as at December 31, 1950, to be 6,012,000 tons, averaging 5.8 dwt. over a stoping width of 42.6 in. That was an increase of 35,000 tons compared with the ore reserve at December 31, 1949, the value being lower by 0.1 dwt. and the stoping width 0.6 in. greater. Tonnage contained in the shaft and safety pillars, which was not at present available for stoping had remained the same at 881,000 tons of an average value of 5.8 dwt.

During the first four months of the current year working profit had been £334,625, additional revenue from sales of gold at enhanced prices had amounted to £92,006, making a total working profit of £426,631.

The special business to be transacted at that meeting was in connection with the alteration of certain of the company's articles of association in order to bring them into line with modern practice and Stock Exchange requirements.

The report and accounts were adopted and the special resolution passed.

HALL TELEPHONE ACCESSORIES

IMPROVED PROFIT

The twenty-third annual general meeting of Hall Telephone Accessories, Limited was held on June 1st in London, Major The Hon. Oscar M. Guest (the chairman) presiding.

The following is an extract from his circulated statement:—

The profit and loss account shows a net trading profit for the current year of £62,375, which compares with £56,209 for the previous year. Although the profit result shows an improvement of £6,166 over the previous year, this is offset by an increase in taxation liability. Your board, however, feel justified in recommending a dividend of 10 per cent. (less tax) for the year.

During the past year, the company has executed further important orders for coin-collectors and stamp machines for the British Post Office and a large coin-collector order for the Argentine. We have also received orders for telephone equipment from a number of other administrations for export.

Our office machinery business has shown considerable expansion. During the year our research department has been very busily engaged on important development work and has, in addition, undertaken development contracts for certain of the Ministries, which should lead to an expansion of our business. We have also widened our field in the manufacture of certain delicate scientific instruments.

With regard to the future, while I think we may look forward to the coming year with reasonable confidence, it must be borne in mind that the material position is becoming increasingly difficult and liable to hinder our production and activity.

The report was adopted.

ENGINEERING COMPONENTS

SUBSTANTIALLY IMPROVED RESULTS

The sixteenth annual general meeting of Engineering Components Limited, was held on June 5th in London, Mr C. C. Griffith, M.C. (the chairman), presiding.

The following are extracts from the chairman's circulated statement:

The combined profits, before tax, amounted to £414,779, compared with £253,804 for 1949, and there is left £186,670, being the net profit for the year.

It is proposed to pay a final dividend of 20 per cent. and a bonus of 10 per cent. (both less tax) for the year, making a total of 40 per cent., and to carry forward £59,850 against £38,903 brought in.

Our export trade continues to expand, and we are striving to build up connections that should assure us a place in these markets when conditions change to a buyers' market.

The help that the Gasket factory has received from Abergavenny has added materially to our service, and I am hopeful that in due time we shall reap our just reward from this enterprise.

Our subsidiary company, domiciled in Brisbane, Queensland, has expanded rapidly, and should become a most useful adjunct to our group.

The present inflationary movement now taking place is causing, I am sure, the gravest concern to all connected with industry, and especially the motor industry, and as a result, we may find in the not far distant future that our goods are costed out of world markets.

It does seem reasonably safe to prophesy, however, that provided we are able to buy our raw materials at economic prices, and there is no substantial increase in labour rates, your company can look to the future with confidence.

The report was adopted.

DE BEERS CONSOLIDATED MINES, LIMITED

(INCORPORATED IN THE UNION OF SOUTH AFRICA)

RECORD DIAMOND SALES

SIR ERNEST OPPENHEIMER'S SPEECH

The sixty-third ordinary general meeting of De Beers Consolidated Mines, Limited, was held on June 5th at Kimberley, South Africa.

Sir Ernest Oppenheimer, the chairman, in the course of his speech, said:—

The year 1950 was a prosperous one for the diamond industry as a whole and your company shared fully in that prosperity. Gem and industrial stones were in good demand throughout the year and sales reached the record level of approximately £51,000,000, which compares with the previous record of £38,000,000 established in 1948. It should be realised, however, that the quantity of diamonds sold during 1950 was not appreciably greater than the quantity sold during 1948, and that the substantial increase in the sterling yield from sales in 1950 was almost wholly due to the devaluation of the pound sterling in terms of the dollar in September, 1949.

One of the main factors contributing towards the continuing prosperity of the diamond industry is, undoubtedly, the harmonious relationship that exists between the principal producers of stones throughout the world and others interested in the trade. Under the agreements that exist and which have a currency of six years as from January 1, 1950, production and trading are proceeding most satisfactorily.

DEMAND MAINTAINED

During the first five months of the current year the demand for both gem and industrial stones has been well maintained, with sales at an even higher level than they were during the same period last year. The present outlook is encouraging and 1951 sales may well equal or somewhat exceed those of 1950.

But I would like to sound a note of caution. We are living in uncertain times and our business is particularly sensitive to world events. As you know, our policy aims at the permanent welfare of the industry and we refuse to be led astray by boom conditions, but follow a conservative price policy. The result is that diamonds are nowadays considered a good hedge against currency depreciation and some hoarding of diamonds takes place, thus augmenting for the time being the volume of gem sales. Then again, our industrial sales include considerable purchases by the American authorities for stockpiling purposes. With the return of more normal times, stockpiling will cease, and the hoarded gem diamonds may be resold.

TAXATION BURDEN

I wish to make a special appeal to the Minister of Finance to be mindful of these factors when assessing the permanent tax that can be reasonably imposed on us.

For a number of years representations have been made to have the special levy which was imposed during the war, and which was intended to play a comparable role to the excess profits tax, removed, and a comprehensive case was submitted to the Income Tax Enquiry Committee. The Committee's report has not yet been issued.

In the recent budget the special war levy of 2s. 8d. in the £ was indeed removed, but in its place the normal tax was increased from 4s. 6d. to 8s. in the £, an increase of 3s. 6d.

The net result is that our tax liability has been increased by 10d. in the £ and our present taxation is only 6d. less than the highest rate imposed during the war.

We are the only industry not relieved from war taxation and taking the 10 per cent. export tax into account we are more heavily taxed than any other industry in the Union.

GREATER THAN INDUSTRY CAN BEAR

Surely it is not equitable to impose war taxation on diamond mines in peacetime. The burden is far greater than the industry can bear in normal times, when with this imposition neither the Premier nor Jagersfontein Mines would give us a reasonable return on the large sums provided for their development and equipment, and a mine like Koffiefontein (unless our sampling work exceeded all expectations) would be relegated to the category of mines "too rich to ignore and too poor to work." We look upon the present taxation as temporary, necessitated by emergency conditions, and accept it as such.

But I can only express the hope that the report of the Income Tax Enquiry Committee will be favourable, that it will receive the sympathetic consideration of the government and that the diamond taxation will be reviewed in the next budget.

PREMIER DIAMOND MINE

One of the features of the diamond industry during 1950 was the resumption of large-scale operations at the Premier diamond mine near Pretoria. Shareholders are aware that this company has a very large interest in the Premier company, amounting to about 91½ per cent. of the issued preference share capital and approximately 98 per cent. of the issued deferred share capital. The Premier mine has increased its scale of operations since the end of 1950 and will shortly be producing to the full capacity of the new plant which has been brought into commission in stages over a period.

Your company has also a very large interest in The Consolidated Diamond Mines of South-West Africa, Limited. This interest was increased during 1950 by purchases of both ordinary and preference shares and at the close of the year totalled approximately 91 per cent. of the issued ordinary share capital and 12½ per cent. of the issued preference share capital. Since the close of the year an offer has been made to the holders of the balance of the ordinary shares in the consolidated company, not held by your company, to exchange their shares in the ratio of 100 ordinary shares in the consolidated company for 125 deferred shares in your company.

HELP FOR INDUSTRIES

The strong financial position to which your company and its associated companies have attained has made it possible to place a very large sum at the disposal of De Beers Industrial Corporation. This, in turn, has enabled that Corporation to take its full share in the provision of additional funds required to finance the ever-expanding business of African Explosives and Chemical Industries, Limited. Furthermore, the Corporation has thereby been able to take advantage of oppor-

tunities that have occurred to transact profitable business in other directions.

A noteworthy part has been played by De Beers Industrial Corporation in the underwriting of capital issues made by certain companies mentioned in the directors' report. Similar opportunities for profitable investment continue to present themselves.

In this way your company, through its dominant interest in De Beers Industrial Corporation, is able to pursue its traditional policy of assisting in the development of various carefully selected enterprises in Southern Africa. The fruits of this progressive policy will, we confidently expect, be reflected in due course not merely in your company's accounts but also in the progress of a number of important national industries.

DIVIDENDS AND DIRECTORS' REMUNERATION

I would now offer some comment on your company's dividends. The normal preference share distribution totalled £1 per share for the year. Dividends on the deferred shares totalled 5s. 6d., an increase of 1s. per share on the 4s. 6d. declared in respect of the year 1949. These dividends were paid out of the profits remaining after appropriations had been made, not only for all foreseen future capital expenditure requirements, but also for additional share acquisitions arising out of the reconstruction of the capital of certain of our selling companies (as explained in the directors' report). A certain amount of capital expenditure is normal each year, but these heavy appropriations should not recur; and if the prosperity of the diamond trade continues, it is self-evident that increased dividends can be expected in respect of the current year.

In terms of Clause 82(j) of the Company's Articles of Association, the directors are entitled to additional remuneration over and above the ordinary fees provided for in Clause 82(i) of the Articles. Such additional remuneration is defined as a sum equal to 5 per cent. of the dividends on deferred shares declared and paid in respect of each year, in excess of a dividend or dividends on deferred shares equal to the total sum of the paid-up capital of the said deferred shares.

BOARD'S DECISION

It will be seen from the accounts before you that the total dividends declared and paid on the deferred shares in respect of the year 1950 amounted to £4,385,346. This sum exceeded the issued paid-up capital in deferred shares, amounting to £4,002,203, by £383,143. In the form of additional remuneration the directors have received the sum of £19,157, this being equal to 5 per cent. of £383,143. It is apparent that, if the dividends on the deferred shares should in future exceed the total of the 1950 deferred share dividends, considerable additional remuneration would accrue to the directors. Your directors are of the opinion that additional remuneration in excess of the sum of £20,000 would be disproportionate to the other costs of administration of the company. Accordingly, the directors have agreed unanimously among themselves that any additional remuneration accruing to them in terms of the Articles should be limited in any one year to the sum of £20,000.

TRIBUTE TO EXECUTIVE AND STAFFS

Before concluding my remarks, I wish to express our appreciation of the work done throughout the year by the consulting engineers, the general manager, the secretary, the chief accountant, and their staffs; and also the secretary and staff of the Diamond Corporation Limited, who have carried out their duties to the satisfaction of the board.

The report was adopted.

RAND MINES LIMITED

A SUCCESSFUL YEAR

DEVALUATION BENEFITS OFFSET BY RISING COSTS

WIDESPREAD INVESTMENTS

MR W. H. A. LAWRENCE'S SURVEY OF ACTIVITIES

The annual meeting of Rand Mines, Limited, was held on June 1st in Johannesburg, Mr W. H. A. Lawrence, the chairman, presiding.

The chairman, in the course of his speech, said that the company had had a successful year, dividend receipts attaining the record figure of just over £1,125,000 and total revenue at over £1,340,000 being one of the highest figures recorded during the 57 years of the company's existence.

Profit earned by the company during 1950 had amounted to £1,112,575, representing an increase of £162,513 compared with the previous year. The main source of income—namely, dividends received, had increased by £175,477. Administration and other expenses had increased by £15,528. Dividends declared had increased by £215,099 to £752,848. The sum of £100,000 had been appropriated to the credit of the exploration reserve account which, after deducting expenditure of ventures totalling £30,738, had thereby been increased to £337,197. After making those and other appropriations and details in the accounts, the sum of £227,233 had been added to the unappropriated balance, which had stood at £1,640,937 at the end of the year.

The beneficial effects of devaluation in September, 1949, on the South African gold-mining industry were reflected in the results for 1950—the first full year of operations under the changed conditions. Further benefit had been obtained by selling gold at enhanced prices for artistic and industrial purposes. Consequently, although the Witwatersrand gold production had decreased by 28,490 oz. to 11,185,222 oz. revenue had reached the record figure of £141.6 million and profits had increased by £18.6 million to £53.7 million, which had also been a record. The major portion of the increase in profits, however, had accrued to the state by way of taxation and lease consideration, which had totalled about £22.6 million in 1950, an increase of £10.6 million compared with the previous year. In spite of that the rate of taxation had been increased for 1951. Working costs had continued to rise and were overhauling the advantages of devaluation all too rapidly. Devaluation had resulted in an increase of 75s. 9d. per ounce in the price of gold, but due to the lower grade of ore mined the cost of production per ounce had increased by 6s. 8d. and due to higher operational costs by 26s. 10d., which had represented an overall increase in working costs of 33s. 6d. per ounce during the period September, 1949, to April, 1951. More than 44 per cent. of the advantage gained by devaluation had, therefore, been absorbed in the short period of twenty months.

SERIOUS IMPACT OF RISING COSTS

That rapid whittling down of benefits of devaluation by continually increasing working costs was not only of serious consequence to the producing mines, but also to the new mines which were being opened up on the West Wits line at Klerksdorp and in the Orange Free State. Costs had increased due to many factors, such as improved wages and conditions of employment, the steadily increasing cost of living allowances, higher prices of stores, foodstuffs and power, increased silicosis charges and increased

railage charges. The impact of those increasing costs on the gold-mining industry was threefold: production costs were steadily rising, the amount of money tied up in stocks of stores was mounting and the capital cost of bringing a mine to production was outstripping all preconceived ideas. In addition, recent and material increases in the prices of such basic commodities as maize and steel would inevitably lead to a further increase in the severity of the general cost spiral.

INCREASED TAXATION

It might well be that those factors and their likely outcome had influenced the Minister of Finance in making his recent Budget proposals and which had led him to increase the rate of taxation payable by gold-mining companies during 1951 in order to offset the effect of decreasing profits. Once again, therefore, the gold-mining shareholder was faced with the prospect of being squeezed between rising costs and increasing taxation. Such conditions would not encourage the flow of capital which was so essential to the development of the industry and the country; and while the Government had our full support in efforts to obtain a more realistic price for gold, it was felt that more determined efforts should be made not only towards halting inflation but also towards counteracting the effects of such inflation as was inevitable under existing world conditions. A tight rein must be kept particularly on basic commodity prices, on transport costs and wages, and every effort must be made to utilise the country's resources to better advantage by increasing efficiency and the volume of trade.

COAL

In the coal-mining industry, total production had reached a record level in 1950 under increasingly difficult conditions, but, nevertheless, output had been well below capacity in the case of the majority of collieries. In addition to increasing production costs, the main difficulties facing the industry were those of prices and transport. The majority of inland prices were to all intents and purposes frozen at the 1938 levels, and the collieries were, therefore, becoming increasingly dependent upon a higher-priced export trade to maintain profitable operations. Some indication of the importance of the export trade could be obtained from the fact that although only 7½ per cent. of the output of the Transvaal collieries had been shipped during 1950, more than half the profit earned by those collieries came from that source. In course of mining, coal of various sizes is produced. The large sizes of coal were required principally for export for railways and to a lesser extent by certain industries. The small sizes of coal were consumed mostly by South African power stations and industrial concerns, the demand from which was increasing rapidly and was already out of proportion to the amount of small coal derived from the run of mine production. Inadequate railway, transport and shipping facilities precluded the sale of sufficient large coal to restore the balance, and the Transvaal collieries had now to crush coal in order to meet demand for small coal. Unlike the position in other countries, however, small coal commanded a lower price than large

coal in South Africa, so that not only did the collieries have to bear the cost of crushing, but also they received less revenue. In addition, the output of the collieries was limited by the very restricted amount of railway transport available, with the result that during April, 1951, two collieries, in which the company was principally interested, worked—like the majority of producers—to only two-thirds of capacity.

CEMENT

A somewhat similar position existed in the cement industry, where rising costs were to a small extent offset by increased production which had reached a high level in 1950. Demands were steadily increasing and extensive programmes of expansion were making good progress. Although the present capacity of the industry was not yet adequate to meet the country's demands, producers were not able to work to capacity due to insufficient railway trucks and tarpaulins to cover them. The company also had material holdings in concerns manufacturing cement pipes and other cement products, bricks and tiles and steel pipes. Those companies had had successful years, but outputs had been limited to a certain extent by the cement position and to a material extent by the shortage of steel plate. That shortage of steel plate had in recent months become acute, but it was hoped that it would be eased during the course of the next few months as output from the Vanderbijl mills increased.

TIMBER

In the timber trade, forestry, sawmilling and mining timber concerns in which the company was interested had had a successful year in spite of the material increases in production costs and they had continued to expand, such expansion being encouraged by the high cost of imported timber and the substantial advance in shipping rates. Stocks of mining timber had, however, from time to time reached dangerously low levels due to the railways' transport difficulties, and that section of the industry was consequently living very much on a hand-to-mouth basis.

RESTRICTING INFLUENCES ON PROGRESS

It was a fortunate fact that South Africa's basic industries were soundly conditioned and undoubtedly had greater potentialities, but those brief observations had, he trusted, made it clear that their progress was being unduly handicapped at the moment by serious restricting influences, not least of which was the railway system whose rate of expansion was lagging behind that of the rest of the country. The gold-mining industry and, therefore, South Africa generally, had already lost much of the benefits gained by devaluation, and there were very real dangers of losing all too rapidly what advantages remained. We must, therefore, press for the earliest possible introduction of a more realistic price for gold and for every feasible step being taken to slow down the inflationary spiral of costs.

COMPANY'S SOUND POSITION

Meanwhile, we could find comfort in the knowledge that the company was in a sound financial position and had adequate cash resources at its command. Its investments were spread over a wide section of the whole field of South African basic industries, and while its major interest continued to be centred in the gold-mining industry, and particularly in the producing mines of that industry, that interest now included substantial shareholdings acquired in recent years in the new developing mines, the producers of the future.

The report and accounts were adopted.

BRUSH ELECTRICAL ENGINEERING

BRUSH ABOE GROUP

CONTINUED PROGRESS

WIDESPREAD MANUFACTURING RANGE

EXTREMELY SATISFACTORY HOME AND EXPORT ORDER INPUT

SIR RONALD W. MATTHEWS ON A DOUBLE DUTY TO THE NATION

The sixty-second annual general meeting of the Brush Electrical Engineering Company, Limited, was held on June 5th at Winchester House, Old Broad Street, London, E.C.

Sir Ronald W. Matthews, D.L., M.Inst.T., the chairman, presided.

The following is an extract from the chairman's statement, which had been circulated with the report and accounts for the year ended December 31, 1950:—

During the autumn of 1950 and the following winter the managing director, Mr Good, has made extensive tours of many of the most important markets in the Commonwealth and in North America. The warmth of his reception was a tribute to the good will enjoyed by the BRUSH ABOE Group throughout the world, but above all it was a personal triumph, and the contacts made during his journeyings will be of lasting value to the organisation.

I am pleased to be able to advise stockholders that the improvement shown in the past three years has continued. At the beginning of the year the major problem was that of maintaining sales at a high level when the postwar "sellers' market" had come to an end and more normal trading conditions were returning. By the close of the year conditions were reversed under the impetus of rearmament and the problem was that of increasing manufacturing capacity to balance a strong order book.

The board have for some time felt that the name The Brush Electrical Engineering Company, Limited, is now by no means descriptive of the wide range of the Group's manufactures. It is not, however, thought desirable at present to change the name of the parent company, but with a view to presenting to the world a more adequate picture of the Group's activities it has been decided to use as a general description of the organisation the words "The BRUSH ABOE Group of Companies." Certain of the companies trading overseas are changing their names to include the words BRUSH ABOE.

The wide range of equipment manufactured by the Group has facilitated a considerable measure of rationalisation of production. The majority of the company's factories are equipped for the building of individual "made to measure" equipment, and it has therefore been convenient to concentrate certain small items suitable for "line" production methods. At the Loughborough factory non-electrical equipment, such as the Petter super-scavange engine and the small engine development section, are being diverted to other factories to provide space for the heavy power station electricals for which this factory is so well known.

RESEARCH

Research and development programmes have been carried through on a wide scale. Methods of increasing pressure charging rates have been investigated and it is hoped that these will result in higher performance and greater reliability of engines. Improvements

have been made in the air-cooled types with a view to enhanced performance on the smaller sizes and extension of air cooling to larger engines. A considerable amount of experimental work has also been carried out on fuel combustion with a view to allowing the use of heavier fuels in a wide range of engine types. The company's laboratory at Loughborough has extended its activity in a number of directions. New X-Ray equipment has been installed for the examination of materials; a tropical chamber has been built and additional high voltage equipment has been installed for the testing and development of insulation materials.

SALES

The input or orders both from the home market and from export markets is extremely satisfactory. The management has always striven to secure at least some sales from even the smallest and remotest markets of the globe in view of the dangers inherent in a dependence on a few large markets, and it is encouraging to see the network of agents increasing under the intensive efforts of the export companies.

The distribution of engines has been improved and service facilities have been extended throughout the world. The recent influx of orders from overseas markets has proved the wisdom of pursuing a determined export sales policy.

Associated Tube Wells Limited has obtained contracts from the three Indian provinces for the drilling of 965 tube wells.

Contracts of this nature are essentially the sale of a service rather than a piece of equipment. The customer, particularly in underdeveloped territories, frequently desires to purchase not a group of machines but a complete installation that will supply him with water, electricity, or oil. These contracts stress the interdependence of the constituent companies of the Group, and only a group of companies such as this can provide from within itself the equipment and technical ability necessary for the operation of such a contract. Similar features can be seen in the combined Group products sold by Brush Bagnall Traction Limited and in the substantial orders recently obtained from the Middle East for the electrification of a number of towns and villages.

To familiarise agents, dealers, and customers throughout the world with the BRUSH ABOE Group, arrangements were made for the production of a Group film entitled *Power*. This outlines the early history and growth of The Brush Electrical Engineering Company, Limited, and then deals with the present-day factories and products of that company and of the four principal oil engine factories. Although primarily intended for overseas, the opportunity has been taken to show the film before important audiences in London and in over a dozen provincial towns. The *première* in London on January 16, 1951, was attended by the Right Hon. G. R. Strauss, Minister of Supply, the Minister of Labour, and by many other

distinguished guests. *Power*, which is a "sound" film, has been translated into three foreign languages and within the next few months will be shown in nearly every part of the world.

STAFF AND TRAINING SCHEMES

Industrial relations continue to be satisfactory throughout the Group, and the established policy of keeping all employees fully informed on current developments through the channels of joint consultation at all levels has been continued. Stockholders will be aware of the difficulties encountered in various parts of the country in the implementation of the last engineering wages award. This was accomplished in the factories of the Group on a perfectly satisfactory basis, due undoubtedly to the progressive approach of factory managements and the co-operation of the trades unions' representatives.

In my last statement to stockholders I indicated the development of training facilities in various directions. The scholarship scheme has now been very broadly extended under the title of the BRUSH ABOE Group Commonwealth Scholarship Scheme. This now offers facilities to young graduates from all parts of the Commonwealth, and in the course of the next few months graduates from Canada, Australia, South Africa, New Zealand, India, and Pakistan will be serving apprenticeships in the various factories.

The Research Fellowship, which enables time-expired graduate apprentices to obtain a higher degree at a British University, was inaugurated in February, 1950. Applications from candidates for the Fellowship to be awarded this year will shortly be invited. It is believed that this period of time spent on research away from the inevitable pressure of industrial life will be of inestimable value both to the successful candidate and to the company.

Two or three years ago when the overseas sales organisation was being developed, it was decided to take steps to ensure that a flow of suitably qualified sales engineers would be made available. Accordingly, the BRUSH ABOE Sales Engineers' Training Scheme was set up and young engineers of high professional qualification were recruited and individual training courses were arranged for them at the various factories. This scheme is enabling the Group to place sales engineers in positions of importance overseas.

I have endeavoured to lay before you a succinct, yet comprehensive account of the activities and developments of the BRUSH ABOE Group and of the parent company during 1950. We can, I feel, look back with considerable satisfaction on the success which has attended our efforts to expand our contribution to the country's overseas trade, particularly in hard currency markets. We have entered upon the current year with a new obligation superimposed on the vital export position—the need to play our full part in meeting the requirements of the Government in connection with the rearmament programme. That we shall not fail in this double duty to the nation I am convinced, although we are fully conscious of the difficulties already arising from shortages of essential raw materials with their inevitable effect on output. In expressing our appreciation of the Herculean efforts of Mr Good and of all those on every rung of the organisational ladder who have loyally supported him during a year of international tension with all its attendant problems, I know you would like me to convey to them your warmest wishes for the continuing success of the undertaking which I am confident they will ensure.

The report and accounts were adopted.

THE UNION-CASTLE MAIL STEAMSHIP COMPANY

UPWARD TREND OF COSTS

SIR VERNON THOMSON ON TONNAGE REPLACEMENT PROBLEMS

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held on June 7th in London, Sir F. Vernon Thomson, Bt., G.B.E. (the chairman), presiding.

The chairman, in the course of his speech, said:—

The report of the directors and the audited accounts of the company for the year ended December 31, 1950, set out clearly the position of the company and of the group as a whole.

The net profit for the year 1950, after providing for debenture interest, depreciation, etc., amounted to £1,478,579—half a million less than for 1949. The net profit for the group, for all services, was £1,576,096. That represents the very moderate return of approximately 8½ per cent. on the real capital of over £19,000,000 employed in the business, namely, share capital, reserves and debenture capital. Our profits are earned by efficient service, modern ships, large turnover and good value given; they are small per unit handled.

The gross earnings of the company and its subsidiaries were somewhat higher in 1950 than in the preceding year, the reduction in profits being in the main due to the substantial increases in running costs. At the annual meeting a year ago I pointed out the serious effect which increases in operating costs would have upon the company's trading for 1950, mentioning in particular the increase in oil fuel prices.

The voyage costs of Union-Castle ships in 1950 showed an increase of more than £1,200,000 over similar costs in 1949. This was mainly accounted for by the increased cost of oil fuel, repairs and maintenance, wages, port charges and cargo handling. Unfortunately, so far from falling, the trend of costs continues definitely upwards.

INADEQUATE WEAR AND TEAR ALLOWANCE

Shipbuilding costs have continued to rise throughout the year; they have risen steadily during the past fifteen years. The national rearmament now planned defers any prospect of early easement. To maintain the company's high standard the regular replacement of older and less efficient ships is essential, and vessels now cost at least three times as much as their forerunners. The Inland Revenue wear and tear or depreciation allowance, which is based upon the original cost of ships, is by itself quite inadequate to provide for the construction of such replacement tonnage; it is thus necessary to make additional provision from revenue for the difference between the Inland Revenue allowance and the actual cost of replacing ships in due course. Only by ploughing back into the business a substantial part of the company's earnings can we provide and maintain the high-class costly tonnage necessary to meet expanding requirements of the trades we serve. The company has three passenger and cargo vessels building at present. Apart from these three, our existing fleet (which includes several vessels built since the war) cost approximately £26,000,000. To replace it at today's prices would cost well over £60,000,000. Replacement in due course of obsolescent ships by new tonnage at the high costs current in these inflationary times is the most serious concern of the British shipping industry today. Some alleviation in the present incidence of taxation on profits retained in the

business and used for building new tonnage in existing conditions is clearly requisite—otherwise the tonnage of the British mercantile marine will inevitably diminish.

One million pounds has been transferred to general reserve, and after payment of the preference dividends and the proposed dividend of 10 per cent. on the ordinary stock, the balance carried forward is increased by approximately £250,000 to £1,925,739.

In recommending a distribution of 10 per cent. (2 per cent. more than for 1949) the directors have had in mind not only the foregoing facts but also the desirability of paying a dividend which, circumstances permitting, they hope to maintain.

FLEET

The company's fleet has been maintained at its usual high standard of efficiency during the year and was operated without serious mishap.

The regular weekly mail service between Southampton and Cape Town was performed throughout the year in accordance with the ocean mail contract with the Union Government.

The company now operates one of the finest passenger liner fleets in the world.

NEW TONNAGE

During the year satisfactory progress was made in the construction of the two vessels which were ordered early in 1950 for the round Africa service. The first of these, the *Rhodesia Castle*, was successfully launched at Belfast on April 5, 1951, by Mrs K. M. Goodenough (wife of the High Commissioner for Southern Rhodesia), who graciously named the vessel. This ship is due to be delivered in September, 1951, and to sail in October in the round Africa service.

The second of the two the *Kenya Castle*, is due to be launched a fortnight hence, when Lady Mitchell, wife of the Governor of Kenya, has consented to perform the naming ceremony; this ship should be delivered about the end of the year for employment in the round Africa service.

These ships will cost well over £2,000,000 each and as a ship has a limited service life we have to provide not less than £100,000 per annum per vessel (and possibly more, dependent upon the course of shipbuilding costs) towards their replacement before any profit is earned out of which to pay interest on the capital employed or to strengthen the company's reserves.

An order has been placed with Messrs Harland and Wolff Limited for a third vessel of the *Rhodesia Castle* type and we hope that she will be delivered well before the end of 1952.

PASSENGER AND CARGO TRAFFIC

The volume of passenger traffic during 1950 was slightly higher than for the previous year, more particularly to and from East Africa, and we trust that the introduction of our fine new one-class vessels in this trade will result in further improvement in our passenger carryings.

The attractions of southern Africa to visitors throughout the year are well known, whilst the round Africa voyage by one of our passenger vessels, with its calls at many interesting places *en route*, provides a pleasant and restful holiday which is becoming increasingly popular.

Coastwise traffic between ports in South and East Africa showed an appreciable increase. To this, the *Bloemfontein Castle*, which has carried large numbers of passengers on excursions between South African ports and Beira, has contributed substantially.

Cargo traffic between United Kingdom/Continent and South and East Africa was variable during 1950. There was a paucity of cargo in the U.S.A./South Africa service.

The Union has achieved remarkable success in securing a closer balance of overseas payments and in advancing the economic well-being of that great country. All sincere well-wishers of South Africa, and especially partners in its progress like ourselves, confidently look forward to still further progress and development.

PORT CONGESTION

During 1950 and since, congestion has occurred at certain South and East African ports, with consequent expensive delays to vessels; the responsible authorities in the territories concerned are fully alive to the necessity for eradicating this serious impediment to the economic development of their respective countries and strenuous efforts are being made to improve facilities in order to ensure a freer flow of traffic.

These improvements in facilities are urgently required to keep pace with the impressive strides which are being made in the development of the resources of the African territories we serve.

RATES OF FREIGHT AND PASSENGER FARES

A year ago I mentioned that the average increase in our passage rates was less than 75 per cent. and in our freight rates less than 100 per cent. above the prewar level. At that time our running costs were over 200 per cent. above prewar. As already indicated, they are still rising rapidly.

The increases which have been taking place in world market rates of freight appear to have led many to believe that liner companies were benefiting correspondingly, but this is not so. Whilst tramp rates of freight on bulk cargoes fluctuate almost daily according to world market conditions, liner companies aim at maintaining stability of rates with regularity of service, irrespective of day-to-day fluctuations; these do not ordinarily follow world market rates but obviously must be at an economic level. In exceptional times like these, the territories we serve benefit especially by this policy. Moreover, from time to time liner companies require to supplement their berth tonnage by chartering tramp vessels and the cost of so doing in present conditions is far in excess of existing liner rates of freight.

The East African Conference, of which this company is a member, increased its rates generally as from March 1, 1951. Although warranted by the substantially higher operating expenses, a world trend today, the South African Liner Conference is the only major conference which has not yet increased its rates of freight. A moderate increase, however, will operate from July 1, 1951.

GENERAL

We are fortunate in our relations with all governmental authorities, notably ministers, overseas representatives and officials, and we are happy to co-operate with them in a spirit of goodwill for the benefit of the peoples and territories with which we are associated.

STAFF

On behalf of my colleagues and myself I should like, as on previous occasions, to express our warm appreciation of the splendid service rendered by the company's staffs in this country, afloat and overseas.

The report was adopted

P. & O. STEAM NAVIGATION COMPANY

THE REPLACEMENT PROBLEM

SIR WILLIAM CURRIE'S VIEWS

The 111th annual general meeting of The Peninsular and Oriental Steam Navigation Company was held on June 6th in London.

Sir William Crawford Currie, G.B.E., the chairman, dealing with the board's reasons for recommending an increased dividend, said that the Government's attempts to stabilise wages and prevent inflation had failed and the board therefore felt it right, on this occasion when profits allowed, to assist deferred stockholders in a modest way to meet the increased cost of living, especially as increases in pay had been given to sea and shore staffs.

Justifying the increased dividend in the face of the difficulty of financing fleet replacement, he said that the spiral of rising costs might well carry the cost of new ships to a point at which some companies might be unable to finance new building, but their difficulties would be enhanced far more by the penal rate of taxation than by modest increases in dividends.

INITIAL ALLOWANCES

The suspension of initial allowances on expenditure incurred after April 5, 1952, had been received with consternation by certain sections of the shipping industry. While the financial position of the P. & O. Group was strong, showing investments of £33 million compared with liabilities of less than £15 million for ships actually under construction, the consolidated balance sheet did not tell the whole story. Seven companies in the group had liabilities for ships under construction exceeding their investments by nearly £2,000,000. These companies had received over £4,500,000 in tax relief on initial allowances. Without that tax relief they would thus have had a deficiency of about £6,500,000. It was evident from those figures how important a factor the initial allowance relief might be in deciding whether or not to replace obsolescent tonnage.

If a business were to remain virile it must be able to make good out of current profits the wastage of capital used in earning those profits. The measure of that wastage was depreciation calculated on the current replacement cost of the assets.

REPLACEMENT COST

The current replacement cost of the fleet was of interest, not so much in its effect on the break-up value of the deferred stock, but in relation to the amount annually required to replace the fleet. If depreciation based only on original cost were charged against profits and the balance distributed, the company could not survive. The additional amounts set aside, although technically reserves, were nevertheless necessary charges against profits. Over the past three years, the amounts set aside by the group for depreciation, as transfers to replacement of assets reserves, and even after charging the tax relief on initial allowances, were less than the amounts required as depreciation based on the replacement cost of the group fleets.

The system of initial allowances was only a palliative and not a solution of how to find funds for fleet replacement. The only suggestion the Millard Tucker Committee could make to meet the situation, however, was an extension of the system; but the announcement of the suspension of initial allowances a few days after the committee had reported, made one wonder if any good at all would result from its appointment.

The report was adopted.

GUARDIAN ASSURANCE COMPANY LIMITED

ANNUAL GENERAL MEETING,
6th JUNE, 1951

EXTRACTS FROM THE DIRECTORS' REPORT—CHAIRMAN: THE RT. HON. LORD BLACKFORD, D.S.O., D.L., J.P.

LIFE DEPARTMENT

Net new sums assured amounted to £6,188,057, the highest in the history of the company, being an increase of £1,671,291 over the previous year of £4,516,766. Claims by death were slightly more than in the previous year but there was a profit from mortality.

The net rate of interest earned on the fund which increased during the year by £1,442,453 to £15,892,511, was £3 18s. 2d. per cent.

FIRE DEPARTMENT

The net premium income at £3,262,895 showed an increase of £389,980 over the previous year and of this figure over £300,000 was in respect of overseas business. The loss ratio at 42.4 per cent. was slightly less than in the previous year. The amount transferred to profit and loss was £381,614.

ACCIDENT AND GENERAL DEPARTMENTS

The net premiums were £3,056,674 against £2,622,961 in 1949. The loss ratio was 52.6 per cent. and the amount transferred to profit and loss £242,213.

MARINE DEPARTMENT

The net premiums amounted to £1,225,529 against £1,021,565 in the previous year and the first year's claims were 27.8 per cent. of the premiums. £180,000 has been transferred to profit and loss leaving the fund at £1,511,835 representing 123.3 per cent. of the premium income.

REDEMPTION ASSURANCE ACCOUNT

A valuation made at the end of the year revealed a surplus of £29,571 of which £15,000 has been transferred to profit and loss leaving the amount of the fund at £2,021,599.

PROFIT AND LOSS

After making full provision for taxation, including that on the profits for the year and transferring £269,668 to a reserve for unpaid capital and £143,141 to general reserve and providing for the final dividend recommended by the directors of 2s. 6d. (less income tax) on each ordinary and staff share and meeting the cost of the preference dividend for the year, the balance carried forward was £257,664.

BALANCE SHEET

A valuation of the Stock Exchange securities was made at December 31st and again showed a surplus over the aggregate value as shown on the balance sheet. The directors recommended that part of the undivided profits of the company be capitalised and that such profits be applied in paying up the balance of 6s. 8d. on each ordinary share, thereby making each ordinary share of £1 fully paid. A reserve has been set up for £414,157, the amount required for this transaction, and of this amount £144,489 has been transferred from the general reserve and £269,668 from the profit and loss account. The general reserve of the "Guardian" now stands at £1,000,000 and that shown in the consolidated balance sheet at £2,604,702.

All the principal classes of insurance transacted; also trustee and executor business.

Head Office:

63, King William Street, London, E.C.4.

UNITED MOLASSES COMPANY LIMITED

INCREASED PROFITS

The twenty-fifth annual general meeting of the United Molasses Company Limited will be held on June 26th in London.

The following is an extract from the circulated statement of the chairman, Sir F. Michael K. Kielberg, K.B.E.:

Last year I mentioned that the profits for the first three months of 1950 compared favourably with the corresponding period of 1949 and that the prospects for the remainder of the year looked promising. As the profit and loss account discloses a gross trading profit of £3,592,941 compared with £2,145,959 and a net profit of £1,215,682 compared with £786,426 for 1949, I think you will admit that the results for the year more than justify the cautious optimism to which I gave expression a year ago.

The substantial increase in the consolidated earnings is partly due to the inclusion for the first time of the earnings of the Anchor Line Limited (£554,961 gross and £117,559 net) but mainly to the increased earnings of our fleet of tankers which reflect the growing benefits the company is reaping from the large investments made since the end of the war in the building of a new fleet and in the reconditioning of old vessels.

The prospects for 1951 are most promising and present indications are that the anticipated prosperity of our shipping companies will be shared by the various other companies in our group. There can hardly be any doubt that present prices are unhealthy and it will be a relief to see prices in the not too distant future recede to a saner and healthier level.

SAN FRANCISCO MINES OF MEXICO

IMPROVED RESULTS

The thirty-eighth annual general meeting of San Francisco Mines of Mexico, Limited, was held on June 1st in London, Mr C. E. Temperley, O.B.E., M.C. (the chairman) presiding.

The following is an extract from his circulated statement:

The operating surplus for the year under review was £2,185,000 against £1,910,000 for the previous year, whilst the net profit after taxes was £818,000 against £628,000. The improvement in the figures for the current year results from a somewhat lower level of metal prices being more than offset by the benefits of devaluation of sterling in terms of dollars and by the increased tonnage milled. The directors recommend the payment of a dividend of 7s. per unit.

In order that the balance sheet should give a better picture of the company's true standing and condition, it is proposed to capitalise £1,028,406 10s. and to apply this sum in paying up new shares in the company and to issue these new shares as a bonus to stockholders in the proportion of one share for each 10s. Stock Unit now held.

During the year under review the mill treated a total of 623,000 tons of ore from the Frisco and Clarines Mines. This is a record annual tonnage and compares with 580,000 tons in the previous year.

Although in the last analysis our net earnings are largely governed by metal prices and taxation, the Mine itself is in good shape and its future seems as assured as can be hoped for in present circumstances.

The report and accounts were adopted and the ordinary resolutions increasing the capital of the company and authorising the bonus issue of shares were approved.

ENGLISH & CALEDONIAN INVESTMENT COMPANY

SATISFACTORY INCREASE IN VALUE OF INVESTMENTS

MR HENRY S. LOEBL'S STATEMENT

The twenty-fourth annual general meeting of English and Caledonian Investment Company, Limited, was held on June 1st in London, Mr Henry S. Loebel (the chairman) presiding.

The following is an extract from the circulated statement by the chairman:

It will be noted that the investments at March 31, 1951, stood in the balance sheet at £1,061,973, compared with £1,005,224 a year previously. The value of the investments at March 31, 1951, was £1,545,830, which showed an appreciation over the book value of £483,857, or of 45.57 per cent., compared with 28.67 per cent. at March 31, 1950, a very satisfactory increase.

The changes made in the company's investments during the year resulted in a surplus which has been added to the contingency fund.

DISTRIBUTION OF INVESTMENTS

The distribution of the company's investments is much the same as in previous years with 87.78 per cent. within the Empire. Of the balance of the company's funds invested outside the Empire almost one-third represents investments in the U.S.A. The investment in our property owning subsidiary company remains unchanged. In the latter part of the company's year, a further property was sold and this, together with the rather heavy repairs effected during the year (to which reference was made in the note to the balance sheet of Encal Estates, Limited, at March 31, 1950) accounts for the reduction in the revenue of that company. Nevertheless, we have received a dividend from Encal of 3½ per cent., which is the same as for the two previous years.

The balance with the company's bankers at March 31st last was down by some £37,000, which accounts in part for the increase in the invested fund at that date. On the other side of the balance sheet it will be noted that general reserve stands at £85,000 following the appropriation of £10,000 from revenue account.

Turning to the revenue account it will be noted that total investment income at £82,644 represents an increase of £10,139 over the investment income for the previous year. After deducting administrative and sundry expenses, directors' fees, debenture stock and other interest, the net revenue for the year was £58,153, compared with £48,411, showing a very satisfactory increase of £9,742. After deducting the charge for taxation and the dividend on the preference stock for the year, the amount earned on the ordinary stock was £23,272 or 21.15 per cent., compared with 16.58 per cent.

DIVIDEND INCREASE

An interim dividend of 3 per cent. on the ordinary stock was paid in October last, and this was followed on April 7th of this year by the payment of a second interim dividend of 7 per cent. As it is not the intention to recommend any further distribution on the ordinary stock for the year ended March 31st last, the total dividend for the year is 10 per cent., as against 7½ per cent. for the previous year. The sum of £10,000 has been transferred to general reserve and there is left a sum of £11,680 to be carried forward.

As regards the results for the current year, I will content myself by saying that, in the absence of any untoward development, we expect them to be at least as favourable as for the past year.

The report and accounts were adopted.

E. POLLARD AND COMPANY

PROMISING OUTLOOK

The thirty-ninth annual general meeting of E. Pollard and Company, Limited, was held on May 29th in London.

Mr H. Edward Pollard, the chairman, in the course of his speech, said:—The profits of the group were £233,687, and after providing for taxation there remained £107,755. Out of this your directors recommend a transfer of £70,948 to reserve.

In April, 1951, a capital dividend of £40,000 was received from a subsidiary company, and after careful consideration your directors have decided not to recommend the usual ordinary dividend for the year 1950, but to recommend that the capital dividend received from the subsidiary company should be distributed as a capital dividend to the ordinary shareholders. This leaves the balance of profit to be carried forward in the accounts of E. Pollard and Company Limited, at £66,409 as compared with £66,208 a year ago. This dividend will be paid without deduction of income tax.

INCREASED DEMAND

During 1950 the demand for our products increased in all sections, although the shopfitting department was handicapped by stringent licence control. During the early months of the year licences were extremely difficult to obtain, and although this situation improved somewhat towards the turn of the year, we were unable to make up what was lost to us.

This control of shopfitting by M.O.W. licences is the most difficult problem we have had to face since the war. Many of our shopfitting licence applications are refused because of the rearmament programme. In 1949 and 1950 refusals were because of the capital expenditure programme, and before that the housing programme. Whatever one may think of these reasons, the fact remains that the shopfitting industry is involved in the complicated machinery of licensing with very little prospect of any relief in the near future.

The display section of shopfitting at our Highbury factory was able to increase its turnover considerably. Increased cost of raw material forced our prices up, but most of the turnover increase was due to new business.

At Walthamstow we have two engineering factories. One making Hammond and Champness electric lifts and Haskins steel shutters. The 21 special lifts at the Ocean Terminal Docks are now in full use and proving most successful, and we have over 700 passenger lifts on hand for 23 of the London boroughs. The export department can claim a very full year on steel shutters as well as lifts, and together with such things as grilles, louvres, and iron doors of all kinds we have a most valuable export market which is continually improving. The home trade in Haskins shutters has also been most encouraging and we are now being specified for nearly all new power stations, wharves, and Government buildings throughout the country.

At our other factory at Walthamstow the architectural bronze work of our subsidiary, The Morris Singer Company, has been developed and increased during the year.

The future prospects of the group are promising and should continue to develop favourably if materials and controls do not cause the position to deteriorate.

Competition is stiffening a little, but we obtain most of our orders not only on the quality of our work but also because of the completeness of our manufacturing facilities.

The report was adopted.

LIMMER AND TRINIDAD LAKE ASPHALT

INCREASED VOLUME OF WORK

The seventy-ninth annual general meeting of the Limmer and Trinidad Lake Asphalt Company, Limited will be held on June 29th in London.

The following is an extract from the circulated statement by the chairman, The Right Hon. Lord Courtauld-Thomson, K.B.E., C.B.:

The trading profit of the company and its subsidiaries amounted to £384,496. This compares with £407,983 for the previous year. After providing £149,443 for taxation and £123,446 for depreciation, the net profit of the group for the year under review amounted to £109,813 against £158,947.

During the year under review, the turnover has increased and, although the work has been carried out at a lower margin of profit, the trading profit shows a reduction of only £6,867. On February 27th we paid a second interim dividend of 10½ per cent., making a total distribution for the year of 13½ per cent. against 10 per cent. in 1949. This is the seventy-ninth successive year in which we have paid a dividend out of the profits earned in each of those years.

The financial strength of the organisation as a whole lies in the somewhat unusual fact that we have no prior charges, mortgages, debentures, preference shares or loans, and our goodwill stands at the nominal figure of £1.

For more than a quarter of a century, at the conclusion of my remarks I have expressed our confidence in the future, and so far our confidence has been justified. Now, in spite of the many world difficulties and problems, I see no reason to depart from my usual fair weather forecast for 1951.

BARTON AND SONS LIMITED

PROGRESSIVE STRENGTHENING OF RESOURCES

The ordinary general meeting of this company was held on June 6th in London.

Mr A. H. Redfern (the chairman) said: It is very gratifying to me that the first accounts which I have the privilege of submitting to you as chairman of your company are so very satisfactory. We have consistently adopted the policy of keeping our plant and equipment completely up to date, and to enable us to do so we have pursued a very conservative dividend policy. The result has been progressive strengthening of the company's resources.

The group trading profit amounts to £494,314 compared with £372,066 for 1949. From this figure must be deducted the colossal sum of £238,653 for taxation, a depreciation charge of £61,436, and other items amounting to £29,647. The net profit remaining amounts to £164,578 compared with £118,509 for 1949.

It has been decided to recommend to you payment of a final dividend of 8½ per cent., making a total of 12½ per cent. for the year, an increase of 2½ per cent., although the profits are sufficient to cover the increased dividend on Ordinary stock 3½ times after making full provision for profits tax.

As to the future, I can only say that our production is at least keeping pace with last year, but along with other companies in the engineering industry we are finding it increasingly difficult to secure the raw material necessary to maintain our plant at full production. Our orders are substantial, and everything possible is being done to maintain maximum output.

The report was unanimously adopted.

SPILLERS LIMITED

SUBSTANTIAL MODERNISATION PROGRESS

DEVELOPMENTS ON NON-MILLING SIDE

MR ARTHUR WHITTAKER'S STATEMENT

The sixty-fourth annual general meeting of Spillers Limited will be held at the Abercorn Rooms, Great Eastern Hotel, London, E.C., on June 29th.

The following is the statement by the chairman, Mr Arthur Whittaker, which has been circulated with the report and accounts for the year to January 31, 1951:—

Personnel.—It is with deep sorrow that I have to record the death of my predecessor, The Rt. Hon. Sir Malcolm Robertson, G.C.M.G., K.B.E., who was chairman of the board from 1930 to 1947. Sir Malcolm rendered distinguished service in many fields and not least to this company, which developed and prospered so greatly under his leadership. I am sure it would be your wish that a message of condolence from the stockholders be conveyed to Lady Robertson.

We are much gratified that the Federation of British Industries should have honoured Sir Archibald Forbes by electing him President. We wish him all success in this high office at a time when industry is called upon to face such exceptional and varied problems.

In the early part of this year two members of the board, Mr W. D. Vernon and Mr H. B. Vernon, visited the United States of America to study the latest developments there in the manufacture and distribution of kindred products to our own. We attach great value to the exchange of views on technical and commercial problems resulting from such visits.

ACCOUNTS

Detailed comments on matters arising on the accounts are contained in the directors' report. The substantial progress made with the present programme for reinstatement, modernisation and development of productive capacity has had the effect of increasing the ratio of fixed to total assets and reducing the liquid balances. This trend will continue as this work proceeds. The conservative policy followed in the past will, we consider, enable this programme to be financed from our own resources (including probable recoveries from war damage claims not yet received) without encroachment upon the existing requirements of working capital. This situation would alter, however, if the existing subsidies on wheat and flour were to be materially reduced since, as I indicated last year, the prices of these commodities are being kept far below their real levels as a matter of Government policy.

The problem of making adequate provision for depreciation, obsolescence and ultimate replacement of fixed operating assets is one which causes concern to most industrial enterprises in these times of rising capital costs and heavy taxation. The method followed by this company is to provide out of profits, firstly, for the writing off of capital expenditure actually incurred on a basis which we consider embraces the obsolescence factor as well as normal wear and tear and, secondly, to take account of the current level of replacement cost. The first part of the provision (in this year £373,000) is written directly off the book value of fixed assets and the second (in this year £187,000) is carried to a special capital reserve which now stands at nearly £2,000,000.

NEW WORKS

For the information of stockholders, I would refer to the major items comprised in the capital outlay during the year. The new Central Laboratory at Cambridge, begun in 1949, has been completed. The original laboratory at Victoria Dock was destroyed by enemy action in 1940, since which date we have been operating in temporary premises, first at Birkenhead and later at Cambridge. The new laboratory has been laid out in the most up-to-date manner and fully equipped for scientific research. We realise that all our products must not only be attractive to the consumer, but they must at the same time be nutritionally sound and it is in this field that the Central Laboratory will operate both in research and in exercising over-riding control of nutritional quality.

Another completed development is the re-modelling upon the latest lines of the Cambridge Mill of Paul Bros., Limited, which is adjacent to the new laboratory. The plant has been completely renewed and designed primarily for milling home-grown wheats. The mill is the first in England to be operated on the pneumatic system.

Work is proceeding satisfactorily on the reinstatement of our London mill and it is hoped that it will be ready to come into operation within eighteen months. At Hull the Silo has been completed and is now working, and a start has been made on the rebuilding of the mill itself.

PROFITS AND DISTRIBUTION

Stockholders are aware that the policy for a considerable time past has been not only to expand the flour milling side of the business but steadily to develop activities on the non-milling side though still within the ambit of the manufacture of human and animal foodstuffs. This, particularly in recent years, has called for the investment of a substantial amount of the stockholders' capital which has derived from the ploughing back of resources over a long period. It is from expansion along these lines and not from an increase in profit margins on the milling side (which remain virtually frozen at pre-1939 levels) that the increase in earnings has come. The Board has concluded that the time has arrived when the stockholders ought to benefit from this further employment of their capital and accordingly recommend a modest increase in the dividends on the equity stocks of the company. I would add that in future, and subject to conditions permitting, it would be the Board's intention that the interim distribution on the ordinary stock should be a somewhat higher proportion of the total for the year than was previously represented by 2½:17½.

I think it appropriate to point out that the total earnings of £1,685,000 (before providing for taxation) represent a somewhat low return on the book capital employed of nearly £14 million, especially having regard to the extent of our turnover and the efficiency of our factories. This is due to the inadequate return from the flour milling activities, the reasons for which I refer to below. Bearing this disability in mind, I consider the results to be satisfactory and am particularly gratified at the progress made on the non-milling side.

Our thanks are due to the managements, staff and workpeople of all the establishments comprising the group for another year of outstanding service.

CONTROL OF FLOUR MILLING

In the past I have referred to the unsatisfactory nature of this control and our firm conviction that the interests alike of the country and of the industry call for its termination, or at least substantial modification. The thesis that profit margins under today's conditions should in fact be lower than before the outbreak of the last war, when they were certainly not other than reasonable, appears to me untenable. But this is less serious than the grave danger of undermining the morale of an industry by stultifying enterprise through the absence of any incentive to economy, technical efficiency, or the development of products to meet the needs of customers or special markets.

Moreover, the present system governing the distribution of wheat appears to us to involve much unnecessary expense. I think it says much for the sense of responsibility of the industry that great efforts continue to be made to maintain and improve its standard of efficiency despite the absence of material reward. I would once more appeal to all concerned to unite in an endeavour to bring these artificial and restrictive conditions to an end and restore healthy competition and enterprise.

ALTERATION OF SHARE CAPITAL

A scheme for altering the share capital of the company, involving the capitalisation of certain of the reserves employed in the business, is now in course of preparation. When completed this will be submitted to the Capital Issues Committee and, if approved by that body, its adoption will then be considered at appropriate meetings of the Stockholders.

SELANGOR RIVER RUBBER

RECORD DIVIDEND

The nineteenth annual general meeting of Selangor River Rubber Estates, Limited, was held on June 5th in London.

Mr J. Bligh Orr (chairman) presided and the following are extracts from his statement:

The past year has been notable for a somewhat spectacular rise in the price of rubber, which began in April and gathered strength as the year went on, reaching a peak in November when the average market price for the month was just over 5s. per lb. This very welcome improvement in the price of the commodity is naturally reflected in the accounts and you will see that we made a profit of £60,972, representing 20.32 per cent. on our issued capital, against earnings of 8.37 per cent. for the previous year. In 1949, 5 per cent. out of the 8.37 per cent. earned, came from the Estate, the balance being interest and dividends received. For the year under review we made 13.84 per cent. on our issued capital from working the Estate and 6.48 per cent. from interest and dividends. Thus, while the increased price for the commodity has brought about such a satisfactory increase in Estate profits it has also resulted in our subsidiary company paying us substantially more by way of dividends for 1950, when Belata River (Selangor) Rubber Estates, Limited, distributed a total of 35 per cent. against 10 per cent. for 1949. The subsidiary company with its high yielding strains of rubber is a most valuable contributor to our profits and it paid a first interim dividend of 20 per cent. on May 1st on account of its profits for the current year.

We are recommending payment of a final dividend of 10 per cent., less tax, making the total distribution for the year 14 per cent., less tax, the highest yet attained by us. We have brought the reserve account up to a round £10,000 by the transfer of £6,000 from the profits this year.

The report was adopted.

BURY FELT MANUFACTURING COMPANY, LIMITED

RECORD TRADING RESULTS

LT.-COL. BUCKLEY ON EXPORT MARKET PROBLEMS

The forty-sixth annual general meeting of The Bury Felt Manufacturing Company, Limited, was held on June 6th in Manchester, Lt.-Col. A. Buckley, C.B.E., D.S.O., J.P. (the chairman), presiding.

The following is his statement circulated with the report and accounts for the year ended December 31, 1950:—

The gross trading profit of £293,968 is again a satisfactory one and is in excess of any previous annual profit earned by your company. The very heavy charge for income tax and profits tax amounting to £146,472 and sundry other debits, reduce the net profit to £123,426.

DEPRECIATION AND DEVELOPMENT

The only material variation in the presentation of the accounts this year lies in the treatment of the provision for depreciation. Today, annual accounts are read and criticised by many people other than shareholders, and erroneous conclusions are often drawn as to the actual capital employed to produce a given profit. It has long been your board's policy to have periodical revaluations made of the company's fixed assets. In a recent valuation, for insurance purposes, our valuers arrived at a present-day depreciated value of the buildings, plant, machinery, etc., of over £800,000, and a replacement value in excess of £1,000,000. In view of the large disparity between these valuations and the figure of £109,785 at which the fixed assets appear in the balance sheet, the sum of £20,000 for depreciation and development charged in the profit and loss account in arriving at the net profit, is carried to a new reserve account in the balance sheet rather than deducted from the existing written-down value of the assets concerned. This practice will be continued in the future.

Some portion of the increase on the 1947 valuation is accounted for by the present inflated costs of replacing plant and machinery, which is a serious matter to industry, especially as the initial allowances for taxation are to be withdrawn.

NOTICES

GENERAL REGISTER OFFICE MEDICAL STATISTICIAN

The Civil Service Commissioners invite applications from men and women for a permanent post of Medical Statistician. Superannuation is at present under the Federated Superannuation System for Universities. The inclusive salary scale (London) is £1,250 x £50—£1,500 x £75—£1,725, £40 being deducted from commencing salary for each year of age below 38 on appointment, and £50 added for each year above 38 up to age 40. This scale is at present under review by an independent committee. Candidates must be registered medical practitioners, and have had statistical training, preferably with a university degree and a Diploma in Public Health, and with experience in at least two of the following: (i) resident hospital appointment; (ii) public health service; (iii) school medical service; (iv) pathology; (v) general practice; (vi) medical research; (vii) industrial medicine. It will be an advantage for candidates to have had statistical training more advanced than that of the D.P.H. course, and also experience in writing reports and commentaries. The successful candidate will have ample scope, under the general technical direction of the Chief Medical Statistician, for original work over the whole field of vital statistics.

Further particulars and application forms from Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 4035/51. Completed application forms must be received by the Secretary by July 5, 1951.

UNIVERSITY COLLEGE, SOUTHAMPTON

Department of Economics. Applications are invited for the post of Assistant Lecturer in Statistics. Salary scale £400 x £50—£500 plus superannuation and children's allowance. Further particulars and details of application can be obtained from the Secretary and Registrar.

The substantial addition of £45,000 has this year been made to stock depreciation reserve account and £20,000 placed to general reserve account. Reserves now total £310,862 and, in addition, the amount carried forward on profit and loss account is £137,814.

and our thanks are due to them for their loyalty.

The report was adopted.

CAPSEALS LIMITED

NEW ACQUISITIONS

The seventeenth annual general meeting of Capseals Limited was held on June 6th in London, Mr Oscar Morduch, B.Sc., A.M.I.E.E. (the chairman), presiding.

The following is an extract from his circulated address:—

During the year your company purchased the issued share capital of the Neptune Waterproof Paper Company, Limited, and Valapak, Limited.

Not least among the advantages in acquiring these new interests was the opportunity, which we have taken, to secure on favourable terms a 21-year lease of commodious modern factory premises at Cowley, near Uxbridge; this lease contains an option to purchase the freehold of the site at what we consider to be a very reasonable figure.

Last year I referred to the difficulties we were then meeting, due to shortage of working space at our Slough factory. With the additional facilities existing at Cowley, both for storage and manufacturing, I can say, with some confidence, that we have now satisfactorily solved these difficulties.

I hope you will agree that the results justify your Directors' recommendation to capitalise a further £12,500 of accumulated profits in distributing as a bonus one new stock unit for every three units held, and to maintain the dividend at the rate of 6d. per unit on the increased capital.

We are now well into the first half of our current trading year, and I am pleased to report that business continues on a satisfactory basis. I must, however, mention that the world shortage of paper and board and the generally known difficulties of present conditions make your Directors feel it necessary to exercise the utmost caution in making plans for the immediate future. So far our supplies of raw materials have been adequately maintained, but further contraction in availability of materials may well necessitate a reduction in the output of some sections of the business. Your board hope, however, that with the co-operation of our suppliers and customers we shall be able to maintain our activities on the present level. The report was adopted.

UNIVERSITY OF HONG KONG

Applications are invited for the vacant post of Lecturer in Economics.

Emoluments (for a married member of the staff normally resident outside Hong Kong or China, and inclusive of allowances), £1,400—£10—£1,640 p.a.

Applicants should be Honours graduates of British Universities, and have appropriate qualifications and experience, and should be prepared to take up the post by September, 1951.

First-class sea passages and furnished houses or flats at reasonable rentals are provided for expatriate staff.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is July 31, 1951.

MULTIPLE Departmental Store Organisation of National Reputation wishes to select a number of senior personnel, not exceeding 35 years of age, for accelerated development with a view to subsequent appointment to executive positions in its Retail Branches and with the future possibility, in certain instances, of appointment to its central organisation. Commencing salaries in the region of £750 per annum will be paid to men of proved ability and status. Successful candidates will be expected to accept assignments anywhere in the United Kingdom. Full details, including age, education, experience, present occupation and salary, which will be treated in strict confidence, should be forwarded to Box No. M.D. 511, 10, Hertford Street, W.1.

A NATIONAL ORGANISATION requires an Education Officer to work in Yorkshire. Preference would be given to a north-country graduate with experience in adult education. Starting salary £600 to £800, according to age and experience.—Reply, stating policies, to Box 663.

PAYMENT OF DIVIDEND
NOTICE IS HEREBY GIVEN that a Dividend of Fifteen Shillings per £5 Share on Coupon No. 124 will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 2s. 4.29d., making 12s. 7.71d. net, on and after May 31, 1951, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4.
Net profits for the year ended December 31, 1950, £168,000 (last year £151,200).
Dated, Alexandria, Egypt, May 24, 1951.
By Order of the Board,
ROBERT WALTON,
Managing Director.

NIGERIA

Old established British private Company of highest standing, having recently opened branches in West Africa, require Branch Manager, also an Assistant with practical and executive ability.
Applicants must have had commercial experience, preferably in hides and skins and general produce. No applicant over 40 years old will be considered. Salary according to experience and qualifications. Appropriate leave and living allowances, etc. Write, with full details, to Box 4254, c/o Charles Barker & Sons Ltd., 31, Budge Row, London, E.C.4.

DO YOU NEED REPRESENTATION IN BRAZIL?

Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro; Member of the: American Chamber of Commerce for Brazil—Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comercio do Rio de Janeiro, etc. Purchasing Agent for: steel, metals, tools, abrasives, machinery, selling Agent for: iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

INTERNATIONAL WOOL SECRETARIAT

Applications are invited for the post of Manager of the Secretariat's Branch in Lahore, Pakistan.
Candidates should have good educational background, considerable powers of observation, and a high level of initiative; knowledge of the wool industry and previous service in the Indian Sub-Continent an advantage.

The selected candidate will be given a three-year Agreement and a first-class passage; if married, wife's passage will also be paid. Salary not less than Rs. 2,000 per month with superannuation benefits. Preliminary selection will be made on letters of application, which should be framed accordingly, and submitted within 14 days of the appearance of this advertisement to: The Secretary, International Wool Secretariat, Dorland House, 18/20, Regent Street, S.W.1, and the envelope should be marked "confidential."

COMPANY secretary/chief accountant desires change. Comprehensive practical knowledge secretarial and modern accountancy procedures, with specialist experience of international trade and finance. Professional qualifications and university degree. Age 38.—Box 662.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statisticians and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments, if desired.

Prospectus from the Director of Studies, Department P17
WOLSEY HALL, OXFORD

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Lecturer in Economic Statistics in the Faculty of Economic and Social Studies. Salary scale, £450 to £500 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than June 30, 1951, to the Registrars, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY COLLEGE OF HULL

RESEARCH STUDENTSHIP

The College proposes to award a Post-Graduate Studentship in the Faculty of Arts for full-time research in Arts, Commerce, Economics or Law. The value of the award is £250 for one academic year, renewable for a second year. Further particulars may be obtained from the Registrar, to whom applications in triplicate should be sent not later than June 22, 1951.

C. MEGGITT, Registrar.

SENIOR BRANCH OF THE FOREIGN SERVICE

The Civil Service Commissioners invite applications for not more than two posts in Grade 7 (First Secretary/Consul) of the Senior Branch of the Foreign Service.

Candidates must be at least 32 and under 42 years of age on August 1, 1951. Recruitment is normally from University graduates, but other candidates of good education will be considered. They will be expected to have a sound knowledge of international problems and to have experience of administrative or other work of a responsible nature, which in the Commissioners' opinion renders them suitable for the Senior Branch of the Foreign Service and for work at First Secretary level. They must also possess a competent knowledge of at least one foreign language. Though these are not specialist posts, there is particular need of candidates with a knowledge of Burmese, Siamese, Arabic or the Slavonic languages. Candidates may be required to undergo an oral test.

Salary scale £1,000 x £40—£1,200 x £50—£1,375 (men); £880 x £40—£1,200 (women); with allowances at overseas posts to meet the cost of living.

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 4033/51; completed application forms must reach him by June 30, 1951.

THE RHODESIA REPORTS organisation supplies information on all projects in the Rhodesias and can act for firms of standing. The Managing Director, Mr. Rex Reynolds, O.B.E., will be available in London for interviews with principals from June 11th.—Write Box 664.

EXECUTIVE, Chartered Accountant and Cost Accountant (43) wishes permanent post with progressive business or group of companies as joint managing director, comptroller, financial or commercial director. Extensive experience administration, accounting, commercial management, investigation and re-organisation.—Box 661.

OTHER NOTICES APPEAR ON PAGE 1411

policy could have been better handled, it is still difficult to argue that Britain between 1945 and 1950 was in a position to do much more than was done towards preparing the defence of the Middle East and protecting British interests there.

There is, therefore, little point in argument about the past unless it reveals the extent to which recent events have changed the circumstances in which British policy has to work. The change has in fact been rapid and considerable. Though Britain's commitments remain heavy, its military and economic strength is increasing. Its purpose in this vital area has been narrowed and more sharply defined as the holding of Russian expansion, not only by military preparation but also by contesting political and social leadership with Communism. And it no longer stands alone in the Middle East; it can hope increasingly for the sympathy, interest and aid of the United States. It is on this fact, so new and significant, that discussion should focus.

★

As yet, the Americans are not fairly and squarely committed to a joint and agreed policy for holding the bridge between Asia and Africa. Far from it. The most that can be said is that the conditions for working out and achieving such a policy are more favourable than ever before. The poison generated in Anglo-American relations by differences over Palestine is almost dispersed; there has been a sharp awakening in Washington to the importance for the western partnership of the Persian oil dispute—indeed, of all oil politics in this area; and the long discussions about ways and means of defending the Mediterranean as General Eisenhower's southern flank in Europe seem to have revealed to American strategists what has been a blind spot in their view of the map. They are perhaps beginning to see the logic of the British argument that the protection of Greece and Turkey is a function not of the existing North Atlantic Treaty Organisation, to which the Americans belong, but of a Mediterranean and Middle East organisation which does not and cannot exist so long as they stand aside from the strategic realities south of the Soviet Union. They may be nearer than is realised to accepting the need to share with allies joint plans, organisation and bases.

Such a fresh start will be inadequate unless there is a clear understanding of what each can contribute and of the fact that military solutions are weak, if not valueless, unless the social problem is also dealt with. The Americans can contribute to this task superior resources and a superior capacity for getting things done quickly. Britain can supply, besides its growing military and technical strength, greater experience of susceptibilities and reactions among proud and touchy peoples. The countries in which the two great powers have worked hand in glove—in Greece and Turkey—have so far proved two of the most reliable buffers against Russian expansion. Further east, an Anglo-American policy of resistance is much more difficult to organise, for virtually no nation in the area except Israel feels that it lives by standards that are worth fighting for.

This aspect of the situation was until lately not clearly seen in the west, chiefly because Russian policy in the Middle East had become quiet and unobtrusive. It needed the threat of political chaos and revolution in Persia—staved off only by concentrating popular atten-

tion on the idea of nationalising the oil industry—to bring home two facts: the frail defences of the free world's key oil resources, and the need for a radical change in the social conditions that the ruling classes have tolerated and defended. The crucial question for Anglo-American policy now stands revealed: it is to organise defence of the oil area and to bid for the shaken allegiance of the "broad masses."

Before a political and military programme can be framed one most important point or principle will have to be decided. What can be done to convince fanatical nationalists that, in their obsession with western intrusion, they are opening the door to another and far more interfering foreigner—the Russian? It has to be proved to Egyptians, Arabs and Persians—what the Greeks and Turks already accept—that there can be no neutrality in present circumstances. If this could be done, the way would be open to an agreed defence programme for the governments of the area. If it cannot be done, is military co-operation to be forced on unwilling allies? This is only one of the questions that the advocates of a tougher policy have to answer. In either case, the military problem is insoluble unless there is a social and psychological policy to offer. At once the question arises how local custom and vested interest are to be dealt with. What line is to be taken with ruling classes who pay lip service to ideas of social reform and yet persist in their rapacious ways? The would-be adviser from the west who feels he has the answer to this question even then remains baffled by the incapacity of these states to administer efficiently the present state of affairs, let alone the far more complicated process of change from feudalism to the modern welfare state. The classic example of failure has been the fate of the American firm of Overseas Consultants Inc. in Persia. Equipped with a splendid team of British and American experts, this firm was able to achieve little and was dismissed last December by the Persian Government for failure which was almost entirely due to the inertia and inefficiency of the Persian Government itself.

Western experience in these matters is now sufficient to justify the view that it is no good persisting in such failures. But the fact has to be faced that the alternative to doing nothing is to do far more than western opinion has so far contemplated: to push changes through and to direct—as the Russians do—the choice of governments and policies. Any decision to use such methods could be taken only if it were known that responsible and capable Arab and Persian reformers were ready to play their part. In fact, few such people can be found. In Iraq and Syria, it is true, there are responsible and moderate leaders of the centre or left; but if they exist in Egypt and Persia they are still hiding their talents. In short, it is difficult to escape the conclusion that nothing but the emergence of a series of Kemals can save most Middle Eastern states from violent revolution. Indeed, any Anglo-American policy that aims at creating healthy societies as well as reliable allies may have to encourage the right men to emerge. And if the main effort must be made by diplomatic and military means, there is also a great opportunity for the joint and separate oil companies to co-operate in a common welfare and public relations policy. Unless someone gets done what the pasha only talks about doing the Russians have merely to sit and wait for the wrath of the masses to boil over.

“British Central Africa”

THERE is nothing new in a proposal for closer union between the British territories in Central Africa, about which an important statement was made in Parliament this week. For over thirty years the proposal has periodically been put forward, only to meet with the careful reply from the Imperial Government that amalgamation, though desirable in principle, was neither practicable nor expedient at that time. This was also the conclusion reached by Lord Bledisloe's Royal Commission in 1939.

What is new about the present proposals is the attitude of the Imperial Government towards them. The proposals are put forward in the report (Cmd 8233), which has been published this week, of a conference of officials drawn from the three territorial governments concerned (Southern Rhodesia, Northern Rhodesia and Nyasaland) and from the Colonial and Commonwealth Relations Offices in London. The Colonial Secretary was careful to emphasise that none of the four governments is committed to the proposals, but they are at least going forward for further discussion. Moreover, instead of the Colonial Office making up its mind what will be best for Northern Rhodesia and Nyasaland, as has happened in the past, there are to be the fullest consultations on the spot with the African and European communities in the two northern protectorates as well as with the Government of Southern Rhodesia.

One reason that has always been given in the past for deferring projects of closer union has been the immense difference in the degree of political development reached by the three territories. Formally, this refers to the fact that, while Southern Rhodesia has been a self-governing colony since 1923 and regarded for some years as on the verge of dominion status, Northern Rhodesia and Nyasaland were governed until the war as crown colonies, with official majorities in their legislative councils. The reality behind this formal distinction, however, is that Southern Rhodesia is governed by its white settlers, while the proclaimed objective of the governments of the other two territories is full partnership between Africans and Europeans. Southern Rhodesia has a native policy which many of its white inhabitants sincerely believe to be in the best long-term interests of the Africans; but it is not one that commends itself to African opinion in the neighbouring territories.

In the past decade the difference in the degree of political development has certainly been narrowed. In

Northern Rhodesia, there has been a substantial transfer of power to the European unofficial members of the legislative and executive councils. At the same time the Africans have far more political maturity than they had before the war and Africans are beginning to sit in the legislative councils of both the protectorates.

If the differences in political maturity between the three territories were the chief obstacle to closer union, the narrowing of the gap ought to have lessened the difficulties. Actually, it has probably increased them. The effect of the increasing political consciousness of the Africans has been to harden their opposition to Southern Rhodesia's native policy and to create a new resistance to white domination in general. In Northern Rhodesia the African Congress, a political party, is demanding that some of the power transferred to the Europeans should be taken away again. At the same time, the vocal and energetic white community is pressing for more self-government on the Southern Rhodesian model; and in

Southern Rhodesia itself there has been a renewed request for complete dominion status, which means the removal of the existing check on measures which discriminate against the African.

Why, then, if closer union is more difficult than it used to be, does the Imperial Government, which has always been content in the past to postpone the issue, now put its weight, however tentatively, behind a project of unification? The answer is not to be found in the officials' report. It is true that they say there is a "compelling case" for closer union and that the need is urgent. But the reasons they give are the reverse of convincing, and the real reason is only hinted at. The

compelling and urgent reason is the course of native policy in the Union of South Africa, the pressure of Afrikaner nationalism and the growing immigration of Afrikaners into the two Rhodesias. The establishment of a strong central government in the three territories would, it is hoped, go far towards withstanding the spread of Boer influence to the north. Why is not Southern Rhodesia by itself a strong enough bulwark between the Union and the British dependencies? No answer is given in the report to this question either. But it is easy to guess that the British Government, and the governments of the two colonies, fear that a time might come when Southern Rhodesia, baulked of complete dominion status and also of leadership in a wider Central African domain, might tend to look more and more towards the Union and possibly seek incorporation in it.

These, it may be guessed, are the reasons that have led to the attempt to design a constitutional framework for three partners who are likely to remain very different. The scheme proposed is certainly ingenious. To begin with, each of the three partners is to retain its own government, which means that one will be self-governing, communicating with the Commonwealth Relations Office in London, while the other two remain colonies, responsible to the Colonial Secretary. But there is also to be a federal government for British Central Africa (an uninspiring title; why not Rhodesia?). This federal government is to have a legislature of 35 members, 17 from Southern Rhodesia, 11 from Northern Rhodesia and 7 from Nyasaland, and it is to have authority over the subjects specifically transferred to it. These comprise external affairs, defence, communications, broadcasting, electricity supply and distribution, foreign trade, customs, higher education, research and economic development planning.

The significance of this list lies in the main omission from it. Native policy, in its widest sense, is to remain a matter for each territory separately—that is to say, neither Southern Rhodesia on the one hand nor the two northern territories on the other are to be asked to change their present policies. It is evidently thought that this does not go far enough to reassure the Africans in the protectorates, so there is to be further machinery for the protection of their interests within the federal government. Since African interests may be indirectly affected by its actions, there is to be an African Affairs Board, consisting of the three Secretaries for Native Affairs of the territorial governments, one elected or unofficial member from each territorial legislature and one African from each territory. Its chairman will be the Minister for African Interests in the federal cabinet, and he will be appointed not by the Prime Minister but by the Governor-General. All proposed legislation will come before the Board and the Minister, and if they object to any proposal as being detrimental to African

interests, the Governor-General is required to reserve it and refer it to the Secretary of State in London. Which Secretary of State is not made clear, and it may be thought to be of some importance whether it is the Colonial Office or the Commonwealth Relations Office that has the last word; the best arrangement might be the two in consultation.

This is a very gallant attempt to square the circle, and it can be said at once that if some form of closer union between the three territories is desirable and necessary, the proposals now put forward are excellently conceived. Nevertheless, it does not follow that the scheme will be accepted. The Africans in the northern territories may remain unconvinced that there is any need at all for federation, and suspicious of an arrangement which, for all the safeguards, would inevitably bring them more closely under the influence of the white men in Salisbury. As for the Southern Rhodesians, though the plan offers them scope in a much larger unit, it inevitably postpones almost indefinitely their ambitions for dominion status and subjects many of the affairs they now run unchallenged to a legislature in which they would not have a majority.

The British Government's problem, in short, is to persuade both Southern Rhodesians and Africans that they will gain by federation when neither side wants the other to gain an inch. It is important that neither side should reject the proposals out of hand, and each should be invited to ponder on what the alternative may be. For the white settlers the alternative might be a permanent block to the expansion they desire. For the Africans in Northern Rhodesia and Nyasaland, the alternative may be an advance of Afrikanerdom, or at least of Afrikaner ideas, to their borders. The task of securing agreement cannot be hopeless, since officials of all four governments believe it can succeed. If it does succeed, it will add by no means the least interesting chapter to the history of British constitutional ingenuity.

Peace with Japan

THE visit to London last week of Mr John Foster Dulles, Republican adviser to President Truman on foreign affairs, was only moderately successful. Less agreement was reached than had been hoped for on the remaining points at issue between London and Washington and, consequently, it now seems that a Japanese peace treaty will not after all be ready for signature quite as early as July. Nevertheless, final agreement can hardly, and should not, now be long delayed. There is little basic divergence left between the British and Americans about the terms of the treaty itself, and it should not be impossible to devise a compromise which would defer decision on the question of who should sign for China and when. The Russians, at least, have finally indicated their withdrawal from participation in any present treaty by their Note to Washington last week-end, while most of the other countries which took part in the Japanese war are only waiting to subscribe to a draft agreed between the major powers.

The delay is regrettable. As Mr Dulles said in London, ever since their discussion of principles last November all the governments on the Far Eastern Commission, and,

indeed, nearly everyone in the free world, is agreed that a peace treaty is now becoming overdue. Much of the blame for holding it up has hitherto lain with the Americans, but they reached a new decision last September when the Korean war was three months old and when there was not a single combatant American soldier left in Japan, and they are now anxious to see their relations with Tokyo put on a new basis. This, moreover, is nearly the end of the sixth year of the Occupation, which, to quote Mr Dulles again,

has reached the point of diminishing returns. If it is arbitrarily prolonged, it could paralysise the promising beginning of representative government in Japan; it could turn the incipient good will and friendship of the Japanese people into sullen hostility; it could even create the illusion that Soviet Russia could be a liberator rather than the cruel gaoler it is in fact.

Seldom, indeed, can there have been any country whose future was wrapped in greater mystery than Japan. In December it will be just ten years since the American fleet was attacked at Pearl Harbour. During this unique decade the Japanese have fought and been defeated in a war which was the culmination of seventy years of grow-

ing modernisation and ambition; they have been struck by the first two atom bombs in history; and they have endured what must have seemed to many of them a most strange and puzzling Occupation, ending with a non-combatant role in yet another war, this time alongside their western conquerors. No one can possibly tell at this stage what effect this decade will have had on the Japanese. Will they reject militarism altogether? Will they become good democrats? All that can be known for certain is that, since the time is ripe for them to try their own paces at the height of the cold war, the first years of test are of even more crucial importance to the rest of the world than they seemed in the moment of victory. At present the Japanese are strongly anti-militarist and mostly anti-Communist. Both their interest and their inclination is to side with the powers at whose head stands the United States. But will that always be so, and, if not, how long will it last? Probably alone of the nations intimately concerned in the peace treaty, Australia and New Zealand are thinking seriously in terms of the next half century, and before accepting the proposed treaty they have had many doubts about the line being taken in it.

Yet there are only three ways of making peace, and there can be little doubt that in choosing to be liberal and magnanimous the victors over Japan have taken the only possible course. Their policy may or may not succeed, but anything less would be bound to fail. Of the two other alternatives a Carthaginian peace would have been quite impracticable, both because it is not in the nature of the American and British peoples to enforce such a thing and because Japan has an inalienable role to play in Asia, on which the future of many millions of Asians may well depend. A peace on the compromise model of Versailles—repressive in spirit but not in substance—has so recently been proved a complete failure that no one could take it seriously. As things are, the problem of actively converting a defeated enemy into a willing ally, in both Japan and Germany, is taxing the ingenuity of western statesmen to the limit.

In Japan the outcome has been to lay the foundations of the treaty on four principal ideas. Territorially, Japan is being cut down to its main islands; the abandonment of all claims to the mainland under the Potsdam surrender terms means that Japan cannot have under its own control the sources of raw materials which gave it its military power. Secondly, however, there will be no war guilt clause. Equally, in the economic sphere—as was also specifically laid down at Potsdam—Japan must not be penalised in such a way as to prevent it earning

its living; on the other hand, not only must the opportunity be taken to try to bring Japanese standards and behaviour into line with normal commercial practice, but Japan cannot expect to gain the advantage of an entirely clean slate in a fresh start. This means no significant reparations, yet at the same time acknowledgment of prewar debt liabilities and commercial claims, and adherence to international conventions on subjects on which Japan used to have a bad record, such as drug smuggling. Lastly, although disarmed, Japan must be given both a sense of security through outside guarantee and the right to look forward in due course to taking over its own defence as a normally armed, sovereign state.

★

These are the substantive provisions of the treaty. By far the most contentious in detail, and the most difficult for the western allies to elaborate, is the economic section. Unfortunately in this the British find their logical interests on the least defensible side of the argument. The war and its aftermath have at least emphasised one lesson: that the world is short of goods and that productive capacity is more important in the long run than hoarding markets. The Japanese have a contribution to make to the under-developed parts of the world and it is only common sense that in the peace treaty they should not be restricted from playing it. The one fully justifiable point at issue between London and Washington has been Japanese shipbuilding capacity. Neither side has cared to embark, particularly at this stage, on trying to dismantle shipyards on the German scale; but there is every reason why, since this capacity was unduly inflated by war from 300,000 to 800,000 tons a year and cannot now be used in any case owing to the shortage of steel, such resources as are transferable should be switched to other industries.

Even when these broad outlines of the treaty were settled, however, a number of serious points of difference still remained. The first of these was whether to proceed without the Russians. The basic decision to do so was taken many months ago, but some of the western countries (the French, for instance) still entertain some doubts, on which the Russians try to play. In this week's Note to Washington the Russians shift their ground from the demand that the whole matter should be remitted to a meeting of the Council of Ministers to a new demand for a special peace conference. The first demand could never be sustained, since it was based on the untrue statement that there was an agreement to that effect at Potsdam, and the result of agreeing would simply be

to give the Russians a veto. The demand for a peace conference cannot be quite so easily disposed of; it is a clever manoeuvre. But there is no reason to yield to it. The Russians have no genuine grievance; they have been kept fully and continuously informed of every step in the negotiations during the past year and have been repeatedly asked for co-operative suggestions. The present state of the world, split into two camps by Russian action, leaves no realistic alternative to the western powers' present intention of completing negotiations for a Japanese treaty through ordinary diplomatic channels, and of holding only a brief, formal conference at the end for the actual ceremony of signing.

The second point of hesitation is over the powers of rearmament that are to be restored to the Japanese. The Australians and the New Zealanders are nervous about this; and the American guarantee of their security is intended to allay their alarms. Indeed, the connection is direct, since the guarantee is to come into force at the same time as the treaty. The doubts are natural enough in view of very recent history. But to impose permanent restrictions on Japan would, at this stage, involve a complete re-casting of the treaty. To put the matter in its bluntest terms, it is the United States that has decided on a liberal settlement with Japan, and it is therefore for the United States, by its guarantee to Australia and New Zealand and by the forces that it is to retain, on Japanese invitation, "in and around Japan," to see that the risks do not materialise.

Personal Incomes

THREE articles in this journal early last year reviewed the facts then available about the course of personal incomes since 1938. This article revises some of the main series of statistics in the light of the latest information, and attempts to form a more up-to-date picture of movements in the purchasing power of different classes of people.

Table I shows the general pattern of net incomes (that is, after payment of income tax and surtax) in 1948-49 compared with 1938-39. It will be seen that rather more than twice as many people in 1948-49 had incomes above the tax exemption limit. The great expansion in numbers occurred in incomes between £150 and £1,000, and more particularly in the £250-£500 group. But, as would be expected, the numbers at either end of the scale had contracted. In spite of inflated prices, there were in 1948-49 less than half as many net incomes between £4,000 and £6,000; and only 86 incomes were above the £6,000 mark compared with 6,560 in 1938-39. Moreover, the average income of this latter group had fallen by nearly £2,000. While it is taxation that has stifled the large income and surtax payers have increased in number, yet they have not done so in anything like the same proportions as those in the more moderate income groups. A further set of statistics, analysing gross incomes according to their amount before tax, shows that between 1938 and 1949 the numbers of incomes in the range £250 to £1,000 increased five-fold (from 2,429,000 to 12,753,000); those in the range £2,000 to £10,000 doubled (from 98,000 to 219,000); while the number of gross incomes of £10,000 and over only rose from 8,000 to 11,000. So, even before taxation, the share of the total income going to surtax payers had fallen.

Finally, there is the controversy over which government shall be invited to sign for China and, as a necessary corollary, which representative of China should be regarded as the legal heir to Formosa. Britain recognises the Peking Government and could hardly do otherwise than hold that, if anyone is to sign for China, it should be Mao Tse-tung. At one stage the British appear to have suggested that an invitation should be sent to Peking; though they do not appear ever to have contemplated that Formosa should be handed over to the Communists in present circumstances. The United States still recognises Chiang Kai-shek and similarly can hardly do other than suggest that he should sign for China. The debate of recent months in the United States has shown that there is no present possibility of persuading the Americans to admit the Chinese Communists to the conference or to recognise their signature. And it can be said with equal force that in London and other capitals the suggestion that Chiang should sign is regarded as outrageous. If both governments insisted on their logical positions, there would be complete deadlock. But it does not take any great wit to see the obvious way out—which is that, for the time being, no one should sign for China. This has certain disadvantages—not least for the Japanese, who would find themselves living under a treaty which neither of their biggest and nearest neighbours would have signed. But the alternative is no treaty at all, which would be far worse for everybody but the trouble-makers.

Although the detailed pattern of income distribution is continually being modified, the postwar structure remains clearly defined. In each of the years 1948, 1949 and 1950 wages have, after tax payments, accounted for 47 per cent of all net incomes (excluding social security payments and other transfer incomes) against a 1938

TABLE I—NET PERSONAL INCOMES

Range of Income After Tax	1938-39			1948-49		
	No. of Incomes in Each Range	Average Tax Paid	Average Income After Tax	No. of Incomes in Each Range	Average Tax Paid	Average Income After Tax

* For 1938-39, figures relate to the range £125-150. The figures include about 6,000,000 incomes in each year which were entirely relieved from tax by the operation of allowances.

figure of 39.5 per cent. The National Income White Paper of last April (Cmd. 8203) which gives these figures also shows the movement of salaries and other forms of income. Although these statistics, which are summarised in Table II, bear the official stamp, the Government statisticians who compile them always emphasise the element of estimation included in them, and this

becomes increasingly apparent with the revisions contained in each publication. Some of these changes arise because of alterations in definition, but mostly because more accurate methods of assessment are found. In particular, the postwar figures of total salaries have been repeatedly revised, and almost invariably in an upward direction, without any modification of the 1938 estimate. This is no oversight—the prewar figure was estimated very carefully when it was first put forward, and the methods of today cannot necessarily be applied in all respects to older statistics. But it seems likely that the compilers, after more extensive investigation, will make some addition to the 1938 figure in order to make it strictly comparable with the present-day figures. In all probability, therefore, the statistics in their present form overstate the increase in the total of salaries since 1938.

Nevertheless, even as they stand, the figures in Table II establish some well-defined differences. The final column in the table is an attempt to show the purchasing power of the different categories of income,

allowance having been made both for direct taxation and for the rise in the market price of consumption goods. The estimates for 1950 show total wages to have increased their 1938 purchasing power by 28 per cent and total salaries by 8 per cent, while the mixed group of "profits, interest and rent" have lost 20 per cent. Two categories from this latter group are shown separately. Distributed profits of companies, assuming taxation to be at the same level as for the whole group of "profits, interest and rent," and the income of landowners have each fared worse than the group as a whole. There is no guide as to the taxation paid on the other types of income in this mixed group, such as professional earnings, which increased (before tax) from £84 million in 1938 to £182 million in 1950, and farming income, which increased over the same time from £64 million to £302 million.

All these figures from the National Income White Paper refer to the total of wages, salaries, etc., without reference to the numbers of incomes in each category. And, indeed, such figures are not available except in the case of farming income which, after deduction of a small amount earned by "spare-time" farmers, was shared in each of the years 1938 and 1950 between 360,000 full-time farmers. So, on the average, the farmer's income before taxation rose from about £170 in 1938 to £808 in 1950. What can be learnt about the average wage or salary? For wage-earners additional information is supplied by the twice-yearly surveys made by the Ministry of Labour covering industrial earnings of manual workers in most of the principal industries — but excluding coal-mining. In October, 1950, the average weekly earnings were 150s. 5d. for men, 82s. 7d. for women and 128s. for all workers; these figures are respectively 218 per cent, 254 per cent and 240 per cent of the corresponding earnings in October, 1938. When direct taxation and changes in consumption prices are allowed for, the average wage-earner was some 22 per cent better off and the male wage-earner some 10 per cent better off. Indeed, the improvement is probably greater than this, for rent and food, of which the prices have been kept artificially low, play a larger part in the wage-earner's expenditure than they do in the price-index of consumption goods as a whole.

No such clear-cut information is available about the average salary. Salary-earners have certainly increased in numbers, and, although the exact amount of the in-

crease is not known, it is probably about 10 per cent. The figures in Table II would then suggest that the average salary-earner in 1950 had practically the same purchasing power as in 1938. But, since salary-earners cover all workers other than those described technically as "operatives," a very wide range of occupations and remuneration is included. For most salaried posts there are no fixed scales of pay and little comparable information. But Tables III and IV give a few examples of known salary movements since 1938 or 1939. Very recent increases have tended to arrest to some extent the ironing-out of the differentials between pay for skilled and unskilled work in these particular occupations. But certainly after taxation is taken into account, it is the junior salary-earners who relatively have fared the best.

While it would be wrong to attempt to draw any conclusions about salaries in general from this limited information, yet the indications are that either the National Income Statistics overestimate salary increases since 1938 or numbers have risen more than has been supposed.

BANK CLERKS			
Men	70-365	157-546	166-579
Women	83-205	155-365	164-385

Prewar scales for teachers are for graduates in secondary grammar schools in the provinces and certificated teachers in industrial and semi-industrial areas; no account is taken of special allowances. School dentists' salaries for 1938 and 1950 are averages of those advertised in the *British Dental Journal* which varied quite considerably; present day scale is that recommended by the Dental Whitley Council (Local Authorities). Bank clerks' salaries are as supplied by National Union of Bank Employees and include a cost-of-living bonus in the postwar rates.

In yet another respect the picture may have been painted too cheerfully for salary-earners. Some very rough estimates of middle-class cost of living indices, published previously in this journal and brought up to date in Table V, show—with no claims to statistical accuracy—that the higher the income the greater has been the rise in the average price of the goods and services bought. The wage-earner has therefore improved his comparative lot to an even greater extent than is indicated by the income differences already calculated.

Throughout these comparisons no account has been taken of increased social services (except that the employees' contribution to national insurance has been deducted as a part of direct taxation). Before the war the services were provided mainly for the wage-earner. Today they have been expanded to cover all classes. In this respect, therefore, the middle classes have stood to gain relatively more. Some idea of what the welfare state can add to an ordinary family's income is shown in the last table in this article. It may be argued that the higher income groups do not utilise the facilities. But practically all families who are eligible take advantage of the child allowance and will doubtless accept a retirement pension. And the Health Service is said to be used by about 95 per cent of the population—although perhaps not for all treatment. Here then are benefits, in cash or kind, drawn from the welfare pool not only by manual workers but by the middle classes. Education is another matter. The independent schools in England and Wales still cater for 500,000 pupils against the 6,000,000 at maintained and assisted schools, although the elimination of the prewar small-fee school may well force middle-class families to use free educational facilities.

Social consciousness is clear about the need for some of the burden of the cost of children to be shared by the

country as a whole. General interest will therefore be felt in some new and interesting statistics relating incomes to family circumstances which are promised by the Inland Revenue Department from an income census being taken for 1949-50. Unfortunately these results

TABLE VI.—INCOME SUPPLEMENTS FROM THE WELFARE STATE
For a Family with Two Children

	£ Per Year
Child allowances.....	13
Education :—	
1 child at primary school	25
1 child at secondary school.....	45
Provision for old age (premium for comprehensive policy taken out at age 30).....	27
Health (at average outlay per head)	36
Total of above	146

Provision for old age is assessed on the charges that might be made by an insurance company to provide the same retirement pensions and other benefits (excluding unemployment) as National Insurance. For an annuity of 26/- a week at age 65 (without return of premiums at death), a man would have to pay an annual premium of about £6.8 for a policy taken out at age 20, £10.5 at age 30, and £18 at age 40. For an annuity of 42/-, the premiums would be about £11, £17 and £29 respectively. Making what allowance is possible for the other benefits and for differing mortality rates of husband and wife, the premiums that would be charged for a married couple at ages 20, 30 and 40 are estimated at about £15, £27 and £45. No account has been taken of any higher rates of pension over 65.

Education figures are based on costs in early 1950; in 1951-52 they are expected to increase and to be over £50 for a child at a secondary school. Fees at well-known public schools will then average about £280 a year for boys and £230 for girls. An independent day preparatory or secondary school charges anything from £50 to £100 a year.

are not expected until early next year, but in the meantime the department has published provisional figures of the same nature for 1948-49. In that year, 2,830,000 married couples had incomes, before tax, below £250 and 1,839,000 of them had one or more children to support. Exact calculations are not possible, but whereas the average income of the one-child family appeared to be about £400 a year, that of larger families was nearer £500. But although incomes may be somewhat higher for the larger families, yet of the 1,266,000 families with three or more children in 1948-49, 339,000 had incomes below £250 and a further 688,000 were between £250 and £500. Thus even with the great postwar rise in the lower incomes, there are still many large families in need.

• This article can do little to bring the story beyond 1950; 1951 will see many claims for income increases to combat the steep increase in the cost of living. Already, by April, wage-rates had increased 7 per cent over their 1950 level, and nearly 6,000,000 workpeople had benefited by wage increases in the first four months. In the upper reaches of the range taxation prevents any such escape from the rising cost of living. On the face of it, therefore, it would seem that the redistribution of income is to be taken still a little further this year.

NOTES OF THE WEEK

"Peace, Then Plenty"

The East Woolwich by-election has shown that there is more to the present political lull than a renewed sense of stalemate at Westminster. Two months ago even the constituency that Mr Ernest Bevin held so safely could not have been the scene of a campaign as quiet as that which ended with Thursday's polling. Springtime passion has evaporated in the country as well as in Parliament.

Perhaps for that reason the Woolwich by-election provided an important indication of the pattern that political campaigning is likely to take in the next four months. A new Labour slogan was introduced. "Peace, then Plenty" is neat, and it is unusually important because it serves a double purpose. It may be assumed to summarise the lines on which Ministers intend to reply to Mr Bevan if and when he begins to press within the Labour Party a campaign to elevate himself to leadership. In effect the slogan emphasises frankly that adequate defence must take precedence over the current standard of living, which Mr Bevan appears to regard as in all circumstances the first charge on the economy. If Mr Mayhew's campaign at Woolwich is an accurate guide, the Labour leaders have decided to take the courageous stand of rejecting Mr Bevan's standards of value. A reply in such terms has the great advantage that it also serves as, in part, an answer to the Tories. However much they may in fact rate the needs of defence even higher than does the present Government, the main basis of popular Tory propaganda is still the promise—or, at least, the hint—that they could squeeze more benefits out of the welfare state than Labour can: the offers are more guns, more houses, and lower prices all at once. The most successful thing the Labour Party could do would be to persuade people that the Conservative position and Mr Bevan's position are essentially alike in their unrealism and perhaps even in their possible "disloyalty" to the cause of the West.

To try to put the two oppositions on the same level is, of course, an obvious strategy that even Mr Morrison will not be clever enough to execute if the Tories know their business. But they seem more likely to play timidly straight into the bowler's hands—to remain afraid of suggesting that what is required is more effort rather than more reward, and therefore to offer the electorate nothing but unconvincing hints at the impossible. Enough has been said about the necessity of "re-thinking" on the Labour side, of finding a new policy that is neither further socialisation nor an expansion of the social services. The fact that the need is talked about so self-consciously is evidence enough that little thinking is in fact being done. But it would be rash to assume that a new policy, however important for the Labour Party in the long run, is essential for an election this year. The Conservative Party still shows no sign of making up its mind whether it is offering people more than Labour can give immediately or a sounder policy in the long run. If the Tories remain undecided, Labour may be able to get along as it is. There is no law that says that nature abhors one vacuum more than another.

Plain Speaking to Europe

Mr Milton Katz, the American representative at the United Nations' Economic Commission for Europe, has added another spirited page to the current international debate on rearmament and inflation, which recently promoted a clash of opinion about the level and control of foreign exchange rates between the International Monetary Fund in Washington and Europe's ECE. Speaking last week at Geneva, Mr Katz carried the war vigorously into enemy

country. He had a double theme: that high defence expenditure has come to stay, and that the only real way to counteract its effects on the economic life and financial stability of Europe is to increase production. To this end, Mr Katz put forward a five-point programme for Europe. There must be a wide variety of imports in order to sustain both industrial and agricultural output, and in return exports must be competitive in price as well as quality. To maintain the tempo adequate new investment is essential, which must produce a harvest of higher living standards; but part of the developing economic strength must go into defence.

It is all very well to urge greater production and to indicate the way to approach it, but to do so does not really show just how it is to be achieved. Even in America a great firm like General Motors has recently had to stop work on certain days in the week owing to shortage of raw materials—a problem that threatens to be more acute in Europe. The other major European difficulty is the restrictive and cautious mentality that has grown up over many years among both certain workers and certain employers. In Britain, even highly successful and progressive concerns suffer from go-slow tactics among the workers, because they fear that to go faster will only run through the available raw materials sooner. On the Continent particularly, nothing that has happened since the war has yet made more than a dent in the small-market, high-price mentality of business men.

Two of the greatest benefits of the American aid programme have been the wide increase in public discussion of economic problems, with the aid of more and better statistics, and the pressure which the United States has been able to exert in the direction of freer trade and higher turnover. Mr Katz rightly emphasised that raw material production is at present the key to a healthy western economy. What he did not do, and what there is still great scope for Americans to do even more than they have, is to think and speak about European problems, both publicly and privately, as if they were their own. There are more and more fields in which, as Americans come to have increasing experience of Europe, their practical advice can be very welcome and useful—provided it is realistic.

* * *

Europe's Recovery

When the Marshall Plan was first introduced in 1948 even its most enthusiastic supporters scarcely dared to believe that Western Europe could be put on its feet in a brief period of four years. But the progress to date recounted in the third report of the Organisation for European Economic Co-operation leaves little doubt that, but for rearmament, the targets set in 1948 would be attained by 1952-53. Some have been attained already, although they were considered pious expressions of hope rather than of belief when they were set. In agriculture, one of the twin keystones of recovery, the production of sugar beet, fodder roots and eggs are above the target, while potatoes, bread grains, meat and milk are all within striking distance. The two uncertainties are coarse grains and oilseeds, which are important because they are the raw material for livestock production. In industry the output of textiles and sawn softwood has exceeded the 1952-53 target while mechanical and electrical engineering is within a few points of it. Again progress has been slowest, in relation to the targets set, in the primary industries: hard coal, crude oil throughput, electricity, and crude steel. The total balance of payments deficit for Western Europe has been reduced from about \$8 billion in 1947 to \$1 billion in 1950. Gross internal investment is 20 per cent above that of 1938 and the level of personal

consumption per head of population is almost, but not quite, back to its prewar level.

Western Europe is certainly recovering and recovering rapidly, but viability has not yet been achieved. A high level of final production both in agriculture and industry can be sustained only if an equivalent high level of output has been developed in the primary stages, or if Western Europe can be assured of an adequate supply of fuel, primary products and semi-manufactures from the rest of the world. So far, a large volume of imports has been possible first because of the annual injection of American dollars and, secondly, because of the high level of prosperity in the United States.

Two years ago Europe was made acutely conscious of the serious consequences to it of only a mild recession in the American business activity.

A further contributory factor to recovery, not specifically mentioned in the OEEC report, has been the resurrection of sterling as an international currency. At present over half of the world's business transactions are carried on in sterling. It is clearly impossible to distinguish between cause and effect and sterling's present strength is no doubt partly derived from Europe's recovery. But events of the past two years would seem to have shown that sound sterling—"sound" to the point of permitting more liberal trading policies—was of paramount importance to the economic health of Europe.

Finance by Night

The Conservatives have duly sought to make up in duration what their attacks on the Finance Bill have lacked in intensity. The combination of Mr Churchill's belligerency and Mr Ede's stubbornness has kept the Commons awake throughout the night on two separate occasions, adding in the process two new long-sitting records (for the postwar period) to the Wisden of parliamentary performances. Last week's private members' business on Friday was lost in the process; at the beginning of this week the arguments dragged through until the normal hours for business on Tuesday had been completed, making a sitting of 31 hours and 15 minutes. The Tuesday evening debates, with members groping wearily for arguments like marathon pianists fumbling for the keys, were hardly an impressive spectacle.

The two all-night sittings have had the effect of forcing the Government to make three extra days available for the committee stage of the Bill, thus almost doubling the time taken last year. Mr Ede sensibly gave way once it became apparent that the alternative was to endure further all-night sittings, which would add nothing to the debates and detract a good deal from the dignity of the House. In the present state of Parliament, this type of badgering and manoeuvring is inevitable; but not all the Tories are convinced that Mr Churchill's tactics have been sound. Their more moderate

wing would have preferred a more compact and coherent debate, using the six days originally offered by the Government for a calmer discussion in which their arguments rather than their emergency sleeping and eating habits might have caught the headlines.

Whatever the form of the debate, the Conservatives hardly made a happy choice in devoting most of their energies to attacking the blanket clause dealing with tax evasion. The clause is certainly clumsy and probably ineffective, but that does not necessarily justify eleven hours of debate on a matter on which—in the words of one sardonic Tory—no gentleman ought in any case to have an opinion.

With the committee stage of the Finance Bill out of the way, the Government can expect to get safely through the last stage of report and third reading, and the House of Commons can turn, with what will certainly be relief on both sides, to some of the more general issues awaiting debate—in particular, to foreign affairs, defence, prices, and the conduct of the nationalised industries.

Missing Diplomats

The case of the missing diplomats arose last week when the world's newspapers were rather short of fresh political news. It would be premature at this stage to assume that it has any deeper significance, and the House of Commons fortunately showed a decent restraint in its discussion of the affair on Monday. Mr Morrison maintained in his brief statement that the Foreign Office had nothing to say and nothing to hide about the case, which has left the superiors of Mr Maclean and Mr Burgess as baffled as the general public.

The Foreign Secretary also set himself firmly against any suggestion that this extraordinary event indicates the need for either a political or a moral purge of the diplomatic service. Though his words might have been more happily chosen this is surely the right position. The efforts of some Conservative backbenchers (and some newspapers) to pin a political or ideological label on the missing men produced, as a healthy reaction, the unusual spectacle of Labour Members hurrying to the defence of that Foreign Service which has so often been the object of their scorn and dislike. This anxiety to prevent a witch hunt has stifled any tendency in the Labour party to revive the old demands, pressed strongly on Mr Bevin in the revolutionary mood of 1945, for a complete overhaul of Britain's diplomatic representation. It is hardly possible that an affair of this kind should be merely a nine days'—or even an eighty days'—wonder; it is important that opinion, both in this country and abroad, should not be formed until more of the facts are known and their implications, if any, soberly assessed.

No Change in Teheran

The chances of an agreement between the Anglo-Iranian Oil Company and the Persian Government are still being queered by the number of voices with which Persia is speaking. Teheran radio has become the most extreme of these; it is tending to incite the public to violence while Dr Mossadegh is receiving the company's directors from London, and while the Persian mission to the southern oil fields is making its first acquaintance with Abadan. Owing to Persian behaviour, therefore, anarchy remains only just around the corner, and the task before the company's emissaries is rendered unnecessarily difficult.

They have done their best to be reasonable, and to explain (whenever any Persian pauses to hear the explanation) exactly where the company and where the Persians now stand over nationalisation. In a press interview given on arrival in Teheran this week Mr Basil Jackson, the head of the company's delegation, made a statement that was a

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.'

But... have you ever stopped to ask yourself

"Who are Britain's Craftsmen?"

Introducing Ernest Langley. He started as a smith in 1899, specialising in coach building work. His hammer has shaped ironwork for undercarriages of Royal coaches and, in later years, luggage grids, seat fittings, structural ironwork and bumpers for the superb luxury cars included in Britain's impressive total of vehicles for Export.*

But... does craftsmanship mean only hand-craftsmanship? When the motor car industry adopted mass production, was craftsmanship

forgotten... even though it may no longer be easy to throw the limelight on one man, or one part of the process?

And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and they follow this rule in making chemicals for a long list of British industries.

With chemicals for tanning, chemicals for paints and varnish, chemicals for wood preservation, Monsanto play an important part in the great body-building firms of the Car industry.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

BRITISH OVERSEAS AIRWAYS CORPORATION

NOT SEPARATE COMPARTMENTS

IF we want to avoid needless discomforts, it would be as well if trade unions and employers got a move on to cut out restrictive practices and waste of manpower in industry. A strong initiative should come from the Government, and the subject should be kept in the spotlight of publicity.

Because, of course, the enormous need for workers on the defence programme must be met. National security demands that the Government see to that, and, whatever may be done by dilution of labour, workers will certainly be drained from civilian production.

Nobody should imagine that there is the least likelihood for long of the defence industries doing without, while civilian work goes on as usual. That will not be the case, either in regard to labour or to raw materials.

The problem we have to face is not simply one of defence production, but of production in general. *It is civilian life that will have to go without, and we will rob ourselves unnecessarily if we continue to fritter away productive capacity by restrictive practices.*

We urge that the problem should be seen as a whole. We are cutting our own throats wherever we have waste of manpower.

Reprinted from the editorial column of the *Daily Mirror* of May 30. The *Daily Mirror*'s net sale—over four and a half million—exceeds that of any other daily newspaper in the world.

AXEL CRONSTEDT

Benefactor of Mankind

In this year 1951 we honour the memory of Cronstedt, a mineralogist of Swedish nationality, who two hundred years ago first discovered and gave a name to the metal nickel.

In Cronstedt's time, minerals were mainly classified by their outward characteristics, form, colour and hardness. He believed the only real basis for such a classification was chemical composition and much of his work was directed to that end. Amongst many ores which he examined was one known to contain iron and cobalt, and he concluded that it contained also a third and unknown metal, "more silver-like than either", which he called nickel.

Many years passed before this discovery was accepted, and even so, little importance was attached to it until the closing years of the last century. Today, the production of nickel is one of the world's great industries, and the metal Cronstedt discovered plays a vital part in bringing us the necessities and the comforts of our daily lives.

THE MOND NICKEL COMPANY LIMITED

Sunderland House, Curzon Street, London W.1

25/6/51

model of moderation and clarity. He recognised the principle of nationalisation. He said that the company "hoped to find a form of it into which we can fit." But he also pointed out that the Persians might create circumstances in which it would no longer be worth the company's while to operate. Were it to have to get out, he said, it would be capable of replacing in not too long a time both the supply of crude oil that is at present obtained from the Persian wells, and Abadan's refinery capacity (Some details of these possibilities were given in *The Economist* of May 26th). He also touched upon a consideration that is far too seldom weighed by Persians—the fact that "the company" is not a mechanism that can be taken over *en bloc*, since it owes its efficiency and prosperity to the services of technicians who are individuals and free agents. Questions of nationality apart, it is always irksome to work under a management that knows less about one's job than one does oneself. If the Persians want to retain the services of such experts, they must create circumstances in which good men will want to stay. Without them, it cannot produce the "unprecedented prosperity" that it has promised to an expectant people.

*

Dr Mossadegh's position remains insecure. He has been out-shouted by his lieutenants. He reveals no capacity for handling the problems which press on his government outside the field of oil nationalisation—notably its financial problems. It is uncertain whether he could retain control of the police and gendarmerie in the event of an outbreak of the public feeling which some of his supporters are fomenting. Yet his continuance in office must be hoped for because there is no sign of a leader with more control than he possesses over the crowd, unless it be a Tudeh leader. The limitations of his mind are well revealed in his insistence that Mr Jackson shall see the notorious slums of Teheran, which are in Persian eyes "all the fault of the Oil Company." Mr Jackson would do well to press for a return visit by Dr Mossadegh, who has never seen the neat dwellings in which the company houses its workers in the oilfields and at Abadan.

Russian Grain for India

The declaration of the Indian Food Minister that, with the passing of the American loan for 2,000,000 tons of grain, India's food position was saved must have struck the Russians as disappointing. For some time now Radio Moscow has been broadcasting almost daily reports on Soviet ships entering the harbour of Bombay with grain for the hungry Indians. Six ships have been mentioned hitherto and the total quantity of grain delivered up to now is probably less than 40,000 tons, which falls far short of the "million tons of wheat for India" which has been used as a trump-card in Soviet propaganda. The speedy despatch of the first ships, before any final agreement with the Indian Government had been made known, had enabled Soviet propagandists to steal another march on the Americans. Previously Soviet spokesmen made much capital of the lengthy negotiations between American and Indian representatives, which the Russians qualified as "five and a half months of noisy propaganda and hubbub about American food deliveries to India... revealing US imperialism in all its savagery." When the special loan for India was on the eve of being approved by the American Congress, the Russians replied immediately by sending the grain ships; they contrasted the "benevolent, fraternal" deliveries from China and the USSR with the "grain with strings" coming from America.

In the skin game now being played in Asia the position of India is so vital that the Soviet Government was willing to make a gesture and dip, if necessary, into its own grain stocks. This policy of cajoling Mr Nehru was not facilitated

by the activities of the Indian Communist Party. A few weeks ago *Pravda* published at length the programme of the Indian Communist Party, in which both Mr Nehru's foreign and domestic policies were strongly attacked. It was notable that the social side of the programme was not over ambitious. Socialism was judged unattainable in the present state of backwardness; the establishment of a "People's Democracy" was put forward as the present aim and there were some overtures to the Indian middle class. As for foreign policy, it was argued that India should leave the Commonwealth but strengthen its ties with Pakistan and Ceylon.

Pravda made no comment on the programme and lately the Soviet press has abstained from its usual attacks on the Indian ruling circles. It would therefore seem that the Soviet Government, appreciating Mr Nehru's potentialities as a mediator or even as a temporary ally in the present struggle, was willing to bring some grain into the bargain to gain the favour of Indian public opinion and thus force Mr Nehru's hand. Now the declaration of India's Food Minister somewhat restores the balance in favour of America. But even at this stage any misunderstandings, delays or hesitations in the American aid for India will still be exploited quickly and adroitly by Soviet propaganda.

One More Dock Strike

Few strikes can have been so unnecessary as that of the tally clerks at the London docks. It lasted 10 days, kept over 100 ships idle and cost some 100,000 working days. The action of 1,469 men gave over 8,000 dockers a paid holiday, for cargoes could not be loaded and unloaded without clerks to check them. The men supposedly struck because they feared that the proposed recruitment of 80 new tally clerks would be followed by the dismissal of some older workers. The Transport and General Workers' Union and the London Dock Labour Board assured them that their fears were unfounded, and that the new tally clerks were needed to cope with heavier traffic in the port and to keep pace with the recruitment of dockers. The assurances were unheeded and Mr Robens's speech did not help, since most newspapers emphasised its meaning as "No concessions for the dockers," rather than as a statement that the Minister of Labour was satisfied that the 80 new clerks were absolutely necessary. Certainly the speech did not save the strikers' faces, for to return to work on the strength of it would have been to admit that they had made a mistake from the start. On Wednesday, however, the strike was called off. No compromise was made by the Dock Labour Board, but the unions concerned—the TGWU and the stevedores' union—have agreed to allow elected representatives to take part in the machinery of consultation alongside the paid union officials.

There is no evidence that the tally clerks' strike was the work of political agitators, although their demands about consultation reflect the prevailing distrust of union officials wherever they become identified with the employers, as they tend to be in the Dock Labour Boards. The unions claim that the machinery of consultation was punctiliously operated at every stage; but the episode perhaps underlines the need for better union information services, as was recommended by the Leggett report on unofficial strikes in the docks. This was perhaps unusual among dock strikes in being primarily a simple case of vested interests. At present there is such a severe shortage of tally clerks that employers will retain a clerk's services on odd days when there is no work for him to do, rather than return him to the pool and risk being without a clerk when a ship berths. Some men may have wrongly interpreted this as a sign that there was already a surplus of labour; others may have seen it as what it is—a comfortable custom which would be ended by an adequate supply of clerks.

Free Sweets—and More Sugar

The Minister of Food, replying to a Parliamentary question last week, said that sweets would be freed from rationing when supplies were big enough to meet the demand—including the rush demand to be expected in the first days of freedom; he could not guess when this would be.

The prospects for unrationed sweets are certainly better than they were at the time of the first ill-fated venture. The increase in their price has done something to establish a prospective balance of supply and demand; the general increase in the cost of living, whittling away the margin of income available for semi-luxury spending, has worked in the same direction. It is possible that these two differences might be big enough to prevent another sequence of queues, chaos, and empty shelves, though the initial buffer stocks would still have to be large. The only real safeguard, however, lies in a step which Mr Webb is unlikely to favour—the freeing of sweets from price control. That, combined with continued control over the supply of sugar for confectionery, would ensure the necessary balance fast enough. Though the principle of fair shares in lollipops might be infringed, it is really rather difficult to maintain that this particular infraction would represent a serious breach in the edifice of social justice.

It is, however, a curious commentary on the Ministry of Food's scale of values that the building up of confectionery stocks should be given precedence over an increase in the sugar ration itself. Home preserving, home jam-making, home cake-making come at the very end of the sugar queue, to be provided with their necessary raw material only after it has been provided for the manufacture of sweets enough to keep the dentists busy till further notice. The alternative is not, of course, to keep sweets rationed in order to increase the household sugar ration: what is wrong is that housewives should be kept short of sugar while sweet supplies are built up to whatever undefined level may be required in order to meet the demand at the present controlled prices.

Bonn Puts on the Screw

There is no mistaking the defiant, hectoring tone of the latest German protests against occupation costs and the export of Ruhr coal. The Bonn politicians and their adviser on raw materials, Dr Friedrich, are determined to blackmail the west. They are giving the occupation powers to understand that they must give way to German demands, or face economic decline and a hostile public.

A few days before Mr McCloy's departure for Washington to present the German case to Congress, Dr Schaeffer, the Federal Minister of Finance, announced to the German Press—before communicating with the High Commission—his solution for the problem of occupation costs. It is that the Americans should themselves pay for a large proportion of them. Not that Dr Schaeffer stated his proposal so honestly; to do so he would have had to acknowledge that Germany cannot ask for anything but gifts, since its credit is already mortgaged several times over and its foreign debts are unpaid. Dr Schaeffer has decided to include DM 5,800 million of occupation costs in the budget and leave the rest for an extraordinary budget. He intimated that this balance, amounting to DM 3,500 million in the German estimate (which is much larger than that of the High Commission) should, and probably will, be covered by "a credit from abroad." If he makes this proposal to the High Commission, Dr Schaeffer will argue that part of the occupation costs represent capital investments, and that the United States is already aiding the defence effort of other countries.

Instead of occupation costs, Dr Schaeffer has decided to include in the ordinary budget the Government's increased expenditure on pensions. He maintains that pensions to former members of the *Wehrmacht*, their dependants and

former officials of the Third Reich also represent a German contribution to Western defence. By this manoeuvre he will be able to impress upon the public that, should they have to pay higher taxes, it would be for the purpose of the occupation. Supporting Dr Schaeffer's blackmail, the economic press declares that the responsibility for any decline in the German standard of living rests entirely abroad. If "foreign countries fail to do what is required," as one journal puts it, the German Government will face the choice of raising money for occupation costs by inflating its credit with the central bank, or by imposing fresh taxes labelled "for the occupation." Naturally, it is pointed out, either course would mean the end to any hope that Germans might be willing to aid Western defence.

Though there are rights and wrongs on both sides, this blunderbuss diplomacy leaves little room for a compromise with Bonn which would not simply lead to further demands. It also ensures that the Adenauer Government, which the western powers genuinely wish to help, will lose prestige at home unless it can claim a resounding victory.

* * *

No German Mandate for Stalin

Plebiscites in totalitarian states are superficially uninteresting affairs, in which questions are framed to attract an affirmative vote, even without the pressure of fear. That held in the Soviet Zone of Germany last week was no exception. Everybody, from the age of sixteen, was asked to declare against remilitarisation and for a peace treaty in 1951. If the Communist organisers are to be believed, nearly 96 per cent of the public did so. This vote would not be remarkable, since the whole Communist-controlled apparatus of house-wardens and "enlightenment committees" was brought into action to secure it. Open voting was encouraged. Propaganda threatened citizens with an American invasion of the People's Republic if they failed to demonstrate for peace.

Under the circumstances, it is somewhat surprising how much opposition to the plebiscite was revealed in Communist speeches. The efforts to win over the Evangelical Church seem to have been relatively unsuccessful. The Church's guidance to voters supported the plebiscite, but intimated that its questions should implicate Russia, as a state which is remilitarising the Germans. It became apparent that many Eastern Germans look upon Dr Adenauer as a leader who supports a German contribution to Western defence and, knowing him to be a sincere Christian, they are influenced by his example. Herr Ulbricht regretted that some Christians failed to understand why partisans of peace were asked to attack Dr Adenauer; the reason was, Ulbricht explained, that he had committed treason. Moreover the Communist leader argued that the Eastern German effort to remove Dr Adenauer would not mean a revolution.

We are convinced that the popular movement for the preservation of peace will bring to power leading political personages who will act as patriotically as Walter Rathenau and Dr Wirth who, in 1922, concluded the treaty of Rapallo with the USSR.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1

The peace plebiscite, which was banned in the Federal Republic, has done little towards attaining this objective. The Communists have attempted to collect signatures without much success, and may continue to do so; but they appear quietly to have abandoned their earlier hopes of announcing an all-German mandate against America.

The Motherless Child

The experts have for long had theories about the effects on the very young child of separation from its mother. The theories are well known. What is new and valuable in the report* recently published by the World Health Organisation is the collection of evidence to support them. The author, Dr John Bowlby, is director of the child guidance department of the Tavistock Clinic, London. He visited several European countries and the United States, and examined the findings of many research teams. He found much agreement among investigators in different countries, most of whom had little knowledge of the research being done elsewhere, and it is this that makes Dr Bowlby's conclusions impressive.

The new report is concerned with the floor of an edifice of child care of which the Curtis Committee in 1946 examined the superstructure. By its terms of reference the committee was limited to the problems of the care of children after they had been deprived of a normal home life, and was precluded from examining in detail the effects of separation on the child or the measures possible to prevent this separation. Dr Bowlby's work starts at an earlier stage. He examines the evidence about the effects of separation on children under the age of three or four and about their development (more often, retarded development) in institutions; and he traces the connection of delinquency and anti-social behaviour with early deprivation.

The results are both convincing and harrowing. They establish the overriding importance of relieving the mother rather than removing the child, of taking preventive action in the home rather than dealing with the consequences of separation in later life. They are a crushing condemnation of institutional life for the very young child. The alternative is a more constructive expenditure of public money within the home rather than the removal of young children to nurseries. To meet the cases where the home cannot be held together there should be more, and better-paid, foster parents rather than still more expensive institutional care. These are important as well as controversial questions, and the report deserves to be as widely read and discussed as the recommendations of the Curtis Committee.

* * *

The Future of Charity

Hitherto when the place of charitable trusts and voluntary effort in the welfare state has been discussed, it has been assumed that their chief function would be to break new ground, to find out new social needs not yet provided for from public resources and to show public authorities how their resources can most usefully be spent. In the sixth report of the Nuffield Foundation, a good example of this sort of pioneering effort is given. In 1946, the foundation made a grant of £14,000 to the Caldecott Community to enable it to run an experimental reception centre for children deprived of their normal home life. Two years later the Children Act made reception centres an obligation of local authorities, and the experimental centre of the Caldecott Community became the prototype. Similarly, the National Corporation for the Care of Old People, which is sponsored by the foundation, is trying to find out the best way of bridging the gap between the provision made by the hospital authorities for the sick old, and that made by the welfare authorities for the able-bodied old, a gap which leaves many infirm old people the responsibility of no one.

* "Maternal Care and Mental Health." HMSO. 10s.

Other practical questions of this sort, which the foundation is helping to answer, are described in the report. But in its second five-year programme, which is just entering on its third year, preference is being given to fundamental biological and social studies. The object is that both these branches of study should acquire the disciplines of the older and more advanced sciences. The social sciences in particular are weak in their lack of "realistic and cumulative research," and it is interesting to note that with the help of the foundation the techniques of sample interviews, on which the validity of so much social research depends, are being rigorously tested at the London School of Economics.

About its future programme, however, the foundation's report sounds a note of warning. Its freedom to initiate and support projects of the more speculative, though promising, kind may be curtailed if a restriction of government spending faces it with demands for help from projects that have already proved their worth. The foundation, and other bodies like it, may be faced with a difficult choice between sustaining and initiating. Instead of mapping out new lands for state action, they may find themselves having to till the known lands from which the state has perforce withdrawn.

* * *

Reinforcements for Korea?

As weeks pass with no sign of any moves by the Chinese to stop the fighting without prior acceptance of their impossible conditions, the prospects of a prolonged war in Korea has to be taken seriously and measures planned for the contingency that the Chinese will keep on fighting in the hope of wearing out the United Nations forces. The question of sending fresh units to Korea must now be considered by all the nations engaged in the struggle, and not least among the problems of a continued war effort is that of sustaining morale, both at the front and at home in each country concerned. A war of this kind is a most difficult one to fight, for there is no declared state of war, the main enemy is immune from direct counter-attack, the overall policy for which the campaign is being fought keeps on changing, and the whole issue is the subject of acute public controversy in the Western democracies.

In these circumstances what is remarkable is not that there may have been some cases of low morale or bewilderment among the troops in Korea, but that the composite army of the United Nations has stood up so well to the strains and stresses of a war which has its full measure of setbacks and muddles—especially during the terrible Korean winter which is now past. There seems to have grown up a special sense of comradeship in arms under the United Nations flag, a loyalty new in human history and different from the solidarity which can be achieved in an ordinary coalition of wartime allies. This unity on the fighting front, however, cannot be expected to endure unless it is backed up by a real will to maintain the war effort on the various home fronts, and it is in this sphere that there are grounds for apprehension. General Wedemeyer has certainly not helped the allied cause in America by advocating withdrawal from Korea; this is the brand of MacArthurism which, if it is foiled in its advocacy of "hitting China," prefers to pull out altogether rather than pursue a strategy of patient and limited action. In America the movement, fostered both by the Communists and the Isolationists, for "bringing the boys home" may now gather increased strength.

* * *

Another Stage in Kashmir

India is pursuing its course in Kashmir by moving from one *fait accompli* to another. The recent session of Sheikh Abdullah's National Conference Party in Srinagar was, he claimed, the prelude to a Constituent Assembly which would put an end to the uncertainties governing the fate of Kashmir.

It was no coincidence that Mr Nehru, the Indian Prime Minister, was in the country at the time and that the session was held just when Dr Graham, the new United Nations mediator, was on his way from the United States. For the Indian tactic is now to treat the Kashmir problem as virtually settled, and to reject any idea that the United Nations—to whom Delhi itself originally submitted this dispute with Pakistan—any longer has any right to interfere. In Pakistan, on the other hand, Dr Graham's appointment represents virtually the last tangible hope of a peaceful settlement. The Indians, however, regard him as an arbitrator and therefore unacceptable; and if he fails Pakistan looks like preparing for war.

It is hard to see at this late stage when the future is once more heavy with grave foreboding—superficially concealed by the revival of a considerable flow of tourists to Kashmir this summer—how the ultimate tragedy of war is to be averted. Britain certainly can do very little more than to urge moderation, as it has done all along. For in India the attitude is that the British are "hopelessly prejudiced" in favour of Pakistan, while in Pakistan they could not do enough to satisfy public opinion without taking sides in the dispute to an extent to which they are neither willing nor in a position to go. India itself will make no move except to resist attack; indeed the Indians are far from aggressive and, in spite of Mr Nehru's deep personal commitment to his hold on Kashmir, the government's refusal to make offensive military dispositions in the strategically placed Punjab is said to be Mr Nehru's own. On the other hand, public opinion in Pakistan is being goaded into action by a burning sense of frustration, and might force the government's hand.

The failure to reach a settlement in Kashmir undermines the security of the whole of southern Asia. Yet no one in the West either can or wants to intervene directly. It seems, therefore, that the people and statesmen of Asia must act themselves. A committee of Asian and Arab states has already been in existence to try to bring peace to Korea. If Dr Graham fails they should make an attempt to do the same for Kashmir.

Struggle for the Ruhr

The source of German power is the stake in a struggle over the future ownership of the Ruhr heavy industries which has now entered its first round. The positions taken up by the contestants were discussed in an article on page 1379 in *The Economist* last week. At first sight it might appear that the British Government was lined up with the German trade unions and Social-Democrats against the Americans and the German industrialists, with Dr Adenauer under fire from all sides.

The division, however, is not so clear-cut as it might seem. The Social-Democrats, for instance, would like to take the question of the Ruhr's future out of the hands of the Occupation Powers; they would do so even though they know that the present German Government, were it left to itself, would neither nationalise the Ruhr nor ban the old owners. Dr Schumacher is playing for time, which he believes will bring him to power at the next elections. The trade unions, on the other hand, appear to prefer that the Ruhr should be reorganised on the present lines by a combination of Occupation authorities and German control groups rather than an alliance of the Government and private industry.

As the fog begins to clear round this complicated matter, two main alternatives begin to appear. The Ruhr, it seems, may be privately owned, but in practice run by a condominium of managers and trade union officials, subject in important respects to the High Authority of the Schuman Community. Alternatively, the Ruhr may be in the hands of a Socialist Government which would, indeed, oust the "old gang," but which would also be pledged to oppose the Schuman Plan. And this power might one day rest with a government which was more nationalist than Dr Schu-

macher and would perhaps not appreciate the dangers of a pact with Moscow as clearly as he. With the Ruhr as bargaining-counter, free from the restraints imposed by the High Authority, such a government might conceivably lead Europe once again to ruin.

This prospect should restrain the British Government from attempting to weight the scales in favour of Dr Schumacher. It also indicates that the best solution would probably be to continue to reorganise the Ruhr on the lines now laid down by the High Commission. At the end, the Ruhr would then probably be privately owned, with the trade unions and the High Authority in a strong position to safeguard it from misuse. In the meantime, however, the Germans would have to submit to the continued supervision of the Allied control groups until the reorganisation was completed. This is a severe drawback. Faced with various discriminatory measures, notably the forced export of coal at low prices, the German Government is inclined to say, in effect, "That was Potsdam—this is."

Correction.—In a leading article on "The Graduate Teacher," in the issue of June 2nd, it was stated that it would be necessary to secure "an increase of 1,000 a year in the flow of graduates entering the teaching profession." The sentence should have read that it would be necessary to secure "an annual net gain of about 1,000 in the number of graduate teachers entering the grammar schools." This implies, of course, a lower rate of recruitment.

France in Convulsions

France has already seen a general election of Deputies, and a Presidential election also; and she still retains a vivid remembrance of the excitement which distracted her on these two occasions. But important as were those occasions, the interests involved in the elections of 1952 will be more profound and stirring still. Then will be decided the question whether France is to be replunged in chaos, or to emerge into peace, order, and prosperity. Then will be the moment for the Monarchists and the Imperialists to make their grand audacious grasp at power—for the Republicans to make their last dogged stand for a position which is slipping away from under their feet—for the Socialists again to seek their fancied pearl amid the mire and darkness of a new convulsion. It will be, to all appearance, a death-struggle of fearful desperation. And at what period will it occur? When the existing Assembly was elected, agitating as was the contest, France was comparatively safe, for the reins of power were in the hands of a dictator, whose firmness and capacity had been signalled in the bloody catastrophe of June. When the country was again convulsed by the Presidential election, it was controlled and steadied by the presence of a recently-elected Assembly, filled with the energy of youth, and strong in the suffrages of the people. But the double election of next May is to take place round the dying bed of an expiring President, and an expiring Assembly;—the proceedings which of all others place public tranquillity in the greatest jeopardy, and which, to be conducted peacefully and without mischief, require the strongest hand of power in its moment of greatest vigour, are appointed for the precise moment when power is paralysed by its approaching dissolution;—and during the four or six weeks when France will be most vehemently agitated, the reins will be dangling between an Assembly which is *no longer*, and an Assembly which is *not yet*;—the helm of State, while the vessel is steering amid the sharpest rocks, and in the stormiest night she ever encountered, will slip between the nerveless and relaxing grasp of one President in his death agony, and the feeble and inexperienced fingers of another in his cradle.

HOTELS

personally and independently
recommended by
Ashley Courtenay

"While we have his parish, and houses for a number,"
So wrote Chaucer in "The Canterbury Tales,"
and applicable today to my activities, except that
disease would be more appropriate than parish,
seeing that my personal knowledge of hotels covers
the whole of Britain and Ireland. My "Shop
Window" below should be cut out for reference.
For other districts please do not hesitate to write
me, enclosing stamped addressed envelope, to
68, St. James's Street, London, S.W.1.

HYTHE, Kent. HOTEL IMPERIAL. Holiday
this year on the Kentish Coast, at this magni-
ficently equipped hotel facing the sea. 50
acres garden, private Golf Course. A large num-
ber of rooms with private bath; some private
suites. Fine Ballroom and Cocktail Lounge.
A.A., R.A.C. Tel.: 67441.

JERSEY, C.I. ST. BREVILLE'S BAY HOTEL.
(1st Register). 14 hrs. flight from London.
Chairs, sunbathing and an equine climate.
Completely sheltered, facing the sea and the
south. Early booking advisable. Details with
pleasure from R. H. Colley. Tel.: St. Aubin 1.

**LONDON, THE STAFFORD HOTEL, St. James's
Place, S.W.1.** First-class hotel, conveniently
situated in the heart of St. James's. Convenient
for shopping and theatres. Fully licensed. Cock-
tail Bar and Restaurant. Tel.: Regent 0111.

GRAND HOTEL

Grand in name, grand in position, grand in
everything it offers.

With a view to a grand family holiday this year,
write E. Paul for detailed brochure. Tel.: 2234.

THE purpose of signs is to tell
without words. Here is a
sign known to connoisseurs since
1742. It stands for a whisky as soft
as the dew, with a heart of softly-
glowing fire. As noble a Scotch as
any that ever came from Scotland.

WHITE HORSE Scotch Whisky

MAXIMUM PRICES:—Bottles 35/-,
1-Bottles 18/3, 1-Bottles 9/6,
Miniature Bottles 3/8 as fixed by
the Scotch Whisky Association.

A good suit is an alarming price

A good suit today is an alarming price: we are as sorry as
you about it

But there are compensations in the suit itself. To possess
any good thing is pleasant; and to possess a good suit is one
of the nice things in life. For your 40-odd guineas*, you
may expect to be well and comfortably dressed for a long
time—long enough, certainly, to forget the shock of the first
cost. Which of the other cheques that you are obliged to
write represents so sound an investment?

*This price, with us, is at present inclusive of purchase tax

IS THE "DICTOREL"

This is the machine YOU have been waiting for—but you need wait no longer, because A.C.E.C. can supply you without delay. It is the last word in dictating machines, and has just the features every executive dreams of—unerring efficiency in "taking down" by a secretary who does not interrupt, catches every word and, by the flick of a switch, reads back exactly what you've said in the way you've said it. If you wish to correct your last sentence, you simply re-dictate the improvement you want, and the previous wording is automatically obliterated by recording the new.

And just one other thought—this "Secretary" is not "hard on the eyes"—in fact, it is a styled and elegant piece of office furniture, as you can see from the illustration.

The further details you will no doubt like to have can be obtained from the two addresses given below or from the London Office of A.C.E.C.

Letters to the Editor

A Higher Pound?

Sir,—Your central argument against the revaluation of sterling (discussed in your issue of June 2nd) was that revaluation would involve stopping the price rise that is necessary to achieve a diversion of resources from home consumption to armaments. Leaving aside the question of how necessary such a diversion is, surely your case is technically unsound.

If import prices are reduced by revaluation to an extent that imports will cost £100 million less in the coming year than they would otherwise, the opening of an inflationary "gap" to this extent will be offset by exporting £100 million less for a given level of external investment. Hence all the counter-inflationary measures you suggest as the domestic price of revaluation would be unnecessary.

Internally the balance of advantage is clearly with revaluation. The price rises this year will, in any case, put severe strains on our whole economy, but the "thanasia" of the rentier (and salaried classes) will be more like "euthanasia" if we revalue sterling.

Externally the case is more open and there are important arguments, as you suggest, against revaluation; but surely the essential point is that the American arms programme is so big that it must make demand inelastic in nearly all markets, including those for British exports. The usual argument that revaluation involves a loss of foreign exchange earnings, involving risks if reserves are low and precluding moves towards convertibility, is based on the assumption that demand is elastic. The question is rather whether we can face the certain social strain and the dangers of losing foreign exchange earnings involved in leaving sterling at \$2.80.—Yours faithfully,
Brill, Bucks

DUDLEY SEERS

Sir,—Mr Johnson's letter published in your issue of June 9th draws attention to one aspect of the revaluation debate that surely needs elucidation. He complains that your leading article left out of account the fact that revaluation, by improving the terms of Britain's trade, would in effect make available more goods for use at home, without thereby worsening the balance of payments. It seems to me that the inflationary significance of any revaluation would be decided by the balance between two opposing influences—the amount of additional goods released to consumers on the one hand, and the extent to which, on the other hand, the effective buying power of consumers is increased. Since you appear to assume that the effects on the terms of trade would not be large, your argument about inflation seems to rest upon a belief that the second of the two groups of influences would be the stronger. On that question there is

surely room for differences of opinion; but it would be helpful to know whether the above supposition correctly interprets your line of approach.—Yours faithfully,
STATISTICIAN

London

[Yes. The supposition is entirely correct.—Editor.]

For What We Have Achieved

Sir,—It is one of the penalties, and also one of the glories, of democracy that, except at moments of deadly peril, it has no heroes. There are, however, limits to public ingratitude; and I would like to thank you most sincerely for your leading article of June 9th.

The policy of containment, and the rearmament necessary to implement it, has no parallel in history. It demands of the democracies a patience and fortitude which will test their powers of endurance to the limit. It is subject to bitter partisan attack on both sides of the Atlantic by European leftists who hate everything American, and American rightists who hate everything democratic. But if it succeeds, and success is perceptibly nearer than it was four years ago, it will have saved the sum of things.

Due credit should be given to the British Government by its political opponents for the part it has played. But the principal architects of the policy, who alone could provide the leadership and the means necessary to carry it out, and have done so, are President Truman, General Marshall, and Mr Acheson. For aught we know, one or all of them may be relieved of office—and that will be none of our business. Nevertheless this does seem to be a moment when the central mass of sober opinion throughout the free world should elbow the critics off the stage and drown their howling with a stentorian shout of "Thank-you" to three resolute and courageous men.—Yours faithfully,

ROBERT BOOTHBY

House of Commons

Inquest on Farming

Sir,—The impression gained by the lay reader of your article in your issue of May 26th is that profits are easier to earn in agriculture than in other industries assuming an equal standard of efficiency. This conclusion is arrived at by an analysis of statistics, which in agriculture are particularly misleading, as anyone who has attempted to translate farming results into figures will agree. The facts are not against the farmer. I have not inconsiderable experience of both business and farming, and think that the efficiency, hard work and adaptability of those engaged in the latter compare favourably with other industries.

The 1945 Act has given landlord and tenant the opportunity of replacing some of the capital which drained from the

land during years of depression. Much has been done already, but whilst an industrialist can choose the site for a factory, a farmer has to make do with his land—a major factor in his costs of production. Of course, by cutting agricultural production substantially and leaving vast areas uncultivated, thus concentrating only on rich soil, costs could be reduced. I cannot believe that this policy is suggested.

With costs and prices at today's levels the production of milk and eggs does not leave a reasonable margin of profit, and unless prices are raised rationing will have to be reimposed. It will be a long time before those who have given up the production of milk will return to work which imposes a degree of inconvenience unmatched in other industries.

To prove that the community is not getting a fair deal from British agriculture, it would be necessary to show that a person of normal intelligence, farming ordinary land, is making a greater return from his capital and labour than he would do in other industries. I have yet to find the person who knows his subject who will claim that this is the case.—Yours faithfully,

CYRIL H. KLEINWORT

London, E.C.3

A Sporting Nation?

Sir,—The article in your issue for May 19th remarked that facilities for athletics are worse than for any other organised recreation. This is correct, but it should not be imagined that the situation is passively accepted by the Amateur Athletic Association. In fact accurate statistics about the number and location of running tracks are only available because the Honorary Secretary of the A.A.A. compiled them to support the efforts now being made by the association to bring about improvement.

Last year Britain was the leading nation at the European Athletic Championships, while every year since the war the standard of performance and the numbers taking part in school and club sports meetings have improved. Keenness for athletics on a nation wide scale has been aroused, but tens of thousands of sportsmen will only be able to enjoy the active recreation of their choice if those responsible for their wellbeing take note of the facts which your article so clearly revealed.

Local authorities are, in the main, responsible for providing outdoor recreational facilities for the public and it is to them, as well as to all others who may provide playing field space for adults or children, that the A.A.A. now looks for assistance in developing those facilities for which there is such an urgent, and growing, demand.—Yours faithfully,

F. W. COLLINS, Hon. Secretary
Amateur Athletic Association

Books and Publications

The Legacy of Bismarck

Know Your Germans. By Count Kurt Blücher von Wahlstatt. Translated from the German by Lord Sudley. Chapman and Hall, 188 pages, 12s. 6d.

As each month brings news of some fresh manifestation of neo-Nazism in Germany—or at least of an indulgent sympathy for the perpetrators of the worst atrocities of the Hitler regime—it is refreshing to read a book written by a German which says frankly about modern Germany what it is so hard for an Englishman or a Frenchman to say without incurring a charge of national prejudice. Count Blücher is a German aristocrat of the type which has never entirely lost the wide European outlook of an earlier age; as a *grand seigneur*, who does not identify himself closely with any of the "isms" of current politics, he sits in judgment on modern Germany and passes an unsparingly severe verdict.

In his view German history took the wrong turning in 1862 and has never recovered from what Bismarck did to it. Bismarck, in Count Blücher's estimation, was indeed a man of genius, but that was the trouble, for he taught the German people not only to associate success with "blood and iron," but also to expect always to be led by a genius. "We Germans," writes the author, "are a race of political genius-worshippers." Because the German Empire of the nineteenth century was the creation of one man, and because Bismarck so successfully crushed and discredited all opposition to himself, Germans acquired the habit of "unlimited trust in inspired leadership." Count Blücher regards both William II and Hitler as, in different ways, essentially charlatans who exploited the genius-worshipping state of mind induced by the extraordinary career of Bismarck.

The author ironically remarks that he writes to refute a book which has not yet been written—the apologia for Hitler which is bound to appear before long. He is merciless in his analysis both of Hitler's character and of German popular responses to it. While critical of the Treaty of Versailles and of the part played by the Allies between 1918 and 1924 in producing a "pariah-complex" in Germany, he finds that the most fatal factor in the destruction of the Weimar Republic was the German readiness to set out on "a fresh venture across the wide ocean of fantasy." He maintains that the success of Hitler was due to his "atrocious primitiveness"; Hitler was "entirely obsessed by an impulse for revenge, which was a product of his will," and against all rationally conceived political theories or programmes he set always one simple idea: the Jews are to blame for everything.

Count Blücher continually emphasises that antisemitism was the real core of Nazi belief and practice, and here his testimony as a German is particularly

valuable. British and American observers, however hostile to the Nazi faith, have always tended to attribute to it a degree of rationality which it did not possess, because they have never been able to comprehend how a nation pre-eminent in modern science and administrative efficiency could have been captured wholesale by a wave of monomaniac frenzy. But in the light of modern German history, as Count Blücher expounds it, the phenomenon is less incredible. He sometimes spoils a good case by over-statement—the minutes of Hitler's secret conferences produced at the Nuremberg trial show that it is going too far to say that Hitler's warfare was "a gigantic Jew-hunt and nothing more"—but he has done well in pointing out how the antisemitic fury provided the mainspring of the Nazi movement and how it drove Germany towards world conquest. For, just as in Communist theory Wall Street controls all countries which do not follow the leadership of Stalin, so in the Nazi myth the Elders of Zion controlled all lands not redeemed by the Aryan swastika; and in both cases alike the doctrine requires that the evil principle be pursued and extirpated in all parts of the world.

Gandhi

Selected Writings of Mahatma Gandhi. By Ronald Duncan. Faber, 253 pages, 12s. 6d.

Gandhi's Letters to a Disciple. Introduction by John Haynes Holmes. Gollancz, 234 pages, 12s. 6d.

While he lived, Mr Gandhi's personality was always good for a controversy. Some saw in him the age's greatest saint, others merely the world's biggest hypocrite. Neither opinion was true. Neither even, as these two books help to make clear, had any appreciable element of truth. Mr Gandhi claimed no mystic communion with the Infinite, no miraculous powers. His Inner Voice was his own conscience; and, far from being a hypocrite, he was a man of quite astonishing consistency of outlook, and of almost equally astonishing persistence in the repetition of a few, to him, very simple truths.

His values show up most clearly in the letters to Mira Behn. This is not an exciting book. Mira Behn's devotion has caused her to publish many letters of no literary or historical value. Some are medical bulletins about her malaria or his weight. Others are mere notes about the arrival of a train or the plan of a cottage. It is, indeed, precisely because they are so ordinary that these letters are so revealing. There was perhaps nobody of whom the Mahatma was fonder than he was of Mira Behn. He talks of her

as a daughter, and he shows for her quite as much concern as he ever did for his own children. To her he was the centre of the spiritual world; and the dominant motive of her life has clearly been the striving after holiness. An Admiral's daughter, Professor Carr-Saunders' niece, she gave up all the comforts of her background to spend her life in serving India. She did not quarrel with her family; she was no foolish ingenué, but a thoroughly practical woman. Whatever Gandhi gave her to do, she did; and nowhere does the way he looked at life come out more clearly than from his choice of tasks for her.

Their relationship continued for over 20 years, and it covered all the period from the disobedience movement of the early '30s to Gandhi's murder after independence. Yet politics are little mentioned. Gandhi has an occasional word of moral justification for his fasts; there is a long report from Mira Behn about the organisation of civil disobedience in Orissa, where a Japanese invasion to be successful, a report which in itself destroys the once popular theory that Gandhi was another Subhas Bose. That is all. There is not one word of hatred for the British, not one imputation of a base motive to anyone, not one letter about the arduous negotiations Gandhi so often had to conduct. The recurring themes are all moral, from the importance of simplicity in diet to the interpretation of the Bhagavad Gita and the Bible.

Gandhi was so close to Mira Behn that in writing to her a hint was enough. Naturally, therefore, the book is full of half-finished thoughts and scraps of attitudes. If one wants the thought in its entirety, the attitude in the mind, one must turn to Mr Duncan's selections. It is the proof of the sincerity and consistency of Gandhi's mind that, though the selections are mainly from books and articles which were in effect political tracts, and though many of them dated from the early '20s, before Gandhi had met Mira Behn, the general themes of both are the same. Over the years the ideas develop and are modified; they do not change. The basic ideas, indeed, go back into early youth. The Non-violence is a mixture between the profound respect for life of the Jain-imbuéd tradition of Gandhi's native Kathiawar and the Quaker aspect of Christianity—only the Bhagavad Gita influenced Gandhi more than the New Testament, and he was obviously deeply attracted by Christianity. The horror of untouchability began at the age of 12 when his mother finally failed to convince him that it was wrong to touch the sweeper. The emphasis on *brahmacharya* went back to a child marriage and an apparently unresponsive wife, which implanted in his mind while yet an adolescent a deep shame for desires most people would regard as normal.

Running through the whole of his thought can be seen two dominant ideas. From the Bhagavad Gita he took

the idea that a man's duty required of him right action, and that true renunciation means not refusing to act, but acting without personal interest in the result. This withdrawal from asceticism, this insistence upon applying the standards of religion to everyday conduct, is Gandhi's greatest contribution to contemporary Hinduism. His other guiding idea, the dignity of man, probably had a more Western origin; certainly it governed his politics. Indian independence, South African Satyagraha, the abolition of untouchability, were all referred back to the one touchstone; and it was altogether in character that Gandhi was deeply suspicious of communism and the all-embracing state; for him what mattered was the moral responsibility of the individual.

No one has been more important in the history of the last 30 years than Gandhi, and there is perhaps no one whom it is more valuable to understand. There could be no better beginning to understanding than to read these two books together.

Tito and Stalin

Tito and Goliath. By Hamilton Fish Armstrong. Gollancz, 318 pages, 18s.

Mr Armstrong begins this book by describing an interview which he had with Bukharin in Paris in 1936, when Bukharin elaborated at length upon the theme that national rivalry between Communist states was "by definition an impossibility." The rest of the book is a description and analysis of the way in which events since the war have proved Bukharin to be wrong. The result is an extremely interesting book which combines an exhaustive knowledge of the subject with great readability. Mr Armstrong never allows himself to get bogged down in a morass of Communist dialectic, and he makes good use of his own experiences in eastern Europe, particularly in Yugoslavia, to give point and colour to his narrative. Nearly half the book is devoted to the quarrel between Tito and Stalin, and the rest describes the reverberations of that quarrel, principally in eastern Europe.

One can only speculate whether the trials and purges that have shaken the east European Communist parties during recent years would have taken place if

Tito had not defied the Kremlin. Mr Armstrong believes that the fact that Tito has been successful in his defiance may, in the long run, have important psychological consequences. But such men as Gomulka in Poland and Clementis in Czechoslovakia would not have needed Tito's example to make them wish to rebel against slavish obedience to Moscow. The recent upheavals have been as much a measure of the Kremlin's implacable determination that Tito should have no successful imitators as of the actual infectiousness of his example. Mr Armstrong believes, for instance, that Rajk may well have owed his downfall to the fact that the eminence of his position in the Hungarian Workers' Party and in the Government made him so "well suited to induce terror as a ceremonial sacrifice." His destruction would demonstrate that "none was immune to the workings of the system."

Mr Armstrong traces the Tito-Stalin quarrel in detail from its first faint beginnings in 1941. He points out that more than any other Communist Party anywhere, the Yugoslav party is the creation of one man. In assessing the significance of events inside Yugoslavia since 1948, Mr Armstrong suffers the disadvantage that his book had to go to press while the situation was still rapidly evolving. But he has had the great advantage of frequent visits to Yugoslavia and discussions with the Yugoslav leaders, including Tito himself. The Marshal could hardly hope to have his position explained to the western world by a non-Communist in a more scrupulously fair way. Mr Armstrong judges Tito's moves to liberalise his regime with realism and common sense. And while emphasising that Tito and the West both need each other's support, he makes it quite clear that the West can never hope to dictate to Tito. "Pressure will not succeed with a man who has staked his life on his ability to resist pressure."

French Institutions

The Parliament of France. By D. W. S. Lidderdale. Hansard Society, 296 pages, 18s.

It is rare for a standard work on the detailed organisation of political insti-

tutions in one country to be written by a citizen and in the language of another. Yet Mr Lidderdale looks like achieving this distinction. Under the aegis of the Hansard Society he has made a valuable contribution towards an understanding of French parliamentary procedure, and with it of the politics of France. This is, however, not the limit of its usefulness. The French rather than the British model has been close at hand for most of the other European countries who have experienced some form of parliamentary government in modern times; and on the international scene, and especially at Strasburg, a knowledge of the French system would appear to be indispensable.

In form, Mr Lidderdale's book is a study of the various provisions of the constitution of the Fourth Republic governing the election and organisation of its Parliament and its tasks, and also of the standing orders which regulate the habits of its two houses. But indispensable as is such an account for purposes of reference, the principal interest of the book for the less technically inclined is elsewhere. In the first place, Mr Lidderdale has a proper sense of the importance of the past, a sense without which the study of institutions is meaningless, and he is able to present briefly but cogently the various elements in the French tradition going right back to 1789 that have made French institutions what they are today. It is a matter of such interest that one could wish he had been able to expand it in greater detail. In the second place, he is well aware of the fundamental differences between the French and British notions of parliamentary government and the way they express themselves in the conduct of debates. "The absence of basic rules of debate [in the French Assembly] is as surprising to an Englishman as their purpose is difficult to explain to a Frenchman." Equally enlightening is his discussion of the use of proxies in France compared with the French bewilderment at the practice of pairing. It is this infusion of the details of procedure with a real understanding of fundamental ideas that explains the outstanding contribution that this book makes to the comparative study of institutions. A similar work on Congress by someone with Mr Lidderdale's qualifications and gifts would be not less valuable.

The Third Way

Freedom, Power and Democratic Planning. By Karl Mannheim. Routledge and Kegan Paul. 384 pages. 25s.

This book by the late Professor Mannheim is described by his publishers as his political testament. It was, indeed, to be the most ambitious attempt of the author of "Ideology and Utopia" and "Man and Society" to grapple with what he saw as the fundamental problems facing our society and to provide both a diagnosis of those problems and a therapy for their solution. This volume, however, is not the finished product of Mannheim's thought but a compilation of a number of unpublished writings; and though they possess a common theme and have been skilfully brought together by his editors, they yet bear the mark of work still far from complete when the author died.

The thread which binds these essays is the conviction that we stand in urgent need of a new social unity. Our society, Mannheim argues, suffers from basic maladjustments because it has failed to evolve social techniques and a system of values for the control and co-ordination of technological progress. Concentrations of economic and political power have increasingly favoured minority rule, divorced the individual from the places of decision and denied him the achievement of active citizenship. The task is to recreate the "integrated society," in which social control is reconciled with individual initiative and government and the community are no longer separate entities. This is the society of the Third Way, the middle ground between anarchy and autocratic control. It is not, however, with the mechanics of economic planning or with the political problems it creates that the author was primarily concerned. Institutional change, the control of power and the selection of governing groups in the democratically planned society were subordinate, in his system of priorities, to a far vaster view of what the integrated society requires. It requires nothing less, in fact, than the "remaking of man and the reconditioning of human behaviour." Reform, in Mannheim's view, must proceed on three related levels. There is first the reshaping of institutions in order that power, in whatever form, may be brought under democratic control. Secondly, we must

foster, primarily by a more adequate social education, "democratic behaviour" and "democratic personality," designed to produce co-operation and tolerance. And thirdly, there must be a redefinition of values, a rediscovery of a shared ethic. Such an ethic, Mannheim came to believe, could be found in a "dynamic religion," alive to social problems and willing to contribute to their solution.

There is much, in these pages that is both stimulating and suggestive and many of its author's aims and hopes would find ready agreement. But as an analysis of the instruments and methods of change, the book is profoundly disappointing. It postulates an ease in transforming men and institutions which strikes one as oddly unreal. It seldom comes to grips with the problems of conflict that accompany the disturbance of privilege and traditional patterns. It seems to suggest that the Third Way is round the corner, were we but willing to see it and act upon the vision. But the faith which creates the vision is no substitute for a more solid evaluation than is to be found here of the means to its achievement.

Bare Bones of Nationalisation

The British Coal Industry. By H. Townshend-Rose. Allen and Unwin. 162 pages. 12s. 6d.

This book is the first of a new "National Board Series." The series, which will finally cover coal, electricity, gas and transport, is intended to meet the needs of the general reader and the university student of the social sciences. In particular—the publishers claim—these volumes should "provide the staffs of the new Boards with a clear idea of the structure and working of the whole organism of which they are part."

The book is of additional interest because it is the first comprehensive study of the organisation of a nationalised industry by one of its employees—the author is a member of the legal department of the National Coal Board. One of the unforeseen dilemmas of nationalising whole industries is that the only people in a position to acquire the background for judging the implications of their admittedly complex problems are the employees of

the corporations themselves. It would be unfortunate if the present volume reflected the extent to which the Boards or their employees are prepared to go in self-analysis.

The book starts with a succinct chapter on the background to nationalisation from the Sankey Report to the Reid Report. The only omission is that no mention is made of the "Foot" Plan. It then summarises clearly the process of nationalising the industry. But when the book leaves history and comes to present-day problems, two factors vitiate its value. First, there is the delay in publication. Secondly, the author imposes on himself two self-denying ordinances: the book is not based on first-hand research, but is only a rearrangement of material generally available to the public. This deprives it of half its possible value. Further, the author thinks that "it would be presumptuous as an employee of the Board to attempt to evaluate what has been achieved" and refrains therefore from any criticism. Thus a second though much more difficult opportunity is lost. This means that the reader looks in vain for any new facts, or any analysis of the internal organisation of the Board. There is, indeed, value in the bare facts which the book supplies. But if nationalised industries are only to have such uncourageous spokesmen it is going to be exceedingly difficult for students or the public to be intelligently informed. As the web of public enterprise extends it is increasingly important to find a way into its intricacies.

Shorter Notices

The Memoirs of Ernst Von Weizsacker.

Translated by John Andrews. Gollancz.

322 pages. 16s.

An English edition of Baron Ernst von Weizsacker's "Erinnerungen" has now been published. A review of the German edition appeared in *The Economist* of February 3rd, 1951.

Guide for the Company Secretary. By

Arthur Coles. Revised by D. S. W.

Poulter. Pitman. 276 pages. 20s.

The seventh edition of this well-known book has been extensively revised so as to take account of the provision of the 1948 Companies Act. Emphasis is made throughout not only on the legal aspects of the Secretary's work but also on the practical requirements of day by day routine.

A RICHER COUNTRY through British Skill

Capital and manpower cannot of themselves produce a thriving new industry. The missing element, although not easily described in one word, is often called technique: the right machines correctly designed and skilfully operated. How can this be acquired? The process of trial and error is costly and slow. Fortunately, there are organisations—such as the Vickers Group in Britain—able to provide not only the most up-to-date production machinery, but also advice on its operation based on long experience. The field that Vickers covers includes transport by land, sea and air; mining; and manufacturing of many kinds, both light and heavy. A cross-section of the Group's work can be seen at an Exhibition now being held at Vickers House, Broadway, London, S.W.1.

AMERICAN SURVEY

Inquest on China

Washington, D.C.

IF the Senators who are inquiring into the MacArthur affair were concerned solely with eliciting and understanding the available facts on United States policy and performance in the Far East, their enterprise would now be within measurable distance of completion. Most of the available facts, from Yalta to Pyongyang, have been elicited, and no phenomenal intellectual equipment is required to understand them. But anyone in Washington who began to read the transcript of the hearings in the belief that all the members of the Senate Joint Committee were men dedicated to the search for truth alone must by now be sorely disillusioned.

Last week's testimony was notable for a long, careful and lucid exposition by Mr Dean Acheson, the Secretary of State, of the policy the United States has pursued in China since the war with Japan ended, of the circumstances that have arisen to frustrate that policy, and of the events which have led the United States to fight the forces of the new masters of China in Korea while the old masters of China dwell in peace on the island of Formosa.

A wholly disinterested auditor might well feel that what Mr Acheson said leaves one important doubt unresolved. The Secretary of State has demonstrated that the Chinese Nationalists lost the civil war, in spite of the immense military, economic and territorial advantages they enjoyed, because their cause was betrayed by inefficient and corrupt leaders under a Generalissimo who would not, or could not, institute the reforms that alone might have saved the day. If this is so, the disinterested auditor might ask, what moral or practical purpose is to be secured by a policy which continues to give American recognition and support to this same Generalissimo and his administration after they have lost the recognition and support of their own people? But though Mr Acheson has been assailed and abused on other grounds, this doubt has not been expressed at all. None of the hundreds of questions put to him even suggest that any Senator feels uncertain about the wisdom of leaving the American eggs in a basket whose bottom fell out when it was last lifted.

This is not the least curious aspect of the inquiry, though in America it is probably the least noticed. The other curious and better noticed aspect is the unconcealed effort of what is already being called a little group of wilful men, in and out of the Senate Joint Committee, to obfuscate and direct attention away from such of the elicited facts as conflict with a different thesis about China, one which, if accepted by the public, would weaken confidence in Mr Truman's Administration and help to secure its defeat at next year's elections. This effort has been encouraged by the "China Lobby," operating on behalf of the Nationalists to an extent and by methods which the Administration's supporters in Congress are now proposing should be investigated in their turn.

The rival thesis requires that Mr Acheson should be held guilty of "barefaced distortion," that his statement on China

policy should be regarded as a "miracle of contrived confusion" which is "well calculated to deceive the American people." These are phrases of Senator Brewster, Republican of Maine, a member of the Senate Joint Committee. One of his Republican colleagues, Senator Morse, of Oregon, had earlier congratulated Mr Acheson on "one of the clearest digests and synopses of a very complex international matter that it has ever been my privilege and pleasure to hear"; but the indications that they are splitting their own party seem not so far to have troubled those Senators who are dedicated to the Up-with-Chiang, Down-with-Acheson endeavour.

What this Republican school of thought is trying to demonstrate is that Nationalist China was sold down the river at Yalta by a Democratic Administration which later showed that it had been fooled into believing that the Chinese Communists were harmless agrarian reformers with whom it would be possible to do future business. Having made this appalling mistake, the story goes on, the Democratic Administration, led by the nose by Mr Acheson and the Communist-loving faction in the State Department, sent a reluctant General Marshall to China to force the Nationalists into an unholy coalition with the Communists, then denied them adequate arms and made their defeat certain.

★

Anyone in America, who is willing to make the effort of attention necessary to discern what has happened since Mr Acheson began to testify, must be aware that gaping holes have been torn in this China thesis in which so large a part of the Republican Party now holds so great a political investment. Not every argument the Secretary has produced has been conclusive, and not every position he has taken has been unassailable. There might be some reservations, for example, on his defence of the deal at Yalta, but it is now beyond dispute that the Republicans are not in a good position to enter them. For Senator McMahon of Connecticut—who has shown more enterprise than any of the other Democratic members of the Joint Committee—smoothly produced a speech that Senator Wiley had made in July, 1945, calling for Russia's entry into the Far Eastern war to save "countless American lives."

Senator McMahon further drew attention to the absence of any single Republican objection at the time to General Marshall's policy. Mr Acheson noted that the coalition plan was not based upon any illusion within the State Department that the Chinese Communists were agrarian reformers, but was an idea originated and produced by the Chinese Nationalists themselves; that it was the only plan for China

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

that the United States had the military strength or public support to further; that General Marshall's arm could hardly have been twisted by the State Department since he drafted his own instructions for the mission to China; that the relevant committees of Congress had learned at the time from the head of the American Military Mission and from testimony submitted by the American Chamber of Commerce of "one of the largest cities in China" that the Nationalist forces, weakened by greedy leaders, were disintegrating and handing over their arms to the Communists; and that General Marshall's request for \$570 million in aid for the Nationalists was reduced by Congress to \$400 million.

These were contributions useful, to say the least, to anyone who wanted to elicit and understand the ascertainable facts. But they were not helping the China thesis of the Republican group, and so vigorous efforts were made to refute them. Senator Brewster at one point found himself in the same half-hour strongly telling Mr Acheson, on the one hand, that the Nationalists could not fight because the United States had not supplied them with enough ammunition and, on the other, that the Nationalists fought so well that they inflicted 1,233,000 casualties on the Communists—a feat, as Senator Long mildly indicated, unequalled in modern times, in that it credited the Nationalists with wiping out 80 per cent of the enemy.

Mr Acheson was released last Saturday after forty hours of questioning. On Monday General Wedemeyer, who commanded the American forces in the China theatre and was General Chiang Kai-shek's Chief of Staff between 1944 and 1946, came in to bat and laid about him briskly with a series of spectacular, if not wholly consistent, swipes. Uninhibited by the fact that he still holds the command of the United States Sixth Army, he first supported General MacArthur's demand for the bombing and blockading of China, and then recommended American withdrawal from Korea, severance of diplomatic relations with "the Soviet enemy" and acceptance of the "calculated risk" of a third world war. But though he did considerable contradicting—of Mr Acheson in the first place and in the second place, in the opinion of many who heard or read him, of himself—he left relatively undisturbed the record of what happened in China.

Everything considered, indeed, the group's China thesis is now leaking rather badly. For those who must sink or swim with it, the obvious technique in these circumstances is to go on making the same accusations as though none of them had ever been refuted—indeed, to say the same things louder than ever. At the end of the week Senator Taft, the Republican leader, was telling a reporter: "Acheson's explanation is just a cover up. . . . They really wanted the Communists to take over. . . ."

Divided Keystone

[FROM A CORRESPONDENT IN PHILADELPHIA]

PENNSYLVANIA began to be called the Keystone State about 1800 and, although California has at last drawn level in population, and New York has long surpassed it, Pennsylvania retains great political importance, by virtue of its voting strength and economic power. Control of the keystone, however, is hotly disputed today. The Republicans regained their century-old hold on Pennsylvania in 1948, after four Roosevelt victories. But inside the party, the venerable Grundy dynasty is challenged by Senator James Duff, the former Governor who last year unseated Senator Myers, the

Democratic whip. This split is the more painful because of the likelihood that the Democrats will be able to capture new votes in the fast-growing industrial areas.

Senator Duff is the most interesting political figure Pennsylvania has produced in recent years. In the state, though a wholehearted Republican, he is engaged in a running battle for control against what he regards as the reactionary manufacturing barony. In Washington, his thinking follows the lines laid down by the late Senator Vandenberg and General Eisenhower. His interest in international affairs, however, will probably have to take second place to the practical matter of winning control of Pennsylvania's powerful delegation to the Republican National Convention, which selects the party's candidates. The task of reviving a bi-partisan foreign policy, which he favours, is also one to be approached with caution by a Senator who, although he is 68 years old, is in his first term.

When Senator Duff departed for Washington he left the state machinery in Harrisburg in the hands of Governor Fine, his running-mate. They had won their nominations over the opposition of the Republican old guard led by followers of former Senator Grundy, an 89-year-old power of the high tariff school. Mr Duff was one of these originally but, shortly after he became Governor, he revolted against their "horse and buggy" ideas and "McKinley politics." Since then he has stressed Pennsylvania's need for progressive government. The split was widened in 1948 when the machine decided to support Governor Dewey of New York for the Republican nomination, rather than Senator Vandenberg, whom Mr Duff favoured. In his irritation, Mr Duff was driven temporarily into the camp of Senator Taft, where today he would hardly feel at home.

While Senator Duff has been in Washington, learning to deal with the problems of a national legislator, the Grundy influence has been making itself felt once more in the state legislature at Harrisburg. Many of Mr Duff's projects for social betterment have been brought to a standstill, though it must be conceded that the state government is beset by trying tax problems, some of them bequeathed to it by Mr Duff himself.

But Pennsylvania's role will not be determined entirely by which Republicans win this internal feud. The state was carried by Mr Dewey in the 1948 Presidential elections, but only by 150,000 votes out of a total vote of 3,735,149. Then, Pennsylvania's population was about ten million; according to unofficial estimates, it is now half a million larger. Neither party can count upon an easy victory next year.

Presumably, the Democrats' aim will be to seize Pennsylvania's other Senate seat for former Senator Myers, a Roosevelt-Truman Democrat, who will be assured of all the support the President can give him. His opponent would be Senator Edward Martin, a Republican, but a representative of the school of Republican thought that Mr Duff so emphatically opposes, in both its domestic and its international ideas. There will be no shadow of bipartisanship, but both ex-Senator Myers and Senator Duff, from opposing sides of the political fence, will be challenging Pennsylvania's traditional, rock-ribbed and very much alive old-line Republicanism.

An important indication of how the battle is going may be given by this year's elections for Mayor and other important offices in Philadelphia, Pennsylvania's largest city. Philadelphia is an old citadel of Republican patronage

politics; the local machine has always refused to share its power by seeking the label of "independence" or "good government." But it has lost four elections, and in 1948 President Truman won 432,699 votes as against 425,962 for Mr Dewey. This was a margin of less than 7,000 in a city of 2,000,000, but the Republicans are badly frightened, and now are frantically searching for independent candidates who might stem the Democratic tide which has been set in motion. The Democrats are still far from controlling Philadelphia, but their progressives have the best chance of winning such control that they have had for fifty years—and some progressive Republicans in the city are on their side.

At the other, western, end of the state, where the freight-laden Allegheny and Monongahela rivers join to make the Ohio, lie Pittsburgh and its industrial environs, a Democratic stronghold. Here, in a city whose political boss is its Democratic Mayor, is the home of the Mellon industrial and financial empire, and also the home of Senator Duff. Between the two extremities of the state lie the rural counties which are the heart of old-fashioned Republicanism, territory which owes its allegiance not to Senator Duff, but to ex-Senator Grundy and his supporters.

It would be foolish to say that Senator Duff is no friend of Pennsylvania's industry and business. He likes to recall that, when he left the governorship, Pennsylvania had more than 17,000 manufacturing establishments with a capital investment of more than \$3 billion. They employed a million workers producing more than \$6 billion worth of manufactures. He does believe that many of the state's ablest leaders are misled both in their international and their social thinking. A studious and unexcitable observer, his view of the MacArthur controversy was that Americans should keep their heads and discover what had happened. He supported General Eisenhower on the troops-to-Europe issue.

There have been suggestions that Senator Duff, whose vigour belies his age, might himself emerge as a Republican candidate next year. It is certain that he will be a power, but he may prefer to exercise it on behalf of some other candidate, such as General Eisenhower, for whom he has so much admiration.

American Notes

Beef on Strike

In the two weeks since the price meat packers may pay for beef was "rolled back" 10 per cent, beef cattle have almost ceased to roll into the stockyards. Slaughtering is down by 50 per cent or thereabouts, and the shortage is filtering through to retail meat counters. There is now little doubt that this is more than a temporary maladjustment, that it is a strike by the cattlemen, an attempt to force the withdrawal of the further roll-backs in the price of beef which have been ordered for August 1st and October 1st. The cattlemen are, in fact, making the prophecies of their Washington lobbyists come true and are seeing to it that price control does produce the beef famine that was predicted. How long they can afford to keep their cattle eating their heads off in the feeding lots is doubtful, but in the meantime they have provided the farmers' representatives with ammunition for torpedoing the Defence Production Act when it sails on to the floors of Congress, as it must before the end of the month.

The leaders of both parties have guaranteed that they will not sink the Act, but it is probable that the present uncertainties in the military and economic outlook may be made the excuse for extending it only temporarily, a move which would add to the uncertainties, at least as far as the economy is

concerned. The President and his advisers do not share this uncertainty; they can see an "unmanageable torrent of inflation" piling up by the autumn, and they are now, rather belatedly, warning the buying public that, if it does not protest, Congress will take away its "economic lifebelts," the controls that have enabled consumers to keep their heads above the inflationary tide so far. The beef strike is the test case, both of Congressional resistance to pressure groups and of the housewives' willingness to go without stewing steak today for the sake of a cheaper joint tomorrow. For beef is the most important single item in the American cost of living, and it was a cattlemen's strike that killed price control in 1946.

Without price control the task of the Wage Stabilisation Board would become impossible; so far it is working satisfactorily, even if only tentatively. True, wages are climbing, but there is a sound excuse for each upward step: the productivity increase that has been allowed to automobile workers was an important part of a contract that has brought peace to the industry, and is not supposed to involve a price rise; shipyard wages, which have now gone up, had not kept pace with those in other trades for several years, because of the depressed state of the industry. The members of the Board, plotting their course from case to case, seem to be arriving at much the same destination, a controlled rise in the wage level, closely related to the cost of living, as they would do by mapping out general principles in advance, a method which Mr Eric Johnston, in charge of economic stabilisation as a whole, would prefer and may yet insist on.

and disgrace" of strategic materials moving through Hongkong to be used against United Nations troops in Korea. What it actually does is to prohibit economic or financial, but not military, assistance to any country which exports arms or military material, or anything which may be used in their manufacture, to the Soviet Union or its satellites. The President was obliged to approve the amendment because it was attached as a rider to an urgently needed appropriation Bill, a procedure which enabled a major piece of legislation affecting the foreign policy of the United States to be passed without being studied by the relevant committees of Congress. It is doubtful if in fact Congress realised that it was doing anything more than embarrassing the Administration.

Senator Kem is now, however, being tormented with the monster he has created; to one whose knowledge of the whereabouts of the iron curtain is probably not very precise, it must come as a shock to find that Communist Yugoslavia is the only country that is not impeded by his rider. For Yugoslavia has already a complete embargo on trade with the Soviet and its satellites; every other recipient of American aid exports at least some of the articles, from feathers to castor oil, which the Administration has decided must be banned under the loosely-worded amendment. The lists just issued would, in the words of an official, "make the Sears Roebuck catalogue look like a drop in the bucket" and the rules, if followed to the letter, would not only prevent the development of Indian manganese deposits that are vital to the United States, but would stop the aid that is helping countries such as Austria to resist Communist influence.

President Truman, while agreeing that it is a sound principle to prevent the Soviet block from acquiring goods that would add to its military strength, pointed out that the most unsatisfactory of the many unsatisfactory aspects of the Kem amendment is that it ignores the benefits of two-way trade; the free world is at present getting more from the Soviet satellites than it gives to them and therefore needs less help from the United States than it would otherwise do. Until Congress provides a workable substitute for Senator Kem's monster, economic assistance will be saved from its jaws by the President's power to authorise exemptions in the interests of national security. Since it would be impossible for countries receiving aid to comply with the regulations in the time allowed, Mr Truman has really no alternative, but his action will not oil the wheels for a Congressional reversal of policy. Now, however, that the full implications of what it has done are being made clear, Congress may be ready to reconsider what was intended more as an expression of opinion than as a change of direction.

* * *

Battle of Thirty-Fourth Street

The price war, with its platoons of comparison shoppers, still continues on New York's 34th Street and sporadically across the country, but there is nothing to compare with the scenes a fortnight ago when shoppers broke plate-glass windows and revolving doors to take advantages of price cuts as deep as 40 per cent in some cases. Stocks of the most popular bargains are temporarily exhausted, and the New York stores, though noting with satisfaction that their trade in the war's first week had risen by 25 per cent, have begun to wonder whether they are not robbing the future to make a shoppers' holiday. As replacements are brought in, even R. H. Macy and Company, which fired the first shot, may be content with the 6 per cent reduction which it has long contended reflects the savings of its "no credit" policy.

Meanwhile, small retailers and manufacturers caught in the cross-fire are attempting to salvage what they can from the wreckage of the fair trade laws, the euphemism for retail price maintenance. The New York Supreme Court, at the request of a Brooklyn chemist, has ordered Macy's to cease

selling pharmaceutical products made within the state at prices below those fixed by the manufacturer. This, however, is small comfort, for home-produced pharmaceuticals make up a small part of Macy's stock. More drastic legal remedies are being proposed by indignant retailers to the New York board of inquiry, such as a ban on the advertising of "loss leaders" without the manufacturers' consent. Such bargains, it is argued, are purely devices to lure the unwary shopper into the spider's web. Some manufacturers have already refused to sell direct to Macy's, on the ground that when their product is sold at a loss public confidence in its value is undermined. Still others are hastening to require resale price maintenance contracts from all their customers.

The usefulness of all these steps is very limited; what most manufacturers and retailers would like would be for Congress to pass a law specifically permitting the states to force retailers to charge the prices on all goods fixed by the manufacturer—something the Supreme Court found the Miller-Tydings amendment did not do. Such a law probably could not be passed unless there developed price wars as severe as those in the nineteen-thirties, something not very likely at a time when supplies of consumers' goods are bound to decline and consumers' incomes to rise. The Senate Small Business Committee, however, is to look into complaints of small businessmen that the decision may force them into bankruptcy. A more real danger to the small businessman would appear to stem from an earlier decision of the Court. This so interpreted the Robinson-Patman Act as to permit sellers to discriminate between buyers, granting lower prices to some than to others, if it is done in good faith to meet competition. When harder times return, it would allow large buyers to secure bigger discounts than are justified and exaggerate the advantages of mass distribution they already enjoy.

* * *

First Aid for Medical Schools

The nation's 79 medical schools, suffering from acute deficits although they are full to capacity, are to receive first aid from a new National Fund for Medical Education. Its chairman is Mr Herbert Hoover and it is supported by the medical profession, the life insurance companies, industry, the trade unions and a number of scientific and educational foundations. The aim is to collect \$5,000,000 a year in voluntary contributions from those who benefit from medical science. The American Medical Association has agreed to turn over to the new fund the \$500,000 it appropriated for the schools last December—a sum the doctors' critics insist on regarding as conscience money for the part the AMA had played in blocking federal aid for the medical schools. The \$500,000 was a part—only a small part—of the \$3,600,000 the AMA collected by assessments on individual doctors to fight compulsory health insurance.

It has been the fervent wish of the AMA that voluntary effort might reverse the tide of federal subsidies and government control. But it is to be hoped that the new fund may be a supplement to federal aid, rather than a substitute for it. For \$5,000,000 a year, even if it can be guaranteed, will not cure the financial anæmia of the medical schools. A committee appointed by the US Surgeon General estimates that \$40 million a year is needed to put them on a healthy foundation at present levels of enrolment; to train more doctors, additional funds for expansion must be found.

Before the rearmament drive, the Public Health Service estimated that the country would be short of 15,000 doctors by 1960. The number of doctors declined from 1940 to 1950 (though three-quarters of the qualified applicants for medical training are turned away for lack of room), while the population, and its ability to pay for medical care, grew. The expansion of the armed forces will drain away both doctors and nurses. The AMA disputes the shortage, arguing that the additional "productivity" of doctors—

Dictaphone TIME-MASTER recording is perfect from beginning to end

YOU WANT absolute accuracy—and you get it when you use a Dictaphone Time-Master for your dictation.

There's no fading or distortion of your words when your secretary transcribes. For Memobelt recording is crystal-clear from beginning to end—far, far more dependable than either notebook-and-pencil systems or any other dictating method.

The reason? Simply—cylindrical recording. Those plastic Memobelts that you can file flat or mail by the dozen in an envelope, are virtually cylinders when they are in the machine.

CONSTANT RECORDING CLARITY

Cylindrical recording means crystal-clear dictation from beginning to end; it means constant recording speed; and it means that back-spacing too is uniform—and therefore simpler.

ONLY THE TIME-MASTER OFFERS ALL THIS

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform back-spacing, immediate place finding.
4. Simple automatic operation.
5. Mailable, fileable, expendable Memobelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd.
Dept. O., 107 Kingsway, London, W.C.2.

What colour is more production?

That's what we said: if you find a factory producing more, more quickly and efficiently, what colour do you expect to see on the walls, the machinery, the controls?

This question matters a lot, and of course there's no single answer to it. But we do know an answer to eye-strain, greatest single factor causing fatigue and keeping production down. That answer is: careful colour planning. Dingy dark greys and browns, which cloak dirt instead of making it easy to shift, are not good enough—even positively harmful sometimes. Yet at no extra cost, when painting, factories can be made lighter, more cheerful, easier places to keep clean and to work in.

This improved atmosphere is always followed by improved production.

In 'Factory Painting for Increased Productivity' you'll find principles that can be applied with profit to any factory, simply and interestingly set out with practical illustrations in colour. We will send you your copy, free of any obligation, if you will write for it to

JOHN HALL & SONS (Bristol & London) LTD

thanks to the so-called "wonder-drugs" and better organisation—more than offsets the decline in their numbers. But no one doubts that if war, accompanied by atomic attacks, should come, there would be a disastrous shortage of doctors and nurses. No one believes it would be safe, this time, to reduce the number of doctors for the civilian population as drastically as was done during the last war.

Last year the Senate passed a Bill embodying the President's plan for a five-year programme of aid to medical education. Each school would have received \$500 for each student, and larger sums were offered to schools expanding their enrolments. The Bill was killed in the House on the grounds it opened the way to federal control of education. Voluntary efforts may be able to keep the medical schools from bleeding to death at once, but last year's Bill, or something like it, is needed if they are to enjoy permanent good health and provide all the doctors that are needed.

★ ★ ★

TV Goes to the Movies

This week the millions of spectator sportsmen who have been taking their exercise on their own television sets had their armchairs pulled out from under them, by a combined attempt by sports promoters and cinema owners to counter television's threat to box-office receipts. To see the Louis-Savold championship in New York, where it was to take place, it was necessary to attend the fight; it was nowhere available in the home, but in Washington, Chicago and a few other cities, it was to be "piped" directly into movie theatres by coaxial cable from cameras at the ring-side. So far only a few cinemas are suitably equipped for this, but the number with large screen television facilities is growing rapidly. Before long theatre owners should be able to offer not only sports promoters, but also producers of other types of entertainment, terms more attractive than can the advertisers who sponsor television programmes on the networks. To many this seems one way of checking the alarming fall in movie attendances, which have dropped by over 20 per cent in the last five years, to under 60 million a week.

United Paramount Theatres Inc., one of the pioneers in this attempt to go along with television instead of being put on the shelf by it, presumably hopes that bigger and better television programmes for its movie screens will be one of the offspring of its proposed union with the American Broadcasting Company. This merger, if approved by the Federal Communications Commission, will be a marriage between two firms that were divorced from their previous partners by anti-trust decree. ABC was formerly the second network of the National Broadcasting Company and United Paramount was until recently the theatre-owning branch of the Paramount Pictures Corporation. Similar divorces are being forced by the Department of Justice upon all the film-producing companies that also own theatres.

Partly because of this separation, but more because of rising costs, Hollywood is so depressed that recently one leading corporation asked its top executives to take salary cuts of from 25 to 50 per cent. It has been estimated that television stations will eventually be in the market for far more films than Hollywood has ever produced in a year, so it is not surprising that the picture-making companies are beginning to flirt with the new medium that they have cold-shouldered for so long. There is no question yet of television networks being allowed to carry the latest feature films, nor indeed could they afford them; but there are plenty of old films that still have life in them and that could be earning their keep if telecasters were allowed to rent them. At present all they can get are second-rate films that even in their first youth were not worth seeing. Furthermore, there are increasing opportunities for making films directly for television, as some independent producers, and some television networks, are already doing.

No Education Without Segregation

The doors of the law school of the University of North Carolina, like those of so many other graduate and professional schools in the South, must open to admit Negro students. Under past decisions of the Supreme Court Negro students may be excluded from white colleges only if a State provides them with equal opportunities within its borders. Unlike most States, which have reluctantly conceded that such equal facilities do not exist and that they cannot afford to provide them for graduates, the University of North Carolina contended that the opportunities for Negroes to study law at the Negro North Carolina College were substantially the same as those at the University, though the resources of the latter are many times greater. That contention has not been upheld by the Supreme Court.

The south is becoming accustomed to the admission of small numbers of highly educated Negroes to its graduate and professional schools, unheard-of though such a thing would have been five years ago. What is creating a solid resistance movement is the threat that court action may abolish segregation right down the educational ladder. Most of the southern States, fearing the long arm of the Supreme Court, are hastily attempting, out of their meagre resources, to remedy the generations of neglect from which the Negro schools have suffered. The suits being brought in three States, however, do not merely ask admission for coloured children to the white schools because those for Negroes are inferior; they argue that no school exclusively for Negroes, whatever its physical or academic standards, can provide opportunities equal to those offered by an unsegregated school. One of these cases is already being heard in South Carolina and a decision from the Supreme Court is expected early next year.

Even progressive opinion in the more advanced States of the South is frightened by the speed with which segregation is being challenged on its strongest ground, and fearful of the disturbances which may follow. In the deep South, preparations are already far advanced to defy or evade an adverse court decision. In Georgia, the legislature has given authority for state funds to be withheld from the schools if a single Negro child is admitted to a white institution; Florida is following suit; and in South Carolina school trustees are to be permitted to sell or lease school buildings to private groups. The Governors of Mississippi, Georgia, and South Carolina—the latter Mr James Byrnes, a former Justice of the Supreme Court—have all declared that they would discard the public schools rather than forego segregation. This is a position they may not be able to maintain either legally or practically. But the South has shown, since the war, that it is willing to modify its racial practices, and the Negro leaders might, with feeling as strong as this, have been wiser to move more slowly.

Shorter Notes

Washington's "captive audience" is on the way to freedom from "forced listening." The District of Columbia Court of Appeals has ruled that the Capital Transit Company has deprived citizens of their constitutional freedom by broadcasting commercial programmes on its trams and buses, since the passengers have had no alternative but to listen or cease to use public transport.

★

For the coming fiscal year, 1952, only \$800 million is being requested from Congress for stockpiling of strategic materials. This programme has been granted \$4.4 billion in new obligational authority since it began and \$2.9 billion in the 1951 fiscal year, "to accelerate current procurement and to provide for long-term commitments for deliveries from new or expanded sources of supply." From now on, therefore, it is necessary to provide only for current procurement and for a few additional long-term commitments.

THE WORLD OVERSEAS

Confidence in Berlin

(From Our Special Correspondent)

FOR the past fortnight the Russians have again been holding up trade from West Berlin. This is on the pretext that "certificates of origin" are required for all raw materials used in exports from the city. But it is in reality an effort to influence current trade negotiations and in retaliation for the efforts being made by the western powers to stop smuggling from western Germany into the Soviet zone. In spite of such pressures, however, the most remarkable feature about Berlin during the past few months has been the way in which this unique sector in the cold war has settled down. In fact, it would probably now be wrong to put Berlin into quite the same category of such actual or potential trouble spots as Korea, Indo-China, Persia or Yugoslavia. Both sides in the city are certainly aware that serious trouble can always be created at very short notice; there have already been sixteen boundary incidents this year on the 150-mile perimeter of the western sectors—including the Russians' legal but crude occupation of Staaken in February. There is, however, a strong feeling that, as a result of intense experience in constantly handling highly inflammable political material, both the Russians and the western powers now "know the form." If the Russians persist in a move designed to embarrass the allied authorities—and the British have labelled as a "pin-prick policy" the Soviet tactics of trying some new gambit two or three times every month—the western powers take counter-action, not necessarily in direct opposition but somewhere else on the great chessboard of Germany. And usually within a few days, the balance is restored to its steady if sensitive normal.

Nothing, of course, will alter the fact that Berlin is in the front line of the struggle between the free world and the Communists. But, as is often the way with the front line, there is an atmosphere of calm and confidence in the city itself which is sometimes lacking in the world outside. And while this atmosphere has mainly grown up since the raising of the blockade, nothing should be allowed to detract from the great credit due to the western occupation authorities—in the British sector Major General Bourne has done an outstanding job—and to the Berliners for the way they have both handled their problems all through the last two or three years. This is most particularly true of the people of Berlin themselves, of whom one in four is still unemployed; without their co-operation it would have been difficult to create the relatively stable conditions of today. That being said, it is well to draw the lesson of Berlin for the rest of Western Europe. Two unusual factors have been at work in the city and have brought its people to resist Communism more stoutly and with greater unanimity than elsewhere. First, they experienced the rule of the Red Army for two months in the summer of 1945 before being taken over by the western allies; and they have never forgotten the experience. Secondly, they have now had plenty of evidence that the western allies mean business and will not abandon them without fighting a world war; Berlin is still the only place in Germany where a public statement to this effect is applauded and cheered.

The Road to Stability

Four landmarks stand out in the recent history of Berlin and have contributed to the city's confidence, as well as to the good relations between the western authorities and

the Berliners—relations which are now in contrast to the deteriorating atmosphere in the Federal Republic. The first was naturally the breaking of the Russian blockade; in that, western success is attributed almost as much to the counter-blockade of the Soviet zone and the stopping of the flow of capital goods from the Ruhr as to the air lift itself, vitally necessary though that was. The next landmark was the very important decision of ECA to rescue the Berlin economy; the American administration put in some of its best men to carry out the programme. Thirdly, there was the calling of the Russian bluff over the Whitsun rally last year, when the Communist threat of a mass move into the western sectors was cancelled after the west had made it clear that the marchers would be met by force. Then, lastly, it was felt that a new stage had been reached—and subsequent events have so far justified the belief—when Berlin was given a security guarantee by the foreign ministers of America, Britain and France after their conference in Washington last September.

Trouble at the Festival?

What of the future? The most immediate threat of trouble on the horizon is the meeting of the Soviet-dominated World Youth Festival in the Soviet sector of the city on

August 5th. This has been coupled with the fact that at the World Peace Council in Berlin last winter the Russians let it be said on their behalf that a peace treaty must be signed with Germany by the end of 1951. Hence it is argued that the August meeting may provide another favourable opportunity for the Russians to raise the political pressure in order to extract concessions from the west. This does not, however, look very likely from Berlin itself. There is little feeling that the Russians have really bound themselves to a date for a peace treaty; they have not spoken of it directly themselves. Moreover, the August Youth Festival has been convoked on such a note of peace that it would seem difficult even for the Russians to switch it into a rally with aggressive intentions, without several weeks of preparation of which there has as yet been no sign.

In addition, last year's experience at Whitsun suggests that unarmed marchers can be stopped more readily than some pessimists believe, if they are met by other large masses of

individuals such as a phalanx of West German police with two or three battalions of troops behind. The very last thing to do, of course, is to use arms or even tear-gas, which itself creates panic. In August the only suitable open spaces in which the Communist boys and girls can assemble in the Soviet sector are either the Lustgarten or Treptower Park. Of the two, the Lustgarten is the only practical proposition for an effective march on West Berlin since Treptow is a considerable distance away from the centre. The capacity of the Lustgarten is limited to 200,000 and there are in effect not more than three routes from it into the western sectors which need to be blocked off. Last year the reply to the Communist marchers was to welcome them into the western sectors in small groups. The young Communist sympathisers in August will again be entertained and shown round if they come as individuals; few fail to return behind the iron curtain from such a visit unimpressed by the superior standards of living and the friendly confidence in West Berlin.

Rienne dure comme le Provisoire

History has a way of spinning out the existence of temporary arrangements, and there is now no reason why the present situation in Berlin, based though it is on a day-to-day war of nerves, should not endure for some time—unless the third world war breaks out. Looking into the future of Berlin itself, however, there seem to be two factors which may eventually work against the western powers: Russian construction of rail and canal links to by-pass the city, and success for the Five Year Plan in the Soviet zone of Germany. At present, although all the railways in Berlin are operated by the East German authorities, one of the reprisals the western powers can take against Russian interference with their own road and rail communications to the Federal Republic is to stop Soviet traffic through the western sectors of Berlin. This is a very strong weapon since communications in the Soviet zone are already bad, and there is virtually no alternative to using Berlin—the former German capital—as a vital part of the east-west rail and canal network in the zone. Now, however, the Russians are building routes round the city, the rail link to be completed—and the Russians have recently reiterated that it must be ready—by the World Youth Festival in August and a canal link some time next year.

The Five Year Plan in the Soviet zone is at present dependent on supplies of coal, steel and capital goods from the Ruhr. And since the economy of the zone has run so far downhill that the Russians have had to bring back some of the equipment they removed at the end of the war, the success of the Five Year Plan is politically essential to them. At present the western powers can retaliate very effectively against obstruction in Berlin by holding up exports from Western Germany. If, however, steel capacity in the Soviet zone has been built up to 3,500,000 tons a year by the end of 1953 and other proposed steps towards industrialisation achieved, its dependence on Western Germany will decline sharply—two separate economies will in fact have grown up in Germany, that of the east zone being increasingly tightly bound to the Soviet system.

Two Years Ahead

It looks, then, as if the western position in Berlin may gradually tend to weaken until, in about two years' time, the power to retaliate is not as great as it is at the moment. To build too much of an argument on this, however, is to think too far and too theoretically into the future. Between then and now many things may happen. And while it may be assumed that the Russians will sooner or later make another serious attempt to wink the west out of Berlin, by blockade or otherwise, their immediate prospects are undeniably poor. With several months' stocks now in West Berlin, another blockade would be a costly business for them. If the Berliners remain as steadfast and resolute as they have been so far there is every reason to hope for the best. In the front line this spirit itself is an essential ingredient of victory.

Election Eve in France

[FROM OUR PARIS CORRESPONDENT]

THE general election in France on Sunday will be a *scrutin de liste départemental majoritaire à un tour avec apparentement de listes, panachage* et vote préférentiel†*. This means first and foremost that, instead of the system of proportional representation used in 1946, all the seats in a department will go either to a majority party or, where there is none, to a majority group of affiliated parties. In the latter case the seats will, within the *apparentement*, be distributed proportionately to the votes received. Only where no absolute majority is gained either by a single party or by the group will recourse be had to proportional representation proper. In Greater Paris (departments of Seine and Seine-et-Oise) PR is, however, being retained: so it is also in Guadeloupe, Martinique and Réunion, which send deputies to the Palais-Bourbon. French Guiana, on the other hand, has the unique distinction of using the British system, a one-seat constituency to go to the man at the top of the poll.

The new system is, of course, designed to whittle down the present Communist representation of 178 out of 620 seats. And with *apparentements* of one kind or another in 87 out of the 103 departments it undoubtedly will. The Third Force proper (Radicals, Socialists and MRP) have affiliated in over half the departments. In another 14 departments the Socialists have desisted from affiliation with the Radicals and MRP, feeling strong enough to try their hand alone and thus escape the stain of contamination with which the Communists are hoping to smear them. The Gaullists have refused all alliances with the Third Force or *syndicat des sortants*, as it is irreverently called, but they have made about a dozen affiliations with the Right groups or "Fourth Force," and in a very few cases with the MRP (which began its life in 1946 as the *parti de la fidélité* to General de Gaulle). It is hard to predict how many seats the RPF is sacrificing by its electoral aloofness.

In the Parisian region the most seats were won last time by the Communists and MRP:

DISTRIBUTION OF SEATS DEPARTMENTS OF SEINE AND SEINE-ET-OISE, 1945				
Communists	...	...	...	32
MRP	...	...	...	20
Socialists	...	...	...	3
Radicals	...	...	...	5
PRL (Right)	...	...	...	6
Other parties	...	...	...	3
				75

This time, although PR has been retained for the region, there is one innovation; on the second round the system of what is called *les plus forts restes* has been substituted for that of *la plus forte moyenne*. The effect of this is that parties at the bottom of the poll are to be favoured at the expense of the heavy vote parties—another means of reducing the Communist and, presumably, Gaullist representation. Paris, which is the most important Communist stronghold—in 1946 it elected Thorez, Cachin, Marty, Fajon, Bonte, Duclos—is now strongly contested by the RPF, which holds the municipality. Marseilles, equally a Gaullist municipality of which the mayor is now standing, should also provide a stiff fight between Communists and Gaullists. The RPF has put up a good number of generals which the opposition usually depicts grimly planning the campaign in the map-room of their HQ. General Koenig has an excellent chance at Strasbourg in spite of not knowing the dialect, and General Billotte is hoping to win the Burgundy wine country.

* *panachage* means the drawing up by the elector of a list of his own by mixing candidates from different lists on the voting paper. This practice affects the total vote, since each transferred candidate counts as an added vote to the party to which he belongs.

† *vote préférentiel*. By this the elector is permitted to change the party list by striking out names and by adding them. But this rule is apt to be a dead letter since no account is taken of those changes unless they are made by half the voters supporting the list.

In the strongly Catholic East and West much will depend upon the extent of the MRP losses to the Gaullists. The Church has said that people must vote (abstentions would undoubtedly favour the Communists, and they are especially feared on account of the lassitude inculcated by the prolonged wrangle over electoral reform). The *Osservatore Romano* has printed an article favourable to the MRP which has led certain observers to believe that the landslide into the Gaullist lap will not be so great in departments such as Moselle and Bas-Rhin. But the MRP candidates are particularly vulnerable when they are affiliated to the Socialists, since they risk losing supporters who are unable to countenance *laïcité* at any price. Those supporters will either abstain or vote Gaullist—Brittany is a case in point.

One of the most interesting features of the postwar period has been the recovery of the political grip of industrialists in such places as Lille, Roubaix, Tourcoing, Lyons. These gentlemen, of whom many are textileists, do not relish the risk of strikes and disturbances following a Gaullist victory. Nor are they at all in favour of the association of capital and labour which the General has now made one of his central planks. If they feel that the Communist threat is sufficiently weak the Fourth Force (of which Monsieur Paul Reynaud is the natural leader) may well be their choice. Unknowns in the heavy industrial east are the relative forces of attraction and distrust exerted by the outgoing coalition's German policy (Saar question and Schuman Plan). M. Schuman has certainly his work cut out to beat off Gaullist criticisms on these counts.

It is said that the Frenchman votes not for but against. The battle is therefore perhaps between the Third Force, which must discredit the Gaullists and Communists for what they might do, and the latter groups, which (having discredited each other) must persuade the people that what the Third Force has not done must really be done by someone else. Inertia is on the side of the *syndicat des sortants*.

**'Why should I
object
to signing?'**

"I can quite see the gov'nor's point of view in taking out a Fidelity Guarantee in my name. I know that he trusts me, but the fact remains that he has the responsibility of other people's money as well as his own, and the Guarantee is only a reasonable precaution—like the annual audit. Any man in his position is justified in doing the same thing—and he will if he's wise."

**Peace of mind
costs very little**

Labour in the Middle East Oilfields—II

[BY OUR SPECIAL CORRESPONDENT LATELY IN
THE MIDDLE EAST]

THE labour policy of the Anglo-Iranian Oil Company was described in last week's issue of *The Economist*. The four other major oil companies working in the area face many of the same problems. But there are some significant differences. For instance, the companies in Iraq and Persia—states which possess parliaments and trade unions and politically conscious capital cities—have to meet far more public criticism than companies which operate in a feudal monarchy, as does the Arabian American Oil Company (Aramco) in Saudi Arabia, or in small sheikhdoms, as do the companies in Kuwait and Bahrain.

No one else handles a payroll nearly so large as Anglo-Iranian's, which numbers over 60,000 inside Persia; after that comes Aramco in Saudi Arabia; the Kuwait field directly employs 7,300; the Iraq Petroleum Company, when its Kirkuk field is working to its 20 million ton capacity, will directly employ 4,500 people there. Again, by no means all the companies have had to build housing and social services from zero as Anglo-Iranian had to do at Abadan. Aramco has done it in the desert at Dahrán, but the Iraq Petroleum Company fields at Kirkuk and Basra, and the Bahrain fields and refinery are close to towns that have been in existence for centuries. Oilfields engender rather warmer local sentiments when they spring into being in populated areas that can remember days of lesser prosperity. The Northern Iraqis appreciate "their" company. Lastly, one of the fields—Kirkuk—is situated in a food-growing district, and

WHEN IT'S A QUESTION OF TIME...

It is only natural that, if there are fast and slow clocks about the premises, workers will tend to arrive by the slowest and leave by the fastest. Industry loses many millions of productive minutes every year through this time leakage alone. There is a simple answer. Accurate time must be clearly shown and sounded throughout the premises. T.R. Time Control does this, and much more, to eliminate time waste in industry and implant a wholesome sense of time values in the minds of everyone concerned. Spend a profitable moment now to write for full particulars.

Will counting costs wake you up?

It's better to count on Burroughs

A BUSINESS that's going ahead must of necessity be constantly creating new accounting problems. All too often, in one department, obsolete figuring methods prevent them being solved. Your growing business then finds itself paying in office overheads for the inefficiency, the bottlenecks, and the delays that make a mockery of careful budgeting.

It's better by far to wake up to modern methods of calculation now. There will be a Burroughs machine that exactly fits your requirements, giving vital facts and figures when you need them—and in the way you need them.

Burroughs have sound advice to offer in the use of these machines. Their long and varied experience is yours for the asking.

GROUP TOTALS AND AUTOMATIC GRAND TOTAL
Where a grand total of individual results is required, the Duplex Adding-Calculator gives maximum speed, simplicity, and accuracy.

Special features are: positive registration of full key values, a column lock that prevents operating errors, direct subtraction without use of complements.

ADDS, SUBTRACTS, MULTIPLIES, DIVIDES, ACCUMULATES.
THIRTEEN COLUMNS OF KEYS.

A FREELY MARKETABLE INVESTMENT IN A TRUST
SPREAD OVER THE SHARES OF THE LEADING
30 BRITISH INSURANCE COMPANIES

INSURANCE-UNITS

AT THE PRESENT TIME, these Trust Units are particularly suitable for those who seek a stable income combined with good prospects of capital appreciation.

Long-term attractions

The insurance companies, whose shares constitute "Insurance-Units," have a common policy of maintaining a wide margin between what they earn and what they pay out in dividends. In the case of virtually all companies (with the exception of the Life companies, where other considerations apply), dividends are covered by income from investments, often by a handsome margin. Other profits are added to the invested funds, thus increasing the income from which dividends are paid.

Dividend prospects

The majority of insurance companies whose shares are included in the Trust Fund have recently declared increased dividends, and there are good prospects that these payments should be at least maintained.

Purchase of Units

The price of the Units is within the reach of the small investor, who is freed from any personal liability for calls on partly-paid shares included in the Trust Fund. Ask any Stockbroker or Bank for full details.

Offer price 14th June, 25/11½. Yield, calculated in accordance with Board of Trade requirements, 43/5/6%.

TRUSTEES: WILLIAMS DEACON'S BANK, LTD.
MANAGERS: BANK INSURANCE TRUST CORP., LTD.,
30, CORNHILL, LONDON, E.C.3.

A Safety First Investment

2½% per annum

Income tax borne by the Society

therefore brings immediate business to neighbouring agricultural producers. The oil operations in the deserts round Abadan, Koweit and Dahrán do not do so.

All the companies—for reasons explained last week—do well by their foreign staffs. But none can as yet claim to treat its local employees so handsomely as does Anglo-Iranian. No other, of course, has made profits for so long. The Iraq Petroleum Company at Kirkuk, which comes second in seniority, has suffered delays in increasing its production owing first to the closure of the Mediterranean in World War II (it exports by pipeline westwards) and then to the Palestine war. In March, 1951, all its European staff were housed, but only 300 workers' houses were ready for use out of a building programme of 1,624 dwellings. IPC's medical services are not yet as extensive as Anglo-Iranian's for they do not cater for workers' families. Its technical education services are only just beginning. Yet the need for workers' betterment is clearly prominent in the company's mind as it prepares for the immense rise in Kirkuk's output and earnings over the next two years. Its measures for the protection of workers from danger and for their cleanliness are excellent. So are its superannuation and savings scheme. A housing estate which is being built by local enterprise, but with some company assistance, in the area between Kirkuk town and the oil suburb, may help to bridge a gap between town and company society. At present this gap is enhanced by the wire fencing behind which all the European employees live. Barbed wire was, years ago, necessary to security in turbulent northern Iraq; but it is no longer so and has a sad psychological effect on Iraqis, and on your correspondent. At the company's southern field, which is at Zubair, near Basra, and which is only now coming into production, labour conditions are less advanced. Workers need not yet be housed, owing to the field's proximity to Basra. They are carried to and fro by 'bus. The recent strike at Zubair was partly due to complaints about the quality of this 'bus service. But 'buses were not the top grievance on the strikers' list. Their first complaint was one of western "rudeness"—a stigma for which the stand-offish British must take part of the blame, though part can be allotted to the Texan drillers.

Winning the Wives

Aramco is handicapped in its treatment of staff by the strict limitations imposed on it by the puritanical government of Saudi Arabia. Its Americans may live as they wish, and do so inside an enclosure into which everything is imported from the United States. Its Saudis are housed in barracks, without their families—a practice which is adequate while a labour force is still primitive and tends to work for so long as is necessary to earn enough to buy a wife or a camel. The company knows that better housing will become necessary as technical skill and liking for regular work increase. But its middle grade, consisting largely of Indians, Palestinians, Italians and Bahreins is unhappy in a no-man's land between these two worlds.

Lastly, in the sheikdoms of Koweit and Bahrein the labour force is of course not without its grumbles and growing pains. But inside small principalities that have good rulers the benefits that accrue from royalties are of course far more visible to every man than are those in large national states. Both Bahrein and Koweit possess such rulers. Both are improving the conditions in which their people live. The immense and chatty queue of women that goes daily, to relieve both disease and boredom, to the new clinics of Koweit, is a sight to hearten any oil company. It suggests that, so long as such rulers continue to spend their revenue from oil on improving public services, labour's attitude to its employer will be mellowed than that in Iraq or Persia. It also suggests that giving the wives cause to keep blessing an oil company, or the royalties it pays, is a good tip for public relations officers.

Freedom and Wealth in the Colonies

SPEAKING in the House of Commons just a century ago, Sir William Molesworth, the leader of the Colonial Reformers, condemned the whole system of government through the Colonial Office:

The wonder to me is, not that the system works ill, not that it produces discontent and complaint, but that it works no worse than it does. The Secretary of State for the Colonies is responsible to Parliament for the government of every colony. . . . If he could divide his time equally between the colonies, as there are forty-three of them, he could give about a week a year to the affairs of each separate colony; but to no single colony could he at one time spare a week of continuous attention; for every colony, more or less, requires his attention simultaneously.

At that time the staff of the Colonial Office consisted of "five superior and twenty-three inferior functionaries." Today it consists of 1,250, although the number of colonial territories has not materially altered. Yet the Secretary of State is still required, "more or less," to give his attention to them all simultaneously; what is more, the activities of his office, like its staff, have multiplied out of all recognition. One glance at the tightly packed pages of his annual report* ranging over every continent and almost every sphere of human activity, leaves the reader wondering, as Molesworth did, that the system works "no worse than it does." Indeed, it is working today with considerable success.

That is due largely to a fact which no one is ready to believe—that the Colonies are no longer "governed" by the Colonial Office at all. They are supervised in Whitehall, and certain key decisions are taken there, but their day-to-day administration is in the hands of the Colonial Governments and Legislatures on the spot. Increasingly, year by year, more powers are devolved from London; and within the Colonies powers are shifting, with unbelievable speed, away from the officials and on to the shoulders of the colonial peoples themselves. The essence of colonial policy in these last years has been the transfer of power.

Steps to Self-Government

The annual report describes how this is being achieved in a detailed chapter on "Political and constitutional developments." In almost every territory some new advance towards self-government has taken place in this one year. Beginning with the spectacular changes in the Gold Coast, we learn of the final preparations for the new Nigerian constitution in 1951, the revision of the Sierra Leone constitution, so as to give unofficials a majority in both Legislative and Executive Councils; and the enlargement of the Gambia Legislative Council. In Uganda the Legislature has been reconstituted, increasing African representation; in Tanganyika a Constitutional Development Committee has been taking evidence; in Kenya, arrangements for revising the constitution have just been announced; in N. Rhodesia far-reaching constitutional changes are in the air. In Malaya a Ministerial form of government has been introduced; in Singapore the executive and Legislative Councils have added extra elected members; in North Borneo a new constitution was brought into operation. In the West Indies further moves towards the creation of a West Indian Federation took place; in the meantime Barbados further liberalised its constitution; a Commission of Inquiry visited British Guiana to recommend a new constitution; British Honduras considered proposals for political reform; and a new constitution was introduced into Trinidad involving the election of five fully responsible local Ministers.

* *The Colonial Territories* (1950-51). Cmd. 8243. 4s. 6d.

Growing Technical Services

Hand in hand with this remarkable record of political advances comes the impressive fact that British recruitment to the services in the Colonies is nearly five times as large as in 1938—the increase being concentrated on the technical services. In the five years since the war 770 doctors and dentists were recruited compared with 243 in the five years preceding the war; 1,116 teachers as compared with 62, and 370 agriculturists compared with 99. This must, further, be seen together with the trend for the colonial peoples themselves to man their own services in increasing numbers. In the Gold Coast, before the war, there were practically no African members of the Senior Service; in 1949 there were 179; in 1950, 269.

In this complex operation of creating self-governing communities in the Colonies the Colonial Office has been imbued with one most significant conception: that democracy does not depend for its success on constitutions alone, but on all the institutions and services which together represent the democratic way of life. This means local government, trade unions, co-operatives, educational facilities, social welfare and health services, and what has been done under each of these heads fills many pages. A complete network of local government authorities, in Africa based often on the traditional tribal councils, now covers most colonial territories, and the functions of these authorities are being continually extended. Over one thousand trade unions have been registered, with an estimated membership of nearly 700,000. In 25 territories Registrars of Co-operative Societies have been appointed; the number of co-operatives extends into the thousands. There are now seven university institutions in the Colonies, four of them founded in the last three years. They have a combined student population of 2,700, and a further 4,500 colonial students are studying in British universities. Teacher-training has also made good progress, and technical education—always a bad gap—is at last being taken seriously. Particular pride is taken by the achievements of the health services. Malaria has, in many bad spots, been completely eliminated; yellow-fever is reduced to a few sporadic cases; smallpox no longer reaches epidemic proportions; trypanosomiasis is under control. The result is that everywhere population is growing.

Production and Trade Expand

What does this spate of progress mean in economic terms? In 1939 the total public revenues of all Colonies amounted to £57 million; in 1950 this figure had increased nearly five-fold, to £246 million. In 1938 the total value of colonial exports (excluding the special case of Hongkong) was £155 million, in 1950 the figure was £922 million; imports had risen from £145 million to £772 million. Price increases have of course played a major part in this expansion, but it is calculated that "the physical volume of goods moving into and out of the territories in 1950 was about one and a half times as large as in the immediate prewar years." The index of the volume of colonial exports has increased from 100 in 1946 to 175 in 1950; in that year the rate of increase began to fall.

This economic development, which extends not only to primary products but to the beginnings of industrialisation, has been spurred on by the ten-year development plans, now in operation in 27 territories. The total sum of money approved for these plans amounts to £227 million—£71 million from the Colonial Development and Welfare funds, and £156 million from loans and local resources. There are, in addition, the spreading activities of the Colonial Development Corporation, with its capital resources of £110 million, and certain smaller sums which have come through ECA. Colonial production has had a strong stimulus, also, from the stiff rise in commodity prices in these last years.

It must not be thought from this satisfying record of

progress that all is now peace and contentment in the Colonies. There are many sore spots and threatening points of danger. The Secretary of State for the Colonies remains a harassed and all-too-busy man, even though he is now assisted by both a Minister of State and a Parliamentary Under-Secretary. But he and his department have this merit: they do appear to know where they are going.

Soviet Industry Moves Eastward

[BY A CORRESPONDENT]

THE recent official report on the fourth Five Year Plan emphasises the continued eastward expansion of Soviet economic power. The shift in relative economic weight from the traditional Donbas-Krivoi Rog region towards the Urals, Siberia and Central Asia, a shift which had been going on already in the 'thirties and was greatly speeded up by the war, has not ceased in the last quinquennium. On the contrary, it has been consolidated and has even exceeded the original estimates of the planners. Thus at the turn of the mid-century the balance of Soviet basic industry seems to be slightly tilted in favour of the more eastern industrial regions.

From the scanty information now disclosed it may be gathered that already the regions farther east account for a larger—though as yet only by a slender margin—proportion of the Soviet primary production than the once overwhelmingly predominant western parts. Even for oil, extraction outside Baku in 1950, the last year of the Plan, was getting close to half of the total Soviet output. By that time more coal was already mined in the Urals and beyond than in the European part of the Soviet Union. Output of iron ore was probably balanced, but there are indications that steel production was already greater in the Urals and farther east.

The available figures show that the tempo of the Soviet internal colonisation surpassed the forecasts of the planners. Thus, for instance, oil extraction outside Baku should have reached 36 per cent of the total at the end of the Plan—it actually reached 44 per cent; while eastern coal output was to account for less than half of the total and not for more, as it in fact did.

In the last decade, the two main eastern coal basins—the Kuzbas in Central Asia and Karaganda in Kazakhstan—have developed with terrific strides: in the Kuzbas output, which was 18 million tons in 1940, has more than doubled since then; in Karaganda it nearly trebled—from 6 to 17 million tons. Simultaneously there has been a rapid expansion in iron and steel production, output rising by more than two and a half times in the Urals and more than one and a half in Siberia. It seems that the Soviet Union is now partly reaping benefits from investments, which, at first, for short term accountancy, did not look like a paying proposition. For instance, the Karaganda coal can be used increasingly for smelting in Magnitogorsk, instead of obtaining coal from the Kuzbas which is roughly twice as far away; while the latter region may use more of its coal for its new ore deposits.

The growing importance of eastern production of fuel and basic materials, particularly of rolled steel, seems to indicate that in metallurgy, too, the European regions of Leningrad, Moscow and the area converging on the Azov Sea are progressively losing their predominance in favour of the Urals, Kuzbas and Karaganda. This is in keeping with the wishes of the Soviet authorities, since already in 1939 Molotov declared that "we must strictly forbid the construction of new plants in Moscow, Leningrad and a number of other industrial centres." True, the east is still lagging far behind in light industry and the building during the last Plan

Aspects of enterprise

No. 2

An American-owned plant, built under an ECA guarantee, was recently opened in Cheshire. Its output of carbon black, an essential material in the rubber industry, saves Britain a million dollars of annual imports from the United States. A bouquet from a client is worth many fanfares on one's own trumpet: "To complete the plant has actually taken just over a year since breaking the first sod. The credit for this achievement largely goes to the general contractors, Simon-Carves Ltd. . . . Harassed by shortages on the one hand and 'American impatience' on the other, they may well be proud of the final result."

of some textile mills in cotton growing Central Asia is far from meeting this deficiency. On the other hand, the new basins are much richer in non-ferrous metals.

The eastward industrialisation drive necessitates large-scale migration of population. According to Soviet statistics between 1926 and 1939 alone over 3,000,000 people migrated to the Urals, Siberia and Far East, while 1,700,000 moved to Central Asia; and it is uncertain whether these figures include the "free settlers" who were transplanted from the west during the collectivisation. During the war towns sprang up like mushrooms in the east.

Most of the 1,360 industrial undertakings evacuated to the east were left behind after the end of hostilities. Large numbers of workers and technicians have stayed behind as well. This has certainly contributed to speed up the industrialisation of these regions; on the other hand, it must have been somewhat detrimental to the European parts of the Soviet Union; a shortage of skilled workers and technicians was felt in central Russia. Yet the internal colonisation forms part of a definite policy. Not only have Ukrainians, the Germans from Saratov, the Crimean Tatars and the various Caucasian tribes been transplanted there *en masse* during and after the war, but to attract labour and to check the departure of evacuated "westerners" wages in the east were raised 50 per cent higher than elsewhere.

The policy of favouring the eastward expansion has the good fortune of combining strategic and economic interests and combining them both with the inclinations of the policy maker. The strategic considerations are obvious: the removal of industry from vulnerable Europe and its dispersal. Economically the Plan at first did not look so attractive, because of the seemingly prohibitive cost of transport. Yet with the general development of eastern economy reductions in transport costs come about automatically. Moreover, the high cost of haulage is more than outweighed by the relatively low cost of production. To take but one example: the open cast ore of Magnitogorsk is certainly much cheaper than that of Krivoi Rog; hence pig iron

output per worker in Magnitogorsk is apparently 2.5 times higher than in the rest of the Soviet Union.

Stalin the "Easterner"

The task of leading Russia's eastward colonisation drive suits Stalin perfectly. As far back as 1923 he said:

... We must turn our faces to the east, taking into account the huge reserves which are still slumbering there. ... The eastern peoples closely linked with China and India are particularly important for the revolution. The qualitative weight of these small nations is far greater than that of Ukraine. ... We are facing the perspective of a powerful movement in the east and the awakening of the east should become our primary task.

A shift of economic power such as the one taking place in Russia must be both preceded and consolidated by railway construction. The Trans-Siberian, and the Turksib connecting Siberia with Central Asia have played a vital part in the development of the east. In the last Plan the most salient features were to be the laying of the Southern Trans-Siberian Railway, linking Kuznetsk (Siberia) with the Volga region (Kuibyshev), the laying of a line connecting Karaganda with Central Asia and another joining the central and northern Urals. It is not disclosed whether these plans have been fulfilled.

Russia's eastward drive is somewhat reminiscent of the American westward expansion in the 19th century, with this substantial difference, that whereas in America the pioneer was a farmer, in the Soviet Union he is an industrial worker. The colonisation has not yet gone deep into Asia. There are still vast, almost untapped resources both to the east and to the south-east. The recent establishment of academies of science in the Asiatic republics shows how the Soviet planners are thinking. Some time hence the mining regions of Tungus or Yakut may be competing for supremacy with the Urals, Kuzbas and Karaganda, as the latter are now competing with the old European parts.

We've solved some problems in our time!

IN 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would pre-heat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity *inside* a diameter of 1½ inches and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and

Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

THE BUSINESS WORLD

Prospect for Prices

IN the last few months, no single economic indicator has been more closely watched than the movement of prices. Last February, after six months of the most feverish buying that the world has ever seen, there was a sudden break and some of those who only a few months before had been prepared to accept the post-Korean level of prices as a semi-permanent fact in the world economy were asking whether a decisive turn was in prospect. At first, only a few commodities were affected. Cotton did not fall until the end of February and wool was strong until April. Some commodities have shown no fall at all. It is a mixed and confusing record. Nevertheless, a general index of commodity prices shows that the peak was reached some time in the first quarter of this year and that since then the trend has been downwards rather than stationary. The question that is now of paramount importance is whether prices are likely to fall further or whether the present phase is a temporary lull that will give way to a renewed boom in the later months this year.

The dramatic rise in commodity prices after the invasion of Korea resulted from the scramble by industry and by governments for raw materials that were already scarce. Once this scramble had exhausted itself prices were bound to react. But an analysis of this simple kind hardly explains the varying performance of different commodities in the first five months of this year, and the break itself owes little or nothing to increased supplies. Output of certain commodities is expected to be larger this year than in 1950, but no significant increase occurred in the first quarter of this year.

The causes of any major change in commodity prices are usually complex but four particular factors—all primarily effective in the United States—seem to have had a significant effect. First, the American price-freeze which came into force on January 26th and the discussion preparatory to the setting up of the International Materials Conference in Washington; secondly, the reduced tempo of stockpiling; thirdly, the slow rate at which defence contracts were being placed and the governmental restriction on civilian consumption to ensure adequate supplies for defence; and, fourthly, the increase in consumers' resistance to higher retail prices. To some extent these factors are interrelated and their impact differs for each commodity. The American price-freeze was adopted to curb mounting internal inflation in the United States. The sceptics refused at first to believe that it would work. Then when the world came to realise that the United States Government meant business in resisting rising prices not only in its domestic market but in the overseas markets from which it draws primary materials, prices reacted sharply. America's attitude was decisive in world commodity markets simply because American demand had conditioned those markets since 1945 and had put them in a high fever since the Korean war started nearly a year ago.

United States' consumption now accounts for as much as 50 per cent of the world's output of copper and lead compared with 30 per cent before the war, 50 per cent of the world's zinc and tin against 40 per cent, 60 per cent of the world's aluminium against 30 per cent, 55 per cent of the world's rubber against 45 per cent, 75 per cent of the world's woodpulp against 48 per cent, 26 per cent of the world's wool against 18 per cent, and 35 per cent of the world's cotton and sisal against 23 per cent before the war. These proportionate increases are significant enough, but in almost every case the physical quantity consumed by the United States has risen even more sharply, since world consumption is now higher than it was before the war. In addition, America instead of being an exporter of copper, lead, and iron and steel scrap is now an importer, and it has increased its proportionate share of imports of most industrial materials. Ceiling prices imposed on American manufacturers were in these circumstances equivalent to ceiling prices on

materials traded across the world. The discussions about the international allocation of scarce materials in Washington had more effect on buyers outside the United States. It was clear that allocation would be effective only if prices were controlled, and while there was any prospect of that buyers could not be blamed for refusing to pay high prices. It is impossible to assess the material effect of the Washington discussions on market dealings; they certainly made buyers more cautious.

The slackening in the American stockpiling first became evident towards the end of February, though there had been earlier rumblings from the United States against having to pay exorbitant prices for defence reserves. These threats to suspend stockpiling made their particular mark on the market for tin, the price of which was already falling when the suspension of new buying was announced early in March. The weakness in rubber from the second half of February onwards can also be attributed to smaller purchases by the American Government, which became the sole importer of natural rubber in the United States at the end of 1950. American production of synthetic rubber was expanding, and the

consumption of natural rubber in the first quarter of 1951 was reduced by government order by about 20 per cent. Wolfram was another commodity affected by stockpiling. In February it reached a peak of 670s. a unit; in the following month, the United States made long-term contracts with the main European and South American suppliers for deliveries over the next two years; the demand for spot supplies declined and the price fell; by April it had fallen to 500s. a unit, though it has since recovered somewhat.

The main specific cuts in civilian consumption in America have been in non-ferrous metals—copper, zinc, lead, aluminium and nickel—and the prices of all these metals have either remained firm or have risen. Copper rose from 24½ to 27½ cents a lb in May, whereas zinc and lead have remained at 17½ cents a lb and 17 cents a lb respectively since last October. Aluminium has also been unchanged since the beginning of this year whereas nickel rose from 50.5 cents to 56.5 cents a lb this month. American metal prices are notorious for their lack of response to changes in supply and demand. But free market prices for these metals are nearly double the official quotations. Thus it would seem that, despite restrictions on civilian consumption and the comparatively slow starting speed of the rearmament drive, no weakness exists in the base metal market and it is clear that manufacturers expect that the supply of these metals for civilian use will decline rather than increase in the coming months.

★

The slow placing of defence contracts, however, is closely related to the increase in consumer resistance that has been in evidence in the United States for the past three or four months. American manufacturers who had accumulated relatively large stocks of raw materials at high prices from last September onwards considered it wise to reduce those stocks rather than maintain them, hence a mild form of the 1949 inventory recession has

been in progress since February. Little or no wool has been bought by American manufacturers since March; this decline in purchases was clearly reflected in the sharp fall in wool prices. Most of the American purchases in February and March were to meet defence contracts, as the market price for wool was well above the American ceiling price; but now the converse is true and still no American buying is in evidence. In Britain and in Western Europe, too, wool manufacturers are concerned lest consumers will refuse to buy clothes made from high priced raw wool, and they, too, have tended to reduce

their purchases. The American cotton price has kept steady at its maximum fixed last January, but prices for Egyptian cotton began to fall in February.

One important feature in the commodity market has been the firmness of cocoa, sugar and coffee. Prices of these commodities are usually a guide to American prosperity. Cocoa has remained high since the beginning of the year and so, too, has coffee; while the price of Cuban sugar, which declined from 5.85 cents a lb in September, 1950, to 5.50 cents a lb in January, 1951, has since risen to 7.50 cents a lb despite the largest world crop ever recorded.

In spite of the price falls since February, many of the principal commodities, particularly metals and fibres, have undeniable market strength. Others, such as rubber and tin, will depend on stockpiling and international events if they are to maintain their present price levels. Cocoa and coffee depend directly on American internal consumption. Even those prices that have fallen substantially since the first quarter are still well above the levels of a year ago and very much higher than they were in the summer of 1949. This point can be illustrated in the behaviour of copra, tin, rubber, wool and wolfram as shown in the accompanying table. The February reaction has been limited to a small number of commodities, prices of which are still high compared with pre-Korean standards.

What of the prospects? Experience of the past year shows the dominating influence of governments over the commodity markets, and particularly the influence of the American Government. What the Administration does about ceiling prices or stockpiling is immediately translated into a new market situation. It is, therefore, not enough to conclude that, because supplies of essential commodities are likely, for the most part, to be sufficient to meet present restricted rates of consumption, prices will stay firm but not feverish. That view would give too little weight to the prospect that the natural acceleration in the tempo of the defence effort will produce new

ADMINISTERS NATIONAL SAVINGS

virtually derelict. Those remaining include the nucleus of important factories in and around London and the other "national factory" at Birtley in Durham retained after the 1914-18 war; a proportion of the 23 permanent ordnance factories that the government of the day began to build late in the 'thirties to decentralise the State arsenals; and a few of the supplementary factories built later in the second world war. They comprise 14 engineering factories, producing and repairing guns, tanks, automatic and other rifles, bayonets, shell and cartridge cases, rockets, bombs, fuses and small-arms ammunition; four explosive factories; and three filling factories. Another half-dozen of the small-arms and loading factories built during the war "in the blue" away from towns, with little possible commercial value, were retained by the Ministry of Supply to store its reserves of materials and machine tools, and some space in the retained ROFs has been used for similar storage. There remain also as strategic potential 19 "agency factories" operated by commercial managements on behalf of the Ministry of Supply, of which only about half a dozen are engaged directly upon defence production; and the Admiralty's Royal Dockyards, torpedo factories, and factories concerned with cordite, propellant explosives, and naval ordnance gauges.

All other wartime ROFs, and the rest of the 180 agency factories operated on behalf of the Ministries of Supply or Aircraft Production during the war, were passed to the Board of Trade for disposal to civil industry. Immediately after the war factory space was at a premium, and the bulk of this reserve was leased by private industry and entirely converted to civil production. In a few cases, special provision was made in leases for returning the factories quickly to arms production in an emergency; the Ministry of Supply may have one or two back by next year. In deciding which ROFs could be handed over, many factors were considered, including the factory's share of total ROF capacity, employment in its locality, its suitability for commercial operation and the general desirability of keeping together a nucleus of labour for ROF work.

This postwar labour force, which it was decided to maintain at roughly 40,000 in the 21 factories, could not have been kept occupied without work on civil contracts. Service orders for the ROFs did not fall away sharply in 1945. During 1943-44 fairly radical changes were made in design of many types of equipment, and after the war the Services were not satisfied with "war finish"; for these reasons, a fair proportion of the defence work carried out in the engineering ROFs since the war has been devoted to bringing weapons that helped to win a war up to the quality desired for training armed forces. Even so, defence orders for most of the factories soon dwindled to a trickle: and the ambitious programme of civil production was begun. It covered ceramics, electrical equipment, gramophone record compound, concrete sleepers for railway lines, internal combustion engines, railway wagons, machinery for food and paper production, watch and clock components, car and cycle parts, mining and oilfield equipment, and much miscellaneous engineering work. Up to March 31, 1950, the factories had completed civil orders costing roughly £20 million; upon that part charged at fixed prices (work for Government departments being done "at

cost"), the factories lost £1½ million. Production was uneconomic partly because of the overheads charged upon factories working to perhaps 30 per cent capacity, and because some of the work was that which private industrialists, having regard to the current supplies of materials, were reluctant to undertake: but it arose mainly from the fact that the ROFs and their staff were not used to manufacture of civil products on a commercial basis, and obtained few large contracts enough to permit mass production. Civil production in the ROFs has now almost entirely ceased: but reconversion of their production lines to defence work, in certain cases, will not be completed for some months.

The share that the ordnance factories will take of the three-year rearmament programme has not yet been disclosed. In settling this problem, ROF capacity for various types of arms production has obviously been a basis: but more importance has probably been attached to the policy of restoring arms production capacity as widely as possible, consistent with the other major needs of the economy. Certain forms of war material, such as military explosives, are scarcely produced outside the ROFs, and the same is true of many processes requiring special care such as shell-filling: these sections of defence requirements can hardly be spread to any considerable extent. In other types of equipment, such as guns, special calibres of ammunition, small-arms cartridges (plans have already been made for a large scale switch to the .280 rimless cartridge), and the mass-production of certain fuses, it would be possible for the ROFs to handle the whole of the programme. The ROFs will be responsible for a major share of tank production, in the Leeds factory that was reconstructed to assemble tanks at the end of the last war, and in a new production line at ROF Dalmuir; but tank engines, and probably tank tracks and links, will mainly be supplied by Ministry factories managed on an agency basis. In general, however, the "re-educative" policy of spreading orders means that much less than the total capacity of the ROFs will be occupied on rearmament work. The single-shift labour force of these 21 factories could reach 120,000, but there has been no suggestion as yet that the labour force required for the present programme will reach 60,000; that represents a rise of some 15,000 in ROF labour during rearmament, out of a total of 500,000 extra workers who may be needed for the whole defence production programme.

Rearmament must be used not only to accumulate stocks of modern equipment, but also to strengthen war production capacity in general; this policy involves the acceptance of certain difficulties. Ordnance factories that operate well below capacity will carry a high burden of overhead costs, and may not gain the full advantage of quality production; and on other items that the ROFs can produce more efficiently than their civilian competitors, the policy of spreading output may tend to make average costs higher than those of the ROFs. In general, however, it is impossible to compare the efficiency of the ROFs with outside engineering companies. Costs in the ROFs are subject to continual scrutiny by the ROF directorate and by two further sets of accountants of the Ministry of Supply and the Treasury. No doubt these checks make some contribution to operating efficiency, but there may be differences

strains on supplies by the end of this year or early in 1952. Copper, zinc, iron ore and wool again threaten to become scarcer. This expectation, however, does not necessarily support the conclusion that the commodity markets will behave as if they were completely free. What would happen to them if some international agreement on the allocation of scarce materials among the countries of the free world were to emerge from the Washington discussions? Is the Administration's attempt to freeze prices proof against the flowing tide of inflation? How far do prices have to fall before stockpiling is resumed, and if the markets remain firm may stockpiling be eventually resumed in any case?

These questions are of great consequence for the world and for this country. The British predicament in the present situation of commodity prices can be left to explain itself from the accompanying chart. Painful price

adjustments are involved at home; the rise in British export prices, so long damped down, is making its appearance at the moment when world trade conditions are perhaps rather more difficult than they were because of the chastening effect that this year's fall in primary prices has had on traders' forecasts of future trends. No doubt, they are making too much of the price reaction, such as it is. It would probably be the wiser course for British industry to assume that supplies of raw materials will be scarce and prices high as the defence programme matures. There is no indication that governments are seriously disposed, either by planning or by broad economic policy, to cut down competing civilian demands to the full extent required. So long as they lack such political courage and economic realism, they must be prepared for prices to rise. The powers even of American Canutes are limited to stop these inflationary waves.

Tasks for the Arsenals

IN May, 1948, a spokesman of the Ministry of Supply, in evidence to the House of Commons Select Committee on Estimates, gave this view of policy about Royal Ordnance Factories:—

"So long as there are in the Ministry of Supply those officials who faced the situation of this country between the 3rd September, 1939, and the fall of France, they are determined never to go again or let their successors go again through that experience. . . . We must have that reserve of productive capacity.

That determination, and the policy based upon it, are largely responsible, for example, for the fact that the ROF Fazackerley, near Liverpool, is still making rifles, and not making confectionery. Later in his evidence, this official referred to the gibe about "being prepared for the last war." He commented that in any future operations infantry soldiers and rifles would still be needed, and therefore a rifle factory would be needed too. This view is right, but its rightness does not rob the comment of point. ROF Fazackerley remains in being for the present rearmament programme. But as and when the new .280 calibre infantry self-loading weapon comes into full production—and it, as is not yet publicly known, it is indeed a substitute weapon for the infantryman's rifle, to be issued on the same scale—the largest rifle production lines in the country will require considerable and lengthy retooling.

This single example emphasises the importance—and

the difficulties—of the ordnance factories in the defence production programme. The importance as war potential of other engineering industries does not suffer from this disadvantage; any service orders that they are ordinarily called upon to meet require a small proportion of their peacetime output, and thus at any moment of general expansion they have little capacity geared to particular weapons. But capacity for war production is the only purpose of the ROFs. The civil production in which some of them engaged between 1946 and 1950 was conceived as an important "balancing" contribution to the needs of the peace economy, providing extra capacity for "bottleneck" tasks. It was an expensive failure; and the ROFs have reverted to their proper function of providing an essential nucleus of munitions production, particularly of munitions to which no form of civil production can easily be adapted. In this role, they find it difficult to change over their production from existing—and sometimes obsolescent—patterns equipment; though it is necessary to add that the Royal Arsenal and the old-established ordnance factories at Enfield and Waltham Cross undertake considerable research work on service weapons and equipment.

Of the 44 ROFs in existence at the end of the last war only 22 were kept at work, and two others were kept on a "care and maintenance" basis: one of the 22, which might have competed for labour with new atomic plant, has been allowed to go out of production and is now

The possession of a banking account from which payments can be made by cheque is an excellent aid to the management of your monetary affairs. Accounts can be opened with small sums. Call at the nearest branch of the Bank, where the Manager will be pleased to give full information about the Bank's services.

WIGHTWICK MANOR
(Property of the National Trust)

Although built only sixty years ago, this manor is specially interesting in that the house and gardens are rare specimens of the mid and late Victorian period. Wightwick is a monument to the pre-Raphaelite and Morris schools. The garden contains shrubs and plants from the gardens of many of the most famous people of the time, including Tennyson, Swinburne and Ruskin. It is situated about three miles from Wolverhampton.

between, say, the attitude of headquarters on the value of time and motion study and its application in the ROFs themselves.

In the old-established factories such as Woolwich Arsenal, scientific methods of this kind meet resistance from traditional attitudes towards their work. These attitudes are not merely obstructive; they may contribute to efficiency. The engineering ROFs employ one skilled man in about every four, and the other factories a smaller proportion, so that the "reserve of skill" that is needed is not, in absolute terms, unduly large. But ROF work does demand from many workers a high level of accumulated judgment and experience. The barrel-tappers in small arms factories, for example, who glance at the pattern of shadows inside a precision-machined rifle barrel and by a few gentle taps with a hammer on the outside bring it into true, are not the less useful for being somewhat outside the mass-production consultant's sphere. A similar degree of care is of value inside the perilous "Clean Area" of a shell-filling factory.

In many other jobs, recruits can easily be trained, but several of the ROFs are encountering difficulty in finding the labour they need. They can offer good labour relations and welfare facilities, and acceptable wage rates, but the disadvantage of uncertainty of employment has its effect even in a period of active rearmament. In one area in South Wales, almost immediately after completing the dismissal of 600 workers as redundant, the ROF superintendent had to begin recruiting again. Nor have they the flexibility in wage incentives that private employers command; central auditing would soon unmask higher wages disguised as "merit awards" or "general output bonuses" that some other firms turning over to defence production can offer. Nor do the super-

intendents at the ROFs appear to receive preference from the Ministry of Labour; in some cases, they even complain that as State employers they are expected to absorb the least promising applicants. In two major industrial areas, Lancashire and the Potteries, ROFs will be competing directly with under-manned staple industries for manpower; it is not surprising that they should find recruiting difficult.

The directorate is meeting other common problems of the defence programme with fewer official privileges than might be expected. In their efforts to acquire scarce but uncontrolled materials—such as steel—superintendents can rely only upon their usual suppliers' regard for national defence; they claim no priority over other producers with defence orders. The ROFs depend heavily upon supplies of tools ordered for the defence programme, and their needs account for a large part of the earliest American orders. But their responsibilities will not cease with their own production. The directorate's staffs are trained in the special techniques of arms production, and their "Process Specifications," compilations of accumulated experience, have been circulated to allied Governments and are being made available to private firms in the same field. They will also be called upon to offer technical assistance in the production of certain equipment by one or more civilian contractors, as in the case of tanks: and certain tasks they are themselves beginning will be entirely new. In a rearmament programme of limited dimensions, aimed not only at re-equipping larger forces quickly but at re-creating a wider war potential, the arsenals must play a large part; but their contribution, in terms both of size and efficiency, will necessarily be circumscribed by those aims.

Business Notes

Mountain and Mouse

In the history of Finance Bill debates there have been few precedents, and none in recent years, for the prodigious labours that have been witnessed this week on the Committee stage of the Bill to give effect to Mr Gaitskell's budget. The two longest sessions extended to 22 and 32 hours respectively. Rarely has determined opposition worked so long and so hard for so little. In no instance has the Government given ground on the central principles of its proposals, though concessions of substance have been won, and a number of promises have been extracted, on marginal aspects of some of the most contentious clauses.

In the circumstances, the technical standard of the debates has been surprisingly high, only rarely descending to the cheaper forms of party politics; nor has it been noticeably impaired by signs of sheer physical strain; and, rather unexpectedly, the Government's attitude seemed to become a little more conciliatory as the week wore on. There have, it is true, been a few prize exhibits of party nonsense, but these have generally come from the back benches—such as Mr Silverman's assertion, in response to Mr Eccles' arguments about the serious disincentive effects of surtax, that "crooks and entrepreneurs" are the bulk of those earning over £15,000 a year. This attitude may be contrasted with Mr Gaitskell's response to the abortive opposition proposal to raise the limit on earned income allowance from £400 to £500: he declared himself to be not unsympathetic to the principle of differentiation between earned and unearned income, and of pushing it further up the scale—but not this

year, because the proposal would cost £5,500,000 "which is not a bagatelle."

Concession for Shipowners

Among the amendments, as distinct from promises, that have been wrung from this debate only two are as yet quite specific and definite. Nine hours were devoted to discussion of the clause withdrawing the initial allowances from capital expenditure incurred after the end of this fiscal year, and many amendments were introduced (and lost) in the effort to secure specific exemptions or concessions—notably for installations designed to save solid fuel, and for capital equipment for new industrial processes. Mr John Edwards repelled these pleas on the ground that, although the case for one or another might look sound, it would be impossible to know where to stop if any was conceded. The object was not to provide revenue but to safeguard the defence programme, and no threat to that could be countenanced.

The one exception to this was the shipping industry, the case for which was accepted as "unique." It was agreed in the end to replace the promised Governmental amendment, which was to exempt ships under construction by last budget day, by one that will exempt ships contracted for by that day—a change that goes far to meet the arguments of the shipowners. On the general principle of suspending the allowances, Mr Gaitskell repeated his earlier arguments—contending that he was using "monetary" controls in

preference to physical controls as the Opposition had always pressed him to do, and suggesting that the stopping of "interest-free" loans was analogous to a raising of interest rates. He remarked, incidentally, that there would be a case for restoring the allowances when the arms pressure eased—which scarcely suggests that the Government contemplates any more adequate solution of the problem of depreciation allowances based on historical cost. Later in the debate he also remarked that it was an "extraordinary doctrine" that the higher prices of stocks must necessarily be financed out of profits: this would put the equity holder in "a privileged position."

The second definitely promised amendment relates to the new powers to compel banks to disclose interest payments made to customers without deduction of tax (for amounts exceeding £15 in a year); the power will not extend to customers who are not resident in the United Kingdom. But the Government's only response to the objections to the basic breach of banking secrecy was to emphasise how rigorous are the Inland Revenue's principles of secrecy and to point out that the power to compel bank disclosure does not extend beyond the bare fact of the interest paid. Prolonged debate on the profits tax yielded no concessions of substance—except a promise, on the evasion clause relating to capital repayments (Clause 27), to try to insert a formula for exempting "genuine" cases of repayment. On the omnibus evasion Clause 28, which allows the authorities to adjust tax assessments to correct the effect upon tax liability of transactions wholly or mainly entered into with the object of avoiding tax, the debate lasted twelve hours—but it yielded little more than a promise by the Attorney-General to consider whether it is possible to introduce a little certainty into this extremely vague and widely-drawn power.

Defining the "Ring-fence"

As expected, one of the most strenuous tussles occurred on the objectionable Clause 32—the "ring-fence" clause that seeks to check tax evasion by making the migration of companies overseas, and other kindred operations, subject to Treasury licence. Protracted debate failed to shake the Government's adherence to the basic principle of this restrictive plan, but it did extract a number of concessions that will somewhat diminish the frictions that are inseparable from the operation of such a system. The broad attack by the Opposition was rightly concentrated upon the damage that will be done to London's status as an international centre. This argument was well developed by Mr Lyttelton, who emphasised that London is traditionally the largest market in international securities in the world, and declared, "with a proper sense of responsibility," that the Stock Exchange "is as necessary a raw material of industry as coal." Clause 32, he argued, would be "poison" to London's internationalism, and was typical of the Government's "sour

puss" mentality: "any damage is accepted to trade for the sake of catching a few evading sprats."

Mr Gaitskell, though adamant on the central issue, happily took a conciliatory tone towards many of the detailed proposals for making the clause less onerous and more readily workable in practice. He reaffirmed that there is no intention to administer the new control purely in the interests of the revenue, and repeated his suggestion, made on the Second Readings, that there should be an advisory tribunal "consisting of persons whose experience is such as to give confidence to the business community"—this body would be consulted before permission is refused in any particular case. He emphasised, too, that the clause is aimed not at the transfer of individual assets ("still less, of course, stock in trade or anything of that kind") but at parts of the trade or business that are going concerns; he offered to make this clear in a new proviso specifically excluding transfer of assets that do not "materially alter" the trade or business carried on by the transferor. Such a proviso would incidentally exclude mining leases.

A third specifically promised concession was to incorporate in the clause a power to the Treasury to exempt particular classes of transactions. The Chancellor stated that it would be impossible to lay down precisely what kind of transaction might rank for this exemption until experience of the new system had been gained, but he gave a number of hypothetical instances to illustrate the principles on which the Treasury intended to work, both with and without this specific exempting power. In particular, care would be taken not to hamper Colonial development, and the authorities might be prepared to grant exemption to foreign companies establishing businesses in Britain "with substantial foreign capital."

Prospects for Steel

Though steel output dropped sharply in May, prospects for the remainder of the year appear slightly improved. Last month's output, at an annual rate of 15,864,000 tons, was well below that in April and about 10 per cent lower than in May, 1950. For the first five months of this year, steel production has been at an annual rate of 16,361,000 tons, compared with 16,651,000 tons in the same period of 1950.

These figures—which as far as they go tend to support the industry's confidence that 16 million tons of steel can be turned out in 1951—reflect the limit that has been imposed upon pig iron production by difficulties in the delivery of imported iron ore. In May, however, 660,000 tons of ore arrived, against an average of 560,000 tons for the first four months: in June it is hoped to bring in 760,000 tons and in later summer months nearly 1,000,000 tons. Shipping has become rather easier to secure; and in parti-

cular eight Liberty ships engaged in carrying coal to the Mediterranean are to bring ore to this country at the end of June and early in July. Consumption of home ore has increased to the rate of about 14½ million tons a year, or nearly 2,000,000 tons a year more than in 1950. Supplies of coke, upon which use of more home ore places a strain, have already increased with the bringing into operation of new coke ovens at Margam, producing 5,000 tons a week. From the end of September another 8,000 tons will be forthcoming from additional plant in South Wales; and at the end of November the doubling of the coke plant at Appleby Frodingham should supply another 5,750 tons a week. These ovens, it should be noted, may require roughly 26,000 tons more coking coal each week throughout the winter, and will thus increase the steel industry's demands upon the mines and the railways. So far this year pig iron production has averaged 182,000 tons a week. With these additional supplies of materials it is hoped to raise this output to 190,000 tons a week by the end of this year. Next year capacity for 10½ million tons of pig iron a year will be available, compared with 9,500,000 tons being produced this year. This increased capacity will demand greater supplies of home and imported ores; though the recently completed long-term contract for Wabana ore will supply an additional 1,000,000 tons a year, total supplies will depend upon normal sources—and upon the restraint of the American steel industry in purchasing ore from Europe.

* * *

Scrap from Home

In May, imports of steel-making scrap dropped to 26,000 tons a month, little more than an eighth of the amount received in the same month last year. It is hoped to bring in 40,000 tons this month and the same quantity next, and supplies during the remainder of the year may be better than recently: but there is obviously no chance of importing a total in any way comparable with last year's.

It is against this background that the British Iron and Steel Federation was this week able to announce first results from the home scrap drive. So far, these are satisfactory. The industry expected this year in any case to receive about 157,000 tons of scrap a week, as it did from home sources last year; though it is now receiving about 2,000 tons a week less from the shipbreakers, it has since February been gathering roughly 167,500 tons a week, or the 10,000 tons a week extra that it initially hoped from the scrap drives. This success has been attained largely by the speeding up of the rate of flow of process and circulating scrap from within the steel works and their closer customers: as yet the drive has drawn little scrap from the farmer or the householder. The industry has formed nine district committees representing scrap merchants and steel makers, and these have some discretion in making special arrangements to gather metal rusting in homes and farmyards. Local authorities—particularly in steel towns such as Sheffield—are co-operating, though in some cases special arrangements may need to be made for the installation of metal baling presses at refuse dumps and dust works. The home scrap campaign is intended to continue into 1952, since the more remote sources of scrap will obviously take a considerable period to tap; and available sources of steel-making materials will obviously be needed to the full next year.

An early statement by the Minister of Supply on both steel allocation and steel prices is now expected. Both questions appear still to be under discussion; the first upon the extent to which licensing of steel supplies shall be carried, the second in settling the specific increases to be made. Announcement of the change in price, at any rate, should not be delayed: its necessity has been obvious for many weeks. The rise, when it comes, may do little to curb present demand for steel: but it is obviously incongruous that the Government should be contemplating the control of

supplies of a commodity of which it is at the same time holding the price uneconomically low.

* * *

Revaluation Debate Continued

The proposal by the Secretariat of the Economic Commission for Europe that the currencies of western Europe should be revalued in terms of gold and dollars, or left to fluctuate on a free market, received very short shrift at the meeting of members of that organisation that took place in Geneva towards the end of last week. Most of the national representatives refused to comment on the proposal, arguing that the Economic Commission for Europe was not the proper body to discuss such matters. The Dutch and French delegates went out of their way to condemn the ECE initiative as an encouragement to speculation and therefore a disservice to the cause of economic stability in the countries whose interests ECE is intended to serve. The most direct attack on the ECE report came, however, from the representative of the International Monetary Fund who attended the ECE meeting. He pointed out that the Fund was not aware of any disposition among its members to discard the existing system of internationally agreed par values and to adopt instead, by unilateral decision, a system that would allow exchange rates to fluctuate. He added that the Fund wished to warn the public against any suggestion that responsible government officials were contemplating such action. The IMF representative also criticised ECE for venturing opinions on questions that do not concern it and are clearly the province of the IMF. Before this meeting the views of the United States Administration on the ECE proposals had also been made abundantly clear by Mr John Snyder, Secretary to the United States Treasury, who pointed out that any appreciation in the exchange values of European currencies would, in the present circumstances, be inimical to their joint defence effort; he added that if the countries in question felt strong enough for such treatment, they should first of all remove some of the exchange and import restrictions by which the existing exchange values of their currencies are still underpinned.

*

The Bank for International Settlements in its recently published 21st annual report also adds the weight of its opinion to those who argue that, in using their present new-found and, perhaps, illusory strength, the currencies of Europe should seek relief from restrictions before trying to reach higher exchange values. The BIS report stresses that the division of the western world into two monetary camps of dollar and non-dollar countries constitutes a dangerous separation and that this may be an opportune moment for proceeding step by step with the task of their unification. Under a policy of gradual relaxation it would be possible, according to the BIS, to rescind some of the restrictions on dollar trade that were imposed when monetary reserves were shrinking. The BIS report gives an interesting illustration of the damaging effect that can be exerted by differences in exchange controls and import restrictions among the countries of Europe. It points out that under existing European Payments Union arrangements the currencies of those members that apply the fewest restrictions in relation to the dollar area—notably the Belgian and Swiss francs—are the currencies most keenly sought after for purchases of so-called dollar goods. The goods in question are then resold at considerable profit in some other country belonging to the Union, against payment in the local currency. In this way arbitrage operations that could not be carried out directly over the exchange rates are successfully engineered through the channels of trade—a method of dealing that is as injurious as it is cumbersome.

Enterprise in Aluminium

for Britain's Festival...

The outstanding architectural feature of the Festival of Britain is undoubtedly the huge Dome of Discovery.

Three hundred and sixty-five feet in diameter and over one-fifth of a mile in circumference, it is the largest dome ever built.

It is also a dramatic illustration of the use of aluminium as a structural material and we are pleased that our construction company—S.M.D. of SLOUGH—has played a leading part in its manufacture.*

* S.M.D. fabricated the massive triangular Main Rib Girders, the Canopy extending all round the Dome and the great sloping Apron, entirely in aluminium alloy.

To Electricity Authorities Everywhere

WHERE RIPPLE CONTROL AND THE USE OF DEVICES WHICH TAKE ADVANTAGE OF THE LOWERING OF FREQUENCY AND VOLTAGE TO SHED LOAD, DIFFER

1. Ripple control gives the engineer complete selective control of the load to be shed.
2. Ripple control is positive signalling, transmitted only as and when required.
3. Ripple control has permanent investment value because it can be used for improvement of the load factor, under all conditions of electrical supply and demand.
4. Ripple control besides being invaluable under peak load conditions, also provides facilities for controlling other services, e.g. street lighting.

Bigger Trade Deficit

Britain's trade deficit widened considerably in May. The provisional estimate for exports, at £229.7 million, is only a little below the high April figure of £230.2 million, and although it is still well above the comparatively low average of the first quarter, the trend must be regarded as disappointing now that export prices are rising. Moreover, the provisional value of imports in May was £338.2 million compared with the April value of £311.5 million and an average for the first four months of £289.9 million. The value of imports between January and May, 1951, was equivalent to an annual rate nearly 40 per cent above that of 1950. Thus the visible adverse trade balance is already greater than during the whole of last year. British exports to the United States in May, at £10.8 million, were £3,100,000 less than in April and were also slightly below the average of the first four months of the year, but exports to Canada, at £14.4 million, were some £200,000 higher even than in April. Exports to the whole of North America during May, at £25.2 million, were in value about the same as the average for the last quarter of 1950, but they were probably less in volume.

The Board of Trade is unlikely to announce specific new export targets until later in the year—and then they will probably be targets for 1952. Export prices are increasing, but so far this year, in the absence of any sharp increase in volume, this has not been sufficient to bear the added burden of paying for rising import costs.

British Debit with EPU

The compensations effected under the European Payments Union reveal for the first time a debit position on United Kingdom account. In the month of May this net debit amounted to £9,681,429, equivalent to 27,108,000 EPU units. In accordance with the cumulative principle on which debits and credits are calculated and gold payments and repayments are effected, half this debit was repaid to EPU by the United Kingdom in gold and the other half was deducted from the accumulated balance standing to the credit of the United Kingdom in the books of EPU. After these transactions, the total gold received by the United Kingdom from EPU since it began operations on July 1, 1950, is reduced to £37,794,286, while the credit balance held in the name of the United Kingdom by EPU has fallen to £113,508,929. No alarming deductions need be made from this reversal of the United Kingdom's usual creditor status. The figures for May should be viewed in conjunction with the exceptionally large April credit of £18,536,786. That earlier credit was in part the result of anticipatory purchases of sterling caused by revaluation rumours. As those rumours dwindled during May (though they may have increased again during the first week of June), the purchases of sterling for current requirements were reduced and this reduction is reflected in the net deficit incurred during May.

When the full results for May are available it will be found that Germany has forsaken its long-standing debtor role and has become a substantial creditor within the EPU group. That credit position, reflecting larger exports to the United Kingdom and the sterling area, played its part in explaining the United Kingdom deficit for May. It should also be realised that seasonal influences are beginning to affect adversely the United Kingdom's balance of payments with the continent of Europe. Sales of wool and cocoa, which in previous months had earned the sterling area considerable income from Europe, had been reduced to a comparatively small trickle in May, while on the other hand the beginning of the tourist season and the invasion of the Continent by British cars had begun to make its impact felt on the demand for European currencies against offers of sterling. In any case no tears need be shed over this modest correction of

the excessive credit balance previously accumulated by the United Kingdom in its trade with other OEEC countries.

Oil Supplies and Defence

The setting up of an Oil Supply Advisory Committee "to advise the Government on oil supply problems with particular reference to defence" has a significance that is not emphatically revealed in last week's rather flat statement. The committee has been formed at the request of the Ministry of Fuel and Power, but it is essentially an industry committee without official representatives; it is headed by Sir William Fraser (chairman of Anglo-Iranian), who becomes chairman of the new committee; the other members are Sir George Leigh-Jones (a managing director of Shell Petroleum) and Mr S. Vos (chairman of Trinidad Leaseholds), with Mr J. P. Berkin of Shell as secretary. The Ministry's statement declares that the setting up of the committee is not related to the situation in Persia and that the request to the companies was made "some time ago."

By virtue of this official request, the new committee acquires a formal recognition of what would otherwise remain an informal authority. Its work in the field of oil problems relating to defence will be of the co-operative character that the competitive oil industry seems to adopt as a matter of course in a period of emergency. Its composition reflects its independence of government direction. Indeed, the comparative simplicity of these arrangements is in marked contrast to the difficulties that the American oil industry and the Administration have recently been facing in their attempts to concert action for defence. The brooding shadow of the Department of Justice prevents the industry from taking action in the broad interest of defence because in doing so it would risk prosecution, fines and imprisonment under the anti-trust laws. The recent strike at Abadan refinery provided disconcerting evidence of the apparent impossibility of obtaining rapid and effective joint action by the American oil industry to assist in meeting a crisis of world importance. The Petroleum Administration for defence has been attempting to work out arrangements that would provide some hope of quick action without risking offence to the Department of Justice; this latter condition was far from easy to secure during the war, and is ten times more difficult in time of cold war. A solution may be found in the new National Petroleum Council that has been set up as an advisory body to assist the PAD. But the conditions have, it seems, been scrupulously laid down to fit the commandments of the anti-trust laws: the Council will be purely advisory; it must not allocate supplies or facilities to individual companies; when the time comes for allocation or other joint action, special advisory committees with full-time government officials will be set up.

Thus joint action in America, it seems, must first await the crisis and then, presumably, the discovery of sufficient dollar-a-year men from the industry to head the separate committees as full-time government officials. At the cost of some delay and confusion, the commandments will be obeyed. It may be, perhaps, that the simpler administrative forms that the British Government and the leading oil concerns have been able to evolve will have a certain interest for Washington, if only because the British committee, in time of crisis, will have an advisory authority that will contain the real substance of executive responsibility.

Fiduciary Issue Increased

In a written Parliamentary answer this week, the Financial Secretary to the Treasury revealed that the Treasury had authorised an increase in the fiduciary issue from £1,350 million to £1,400 million, as from June 12th.

The Bank return made up on the following day showed that the note reserve in the banking department was hoisted by this increase to over £59 million. As holiday demands last year raised the active circulation of notes by about £40 million between mid-June and early August, this week's increase in the fiduciary limit was clearly inevitable. This is the first time since February, 1948, that the fiduciary issue has been as high as £1,400 million. Between the spring of 1948 and the outbreak of the Korean war, it remained at £1,300 million for all non-holiday periods, though it was raised to £1,325 million or £1,350 million for the Christmas and summer holiday peaks. The "summer holiday" increase last year, however, (by £50 million to £1,350 million on June 27th) was never rescinded; the issue remained at £1,350 million, except for the month spanning Christmas, when it had to rise to £1,375 million. Between the end of January and the middle of June this year, the active note circulation has risen by £59 million to £1,340.9 million; in the same period last year it rose by £45 million to £1,291.4 million. It is clear that the creeping rise in retail prices is exerting a steady upward pressure on the demand for notes, and there may be room for doubt whether the fiduciary issue will be able to revert to £1,350 million when the present holiday season comes to an end.

Synthetic Rubber for Britain?

The rubber industry is growing conscious of the fact that synthetic rubber has its place in commercial use just as rayon has established its place among the fibres. Six months ago the Dunlop Rubber Company announced that it was considering plans to open a synthetic rubber plant in Britain. This week, Sir Clive Baillieu, the chairman of the company, in his speech at the annual general meeting alluded to the need of the British rubber industry to secure adequate supplies of synthetic rubber at reasonable prices. He added that the synthetic rubber industry in the United States was not only an insurance against interruption in supplies of natural rubber but also a national asset of real commercial value "providing American industry with a product at reasonable cost which has a wide and increasing diversity of use in a highly competitive world."

Rubber growers have feared the increase in synthetic production not so much because of the increased competition but because in the United States natural rubber is not allowed to compete freely with synthetic rubber. For certain uses synthetic rubber may be more suitable than natural. For tyres and inner tubes, which account for about 60 per cent of the world's rubber consumption, however, natural rubber is still preferred. But if, as was suggested in an article in last week's issue, world rubber consumption continues to expand at the rate it has done since 1900, supplies of natural rubber may be insufficient to meet requirements in 1960, and scope would exist for extending synthetic production.

The problem of synthetic rubber costs has not been solved. It is not certain, for example, whether the sale of synthetic rubber in the United States is subsidised or whether the price of 24½ cents a lb for general purpose synthetic covers all normal commercial costs. But if Sir Clive's remark that "this problem will not be allowed to lie dormant" can be taken to mean that the Dunlop Rubber Company is pursuing its plan to erect a synthetic plant in this country, it is presumably satisfied that the cost of producing synthetic rubber is no longer the main obstacle to be overcome.

Cotton Commission Report

Cotton trading has become a profitable business and the Raw Cotton Commission has shown a substantial increase in both its net profit for the year ending July 31,

1950, and in its surplus and reserves. Its annual report and statement of accounts, published this week, are commendable for the detail they contain; but it is all the more regrettable that it has taken the Commission eleven months to produce them when any private undertaking can publish its accounts within six months of the close of its trading year—though in fairness it should be stated that preliminary figures were released at the end of November and discussed on page 974 of *The Economist* dated December 2, 1950.

The Commission benefited from the effects of devaluation since it raised its selling prices to bring them in line with current replacement costs. Its net profit for the year amounted to £9,939,000 compared with a deficit of £707,000 in the previous twelve months, and surplus and reserves rose from £24,380,000 to £40,049,000. Stocks are valued at the lower of cost or replacement value. At the end of July, 1949, they amounted to £74,764,000 (valued at replacement cost) and at the end of July, 1950, they had increased to £83,988,000 (valued at cost), although the physical stock was some 10 per cent smaller. About 42 per cent of the physical stock appearing in the balance sheet at the end of the trading year represented cotton sold to spinners for delivery at fixed prices in the months subsequent to the date of the balance sheet. The value of these forward commitments amounted to £35 million; sales for deferred delivery at the end of the previous year amounted to only £8,000,000. But the sales for delivery after July, 1950, were all effected at prices which show a profit over the cost of raw cotton.

Most of the Commission's purchases continue to be made through shippers' agents in Liverpool and Manchester. The main exceptions to this policy are certain colonial growths bought under contract and Egyptian cotton bought through the Commission's Alexandrian office. New sources of supply are being developed to replace American growths; the Commission bought substantial quantities from Turkey, Syria and Haiti and smaller lots from El Salvador, Nicaragua and Cyprus to enable the trade to make extensive tests. Regular meetings have been held with representatives of the Federation of Master Cotton Spinners' Associations; this innovation has no doubt been responsible for the decline in the number of complaints about the way the Commission has conducted its affairs. At least the Commission has understood and applied sound principles of government trading, which some of the Government's departments could do well to copy.

Critics' Plan for Coal

The three most prominent expert critics of the National Coal Board have now united in proposing a changed structure for the nationalised coal industry. Col. C. G. Lancaster's "Structure and Control of the Coal Industry," which is not yet official Conservative policy on coal mining but may later be adopted as such, was written "in association with" Sir Charles Rtid and Sir Eric Young. It is, in effect, a slightly modified reconciliation of the reorganisation plans for the industry put forward almost simultaneously in 1948 by Col. Lancaster and Sir Charles; the specific influence of Sir Eric Young's views is less apparent.

Col. Lancaster proposes to sweep away the present structure, below the Coal Board itself, of nine Divisional Coal Boards and 48 Areas controlled by area general managers. He would substitute "about thirty" District Coal Boards, of which the district production directors would have full executive control, assisted by a number of area production managers, "one for each of the areas into which it was considered technically appropriate at that time to divide the districts" (possibly in fact three or four to each district). The District Coal Boards, unlike the existing intermediate coal authorities (but like the Area Gas and Electricity Boards) would be statutory entities recognised in an amended Coal

"...we need Emidictas"

The Electronic Dictation Machines which outdate all past achievements in the field of recorded dictation.

With the Emidicta, you need never be held up on 'dictation'. In the office it ensures a smooth flow of recorded dictation to the 'pool'—and the work comes to the Typists, who freed from calls for dictation can devote their whole time to their real job—typing! The Emidicta makes everybody's job easier—gives greater efficiency, increased output, less strain.

Let us prove this by demonstrating the Emidicta to you in your own offices.

The EMIDICTA is a product of the E.M.I. Group (His Master's Voice, Marconiophone, Columbia, etc.), past masters in recording and sound reproduction.

POST THIS COUPON NOW.

To E.M.I. Sales & Service, Ltd., Emidicta Division, Dept. 28, 262-267 Oxford Street, London, W.1. Phone: MAYfair 8551, Gresham 7127/8.

Please send descriptive brochure.

Please arrange a demonstration.

The MECHANICAL CHARWOMAN

says
"I've been CHOSEN for the FESTIVAL"

- In daily use at the Festival Gardens.
- Exhibited twice at the South Bank Site.
- In the South Bank Stock List of the best that Britain makes.
- Touring the country with the Travelling Exhibition.

The wonderful Mechanical Charwoman is the only machine in the world that Scrubs, Dries and Suction Polishes Floors, Suction Cleans Carpets and Dusts from floor to ceiling.

No wonder it was chosen for the whole world to see at the Festival of Britain.

Write for descriptive literature and your COLUMBUS Dealer's Address.

ZINC AND CHEMICALS

During the last 30 years a great industry has been built up in Britain. Imperial Smelting Corporation have produced annually substantial quantities of zinc, including high purity zinc (99.99+%)—Cadmium, Sulphuric Acid, Mazak, Orr's Zinc White Lithopone and Fricker's Zinc Oxide. The production of Anhydrous Hydrofluoric Acid, Fluorine and fluorine compounds are being actively developed from fluorspar mined by the Corporation in this country.

The Corporation employs a large research staff in order to keep abreast of modern technique and scientific progress and thus plays an indispensable part in the complex metallurgical and chemical industries of the country.

Industry Act; but the National Coal Board would retain the power of appointing and replacing their full-time chairmen and part-time members. Each district Board would be responsible for producing a certain yearly output set by the National Coal Board; it would publish its own balance sheet, though it is recognised that not every district board could immediately become self supporting, and that in the meantime some would need to be subsidised by others. Specialist staffs on the "board of management" of each district (there is no mention of any such staff, including labour managers, below this level) would act strictly as advisors to the district chairman, and would ordinarily have no direct contact with parallel technical staffs at national headquarters that would offer a central advisory service that district chairmen might consult if they wished (and would probably pay for). The Coal Board itself would be a policy, and not a functional board; its chairman, deputy chairman and four or five full-time vice-chairmen would have no executive responsibilities, and would be assisted by a similar number of part-time members. Its purview—and "substantially reduced" staff—would cover annual budgetary control and finance "which should now include the issue of stock," planning of long-term development, co-ordination of sales policy (Col. Lancaster believes a marketing structure would need to be created separately from the production districts, but does not describe it), national wage negotiations, control of carbonisation, and the encouragement of local and central research.

The proposals would ensure considerable decentralisation of responsibility—though less than has elsewhere been suggested—between the Coal Board and the administrative units immediately beneath it in the structure: this is the only decentralisation that has been attempted to any extent in the existing structure. But these second rung units in the new system would be much smaller—an average of 7,000,000 tons of coal a year and up to 30,000 workers; though statutory bodies, all 30 could hardly be made accountable to Parliament. It is not easy to see how the proposals as they stand would carry the principle of decentralisation much farther down, would demand any smaller number of the industry's scarce high-grade mining engineers in intermediate jobs, or would greatly reduce the number of levels in the structure. The proposals need elaboration, and will then deserve fuller study—particularly in conjunction with the report of an independent research body that is soon to appear on this subject. At present, however, the authors seem to assume too confidently that what is mainly wrong with nationalised coal mining is its organisation, and they perhaps devote too little analysis to the weaknesses and frictions in the human elements of the industry that they hope to treat by redesigning its structure.

Slight Improvement in Stocks

The figures in the latest Digest of Statistics show some improvement in stocks of certain materials. Apart from coal, which showed a seasonal improvement in April, stocks of zinc, copper, cotton and rubber improved in March, and sulphur and pyrites stocks improved a little in February (the latest figure) over the previous month. Copper stocks in March were the highest since last October, and rubber the highest since September, 1949; cotton and zinc showed gains over the previous month.

It would be easy to exaggerate the importance of a single month's movement in these commodities. Moreover, some important materials showed no improvement. Thus stocks of pig iron at the end of March were little more than two-thirds of the end-1950 total. Coke stocks in April showed a further decline from March. Stocks of coke at coke ovens and blast furnaces were 264,000 tons in April, 1951, compared with 347,000 in April, 1950, and 371,000 in April, 1949. The fall in stocks of pig iron and coke clearly reflects

the scarcity of iron and steel-making materials, though there are grounds, as a note on another page suggests, for expecting an improvement. Stocks of softwood, wool, woodpulp and

Hawker Recapitalisation

To describe the reforming of Hawker Siddeley ordinary capital as a capital "bonus" is to put a greater weight on that overworked word than it can possibly bear. The operation has long been in the company's mind, and, as the chairman disclosed last January, rested on the consent, withheld over many months, of the Capital Issues Committee. Given the Chancellor's revised directive to the CIC last April, the company renewed its application and at long last it has obtained consent to a three for one issue from reserves, raising the nominal value of the 5s. shares to £1.

A company in the limelight of the armament business finds it desirable to keep as small a gap as possible between issued capital and capital employed. Issued capital and reserves will remain as before at £14,471,271, but the ordinary capital will in future represent 40 per cent of this total instead of 10 per cent—or, in accounting terms, £5,822,350 against £1,455,587, the increase being found from capital reserves. Together with the announcement of the capital issue, the directors took the wise step of stating the maximum dividend that they would be prepared to consider in respect of the year ending July 31st. This is 10 per cent, of which 4½ per cent has been declared as an interim. No doubt this will disappoint shareholders who have bought Hawker with their eye on the much greater earnings. But presumably some informal understanding was needed between the company and the CIC, and in any event the group's needs for capital are likely to press hard against its resources in the next year or two. The 5s. shares fell from 45s. to 42s. 4½d. on the announcement and after allowing for the interim dividend, yield £4 14s. 5d. per cent on the expected 10 per cent distribution for the full year.

* * *

Utility Clothing Prices

Since the beginning of the year maximum prices of nearly all articles of utility clothing have been increased, the most recent being one of 25-30 per cent announced last week in the price of certain children's clothing. The increases became necessary after maximum prices of utility cloth were raised early this year to allow for rising raw material costs;

but they also take into account recent wage increases to clothing workers. The Board of Trade before granting these rises in ceiling prices has carried out some of its periodic "cost investigations" into manufacture of certain garments, and the increases finally granted are by no means uniform. They average between 25 and 30 per cent for wool garments, about 12½ per cent for rayon and 10 per cent for cotton garments. But while the price of a man's suit in the cheaper ranges, for example, will now go up by a full 30 per cent, the maximum price for a top-grade suit has been raised by only 22 per cent.

The interim index of retail prices shows that by the middle of April the cost of clothing had risen by 34.2 points compared with prices in June, 1947, and had gone up ten points this year. Garments selling at the new prices will not be on sale before September, when their effect on clothing sales is hard to predict. In spite of the high rate of clothing sales this year, stocks of both cloth and garments at the old prices are still large. Weekly clothing sales rose from 141 in January to 183 in March (1947 average = 100), and although the April sales index was four points lower, it was still 35 points above that for April, 1951. Yet the value of retail clothing stocks at the end of April was 9 per cent higher for women's and 11 per cent higher for men's clothes than twelve months previously. Clothing prices have risen during the period, but figures of stock still indicate a high volume of production at, and in many cases below, current maximum prices. Many manufacturers are selling even now at prices some way below the maximum; and with stocks at these prices, and the prospect of falling raw material prices, the clothing industry may find it hard to take full advantage of the new price ceilings, particularly those for wool garments. It may find it even more difficult to pass on to the consumer the full effect of the price rise in raw wool since last October, for which no allowance has yet been made in either cloth or clothing price schedules.

Silver Falls in New York

An unexpected buyers' strike has sent the New York quotation for imported silver down from 90.16 cents to 87½ cents per ounce. The London quotation for silver provided for authorised users by the Bank of England has dutifully followed suit from 78½d. to 76½d. per fine ounce. The movement in New York is in the main explained by the customary seasonable slackening in the demand for silver by the jewellery trade. This is a regular phenomenon and the buying from this quarter normally revives in August and September in preparation for the Christmas jewellery trade. On this occasion other industrial buyers of silver scented an opportunity of "banging" the price and, as the principal smelter in the United States normally continues offering irrespective of the market quotation, the price inevitably yielded. The market has been steady at the lower level and reports from the United States suggest that industrial demand is beginning to pile up; an early recovery in the price for imported metal is a distinct possibility.

While the price of silver in the United States has been going down, that in India continues to soar. During the past week the quotation in Bombay has risen above 200 rupees per 100 tolas, a price that gives a sterling parity of just over 100 pence per ounce. Too much should not, however, be made of the behaviour of the silver quotation in the domestic and insulated Indian market. Imports of silver into that market continue to be strictly prohibited and though a certain amount of smuggling is encouraged by the present margin between world and Indian prices, the movement can be little more than a trickle. This is partly because silver is a bulky and difficult commodity to smuggle, and partly because available smuggling facilities are fully occupied in dealing with a much more profitable traffic in gold.

Control of Non-Ferrous Scrap

The Ministry of Supply has made a new Order, taking effect on July 2nd, to extend the licensing system for virgin copper, lead and zinc to cover scrap and residue of these metals or their alloys. This control of distribution was envisaged in February when the Ministry imposed ceiling prices for non-ferrous scrap metals. A licence will be required to obtain any quantity of metal for processing, including the making of secondary ingots; the acquisition of small quantities without processing, under 13 tons in a quarter, does not require a licence. At present it is not intended to apply quantitative control, but under the new Order returns are to be rendered of stocks and transactions; it would be possible, therefore, to impose a more complete control later.

By this control the Ministry hopes to limit the issue of licences to reputable dealers. Yet it is unlikely to end the black market in non-ferrous scrap without a campaign of investigation and prosecution, upon which the Ministry so far has hesitated to embark. Moreover, the lack of price control of secondary ingots makes it profitable to buy scrap, at prices above the statutory limit, for melting and ingot making. Further, the Order is unlikely to affect the various types of conditional sale that are common in the non-ferrous metal fabricating industry. For example, some dealers in scrap brass have recently been holding back part of their scrap from the normal market and offering it to brass mills partly in exchange for such mill products as strip and sheet, which they have been able to sell at prices ranging up to twice the regular prices. The mills could, of course, refrain from this trading, but they are in urgent need of scrap to supplement metal supplies to meet the increased demand for brass mill products. Action by the British Non-Ferrous Metals Federation would not be wholly effective since not all the mills are federated.

*

Moreover, scrap dealers who are exploiting conditions of sale are pursuing their own form of the somewhat more widespread arrangements by which mill customers return their own scrap directly to the mill. All mills have encouraged this prompt collection and recirculation of scrap and some have insisted on receiving given quantities of scrap as a condition for supplying new orders. The mill customers have usually fallen in with this procedure willingly, since they have been anxious about their own supplies of sheet and strip. These are not altogether unreasonable arrangements, and if the scrap dealers take advantage of them by bartering in brass semi-fabricated products, they can hardly be blamed. They reflect the shortage of non-ferrous metals and they have arisen, in part, from the Ministry's policy of keeping maximum scrap prices at levels incommensurate with demand. Copper, cupro-nickel, brass and other copper alloy scrap prices have recently been raised—copper scrap, No. 1 wire, to £207 a ton, cupro-nickel 70/30 process scrap to £257 a ton, and brass heavy scrap to £163 a ton; but these increases are a mere consequence of the increases in price of virgin copper and nickel. If scrap prices were raised generally, more scrap would no doubt become available through normal trade, much scrap now wasted would be worth a special effort to conserve, and the breaches of normal trading relations such as conditional sales would become less important.

* * *

Cotton Output

Output in both the spinning and weaving sections of the cotton industry has been rising during the first four months of this year, but the figures invite the question whether the postwar rise in output has reached its peak. Yarn output was 4.9 per cent higher in 1949 than in 1948, and in 1950 it was 6.3 per cent higher than in 1949. How-

ever, output for the first 21 weeks of this year was, at 433.91 million pounds, only 3.47 million pounds or less than one per cent higher than in the comparable period last year. But in this case a direct comparison can be misleading, because this year's figures include the Whitsun holiday while the 1950 figures do not. There were also temporary factors at work, such as the need to adapt mill schedules to the limited choice of raw cotton and yarn, that might have been expected to check the upward trend of output. The period between Whitsun and the opening of the Wakes weeks is by tradition the time of highest output in the industry, and production of yarn this year in the first week after Whitsun was 19.78 million lb. compared with 18.95 million lb. in the first post-Whitsun week of 1950. This is an increase of more than 4 per cent which, given this year's production difficulties, compares quite favourably with last year's rate of expansion.

*

Output during the first half of the year is not likely to be affected by the 20 per cent cut in the rayon industry's allocations of sulphuric acid. The rayon producers, by drawing upon their stocks of acid at the time of the cuts, are preventing rayon production from falling by more than about 10 per cent in the first half of this year, despite the 20 per cent cut in sulphur supplies; and stocks of rayon have enabled them to maintain deliveries to most consumers so far. The cotton industry has been steadily increasing its production of rayon and rayon mixture yarns and cloths; and when the full effect of the 20 per cent cut in sulphur is passed on in rayon deliveries in the coming months it is bound to cause difficulty for many spinning and weaving companies that have plant to handle rayon.

	COTTON OUTPUT (Weekly Averages)

Source: Cotton Board.

The fall in rayon output may also affect the demand for cotton yarn from other rayon users such as the tyre or knitting industries. If these demand more cotton yarn, Lancashire's weavers will immediately feel the effect. A good cotton crop in the United States could go a long way towards meeting the extra demand created by shortage of rayon, but the cotton industry has also yet to feel the effect of competition for labour from the rearmament industries. Its labour force has continued to rise this year, reaching 316,840 at the beginning of May; but re-deployment is making slow headway and output is still closely dependent on the supply of labour. Should Ministerial warnings (much resented in Lancashire) of a transfer of labour from cotton be fulfilled, this could hardly be offset now by the installation of more new machinery. Current supplies of automatic looms are small compared with the numbers of looms in operation; though there are grounds for believing that many sheds equipped with these looms are not taking full advantage of them, the practical opportunities for savings are probably small. The next few months, therefore, will show how developments in other industries may affect output of cotton and hamper Lancashire's chances of fulfilling its export commitments—and whether certain recent signs of an abated pressure of demand portend some fall in home and export

Finance 8. 1. 1951

Freight Market Activity

There is no sign yet of a break in the high level of freight rates that has ruled since last January. The latest Chamber of Shipping tramp freight index, for April, shows a slight drop, by 3.8 points to 176.8, but the index still remains higher than in either February or January, and more than double the average for the whole of 1950. The high levels of recent months are largely due to the disorganisation of the markets caused by the urgent demands of Government bulk buyers for trans-Atlantic timber and coal, although other influences have continued to bolster the demand for tramp tonnage. Europe's winter importation of coal from North America, it may be recalled, was carried out only at the expense of depriving other markets of tonnage, and United Kingdom imports of iron ore, in particular, are well behind schedule. Tonnage in the Mediterranean trades still fails to satisfy demand, so that high rates are now obtainable there. This tendency shows signs of continuing through the Baltic timber season, so that higher rates than before (and more favourable chartering terms and conditions) will certainly have to be paid by the timber charterers to divert the attention of shipowners from Mediterranean prospects.

On the other hand, one or two weaker points have begun to show in certain directions, sufficient at any rate to cause the slight drop in the freight index for April. The Plate market, for example, is behaving rather oddly. Recently, higher freights have been paid for grain to India, whereas employment for vessels bound for the United Kingdom is not easy to find and charterers are quite ready to let vessels go unheeded. The exportable surplus of Argentine maize, too, promises to be poor, so that most of it could be carried in the liners during the season. The homeward liner conferences, however, are holding out for high rates, and one or two tramp ships that have offered lower freights have been preferred. It is expected that 500,000 tons of British coal will have to be shipped to the Plate this year, but shipowners will need some extra inducement to take their vessels to such a dull market as the Plate, particularly while employment nearer home is still so easily obtainable. Trans-Atlantic grain and sugar, as well as occasional coal cargoes, have kept rates fairly high, and the United States exports of grain to India have readily absorbed the extra tonnage released from the U.S. laid-up reserve fleet this year. Ready employment can be found, too, in the West African trades. Here and there, however, rates are tending to weaken somewhat—an indication that perhaps seasonal fluctuations are again beginning to make themselves felt.

FACTS, FIGURES, AND OPINIONS

Company Notes

Hudson's Bay.—It is impossible to bring the activities of the Hudson's Bay Company within a single focus. In recent years, the company has moved in step with the development of Canada itself—that is, towards new commercial and industrial frontiers, inevitably leaving behind something of the old pioneering endeavours in a new and promising land. But it is the range, rather than the intrinsic character of the company's operations that has changed. Hudson's Bay was founded as a trading adventure. The modern reflection of those origins is found in the fact that the six departmental stores owned by the group contributed the largest share to last year's considerable improvement in trading profits from £1,415,659 to £2,674,268, establishing a new record of sales turnover. The advance in profits reflects this expansion of business, but it also owes something to the more favourable exchange rates at which Canadian earnings were converted into sterling after the freeing of the Canadian dollar and to the general inflation of values following the Korean war. This last factor justifies the transfer of £400,000 to a special merchandise reserve. These records of business and profits permit the raising of the ordinary dividend from 8 to 12 per cent (in addition to the tax-free 5 per cent dividend from land sales).

	Years to Jan. 31, 1950	1951
Consolidated earnings:—		
Trading profit	1,415,659	2,674,268
Total income	1,519,664	2,752,606
Depreciation	200,841	274,586
Taxation	531,178	1,183,730
Group earnings for ordinary stock	406,540	518,846
Ordinary dividends	109,658	159,502
Ordinary dividends (per cent)	8	12
Retained by subsidiaries	232,055	285,465
Added to general reserves and carry forward	131,594	107,261

	Years to March 31, 1950	1951
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	5,374,078	5,536,096
Net current assets	8,880,779	10,521,373
Stocks	6,294,394	7,790,184
Cash	1,652,442	1,528,647
Reserves	10,576,824	12,127,598
Ordinary capital	2,492,224	2,492,224

£1 ordinary stock at £6 yields £3 11s. per cent on a distribution basis of 21.3 per cent.

Tax-free dividends from land sales have given ordinary shareholders a welcome bonus for some years past, but this source of income is rapidly being exhausted. The land department is gradually being wound up and "little more revenue can be expected." The fur trade, still of great importance, made an average contribution to last year's profits. The group in association with Continental Oil, is exploring the Hudson's Bay acreage (4,300,000 acres, with other options, together totalling 8,000,000 acres) for oil and natural gas. This new joint venture has been undertaken on the long view with no expectation of great benefits for some years to come.

The indications appear to be that the company is stronger and is growing faster than at almost any time in its long history. Its fortune, however, will remain closely linked to the prosperity of the North American economy.

Courtaulds.—Judged by an accountant's "true and fair view" of profit, the giants of British industry were more profitably employed last year than in any other period in their history. Courtaulds are no exception; indeed, the expansion of profits by 116 per cent from £7,994,741 to £17,270,823 in the year ended March 31, 1951, is relatively greater than that recently revealed by its fellow giants. Such figures throw a deceptive light on the underlying problem of replacing fixed and working capital as prices continue to mount; big though they are, they are expected to do too much, including the satisfaction of the tax collector's claims

which reached the phenomenal figure of £9,049,664 against £3,787,193.

Courtaulds is among the long list of companies to make specific reserves in defence against present-day prices; some £2,600,000 has been set aside against the replacement of material consumed last year, and £1,704,692 (against £1,701,679) has been appropriated to a fixed assets replacement reserve.

Record profits have nevertheless given the Courtaulds' board an opportunity to take a step outside their traditional role of financial ultra-conservatism by raising the ordinary dividend from 7½ per cent to 11½ per cent. If retentions by subsidiaries of £1,556,527 (against £614,851) are regarded as free reserves, these sums and the addition to the carry forward comfortably cover the ordinary dividend. Investors have therefore to balance the undoubted profitability of the group and the company's break with dividend conservatism against the financial problems of replacement brought in the wake of inflation. They have also to assess the potential effects of the scarcity of such materials as sulphur particularly as it is pointed out in the preliminary statement that production, which increased in the earlier months of the financial year, has been restricted in recent months by certain raw material shortages. On a slightly longer view, perhaps, these difficulties may not prove so burdensome as they now appear. At the current price of 50s. 6d. the £1 ordinary stock units yield £4 9s. per cent.

J. Lyons.—A year of steady, if unspectacular, achievement is reflected in the advance of Lyons' group trading profits from £2,569,485 to £3,022,138 and the maintenance of the ordinary dividend at 22½ per cent. The expansion of profits may be linked with the completion of a further stage of

	Years to March 31, 1950	1951
Consolidated Earnings:—		
Trading profit	2,569,485	3,022,138
Total income	2,641,994	3,089,785
Depreciation	605,332	721,400
Taxation	893,416	874,210
Group earnings for ordinary stock	393,597	506,527
Ordinary dividends	223,714	221,593
Ordinary dividends (per cent)	22½	22½
Added to group revenue reserves and carry forward	163,883	293,101

	Years to March 31, 1950	1951
Cons. Balance Sheet Analysis:—		
Fixed assets, less depreciation	11,634,456	12,733,641
Net current assets	6,145,845	7,932,751
Stocks	6,151,111	8,221,112
Cash	995,737	1,416,177
Reserves	5,997,483	6,444,175
Ordinary capital	2,391,273	4,258,660

£1 "A" ordinary stock at £5½ yields £4 7s. per cent. capital development for the book value of fixed assets at cost has risen from £11,634,456 to £12,733,641. Plans for further development appear to be well in hand as outstanding commitments are estimated at £1,729,000.

Any strain imposed on financial resources by this capital programme or by further commitments in current assets—stocks, for instance, are higher at £8,221,112, against £6,151,111—has been relieved by the proceeds of the issue of 660,000 £1 "A" ordinary shares at £4 10s., which do not rank for dividends in the latest financial year. At the balance sheet date, £1,867,387 had already been received from subscribers to the issue, leaving over £1,000,000 still to be collected. The addition of this sum should strengthen liquid resources to meet any call made on them by any further expansion of fixed or working capital.

The financial strength of the group, and a record of slowly mounting profits and of comparatively generous treatment of ordinary shareholders, confirm the impression that Lyons' equity deserves its blue-chip status, though some stockholders may well feel disappointed at the lack of any dividend increase.

EXCHEQUER RETURNS

For the week ended June 9, 1951, total ordinary revenue was £75,068,000, against ordinary expenditure of £66,852,000 and issues to sinking funds £420,000. Thus, including sinking fund allocations of £1,970,000 the surplus accrued since April 1, 1951, is £26,641,000 compared with a surplus of £26,419,000 for the corresponding period of the previous year.

THE ANGLO-PALESTINE BANK LIMITED

TRANSFERENCE OF CONTROL TO BANK LEUMI

RESERVE FUND EQUAL TO PAID-UP CAPITAL

MR S. HOOFIEN ON THE CHANGED POSITION

The forty-ninth ordinary general meeting of the Anglo-Palestine Bank Limited was held on June 5th at 6, Gracechurch Street, London, E.C.3.

The following is the statement by the chairman, Mr S. Hoofien, which had been circulated with the report and accounts for the year ended December 31, 1950:

In my statement to the annual general meeting of last year I announced the steps to be taken towards transformation of the bank into an Israel company which were then under consideration. These steps have now virtually been completed. The Anglo-Palestine Bank Limited, though formally still in existence, has ceased to function and the Bank Leumi le-Israel B.M. is continuing the business.

It will be recalled that in October of last year I addressed to the shareholders, on behalf of the board, a statement in which I explained the reasons which impelled the directors to come to them with certain proposals, and I set out at some length the nature of those proposals. A report on the action which followed this circular will, I assume, be welcome.

BANK LEUMI OFFER ACCEPTED

I ought first of all to point out that as a result of this action the Bank Leumi le-Israel B.M. has become the only shareholder of the Anglo-Palestine Bank Limited, and my present statement should, therefore, formally be addressed to it only. In view, however, of the fact that in the ordinary course of business the former shareholders in the Anglo-Palestine Bank, who are now shareholders in the Bank Leumi, will receive the first report and accounts of the latter bank only in a year's time, and so as to preserve continuity, the directors have deemed it proper that I should address the present statement to the shareholders of the two banks, who will also receive the report and accounts.

On October 27, 1950, the Bank Leumi le-Israel B.M. made an offer to the shareholders of the Anglo-Palestine Bank Limited, of three of its £1 ordinary or "A" ordinary shares, respectively, in exchange for two ordinary or "A" ordinary shares held by them. This offer, which expired on November 22, 1950, was until the date of expiry accepted by ordinary shareholders holding 304,518 £1 shares—that is, over 98 per cent.—and by "A" ordinary shareholders holding 291,887 £1 shares—that is, over 94 per cent. Further acceptances came in during the period of four months (expiring on February 27, 1951) which, under the Companies Act, 1948, had to elapse before further action could be taken, and ultimately all the remaining shares in the Anglo-Palestine Bank were acquired by the Bank Leumi.

TERMS OF EXCHANGE

The exchange offer made by the Bank Leumi to the shareholders of the Anglo-Palestine Bank also gave accepting shareholders the right to subscribe for cash at par for additional shares of their own class in the proportion of two additional shares for every seven shares held. The holders of nearly all the ordinary and "A" ordinary shares exercised this right or disposed of it

to others and the small balance which remained, owing to the fact that a few shareholders abroad were never able to respond to the offer, has been taken care of on their behalf by the Anglo-Palestine Bank.

On the strength of the exchange offer there were taken up as fully paid:—

Ordinary shares	£465,000
"A" Ordinary shares	465,000
and on the strength of the cash subscription offer there were taken up and fully paid:—	
Ordinary shares	135,000
"A" Ordinary shares	135,000
The subscribed and paid-up capital of the Bank Leumi amounts, therefore, to	£1,200,000

The authorised capital has been fixed at £3,000,000.

ASSETS AND LIABILITIES TRANSFERRED

The assets and liabilities of the Anglo-Palestine Bank in Israel have passed to the Bank Leumi through the operation of law, a special section, providing for our own and similar cases, having been added to the Israel Companies Ordinance. The assets and liabilities of the London office have been specifically and individually transferred to the Bank Leumi.

The transfer of the assets and liabilities in Israel under the special section of the Companies Ordinance which I have just mentioned called for an Order of the Court which was applied for and was duly issued. Under this Order the transfer entered into effect on Tuesday, May 1st, on which date the Bank Leumi le-Israel B.M. opened its doors and continued the business of the Anglo-Palestine Bank Limited, under the same director and management, with the same staff in the same offices and without any interruption or change. Thus the history of the Anglo-Palestine Bank Limited has been brought to a close after 48 years of activity, during which the bank has given useful service in every field of the country's economy, through several wars and many periods of unrest and commotion. During this long period the bank has grown considerably, until it now takes the undisputed position of the leading bank of the country, conducting the larger part of its banking business, serving as bankers to the Government and to the Jewish Agency, issuing the country's currency and administering the Government loans.

SHAREHOLDERS' REASONS FOR SATISFACTION

Having been connected with the bank myself for nearly 40 years I have been able to observe the single-minded devotion with which the bank has been served at all times by its management and staff. The bank's aim to promote the welfare of the country by all such means as are at a bank's disposal has always been their own, and they have pursued it through good times and bad, giving the utmost of their skill and zeal. It is proper that, on behalf of the shareholders, I should on the present occasion give due recognition to their faithful co-operation.

The shareholders, I believe, have reason to be satisfied with the way their interests have been served by the bank. Taking the

period of 15 years, starting with the year 1936 (when the bank issued its "A" ordinary shares to the general public) and ending with the year 1950, and calculating all dividends paid during that period on a "subject to tax" basis it appears that an average annual dividend of 9 per cent. has been paid, besides which an amount of £960,000 has been added to the reserve fund and sufficient amounts to the other reserves to allow for the allocation to shareholders of £310,000 fully paid shares in the Bank Leumi without in any way unduly impairing those reserves.

FURTHER SUBSTANTIAL EXPANSION

The accounts for the year 1950, while showing further substantial progress, also bear the mark of an expansion which calls for careful watching. It is only natural that in a country which is attempting to absorb so enormous an immigration as is the case in Israel many inflationary factors should be at work. The Government's special development budget is bound to lead to a large expansion of credit and to the creation of disproportionate buying power. The bank has at all times attempted to avoid any exaggerated credit expansion and has done its best to select those credits from which an increase of productive capacity can reasonably be expected. Even so, there remains room for further efforts to prevent undue credit expansion. Those efforts are being made with the co-operation of the entire banking community.

That the balance of payments would be upset by the strain on the country's resources brought about by the events of the last few years was to be expected. However, a good part of the decline in the quotation of the Israel pound in some free markets which has occurred during the last year could have been avoided and was in no way justified. It seems to have been brought to a halt. There is reason to expect that the efforts that are now being made to raise a loan for the Israel Government from the public in the United States, which look quite promising, together with other actions which have lately received some publicity, will result in a considerable easing of the present difficulties. Moreover, and this is, perhaps, more important, the Government which by that time will emerge from the elections which will take place at some time in midsummer will possess both the stability and the means to make a vigorous and thoroughly planned effort to stabilise the position. It will not be an easy task, but there is no doubt that the thing can be done.

PROGRESS OF THE SUBSIDIARIES

All the bank's subsidiaries have been prospering during the year under review. The General Mortgage Bank of Palestine, Ltd., has raised its working capital from £3,600,000 to £7,600,000 mainly through debentures taken up by the Government. It is paying a dividend of 6½ per cent. on its ordinary shares and 6¼ per cent. on the preference shares.

The A.P.B. Investment Company, Ltd., has also considerably raised its working capital and is paying a dividend of 7 per cent. on its ordinary shares.

The Otsar La-Taasiya, Ltd. (Industrial Credit Corporation), and Otsar La-Haqlauth, Ltd. (Agricultural Credit Corporation), have expanded their activities with gratifying results.

RESERVE FUND EQUALS PAID-UP CAPITAL

As appears from the directors' report an amount of £230,000 has been transferred out of available profits to the reserve fund, bringing it up to £1,100,000. The dividend for the year, at the rate of 13 per cent., has already been distributed in the month of November by way of interim dividend, in

order that shareholders should have the benefit of it before they parted with their shares in exchange for shares in the Bank Leumi. As announced at the time, there will be no final dividend. I may, however, say that the Bank Leumi intends to follow the tradition of the Anglo-Palestine Bank in paying an interim dividend.

The period of four months which terminated on May 1st, when the business was taken over by the Bank Leumi le-Israel B.M., has again proved to be one of further satisfactory development. The profit earned during those four months increases the sur-

plus available in the Anglo-Palestine Bank which in various forms has been passed on to the Bank Leumi le-Israel. Out of this surplus an amount of £1,200,000 has been allocated to the reserve fund, and the Bank Leumi le-Israel has, therefore, started its career with a reserve fund equal in amount to the paid-up share capital.

The report and accounts were adopted.

The retiring directors, Dr G. Halpern and Mr L. Braudo, were re-elected and the remuneration of the auditors, Messrs Jackson Pixley and Company, having been duly fixed, the proceedings terminated.

MARKS AND SPENCER, LIMITED

VOLUME OF BUSINESS INCREASED BY 25 PER CENT.

GREATER EXPORTS TO HARD CURRENCY AREAS

SIR SIMON MARKS ON MAINTENANCE OF HIGH STANDARDS

The twenty-fifth annual general meeting of Marks and Spencer, Limited, was held on June 7th, at 82, Baker Street, London, W.

Sir Simon Marks, chairman and joint managing director, who presided, said: I am pleased to report that our profits for the year, after provision for taxation, amount to £2,557,000, compared with £2,121,000 last year. We have provided £3,525,000 for taxation, compared with £2,530,000 a year ago. With the amount brought forward there is available for distribution £6,529,000.

We propose a final dividend of 60 per cent., making 75 per cent., less tax, for the year on the ordinary and "A" ordinary share capital, which absorbs the sum of £879,500. This compares with the amount of £713,925 last year, when the dividend was 60 per cent., less tax. Taking into account the rest of the appropriations, we carry forward the sum of £4,663,000.

We have not included the profits of the reserves of our subsidiary companies in our accounts. Their profits, after taxation, amount to £84,821, and their reserves now stand at £200,000.

BONUS ISSUE

It is proposed to capitalise the sum of £49,168, being part of the general reserve, to enable a distribution by way of bonus of one "A" ordinary share in respect of every 45 ordinary and/or "A" ordinary shares held on May 19, 1951.

We have increased our general reserve from £2,343,000 to £3,000,000 by transferring our property contingency reserve of £200,000 and adding £505,321 from this year's profits. We have also increased our stock contingency reserve from £150,000 to £500,000.

Our total reserves, including capital reserves, now amount to £9,332,000, an increase of £1,522,000.

We have spent £520,000 on the maintenance and repair of our properties and equipment. We have taken into account the balance of our deferred repairs reserve, which is now eliminated from our accounts. The amount expended a year ago was £505,000. Depreciation has required £733,000, against £687,000 last year.

STORE DEVELOPMENTS

We now operate 232 stores. In the five years since the war we have opened three stores, at Sheffield, at Norwich, and at Leeds. Our store at Leeds replaces the old one in that town. We have made extensions at 12 stores and nearly 100 stores have been modernised.

In regard to the 16 stores destroyed in the

war, I am glad to tell you that we are rebuilding at Exeter, Plymouth, Sheffield, Yarmouth, Clacton, and Bristol, and we hope quite shortly to start work at Southampton. Arrangements have not been settled with the local town planning authorities in regard to the remaining bombed stores.

EXPORT TRADE

As I indicated to you in my last report, in view of the national need we have directed a larger proportion of our sales to the hard currency areas. Nearly 60 per cent. of our exports have gone to these countries. With rising prices it may be difficult to maintain exports at their present level.

GENERAL SURVEY

We are glad to report a rise in our volume of business of 25 per cent. over the preceding year, and, as a matter of interest, 47 per cent. above the figures for 1949.

It has been a constant struggle since the end of the war to increase the quantity and to extend the range of our textile goods, which form the major part of our business. During the war and for some years after textile materials were in short supply and the quantity and variety of goods were both limited and austere. It is only during the past two years, thanks to greater productivity in the textile industry, and to the development of our special arrangements with our cloth suppliers, that we have been able to make good, to an appreciable extent, the shortages of some of our most important basic materials. We have, as a result, been able progressively to increase our production of a wider range of goods, which in price and quality fit the purse of our public.

We have built up our stock in trade which stands at £4,372,000, compared with £2,894,000 last year. This is an outstanding feature of the accounts, and the measure of improvement can be seen from the corresponding figures for recent years. In 1947 our stock in trade was as low as £927,000, and in 1949 it was still only £1,600,000.

I would draw your attention to the item of advances to subsidiary companies, which has grown from £1,134,000 to £2,442,000. To ensure regular supplies of the goods our stores need, we have had to take an increasing interest in the actual production of the basic materials which enter in the manufacture of a considerable range of our made-up garments.

The yardage and the finance involved are on such a scale that we have had to assume the responsibility for the purchase of a substantial part of the grey cloth and its conversion into the finished product. Without regular supplies no manufacturer can produce efficiently and economically. The func-

tion of our subsidiaries has therefore become of great importance. As the instrument of our merchandise development department they are responsible for the dyeing, printing and finishing of the grey cloth, which we then allocate to our garment manufacturers. This pipeline of supplies is an important service to them; without it their productive capacity could not be used to the best advantage.

ATTRACTIVE RANGE OF GOODS

A visit to our stores would demonstrate that we are presenting a range of articles attractive, of good quality, and inexpensive. The fruits of our policy of continuous upgrading can be seen in improved styling, design and finish, and beyond all doubt our goods are appealing to a widening section of the public.

We set high standards of quality for our foodstuffs and insist that they should be made and packaged under the most hygienic conditions. Shortages of the raw materials traditionally used in food manufacture have caused many substitutes to appear on the market, which vary so widely in quality that we have to exercise the most careful control. Our technical staff have an up-to-date laboratory for the examination of such raw materials, which are recommended and used only if they reach our standards.

Over the whole field of the goods we offer to the public we set our buyers and our scientific and technical staff the task of maintaining strict quality control and, in collaboration with our suppliers, improving standards. We endeavour, with mutual benefit, to supplement by our own services, the technical services of our manufacturers, our relations with whom are based on mutual understanding and confidence. We value their efforts and are grateful for their co-operation. It is this combined team work which produces and will produce a most varied range of merchandise at prices which will, to some extent, mitigate the rising costs of living.

RAW MATERIAL PRICES

The very great increase in raw material prices since the Korean war has created acute problems for the manufacturer and the retailer. Merchandise is being sold today at prices much below its present replacement cost, and the continuous raising of price levels must inevitably produce customer resistance and reduce public demand.

Our manufacturers have a common interest with us in countering this upward movement of prices, for in the long run, their ability to keep their plant running to full capacity and with maximum efficiency depends on the customers. Together we can do much to keep prices within reach of our public.

Our manufacturers have invested considerably in new machinery and equipment which is now fully operating. This, together with the regular flow of production which they enjoy, puts them in a more favourable position. It has always been our joint policy to pass on to the public the benefits of efficient production and an even greater effort must now be made in this direction. This business lives and grows by our co-operation with our suppliers in creating and offering the best values. That policy will retain for us the public goodwill built up over many years of trading.

At the same time, we have to take into account that certain commodities have recently declined from their peak levels—as, for example, wool and rubber, and it may be that, in the near future, we shall have to face further falls in a wider range of raw materials. Because of this uncertainty, we have thought it prudent to provide for such an eventuality by increasing our stock contingency fund to £500,000.

The war years witnessed a steady deterioration of our properties, and the appearance of our stores left much to be desired. Maintenance and repairs were not possible during those years and redecoration and re-equipment were not permitted.

It has always been our policy to keep our properties in good order, and to make our stores up to date and attractive. Therefore, as soon as we recovered a measure of freedom, we embarked on a programme of modernisation. The function of the stores is to provide the goods with the setting which displays them to the best advantage. We aim to make our stores distinctive in character and well adapted to their purpose through their architecture, their decoration, their equipment, their lighting, and their general layout.

This policy of modernisation involves a considerable outlay. We believe it to be an excellent investment as the accounts before you indicate. We have already dealt with a large number of stores, but much remains to be done before we have brought all our stores up to the standard we have in mind.

We have, for many years, pursued a consistent policy of acquiring our own sites and building our own premises which in the main are freehold. The original cost of our properties and their development was nearly £11,000,000. They stand in our books, after depreciation, at £8,342,000. It is obvious that their replacement value today would be greatly in excess of these figures. Whilst all other main items of expense have risen considerably, the rental charges in our accounts are nominal as a result of this policy, and the profits we show benefit accordingly.

STAFF AND WELFARE

Modern management demands the understanding of people, no less than the technique of trading. A loyal and efficient staff is indispensable for the successful conduct of a business. Management must create conditions of work wherein each person feels himself or herself a responsible member of a team, interested in the success of the venture.

We give a great deal of thought to the well-being of our staff, and our welfare department directs its efforts to create for them pleasant and healthful conditions of work. Our employees now total more than 20,000, of whom a large number have served the company for many years.

We have always laid stress on the need for the development of a team spirit among our staff, and the fruits of this are seen in the courtesy, competence, and helpfulness which characterise our sales staff in their relations with our customers.

Moreover, the social and cultural activities, initiated and organised by the staff, and encouraged by the company, develop this team spirit still further, and a common purpose is given to their leisure.

Our medical department and dental services continue to function and, by the personal interest taken in each case, we are able to give a welcome and beneficial service. Chiropody treatments are available to all our staff and physiotherapy is being made available in increasing measure. All these activities and many other services are organised so that our staff may realise that they are part of an organisation which is greatly concerned with their welfare and progress.

I am sure you would wish to join with me in expressing our appreciation of the loyalty and devotion of our staff.

The report and accounts were unanimously adopted and a resolution was passed approving an issue of one "A" ordinary share in 45 on a capitalisation of reserves, allotment letters in respect of which will be posted on July 23rd.

The proceedings terminated with a vote of thanks to the chairman, directors and staff,

MONSANTO CHEMICALS LIMITED

EXTENSIVE DEVELOPMENT PROGRAMME

MR EDW. A. O'NEAL'S REVIEW

The seventeenth annual general meeting of Monsanto Chemicals Limited was held on June 7th in London, Mr Edw. A. O'Neal, Jr. (chairman and managing director), presiding.

The following are extracts from his circulated statement:

The results of the company's activities for the year as a whole have been satisfactory. Net sales exceeded our budget estimates by 7 per cent. and were 41 per cent. above the 1949 record. Less than 5 per cent. of the increase in sterling worth of goods sold is to be attributed to increases in selling prices. The bulk of the additional volume of business came from the incidence of greater production at the new factory at Newport, while production efficiency at the Ruabon factory, where most of the major expansion was completed by the end of 1949, was greatly increased through improved methods and emphasis on operating and cost control.

NEWPORT SALES TARGET EXCEEDED

At Newport all manufacturing processes contemplated in the original programme for this location were in production at the end of the year. Most of the units have been developed to maximum capacity, some to extraordinary production records, and although due to recurrent shortages of raw materials consistent full production was impossible, nevertheless, the rate of sales of Newport products during the last quarter of the year exceeded our target for that period.

OVERSEAS ACTIVITIES

Monsanto Chemicals (Australia) Limited has continued to expand its manufacture and reported record sales during 1950. The rate of growth of this company, in which we have the controlling interest, is very satisfactory.

Expansion of activities of Monsanto Chemicals of India Limited to embrace manufacture in India continues to be studied, but the very unsettled conditions existing in that country and the East as a whole are likely to delay any action on our part. The Indian company continues to handle satisfactorily the sale of our goods in its area.

FUTURE DEVELOPMENT

Following the policy, typical of the chemical industry in the United Kingdom and in the United States, of maintaining continuous development and expansion, we have completed our plans for the next stage of development. This will be to increase the output of important products already in manufacture, and to extend the company's range of new products. Total capital additions during the four-year period 1947-1950 amounted to approximately £5,259,356. We see no reason why this rate of expansion at least cannot be profitably maintained, given favourable fiscal conditions.

In budgeting the company's production and sales for the year 1951, we have felt justified in anticipating an appreciable increase in turnover. Yet we have felt it necessary to set our budgeted output considerably below the maximum capacity of our manufacturing plant due to the increasing difficulty of obtaining sufficient supplies of raw materials, and of maintaining their flow to the factories in that continuity which is so important to efficient operation.

THE ACCOUNTS

The income of the Group for the year was £1,686,478, compared with £963,766 in 1949, whilst the Group profit carried forward to the appropriation account was £545,405. After providing for Parent Company's dividends, there remains to be carried forward

MONSANTO CHEMICALS LIMITED AND SUBSIDIARY COMPANIES CONSOLIDATED PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED 31ST DECEMBER, 1950

	1950	1949
Balance from Trading Account	1,685,897	959,127
Add: Miscellaneous receipts	581	4,653
	1,686,478	963,780
Deduct:		
Depreciation and obsolescence	364,712	233,604
Bank interest	6,405	...
Provision for taxation	695,124	377,139
Provision for auditors' fees	2,100	1,514
Remuneration of directors	36,501	33,364
	1,104,942	645,621
Net profit of the group for the year	581,536	318,085
Deduct: Proportion attributable to minority interests	36,131	21,701
Balance attributable to Monsanto group	545,405	296,384
Deduct:		
Appropriations:		
Dividends to shareholders of Monsanto Chemicals Limited, less tax:—		
Preference dividends	30,820	30,934
Interim ordinary dividend at 15%	74,250	74,250
Provision for final ordinary dividend at 40%	189,000	148,500
	294,070	253,684
Leaving undistributed	251,335	42,695
To which is added:—		
The balance brought forward from the previous year	487,992	445,296
Provisions no longer required	12,665	...
	501,000	445,296
and from which is deducted:—		
Profit of a subsidiary company acquired during the year applied to extinguishing deficit at date of acquisition	11,893	...
Making the balance carried forward	£740,099	£487,992

to 1951 £740,099 for the Group, as compared with £487,992.

I should like to refer to the recent successful offer for sale of the 1,500,000 4½ per cent. second preference shares of £1 each. All stockholders were given the opportunity of making application for these shares on a special form and such applications received preferential consideration by the issuing houses. The issue was a successful one both from the point of view of the company and of the subscribers. The board are appreciative of the strong support given to the issue by existing stockholders.

The report and accounts were adopted.

Following the annual general meeting an extraordinary general meeting was held at which new articles of association were adopted.

THE NATIONAL BANK OF NEW ZEALAND

SUBSTANTIAL EXPANSION OF BUSINESS

The annual general meeting of the National Bank of New Zealand, Limited, will be held on July 5th, in London.

The following is an extract from the circulated statement by the chairman, Sir Sydney Parkes, C.B.E.:

There has been a substantial expansion in the Bank's business during the year and it is pleasing that, in spite of the increases in our costs, the net profit for the year reflects this increased activity.

Deposit and Current Accounts at £49,964,000 show a notable increase of £9,988,000. The total of the balance sheet at £57,855,000 is £10,920,000 higher than last year.

The net profit after taxation, of £204,900, shows an increase of £36,600. This must be regarded as satisfactory in the light of the heavy increases there have been in our expenses during the year. An interim dividend of 3 per cent., less United Kingdom Income Tax at 9s. in the £, absorbed £33,000 and the Directors now recommend a final dividend of 4 per cent., less United Kingdom Income Tax at 9s. 6d. in the £.

The Dominion is developing steadily and should continue to do so provided international conditions are favourable. The bank has shared fully in this business development, and it is gratifying to be able to report a record turnover and a very large increase in the number of accounts on our books during the last year.

The large increase in purchasing power which the high wool prices have created has given much concern to the Government. After obtaining the agreement of the growers the Government passed an Act providing for the freezing of one-third of this year's wool returns. These blocked balances are to be carried in special accounts in the growers' names at their bankers and are not to be available as purchasing power in the meantime, but are to be released at the rate of 20 per cent per annum, commencing in 1952.

During the year trading conditions have been buoyant and all sections of the community have been prosperous. This has been assisted by the high prices ruling for the main export commodities, together with a good production season.

Inflationary pressure upon prices and costs and upon the supply of goods available for consumption still remains the Dominion's most pressing problem, despite the useful steps which were taken during the year to relieve this condition.

AMALGAMATED ROADSTONE CORPORATION

IMPROVED RESULTS

The fifteenth annual general meeting of Amalgamated Roadstone Corporation Limited was held on June 8th in London, Mr J. S. Killick, C.B.E., M.Inst.C.E. (the chairman), presiding.

The following are extracts from the chairman's circulated statement and the directors' report:

The report and accounts clearly show the company's position. It is sufficient for me to draw your attention to the salient points.

(1) The trading profits of the corporation amount to £313,328, as compared with £255,893 for the previous year.

(2) Whereas only £89,613 net is proposed to be paid to our shareholders, no less than £111,506 is provided for taxation.

(3) The future taxation reserves shown in the balance sheet at £125,583 are considered to be equivalent to rather more than two years' estimated income tax liability at current rates.

(4) The balance carried forward is £82,814, compared with £51,290 in the previous year—an increase of £31,524.

(5) The amount provided for depreciation is £123,265, compared with £97,469 the previous year—an increase of £25,796. Provision for initial allowances on capital expenditure on plant and equipment amounts to £80,678, compared with £46,757.

During the past four years provision for ordinary depreciation has exceeded £375,000, and for the same period the total amount of initial allowances written off has exceeded £210,000—an aggregate amount of £585,000, which exceeds one-half of the total amount of capital expenditure on plant and equipment incurred during that period, amounting to approximately £1,100,000.

It is anticipated that by the middle of 1952 practically the whole scheme of reorganisation and mechanisation of your company's quarries now envisaged will have been completed. We consider it fortunate that the major part of the cost of such reorganisation and mechanisation should have been incurred before the recent and abnormal increases in prices. Production efficiency is, and has been, the earnest endeavour of your board.

EFFECT OF OUTPUT ON COSTS

It is certainly true in our industry, and probably even more so in ours than others, to say that the volume of output affects costs to a much greater degree than any other element. Therefore, when the time comes, as it surely must, when an adequate sum is spent upon the reconstruction and maintenance of our roads, the demand for our products will be spread more evenly over the year, accompanied by a decrease in costs and, we hope, an increase in profits.

The abnormally bad weather since the beginning of the current financial year which, as you know, dates from November 1st, adversely affected production and sales during the first three months, November to January; February and March, however, showed substantial improvement and in spite of the continuing bad weather, brought the five months' turnover fully up to that of the corresponding period of last year. As regards the remainder of the financial year, the board feels justified in anticipating continued improvement.

Your subsidiary, Amalgamated Limestone Corporation Limited, whose first accounting period will run to October 31, 1951, is still in its teething stage of development, but your directors are satisfied that its prospects appear to be most encouraging.

The report was adopted and the dividend of 10 per cent. for the year was approved.

CAPE ASBESTOS COMPANY

MOST SUCCESSFUL YEAR IN COMPANY'S HISTORY

The fifty-eighth ordinary general meeting of The Cape Asbestos Company, Limited, was held on June 7th in London, Mr Robert Walker, M.B.E. (chairman of the company) presiding.

The following is an extract from the Chairman's speech: This has been the most successful year in the history of our company.

The group's trading profit increased from £712,483 in 1949 to £913,960 this year. After the addition of certain credits and charging depreciation and other expenditure under specified headings, the amount of £715,971 appears as the net profit for the group, of which £695,075 is attributable to the parent company, after transferring to capital reserve £14,901 for pre-acquisition profits relating to shares of a subsidiary purchased during the year. Adding an amount of £7,542 withdrawn from stock reserve and £561,827 brought forward from previous years, there is £1,264,444 available for appropriation. After setting aside £334,481 for taxation, £115,508 to reserves and £97,534 for dividends paid and proposed, £716,921 is left to be carried forward in the books of the various companies.

Turning to the parent company's accounts, the trading profit amounts to £374,330, the comparable figure in 1949 being £171,826. Adding the amount brought forward from last year of £139,373, there is £513,703 available for appropriation. Taxation this year amounts to £193,166, and £80,000 is placed to reserves. The dividends recommended require £97,534, leaving £143,003 to be carried forward to 1951.

A considerable proportion of this increased profit arises from larger dividends paid by our South African mining companies in respect of their 1949 operations and received by us in 1950. In addition, each of your company's factories has shown improved results compared with last year.

In submitting their proposal of a final dividend of 15 per cent., giving a total for the year of 17½ per cent. on the ordinary shares, your board consider that this is a prudent and conservative assessment of the sum that it is equitable to distribute, having regard to the new capital and to the year's earnings.

FACTORIES

At Barking a record figure of production has once more been achieved, and plans for further extending the scope of our operations and improving their efficiency are in hand. In addition to our well-established products, our new, high quality Capasco moulded brake linings have met with marked success during the year.

At our Acre Mill factory in Yorkshire notable progress has been made and the factory has had a satisfactory year's trading. Here also plans are afoot for further improving and increasing output, and additional premises, acquired earlier, are now being prepared for occupation.

Our Kentmere diatomite plant has worked at full capacity, and this, combined with the manufacture of insulating compositions, now made extensively in these works, has resulted in a profitable year's operations.

At our Uxbridge works, although the situation is still not satisfactory, much knowledge has been gained in the initial stages of manufacture of special board products. A small but rising demand exists for these and Pluto Board sales.

Throughout the factories, and indeed in all our branches and subsidiary companies, there have been embarrassments caused by rising prices and more recently by shortages in the supply of essential goods.

The report was adopted.

DUNLOP RUBBER COMPANY

YEAR OF OUTSTANDING SUCCESS

RECORD PRODUCTION, SALES AND PROFITS

SIR CLIVE BAILLIEU'S SPEECH

The fifty-second annual general meeting of the Dunlop Rubber Company, Limited, was held on June 11th in London.

Sir Clive Baillieu, K.B.E., C.M.G., the chairman, in the course of his speech, said:—The activities and achievements of the Dunlop group of companies during the year 1950 have been notable in many ways. It has been a year of outstanding success, in which, at home and overseas, records in volume of production and in value of sales have been attained. Operating profits constitute a record, an outstanding contribution thereto having been made by our export and overseas activities. Not less than two-thirds of our profits came from this source.

You will note that after bearing the very heavy burden of taxation now demanded, by far the largest part of the increased profits earned in 1950 by the group, has been placed to reserve either in the parent company or in the accounts of the various subsidiaries at home and overseas. Thus reserves are strengthened for future contingencies and the provision of the further finance required under present conditions is eased.

RISE OF COMMODITY PRICES

Prices of commodities rose throughout 1950. The rise in the sterling cost of raw materials was initiated by devaluation of the pound in September, 1949, but was greatly accentuated by the uncertain political conditions prevailing throughout the year and by the demands for stockpiling.

The price of rubber during the period under review fluctuated between a low price of 15d. per pound and a high price of 68d. per pound. During the same period cotton prices showed an increase of up to 90 per cent. Such wide and sharp fluctuations in raw material prices create many problems for those who are responsible in a great organisation for providing its supplies of essential materials. The increased price of these materials during 1950 inevitably resulted in an overall increase in the selling price of our products.

Notwithstanding the increasing pressure on costs, we have always given our customers substantial benefits deriving from our inventories in a rising market.

High material costs also greatly increased the total capital requirements of the group. At the end of 1950, this was over £100 million compared with £73 million at the end of 1949, and £35 million at the end of 1939. Such high figures involve considerable financial risks which is an added reason for strengthening reserves out of profits.

SHARE ISSUE

Towards the close of 1950, we made a rights issue of ordinary shares, the principal purpose of the issue being to provide capital for our expanding fixed assets. At the time of the issue we indicated that considerable working capital requirements were also needed, and that we proposed to finance these by temporary borrowings rather than by fixed capital until conditions, and particularly raw commodity prices, had become more stable. The level at which prices will settle down is not yet sufficiently clear so that it is premature to try and determine what additional working capital we may require.

With the cash recently subscribed and the

increase in our borrowing powers we should for the time being have sufficient capital for our needs, unless there is a major change in the volume or profitability of our business.

Nevertheless it is pertinent to mention the coincidence that the amount payable in taxation by the group as a whole in respect of the year 1950, is almost equal to the proceeds of the recent issue of capital by the parent company. What has happened to the Dunlop Company in the course of a single year reveals in striking fashion the underlying weakness and the latent dangers of the fiscal and taxation policies which affect industry.

EXHAUSTION OF INDUSTRY'S CAPITAL

I do not think it is yet sufficiently recognised that increasing taxation of industrial profits is exhausting the capital resources of industry. The more this process goes on, the more must industry earn higher and higher profits with which to pay these taxes and maintain its capital, plant and equipment, without which industry simply cannot function. This vicious spiral of increasing taxes, higher costs, higher prices and greater profits only serves to increase inflationary pressures.

Attempts have been made to assess the degree of exhaustion of industry's capital. These are not yet conclusive, but the pattern is clear. Industrial resources are being steadily absorbed by the vast increases in the working capital requirements for which the profits of industry, high as they superficially appear to be, are in fact insufficient.

What is left is certainly inadequate to make good the growing deficiency of capital required to replace and modernise the permanent fixed assets. We have endeavoured to meet the position by making reserves out of taxed profits.

WITHDRAWAL OF INITIAL ALLOWANCES

The recent Budget has withdrawn the initial allowances which in the past few years have mitigated to a considerable extent the effects of the deficiency of capital. We have noted from the Chancellor's Budget statement that the decision to withdraw these allowances is made in the interests of our rearmament programme and that when this period of rearmament is over and we can increase home investment again, it will no doubt be desirable to reintroduce them. Notwithstanding that their withdrawal is intended apparently to be only a temporary measure, it must be recognised that these initial allowances did provide industrialists with a proportion of the immediate finance required for buildings and machinery.

Their permanent withdrawal would mean that there would be still less capital available for industry to maintain itself, let alone expand. It would indicate either that the evidence of the growing deficiency of industrial capital was unrecognised or that we had chosen to mortgage our future in order to sustain present policies. In the end the account would be presented and the nation would have to pay.

Industry must operate within the policies and plans, whether we approve them or not, of the Government of the day. To these we must conform our own policies and actions. But it is our duty no less than our right to raise our voice when we consider the stability

of employment and future production is imperilled by public policies.

STATE EXPENDITURE

I have in recent years expressed the opinion that a basic inflationary influence in our affairs has been the vast and menacing increase in state expenditure. I am, of course, aware that inflation is a hydra-headed monster and that an answer is not to be found alone in dealing with state expenditure. The failure of the state, however, to recognise its duties in this sphere has created an atmosphere of illusion and make-believe which has warped our thinking and our policies in recent years.

A high and extravagant level of expenditure has been sustained by the highest level of taxation amongst the great industrial nations of the world. The resources of industry essential for its replenishment and growth have been diverted into the hands of Government to satisfy the ever-mounting claims of the modern state. These policies have been justified in the interests of the Welfare State regardless of the menace inherent in them to the interests of the Welfare State itself and to the employment and standards of living of our people.

All of us desire to see in these islands, the highest possible standards of life and well being. But we cannot hope to preserve the gains of recent years unless we accept the hard facts upon which our existence as a nation rests. The Welfare State must rest upon a sound national economy and a foreign policy ensuring our national security. A sound economy means little more than living within our means, and this we are still failing to do.

NATIONAL SECURITY

National security must derive from a foreign policy, resting upon an adequate basis of power, both physical and moral. We are learning—I trust not too late—the price we pay, the hazards we run, when this vital principle of national safety is made subservient to local and domestic policies.

If we are to survive as a great commercial and industrial nation, supporting the population of these islands at a reasonable standard of living, those policies must ultimately be reconciled with the basic principles to which I have just referred. The resources of industry are not inexhaustible, nor can we plan our social and economic policies in a national vacuum.

THE FUTURE

We have not yet felt the impact of our rearmament. You may be assured that the productive resources of the group will be fully geared to national requirements, both at home and overseas, whenever they are needed.

We could have enjoyed a quiet, respected and relatively profitable life by confining our business to these islands. But we have chosen to respond to the instincts of our race, to venture abroad and, by so doing, seek to establish a firmer and wider basis for the development of our own business, and that of our country. Happily, this policy has been justified by the results which you see manifested today, in the splendid contribution made by our overseas interests to the profits of the group.

We have every confidence that for the future we are well placed to discharge our responsibilities to our country, to our shareholders and employees, and to all those who, in ever-increasing numbers, are customers for Dunlop products.

The report and accounts were adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

The thirty-first annual general meeting was held on June 8, 1951.

In opening the meeting the chairman, Mr H. G. Bartholomew, referred to the marketing of shares of the Anglo-Canadian Pulp and Paper Mills Limited, and disclosed that the company's interest in this marketing was limited to a total of 24,825 shares, the proceeds from which, he estimated, would be around £260,000. The deal depended on the exercising of two options. The cash proceeds from the sale will be utilised in the general expansion of the business.

In dealing with the accounts he said: We recommend maintenance of the final ordinary dividend at the same rate as previously.

Despite the imposition of additional newsprint rationing in October last, a further increase in the net sales of the *Sunday Pictorial* has to be recorded. Over the whole of the year under review, the average net sale was above 5,150,000 copies weekly.

ADVERTISING

The advantage of increased sales of the *Sunday Pictorial* is also reflected in the revenue from advertisements carried in the paper.

It is regretted that the effect of smaller size papers has necessitated a reduction in the advertisement space available in the columns of the *Sunday Pictorial* as compared with the previous year. How long we will have to impose restrictions of this nature it is impossible to forecast. Demand for space in the paper is so great—recognising as it does its value as an advertising medium—that these limiting conditions must, we realise, be of great inconvenience to our regular advertisers.

The picture before you would certainly have been much less satisfactory but for the benefit attached to the increased revenue from sales of the *Sunday Pictorial* and advertisements.

INVESTMENTS

All in all, total profit before taxation is some £38,400 more than in the previous year.

The main items on the balance sheet to call for comment are those related to our investments.

Certain of our quoted investments, including a trade investment, were sold during the year.

Unquoted trade investments include our interest in such companies as Reville Newspapers Limited, West African Newspapers Limited, West African Graphic Company Limited, The Argus and Australasian Limited—all newspaper publishing companies—and Anglo-Canadian Pulp and Paper Mills Limited—a newsprint company.

Reville Newspapers Limited, has recently announced its maiden dividend. It has also announced that the current net sale of its publication *Reville for the Weekend* is now in excess of 2,500,000.

The interests in West African Newspapers Limited, and West African Graphic Company Limited, are not large. The first publishes periodicals in this country dealing with West African affairs and a daily paper in Lagos, Nigeria.

The West African Graphic Company Limited, is now engaged in printing and publishing a daily paper in Accra.

The interest in The Argus and Australasian Limited, was acquired last year.

In conjunction with this interest we, in association with The Daily Mirror Newspapers Limited, formed during the year a proprietary company in Australia.

In consequence of the further substantial increase in the price we have to pay for newsprint, we, in conjunction with other national newspapers, have had to raise the retail price of the *Sunday Pictorial*. The compensation to be found by this increase is, at the moment, problematical, as it will be our objective to give as good a value for the higher price as we have been giving for twopence.

In closing this review I would again record a sincere "thank you" to all those members of the staff who, by their consistent efforts, loyalty and service, have contributed so much to these results.

All the Resolutions on the Agenda were approved, and at the extraordinary general meeting that followed a resolution to adopt new Articles of Association was also approved.

It was announced that a further extraordinary general meeting was to be called for the purposes of approving a resolution for the capitalisation of reserves and the issue in the form of a bonus of three new ordinary £1 shares, fully paid, for every £7 ordinary stock held.

THE DAILY MIRROR NEWSPAPERS LIMITED

The thirty-first annual general meeting was held on Friday, June 8, 1951.

In opening the meeting, the chairman, Mr H. G. Bartholomew, referred to the proposals recently announced to capitalise £1,400,000 of the reserves of the company and for the issue to ordinary stockholders of one new £1 "A" ordinary share for every £1 of ordinary stock held. These new "A" ordinary shares will carry no voting rights, but will rank *pari passu* in all other respects with the present issued ordinary capital.

He also referred to the marketing of shares of the Anglo-Canadian Pulp and Paper Mills Limited and disclosed that the company's interest in this marketing was limited to a total of 24,825 shares, the proceeds from which, he estimated, would be around £260,000. The deal depended on the exercising of two options. If the whole of the proceeds were received they would go a long way to covering the known capital commitments of the company.

In dealing with the accounts he said:—In considering the recommendations that we had to make as to the disposal of the available balance of net profit for the year of £404,742, we were conscious of the need to strengthen the company's cash resources. For this reason your board recommends that the final ordinary dividend be maintained at the same rate as last year.

The gross profit from trading of £811,645 has been derived from three main sources: from sales of the *Daily Mirror*; from advertisements, and on the contra side by reduction in the average cost price of newsprint consumed during the year. This reduced charge for newsprint was due in a measure to the use, through a major portion of the year, of relatively low-priced newsprint drawn from stock and through deliveries in the early part of the year at the then prevailing lower prices.

Throughout the year under review the public demand for the *Daily Mirror* has been maintained at a level in excess of 4,500,000 copies daily, and revenue from this source reached a new high level.

ADVERTISING

The demand for advertisement space in the columns of the *Daily Mirror* has been more than maintained throughout the year. This demand has contributed substantially to the revenue of the company.

It is a pity that, due to the increased severity of newsprint rationing, it has been found necessary to limit further the amount of space that can be made available to advertisers.

This year, dividends from our main subsidiary company—Anglo-Canadian Pulp and Paper Mills Limited—show a further increase.

Dealing with the charges against gross income, depreciation is not materially greater than last year. Taxation has been provided with due regard to the impact on the year's trading of the additional taxes created in the recent Budget.

Turning to the balance sheet, some £190,000 has been added to the figure at cost of our machinery, plant, etc.

Machinery deliveries are slow and well behind schedule. We are, however, hopeful that one new press will be erected in premises in Stamford Street during the current year.

The consolidated accounts of Anglo-Canadian Pulp and Paper Mills Limited make satisfactory reading. Earnings for the year to end December last represented 2.87 dollars for each share of that company's issued capital. Of this, it is the intention of that company to distribute 1.80 dollars per share by way of dividend during the calendar year 1951.

Steps have been taken to establish a quotation for the shares of the Anglo-Canadian Company on a Stock Exchange in Canada. To assist in this operation your company has agreed to sell a small number of shares at a price which your directors consider satisfactory. The number of shares involved is not large and does not affect our share control of that company.

INVESTMENTS

Certain additions have been made in our holdings of quoted trade investments.

Reville Newspapers Limited has reported a satisfactory year of trading and has recently paid its first dividend.

The publication owned by that company, *Reville for the Weekend*, has reached a new high level of net sales, which are now in excess of 2,500,000 copies weekly.

Our West African interests are making satisfactory progress. The *Nigerian Daily Times*, which is published in Lagos, has reported further substantial advances in net sales.

In Accra, we have the West African Graphic Company Limited. That company began publication in October last of a daily newspaper. The demand has greatly exceeded the capacity of the plant available and further additions to plant and premises are called for.

The increase in the total figure for unquoted trade investments is, in the main, explained by our having, in conjunction with Sunday Pictorial Newspapers (1920) Limited, formed a new proprietary company in Australia.

The capital subscribed has been applied towards financing the further capital requirements of our other interest in Australia, The Argus and Australasian, Limited.

It is quite impossible at this moment to assess with any degree of accuracy the likely effects on the current year's trading profits of the increase in the retail price of the *Daily Mirror*. In addition to the adverse effect of the high price of newsprint, other factors have to be borne in mind. Wages have risen, the cost of materials, fuel, carriage, etc., has also increased.

I take this opportunity of thanking all those members of the staff who, by their efforts, have contributed so much to the satisfactory results disclosed by the accounts.

All the resolutions on the agenda were approved. At the extraordinary general meeting that followed, resolutions increasing the authorised capital of the company to £4,000,000 and for the adoption of new Articles of Association were also approved.

TELEPHONE RENTALS, LIMITED

ANOTHER SUCCESSFUL YEAR

FURTHER EXPANSION OF OVERSEAS SUBSIDIARIES

RECORD INQUIRIES FOR SERVICES

MR FRED T. JACKSON ON THE PROGRESS MADE

The twenty-second annual general meeting of Telephone Rentals, Limited, was held on June 11th, at the Caxton Hall, Westminster, London, S.W.1, Mr Fred. T. Jackson, O.B.E., Comp.I.E.E. (chairman and managing director), presiding.

The secretary (Mr G. H. Field) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1950:—

It is with pleasure that I am able once again to report another successful year in which the company has made considerably larger profits than in the previous year. The accounts have been prepared in the same form as last year, and you will readily be able to compare the individual figures with those of previous years. There are, however, a few items to which I should like to direct your attention.

PROFIT AND LOSS ACCOUNT

The profit for the year, before providing for taxation, was £454,783, as compared with £366,475 for the previous year. This result is due partly to the steady expansion of our revenue, and partly to the reduction in operating costs and general and administrative expenses, though the provision made for the depreciation of our fixed assets is considerably higher.

Last year I referred to the decentralising of our London branch in order to give better service to our subscribers. This has been very successful, as indicated by the accounts—so much so that we decided to reorganise the engineering side of our business, the result of which is again reflected in the accounts before you. Also, to give credit where credit is due, our engineers, sales and office staff have certainly done their best towards consolidating the good relations we have with our subscribers. Our profits participation scheme has also had very definite effects on the results before you, for it has created interest and enthusiasm among the whole of our staff in the continued success of our business.

In order to give you a concrete example of this, practically the whole of the participation payment shown in the accounts has resulted in direct savings. For instance, the cost of maintaining our installations shows a reduction of £23,173 compared with 1949, although the rental revenue for the relative services has increased by £135,981 in the same period. If the cost of maintenance had increased proportionately to our rents, the additional expenditure in 1950 would have been some £46,700. In addition to this, new installations are being fitted with greater speed, efficiency and economy.

ALLOCATION TO EMPLOYEES' PARTICIPATION SCHEME

The amount allocated to the employees' participation scheme of £50,400 (the amount in the profit and loss account is reduced to £48,351 by an amount over-reserved in 1949) may be rather misleading to shareholders as compared with the dividends paid. I would like to point out that the amount provided for the participation in profits is shown "gross," as it is not possible to show it less

tax, as the employees have various code numbers, while the dividends have to be shown "net"; the gross amount of the dividends to shareholders for the year is actually £118,000.

To sum up, therefore, the successful year's trading is due to several factors, among which I might mention the reorganisation of the engineering department, the wholehearted co-operation of the whole of our staff—and the participation in profits scheme. The management consider this result a complete justification of the scheme, by which workers share in the profits at the same rate as dividends paid to the shareholders.

In conclusion, on participation, I ought to explain the comparatively large increase in the amount to be distributed this year. When we first introduced the scheme, we wanted to be sure that it would be successful inasmuch as it would give our employees a sense of partnership in the business, which would enable them to identify their own interests with those of the company. To this end, there was a qualifying period of five years before an employee became a participant. We reviewed this a few months ago, and from the results attained decided that we could reduce the qualifying period to three years. This decision meant that the amount of distribution, as included in these accounts, was increased by the sum of £9,400.

REASON FOR INCREASED CHARGES

Although we have been successful in reducing our operating costs, our charges for rent and rates have increased considerably, due to the fact that three of our branches have had to move to larger premises during the year. Other leases have fallen in and had to be renewed at greatly increased rates. These moves were inevitable and largely brought about by the rapid expansion of your business. In spite of all this, reduction in operating costs and general expenses for the year under review amounts to £14,454.

The profits tax and income tax charged against the profit include an estimate of the amounts payable on the profits under review at the rates now in force.

The dividends on both the ordinary and the preference shares have been provided, and the decrease in the reserve for the final dividend of 6 per cent. on the ordinary shares is due to the increase in the standard rate of income tax from 9s. to 9s. 6d. in the £.

The only other appropriation from the profits is a transfer to general reserve of £30,000, the total now stands at £350,000, and we carry forward to 1951 £149,147.

BALANCE SHEET

Referring to the assets side of the balance sheet first, a substantial amount has again been added to the amount invested in installations from which the major part of the company's revenue is derived. The original cost of the installations as at December 31, 1950, was £3,360,641, while the accumulated depreciation amounted to £1,381,058; leaving a net book value of £1,979,583, an increase of £175,686, compared with the total at the end of 1949. This net total value represents about one and three-quarter times the rental revenue for the year.

We have added to our freehold and leasehold properties during the year, principally in the purchase of premises to house our Glasgow branch, which has been very cramped for space for many years. Unlike the other three branches who moved during 1950, we were unable to find any premises to rent and were therefore obliged to purchase.

The increase in the amounts due from subsidiary companies is due to the further expansion of our Irish and South African companies which continue to develop their businesses in a satisfactory manner.

STOCK POSITION

You will no doubt recollect that in my report on the 1949 accounts I remarked that we hoped to reduce still further the stocks held by the company, and as you will see we have indeed made a very substantial reduction to the tune of £86,321, and this factor has helped our cash position considerably. The present level of stock and work in progress is a little below the safety level and is lower than we had anticipated on account of difficulties encountered in obtaining deliveries towards the end of the year. It is very probable, therefore, that by the end of 1951 our stock and work in progress figure will show an increase.

Turning now to the other side of the balance sheet, you will notice that the authorised capital has been increased during 1950 in accordance with the resolution passed at the last annual general meeting.

The share premium account shows a reduction of £2,500, representing the duty payable on the increase in the authorised capital.

Due to the increase in the general reserve and the substantially increased carry-forward on the profit and loss account, the total of the company's capital reserves and surplus has risen from £2,223,866 at the end of 1949 to £2,334,502.

The larger total of current liabilities is attributable mainly to the increase in amounts due for taxation, which, paradoxically, is one of the penalties we have to pay for developing our business and increasing our efficiency. In our business particularly, the high rates of taxation place an onerous burden on our shoulders, since it is robbing us of the cash which is so vitally needed to finance our constantly increasing new business.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

As in former years, the consolidated balance sheet and profit and loss account have been prepared in similar form to those of the holding company. Apart from the movements already referred to, and which are reflected in these consolidated accounts there are few material changes to which your attention need be directed.

There are, however, just two items which I would like to explain, both of which appear under the heading of fixed assets. The first is an amount of £3,224 shown against patents and developments expenditure. This represents the balance of expenditure incurred by a Continental subsidiary company during 1950, for the purchase and development of patents, part of such expenditure having been charged against the profits.

The second item is the figure of £1,202 for goodwill. The reduction in this figure from £7,325 in 1949, is due to an increase in the capital of one of our Continental subsidiary companies effected by the capitalisation of undistributed profits in the amount of £6,123. I should perhaps explain that this figure of goodwill represents the net difference between, on the one side, the premiums paid in obtaining the shares in our South African companies, and on the other side, the excess of the nominal value of the shares in our foreign subsidiaries over the

figure at which they stand in the holding company's books.

Finally, the profit of the group before taxation is £480,935, compared with £388,286 for 1949. After providing for taxation, the transfer to reserve and dividends, the balance of unappropriated profits carried forward and attributable to the holding company's shareholders amounts to £175,092, as against £86,454 at the end of 1949.

CAPITAL

At our meeting last year I told you that we were approaching the Capital Issues Committee for the right to issue 400,000 5s. shares, fully paid up, by utilising part of our share premium reserve. This application was refused, no reasons being given, as is usual in such cases. We are renewing our application, but it is impossible for me to say whether or not permission will be granted.

THE YEAR IN REVIEW

Without entering into the realm of long-term prophecy, the results achieved for the first four months of this year are again satisfactory and should enable us to put forward accounts for the current year which will not compare unfavourably with those you are at present considering.

We have, however, to take into consideration the difficulties which not only face your company, but other firms in the industrial world, that is, the possibility of a severe shortage of materials. We have taken all steps in our power to prevent our suffering unduly, but I do wish that the Government would relinquish their bulk buying and leave the industries of this country to make their own arrangements for supplies.

During the year under review, your company has received a greater number of inquiries for its various services than ever before. The reason for this is probably reflected in the fact that your company is well known for the services it gives and the universal satisfaction of subscribers. Another reason is that for our operations in the field of time control and job costing your company is now recognised as an industrial consultant in the sphere of efficiency and time saving.

A COMPOSITE SERVICE

The title of your company—Telephone Rentals, Limited—no longer accurately describes your company's business, for we offer a composite service, which consists of telephones, broadcasting, time control and job costing. And, without exaggeration, the whole of these services are of the utmost importance in a period such as we are passing through at the present time, when shortage of labour is acute and reduction in production costs is essential.

Apart from the services mentioned above, we have added a new equipment to our time control services in what is known as "Centralograph." This enables the management of the textile industry in most of its ramifications to get the advantage of visible and recorded time on every machine through a record in the works manager's office. There is a likelihood that the uses of this apparatus will be extended to industries outside the textile, but at present our activities are being concentrated on the one industry.

What I have briefly told you of the activities of your company will give you a good idea of the progress which has been made.

The report and accounts were adopted and the final dividend of 6 per cent. on the ordinary shares, making 10 per cent. for the year was approved.

The retiring director, Mr J. MacMahon, was re-elected and the remuneration of the auditors, Messrs Chas. W. Rooke Lane and Company, having been fixed, the proceedings terminated.

BRIGGS MOTOR BODIES

RECORD VOLUME OF BUSINESS

MR W. D. ROBINSON'S STATEMENT

The sixteenth ordinary general meeting of Briggs Motor Bodies, Limited, was held on June 12th in London, Mr Stanley Worth Cochrane (deputy-chairman) presiding.

The following is an extract from the circulated statement by the chairman, Mr W. D. Robinson: Your board of directors is pleased to present a financial statement reflecting the results of the year when our volume of business, which was very largely for the export markets, broke all previous records, and new production programmes were introduced.

1950 was a year of great achievement for your company. The introduction of the new production involved large-scale re-arrangement of factory lay-outs whilst at the same time maintaining existing production.

The equipping of the leasehold factory at Southampton purchased during 1949 was substantially completed during the year and production at this factory reached a high level in the latter part of the year. Production at the Doncaster factory also maintained its valuable contribution to the total output of the company.

The net profit (after taxation) for the year amounted to £639,843 and compares with a corresponding figure of £654,572 for 1949.

The company was able to purchase during the year a further large leasehold factory at Southampton having some 260,000 sq. ft. of floor space. The further small factory at Croydon has also been taken over on a short-term lease. With these acquisitions the total operating space of the company's factories will exceed 2,500,000 sq. ft.

It is the company's aim to provide fair wages and steady employment for its employees. The rising spiral of cost levels generally and the lack of adequate material supplies has been the concern of your board, bearing in mind that the company's existence depends on the availability of material supplies and on its ability to sell its products at competitive prices. However, in November last the company granted a wage increase of 3d. per hour to its workers, and during the last year it was possible to organise our production and material supplies and maintain output at economic cost levels so that very few employees were discharged as redundant and no worker suffered through short time working. Whether this position can continue will depend to a large extent on factors outside the company's control.

The company has, since its inception, followed a conservative dividend policy, and consistently each year a large proportion of profits earned has been ploughed back into the business. The board are satisfied that it will be no departure from that policy for them to recommend as they do that the dividend on the ordinary shares be increased from 12½ per cent. to 17½ per cent., less income tax, in respect of the year 1950, which dividend is equivalent to 3-4 per cent. on the capital employed in the business.

As you know, the motor industry has been faced with shortage of sheet steel and other important supplies and we have recently been notified of still further reductions in sheet steel allocations during the coming months. It now seems fairly evident that we shall not be able to maintain our volume of output for 1951 at the record 1950 level and the results of the present year will largely depend upon the availability of sheet steel and other material supplies.

The impact of world rearmament is, of course, already having its effect upon our operations and some of our energies are being diverted from the making of peace-time products to those of defence requirements.

The report was adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS

MR H. ERIC MILLER ON INDONESIAN PROBLEMS

The forty-third annual general meeting of United Serdang (Sumatra) Rubber Plantations, Limited, will be held on July 18th in London.

The following are extracts from the review of the chairman, Mr H. Eric Miller, circulated with the report and accounts for the year ended August 31, 1950:

With the reoccupation of Nagodang estate in July, 1950, the company had regained possession of all its estates in Sumatra. We are left with approximately 27,413 acres of rubber (88 per cent. of prewar) and 4,252 acres of oil palms and gambier (43 per cent. of prewar).

In all the difficult circumstances it is much to the credit of our estate managers that we secured a rubber crop of 9,712,372 lb. in 1949-50, which closely approximates that harvested in 1948-49.

After writing off £52,500, approximately one-half of the rehabilitation expenditure, £31,231 depreciation of buildings, machinery, etc., and setting aside £35,000 for contingencies, we are left with an available balance of £94,130. The proposed dividend of 5 per cent., less income tax, will absorb £37,361, leaving a credit balance of £56,769 to be carried forward as against £54,273 brought in.

FUTURE PROSPECTS

As regards the year now current, while we have had the benefit of higher prices for rubber, there has unfortunately been a substantial fall in the crop secured, which for the eight months to April 30th was only 4,485,699 lb. as compared with 6,800,539 lb. for the same period in the previous year.

We are so much in the hands of the administration of the U.S.A. that their actions and decisions outweigh all other calculable considerations. They are aware of the importance of rubber to the economy of South-East Asia and have it in their power to maintain a reasonable price level for the commodity which plays so vital a part in modern transportation and finds so many other useful applications.

Out of our 1950-51 crop of rubber we have sold or contracted to ship some 3,600,000 lb. at an average equivalent to 4s. 2½d. per lb. landed London terms. Sale contracts for the whole of our 1950-51 output of palm oil and kernels have been effected at good prices.

Provided there is no further general deterioration of the situation in South-East Asia and the Far East, we are hopeful that conditions may become gradually more tolerable for the teeming population of the Islands of Indonesia, and for companies, like United Serdang, which have made a very real contribution to their welfare.

The transition to Republican self-government, following so soon after the Japanese occupation, involved strains and stresses which would have taxed the capacity of the most experienced of administrators. In the main, the present Government of Indonesia seem to be taking a more realistic view of the difficulties of running a country under present disturbed conditions.

There are indications that they recognise the need for Western co-operation in the rebuilding and development of their economy; the nettle of discord is grasped firmly now and if the Communistic and other disruptive elements are appropriately dealt with and discredited, I hope to see the day when United Serdang may again be in the very front rank of plantation companies.

1482

INSTITUTE OF COST AND WORKS ACCOUNTANTS

MR LAWRENCE ROBSON ON THE TRUE COSTS OF PRODUCTION

The thirty-second annual general meeting of the Institute of Cost and Works Accountants was held at the Dorchester Hotel, London, on June 2nd.

In the course of his address, Mr Lawrence W. Robson, F.C.A., F.C.W.A., the President of the Institute, said the year had been notable for the steady increase in membership and student registrations; the extension of branch activities; the announcement of the revised examination syllabus; the holding of the first summer school at St. Catharine's College, Cambridge; and the issue of research publications on "Budgetary Control and Standard Costing" and "The Presentation of Information to Management." Other notable events of the year were the visit to America of a team of accountants and managers under the auspices of the Anglo-American Council on Productivity, the issue of their report on management accounting, and the subsequent series of meetings held throughout the United Kingdom at which members of the team had discussed their report.

He also referred to the collaboration with other professional bodies for purposes of joint research, mentioning particularly municipal costing and the measurement of productivity.

The President paid warm tribute to the Institute Director, Mr Stanley J. D. Berger, M.C., F.C.I.S., whose efforts over the past 25 years have so largely contributed to the Institute's standing usefulness. He was also glad to announce that Mr Berger would shortly visit the Union of South Africa Branch.

The report and accounts were adopted.

At the conclusion of the meeting, the President invested Mr A. W. Muse, F.C.W.A., the new President, with the badge of office, and Mr Muse in turn presented Mr Robson with a miniature replica of the badge for his personal keeping.

BRITISH INDUSTRY'S TRUE COSTS OF PRODUCTION UNDERSTATED

At the twenty-second National Cost Conference, held on the previous day, Mr Lawrence W. Robson spoke of the onerous responsibilities of the accountant of today to the management he serves and the general public. He stated that, in his considered judgment, British industry is understating its true costs of production in both its cost statements and its published accounts. It was, he continued, the accountant's professional duty to draw attention to no uncertain terms to the deleterious effect that this artificial statement of costs is having on the current and long-term health of the national economy.

Two main factors cause the distortion of production costs:—

(a) The continuous development of inflationary conditions since the outbreak of war in 1939.

(b) The redistribution through the Budget of national income by means of subsidies and other forms of social expenditure that are, in effect, the payment of additional wages.

FALSE POSITION GIVEN BY ORTHODOX METHODS

It is true to say that it is now possible to prepare completely orthodox annual accounts for taxation which show a profit where, in fact, losses in terms of real capital have been severe. Taxation of this profit at current levels seriously reduces the capital resources of the undertakings concerned and if this trend continues it will cause a grave state of affairs in British industry.

The effect of subsidies and welfare payments is to hold down the level of wages and salaries and to lead to an understatement of industrial costs. These amount to nearly £1,000 million—about 10 per cent. of the national income and one-quarter of the total budget.

TERMS OF TRADE

Since the last war, the terms of trade have moved steadily in favour of the primary producing countries, and the trend has been aggravated severely since the outbreak of fighting in Korea. In spite of all we have done as a nation, the adverse balance on visible trade for the first four months of this year was about £305 million, and may deteriorate further. We should be most careful in these circumstances to see that internal fiscal actions do not distort our industrial costs. Yet wage restraint has only been made palatable by expending lavish sums on welfare payments, and these subsidies, besides being internal benefits, have become also an export subsidy which is a serious contributory factor in the deterioration in our balance of payments.

The present price relationship between British exports and primary products is such that in return for one Jaguar XK120 motor car we receive four and a half bales of fine merino wool; that is to say, in return for 3,896 lb. of magnificent car we get 1,125 lb. (one-third of its weight) of wool.

If the policy of subsidy was abandoned the national budget would be relieved of not less than £500 million, and the trades unions could then resume their proper function of agreeing with the organised employers what the true level of wages should be.

NEED FOR A NATIONAL ECONOMIC COUNCIL

The British Government seems to have taken on the task of directing our economic life without maintaining a sufficiently close relationship with those responsible for the achievement of our industrial production. "The Government," said Mr Robson, "would in my view be well advised to consider setting up immediately a National Economic Council representative of our industrial and commercial life."

GREEFF-CHEMICALS HOLDINGS

MR S. BAYLISS SMITH ON THE INCREASED DEMAND

The fifteenth annual general meeting of Greff-Chemicals Holdings, Limited, was held on June 12th in London, Mr S. Bayliss Smith, F.C.A. (the chairman), presiding.

The following is an extract from his circulated statement:—

I know you will all wish to pay tribute to our former chairman and managing director—Mr A. J. Thompson—who for 44 years has been intimately concerned with the management of this business. We very much regret his decision to retire on medical advice from the chairmanship and directorship of both this company and its operating subsidiary, but I am glad to be able to inform you that he has agreed to continue as consultant and you can be sure we shall make full use of his advice and long experience.

The net profit of the group before taxation is nearly £11,000 up at £73,667, and after providing for taxation amounts to £40,348, an increase of £8,501. This increase enables your directors to make an increased return to the ordinary stockholders, namely, an increase of 1½ per cent., making a dividend of 12½ per cent. and a bonus of 5 per cent., both less income tax. In maintaining the

ordinary dividend at 12½ per cent. we wish stockholders to realise that this percentage, on a long view, is one which the directors feel confident, subject to any major catastrophe, can be maintained in the future. By declaring an interim of 4 per cent., as against an interim of 3½ per cent. in the previous year, we indicated in November last that the trend of trade was favourable, and we shall continue to attempt to indicate the trend in future interim distributions, but, of course, it can only be an indication, as, when final accounts are prepared, provisions sometimes have to be made which cannot be foreseen earlier.

After providing for the final ordinary dividend and bonus, placing to general reserve in the subsidiary £12,500, as compared with £10,000 in 1949, providing for deferred taxation £4,750 and deducting preference dividend there remains £742, which has been added to the amount brought forward, making £19,070 to carry forward to next year.

I should perhaps refer to the provision for deferred taxation. During 1950 the company completed the building and equipment of a research laboratory at Newbury and has claimed the initial allowance to which they are entitled thereon of 60 per cent. of the cost. As this has had the effect of reducing the taxation charged for the year 1950 it was thought prudent to set aside an equivalent amount so that results for the year should not be unduly inflated and this provision will be utilised in the coming four years to equalise taxation in respect of that item.

THE OUTLOOK

While the first half of 1950 was one of normal trading, the effect of stockpiling and world shortages were beginning to be felt in the second half of the year, and this trend has been accentuated so far in the current year. The consequent increased demand for goods has meant that your resources have been fully extended, as is shown by the increase in the debtors and trade creditors in the consolidated balance sheet. How long this trend will continue it is not possible to say, but it would be prudent to be prepared for a recession in trade and prices once stockpiling has ceased. As Mr Thompson indicated in his last address to you, the adaptability of the business coupled with the close study of developments in and connected with the chemical and other industries have enabled the company to carry through in the past, and I have every confidence that they will do so in the future. I am glad to inform you that the manufacture of carbon black in this country, with which we are associated and in which we have an investment, is now in operation.

The other companies in which we have trade investments continue to prosper and the results are eminently satisfactory, as is shown by the increased return we have received. Two of your directors have visited the United States of America during the year with satisfactory results, and the associations with all our connections overseas are close and cordial.

It has been a year of hard work and the loyalty and enthusiasm of all, particularly of those who have been associated with the company for a number of years, deserves every commendation.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Economist,
22 Ryder Street, S.W. 1*

THRELFALL'S BREWERY

SATISFACTORY RESULTS

The sixty-fourth annual general meeting of Threlfall's Brewery Company, Limited, was held on June 7th in London.

Mr Frederick Cornwall (chairman and managing director) in the course of his speech, said:

It is with much satisfaction the directors submit the accounts for the past year, enabling them to recommend the payment of dividends (20 per cent.) and a bonus (2 per cent.) on the ordinary stock on the same basis as twelve months ago. Having in mind the general decrease in the consumption of beer, your board consider the results may be deemed highly satisfactory.

We are living under rapidly changing economic conditions, and it is, indeed, difficult at the present time to anticipate what the future may hold in store for us. Although industrial wages and salaries have been increased during the year and higher gravity beers generally have been brewed, which factors in normal times would have had a marked effect on our trade, the peculiar position has arisen that the fall in consumption has not been arrested. We have, therefore, before us a possible reduced demand coinciding with greatly enhanced costs of brewing which have risen substantially in recent years.

The net profit for the year after crediting £24,166 for adjustments in respect of prior years' taxation provisions amounts to £277,649, to which should be added the balance brought forward from last year—£204,768—giving a total of £482,417. After taking into account the final dividends and bonus recommended by the directors, which will require £100,804, the balance to be carried forward will be £202,258.

The report was adopted.

AULT AND WIBORG LIMITED

RECORD SALES AND EARNINGS

The seventeenth annual general meeting of Ault and Wiborg, Limited, was held on June 8th in London, Mr Gerald Wellesley, the chairman, presiding.

The following is an extract from his circulated statement:

I believe that shareholders and stockholders will be well satisfied with the progress

NOTICES

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability).—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held today, a dividend of seventy-five cents per share on the Ordinary Capital Stock in respect of the year 1951 was declared payable in Canadian funds on August 1, 1951, to shareholders of record at 3 p.m. on June 22, 1951. Of this dividend, twenty-five cents is attributable to railway earnings and fifty cents to income from other sources. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 11, 1951.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability).—DIVIDEND NOTICE.—PREFERENCE STOCK.—At a meeting of the Board of Directors held today, a dividend of Two per cent. on the Preference Stock in respect of the year 1951 was declared payable on August 1, 1951, to stockholders of record at 3 p.m. on June 29, 1951. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 11, 1951.

A SENIOR RESEARCH OFFICER (Geneticist) is required for Malaya by a prominent Group of Plantation Companies. The post calls for a scientist with experience of genetical work on tropical cultures, if possible with special emphasis on oil palms. Exceptional opportunity to use large research resources at own initiative for work on the frontiers of present knowledge in this field. The appointment will carry a high remuneration.—Write with full details to Box 926, Dorland Advertising, 18/20, Regent Street, S.W.1.

BRIGHT ideas are easier to find than the right ideas. For advertising that sells because it suits both your product and its public, consult SAMSON CLARK & CO. LTD., 67/61, Motherton Street, London, W.1. Museum 1060.

which we are pleased to report, sales and earnings having reached a record in the history of the Group.

Group profits before taxation amounted to £400,619, as compared with £331,255 for the previous year, and the company's profit to £397,754, as compared with £310,840. The directors recommend a dividend of 6½ per cent., less tax, and a further dividend at the rate of 18½ per cent. on the ordinary stock, making 25 per cent. in all. I have no doubt the stockholders will approve the larger distribution which we recommend today. It will be the first increase they have received for four years, although the profits of the Group have appreciated by 119 per cent.

Group exports have increased by 57 per cent., as compared with the previous year. This in itself is a remarkable achievement, exports having been made to 42 different countries. In these days it is difficult for any of us to look far into the future, but I think it right to state that your company's business is strong, healthy and active, and the expansion continues in every line which the company produces and sells. For the first few weeks of our new financial year, turnover has been substantially greater than during the corresponding period in 1950.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES

INCREASED PROFIT

The forty-fourth annual general meeting of The Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held on June 14th in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his circulated address:—

Mainly as a result of the considerably increased selling price of rubber, and partly as a result of a slightly larger tea crop and price, the year's profit is £217,584, or more than double the equivalent figure for the previous year. The total dividend proposed has been increased by a final of 12½ per cent. to 20 per cent., against 15 per cent. for 1949.

Tea: Conditions for crop were more favourable than in 1949, and the total harvested for the year was 8,361,977 lb.—about 164,000 lb. above the estimate and over 300,000 lb. more than the 1949 crop—representing an average yield per mature acre of 769 lb. Costs of production are still rising and, although these increases have so far been largely offset by higher selling prices, that

state of affairs cannot be expected to continue.

Rubber: The profit from this product in 1950 was greater than for some years past. The crop was slightly more than in 1949 in spite of the smaller total area in tapping.

Estimated crops for 1951 do not vary appreciably from those of 1950, but estimated costs are higher. About half the estimated tea crop for 1951 and 138 tons of rubber (smoked sheet) have been sold forward at satisfactory prices.

Given reasonably stable political, economic and climatic conditions, we may hope that the results for the current year will be satisfactory to the stockholders.

The report was adopted.

GOLD COAST MAIN REEF

IMPROVING POSITION

The seventeenth annual general meeting of Gold Coast Main Reef Limited was held on June 8th in London.

Major-General W. W. Richards, C.B., C.B.E., M.C. (the chairman), said:—Members will have observed the severe drop in the profit to £9,937 for the year under review, as compared with that for 1948-49, which amounted to £63,616. We were able, nevertheless, to pay a dividend of 5 per cent., less income tax, by utilising a part of the unappropriated profit brought forward from the previous year.

Members will expect me to say a few words concerning the company's operations and profits for the current financial year, which ends on June 30th.

As regards the present operations, the deeper levels in the main shaft area between the 12th and the 17th level horizons are opening up reasonably well, although it is too early to form any definite comparison with the disturbed zone immediately above. On the whole, it is considered that the prospects are good; but we must await results from the next few months' work before forming a conclusion.

The mine working profit for the four months January to April, 1951, was £37,600, as compared with £9,000 for the same period in 1950.

We have now completed a pro forma analysis of the profits for the current year and, as a result, I am pleased to declare on behalf of the board an interim dividend of 5 per cent., less income tax, for the year ending June 30, 1951, and the warrants will be posted on Tuesday, July 10, 1951.

The report was adopted.

A BANKING CAREER IN THE EAST

THE EASTERN BANK LTD. has a few vacancies in executive positions for suitable men seeking to enter into a banking career in the East. Applicants should be between 20 and 25 years of age and unmarried. Applications, which should include particulars of banking training, should be addressed to The Secretary, The Eastern Bank Ltd., 2-3, Crosby Square, London, E.C.3.

WHERE ARE YOUR BEST MARKETS and customers? How can you most profitably exploit them? What media and services cover them? To these questions, and hundreds more like them, you find instant, accurate answers in the new *County-by-County Marketing Survey of the United Kingdom*, which enables you to expand your markets, sell more goods, find new sales outlets, cut your marketing costs. Send p.c. (no obligation) for descriptive Leaflet MSS. to Business Publications, Ltd., 180, Fleet Street, London, E.C.4.

MANAGEMENT and Industrial Consulting.—Production-Engineering Ltd. invite applications from qualified Engineers and Chartered Accountants, preferably with university degrees and with a real interest in the problems facing management today; there are exceptional openings for first-class men with initiative requiring permanent posts in this type of work; engineers should have served an apprenticeship and should also have had good practical experience and an executive position in industry; accountants should have experience of modern developments in financial control and its application in industrial management; after training there is a four-figure starting salary as well as life assurance and superannuation schemes; applicants should be between 27 and 35.—Write, giving age and full details of education, qualifications and experience, to Production-Engineering Ltd., 28, Bruton Street, London, W.1.

FOR SALE.—The *Economist* bound in half-yearly volumes, July, 1925-December, 1941; since January, 1942, unbound. Complete. Offers to Box 675.

UNIVERSITY OF ABERDEEN

APPOINTMENT OF SECRETARY TO THE UNIVERSITY

The University Court will, in the Autumn, 1951, proceed to the appointment of a Secretary to the University which office will become vacant on September 30, 1952. It is intended that the person appointed should take up duty some months before the present Secretary's term expires.

Salary at least £2,000 per annum with F.S.S.U. and Children's Allowance. The University pays a proportion of removal expenses. Further particulars and form of application may be obtained from the Secretary, with whom applications should be lodged not later than September 30, 1951.

H. J. BUTCHART, Secretary.

The University, Aberdeen.

UNIVERSITY OF READING

Applications are invited for the following posts:—One Agricultural Economist and two Assistant Agricultural Economists in the Provincial Agricultural Economics Service. Applications should be submitted, not later than July 14th, to the Registrar from whom further particulars may be obtained.

UNIVERSITY OF READING

Applications are invited for a Research Fellowship in Rural Sociology, value £400 p.a. Candidates should possess good academic qualifications in the Social Sciences. Applications should be submitted, not later than July 14th, to the Registrar from whom further particulars may be obtained.

AN ADVERTISING ORGANISATION, such as our own, owes its success and reputation to creating, in turn, success and reputation for its clients—with economy. If you are not entirely satisfied with your own advertising, we believe that our experience, facilities and director level co-operation could more efficiently progress your purpose. We shall be happy to be of service to you.—Townend-Smith Limited, Advertising, 40-41, Conduit Street, London, W.1. REGent 2600.

MULTIPLE Departmental Store Organisation of National Repute wishes to select a number of senior personnel, not exceeding 35 years of age, for accelerated development with a view to subsequent appointment to executive positions in its Retail Branches and with the future possibility, in certain instances, of appointment to its central organisation. Commencing salaries in the region of £750 per annum will be paid to men of proved ability and status. Successful candidates will be expected to accept assignments anywhere in the United Kingdom.—Full details, including age, education, experience, present occupation and salary, which will be treated in strict confidence, should be forwarded to Box No. M.D. 511, 10, Hertford Street, W.1.

EXPORT MANAGER.—Applications are invited by the Boot and Shoe Manufacturers' Federation for the position of Manager of the Federation Export Section.

Applicants must have knowledge of all types of Footwear construction including materials used.

Experience necessary on all aspects of exporting procedure and knowledge of various markets including the United States and Canada.

Salary £1,000.
Applications should be sent immediately to: The Director, 22, Gilbert Street, London, W.1.

NORWICH EDUCATION COMMITTEE

THE NORWICH CITY COLLEGE AND ART SCHOOL
ST GEORGE STREET, NORWICH

Principal: FRANK BRIERS, D.Phil. (Oxon)

Wanted as soon as possible, Lecturer for teaching Advanced Commercial and Management Subjects in the Department of Commerce and Languages. Teaching and business experience essential. Salary will be in accordance with the 1951 Burnham Award for Teachers in Establishments for Further Education, namely, £900 per annum rising by £25 to £1,000.

Application forms, which may be obtained from the Director of Education, City Hall, Norwich, on receipt of a stamped addressed envelope, should be returned to the Principal as soon as possible.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the post of Lecturer or Assistant Lecturer in Agricultural Economics. Salary according to experience and qualifications. Applications, together with the names of two referees, should be sent within three weeks of the appearance of this advertisement to the undersigned, from whom further particulars can be obtained.

T. MAELGWYN DAVIES, Registrar.

UNIVERSITY OF TASMANIA

LECTURER IN STATISTICS AND ECONOMICS

Applications are invited for the above position in the Department of Economics and Commerce. The appointment will be offered as Senior Lecturer or Lecturer Grade I, according to qualifications and experience.

The present salary grades for men (including cost-of-living allowance as in May, 1951) are as follows:—

Senior Lecturers: £A1,047—£A1,147

Grade I: £A817—£A1,017

The corresponding grades for women are 10 per cent less. A new grading is under consideration which may increase the salary for a Senior Lecturer to a maximum of about £A1,250, plus any future additions to the cost-of-living allowance.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is July 31, 1951.

UNIVERSITY OF MELBOURNE, AUSTRALIA

Applications are invited for the position of Ritchie Professor of Research in Economics.

Salary £A1,952 per annum (including £A102 cost-of-living allowance), subject to superannuation contributions.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is August 7, 1951.

WEST AFRICAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH UNIVERSITY COLLEGE, IBADAN, NIGERIA

Applications are invited for the post of Research Fellow in Economics.

Salary £800 x £50—£1,300 per annum. Point of entry in scale according to qualifications and experience. F.S.S.U. Partly furnished residential accommodation at rent not more than 7.7 per cent of salary. Passages paid for appointee and wife on appointment and annual leave. Outfit allowance of £60.

Applications (six copies), giving full details of qualifications and experience, including the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date, July 7, 1951.

DO YOU NEED REPRESENTATION IN BRAZIL?

Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro; Member of the: American Chamber of Commerce for Brazil—Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comercio do Rio de Janeiro, etc. Purchasing Agent for: Minerals, raw material, sugar, wood, etc. Selling Agent for: Iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

YOUNG Man, public school and Cambridge (open scholarship), degree in economics, fluent German, good French, knowledge international and commercial law, seeks position in business, commencing autumn, with some scope for initiative and responsibility, perhaps as assistant to an executive. Some factory, office and department store experience. London area preferred, but willing to travel.—Box 665.

Whether or not that was the right decision is, for the moment, beside the point. There is no present possibility that either of the other courses of action will be substituted for it. The practical alternative at this moment to allowing prices to take their natural course is not to remove the root causes of inflation: it is to drive inflation on to another course. By more rigid and more extensive price controls the Government might squeeze the profit margins of some companies; the main result would be to reduce company savings and to leave consumers with correspondingly more money to spend on other things. To the extent that they succeeded in getting more things—to the extent, that is to say, that the policy succeeded in doing what the trade unions and others want—the amount of the national output going into defence, exports and investment would be smaller than the Government thinks necessary. If, in fact, these commitments were maintained in spite of the extra pressure of consumers' demand, price control would have served no purpose; the money not spent on the artificially cheap, price-controlled goods would be chasing other goods that did not exist, and would be reflected either in more shortages and queues or in a faster bidding-up of the prices of non-essentials. The public would not, in either case, be better off; indeed, it would soon be worse off.

*

This, the road of more control, is the wrong road for prices. The proper alternative is not, of course, to do nothing at all and watch prices rise. It is to remove the conditions in which rising prices have to be relied on as the means of curbing consumption. Here two methods of approach are possible. One, and in the short run the most effective, is to reduce money demand at its source; this is the method of budgetary and monetary policy—on which, unfortunately, the Government's views must for the moment be taken as static. The other possibility is to reduce prices, not by administrative fiat, but by cutting costs; it is, that is to say, to increase efficiency so that more goods are produced from the same effort and resources. This is the direct opposite of the policy of control: it is the policy of removing distortions that hamper efficiency, instead of imposing new ones.

Everyone pays lip-service to such a policy, but this week the Government has made a rare tentative step towards doing something about it in practice. A warm welcome should be given to Sir Hartley Shawcross's statement on resale price maintenance—on the practice, that is, by which the manufacturer or wholesaler insists that his branded products shall be sold at the same fixed price by every retailer in all circumstances. The Government has only reached the point of issuing, in effect for discussion, a general statement condemning all price maintenance but declaring that there may be some cases—which it does not try to define—where exceptions should be made. This is hardly the tactic (two years after the Lloyd Jacob committee published its exhaustive report on the subject) that will get legislation through Parliament at high speed, if the Government ever has the opportunity, and it would be rash to assume that the pure economic liberalism of the White Paper will survive untarnished through the processes of drafting and of Parliamentary pressure.

The practical importance of these reservations remains

to be seen. But if the spirit of the White Paper is in fact preserved, the Government will be making a determined attack on one of the most obvious of restrictive practices. Price maintenance is not primarily associated with monopoly or with price rings among manufacturers. It is designed to provide a comfortable life for retailers and to give manufacturers the feeling of security that goes with an "orderly" market. Its main economic effect is to prevent the consumer from getting any benefit by buying through the distributors whose costs are lowest—any benefit, that is, in cheapness; he may be forced to accept benefits in the form of better service that he would prefer not to have to pay for. Admittedly, two-thirds of the things the consumer buys are free from price maintenance; but those are, in general, the less standardised products for which he cannot easily compare prices for like qualities. In large sections of retail trade there is, therefore, hardly any price competition at all. The results are not open to serious dispute. They are not, it should be emphasised, that all retailers earn large profits. They are that the inefficient retailer survives too easily.

The White Paper insists that this economic criticism applies to all forms of price maintenance. The Lloyd Jacob committee—and also some Conservative speakers in last week's debate in the House of Commons—made a sharp distinction between price-fixing for his own product by the individual manufacturer and the collective action of trade associations designed to maintain the retail prices for all brands of a commodity. It is true that the individual firm has no weapon so effective, nor so repugnant to the sense of fair play, as the collective boycott and stop list, whereby a retailer may, in an extreme case, be put out of business altogether because he has cut the price of one commodity. It is also true that such action by the trade association may be, additionally, the means by which a price-ring among manufacturers keeps out competitors.

If the Government is right in deciding to forbid all price maintenance, whether collective or individual, it will—if it ever brings itself to legislate on such simple lines—have to answer two main objections more effectively than it has done in its first thoughts. One applies to the technically elaborate product, such as a motor car, for which the manufacturer is anxious to encourage good servicing arrangements; it would be unfair if the retailer who provided such services could be undercut, in the actual sale of cars, by one who does not provide them. This is a genuine difficulty: the lines of the solution are, presumably, that the manufacturer should be free to refuse supplies to a retailer who does not provide defined standards of service. But this would be a difficult condition to lay down and to make effective, without abuse, and the Government should have something to say about it. It does try to answer the other principal objection—the argument that orders for branded goods fluctuate seriously if retailers are free to sell them below cost, as "loss leaders" attracting custom to the shop. This case is no doubt much exaggerated, and the Government is probably right in thinking that it would matter very little as soon as the shopper had stopped expecting to see branded goods offered at the same price everywhere. But the implications of this mental revolution will have to be examined more fully before the Government can succeed in getting its case accepted.

These are, however, secondary points. The essential

point is that the Labour Government has at last decided to try to remove one of the basic rigidities of the British economy, and has chosen, in general principle, the right method of attack. One can only hope that, if it has the chance, it will persevere—and go on to be as radical not only about monopoly practices in industry but also about trade union practices, about nationalised industries, and about its own policies of control and subsidy. The truth, unfortunately, is more probably that the Government has

Breakdown in Persia

THE blame for the breakdown of the Anglo-Persian negotiations for a nationalised oil industry lies squarely on the Persian government. They stated as their minimum terms for beginning to talk that 75 per cent of the company's revenue from oil must be handed to them from the date of "nationalisation." The company replied that 25 per cent of that revenue would not provide an adequate return for the capital and effort required for its operations in Persia—a contention supported by all the principal American companies. There is a limit beyond which operations in a foreign country are not worth while. The Persian demand exceeded this limit and afforded no guarantee of future security. Indeed, it read as if it had been framed with intent to force the foreign investor to get out and to stay out. The oil company's negotiators are expected to be back in London this week-end.

Could the Anglo-Iranian Oil Company have done more, since the negotiations started, to keep the door open to compromise? It seems doubtful. The company had fallen in with all Persian requests for meetings and visits. Knowing that the Persian exchequer was in dire straits for ready money, it had offered the financial sweetener that has throughout been advocated by the Americans as a means of producing a less strained mood in Persian government circles. It proposed, as a temporary alternative to the Persian demand for a percentage of the oil revenue, to make an interim payment of £10 million immediately and of £3,000,000 monthly while the future of the industry was under discussion. But Persian tempers had been allowed to run far too high to be abated with mere money. The company was also ready to vest its assets in the National Iranian Oil Company, which would grant them to a new mixed company with a number of Persian directors. This suggestion also was turned down. It is impossible to deal with men who are deaf to all arguments, economic as well as political.

There are some who contend that the company would have done better had it been tougher. In the economic field it has, since its delegation arrived in Teheran, carried toughness as far as ordinary words and decisions can take

hit on one section of the right road for prices because its present desperation makes it explore every road. It is difficult to detect the millennium round the corner in a policy that promises to ease the economy of one set of clamps but promises to screw down another set, in the form of stricter price controls. But even if it is for offering no more than a hopeful gesture, the new President of the Board of Trade has earned some congratulation.

it. To do more would have entailed the backing of force. One glance at the map of Persia reveals how great would be the force needed for toughness in an area which includes not only the Abadan refinery but hundreds of miles of pipelines and a string of wells stretching for over 200 miles along the fringe of the Bakhtiari mountains. What western power could, at its present strength, spare the force for so spreadeagled an operation? Would the result be worth the effort? Would the chance of success justify the gravity of the risk? The free world would be saved some discomforts from a shortage of oil which will, for several months, be very great. But the price of the effort would be the pinning

down of a task force at a fresh point in Asia in conditions that would be satisfactory only to Moscow. The single justifiable use of British force in the Persian oil-fields would be to save British life if that were to be threatened during an evacuation of the area. Mr Morrison did well, in his statement in the House of Commons on Wednesday, to make it clear that British subjects would not be left defenceless and in jeopardy.

The only hope, therefore, of stopping the Persians from perpetrating acts that are more damaging to their own prosperity than to that of any other country is to bombard them with economic, not military arguments. Unfortunately it seems that part, at least, of Dr Mossadegh's team is impervious to any such pounding. The Persian authorities are still speaking with several voices, the most extreme of which is that of Hussain Makki, *rapporteur* of the liquidation commission now in Abadan. Some new edicts from Teheran amount to a back-handed method of obtaining the financial result that the AIOC delegation turned down. It is difficult to see how the company could continue operations under such a condition.

At Abadan itself Hussain Makki's desire to turn off valves, to stop the flow of oil and to seize the refinery seems temporarily to have been checked. This respite is all to the good, for he seemed, in the height of his nationalism, to have snapped his fingers at the danger that such acts, if performed by inexperienced hands, can throw out of its delicate balance, and irreparably damage,

valuable pumping and refining machinery that Persia can ill replace, and that is insured for £78 million. Few of the 5,500 Persians of staff grade at Abadan and in the fields are managing technicians, but there are many who know enough to work parts of the apparatus. Mr Makki mentioned an output of 8,000,000 tons a year as a figure that could be managed were the British company to pull out. Even at this rate, the dearth of Persian technical experts is such that some foreign technicians would be necessary. And in making his statement Mr Makki appeared to ignore two non-technical problems that have entered far too little into the Mossadegh government's calculations. The first is that of creating sudden unemployment not only among the company's 48,000 Persian workers, but also among the further 12,900 workers employed through Persian contractors on building connected with its expanding output and social services. Contraction of operations must throw great numbers of these people out of work. The second problem is that of mitigating Persia's growing reputation as a bad employer of foreigners. A country that has within the year refused to parley with its British concessionaire, and discourteously sacked the American firm of consultants which it had engaged to help execute its Seven Year Plan, must make itself more attractive if it wants to secure the best type of foreign technician.

★

It is still uncertain whether the last word lies with the more extreme members of Dr Mossadegh's team. Undoubtedly, Persia contains many thinking men who are vastly uneasy at the turn events have taken. One or two have had the courage to speak out, but they tend to be shouted down. It seems that, owing to Dr Mossadegh's weakness in allowing free rein to extravagant statements, the crowd has taken charge, and no action can be taken except by a government that can command its allegiance. Dr Mossadegh, armed with his thin but catchy nationalisation slogan, has yet to lose this. Were he to do so, the only other discernible candidate for public favour is the Tudeh party. Even the Shah, backed by a strong team of elder statesmen, would now find difficulty in using the wide public esteem for his office to capture support for negotiation with foreigners. A task so difficult is repellent to any Persian, who, proverbially, prefers swimming with the stream.

A debate on Persia is taking place in the House of Commons as *The Economist* goes to press. But it can alter matters little. The next step lies with the Persians.

If, as seems almost inevitable, they take measures that greatly reduce Persia's oil exports, the dislocation imposed on the free world's oil supplies will temporarily be great. As a result of the Korean war stocks are at maximum almost all the world over, and producers and consumers will have a few weeks of grace in which to adjust their purchasing, shipping and loading arrangements. But the next nine months will be hard. The principal markets that are likely to be affected will be those east of Suez, including South Africa, which take nearly three-quarters of Abadan's refined products. The whole British and western European refining programme is dependent on Middle Eastern crude oil, and the loss of Persian crude would affect these new plants at a critical time, though they could be supplied, after a time, from other sources in the Middle East. Persia produced in 1950 32.3 million metric tons, compared with 26.9 million tons by Saudi Arabia, 17.3 million tons by Koweit and 6,500,000 tons by Iraq, in all of which the rate is rising. But the serious consequences of Persia's step lie in the threat to economic expansion and the defensive preparedness of western Europe.

★

Recriminations do not sound well at a moment of crisis. Yet praise for the company's conduct of its case in the last few weeks, and for the support it has had from the British Government, has to be tempered with the comment that both have, in the two years since the Supplemental Agreement was initialled with the Persians, taken Persian grumblings and prevarications too smugly, and failed to take any action calculated to forestall the outburst of passion that now threatens to end the Persian part of British oil operations. From Mexico the warning had already been sounded that, once nationalism takes charge, the prospect of mere loss of money and destruction of valuable assets does not daunt the nationalist. "Nationalisation" is a mid-century fashion. Even though it may be demonstrably unprofitable, nationalists still want to try it. It remains to be seen whether the fever will spread to the other oil-producing states of the Middle East or whether they will sensibly wait and see what happens to Persia's fortunes if and when it attempts to run its industry for itself. Some of Persia's neighbours are far more cautious, but that does not make them immune from the ferment of nationalism. The lesson of Persia is to underline the new problems of co-operation between Western enterprise and underdeveloped territories, and to demonstrate that they cannot be solved by old methods.

France Moves Right

THE French elections have removed an important stumbling block from the path of the western alliance. Until they had been held, it was impossible to be sure that France, at the centre of the whole western defence system, could pull its weight. This is not to deny the weakness of the political *impasse* in Britain and the gathering uncertainties which already begin to spread their shadows a full year before the 1952 Presidential election in America. But there is now hope, after the elections, of a fresh and a stronger assembly in Paris on July 5th. That, however, is about all that can be said. While the technical results of the election are good in that Communist representation in the Assembly has gone down sharply, it is most depressing and, indeed, alarming that half the French electorate should vote for one or other of the two extreme parties—the Gaullists or the Communists. After three years of Marshall aid and with the remarkable improvement in the French economy, this result does not promise well for the next five years of French democracy.

The immediate problem is to form a government. If France were Britain, the head of the state would be under a constitutional obligation to call first on the leader of General de Gaulle's party in the lower house to try to form a Cabinet; the Gaullists—the RPF, the *Rassemblement du Peuple Français*—are now the largest single party in the French chamber. It is not yet certain, incidentally, who their parliamentary leader will be—though M. Soustelle is a likely choice—since the General himself did not stand as a deputy and M. Capitant, a former leader, lost his seat; but it is not constitutionally impossible for General de Gaulle to be Prime Minister, even though he is not in the Assembly. There is, in fact, little chance that if the President, M. Auriol, does call on the RPF this would be more than a formality. The General would not, and could not at this stage, form a government, since he would have to rely not only on the small right wing parties—the PRL (*Parti Républicain de la Liberté*), the Independents and the Peasant party—who now have almost a hundred seats between them but on another hundred members of the Third Force as well. Hence it seems that the Third Force itself, standing together, fresh from the triumphs of its electoral *apparements*, and representing a much larger block than the Gaullists, must form the first government. As the main trend of the election has been a swing to the right, M. Auriol is expected to invite someone not too far to the left but who might retain the confidence of the Socialists; the name of M. Pleven is being mentioned. If this is unsuccessful then the invitation may go to a Radical: if not to M. Queuille, then to M. Daladier, M. René Mayer or M. Petsch.

In any event, it seems likely that a new Third Force administration—or successive administrations—will govern France at least for some months after last week's elections. What will be their position? Looking back on the elections, the leaders of the Third Force will know that they have the backing of most of the citizens of metropolitan France and Algeria; in spite of the Gaullist gain, it was clear from the polls that Frenchmen do not want a fundamental change in the way they are governed. Looking around the Assembly, however, they

will be very conscious of their inability to secure a clear majority by themselves; they need the support either of the smaller right-wing parties, as would the Gaullists, or of the Gaullists themselves. This means—and here is the second main lesson of the elections—that a new element of considerable strength has emerged, the Fourth Force of rightist parties of which M. Paul Reynaud is the natural leader. There has in fact been a shift in the parliamentary balance of forces inside the Third Force itself and this has inevitably weakened the combined progressive influence of the Socialists and the MRP.

A very important question which emerges from the election is the role that General de Gaulle intends to adopt. His party has now gained a powerful position in France. Although the electoral law favoured the RPF as compared with the Communists, so that it has more seats in the Assembly than they have, it came a close second only to them in the number of votes that it polled. The RPF could not have achieved this result without winning the support of men and women from all sections of the community. And whether or not General de Gaulle finds himself outside the government during the next few months, while the leaders of the Third Force once more steer their way—in a stouter ship—between the Scylla of Gaullism and the Charybdis of Communism, a heavy responsibility now lies on the General's shoulders. For sooner or later, in the absence of new elections, the fate of the Third Force will assuredly turn on its relations with the RPF.

General de Gaulle can either show willingness in due course to join a coalition or he can refuse to do so. Since he cannot govern France alone and since he has now put his RPF to the electoral test—he long since forswore any intention of trying to seize power outside the constitution—there can be no question in which direction his logical duty must lie. He owes it to those who have voted for him, and to the France for which he stands, to join in the work of government. If he does, his party would almost certainly come to make its permanent mark on the political life and history of his country. If he does not, his own supporters may begin to drift away; but they will not transfer in sufficient strength to bring effective support to the Third Force in its primary struggle of defending the democratic method and the future of France itself against Communist attack. General de Gaulle has a great opportunity to bring an element of determination into French democracy that has hitherto been lacking in the Fourth Republic, by using his mass party as a firm but constitutional right wing against which a non-Communist left—can afford on occasion to go into opposition.

The weakness of France, as resort to the new electoral law in the latest elections has shown, lies not only in hesitation to resist the threat of Soviet imperialism abroad, but in preoccupation with the fight against the Communists at home. It is fanciful to suppose, as some British admirers of France assert, that a French Communist state would be much more French than Communist. That would be as inaccurate as similar judgments made about the new China. The French Communist party, led by men who know precisely where they are trying to go and sufficiently adroit to persuade

just over five million frustrated but misguided citizens to vote for them, occupies a key position in the Soviet tactics directed against the people of Western Europe. The party is too big and too dangerous for compromise. The parties of the centre and right, for all their own differences, have had to band together and, in effect, to limit the free working of full democratic debate. Hence the paradoxical outcome of the elections: the democratic forces have emerged stronger and with a new opportunity to make the parliamentary system work effectively;

PROVISIONAL ANALYSIS OF RESULTS

Party	Com- munists	(Third Force)			(Fourth Force) Conser- vatives	RPF
		Socialists	MRP	Radicals		
Votes (000)	5,489	3,432	5,058	2,381	2,466	314
Percentage of votes	28.6	17.9	26.4	12.4	12.8	1.6
Seats	177	99	143	60	86	25
Votes (000)	5,039	2,764	2,354	2,194	2,497	4,135
Percentage of votes	26.5	14.5	12.3	11.5	13.1	21.7
Seats	201	104	86	95	99	117
Loss or gain of seats	- 76	+ 5	- 57	+ 35	+ 13	+ 92
Loss or gain of votes (000)	- 450	- 668	- 2,705	- 187	+ 31	+ 3,821

As will be seen from the table the Third Force together lost 3,560,000 votes for a loss of 17 seats. The Communists, on the other hand lost 76 seats for a loss of 450,000 votes. Within the *appartements* the Socialists who lost 668,000 votes managed to win 5 seats.

but the Communists have come through with their backing in the country not seriously impaired and have been provided with a grievance—that they have been defrauded of seats—which they are already busy exploiting. If the opportunity ever arose, it could give them a dangerously plausible excuse for a *coup d'état*.

Compared with the rise in the Communist poll at the recent Italian regional elections over the figures for 1948, the fall in France is satisfactory. It is also more important that three-quarters of the French electorate should

vote against the Communists than that one in four should vote for them. Nevertheless, the drop of only 3 per cent shows how hard is the core of French Communism. The main reason for this small decline in voting strength is that there is still no alternative to the Communists as a working class party. Until the French Socialists, or some other party of the left, can really represent the feelings of the men at the bench and the plough this condition is bound to persist, to the detriment of good government and ultimately to the danger of the state. As it is, there is an unhealthy smugness in Paris about the way in which the Communists have been jockeyed out of their seats. At the same time, it should be remembered that, in any country not conditioned to proportional representation, the loss of a majority in a given constituency is unequivocally accepted as defeat. In Britain, governments have often ruled with a majority in the House of Commons but a minority of the votes cast.

At the present pace of French economic recovery and with the new sense of security which is beginning to grow with every month of the North Atlantic alliance, the face of France is changing. It was not for nothing that M. René Pleven, as Prime Minister, and President Auriol went to the United States in February and April to make ringing speeches that made the western world put new hope and trust in its French ally. In these elections France has repudiated Communism as a governing force and has chosen its path for the next five years. For the French themselves, the task is now to improve the technique of government and to see that the Assembly tackles great economic and political problems with a higher sense of reality and purpose. Nothing would better encourage France's western partners to put new faith in the good sense of the French people and in the destiny of France.

Two Kinds of Inflation

ALL economic, and most political, discussions today are dominated by the spectre of inflation. In the past nine months money has been visibly losing its value from week to week; the stage has been reached—and it is potentially a very dangerous stage—when, for the first time in British history, the man-in-the-street is aware that his money cannot be relied upon to keep its value. For politicians—at least when they are in their constituencies—the rising cost of living has become almost the most crucial issue of the day. And on the world stage, there has recently been a weekly series of reports by one international body after another viewing with grave alarm the ravages of inflation and summoning the nations to action against it.

Unfortunately, the more the public mind becomes concerned about inflation, the more muddled it shows itself to be. This has been made very plain by the public discussion of Mr Gaitskell's budget and of the suggestions for a revaluation of the pound sterling. The muddle arises almost entirely from one fact: that a state of inflation and a state of rising prices are generally spoken of as if they were one and the same thing, whereas in fact not only are they quite distinct phenomena but they can even be in contradiction. One of the chief requirements for clear economic thinking today is to insist on the distinction.

The basic meaning of inflation is a state in which the flow of money being offered for goods and services in general is in excess of the value, at existing prices, of the supply of goods and services in general available for purchase. Inflation is "too much money chasing too few goods" and its essence consists in the excess of demand over supply. It is true that in a perfect market a state of inflation leads at once to a general rise in prices—and even in a planned economy, provided there is any freedom left at all, some prices will tend to rise. Hence the confusion between the two phenomena. But it is not impossible to imagine circumstances in which perfection in planning and control prevented a state of inflation—an excess of demand over supply—from causing any price increase at all. There would then still be inflation, but the index numbers of prices would be stable. Britain had plenty of experience of something approximating to this state of affairs in the Daltonian era. The effects of suppressed inflation differ from those of the more familiar open inflation; but they are effects of inflation all the same.

Not only is the rise in prices not the same thing as inflation; it is, in a sense, nature's cure for inflation. This can be illustrated by the simplest possible example of a classical inflation. Let us imagine a community with a national income of, say, £10,000 million and enjoying

both stable prices and full employment. The government thereupon decides to embark on a rearmament programme which, it is calculated, will require about one-tenth of the community's resources, and further decides to finance it not by taxation but by the creation of £1,000 million of credit. This is inflation; the flow of money coming on to the market is increased by one-tenth; in a state of free markets prices will rise, on the average, by something like 10 per cent; and if nothing further happens, private consumption will be reduced by one-tenth and the government will find itself in possession of the resources it requires. The rise in prices, it should be noted, is the means by which demand and supply are once again brought into equilibrium; if nothing further happens, the new flow of money will equal the old flow of resources at the new price level. The rise in prices, so far from being synonymous with the inflation, will have destroyed it. Of course, in practice, other things do happen; most notably, trade unions and others insist on increasing their money incomes to compensate for the rise in prices and a new bout of inflation starts—the celebrated vicious spiral. But it is the increase in the incomes, not the rise in prices, that provides the impetus to the spiral. Rising prices, by themselves, must be disinflationary, since they reduce demand relatively to supply.

★

This excessively simplified model of a classical inflation can now be compared with a different state of affairs. In this second example the flow of money demand is not the first to rise, sucking up prices after it, but it is prices that take the initiative by rising. This could come about, within one country, by a devaluation of its currency, causing all imported foodstuffs and raw materials to go up in price; or it could happen in consequence of a rise in prices, induced by inflation, in the outside world; or, of course, by a combination of the two. In these circumstances—if this is all that happened—there is no inflation inside the country at all. Nothing has happened (in this simplified example) to increase the flow of money incomes or of money coming on to the market in demand for goods and services, but some of the goods have become more expensive. Taken quite by itself, this is an example of how there can be a rise of prices without any inflation—indeed, with the opposite of inflation. In real life, of course, incomes begin to be pushed up and the spiral begins to revolve; but, once again, it is the rise in incomes, not the rise in prices, that is the inflationary factor.

In common parlance, both these states of affairs are described as "inflation," although in many ways they are the opposite of each other. The confusion would be eliminated if everybody could be induced to use the word inflation only of the first state of affairs, and to call the second a rise in prices. But after all these years there is really no prospect at all of carrying through such a semantic reform; the public will go on calling both of them inflation. That being so, the second best course is to insist on all occasions that there are two kinds of inflation, income inflation and cost inflation. And perhaps this is not, after all, too misleading a procedure since the one invariably leads to the other. The two types are connected as closely as diastole and systole in a heart-beat: the sucked-up prices of demand inflation become the upward-pressing costs of cost inflation; the extra purchasing power released, in the interests of full employ-

ment or in response to complaints of the rising cost of living, renews the sucking-up process, and so *da capo*. Indeed, both systole and diastole may be found simultaneously in different sectors of the economy: the price of fuel, for instance, may be getting pushed up by higher mining costs while the price of uncontrolled house room is still being sucked up by excessive monetary demand; on the railways wages may be pushed up by the cost of living and in the mines sucked up by scarcity values; suction may be most important in the field of capital goods while pressure is most effective in that of consumer goods.

Nevertheless, one or other of the two types of inflation predominates at any one time. In Britain since the war, income inflation was clearly uppermost until about the end of 1947. Sir Stafford Cripps went a long way in 1948-49 in getting it under control, so much so that by the autumn of 1949 it seemed possible to risk the dose of cost inflation implicit in the devaluation of sterling. Unfortunately, the dose was very greatly strengthened by the world-wide scramble for materials that followed on the Communist aggression in Korea—an income inflation so far as the outside world is concerned, but a cost inflation in its impact on Britain. There are a few signs that the impetus of this cost inflation may now be slackening; but it is unfortunately only too likely that the development of the rearmament programme will give rise to a new income inflation a little later on.

Not only is the distinction between income inflation and cost inflation clear in theory, it is important in practice. For one thing, it has important political consequences. Income inflation produces a kind of economic euphoria. To have money burning holes in one's pocket, even if the objects on which one would most like to spend it are generally rationed, allocated by hard-to-get licences, or perpetually elusively "on order," gives a deceptive feeling of wealth, a welcome surcease from the mental and moral strain of balancing one's budget. The fixed-income groups are, of course, in different case; but in an income inflation they are by definition in a minority, since an income inflation is a state in which the average income is increasing faster than prices. But cost inflation, again by definition, hurts the majority; by burning up the money instead of the pocket lining, by turning personal and business budgets into an obsessive nightmare, it causes far more lamentation, far more demands that someone shall somehow do something to stop it.

Obviously the best and the only effective way of stopping either kind of inflation is to remove its cause. But in the case of an income inflation, that would involve reducing the average money income—in the simplified example given above, by paying for the rearmament programme entirely out of additional taxes—and that may be difficult for politicians to contrive. In the case of a cost inflation, it may be impossible to remove the cause if that cause lies abroad. Anti-inflationary policy therefore usually concentrates on attempts to prevent the spiral from beginning to turn—that is, to prevent diastole from giving rise to systole. And it is here that the distinction between the two is of most practical importance, since the measures to be taken may be very different in the one case from the other. A few over-simplified examples may make this clear.

If income inflation is in the ascendant, there is some chance of preventing prices from rising by administrative action. There is at least no compelling necessity, in the

profit-and-loss accounts of the producers, for them to rise, and if they rise at all it is only in response to the excess of demand. A mixture of price controls and rationing may therefore work. True, it can work only at the cost of a tremendous administrative apparatus, for it will have to be progressively extended over the whole economy (as otherwise the surplus of purchasing power will simply spill over from one object to another); and if resources are not allowed to be shifted—into rearmament, for example—by the attraction of higher prices, they will have to be directed by administrative fiat. Still, the task is not inherently impossible; whereas in a cost inflation prices cannot be stopped from rising and attempts to limit the rise will cause supplies to dry up. In this situation rationing is unnecessary, since rising prices impose “rationing by the purse.” Again, subsidies in aid of the prices of food and other necessities are harmful in an income inflation, since they prevent the excess of purchasing power from being absorbed, but

merely divert it with redoubled force on to unsubsidised items; while in a cost inflation, subsidies, if they can be afforded, may be a means of preventing the spiral from beginning to revolve.

These examples, it should be emphasised, are very over-simplified. It is not part of the intention of this article to make recommendations for policy in any actual circumstances, where there is always a multitude of sometimes contradictory factors at work and where the practical limits of action have to be taken into account. Indeed, if from this exposition any moral at all emerges, it is surely that the process of conscious control of the economy is one of great difficulty and complexity, requiring an infinite delicacy of technique if it is to be mastered. Possibly it can be handled by democratic methods, the technicians convincing the politicians and the politicians convincing the electorate, all within a time limit before diastole once more gives way to systole. But no one should imagine that it is easy.

NOTES OF THE WEEK

Korean Anniversary

No one will want to celebrate the first anniversary of the Korean war that falls on June 25th; but it offers an opportunity for reflection which statesmen and public opinion should not let pass. Most of the peninsula has been devastated in a campaign that has twice swung from north to south and back again; the toll in civilian lives has been ghastly, and there is an immense task of reconstruction to be done when the fighting stops. The long-suffering and bitterly divided Korean people will be asking whether it has been worth while. In the United States and this country—as indeed in all the countries that have contributed contingents to the United Nations forces—there will be the poignant thought of losses: 20,000 Americans killed and missing, and 44,000 wounded; 2,000 British killed and missing, and 750 wounded. The question whether it has been worth it merits an honest answer.

In terms of crude political and military calculation it has been worth it; but there has been also the moral gain, now so seldom mentioned. What would have been the state of mind and conscience in the free world if the act of aggression a year ago had passed unchallenged, if Korea were now a Communist state, pointing at the heart of Japan? There would have been again the sense of guilt and cowardice of 1938; the mood in which rearmament is being tackled would have been more nervous and emotional, notably in the United States; the smaller allies of America and Britain, especially those on the very frontiers of the Soviet empire, would have felt more frightened and more sceptical than some of them already are of the ability of the members of the United Nations to defend them. Few would have respected any more the idea of collective resistance to aggression; and without respect the idea would have lost its power both to attract loyalty and to deter aggression.

The political gain has been immense. Many in Asia think worse of the white man for the way he has won a victory on the Asian mainland; but many are less confident than they were that the future in the Far East and southern Asia lies only with Communism and the friends of Peking. A limit has been firmly set to what is tolerable in the cold war, and Moscow has less reason and excuse now than before to underestimate the resolution of the free nations. It is fair to say that those in Washington and London who hoped last year that world war could be averted now feel their argument has been strengthened.

To conclude that Korea has been a useful test case is to

appear indifferent to all the suffering that it has caused; but it has in fact been valuable, as a test of the United Nations, of the western alliance, of its troops, weapons and organisation, of civilian capacity to grasp what is involved in bringing about a settlement of the post-war world. It has removed some grave doubts about the free world's capacity to resist aggression. If the experience has been bought at a high cost, the blame must be squarely placed on the ambitious and unscrupulous men who forced the transaction on the world. What was not done in the 'thirties has been done in the 'fifties by soldiers from all over the world; and the question now is whether the test case can be closed.

Peking's "Patriotic Pact"

On June 7th the Chinese Peace Committee issued an appeal for what was called a “patriotic pact” movement, in which the people were exhorted either to give cash for the purchase of arms for the Korean war or to increase production and contribute extra earnings for the same purpose. Great prominence has been given to this appeal by the Chinese Communist press and radio; and the statement that a check is to be made on the progress of the campaign in January, 1952, suggests that the Chinese People's Government is thinking in terms of a long war. As China's most recent precedent in foreign war, the struggle against Japan, went on for eight years; and as it has now a fairly definite assurance that its territory will be neither bombed nor blockaded, there is no reason why its rulers should be in a hurry to terminate the fighting, provided that the morale of the Chinese people can be kept up and a breakdown of the national economy avoided.

That the economic front is causing concern has been shown by the Government's decision to stop work in all cotton mills from June 6th to July 21st. Difficulties in importing foreign cotton are mentioned as a contributory factor; but the main cause is held to be hoarding by the cotton growers and a new drive is to be launched for getting them to sell their stocks. In other words, the Communist regime, which in China, more than in any other country, has been carried to power by an agrarian revolution, is now running into difficulties with the peasants, who have come to own the land they cultivate and do not feel inclined to part with their produce when prices are too low and there are no goods for them to buy. Officialdom is certainly doing its best to remedy this state of affairs. There is talk of sending

“cadres” into the countryside and “mobilising the masses,” of the “formation of local committees to promote techniques for different crops and of teams to supervise cotton growing”; Hangchow radio declares that “complacency must be overcome, rumours must be exposed, there must be strict watch against sabotage, and the peasants must be taught to overcome despondency.” Peking might do worse than to consider the measures that Marshal Tito has been taking to deal with the same problem in the villages.

It remains to be seen how far China can adjust its economy for a prolonged war in Korea. Conditions are different from those of the Japanese war; for although China is in some ways better off now than it was then, the war is being waged abroad, and it is harder to arouse patriotic fervour when there is no enemy in the land; economically the very fact that China now holds the centres of urban industry which were formerly in Japanese possession means that the old advantages of primitiveness and local self-sufficiency have largely been lost. Inflation, which was the plague of wartime and postwar Kuomintang China, is again rearing its head, even though it is still relatively under control. The main purpose of the “patriotic pact” drive is probably not so much to pay for aircraft or tanks as to mop up purchasing power and curb inflationary tendencies.

The Only Man

Mr Bevan wants to lead the Labour Party, but he is by no means sure where he wants to lead it. His speech at the Keir Hardie demonstration last weekend was concerned less with policies than with the class origins of Labour leaders. They should be taken, he argued, not from the “top drawer of society” but, in the main, from those who have spent their lives in the Labour movement, “who have come up from below, and who not only understand socialism with their heads but know it with their hearts.” As the *Manchester Guardian* remarked, “the Member for Ebbw Vale obviously qualifies under Mr Bevan's rule, as did Ramsay MacDonald, Philip Snowden and J. H. Thomas.” The attitude behind Mr Bevan's remarks is not, of course, new to him. He was simply extending the line of thought of the “lower than vermin” speech to cover his former Cabinet colleagues, well over a third of whom would certainly not pass the test of having come into socialism “from below.”

Mr Bevan did not develop in this speech any of the ideas being mullered over by the Bevanites in the House of Commons for their promised pamphlet on “The Only Way.” For this task he has the help of the former “Keep Left” group, and the new pamphlet will be to some extent a successor to the two that the group produced during the days of a large Labour majority. It will apparently develop in some detail an argument against the present scale of rearmament, and will urge the full implementation of all promises of further nationalisation. Mr Morgan Phillips, the Secretary of the Labour Party, has made it clear that he for one will not regard this as the enunciation of an heretical Bevanite programme, but the constituency Labour parties and the unions will almost certainly look on it as an alternative to existing policy. And they may be much more attracted by it than the orthodox party leaders at present admit. For that reason it is particularly important, to the public as well as to the Labour Party, that the statement of policy should be clear and detailed. Even Mr Bevan cannot rely for too long simply on his personality. Friends as well as foes have to evaluate the exact nature of his views as well as his ambitions. At present there are Bevanites, but there is no real Bevanism.

Legislation, Present and Future

In the early hours of Wednesday morning members of Parliament reached the end of their long journey through the committee stage of the Finance Bill. The House of

Commons was able to turn its full attention to the Persian crisis, on which a special debate was held on Thursday. After almost 100 hours of debate, the Finance Bill emerged from the committee without any real concessions by the Government, though there were a few changes in the section about income tax avoidance and some modification of the cinema tax may be made on the report stage.

On Wednesday the Lords amendments to the Leasehold Property (Temporary Provisions) Bill were taken—a task which threw a further burden on the indefatigable Attorney-General, Sir Frank Soskice, whose work at the despatch box has earned much admiration from both sides of the House. Though the Leasehold Bill has attracted little public notice it is—apart from the Sea Fish Industry Bill—the only major piece of legislation that has in this session accompanied the Finance Bill and its attendant Health Service and Insurance Bills. But the postponement of other promised measures—those to make the Government's emergency powers permanent and to nationalise the sugar beet industry—has left Mr Chuter Ede with something to put in the King's Speech in the autumn, if Mr Attlee should be determined to carry on for yet another session. Sir Hartley Shawcross's statement on resale price maintenance is also important not only in itself but also for the part it could play in the Parliamentary time table. A Bill forbidding resale price maintenance could give the parties something to bite on next winter, and would be thought by the Labour party to have considerable political value in the country.

Admiral Carney and His Carriers

What is called the problem of the Mediterranean command remains unsolved, even now that the American Admiral Carney has been appointed Commander-in-Chief and commander of naval forces in the southern sector of General Eisenhower's European command. That is in many ways a good thing, because it leaves open the vexed question whether General Eisenhower's southern flank—and the responsibilities of Nato—should extend eastward of Sicily and Malta and the much wider problem of defence organisation for the Middle East which must include at least part of the Mediterranean. The Supreme Commander's Chief of Staff, General Gruenther, has made this clear by describing the new appointment as a “functional assignment,” the function being to bring air and sea power, if needed, to the aid of continental defence in southern Europe.

The choice of Admiral Carney in this role is welcome, both because he is a personality of the Eisenhower type and because of the strength he commands. The US Sixth Fleet, with over 200 aircraft, is probably the most powerful naval force ever assembled in peacetime, with the two 45,000 ton aircraft carriers *Coral Sea* and *Franklin D. Roosevelt*, the smaller carrier *Saipan*, the two large cruisers *Newport News* and *Salen*, and some 13 destroyers. The limits assigned to his role are also welcome because they appear to mean that Washington has, if only for the moment, given up its insistence on placing supreme command of the whole Mediterranean in the hands of an American admiral under General Eisenhower. The argument for Admiral Carney's role is one that is particularly acceptable to British minds because it is similar to, if not identical with, the case for Sir Patrick Brind's appointment as Commander-in-Chief Northern Europe. Both in the North Sea and the central Mediterranean the need is for swift local action in case of aggression; and that can be best taken by mobile, sea-borne air power, the possibilities of which have been closely studied in Korea.

In these latest arrangements the Italians will be pleased that their General de Castiglione is to command southern Europe's land forces, and the French will deduce that the lines of communication with North Africa will be in their care. Malta and Gibraltar remain under British command and it seems that Admiral Carney will rely for supplies and

1492 on Italian ports. Now that the powers-
profit at this time better than one that is strategically ideal,
General Eisenhower can get on with his planning.

£50 Million for Yugoslavia

If the American, British and French governments agree to the recommendations of their advisers, Yugoslavia is to receive a direct grant of £50 million to cover its estimated trade deficit for the period ending June, 1952. The money would be spent on machinery, transport, and other supplies, including some raw materials; and it is expected that the Americans will contribute roughly two-thirds of the grant, the British a quarter and the French an eighth. This is the unanimous conclusion of long and complicated negotiations in London which is now to be put before the governments.

The Yugoslavs hope that this aid would put their economy on a basis sound enough for the International Bank to accept their request for a long-term loan of \$200 million to be invested in basic industrial projects. For their part, the western governments are anxious that the aid should be used in the most constructive and thrifty way and not dissipated on ambitious projects that are beyond the range of Yugoslavia's present economic capacity and administrative skill. This most emphatically does not mean that Marshal Tito is prepared to accept any political and economic conditions tied to the aid.

The question of efficient use is all the more important because it is a grant and not a loan that is proposed. In the past 18 months the Yugoslavs have received from this country loans and credits amounting to £22 million, from the Americans £53 million in the same form, together with £10 million that was mostly expended on food for the army. The present agreement on aid does not include any provision for military aid, which is still under discussion. As its former Communist partners will remember, Yugoslavia has strong bargaining counters in its maize and non-ferrous metals; it has no need to rely on purely strategic and anti-Communist arguments in order to get good terms from the west.

The Commonwealth in the Middle East

On Thursday the defence ministers of certain Commonwealth countries assembled in London for a week's conference. Those represented were Britain, Australia, New Zealand, South Africa and—represented by its Minister of Finance—Southern Rhodesia; Canada sent an observer. Mr Shinwell was in the chair. The meeting is technical rather than political; it is surveying ways and means rather than taking the political decisions necessary to implement them.

Although the conference was decided upon by the Commonwealth Prime Ministers when they were in London last winter, it meets with the situation in Persia and the Middle East more critical than then seemed likely. This is bound to be the main topic of discussion, and it will be the duty of the conference to draw up a clear and concise plan of what is technically possible in the way of Commonwealth military action in the Middle East. With the facts in their hands, the Commonwealth governments must then above all agree how far they can go together. It is not for Britain to act alone, even if the United Kingdom is the first to reinforce the 35,000 troops already there.

A grave weakness of the conference is that Pakistan, India and Ceylon have declined to be present, although both Karachi and Delhi have vital interests in Middle East security; while both recognise that a collapse of the free world's positions in that area would affect them closely, they

refuse to take any action, at least until the Kashmir dispute is settled. It is not too much to ask that they should bear in mind that the positive and energetic association of the Asian members with the rest of the Commonwealth in dealing with Middle Eastern problems might help to reduce the possible need for military action. It is true, as Mr Nehru has often said, that India is militarily weak because of its over-stretched economy; but its influence and that of the biggest Islamic state in the world, Pakistan, could be very great if ranged with the power of their friends.

Wage Claims

The engineers at their annual conference this week decided to modify a claim for an increase of 30s. in the interests of realism, and to ask for £1 a week for all workers. It was only last November that their union gained wage increases for its lower paid and unskilled workers. Its demand is one of the most important in the new round that is following so fast upon last year's awards.

Among the engineers' partners in the Confederation of Shipbuilding and Engineering Unions, the foundry workers are asking for an increase of 20 per cent and the Electrical Trades Union for a "substantial increase." The vehicle builders at their conference in May resolved to ask for an increase of 6d. an hour and an extra week's paid holiday. The bus and motor workers are to ask for an extra 4d. an hour. The unions in the textile trade want an immediate increase of 10 per cent. The boot and shoe operatives have resolved to ask that their minimum wage should be raised by 12s. a week. The police have applied to the Home Secretary for an increase of 14s. in minimum

WEEKLY WAGE RATES AND RETAIL PRICES
(Index numbers, June 1947=100)

rates and of 70s. for sergeants. The laundry workers are asking for an extra 15s. a week. The cinema and theatre workers have staked new claims; and the annual conferences of the railway clerks, the Post Office workers and the tobacco workers all produced resolutions demanding increases so far unspecified.

These claims constitute the second round since wages "thawed" last year. The awards then made are undoubtedly being overtaken by rising prices. The chart shows how the gap between the price and wage indices is beginning to widen again; the May and June figures will widen it more. The Chancellor's intention was, of course, that surplus purchasing power should be partly absorbed by prices rising faster than wage-rates. He naturally has not revealed how large a rise in wages was assumed in making the Budget calculations, and the estimate made in the report of the Economic Commission for Europe—a rise of 7 per cent in average wage cost per unit—is too speculative to help much. But it certainly seems likely that, if they are not upsetting the Government's economic planning, the unions are demanding quite as much as it feared.

Back to de Valera

Mr de Valera was last week restored to the Premiership of Eire by the decision of five of the fourteen independent deputies in the new *Dail*. For them, the risk of dissolution—a weapon Mr de Valera has used so often in the past—was outweighed by their differences with the inter-party government, and the motion for Mr Costello's re-election was lost by 74 votes to 72 in a full House. Dr Browne, who resigned from Mr Costello's government on account of the disputed mother and child welfare scheme, lectured Mr de Valera at some length in the debate and apparently has every intention of keeping him to his published programme. This will be a novel situation indeed—if it arises.

Mr de Valera has taken office without any overt arrangements with these independents. At first sight his majority seems to be exceptionally unreliable, but it should suffice for ordinary business during the next few months. His administration contains the same men who held office under him from 1932 to 1948—some of them shifted to new (and in certain cases unexpected) posts in order to provide variety. His policy, as so far revealed, appears to be a continuation of the main heads of the inter-party programme which, it is now claimed, was itself taken from the pre-1948 *Fianna Fail* policy. The land project (of reclamation, refertilising and drainage) is to be continued, and the possibility of compulsory tillage is scouted. Obviously, Mr de Valera has decided that Mr Dillon is the man he must beat. For the rest, the *Fianna Fail* programme consists of objectives, such as industrial development, that are common form, though it places a heavier emphasis on the need for defensive preparations than would have been the case with the outgoing government.

The similarity of programmes is only another example of the unreality of the present party lines in Dublin. The life of the present *Dail* will probably depend on the degree to which the incoming ministers realise that they cannot simply start from where they left off in 1948. An alternative government now exists, and it is at least possible that it has the support of a majority of the electorate. This advantage might be lost if the parties that composed Mr Costello's government prove factious in opposition; the public is clearly weary of party politics. But the component parties did hold together in office, and a new coalition is still a possibility. These considerations may make Mr de Valera content to preside over a policy of economic and social reconstruction and development. But such matters have not engaged his personal interest in the past, and he is more likely to try to attract public attention to the question of partition, which affords a special opportunity for the exercise of his gifts and aptitudes.

The Battersea Scandal

The story of the Festival Gardens' need for an extra £1,000,000 of public money is a saga of almost unparalleled incompetence, even in state-controlled enterprise. The investigations of two firms of chartered accountants, whose reports were published as a White Paper this week, show that there was failure on three main counts: in starting the work in time, in management, and, to a lesser extent, in control and organisation on the site. Five months passed in discussion before operations on the site were begun in April, 1950, and consequently work which should have been done last summer was overtaken by a very wet winter.

The failure of management lay partly in the composition of the board of the Festival Gardens company. Thirteen part-time members were appointed with Mr Morrison's approval. Many of them were eminent in vaguely relevant walks of life, but none was an accountant or building contractor, and there was difficulty in finding a suitable managing director. The board seem to have had a very indistinct idea of what was going on. A month before they gave Mr Morrison his big shock they had assured him, on the quantity surveyors' advice, that no more public money would

be required. In November decisions were taken informally which were interpreted as a change to "cost plus," and from then onwards the contract was operated on that basis. The managing director did not know, and the finance committee and the board discovered four months later.

The failure on the site arose mainly from the chaotic speeding-up of the work. The labour force was expanded with whatever casual and unskilled labour could be got, and a few whom the contractors had never engaged got on to the pay roll. In one week £500 was paid out in wages over and above the amount represented by hours actually worked. The deadline set for the opening, and the knowledge that the company would do almost anything to avoid strikes, led to very low output. Security regulations were for a long time such that a lorry could be checked in at one gate and drive straight out of another on the pretext that part of its load was for another destination.

In short, the Festival Gardens show clearly what can happen when the state goes into business, when no one is risking his own money and the taxpayer can always be asked for more, and when there is no possibility of unemployment to make the men accept reasonable discipline. If those who planned the Festival had wanted to illustrate the pitfalls of contemporary economic policy they could hardly have produced anything more telling than this performance at Battersea.

The Case for Tshekedi

The unedifying public debate between Mr Gordon Walker and Tshekedi Khama has continued, probably with little satisfaction to either party. For the Commonwealth Relations Office is patently failing to convince; public disquiet, in Parliament and out, has not been allayed; and Tshekedi, firmly insisting that there should be a public inquiry to which he is prepared to submit all his contentions,

Men
who mean
Business read

EVERY DAY

has gained in dignity and respect. The Minister is now justifying the banishment of Tshekedi by the view that he is unpopular with the tribe. In spite of the fact that he has repeatedly announced his renunciation of the chieftainship, it is still feared by the Minister that, if he returned, he would "make himself chief" or otherwise secure power, and revenge himself on his opponents. This would lead to disorder. Further, progress towards setting up more representative native councils was being delayed by the fear that Tshekedi would return. Any new inquiry would arouse doubts and fears and set back "perhaps irrecoverably" the development of a more representative native authority. "To put the whole thing in a nutshell," said Mr Gordon Walker, "a choice had to be made between a man's private rights and the public good of the tribe." This is a characteristically Socialist way of putting the issue.

To this Tshekedi has made the obvious retort. If he is so unpopular with the tribesmen, how could he work his way back to the chieftaincy, which he has renounced? How could he wreak vengeance if the great majority are against him, "unless the Minister is suggesting that I may have criminal intentions"? And how do these attacks on his public record tally with the Minister's offer to Tshekedi of the responsible position of economic adviser to the Government of the Protectorate—the offer which he refused because he was not allowed access to half the tribal areas?

No proof has been given that Tshekedi's rights are incompatible with the public good of the tribe. There have been assertions that tribal councils could not develop if he were there, but it is also known that these councils have not progressed even in the year of his banishment. And, even if everything said about Tshekedi were true, what, other than political considerations more complicated than any openly mentioned, could account for Seretse's continued banishment as well? Unless there is an inquiry, it will be impossible to eradicate the many suspicions about British policy that this affair has already aroused.

* * *

Advice from M. Monnet

M. Monnet's office issued, just before the elections, a further report on the progress of France's modernisation and equipment plan. The report, like its predecessors, traces the economic regeneration of the nation since the last war. In four years its economy has emerged from sheer ruin and is now well on the road to recovering the competitive status which it lost in 1913.

TRENDS IN PRODUCTION AND TRADE
(Index Numbers: 1938=100)

	1946	1950	1951 (1st quarter)
Production:—			
Power.....	101	132	148
Industry	79	123	138
Agriculture	88	108	...
Productivity.....	78	100	...
Foreign Trade:—			
imports*	115	105	108
exports*	50	174	213

* Foreign plus overseas territories.

The report, however, stresses the need to extend the modernisation already effected in basic sectors (barrages, oil refineries, steel works, railways) to manufacturing industries, which are still weak. These industries, which have a low ratio of investment to turnover, normally fall outside the orbit of the modernisation fund; with them, therefore, it is the management itself which must stimulate the necessary equipment and rationalisation of factories. It is remarked that these producers of consumption goods bear the responsibility of combating the inflation which rearmament now threatens to cause. Much also has been done to help French productivity by the ECA mission, which has already sent 70 teams of French specialists for training in America.

The \$2,300 million that France has received during the three years of Marshall Aid has indeed transformed most of its basic industries except agriculture, which, in spite of the employment of five times the prewar number of tractors, still shows a very low productivity. But the chief national economic scourges have little to do with production: they are the appalling housing shortage and the anarchic system of distribution, upon which evils planning agencies make very little impression. The *commissariat général du plan*, which acts as a kind of hospital nurse to the sickly coalitions that govern France, owes its real but limited efficacy simply to the fact that, as the authorised channel of American gifts, it cannot be "got at" by partisans in the Assembly. What it could achieve if ever there were a real government in France would certainly be tremendous. The French economy cannot ultimately progress unless the nationalised industries, notably the railways, are purged, agricultural holdings consolidated, the fiscal system overhauled and unless, above all, the state recovers its credit. At a given stage in industrial evolution the prosperity of the man-in-the-street is as much linked to the administrative technique of a country as it is dependent upon improvements in productivity. The report, however, concludes with the belief that the single enlarged competitive market, which is the objective of the Schuman Plan, will "cause the elimination of monopolies which hinder the participation of the workers in the real resources of the collectivity." If the Pflimlin Plan can ensure a cheaper supply to the workers of meat, vegetables and dairy produce it will also be extremely useful.

Geneva Tourney

Every year the question arises: what shall it profit the delegates of governments in Western and Eastern Europe if they meet in Geneva, under the auspices of the Economic Commission for Europe, to exchange views and abuse? The arguments for and against this expensive tourney of officials and economists remain much the same as they were. The sixth session that ended on June 13th produced some very tedious orations on warmongering by delegates under the leadership of the tireless Russian Mr Arutiunian; some factual but colourless speeches from their western rivals; and some unexpectedly firm chairmanship from Mrs Karen Koch of Sweden, who did not allow the indictment against "American exploitation" of Europe to unroll its whole spiteful length. But it also produced a general feeling that good work was being done by technical committees—although they, too, were accused of being dragged along by the western war chariot—and that ECE should unanimously recommend to its master, the Economic and Social Council of Uno, a continuation of its work.

Those from east of the Elbe were anxious to revive the moribund committees of manpower to deal with unemployment, of agriculture to assist small and medium farmers, of trade to encourage the expansion of east-west trade; but their refusal to give adequate information about their own problems threw into relief their eagerness to display all the skeletons in the western cupboard. There is still no basis for co-operation here; if there were, much more could be learned of the methods by which Moscow co-ordinates the economic activities of the satellites through the mighty but mysterious Comecon. Among the pieces of solid work which are to the credit of ECE, and which no other body would be likely to undertake, are the following: the working party which has been pegging away at the scheme for complete coal classification for Europe, and which could not work without Polish co-operation; the work of the Transport Committee on rail tariffs, simplified customs formalities for goods and passengers, technical identification of rolling stock and the movement of perishable foodstuffs; the preparation, by the Industry and Materials Committee, of a glossary of machine tools, which has been welcomed even by the sceptical British. There is, too, still some hope of working

for increased east-west trade in grains. It is fair to add that the annual survey and the quarterly bulletins are documents of merit and usefulness. The bridge between east and west that Geneva still provides has been held by the personal faith of the Executive Secretary, Mr Myrdal; and there is some value in enabling Communists to emerge from behind the iron curtain and breathe the air of the free world. There is always the possibility that someone may settle in Switzerland, like Lenin.

Industry and Civil Defence

There is nothing either drastic or unfamiliar in the advice to industry on civil defence that was put out last week by the Home Office.* Having dealt frankly and soberly with the special risks of atomic warfare in pamphlet No. 6 of their "Manual of Basic Training," the authorities doubtless felt that it would be sufficient to draw the attention of all establishments with over 200 workers to the need for certain basic steps: appointment of a civil defence officer, formation of warden and rescue sections, recruitment of fire guards and first-aid specialists in case of war, and the forming of links with the local authorities in charge of air raid precautions.

These things should be started as quickly as possible, not because war is any more likely now than it was when the instructions were drafted, but because civil defence will not be taken seriously by the population until efficient cadres for it exist in what are obviously target areas. Even when they are trained and active for all to see, there will remain an immense amount to be done before civil defence has found its proper place in normal life under cold war conditions. Fortunately a useful body of doctrine and experience has been built up at the Civil Defence Staff College, and it is gradually percolating downwards. But until industry gives serious attention to the old dangers of blast, fire and personal injury, and the new dangers of atomic devastation, it will be difficult for the local authorities and the area controllers above them to get a real grip on their work. And it is certain that recruitment for civil defence will be much affected by the way in which the local difficulties are put by managements to the employees.

The chief obstacles to be overcome are ignorance and reluctance to face the facts of this dangerous world. The former can be tackled by the trained men and women of Civil Defence, provided that they are briefed to meet the arguments, questions and objections that will be put by the sincere as well as the mischievous listener. The latter is a job for the politicians. It is true that Mr Chuter Ede says in a foreword to this pamphlet that "while civil defence alone could not win a war, the lack of such defence could lose it"; but he needs rather firmer backing from his colleagues on the public platform.

Doctors' Earnings

A new stage has been reached in the three-year-old struggle between the Ministry of Health and the general practitioners about the amount of their remuneration. In February the Minister of Health stated that there was a good case for reviewing, "as a matter of urgency," the total amount of public money allocated to the general practitioner service and its distribution among individual doctors. Since then the Budget has been presented, and an undertaking has been given that the total expenditure on the health service should not exceed £400 million. Mr Marquand, the Minister of Health, has accordingly changed his tune. The emphasis, in his proposal to set up a working party,

* Civil Defence Industrial Bulletin No. 1. HMSO, 6d.

is on redistributing the central pool of money rather than on increasing the size of the pool. The Minister has not ruled out the possibility of additional public money being granted; but he has made it clear that it would be forthcoming only on three conditions: that the working party would reach agreement on satisfactory methods of distribution aimed at securing certain specified objects; that steps would be taken to stop extravagance in prescribing; and that it was understood that the amount of new money could not exceed £2,000,000 a year—the balance between this year's estimate for the cost of the health service and the limit of £400 million.

The doctors' representatives are fully justified in refusing this proposal for a working party and in asking that the amount of their remuneration should be settled by arbitration. They want their claim to a bigger central pool to be considered on its merits and not subject to conditions. They are not, it should be emphasised, asking for an increase on a previously accepted rate of pay. They have never agreed that the Spens Committee's recommendations were being properly applied because, for one thing, the Ministry of Health has refused to add more than 20 per cent to bring the Spens scale of earnings into line with the rise in the cost of living since 1939.

It is quite true that a realistic interpretation of the Spens Committee's proposals might well involve an addition to the central pool of more than £2,000,000. If so, then it is up to the Ministry of Health to find the necessary economies elsewhere in the health service. The doctors ought not to be placed in the invidious position of having to refuse prescriptions in order to earn their higher capita-

A Patient Animal

John Bull is beyond parallel the most patient and passive of European animals. The amount of injustice, oppression, and maltreatment he will endure—not indeed without grumbling, but without going mad about it . . . is something quite incredible. Severe suffering and indefensible anomalies, he appears to consider, within certain very liberal limits, as his normal condition, his appointed lot, his natural inheritance. When these limits are passed he rouses himself to resentment and revolt, throws off the burden by an easy effort, looks back with wonder on his long endurance, and relapses again into his old indifference. Such is ever the way with our lazy, good-natured, unvigilant countrymen. No evil is ever remedied till it becomes too grievous to be borne. No abuse is ever rectified till it has reached its climax, and sown all its seeds of mischief. No danger is ever provided against till it has become the pressing and peculiar danger of the hour. In this national tardiness there is, undoubtedly, some advantage; but there is also much peril and much loss. We redress no imaginary wrongs. We appear to hold with Mr Burke that "it is no inconsiderable part of wisdom to know how much of an evil ought to be tolerated." But we endure burdens which an effort—almost a resolution—might remove. We bear much for centuries, which ought never to have been borne for an hour. We have another marked national characteristic, to which may perhaps be ascribed much of our success in political practice. We are singularly deliberate in our proceedings. We have a strong predilection for doing one thing at a time. We dispatch one practical evil before we attack another. If we find our shoe is too tight, we do not alter its entire shape, or make a new one, but we cut a hole above the oppressed and irritated corn. If our coat is inconvenient or worn-out in any quarter, we rip up a seam, or sew on a patch. Our whole legislation is a series of ingenious and short-sighted expedients *pro re nata*.

The Economist

June 21, 1851

tion fee. The blame for the extravagant administration of the health service, which has made the limit of £400 million necessary, ought not to be shifted from where it squarely rests—on the Ministry's shoulders.

* * *

Row About Milk Prices

Dissatisfaction with the reduced profitability of milk production was strongly expressed at the annual general meeting of the Milk Marketing Board last week. Many delegates argued that production would decline during the coming year, and Mr Hinds, the chairman, urged that the proper policy was one of continuous expansion. He pointed out that nutritionists said that the consumer needed one pint of milk a day instead of the three-quarters of a pint he is now getting. He supported the view of one speaker that the board should cut itself free from "the octopus of the Ministry of Food" and should retrieve its own marketing powers.

The indignation of farmers, especially those in remote areas, who since the war have invested much capital in dairying and now find their profits cut, is understandable. But it would seem that the board is living in cloud cuckoo-land. Milk is in fact the one food for which nutritional standards have improved enormously since prewar days, and the liquid milk market is now absorbing nearly double the prewar quantity. No doubt a further increase would be "nutritionally desirable." But man cannot live by milk alone, and many other foods (unlike milk) are in short supply.

Milk production has in fact more than kept pace with consumers' demand, as is shown by the fact that, although now unrationed, it requires an annual subsidy of £72 million (exclusive of the welfare schemes). The public today, whatever may be nutritionally "best" for it, would much prefer more meat to more milk. The Government, at the last price review, slightly reduced the differential advantage of milk production as a means (the only one open to it) of persuading farmers to produce more meat. Probably this step should have been taken two years ago, before so many high-cost milk producers entered the field. If the result now should be a slight fall in liquid milk supply (which is very far from proven), then the proper remedy is to raise the retail price slightly in the winter months, when production costs are high. This would avoid any danger of a return to rationing. Mr Hinds wants to cut free from government control. If his board can successfully market present supplies of milk without the aid of a large public subsidy, there is every reason for letting it do so.

* * *

Reactions to Federation

The first public reactions to the proposed federation of the Rhodesias and Nyasaland have naturally come from the Europeans. On the whole, their opinion is cautiously favourable. No one is likely to commit himself to a whole-hearted acceptance of the scheme as it stands, but the general view appears to be that it provides a good basis for dis-

cussion. In Southern Rhodesia, however, it has been pointed out that if federation were adopted the colony's claim to full dominion status, which is one of the planks in the Opposition's platform, would be indefinitely postponed.

It is too soon for African opinion as a whole to have expressed itself. It can be taken for granted that those Africans who had rejected in advance any idea of federation have not changed their attitude one jot now that the proposals are known in full. They will refuse, that is, to consider the scheme even as a basis for discussion. Much more important is the attitude to be adopted by the native authorities and the advisory African councils. Their opinion is not likely to be known for some time, but it is perhaps a fair guess that the more favourable the reactions of the Europeans the more suspicious of the scheme they themselves are likely to be.

In this connection Dr Malan's comments on the proposed federation are significant. He said that, while offering no opinion on the merits of the scheme, he deplored the attempts being made to persuade people into federation by stirring up fears of South Africa. Yet the truth is that the only real reason for putting forward the scheme now is political. An article on page 1510 shows how unconvincing are the economic arguments for federation. What Africans and Europeans in Central Africa have to decide is whether their fears of South Africa's native policy spreading northwards outweigh their suspicions and dislike of each other. If so, then they should consider the scheme on its merits or put forward some practicable alternative.

* * *

Colonial Universities

In this country the postwar appetite for increased numbers of university students has been at least temporarily satisfied. The latest report of the Inter-University Council for Higher Education in the Colonies* shows how different is the situation there. In the three universities and five university colleges scattered over the territories of Malta, Hong Kong, Malaya, the West Indies, Gold Coast, Nigeria, East Africa and the Sudan, there are now 3,000 full-time university students. With a population of over 70 million this gives a ratio of nearly 1 to 25,000: in Great Britain the ratio is about 1 to 600.

Such a disparity is not surprising, but it emphasises the additional problem of space in the colonial universities that is likely to arise in the coming year. The report states that the new minimum requirements for entrance to universities in the United Kingdom will mean that few colonial students will qualify, whereas in 1950-51 some 1,800 were studying here; the pressure on the local universities will therefore increase.

Two of the limitations to the expansion of the colonial institutions—the shortage of qualified staff and of buildings—are familiar enough in this country. But British arguments about whether university standards have been maintained since the war become insignificant when set beside the difficulties of the colonies. For this reason the University of London, which has assumed a special responsibility towards the colonial university colleges, has secured the adoption of special local arrangements: where the local educational system make it necessary to arrange lower entrance standards, the university course is suitably prolonged. But this solution has its own difficulties. Who is to finance the extra expense of the longer course? Here again is the repetition of a problem already familiar in Great Britain. The colonies need money to cover schemes of this kind, but the £6 million for university work available up to 1956, under the Colonial Development and Welfare Act, is already almost wholly committed. Without more money, progress must continue only slowly; it is desperately needed.

Letters to the Editor

Lebanon at the Polls

Sir,—I am sending you herewith the translation of part of an editorial published in the Lebanese daily newspaper *Le Jour* of Beirut in its issue of May 29, 1951, criticising your surprising report on the Lebanese elections, which appeared in your issue of April 28th.

We quote (from *The Economist*) only what calls for our personal testimony and what can be refuted *par l'absurde*. . . . Everyone knows how long we had to fight to move the chamber to vote even the partial modification of the electoral law and to augment the number of deputies. . . . The truth is that the President of the Lebanon Republic was unfavourable to the increase of the number of deputies and it took a strenuous effort to convince him. We loudly testify to this. Is it not evident, also, that the less numerous the deputies the easier it becomes for the Executive power, and above all the President of the Republic, to satisfy them if he desires to do so.

In a following paragraph, *The Economist* writes, "The country was divided into nine electoral divisions and the Government began the work of compiling a list of thirteen candidates for each division." How does *The Economist* (for which the figures are so important) make up its account? Nine electoral divisions with thirteen deputies each would give a total of 117 deputies. Actually, there are only 77. *Ab uno disce omnes*.

I like to add that *The Economist* is widely read and highly esteemed in Beirut. Such inaccurate information as that found in your report can only lower its prestige.—Yours faithfully,

MANSOUR CHALLITA

Beirut

[The campaign for more deputies was begun in June, 1950, by a Christian leader, Mr Henry Bey Pharaon. It was supported by the National Bloc (Christian) but opposed by the leaders of the electoral districts in which Shiah Moslems predominate. The difficulty was solved by a compromise acceptable to the President in which the electoral districts which previously returned over 15 deputies were divided; those returning less (as did the two predominantly Moslem districts mentioned) remained as they stood. The *Bloc National* were in the end dissatisfied with this compromise since it returned fewer Maronites than formerly. *The Economist* regrets and withdraws its statement that the initiative for creating a larger chamber was the President's.

The calculation also quoted by *Le Jour* was wrong because the figure of 13 candidates was incorrect. The number of candidates for each of the nine divisions varies according to the size of the districts. In the largest it is 14 and in the smallest only four.—EDITOR.]

Breach of Banking Secrecy

Sir,—Your correspondent, Mr Peter R. Daish, has given an inaccurate impression by his letter to you in your issue of May 26th. The position is that the requirement placed upon trustee savings banks to render a return of depositors

receiving interest amounting to £15 or more is confined to the special investment departments of trustee savings banks, which constitute only a very small part of their business.

Since the inception of trustee savings banks over one hundred and forty years ago, no such return has been required by law as to depositors in the ordinary department, which constitutes more than three-quarters of the business of the trustee savings banks, whose combined funds now exceed £1,000 million.—Yours faithfully,

F. E. HARVEY,
Assistant Secretary

Trustee Savings Banks
Association, W.C.1

Economic Glossary

Sir,—Would you be very kind and define, or if necessary again invent, a few terms. There is already a debt to *The Economist* for the distinctive antonyms: deflation-reflation, inflation-disinflation. Now: devaluation-revaluation (?), appreciation-disappreciation (?). Or should "revaluation" be kept for all changes, up or down, in external currency values (a convenience to non-committal Chancellors wary of informative denials) and the two pairs merged into "devaluation-appreciation"? This might be the better course: the long-term "equilibrium" exchange rate, even with free currencies, would be a concept far more arbitrary than that of "just full employment" (which I take to represent the hyphens in the first two pairs above) and the use of the correct term might depend ultimately upon historical precedent.—Yours faithfully,

STANLEY ALDERSON

London, N.W.8

[As we understand the usage of the day, which is rather arbitrary, devaluation and revaluation imply the determination of a new fixed parity for a currency, lower in the former case and higher in the latter. Depreciation and appreciation imply a fall or rise in exchange value without the fixation of new parities. We have never seen "disappreciation," but it might be useful, on the analogy of disinflation, to describe a movement which, while downward in direction, was regarded as being merely the correction of a previous excessive rise.—EDITOR.]

The Floating Penny

Sir,—In your issue of May 19th you comment very fairly on the increasing burden of taxation borne by the cinema industry, pointing out that our income is only 40 per cent higher than before the war although our costs have probably more than doubled. In truth many of our costs are four times greater than in 1939.

It is not so fair, however, to suggest that the industry has suddenly decided that it needs an extra penny per seat from the cinemagoer. Our needs are the same whether the Chancellor proposes to increase seat prices by 3d. or 3s. each. We would still need a minimum of an extra penny to help cope with the ever

rising spiral of wages and other operating costs in this inflationary period.

The industry is as much against higher prices as it has ever been. We say that if we were fairly taxed, being called upon to bear an equal burden to that of other forms of entertainment, the exhibitor would get a fair recompense and the cinemagoers would get their entertainment at a lower cost.—Yours faithfully,

H. P. E. MEARS
President

Cinematograph Exhibitors'
Association, W.C.2

The Obsequies of Copartnership

Sir,—In your Note in your issue of June 2nd you state that

There is obviously no room for profit sharing in an industry whose governing directive is to break even, taking one year with another.

I would suggest that this statement is incorrect. If in such an industry as you suggest the directors decide that a certain project will cost £5,000 and the workers by increased output lower the costs to £4,500, then the saving of £500 may be proportionately divided between the workers and the industry (i.e., the public in nationalised concerns). In this case public money is saved and the workers still share in the "profits."

I acknowledge that to prevent exploitation of the employees, workers' representation on the managing boards is essential, but such schemes have been suggested for establishments like H.M. Dockyards and I believe are capable of application.—Yours faithfully,

DAVID MORRIS

University College, Exeter

The British Universities

Sir,—Your recent articles prompt me to draw attention to the most tragic neglect of which the British universities are guilty: the neglect of sociology. It seems that the nation which contributed so much to other fields of learning is determined, misguided by obscurantist traditionalism, to remain shockingly backward in this field. Indeed, in the number of works on sociology published between the two wars, Britain stands far behind countries so severely handicapped as Poland and Czechoslovakia. In comparison with France, Germany and the United States (though there the quality does not match the quantity), Britain is unbelievably backward. Of all European nations, except the few smallest, only Russia (and now its victims) stand behind Britain in this respect. It appears that the blind conservatism of the British universities is almost as successful in stifling sociology in Britain as is the Stalinist police in the Soviet Empire.—Yours faithfully,

STANISLAW ANDRZEJEWSKI

Rhodes University,
Grahamstown, South Africa

Books and Publications

Inter-Allied Co-operation

Calculated Risk. By General Mark Clark. G. Harrap. 478 pages. 22s. 6d.

General Mark Clark, who has now added his contribution to the lengthy shelf of American war memoirs, had a wider experience in the last war of the thorny task of leading a mixed Allied army than any other American commander except General Eisenhower himself. In these times when the technique of conducting a successful alliance is once again of paramount importance it is inevitable that this aspect of his book should hold one's attention, rather than his views on past strategy.

Not, however, that General Clark has set out to write a text book on inter-allied co-operation. These are essentially the personal reminiscences of a man whom President Roosevelt once described as a "staunch fighting commander." Primarily he is concerned with the story of his war experiences. His comments on the problems of the Allied armies have a secondary place.

The greater part of his book is concerned with his Italian campaign, though he has an important section on the North African invasion and the Darian deal. The planning for this invasion brought him at an early stage up against those differences in military method which, more than any clashes of personalities or of national habits, formed—and still form—the central problem in Anglo-American co-operation in the field. The Americans disliked the British technique of planning in conferences, preferring their own method under which the commander summons his subordinates and advisers singly or in groups and then formulates his final plan—though General Clark comments somewhat sourly that the British ways are now seeping into the American Army. The British for their part found the American system of command too rigid—indeed, one of General Clark's own battles in Italy, the Rapido crossing, has been the subject of strong British criticism on this score.

In his efforts to smooth out these difficulties General Eisenhower, in General Clark's opinion, "perhaps overdid his efforts to avoid showing any partiality towards the Americans in his desire to be objective and promote harmony." Yet the possibilities for Anglo-American misunderstanding even on unessential matters were so manifold that some such action was essential. Students of national *mores* will, for instance, find a fascinating contrast between the strictness of British mess etiquette and one scene which General Clark describes at his headquarters, when his birthday was marked by two Red Cross girls who arrived wearing Western Union telegraph signs and sang "Happy Birthday to You."

On the major strategic issues of the Mediterranean campaign the difficulties were however eased by the fact that General Clark was in agreement with

the London rather than the Washington school of thought, a fact partly due to his respect for Mr Churchill, whom he regarded as the greatest man he had ever met. Clark for instance backed an attack into the Balkans, a plan which was rejected, he argues, largely owing to Harry Hopkins's opposition. He resisted the withdrawal of troops from Italy for the invasion of Southern France at the moment, after the fall of Rome, when the final defeat of Kesselring seemed possible. And, like his British colleagues, he chafed at the limitations on ammunition and reinforcements which forced the Allies to halt their offensive amid the Apennines.

Mark Clark's disagreements with the British were chiefly on tactical issues, but they were none the less vigorous for that. He writes of these disputes outspokenly but without that rancour which mars so many other American war memoirs. He says that his disagreements with British commanders were very real and very important, but adds that they should not "overshadow the routine of friendly collaboration which went on day after day and which was such a paramount contribution to victory." Only occasionally does he permit himself an outburst of exasperation, as when he noted in his diary once that he was "about ready to agree with Napoleon's conclusion that it is better to fight allies than be one of them."

Yet it is not the extent of inter-allied friction so much as the degree to which it was limited and controlled which stands out from this tale. This was aided, of course, by the fact that the Allies were able to maintain the offensive throughout the Italian fighting. At no time was the alliance tested in retreat. Moreover at the head of their Mediterranean forces, arbitrating between half a dozen generals each as aggressive and obdurate as General Clark, was Field Marshal Alexander, whose skill at holding his team together was almost as great as that of Eisenhower. But the most potent unifying force of all was undoubtedly the mutual trust engendered by months of facing and overcoming difficulties in common. It is in its study of this process that lies the chief value of this book.

The Totalitarian Challenge

The Burden of Our Time. By Hannah Arendt. Secker and Warburg. 477 pages. 30s.

For anyone who wishes to penetrate beneath the surface of events in this age and comprehend the deeper process of history in which all mankind is involved *The Burden of Our Time* is certainly a very important book. It is a serious and extremely intelligent effort to discover what has really happened to the world in the last two decades. It is not easy

going for a British reader, for it is heavily loaded with the kind of deductive, theoretical reasoning which our habitual empiricism always tends to reject, and sometimes indeed the philosophical superstructure appears to lack a sufficient support of historical fact. Nevertheless, the present situation of mankind is one which requires a very rigorous examination of basic categories of thought about society and human nature, for it is becoming increasingly evident that the phenomena of totalitarianism represent something new in human history; they are indeed a progress—a progress not in human virtue or welfare, but in diabolism.

In essentials the theme of *The Burden of Our Time* is the same as that fictionally presented in the late George Orwell's "1984." The author finds the essence of totalitarianism, in both its Nazi and Communist forms, to lie in the "deliberate de-humanisation of humanity." This can in our age be carried further than was ever before possible because of the new technical means of propaganda and terror, and the appetite for unlimited power has grown with the capacity for attaining it. Totalitarian power is something different from old-fashioned monarchical autocracy and even from ordinary dictatorship; it involves control of the whole life of the individual, and in order that all obstructions to its operation may be eliminated, human beings must be systematically corrupted and brutalised. It is the success which totalitarian regimes have had in destroying the moral sense of ordinary people that is the most horrifying feature of the new despotism. The author, however, is not content to analyse the political systems of Hitler and Stalin; she goes back into the nineteenth century to trace tendencies which have only found their consummation in the contemporary age. She has a very interesting section on antisemitism, showing that it was international at an early stage of its development, and analyses the Dreyfus affair as a "dress rehearsal for the performance of our time." She has another section (rather less successful because she is dealing with phenomena remoter from her own experience) on imperialism, which in its extreme form she holds to be a tendency destructive of the nation-state from which it emanates and committed either to collapse or to expansion without limit.

Dr Arendt makes the penetrating comment that "totalitarianism became this century's curse only because it so terrifyingly took care of its problems." She believes that it is only in the spiritual sphere that it can really be overcome, and that the task of the century is "to create—not merely discover—a new foundation for human community as such." If her prescription for doing this is left somewhat vague, she has certainly contributed to the awareness of such a need by the appalling, yet only too true, portrait of "our time" which she has painted.

American Conservation

Water, Land, and People. By Bernard Frank and Anthony Netboy. Knopf, New York. 331 pages. \$4.00.

Conservation of Natural Resources. Edited by Guy-Harold Smith. John Wiley, New York. Chapman and Hall, London. 552 pages. 48s.

In America books on conservation appear with the regularity of those books by clerks or company directors who go Back to the Land in this country, and possibly find their sales through similar emotional needs of city dwellers. In the first and more "popular" of these two books Mr Frank and Mr Netboy are concerned primarily with the water resources of the USA, which like this country suffers from an infuriating alternation of drought and floods. In addition the USA has problems unknown in this country: in nearly all states west of a line from central Texas to central North Dakota water is not even nominally a ubiquitous commodity. The authors state their attitude quite clearly: "in the final analysis, water problems are land problems," which can be solved only as part of a general programme of soil conservation on the watersheds. Unfortunately this means that much of the book is taken up with problems of soil erosion and watershed protection which have been treated elsewhere, adding little material that is actually new.

The most interesting sections are those which criticise the various existing methods of soil and water conservation and the confusing number of US departments and agencies responsible for them. While recognising the good work of TVA, the authors are critical of dam building as a panacea for flooding. They rightly point out that each dam involves an inevitable cost in drowned fields, displaced population, disturbed fishing and ruined amenities, while the reservoir is liable to rapid silting without watershed protection by soil conservation. Even the agencies with a "land" approach to water problems, which are favoured by the authors, do not escape criticism. In particular, there is support for the allegation that subsidy payments to farmers under the Agricultural Conservation Programme have not resulted in an

appropriate increase in standards of cultivation. "There is little supervision or inspection of the practices for which conservation payments are made," while "many of the practices eligible for payments should be undertaken by farmers without a *quid pro quo*," as part of normal farming practice.

The authors close with an appeal for the planning of rural land use. This is also one of the themes of Mr Guy-Harold Smith's beautifully produced volume, in which twenty authorities write on the conservation of the United States' various resources. The various sections range from soils, agriculture and forestry through water to minerals and even wild life and recreation, and should be of considerable interest to the student of United States economic conditions. Where perhaps the book fails is in the relation of conservation to the total economic life of the country. Nobody can dispute that measures against soil erosion are necessary, and in fact some of the restrictions demanded have for centuries been normal practice in Western Europe. The fact that immediate individual advantage may conflict with the general good can also not be denied: the silt from one man's eroding land may choke a city's reservoir. The call for control of land use is therefore understandable. What is disappointing is that writers who see clearly that the various problems of soil, water and plant life are physically interdependent do not also appreciate that they cannot be treated in economic isolation. There are other resources than land which are limited at any one time: conservation is not exempt from opportunity-cost.

Proportional Representation

Europe Between Democracy and Anarchy. By Ferdinand A. Hermens. University of Notre Dame. 291 pages \$4.00.

Professor Hermens is worried by the common accusation that democracy stifles leadership and he admits much in the accusation. He maintains that modern democracy was born out of a spirit of negation, inasmuch as it originated in opposition to absolutism.

(But is opposition the same as negation? Did the revolutionaries deny Louis XVI his head or did they cut it off?) Yet, says Professor Hermens, there is no reason why leadership and authority should not exist in a democracy without perverting it into dictatorship. Democracy need not be negative. The fact that it has been so must largely be laid at the door of Proportional Representation. The alarming title of this book conceals a strong attack on all forms of PR.

The need for such an attack is not obvious in England, where PR has relatively few adherents. But Great Britain has had a full share of responsibility for introducing PR in other countries after both world wars and it accordingly behoves us to consider carefully Professor Hermens's main arguments, which are: that PR benefited and benefits communists and fascists; that in consequence the democrats in the centre (for whom poor *Signor Facta* stands as the *reductio ad absurdum*) are reduced to impotence—in other words, to mere negative democracy; and that PR encourages and assists narrow political sectarianism and the election from party lists of deputies more conspicuous for the interests that they represent than for their native talents. He might have added that an electoral system in a democracy must not only be simple but also appear simple. Professor Hermens's case is a strong one and he demolishes with gusto the favourite examples of the partisans of PR.

His book is divided into two parts, separated by the Second World War. It is a pity that in the first part he is sometimes tempted into generalisations which give an air of hurried compilation and inadequate scholarship. The second part of the book contains a useful survey of party politics in France, Italy, Germany and Austria (and also, briefly, in Turkey, Israel, India and Japan) in the last six years, but one can still read this book and remain vague about the meaning of "positive democracy." In a brief concluding statement Professor Hermens argues that the USA must give the lead which will induce European democracy to become positive, and he calls this a political Marshall Plan. Perhaps one day he will elaborate this idea.

London, East and West

East London. By R. Sinclair. Robert Hale. 416 pages. 15s.

West of the Bars. By D. Newton. Robert Hale. 330 pages. 15s.

Of the books in the *County Books* series covering London, Mr Sinclair's is so far much the best. He is in sympathy with East London and is interested in the human and sociological features of its development as well as in its famous and infamous buildings. His book is therefore much more than a visitor's guide. The sequence into which he has chosen to put his material is a reflection of this attitude. The descriptions of notable places comes last as he takes his visitor on a series of perambulations round his area. The two preceding sections are concerned with the causes and character of the blight which has settled in the inner ring of boroughs, usually known as the "East End", and the migration to respectability in the outer ring in Essex, to Walthamstow, Woodford, Ilford, Leyton and Barking. A million and a half people live in this huge area, which ranges from the worst slums to middle-class prosperity.

Mr Sinclair conveys his atmosphere best in the seamy streets of Stepney, Poplar, Bethnal Green, Shoreditch and West Ham. His most interesting theme is the degeneration and evacuation of the five poorest boroughs of East London, an evacuation accentuated but not caused by the war. After 1918, the population of this inner area was 930,000; by 1938, it had fallen to 740,000. By 1947, when all evacuees who intended to return had done so, it was 450,000. For centuries, East London has collected the economic sediment of London, and although since 1945 this process of silting has ceased, its effects remain—a heritage of social isolation and cultural privation. The "enforcement of a social pale round inner London has had the terrible effect of creating stagnant pools of population in the poorest spots."

One bee buzzes persistently in Mr Sinclair's bonnet. He attributes much of the final degeneration of East London to the charitable and zealous activities of those who descended from higher social circles to do good to the East End, by attempting to save his soul or his body in churches, settlements or soup kitchens. His accusation is that these missionaries never mixed on equal terms, rarely attempted to make the East End their home, never shed their separateness. As a result their charity undermined the East-Enders' self-respect. This view is perhaps exaggerated: nevertheless, there is enough truth in it to be uncomfortable.

In "West of the Bars," Mr Newton covers Westminster and the West End, Bloomsbury, Belgravia and Kensington. His account is too often anecdotal, adjectival and patchy, but every now and then he brings a place or person alive. With the ability to do this, it is a pity he did not omit half of the detail and concentrate on a selected number of places and stories. Some of his vignettes are excellent, particularly those of women

—such as Henrietta Maria, Queen Anne or Queen Victoria; the readers could have done with more of them. As it is, there is too little about too much, and the only theme which stands out is the advancing human and brick tide that flowed out from the city's bars. Mr Newton follows this growth as the pattern of his book, and this gives it form.

Welfare Economics

Social Economy and the Price System.

An Essay in Welfare Economics. By Raymond T. Bye. Macmillan. 356 pages. 26s.

Modern welfare economists generally fall into one of two categories. In one group are those who maintain, by increasingly subtle philosophical arguments, that the economist, as a scientist, can make no firm statements whatever about economic welfare; in the other group are those who apply the elegant structure of modern economic theory to welfare problems with a bolder disregard for philosophical difficulties than their Pigovian predecessors would have sanctioned. As a result of this division, modern welfare economics is split in two.

Professor Bye fits into neither category; the pre-eminent characteristic of his essay on the welfare functions of the price system is a sturdy common sense, distinguished by more familiarity with the real world than is common among welfare economists. Except for certain reservations on the score of

individual liberty, he has no doubt that, as an economist, he can establish a complete set of welfare criteria; but he deduces them, in his first chapter, from the requirements of group survival, and he applies them, in the remainder of the book, to the price system as it functions in reality. Where he makes recommendations for reform, he keeps his eyes firmly on their legislative and political practicability.

Professor Bye writes at textbook pace, and with a textbook's self-assurance. Some of his ideas bear a large "Made in America" label, particularly his notion that the elimination of fractional reserve banking would solve almost all monetary problems. On the whole, however, his essay is a breath of fresh air in what has tended to become a rather stuffy desert.

Shorter Notice

Proceedings of the Seventh International Conference of Agricultural Economists. Geoffrey Cumberlege, OUP. 372 pages. 25s.

This book is of considerable interest to anyone interested in the economic problems and prospects of agriculture. The papers cover a wide variety of subjects affecting different parts of the world, such as problems of peasant farming, agricultural co-operation, and the spread of industry in rural areas. There are interesting papers on the machinery of forward price-fixing in British agriculture and on farm prices in the US. The conference took place in August, 1949.

Dance of Death

by ERICH KERN

- ★ The first account to be published in this country of the war on the Russian front.
- ★ Written by a Nazi soldier who for 4 years was in the thick of the fighting with the S.S. divisions.
- ★ An important book for the British reader:

- (1) for its documentary reporting of the war's biggest battle-ground of which the British reader has been least well informed.
- (2) for its insight into the mind of a German, typical of many of his countrymen, about whom again the British reader knows too little.
- (3) for its bearing on the controversial issue of German rearmament.

AMERICAN SURVEY

Breathing Spell

Washington, D.C.

THE price war between Macy's and Gimbels, two New York department stores whose feuds have, to their mutual benefit, come to take the place in American folklore occupied at various times in the past by the North and the South or the Cohens and the Kellys, was dramatic proof that, on one front at least, the Administration's fight against inflation was being unexpectedly successful. Some way had to be found by retailers of unloading their expanded inventories—expanded in the belief that the public would go on buying—because the banks were becoming increasingly reluctant to finance them, since the agreement at the beginning of March, between the Treasury and the Federal Reserve Board, on the government bond market. The method adopted by Macy's and Gimbels, and later followed by other stores in New York and all over the country, was made possible by a decision of the Supreme Court which pulled the rug from under the state "fair trade" or price fixing laws. Competitive price-cutting on a whole range of goods which had hitherto been protected by these laws was the bait used to lure the public into helping the stores into a more liquid position.

Between the end of December and the end of April the inventories of department stores rose in value from \$329 million to \$377 million. But sales, which had reached \$362 million in January, the month in which Macy's took a full page in the New York newspapers to ask plaintively "Why are you buying so much, New York?" were only \$290 million in March and \$306 million in April, no more than 5 per cent above the figures for the corresponding months of 1950, when inventories were but three-quarters of what they are today. The epidemic of public buying against future shortages came to a sudden end during the spring and left many shops, which had been lecturing their customers on the evils of hoarding, with embarrassing hoards themselves.

The "breathing spell," as the President called it two or three weeks ago, caught other people besides the department stores off guard. Like so many changes in the American economic climate it seemed to be largely accidental. But the kinds of discipline to which the American economy is prepared to submit, or which it imposes on itself, often appear deceptively undisciplined. The various measures which were thought hardly adequate at the time—Regulation X for hire

purchasing, Regulation W for mortgages, price and wage controls, voluntary controls on bank lending—have had an effect in the aggregate, though it would be hard to say which has had the greatest influence; none has had as much as the involuntary credit controls arising from the unpegging of government bonds. The two regulations date from last year, though their effects were necessarily delayed; wage and price controls began in January; and the lull was first noticeable in February. Since that month, as Mr Truman has pointed out, wholesale prices have increased less than 1 per cent and in the last month they have actually declined.

Satisfactory as this lull is to the government's economists, it could hardly come at a worse time for them in their relations with Congress. As one official said recently, had the measures taken so far proved insufficient, the President and his advisers would have been blamed for not doing more. Because the controls seem to have worked, Congress is now convinced that they were unnecessary. And this, unfortunately, is the moment when Congress has to make its decisions about the future. Last week Mr Truman took to the hustings—or their modern equivalent, the microphones—to speak for, and to, the consumers, whose representative he said he was. A group of Senators and Congressmen, he warned the country, had told him that "they were under a lot of pressure from the special interests to do away with the controls" but that the consumers were not making themselves heard.

The Defence Production Act, which authorised the controls which have been imposed, expires on June 30th. The Congressional Committees have been bearing evidence for six weeks on the new Bill which the President sent to Congress in April. "After the representatives of the Administration testified in favour of a good, strong law," Mr Truman pointed out, 124 witnesses were heard representing private organisations, only 20 of whom were in favour of the Bill. "All the rest were against the whole anti-inflation programme, or they opposed very important parts of it, or they were trying to get special exemption for themselves." But nothing the President said had any effect on the Senate Banking and Currency Committee, which spent the next week removing controls rather than adding to them.

Both houses have now bowed ignominiously to the cattle lobby, the Senate has given way to the automobile dealers, and many other holes are being drilled in the fabric of

Herblock in the Washington Post

THE ECONOMIST, June 23, 1951

controls. There is nothing to suggest that inflationary pressure, and therefore popular enthusiasm for controls, will be renewed in time to be of any use to the Administration in its persuasion of Congress. Everything suggests rather that the present breathing spell will last for at least six or eight weeks more and, possibly, well into September. So Mr Truman made his appeal to the public to come to his, and their, rescue and write to their representatives.

*

The lull since February, to which the controls then imposed, however little their chance of strict enforcement, certainly contributed at least some moral effect, was overdue by the time it came. The pace of inflation had far outstripped any inflationary force which the defence programme had generated by then and both business and the public had probably done all the anticipatory buying they wanted to do. The defence programme has still not had much direct inflationary effect. On the contrary, the two increases in taxes during the last year have had a greater deflationary one and the cash surplus, when the fiscal year ends this month, will be more than \$6 billion. But federal expenditure this year will have been only about \$46 billion against an estimate of \$74 billion for next year and \$84 billion (which may well be increased) for the year ending June 30, 1953. The lull can only continue until the real inflationary force of the defence programme makes itself felt or until the public has digested its post-Korean purchases and is ready to start buying again.

If the early measures helped the anticipatory inflation to wear itself out, the continuation of the breathing spell into the autumn will be attributable largely to the effects of the agreement between the Treasury and the Federal Reserve Board. The prices of long-term government securities have fallen to a level which has discouraged the private banks from selling them in order to lend the money at a higher rate to private borrowers. As long as they keep these securities they can legally be carried at par, so no loss is shown until they are sold. The supply of credit has, therefore, been restricted to an even greater extent than was envisaged, or probably intended, when it was decided in March that, for the first time in ten years, the market in government bonds should be orderly rather than rigid.

None of this, however, even with the third tax increase which Congress is considering and which now appears likely to produce about \$7 billion a year from October 1st, can be expected to offset the inflationary effects of the defence programme when it is in full tide, as it will be within the next fiscal year. Certainly, if other countries are to get an adequate, or even tolerable, supply of raw materials for their defence programmes and their minimum civilian needs—and since Mr Charles Wilson's visit to Europe it would be churlish to doubt it—there will not be enough consumer goods to satisfy a national income which rose during April to an annual rate of more than \$265 billion, \$30 billion more than the annual rate for 1950, with most of the increase coming under the heading of "compensation of employees," where it has the most inflationary impact. There will undoubtedly be need for that extension and improvement of the laws controlling prices, wages, credit and rents for which the President asked on June 14th. And there will also be need for something he did not mention when making his case to the people, for an understanding of the necessity for private saving at a time when the attraction of spending will be greater than it ever was during the war and when the customer will be ready for another round of hoarding.

1505

Sport is Big Business

[FROM A CORRESPONDENT IN THE UNITED STATES]

Americans pay more money to see intercollegiate football games than to watch any other sport, professional or amateur—an annual total of approximately \$106 million. Admission charges for this sport alone pay for the entire athletic programmes of most colleges. Naturally the colleges are afraid that television is going to kill the goose that lays this golden egg. Already twenty-four small colleges, unable to compete with the free viewing of large university contests, have abandoned intercollegiate football matches. The gate receipts even of the most popular games have been reduced because television relieves the spectator of the expense, trouble and discomfort of attending them in person. As a result the major colleges and universities have announced a one-year moratorium on the unlimited televising of college games.

This has produced something more than an academic argument. In the first place, the government has reminded the collegiate governing bodies that they must be careful not to form combinations in restraint of trade, which are forbidden by the Sherman Anti-Trust Act. Another complication is added by the refusal of Mr Stassen, president of the University of Pennsylvania, a politician who seldom avoids any controversy, athletic or otherwise, to abide by the agreement. His university stands to gain an additional \$200,000, in television income, but when it announced that it proposed to disregard the moratorium, four universities—Princeton, Cornell, Dartmouth and Columbia—indicated that they would not play their scheduled games with Pennsylvania.

There is, of course, nothing new in the commercialising of

college and university sports in the United States. It has been a subject of bitter controversy among educators for years. Enormous arenas, some of them challenging Wembley in size, have been built out of the gate receipts of college football games. Since the public has little interest in a losing team, the desire for good players has led to an annual competition among the universities to outbid one another for the services of the best school athletes. The schools and colleges also find themselves involved in a scramble for the ever-increasing amount of money spent in America every year on sport. With rising wages, there is the trend, usual in an inflationary period, toward greater expenditure on all frivolities. Sport has become "big business," and it is subject to all the harsh competition, the opportunities and evils inherent in all large private business enterprises.

★

Expenditure on sporting activities in a normal year is approximately \$4 billion. This amounts to an average expenditure of \$134 for each of the 30 million sports "fans"—an appropriate and popular American abbreviation for sports enthusiasts or "fanatics." Surprisingly, it is the 13.5 million peaceful fishermen, spending an estimated \$1.2 billion a year, who get hooked for the biggest portion of America's sports bill. Transportation expenses are included in this item and anglers in the United States are used to going a long way for a "better 'ole." Florida, for instance, reports a catch of 2,000,000 tourists every year who come there for the sole purpose of fishing its coastal and inland waters.

After fishing, the most lucrative sports in terms of yearly expenditures on them are hunting and shooting (\$650 million), motorboating (\$600 million), golf (\$500 million), bowling, indoors and out (\$450 million), and skiing (\$150 million). Other sports get \$190 million. In addition to those who participate in such recreations there are also, of course, the "fans" who take \$260 million out of their pockets every year just to have a look at the fun. Annual peacetime attendance at sports events approximates 365 million, or an average of 1,000,000 a day. Basketball, a comparatively new sport, leads with 90 million followed by softball (baseball played with a larger ball which requires less agility and space and causes fewer accidents), baseball, football (the American form something like rugby), boxing and horse-racing, in the order named. Soccer is popular as an inter-class game in schools and colleges, but not as a spectator sport.

Baseball, still called America's "national game," brings in \$66 million in admission fees each year, but is far down the earnings list. On the other hand, no other athletic heroes in America receive the rewards of the "home-run kings" of baseball; the salaries of the top players are higher than that of the President of the United States. The lowest wage for regular members of the big teams is about \$15,000 a year but may reach \$125,000 for a star such as Mr Joe DiMaggio of the New York Yankees, and \$150,000 for the most powerful hitter in the game today, Mr Ted Williams of the Boston Red Sox team. In addition, such leading players may collect as much as \$50,000 for endorsing things they do not eat,

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

wear or, it is suspected, even know very much about. Another \$5,000 comes their way if their team plays in the championship games, known somewhat presumptuously as the "World Series."

Followers of Mr DiMaggio also may occasionally set aside a day in his honour, during which, before the game, he is showered with gifts. This happened a couple of seasons ago. A list of his gifts included: \$7,191 in nickels, dimes and quarters sent in by 3,000 devotees throughout the country (Mr DiMaggio lost no time turning over this sum to charity), a Cadillac motor car from New York fans and a Dodge motor car for his mother from his followers in Hoboken, a Chris-craft motor boat from New Haven, Connecticut, a cheese from a Wisconsin baseball team, a four-year college scholarship from *Il Progresso*, the Italian-language newspaper in New York City, for any boy Mr DiMaggio might choose, 300 free taxi rides from the Brown and White Cab Company, and 300 quarts of ice cream from the Joe Cardani Ice Cream Company.

★

The enormous profits, both legal and illegal, to be made from sport are the more remarkable since organised sport is really comparatively new in the United States. In colonial days sport of all kinds was looked upon by most citizens as evidence of idleness and by many as downright sinful. Such an attitude persisted during the first half of the nineteenth century when Americans were so busily engaged in developing their country and pushing its boundaries westward.

In the closing decades of the century America began to look more tolerantly on sports as something other than the work of the devil. Basketball was invented in 1891. The businessman discovered golf in the eighteen-nineties with the aid of imported professionals from the United Kingdom. The natural combative instincts of the American male and his fierce geographical pride contributed greatly to inter-city and inter-state competitions which often engaged the emotions of large numbers of people. The great competitions with Britain such as the Walker and Ryder Cup matches in golf and the Wimbledon and Davis Cup tennis matches, widened this interest and threw up a number of shining personalities such as Mr Bobby Jones and Mr Bill Tilden. Finally, the technological revolution of the second quarter of this century has affected and complicated the sports world, as it has everything else. It has enabled the camera to pick up the most intimate details of a game in New York, and flash it immediately on the television screen in the front parlour of a workman in Omaha, over a thousand miles away.

During the war sports events were indifferently attended, and spending on sport was cut in half. Since then, however, as after the first world war, there has been a boom encouraging various unsavoury practices which have attracted the indignant interest of educators and legislators. Senator Kefauver, the chairman of the Senate crime investigating committee, turned the light on the fabulously lucrative business of illegal bookmaking, controlled by a racing wire company which counts among its directors some former associates of the infamous Al Capone. The "fixing" of college games for the benefit of gamblers has shown that even amateur sport is not immune to corruption; betting on college basketball alone runs to millions of dollars every year. Americans would be the first to admit that they have not yet solved the social problems created when sport became big business.

American Notes

MacArthur in Texas

The inquiry into General MacArthur's dismissal, now in its seventh week and growing intolerably wearisome with repetition, is to be wound up by June 30th at the latest. Only three more witnesses are to be heard. The Republicans are wisely not anxious to prolong the agony; of the last four to testify, only General Hurley came up to the MacArthurites' expectations. General Wedemeyer, Mr Louis Johnson and Admiral Badger did not weaken the strong case made for the Administration by General Marshall, Mr Acheson and the Chiefs of Staff.

General MacArthur himself has stolen some of the lime-light by betaking himself to Texas, a state which is reputed to be overwhelmingly critical of the Secretary of State and thus likely to provide a happier hunting-ground than Washington. Here he devoted a triumphal tour to a series of frankly political speeches. Going far beyond anything he said before Congress, he accused the civilian authorities of appeasement and defeatism and of allowing their policies to be determined by foreign pressure. He firmly set the first line of defence of Western Europe on the Yalu, not the Elbe or the Rhine. His anxieties on the score of "creeping socialism" and the throttling of individual initiative place him, at home, to the right if anything of Senator Taft, whose presidential campaign some observers think he is abetting.

Texan hospitality is traditional and, indeed, big crowds turned out to welcome General MacArthur. But relatively few remained to hear what he had to say. In the capital, the *Washington Post* remarked angrily that such demagoguery and recklessness in uniform provided fresh justification for his removal. But if General MacArthur's reception was chilly, it was not so icy as that accorded Senator McCarthy when, having been disappointed in his hopes that the Senate investigation would destroy Mr Acheson, he raised his sights to General Marshall. Mr Marshall is generally conceded to be above politics; he is the chief pillar of the Administration, and in the President's view the greatest living American. Hence he is a particularly irritating thorn in the Republicans' side. But the Senate emptied rapidly as the Senator from Wisconsin, in 60,000 scurrilous but privileged words, accused Mr Marshall of making common cause with Stalin at Yalta and marching with him ever since in a conspiracy to let the United States fall victim to Soviet intrigue. Republicans as well as Democrats walked out; when only three listeners were left, Senator McCarthy called it a day and left more than half of his speech unread, for burial in the *Congressional Record*. What is deplorable, however, is that no Republican has yet had the courage to repudiate an attack which, however nasty, might influence a few votes in 1952.

★ ★ ★

Modern De Quinceys

A horrifying new series of "confessions of an opium-eater" have been recorded on tape and played out at the New York State investigation into the drug traffic. These confessions, far from extolling the joys of narcotics, recount the begging, prostitution and robbery to which teen-age addicts in New York City are driven by their need to secure money for habit-forming drugs. Narcotics are peddled even in the schools, by students to other children, and taken under the innocent eye of the teacher; they are even more freely obtainable from salesmen in hotels, bars, chemists' shops and amusement centres, under the less innocent eyes of the police. Reluctantly the Superintendent of Schools has had to agree that there might be as many as 1,500 addicts among a school population of 300,000, and 6,000 teen-age addicts in the city. This is one more nail in the coffin which the Republicans, who control the state, hope to have ready for the Democrats in the city before the next mayor is elected.

The spread of the drug-habit to young people is marked in all big cities, but New York, partly because it is a great port, leads the shameful procession. The Federal Hospital at Lexington, Kentucky, admitted 440 minors last year for rehabilitation, compared with one in 1940; half came from New York. This hospital, the only one of its kind, is desperately overcrowded, despite the widespread, though erroneous, belief that a conviction is the only passport to a cure. Voluntary groups in New York are pressing for a new institution where young victims can be segregated from hardened cases and cured without any stigma attaching to them. A new experimental programme of rehabilitation is also to be tried in one of the state prisons for women.

Prevention, which would be better than cure, is made difficult by the under-manning of federal and state enforcement agencies, for reasons of economy, and by the enormous profitability of the traffic. With heroin selling at \$300 a pound in Turkey, and \$100,000 a pound in the United States, the temptation for a seaman to bring in a small fortune strapped to his body is hard to resist; pedlars make a 100 per cent profit. The nation's yearly drug bill is put at \$250 million a year, without including the sales of marijuana, a variety of hemp which can be grown in any backyard. Nevertheless, Mr Anslinger, head of the Federal Narcotics Bureau, believes the traffic can be stamped out if judges are

... requires a well planned and executed sales program. Irving Trust Company will put you in touch with competent organizations in the United States to help you develop or expand your sales there.

forced to give heavy sentences; pedlars in the New York area have moved to Manhattan from Brooklyn, where maximum sentences are usual. A House Committee has now approved a Bill giving the Narcotics Bureau what it wants. Jail sentences of five, ten and twenty years would be mandatory under it for second and third violations of the federal laws against importation, sale, or concealment of narcotics, and there could be no suspended sentences for repeaters.

Rounding Up Reds

The government has begun the second stage of its round-up of the leaders of the Communist Party by proceeding against the twenty-one members who, it is alleged, will be taking over the party organisation from the eleven whose convictions were recently confirmed by the Supreme Court. The new charges, like the old, are of conspiring to overthrow the government by force, and are brought under the Smith Act. The Supreme Court's decision established that this Act is constitutional and cleared the way for the Administration to proceed against Communists by the road which it has always thought was the best, even if the longest.

Congress has tried a number of supposedly shorter routes. One of these was the establishment of the Subversive Activities Control Board, which is at present trying to decide whether the Communist Party is a group dominated from abroad and therefore obliged to register with the Department of Justice. The members of the Board hold only temporary appointments because Senator McCarran, who was responsible for the Act establishing the Board, has obstinately refused to conduct hearings on their confirmations. He doubtless enjoys the sense of power that this gives him over what ought to be an independent body, but his excuse for delay has now been removed by the resignation, through illness, of the chairman of the Board, Mr Seth Richardson. Mr Richardson, in his own words "a life-long contentious Republican," would seem, from his reactionary views on both domestic and foreign affairs, to be a man very much to Mr McCarran's taste. But as chairman of the President's Loyalty Board, which passes on the reliability of government employees, he showed a judicial impartiality which was more than Mr McCarran could stomach. The outstanding example of this was the case of Mr William Remington, who was cleared of disloyalty while in federal service, but was later convicted of perjury for denying that he had been a Communist before he worked for the government.

Mr Richardson believed that to have dismissed Mr Remington would have left "no room for a change of heart," the objection which Mr Justice Burton advanced to the Supreme Court's decision upholding the anti-Communist oath required of its employees by the City of Los Angeles. The decision, accompanied by a rider that those unable to take the oath should not be dismissed simply because they had once been affiliated with the Communist Party, would seem to establish the constitutionality of the loyalty oaths now required by many state and city governments. The Regents of the University of California have, however, at last given up their attempt to insist on a special loyalty oath for the staff at the university only. Dr Tolman, the leader of the professors who lost their jobs because of their refusal to be singled out in this way, has just received an honorary degree from Yale University in recognition of his valiant defence of freedom of the mind.

Shipping Stoppage

The American Export Lines' new SS *Constitution*, due to sail on her maiden voyage to the Mediterranean this week, looked like having her debut postponed as a result of the refusal of the 60,000 members of the National Maritime

Union, the Marine Engineers' Association and the American Radio Association to work without a contract. The last-named union is the only one of the three employed on Pacific coast routes but, since no vessel may sail without a wireless operator, shipping has been tied up on both coasts since last Friday, for the first time in three years.

About 650 ships will gradually be affected as they come into port and the anxiety of the owners to prevent such a disruption of passenger traffic in the middle of the tourist season explains, according to the unions, why President Truman was asked to invoke the Taft-Hartley Act and thus delay the strike for eighty days. The President did not, however, feel justified in doing this, since the unions had promised to move all emergency and defence cargoes, for Korea and elsewhere. This guarantee permitted the dispatch of the first shipment of grain for India under the \$190 million loan authorisation which Congress has at last allowed the President to sign. But Marshall Aid deliveries, half of which must by law be carried in American bottoms, will not necessarily be regarded as emergency cargoes. Oil tanker and collier crews were not concerned in the dispute, nor were foreign ships whose crews do not belong to American unions.

The NMU, which sets the pattern for the other unions, is demanding a 40-hour, instead of a 48-hour, week at sea, an increase of 25 per cent in pay (an able-bodied seaman at present gets \$248 a month plus bonuses and overtime), holidays with pay and other minor benefits. The employers say that this would add another \$170 million a year to the already high operating costs of the American merchant marine and would be far above the increases permitted by the Wage Stabilisation Board. During the eight weeks of negotiations that preceded the stoppage, the companies proposed a pay rise of 10 per cent and a less generous scheme for financing holidays, but no change in hours. They have refused to improve this offer and, although the unions insist that they are anxious to negotiate, the government mediators have so far found no readiness to compromise on either side. At the time of going to press, there is no sign of a settlement except possibly on the West Coast.

Paper Bullets

Barbed words have been flying across the world's longest undefended border. Four Canadian newsprint manufacturers have announced that they will raise their prices by \$10 a ton on July 1st. This will bring the price of Canadian newsprint in New York to \$116 a ton, only \$4 a ton short of the peak reached in the nineteen-twenties, and more than twice what it was ten years ago. As the United States buys 5,000,000 of the 6,000,000 tons of newsprint it uses from Canada, publishers will have to find an additional \$60 million or so a year. It is conceded that rising costs make a somewhat higher price inevitable; ceiling prices charged by American producers are likely to be raised by \$3 or \$4 a ton soon. But the extent of the Canadian advance, coupled with the profits the Canadian newsprint companies are earning, has brought the now familiar charge of gouging both from Congressmen and anonymous officials of the Administration. The new price has, however, been found to be justified by the Canadian Cabinet.

Mr DiSalle, the Price Administrator, believes the issue is bigger than the mere addition of \$60 million a year to the bloodstream of inflation; he notes that some people are asking whether the United States should continue to control its export prices when other countries do not limit theirs, and adds that it is directly contrary to the entire principle of a joint defence effort that essential materials should be permitted to flow to the highest market, regardless of need. This is a principle of relatively recent adoption in the United States, and most of the newsprint-hungry

democracies might dispute whether the giant appetites of the American newspapers represent a genuine need.

Among the means of frustrating the advance which are being discussed is the imposition of a ceiling on the prices which might be paid for imported newsprint, if this were found legal, and retaliation by the withdrawal of defence contracts placed in Canada. These are tactless speculations so soon after Mr Lester Pearson, the Secretary for External Affairs, underlined Canada's independence by saying publicly that while Canada is anxious to support the United States in the leadership she is giving to the free world, she was not willing to be an echo of somebody else's voice. The publishers, at least, have no illusions about their need for Canadian newsprint; while groaning at the prospect of the new burden, they are counselling Mr DiSalle to do nothing rash until he, Mr Wilson, the defence mobiliser, and Mr Eric Johnston, the economic stabiliser, have seen what a friendly talk will do.

Shorter Notes

This week President Truman signed the new Military Manpower Bill, which reduces the conscription age to 18½ from 19, lengthens the period of service from 21 to 24 months and extends conscription until June 30, 1955. It also lowers physical and mental standards and withdraws deferment from men whose only dependant is a wife. The Bill sets up the framework for a universal military training programme to replace the draft after the present emergency is passed, but Congress will have a chance to reconsider this programme before it actually begins.

*

Fine weather made May an excellent growing month and the wheat crop took full advantage of it. As a result it is

expected that over a billion bushels of wheat will again be harvested this year, over 20 per cent more than was forecast in the pessimistic May crop report. But this will only be just enough to cover domestic needs and the increased export demand arising from the greater number of American troops abroad and the need for relief shipments to India and Korea.

*

In 1950 some 300,000 Americans visited countries receiving Marshall Aid, nearly 20 per cent more than in 1949. They spent nearly \$400 million, 32 per cent more than the year before.

*

Telephone subscribers in Englewood, New Jersey, will soon have no need to call the exchange in order to talk to their friends in San Francisco. Plans have been announced by the Bell System enabling long-distance calls to be dialled, and it is hoped delays will be reduced to a matter of seconds. The equipment should be installed by the end of the year and the plan will include cities such as San Francisco, Chicago, Cleveland, Detroit and Boston. At first the system will only work one way, but in time, no doubt, San Francisco will be dialling direct calls to Englewood.

*

It may not be long before the Fuller Brush man is relegated to legend, for the Supreme Court has decided that local governments have the right to regulate door-to-door selling, provided they do not discriminate between salesmen or products. No one knows how many communities ban such activities or the volume of business done in this way, but over half the country's magazine subscriptions are collected by this method, which is often hard to distinguish from blackmail.

THE WORLD OVERSEAS

Development of Central Africa

THE case for the federation of British Central Africa rests—at least in part—on economic considerations. It has been argued, officially, that these three territories of Southern Rhodesia, Northern Rhodesia and Nyasaland are so interdependent that if they are to be developed to the full, they must be very closely associated in their economic planning. Three separate administrations will not ensure economic security, and a slump in the price of their main products could be disastrous if the risks are not spread.

The three territories cover 480,000 square miles (apart from lakes)—nearly nine times the size of England. They carry a population of something over six million, divided with rough equality between the three; only 169,000 are Europeans, and of them 129,000 are in Southern Rhodesia. The combined national income in 1949 was no more than £113 million, or under £20 per head per year. Of this Southern Rhodesia contributed £73 million, Northern Rhodesia £27 million and Nyasaland £13 million.

These, then—Europeans apart—are poor populations, yet the potentialities for development are known to be large. How rapid economic development could be has already been indicated by the extraordinary progress, at least in the Rhodesias, in the last 15 years. Since 1938 the value of gross industrial output has increased more than fivefold in Southern Rhodesia and in 1949 it was £44,891,000. Mineral production, on the other hand, has increased by only 47 per cent to £11,293,000. Revenue has expanded from £3,500,000 to over £16 million in 1950. From 1939 to 1949 Northern Rhodesia's mineral production has increased three and a half times to £35,500,000 and its revenue four times to £12 million. Industrial production figures are not available for earlier years, but in 1948 they stood at £19,917,000 and in 1949 at £29,243,000. Nyasaland's wealth has grown more slowly; its revenue was £1,000,000 in 1939 and £3,000,000 in 1950. The index of output per worker rose in Southern Rhodesia from 100 in 1938 to 118 in 1948.

The external trade figures are equally impressive:—

	Imports (£'000)		Exports (£'000)	
	1938	1949	1938	1949
S. Rhodesia	9,673	54,586	10,574	29,621
N. Rhodesia	5,168	21,266	10,027	32,753
Nyasaland	534	5,592	960	4,690
Total	£15,375	£81,444	£21,561	£67,064

Until the war, mining—mainly gold—had been Southern Rhodesia's largest source of wealth. But by 1950 secondary industry had become the major activity. Factory industries have grown more than sixfold since 1938. The most important secondary industries are sugar-refining, baking, grain-milling, bacon and meat preserving, brewing, mineral waters, tobacco manufacturing, oilseed crushing, soap, textiles, metal manufactures, building materials, paper, printing and publishing. The foundations of a big textile industry and of an iron and steel industry are being laid, and about £1,000,000 worth of coal a year is produced. Tobacco and agricultural production has also increased significantly and tobacco exports last year were valued at nearly £12 million.

Northern Rhodesia's economy is based on the prosperous copper industry. There are efforts to diversify it by increasing tobacco and agricultural production and encouraging secondary industries. Saw-milling is successful and important and a cement works will be in production by 1951, but the remaining manufacturing firms are on a small scale. Tobacco is a valuable cash crop, but agriculture in general has to contend with serious natural disadvantages. Nyasaland relies on agriculture—tobacco, tea and cotton. Tung oil is increasingly valuable and there is an important fishing industry. There is no mineral production, though asbestos, coal and bauxite are known to exist; and there is very little secondary industry.

The impressive development of the area as a whole has been based on the export trade to countries overseas. But the economic case for federation rests on their interdependence. In what way, then, are they interdependent? In some measure, in their labour supply. Thirty-one out of every 1,000 Northern Rhodesia Africans work in Southern Rhodesia; 39 of every 1,000 Nyasaland Africans work in Southern Rhodesia, and three in Northern Rhodesia. These figures are more striking when related to the total of Africans in employment. In 1949, for example, only 41 per cent of the Africans in employment in Southern Rhodesia were indigenous; in Northern Rhodesia the figure was 80 per cent. There is also interdependence between the Northern Rhodesian mines and Southern Rhodesia's coal—at the moment copper production is restricted through shortage of coal. Cotton production in Nyasaland feeds the textile industry of Southern Rhodesia, which finds markets in the other two territories. In general Southern Rhodesia's secondary industries find this a useful outlet. Southern Rhodesia is also a natural distribution centre for Northern Rhodesia—the value of its re-exports to this territory

was £3,000,000 in 1949. The total internal trade between the three territories was £8,000,000 compared with a total external trade of £148 million. Southern Rhodesia has a Currency Board on which the other territories are represented. There is no exclusive trade or customs agreement between the three. Nyasaland and a portion of Northern Rhodesia are governed by the Congo Basin treaties and so are precluded from granting preferences on customs duties.

Movements of Labour

None of these facts give convincing proof of far-reaching mutual dependence. The migration of labour is by no means confined to these three territories. Ten in every 1,000 Southern Rhodesian Africans work in the Union, so do 8 of every 1,000 Northern Rhodesians, and 20 of every 1,000 Nyasalanders. Many African employees from Portuguese territory and from Tanganyika also migrate southwards. Total trade between the three territories in 1949 was only 5 per cent of their total external trade. The Rhodesias trade far more with the Union than with each other. Even the argument that a large, diverse economy is necessary to counter the disastrous effects of a possible trade depression does not bear close examination. A world depression would in any case involve all the main exports of all three territories. But a major slump is unlikely in the foreseeable future, with the defence and production needs of America, Britain and Western Europe stretched to the limit; even apart from rearmament the United States is becoming a net importer of raw materials, particularly of non-ferrous ores, of which Central Africa is an important producer.

The great difficulty for this whole area is transport. Each territory looks outwards for the overwhelming part of its trade, yet each is landlocked. The main outlet is the port of Beira in Portuguese East Africa, and its capacity has been consistently inadequate to handle the volume of trade since the war. In June, 1950, a convention was signed under which the Portuguese Government have agreed to develop the port in return for guarantees that it will be fully used. The Rhodesias (but not Nyasaland) have an alternative outlet in the South African ports, but the distance is too great for them to be used for the basic export traffic. Yet another alternative for N. Rhodesia is on the west coast at Lobito Bay; but this means using the Portuguese and Belgian railways and a recent agreement is waiting approval. The haul is too long to be of use to Southern Rhodesia. The road system of all three territories is inadequate for heavy traffic. An inter-territorial route from South Africa right up to the Sudan was agreed at the Johannesburg Transport Conference last October. Railways link the Rhodesias with South Africa, but the line is single-track and also has insufficient carrying capacity. Northern Rhodesia is considering a link with the East African railway system; the Nyasaland railways are already linked with Beira.

Case for Federation

The economic case for federation is not, therefore, convincing. If the economic dependence of the territories were the main consideration, would not a transport union, a customs union (as treaties permit) and certain common administrative arrangements from the South African border to Kenya, meet the case equally well? That there is vast scope for development is not in doubt, and this may be carried out more easily if the territories form part of a bigger unit, though not necessarily the unit now proposed. But the real case for federation in Central Africa is political, not economic.

Canberra Seeks More Power

[FROM OUR MELBOURNE CORRESPONDENT]

THE 20th Commonwealth Parliament has opened in Canberra amid scenes of great splendour, celebrating the Golden Jubilee of the achievement of federation in Australia. Mr Menzies, the Prime Minister, heads a ministry which now commands a majority in both Houses of Parliament; thus resolving the political deadlock between the two chambers which had made effective government impossible. To achieve this, Mr Menzies resorted earlier in the year to the drastic constitutional expedient of a double dissolution, which had been invoked only once before since federation.

It is ironical that, at the very moment when the nation is celebrating the jubilee of the coming into being of the Commonwealth Parliament, that body itself finds it virtually impossible to legislate on a number of vital issues because of the meticulous care taken by the makers of the Constitution to ensure that the Federal Legislature should not have too much power. As a result, Mr Menzies, despite the clear mandate from the people at two general elections, finds himself unable to legislate against the Communists and very uncertain about the powers that the Commonwealth possesses in the economic field.

The Menzies Government has made the issue of Communism its most important policy plank. Action was taken to outlaw the Communist Party and confiscate its property soon after the Government took office in December, 1949, but the High Court declared by a six to one majority that the enabling legislation was in peacetime *ultra vires* the Constitution. This was a severe blow to the Government, and it raises the possibility that other legislation, both present and future, might be in jeopardy because of the insecure basis on which rest most of the current and prospective economic controls.

For instance, the Government's plans to bring down a defence preparations Bill early in the new session of the new Parliament might well lead to another appeal to the High Court, on the grounds that measures needed to place the nation on a "semi-wartime" footing under a "peacetime" National Security Act could not be legally sustained. It was only through the use of its wartime powers that the Federal Government was able to assume complete control of the economic life of the nation between 1939 and 1945. The Government has no peacetime powers as such to exercise what would be tantamount to a wartime direction over industry. Should it attempt to do so, there would certainly be a challenge in the High Court by affected parties.

Defence and Finance

On the control of new capital issues the Government is already facing a challenge in the High Court about the validity of the present regulations, and upon the Court's decision much of the future pattern of peacetime economic control will depend. This point was referred to by the Governor-General (Mr McKell) in opening Parliament on June 12th. Mr McKell said:

The extent of the powers of Parliament over defence preparations have been rendered doubtful, though the matter may be to an extent cleared up by proceedings in the High Court.

There would be fierce opposition in Australia today to any deliberate direction of manpower; while in other spheres of economic control, such as direction of materials in short supply, there would always be a real danger of a successful appeal to the Court. But in the two spheres of credit control and taxation the Federal Government has undisputed authority. These powers are expressly set out in the Constitution and, in the case of taxation, the High Court has held that the Commonwealth takes priority over the

States both in peace as well as in war. This confirmed the Commonwealth Government as the sole income taxing authority in Australia, since it assumed this power with the assent of the States in 1942. The Federal Government is thus not completely helpless in the economic field, but its lack of jurisdiction over certain vital phases of economic life makes difficult any all-embracing policy.

What, then, is the way out of the present constitutional impasse, which springs from the limited sovereignty granted to the Federal Parliament by the framers of the Constitution? As the Melbourne Age points out:

Nobody looking at the record can fail to realise that the machinery devised half a century ago is grotesquely out of date and seriously inadequate for the highly important obligations of the national Government, the range and scale of which have grown enormously in the last two decades.

The solution, in theory, seems simple. The Constitution can be amended to provide for modern conditions if a majority of electors and a majority of States agree to do so by a referendum poll. That is the logical and obvious way out of the impasse. It would be a way out of the Government's dilemma in dealing with the Communists, for here the Commonwealth Parliament's will to legislate has been frustrated by the High Court and not by the Labour Party. A referendum would likewise resolve the difficulty of legislating in peacetime on matters which normally fall to the Federal Parliament only in wartime.

Strain of the Straitjacket

For a number of persistent and deep-seated reasons, however, Australian electors are exceedingly reluctant to endow the Federal Government with any more power. It is a reflection of the mortal fear that any power given to the Commonwealth must redound to the detriment of the States. It is illogical but nevertheless a no mean factor in Australian politics. Therefore, before risking an unfavourable referendum verdict, the Government is likely first to make a bid to obtain reference of the appropriate powers by the States to the Commonwealth. Alternatively, it could invite the States to co-operate with the Commonwealth in passing identical legislation.

If both these courses fail—as well they might, because of the political differences of the States (New South Wales, Tasmania, and Queensland have Labour governments)—the Government, to quote again the Governor-General, “will bring forward a measure for the amendment of the Commonwealth Constitution.” Thus, the Menzies Government's main task in the opening months of the new Parliament will be not so much to legislate, but to prepare the way constitutionally for legislation, the validity of which will be beyond doubt. Its foremost task will be to convince either the State Legislatures or the people as a whole that modern times demand more than a “horse and buggy” Constitution, and that the Government will be weak and ineffectual if the National Parliament continues in its present straitjacket.

Indonesia's Lack of Order

[FROM A CORRESPONDENT]

ALTHOUGH the new Indonesian Republic has now been independent for a year and a half, there is still sadly little evidence of any real internal stability. This rich territory, occupying an important strategic and economic position in the eastern world, is bound to disappoint the optimists so long as there is such an acute lack of competent men in public office. Even some of the recently appointed new cabinet ministers made “tub thumping” speeches before their first cabinet meeting. Such speeches are directed at the mob, but those who deliver them do not realise that such outpourings do nothing to help their country along. The

stable type of man in public life receives little or no encouragement as he is immediately termed “colonial” by all and sundry. And this is a most opprobrious epithet these days.

Meanwhile little or nothing is done to deal effectively with the lawless elements. The numerous murders during the last eighteen months are a black page in Indonesia's record; but even blacker are the less than half-hearted attempts to bring murderers to justice. However, law and order cannot be obtained when police and army are poorly and irregularly paid. The army is involved in many of the thefts of cars and produce, but its members almost invariably go scot-free. Theft, indeed, is the order of the day: factories and estates have to count on losing regularly up to 25 per cent of their production—an almost incredible and ruinous figure. Some rubber estates are tapping three times daily, once for the owning company, once for the labourers themselves, and once at night for the surrounding villagers. At other estates the labourers tap and give the owning company what they think fit, the estate staff being prohibited from going into the gardens.

In the harbours nothing is safe. Recently a ship berthed with a cargo of tinned Japanese sardines. The unloading coolies were into this cargo like lightning, but it so happened that a ship carrying tinned American sardines came into the berth ahead—with the result that the Japanese sardines were just left flat and the swarm of locusts invaded the American ship. On the inter-island steamers, officers are not allowed to go into the holds and cargo is ransacked right and left. Indeed, one crew, seeing that they were carrying bales of

textiles, sent one of their members ashore to fetch a sewing machine so that during the voyage what clothes they needed could be run up according to taste from the bales at hand. The harbours are also in a shocking state from the point of view of organisation. Goods are not cleared quickly enough and the ports are so congested that, in the case of Tandjong Priok—the port to Djakarta—there was recently a suggestion that it might be necessary to close the port for a month. The Customs only work from 8 to 12 o'clock, and from 1 to 3; if one wants goods cleared in reasonable time it is necessary to slip a 50 rupiah note in amongst the import permits.

The Menace from Labour

On the labour side things are chaotic. The country just cannot afford a 40-hour week at this juncture, and the unions, Communistic as they are, do all in their power to keep down production and stir up strife. Strikes are called when the labourers themselves have not the slightest idea of why they are striking; but the unions follow the pattern of action laid down by the Chinese Ambassador. Intimidation is the order of the day as a union weapon in controlling its members; this was even looked upon with approval by a recent Minister of Labour. At discussions between employers and unions, the invariable cry from the latter is “exploitation of labour.” The unions themselves never account for their

Coventry Climax
fork-lift trucks
put production
up!

This is a machine for cutting non-productive time. It carries, lifts, stacks and loads almost any material up to 6,000 lbs. at a time — swiftly, deftly, economically. Think of your present costs in moving and storing; the cost of handling and trundling by old-fashioned methods; and you will see how, with this machine, these non-productive costs may be cut and your output increased — forthwith.

COVENTRY CLIMAX fork lift trucks

funds, but when a strike is called expect the employer to pay. Even so, after a recent strike at a cigarette factory in Djakarta, the union official concerned demanded 25 rupias from each monthly paid employee and a full day's pay from each daily paid employee, in all about 3,500 rupias "for services rendered."

Economically, Indonesia is like a house built on sand. Very few even of the intelligentsia realise the extent to which the country depends on world market prices for its income from exports. Costs continue to go up but rubber prices are slowly descending, and sooner or later someone will have to say to the labourer "your daily wage must go down." Then the fat will be in the fire, and the danger to Indonesia from Communism greatly increased. There is, however, nothing inevitable yet about the Communists capturing power. Although the present picture is so discouraging, the government could still take matters in hand if it had the courage of its best convictions—and if the Chinese and Russians do not make any further startling progress in the rest of eastern and southern Asia. Indonesia's need is to keep the hotheads in place, to get down to restoring law and order even if this means using extreme measures, and to accept the advice of foreign technical experts however unpalatable.

Land Reform in China—I

[FROM A CORRESPONDENT RECENTLY IN CHINA]

EXCLUDING Tibet, but including Formosa, China has an area of something over 2,500,000 square miles. No definite figures of its population are known, but it numbers something over 400 million, representing one-fifth of the world's population. Its average density of about 170 persons per square mile does not seem great at first sight, since France has a density of just under 200 persons, while that of this country is over 500. But in China the localised concentrations are very large; 83 per cent of the population lives on 17 per cent of the land, while only about 20 per cent can be described as urban and half of these are connected in one way or another with agriculture. With only 10 per cent of the land of China at present arable and around 1,500 people living on every square mile of cultivated land the true pressure of the population becomes apparent. Even though the Chinese farmer is an intensive producer, the continually expanding population of his country presents him with an ever-increasing problem.

A fundamental social problem has for long been the maldistribution of the land, with a great concentration of ownership in the hands of a relatively small proportion of the population. Though China still suffers from a lack of reliable statistical material, Kuomintang figures indicate that before the war landlords and rich farmers, representing 10 per cent of the rural households, owned 51 per cent of the land, the rest being divided between the middle peasants (22 per cent of the households, 25 per cent of the land) and the poor peasants and labourers (68 per cent and 22 per cent); the official figures of the present regime state that 10 per cent of the rural population controlled 70-80 per cent of the land. Whichever evidence is accepted, the maldistribution is evident.

The actual holdings themselves are small, as was demonstrated by a prewar official investigation of a sample area, which showed that 20 per cent of the land was cultivated by poor and middle peasants in holdings of up to five acres; 17 per cent by rich peasants with 5-8 acres; while the remaining 63 per cent belonged to small and large landlords owning from 8 acres of land upwards, mostly let out in small lots. The rents charged were almost always very high, 50 per cent of the crop being quite a normal amount: this was recognised by the Kuomintang, which introduced a law reducing rents to a maximum of 37½ per cent, but this never seemed

to have been applied in practice. Usury was also prevalent.

When the Chinese Communists set up the Central People's Government in the autumn of 1949, one of their first acts was to issue their "Common Programme" as the basis of the new regime's general internal and external policies. In this it is stated (Article 27) that "Agrarian reform is the necessary condition for the development of the nation's productive power and for its industrialisation."

After this came the Agrarian Reform Law of June 30, 1950, which codified the land redistribution which had already begun in the "old liberated areas" of the north-east and which is now spread virtually everywhere.

The immediate purpose of the Agrarian Reform Law is to implement that part of Article 3 of the Common Programme which stipulates the systematic transformation of "the feudal and semi-feudal land ownership system into a system of peasant land ownership." This intention is made clear by the first section of the Law which states:

The land ownership system of feudal exploitation by the landlord class shall be abolished and the system of peasant land ownership introduced in order to set free the rural productive forces, develop agricultural production and thus pave the way for New China's industrialisation.

The second section covers the scope of confiscation and requisition. The landlord loses all his land, draught animals, farm implements and surplus grain and his "houses in the countryside," all else remaining untouched. Agricultural land belonging to ancestral shrines (which occupy relatively large spaces), religious orders, schools and other organisations also come under requisition, but with provision for compensation for lost income where the local "People's Government" thinks it necessary.

Exemption for Industry

Industrial and commercial premises are in the main exempt. A partial exemption is also given to "revolutionary army men, dependents of martyrs, workers, staff members, professional people, pedlars" and certain others who rent out land, but who are either unable to work or are employed usefully elsewhere. They are not classified as landlords and are allowed to retain a relatively large part of their original holdings. Though the landlord loses virtually all his land, the "rich peasant" is allowed to keep all the land he cultivates personally or with hired labour. He is likewise allowed to keep small portions of rented-out land, although in certain unspecified "special areas" this can be requisitioned.

Section three is devoted to the manner of distribution of the requisitioned land, which is to be taken over by the local peasants' association for "equal, equitable and rational distribution to poor peasants who have little or no land and who have no other means of production." As far as possible the land is to go to its present tiller. The small land-owning peasant who receives redistributed land is to be allowed to have *in toto* more than a previously landless peasant.

Landlords who have "reformed" or who are not considered "reactionary" are also to receive equal parcels of land, providing "they are willing to earn a living by agricultural work." But no land is available for "collaborationists, traitors, war criminals, counter-revolutionaries guilty of extremely grave crimes, or criminals who have persistently sabotaged agrarian reform." Exemption is given to innocent members of their families.

The machinery for carrying out the reform is to be a local peasant committee, aided by a travelling "people's tribunal," the job of which is, according to Article 32,

To try to punish, according to law, hated despotic elements who have committed heinous crimes, whom the masses of the people demand to be brought to justice, and all such persons who resist or violate the provisions of the Agrarian Reform Law and decrees.

(To be concluded)

THE BUSINESS WORLD

Ministry of Materials

THE Ministry of Materials is a product of the present raw material shortage, but it could still be accepted as a step forward even in a more peaceful era without the strains of rearmament. A White Paper published last week-end set out the functions to be assigned to the Lord Privy Seal and his new department and these are to be debated in the House next week. The Ministry is essentially a procurement department in its widest sense:

It will be the duty of the Minister of Materials to do everything possible to ensure adequate supplies of the materials with which he is concerned. Where they are dealt with on public account, he will be responsible for their purchase and sale. Where appropriate, he will take steps to increase the production of materials of which supplies are, or may become, inadequate, to promote their economical use, salvage and recovery and to develop the production and use of substitutes.

The actual buying and selling of those materials on public account will be the administrative work of the department. Its policy, however, will cover a wider field. It will assess current and future trends in supply; it will be responsible for detecting a threatened shortage before it arises and for taking appropriate action to forestall it. If such a department had existed four years ago, the impact of the present dearth of sulphur, and indeed of most other raw materials, on British industry could have been considerably reduced. Nobody would pretend that the new Ministry will be omniscient; it is as likely to misjudge future trends as any other government department or any business concern. But the fact that its work will cover nearly all the essential raw materials will give weight to its judgments and enable it to act quickly and consistently—in short, its job will be to devise and follow a commodity policy that is realistic and productive.

The conservation of supplies, the recovery of salvage and the development of substitutes are all important aspects of procurement and their inclusion in the responsibilities of the new department is wise. These tasks of the new department may in time expand to include development of production in colonial territories. Colonial development has in the past been hampered by the cautious attitudes of the Ministry of Supply and the Board of Trade and the spectre of surpluses; the need for a great increase in supplies of primary materials had been put in the background. Mr Stokes's task is to put this need right in the foreground.

Similarly, the Minister of Materials will represent the British Government at international commodity conferences; thus in future it will be possible for one single authority to take a synoptic view of all commodity problems. Again, a Minister who can search the world for scarce materials has his valuable uses. Mr Stokes lost no time in going to Washington and rumour credits him with securing more sympathy for the British case

in seven days than the Government had been able to secure in several years—and in present conditions, more sympathy may well mean larger supplies.

But it is one thing to set out the responsibilities of the new Ministry in broad terms; it is another problem to translate them into effective action without causing a major administrative upheaval. Since the war, the responsibility for raw materials has accompanied the responsibility for the using industries—cotton to the Board of Trade, non-ferrous metals to the Ministry of Supply. This trend has had at least this logic—that the interests of the industrial consumers must be properly looked after. The present move in that sense might seem to be a retrograde step, since it goes some way to create a division between procurement and use. This is not an argument against the creation of the new Ministry; under present conditions, it is procurement that is compelling, and this duty has not been successfully carried out by the production Ministries. But the change does raise the problem of where to draw the line between the responsibilities of the Ministry of Materials and of the departments looking after production.

*

The guiding principle in assigning tasks to the new Ministry is to make it responsible for raw materials up to the point at which they enter into manufacture, leaving the interests of industrial consumers to be looked after, as hitherto, by the Board of Trade or the Ministry of Supply. Where a scheme of allocation of materials is already in force, or where one is likely to be introduced, the broad division of supplies among the various groups of users will continue to be decided by the Cabinet Programmes Committee under the Chancellor of the Exchequer. Detailed allocations to firms, where these are necessary, will continue to be made by the departments responsible for their use, since they have a more intimate knowledge of the importance of the various users. The Ministry of Materials will thus be responsible only for the administration of the allocation scheme and for seeing that supplies exist to honour the quotas given to firms. This arrangement is sensible. It ought to give confidence to individual firms, since their supplies will be allocated by a department that should be fully acquainted with their work, while at the same time the procurement of supplies and the broad administration of the schemes will be under a single control.

British administrative genius never carries a principle to its logical conclusion. The White Paper reveals many qualifications to the guiding principle, though each anomaly has its special reasons. Metals are fairly straightforward. The Minister of Materials will take over from

the Minister of Supply the responsibility for non-ferrous and light metals in unwrought forms including ores and concentrates, but not the responsibility for the industries fabricating these metals. The Minister of Supply, however, will remain responsible for the iron and steel industry as a whole and will therefore look after the procurement of the industry's basic raw materials including manganese ore (except dioxide), ferro-manganese and scrap. The new Ministry will take over the Board of Trade's responsibility for chemicals, textiles, paper, hides, skins, tanning materials, natural and synthetic rubber, carbon black, softwood, hardwood, pit-wood, plywood and veneers and a host of minor materials ranging alphabetically from abrasives to waxes. The three anomalies in this list are chemicals, paper and textiles. The procurement of the basic raw materials for the chemical industry will be transferred to the Ministry of Materials while the Board of Trade will continue to look after the chemical industry—except sulphuric acid and fertilisers. The reason for this is that sulphuric acid cannot be considered separately from sulphur; since one of the more immediate tasks of the new Ministry will be to mitigate the scarcity of sulphuric acid by developing pyrites and anhydrites to replace elemental sulphur, it is essential for it to control sulphuric acid. Once this point is accepted, the transfer of fertilisers follows as a matter of course. The same argument applies to some extent to paper. There is no clear division between woodpulp and other paper-making materials and finished paper. The choice lay between transferring the whole industry to the Ministry of Materials or keeping it under the Board of Trade. The Government has chosen the former, presumably because woodpulp is one of the commodities at present subject to international negotiation.

Textiles present a more complicated case. Raw cotton, raw wool and other animal fibres will come under the new department. But the Board of Trade will still exercise its power of appointment of members to the Raw Cotton Commission and will still make raw cotton available to users, though in conjunction with the Ministry of Materials. The cotton industry and the wool textile industry will remain under the Board of Trade, which will also continue to be responsible for rayon and other synthetic fibres. This division of responsibility in the textile industry could give rise to serious problems unless the closest consultation is assured between the two departments at all times. In this the Textile Fibres Advisory Committee, which was recently set up, will no doubt have great scope. The committee will continue

to be under the chairmanship of the Parliamentary Secretary to the Board of Trade but it will now include a senior representative of the Ministry of Materials. The whole of the jute industry has been transferred to the new department, since the Jute Control is at present responsible for the import of jute goods as well as the import of raw jute and jute yarns. Again, the choice was between keeping it wholly as it stood under one or other department. Other fibres such as raw silk, flax, soft and hard hems, coir, kapok, etc., will be within the responsibility of the Ministry of Materials. In fact the only raw materials retained by the Board of Trade will be china clay, diamonds and tobacco.

*

The setting up of this new department is unlikely to lead to any immediate change in policy. The appropriate staffs of both the Ministry of Supply and the Board of Trade will be transferred; this will ensure continuity of policy—especially price policy. If it is wise, however, the new Ministry will question the policies that it must for the time being take over. One of the advantages of putting responsibility for the procurement of materials upon one Minister ought surely to be the application of the lessons learnt from one commodity to the case of other commodities. Wool, for example, has shown very clearly how price can restrict consumption much more effectively than exhortation or rationing, by compelling manufacturers to use cheaper substitutes. Again, the Raw Cotton Commission has shown that successful government trading implies following rather than forcing the market. If the Ministry of Supply had refrained from speculation fifteen months ago, British metal users would be in a much more comfortable position than they are. The new Ministry should include in its first tasks a review of methods of governmental procurement and pricing policy.

The first bite at the problem of raw material supplies has been a big one—bigger than most people expected. But it is still only the first, and it is concerned with the two departments that until now have been mainly responsible for raw materials. Later on, it may be necessary to ask why linseed oil (an industrial material) remains with the Ministry of Food. Petroleum, which is at present considered a fuel rather than a commodity, may in view of political developments in the Middle East be the subject of international negotiation, in which case, presumably, the question of its transfer to the Ministry of Materials will be considered. Difficulties of co-ordin-

ation between procurement and use will certainly arise and may involve amendments to the proposed outline of responsibilities. If, for example, synthetic rubber were to become an important industry in Britain it might have to be treated like rayon and given back to the Board of Trade. Again, the intricate interrelationship of the textile industry may require rayon to be moved to the Ministry of Materials. Such a step, however, would mean transferring the responsibility of the manufacturing

Unilever Universe

IT takes the highest arts of presentation to make the annual reports of the Unilever group readily intelligible to the average shareholder, and it is no reproach to their skilful arrangement of figures and comment to say that the Unilever universe remains, in the lay investor's scheme of things, astronomic in range and size and correspondingly difficult for him to grasp. He knows in a general way that the Dutch and British siblings are linked by an agreement to secure that the ordinary dividends they pay are equivalent in value. What is paid by Limited is therefore conditioned by what is paid by NV; immediately, he is plunged into calculations about international trading conditions and taxation in the hope of measuring his prospects. NV's dividend is limited by a formula that is based, under Dutch law, on the capital employed in the business; to that extent it is variable, and the 12 per cent payment for 1950 seems to have left something in hand. Given the decision to pay 12 per cent, the dividend agreement automatically set Limited's dividend at 13½ per cent, a rate that was greeted with satisfaction though it involves a most modest inroad on the year's earnings.

One of the difficulties in a set of accounts of this order of complexity is to draw precise lines below which true earnings can be struck. It is obvious from the outset that the trading experience and accounting results of Limited and Unilever differed markedly last year—Limited with its rise in balances from trading account from £29.8 million to £34.3 million showed a moderate gain that cannot have owed very much to rising stock values, while NV's balances from trading have jumped one and a third times from £13.3 million to £30.9 million and would have been another £3,000,000 higher if the American Lever Brothers Company had not changed its basis of stock valuation to "last in first out." Evidently, the advance in turnover and in prices in the European and American markets mainly served by NV has had a phenomenal effect on the year's results, compared with the more modest course of Limited's profits. Unilever's total sales increased last year by nearly one-fifth, from £801 million to £989 million, and the group balances from trading rose by one half, from £43.1 million to £65.2 million; it is

process to the new department, and it might well hamper the Ministry of Materials in its prime function of securing immediate and long-term relief to possible scarcities. These are only a few of the problems that may lie ahead. Meanwhile a start has been made in the right direction, and at first sight it would seem that the Minister of Materials has been given ample scope to carry out his task of securing an adequate supply of raw materials for defence and essential needs.

*

Much play has been made with the Unilever figures (and indeed with those of other companies recently announced) on the score that they are unconscionably high; but those who are the first to cry "exploitation" are the last to understand the effect of a world-wide inflation on the true profits and financial foundations of a group such as Unilever. Certainly, no charge of rapacity can be levelled against the shareholders of the two companies; there are nearly 200,000 stockholders in Limited and a large, but unascertainable, number of shareholders in NV, who together received an increase in net dividends of rather more than £700,000—a matter of a few pounds per head. The largest claims on the trading balances are represented by depreciation and additional reserves for replacement of fixed assets and provisions against stocks; in total, these sums set aside to maintain the real substance of the group's fixed and

working capital have absorbed £15.4 million from the year's revenues, compared with £10.8 million in the preceding year. Even so, a true comparison of profit before taxation, as shown in the accompanying analysis of the consolidated profits, must take account of the sum of nearly £2,000,000 brought in by NV from stock reserves in 1949, and the big adventitious credits of £4,700,000 for the group as a whole that resulted from devaluation in that year. When these exceptional entries are removed from the reckoning, the increase in the past year's profits considerably exceeds the £10½ million shown in the table. In such a situation, there is at least one man who is undaunted; the tax collector has put up his claims by practically £11 million, from £17.6 million to £28.5 million, and on this footing the consolidated net profit of the group, after providing for taxation and the maintenance of assets, is actually down on the year—from £19.6 million to £19.2 million. Even though the fall in the net profit figure is to some extent notional, it is an astonishing result for a year of such bounding figures.

*

The reverse of the inflationary medal is to be seen in the consolidated balance sheet. The capital employed by the Unilever group as a whole has increased during the year by £35.4 million (from £273.5 million to £308.9 million), towards which Limited contributed

£10 million by last year's debenture stock issue, while revenue reserves provided £15½ million and capital reserves £8,000,000. The whole of this increase in resources has been used to finance a net expansion of fixed assets, after depreciation, of £15 million (from £153.6 million to £168.6 million) and an increase in stocks of nearly £21 million. So far as Limited is concerned, the report states explicitly that last year's debenture issue will go "by no means all of the way" towards meeting its increasing demands for working capital and extension of fixed assets. The company is seeking powers to increase its present borrowing limits, and it is evident that the directors will have to consider their future capital requirements before this year is out. Whether they may feel, when the time comes, that they are justified in pursuing a natural inclination towards an increase in Limited's ordinary capital, or whether the pressure of profits tax may lead them to resort, as last year, to a fixed-interest issue (with its disadvantage of a further arbitrary distortion imposed on the group's capital structure) remains to be seen. The possibility of a wholesale capital revaluation, on ICI lines, may also arise in the future. To judge from the consolidated accounts, however, this would be a task of great magnitude, for the fixed assets must in many cases represent the book values at which they are entered in the subsidiaries' accounts; they appear at a gross book value of £143.3 million, but there are also premiums arising from the acquisition of shares in subsidiaries amounting to £62.7 million which in their nature partake of additional values to be placed on the fixed assets.

*

A group of the world-wide range and size of Unilever can control its destinies up to a point; beyond that point it becomes in a sense the plaything of prices. Where prices have full sway—as they seem to have done in the NV empire—the consequences are distinctly different from those that are recorded by Limited, which to a much greater extent lives in a world of controls and government trading. By comparison, for example, Limited's stocks rose much more modestly last year than did NV's (partly because stocks of raw materials in this country are held on government account), but Limited's debtors increased far more rapidly than did NV's (is it justifiable to see in this increase the natural reaction of consumers to relatively low, controlled prices during a period of rapidly rising prices?). The big increase in Unilever's profits as a whole was clearly derived from the freer markets of Europe and the United States rather than from this

country—a point that the group's critics here might have the grace to bear in mind. There is nothing in last year's report that suggests any marked consumer resistance to the group's products in those markets where they were sold without rationing. Indeed it was in this country (which together with Finland and Israel shares the distinction of continuing the rationing of edible fats) that sales of margarine actually fell; in the Netherlands, sales of margarine reached a new record, and in Western Germany pre-war tonnages were restored. The debated question, particularly important for Unilever, about the future demand for soap and the so-called synthetic detergents remains, it would seem, unresolved. Consumption of the synthetic detergents continues to increase, particularly in North America; but in the United Kingdom the group found last year that the ending of soap rationing promoted a greater additional demand for soap powders and toilet soap than for detergents. Among the many important points in the detailed review of the group's operations, stockholders will not fail to note the marked improvement in turnover in soap, edible fat and toilet preparations in the United States; the new management structure, it is stated, "is proving its effectiveness," and the abolition of the federal tax on coloured margarine (a piece of agricultural feather-bedding enacted in 1886 and unassailable until last year) evidently holds out promise of increased trade for the American Lever Brothers company.

It is evident from the review of the past year that shortages of certain materials were already conspicuous towards the end of 1950. Their persistence into 1951 cannot be making for easy trading conditions, though it may be doubted whether shortages have become so universal as seriously to threaten the group's turnover as a whole. On a longer term view, it may well be that prices rather than supplies confront the group with more serious problems. Unilever has made important dispositions against the risk of falling prices—the change to a LIFO basis for the American subsidiary and the strengthening of the reserves against stocks, which now stand at £10.7 million against stocks valued at £143.1 million, are clear examples. The group has also continued the practice of fortifying the current year's depreciation provision with a large appropriation against the replacement of fixed assets—thereby meeting the full burden of replacement on assets "used up" during the year, though the depreciation provisions for the entire period before this practice was adopted would still be insufficient to provide for replacement at current price levels. Stockholders may feel that the recent increase in the dividend provides a new point of departure for valuing Unilever ordinary, which at 52s. 3d. ex dividend now yield 5½ per cent. But they will also acknowledge that there are few boards who would be more insistent than the directors of Unilever on the need to preserve the real substance of the group.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 58 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 1.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

A housewife
in Melbourne
goes shopping . . .

And an exporter here in Britain wants to know all about what she buys. He wants other information as well, for the success of his Australian export venture may depend on it. Many shrewd British exporters consult the Bank of Australasia which is in constant touch with all aspects of life in Australia and New Zealand. The information available at the Bank is accurate and up-to-date, it can be relied upon absolutely. Please call at, or write to, either of the addresses given below.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835)

Manager: G. C. Cowan

Head Office: 4 Threadneedle Street, London, E.C.2

Strand Branch: 263 Strand, London, W.C.2 (Opposite Australia House)

Business Notes

Higher Rates for Bank Advances

The efforts that the clearing banks have lately been making behind the scenes to agree among themselves upon a policy for raising rates charged on bank advances were abruptly thrust into the limelight on Tuesday last. Action by one of the leading banks—the Midland Bank—in instructing its branch managers that rates should be raised was represented in certain press reports as action by all the “Big Five” banks acting in concert; it was also stated that the increase would amount to “about 1 per cent” and would be supported by a “secret understanding” among the banks “not to steal each other’s customers” while the revision of rates was in progress. This action by the Midland Bank, and especially the false impression conveyed by the press report, forced the clearing banks to declare their intentions more formally and overtly, and certainly much sooner, than they would otherwise have done. The Committee of London Clearing Banks promptly issued the following statement:

Certain sections of the press have stated that it is the intention of the banks to increase interest rates to borrowers by 1 per cent, a statement which is entirely inaccurate.

It is contemplated that in view of present monetary conditions and the ever-increasing running expenses modest increases of $\frac{1}{4}$ per cent and $\frac{1}{2}$ per cent should be made in cases where the lending rate is comparatively low, but this is a matter which will be dealt with domestically by each bank with its own customers and not by general application.

The clearing banks have refrained from increasing charges generally except in a modest degree, but under present conditions some increase is unavoidable.

This statement has helped to clear the air, but it still leaves the public in some confusion about what is in prospect.

It is unlikely, however, that the banks will make any further specific effort at clarification—partly because they are not given to public utterances on matters such as this, and partly because the understanding that was maturing in their private discussions was not (and was never likely to be) in the cut-and-dried form that the reports have implied. These discussions, which have been proceeding for some months, have embraced the whole range of bank charges, and not merely rates of interest charged on loans and overdrafts, from the standpoint of exploring the possibilities of meeting the problem posed by the steadily rising pressure of costs upon revenues. The underlying assumption in these talks was the perfectly natural one that no individual bank could work towards higher charges unless the other banks moved more or less in step; but it was never to be expected that the outcome would be any detailed agreement for concerted action—if only for the reason that, even within any one bank, there is no precisely defined “tariff” of rates and charges for domestic business. The whole subject of service charges, in the fixing of which there is a wide variation of principles as well as practice, is inherently more complex than that of interest rates on advances; and it seems that it was only on the latter question that any general understanding was emerging.

To this extent, the situation has been crystallised by the unexpected events of this week. This does not mean, however, that the individual banks will now act in any prescribed and uniform way, or even exactly simultaneously, in raising the rates charged to borrowers. The extent to which individual customers are affected will depend partly upon the policy of the bank in question and partly upon the particular circumstances of each account. This loose arrangement does, however, apparently presuppose a regard for the principle, generally recognised during the war, that the banks should not directly compete with one another on terms. In so far as this principle is observed, a customer would find

it difficult, if not impossible, to shift his account from one clearing bank to another merely on the ground that he expected to be able to borrow at a lower interest rate from the second bank than from the first; no obstacles, however, would be put in the way of a shifting of business for other reasons.

* * *

No Deliberate Disinflation

It should be emphasised that this movement of bank advances’ rates springs purely from the banks’ concern about the pressure of costs upon their earnings. It is not the result of any action by the monetary authorities to use dearer money as a deliberate weapon of disinflation, nor does it even reflect a sudden reconversion of commercial bankers themselves to principles of monetary orthodoxy. Many of them, indeed, profess scepticism about the merits of a tougher monetary policy as a means of resisting inflation in present circumstances; and some, at least, were not sympathetic to the case for monetary policy as recently argued in *The Economist*—apparently on the grounds that a more positive policy, if it involved any significant rise in rates, would not be confined to bank interest charges on advances but would extend, in particular, to the interest paid by the banks on deposit accounts. In addition, of course, the banks fear the threat of further depreciation of their investment holdings.

This selective increase in rates is intended to help the banks to meet the steady rise in all administrative costs, the heavy pressure of the cost-of-living upon their staffs, the rapidly growing burden of actual and prospective liabilities for pensions (caused not only by rising prices but also by the “bulge” in the age-distribution of staff) and the need to make bigger provisions for contingencies. But although the higher rates are designed for this domestic purpose, it may be considered that they will also serve the interests of disinflation, by acting as a deterrent to borrowings. To some extent this will be true, but the disinflationary force of a rise in rates thus initiated (in circumstances in which it is in the interests of the banks to increase their loans relative to their low-yielding liquid assets) is certainly incomparably less than the force that might be exerted if a similar rise were dictated by the pressures of an orthodox monetary policy pursued by the authorities. There is, however, one way in which the banks’ action may exert a secondary disinflationary effect: it is far from certain that this movement can be kept as selective as the banks seem to assume, and the further it spreads, the greater the restraint that will be exerted. Already, fears that the trend towards dearer money is gathering momentum are having a strong influence in the gilt-edged market. Despite the substantial fall that has occurred in the past few months, gilt-edged prices have eased further in this past week—carrying a number of them decisively below their 1949 lows. The net price of “Daltons” has this week dropped below 64, to offer a flat yield of £3 18s. 2d. per cent.

* * *

Finance Bill—Postscript

The later stages of the Finance Bill debate in committee were largely free from the excitements and endurance tests that marked its middle phase in the previous week. Most of the time was spent in discussing (and mostly rejecting) proposed new clauses generally relating to matters of detail or technique that did not provide any occasion for significant statements on wider policy. Of most general interest, perhaps, was the Chancellor’s promise to launch an *ad hoc* inquiry into the operation of the purchase tax in spheres of trade that embrace utility goods; and also his

reaffirmation of intention to review before next budget day the whole structure of the entertainments duty. Both these matters are discussed in separate notes below.

From the standpoint of industry in general, the most notable addition to the Bill resulted from Government initiative to introduce a new clause extending from March 1952 to March 1954 the period within which capital expenditure on postwar rehabilitation has to be incurred if it is to rank for allowance as an expense when computing liability for income tax and profits tax. A further clause, proposed by Sir John Mellor, was also admitted, to extend similarly the period for relief from E.P.T. for terminal expenses. A number of proposed new clauses designed to give effect to detailed recommendations of the Tucker Committee were shelved, on the Chancellor’s affirmation that, while he was sympathetic to some of them in principle, the Government could not reach its conclusions on such technical matters until it had “fairly full” consultations with industry. There was no prospect, therefore, of legislation on these matters until next year. Incidentally, the debate produced still more evidence of the damage that has been done to the cause of relieving the pressure upon industrial capital by the Tucker Committee’s acceptance of the accountancy. Mr Nigel Birch moved a clause to exclude fixed preference dividends from the definition of distributed profits, and to treat them instead as payment of interest, for the purpose of profits tax. His object, of course, was to remove the arbitrary injustice to the equity shareholder and the unnatural distortion of the pattern of new industrial financing caused by the distinction drawn in accounting and inland revenue practice between preference and loan capital. Such arguments, however, merely drew from the Economic Secretary an assertion that the proposal was a “radical challenge to the whole of the Profits Tax principle” of which, he affirmed, the treatment of preference dividends as distributed profits (carrying the higher rate of tax) was an integral part. He then proceeded to stand the Opposition’s argument on its head, by declaring that the proposal would “greatly favour” a company with a large preference capital as against one with a small preference capital and a large equity capital. It is curious logic to contend that the removal of injustice would be of itself unjust.

Exports in May

Exports last month were valued at £229,800,000, compared with the average value, for the first four months of this year, of £202,700,000. Half this increase was due to higher prices; moreover, without an exceptionally high export of ships the total value would have been about 3 per cent lower than it was. Export prices in May were about 2.6 per cent higher than in April; whereas the volume of trade during the month, measured by the Board of Trade’s index, fell by 2 per cent. However, during the first five months of the year the volume of exports has been about 4 per cent above the 1950 average.

The May tonnage of exports of ships, in contrast to the low April figure, was about double the average for both 1950 and the first four months of this year; exports to Canada, Sweden, Portugal and Argentina, and to other foreign countries were exceptionally high. The volume of car exports in May was a little below that of April, but in these two months it has been at about the same level as the average volume of 1950 and above the exports of the earlier months in 1951. Among metal semi-manufactures, aluminium exports alone have been maintained during the first five months at last year’s level. The total quantity of machinery exported was slightly higher than the average of last year.

Textile exports fell in May, but during the first five months the quantity exported has been at about 10 per cent above the rate during last year. Cotton yarn exports at 6,785,000

lb, were above both the April figure and the monthly average of last year. On the other hand, cotton piece-goods exports dropped from nearly 96 million square yards in April to 78 million in May, although this was still well above the 1950 average. Rayon exports do not seem to have been affected yet by the sulphuric acid shortage; yarn exports were above their April level and above their average of last year, while rayon fabric exports, though less than in April, were decidedly higher than the average of 1950. Woollen and worsted manufactures, though less than in April, were also higher than the average of 1950. Both in April and May, however, exports of wool tops have been less than last year.

The main increases in imports in May were of foodstuffs, particularly coarse grains, softwood, woodpulp, paper and board, and crude and refined petroleum; imports of manufactured textiles from Western Europe were also high. The steady deterioration in the terms of trade, which continued in May, poses a serious problem for the country’s export trades. The returns show that exports in general are running at a fair level above the rate of 1950, but not sufficiently so—as the excess of the value of imports over exports during the first five months of the year shows. Sir Hartley Shawcross in a speech this week pointed to the problem; “when the Economic Survey was published it looked as if we should have to earn about £2,750 million by exports in order to achieve a balance of payments. Now the task is a good deal harder.”

* * *

Trade with China Controlled

The Government has decided, with effect from June 25th, to impose control by export licences on all goods exported from the United Kingdom to China or Hongkong in order to provide a completely watertight method of preventing the export of items directly or indirectly of assistance to Chinese military strength. Similar arrangements are to be made in all British dependent territories, including Hongkong. This statutory control of exports is to take the place of the informal, though nevertheless largely effective, arrangements to prevent military exports to China during this year—such as the arrangements with the iron and steel industry; and it is the Government’s response to the United Nations resolution of May 18th urging embargoes on all military or strategic items.

The principal categories of goods whose export will be subject to embargo are petroleum products, transport materials, metals, minerals and their manufactures, rubber and rubber products, certain types of chemicals of military value, including strategically important plastics, petroleum equipment and plant, certain chemical equipment and plant, electronic equipment, scientific instruments, metal-working machine tools, rubber machinery, industrial diamonds and tools, bearings, electric generators and welding machines. Britain in 1950 exported to China significant quantities of iron and steel manufactures, copper and manufactures, electrical goods, apparatus and machinery, machine tools and scientific instruments; and, during the first four months of this year, some exports that come under these categories continued, though in May they were very much reduced. China will therefore be deprived of many materials and products that she has been in the habit of importing from this country. China’s greatest needs, apart from rubber—on which an embargo was placed on May 10th—are probably for transport equipment, electric generators, metal-working machine tools and petroleum products; and even if it can get these from Russia it would only be by taxing present transport routes to excess.

United Kingdom exports to Hongkong are of course not so easy to control as to China. Satisfaction from the Hongkong authorities is to be obtained, wherever it is considered necessary, concerning the final destination of goods before British export licences are granted. This is in addition to

COTTON: The association between Egypt and cotton dates from the earliest days of that ancient country and woven cotton has clothed its inhabitants ever since the time of the Pharaohs. In spite of this long association, it was not until 1820 that Egypt set out to produce cotton in the quantities required by European manufacturers, and the year 1821 saw the first shipment of Egyptian cotton to England. The shipment was only 100 bales—but from this small beginning the export of cotton has become the mainstay of the Egyptian economy. Full and up-to-date information from our branches in Egypt on market conditions and industrial trends in the country is readily obtainable on request. Please write to our Intelligence Department at the address given below.

BARCLAYS BANK
(DOMINION, COLONIAL & OVERSEAS)
54 Lombard Street, London, E.C.3.

the import licence control that the Governor of Hongkong has been recommended to impose. Yet it has always been difficult to find out the ultimate destination of goods sent to Hongkong, even after the event, and trade records including Hongkong have always suffered from that disability. Moreover, smuggling is almost impossible to control completely and Macao is over the water.

The Government's intention, Sir Hartley Shawcross affirmed, is not to stop all trade with China any more than it is to injure Hongkong. In April Britain was still importing liquid eggs, tung oil, bristles and animal feedingstuffs from China—which are not significant; though hardly anything was imported in May. The main British exports to China that do not come under the embargo are textile machinery, wool, wool tops, and paper and cardboard. On both sides, therefore, there should still be some ground for continued trade.

* * *

IMC Breaks the Ice

The first fruits of commodity negotiations in Washington are the unanimous recommendations of governments that an "international system of equitable distribution" for tungsten and molybdenum ores and concentrates should be established. Details of the proposed scheme have not yet been published, but the tungsten and molybdenum committee of the International Materials Conference reported that an interim distribution would commence on July 1st and that temporary allocations have been recommended for the third quarter, July 1st-September 30th. Detailed measures to be adopted by importing and exporting countries have been agreed and price limits (also not published) have been fixed within which ores and concentrates should be bought and sold during the third quarter.

Eleven countries are represented on the committee, comprising both major producers and major consumers: Australia, Bolivia, Brazil, Chile, France, Germany, Portugal, Spain, Sweden, the United Kingdom and the United States. Until more details of the scheme are known, it is difficult to assess how well it will work. But since agreement between the member countries has been unanimous, the scheme has a fair chance of success. Its form is likely to be similar to that of the international wheat agreement, whereby the major producers guarantee to export specified total quantities to member countries during the quarter, at prices not exceeding the maximum limit, while consuming countries guarantee to import specified total quantities at prices not below the minimum. The actual buying and selling would then be left to individual bargaining between the various countries.

Of the other committees of the conference, the wool committee adjourned at the end of May without making recommendations. The cotton and cotton linters committee, which has not met for some time, is due to meet again this week. The sulphur committee is working on a scheme "for equitable distribution" and the paper and pulp committee is discussing the supply of newsprint, while the committee dealing with non-ferrous metals is considering means of expanding world production. At least the ice has been broken and international allocation for one group of commodities has been achieved. It remains to be seen how many of the other committees will follow this lead.

* * *

More Metal Restrictions

This week's prohibitions of the use of stainless steel, nickel alloys and nickel plate in a wide range of civilian articles and components form the second stage in the process of restricting general use of nickel and other alloy metals that started at the beginning of May. Mr Strauss then announced that stainless steel producers would receive 70 per

cent of their 1950 deliveries and that anodes for nickel plating would be reduced to 50 per cent of 1950 supplies. The third stage he then forecast—closer control of the distribution of nickel, tungsten, molybdenum and alloy steels—is still to come. It will be the most important instalment. This week's prohibitions will do no more to limit production of stainless steel and nickel plating than the first percentage cuts have already.

The nickel prohibitions cover not only its use in durable consumer goods—fittings and trim on cars, motor cycles and cycles, and domestic equipment (though not kitchen pots and pans)—but also a range of building materials, electrical items and certain machinery. The orders have been framed so as to allow exceptions for those special cases that were found to exist after similar prohibitions for copper and zinc were announced at the beginning of the year—and also, presumably, with an eye to the prohibitions that have been in force for nickel in the United States for some time. Use of stainless steel and other alloys is prohibited from this week in such manufacturing processes, but the plating ban will not come into force until August 22nd, and makers of prohibited articles have until October to use up stocks of components made of nickel and nickel alloys now in hand.

Licences to use nickel in the forbidden articles will be granted for making goods for export where the "conversion value" is at least 15 times that of the nickel or alloys incorporated; for finishing off nearly completed articles or making essential parts, using up semi-manufactured material stocks that cannot be converted to any other use, or making parts undergoing exceptional wear or corrosion; and "if the full application of the Order would cause exceptional personal hardship." The last condition might appear an invitation to complaint, but licences in fact will probably be granted sparingly on such grounds. The end of the "period of grace" for using up stocks of zinc and copper alloys in prohibited goods is now approaching; and applications for exceptional treatment under these orders are reported to be fairly numerous. When the orders were first made, production of the metals in semi-manufactured form was increased for a time, and a larger number of manufacturers than was then expected still retain stocks of metal in what they consider "inconvertible" forms. Licences to finish off these stocks are being granted: there is in fact some possibility that the original orders will shortly be amended, though in points of detail that will not necessarily loosen the control now coming into full operation.

* * *

Nickel Remains Scarce

World supplies of nickel (outside Russia which with Petsamo has a fair output) are wholly inadequate to meet rising civilian and rearmament demands. The shortage has been aggravated by substantial stockpiling, and by the addition of German, Italy and Japan to the market that Canada has to supply. The expansion of demand for rearmament arises particularly from the need for high-temperature resisting alloys for jet-plane production; and nearly half the nickel used in this country is for alloy steel.

More than 95 per cent of western supplies comes from Canada, and nearly nine-tenths of production is from the International Nickel Company's deposits. The Canadian Dominion Bureau of Statistics estimated Canadian output last year in nickel content at about 120,000 long tons, of which International Nickel produced about 110,000 and the Falconbridge Nickel Company the remainder. This was a few thousand tons less than the 1949 output, although International Nickel's deliveries in 1950 were much higher. Last year's deliveries by the company were the highest since the war, though lower than in 1942 and 1943 when total Canadian output was at its peak. The very high demand at the beginning of the war was only met by working the then newly-tackled Frood-Stobie open pits, the company's

only opencast mines, to such an extent that they are likely to be exhausted by 1953. International Nickel is thus faced with the task of rapidly hastening a huge programme for the extension of underground working in order to meet demand; and because some of the new ore-bodies are of lower-grade ore, changes in mill and smelting processes are necessary. In 1953, however, the company may be producing at the rate of something over 150,000 tons a year, or over 30 per cent more than last year. Further ahead it may well begin mining at Shebandowan Lake, where drilling has suggested extensive deposits.

The Falconbridge company is also expanding mining output in Canada and is increasing the capacity of its Christiansand refinery in Norway. Over the next two years a few thousand tons extra may be provided. The Sherritt-Gordon mines in Manitoba are expected to be in production this year, but their output will go to the United States. Similarly, two United States companies, with government aid, plan to begin production again in Cuba, where it was stopped in 1947 as too costly for normal peacetime requirements. A small extra quantity may also be obtained from the American Frederickstown deposits in Missouri. Elsewhere, New Caledonia is unlikely to do more than supply French needs. A little nickel is mined in Goiás, Brazil, by a Brazilian company in association with an American concern. The deposits are large, and a Canadian company is reported to have also obtained a concession there; but difficulties of transport are likely to impede large-scale production in Brazil for some time. No result has been announced from the exploration by the International Nickel Company in Venezuela. Thus, though the Sherritt-Gordon mines and Cuban production may help to meet American demand and thus ease the strain on Sudbury output, little alleviation of the present world shortage can be expected during the rest of this year or in 1952. In 1953, with increased International Nickel output, the prospect may be better, depending perhaps on the extent of rearmament; and in the long run there are large deposits in Brazil as well as in Canada that could, at a price, be worked.

* * *

Germany Eases Import Licences

The complete figures of the position of members of the European Payments Union at the end of May, 1951, are now available. They reveal some interesting changes in the situation. One of these, the sudden emergence of the United Kingdom as a debtor country, was disclosed last week and was then discussed in a note in these columns. The other striking development disclosed by the figures is the new-found creditor status of Germany. In May, Germany accumulated a credit of \$81 million with other members of the Union. Of this, \$50 million was required to repay the outstanding balance of the special credit of \$120 million that had been put at Germany's disposal when its balance of payments difficulties had caused it to exceed the facilities of the original EPU quota. The balance of \$31 million of Germany's May credit was refunded to Germany in gold or dollars. At the end of May Germany had accumulated a net deficit of \$330,600,000 since July 1, 1950. Of this, \$11,900,000 had been met by the use of existing resources previously held by Germany. This left a balance of \$319,600,000, or virtually the equivalent of Germany's initial quota of \$320 million; of this, under EPU rules, \$191,900,000 had been taken in the form of credit from EPU, and the rest (\$127,700,000) had been paid out in gold or dollars to EPU.

The improvement in the German balance of payments has been rapidly followed by an adjustment of import licensing policy. The total of licences, which had been cut down earlier this year to the equivalent of \$150 million a month, has already been increased to the equivalent of \$170 million. The country which is likely to benefit most directly from

this relaxation of previous restrictions on German imports is the Netherlands. It is in dire of this relief, for at the end of May it had run up an overdraft of \$169,400,000 with EPU and had already lost \$56,100,000 in gold to the Union. These figures indicate an accounting deficit of \$225,500,000 with EPU countries; this compares with the Netherlands initial quota of \$330 million. The Dutch position thus remains decidedly strained, and in considerable need of the help it should receive from increased possibilities of export to the traditional German market.

* * *

Tinkering with Purchase Tax

The Chancellor of the Exchequer made it very clear this week what the *ad hoc* committee he proposes to appoint to study certain aspects of purchase tax would not be. It would not be the standing advisory committee the Opposition wanted. It would deal with problems quite other than those the FBI had suggested deserved a committee's attention. It would not act as a buffer between trades and the Treasury. Nor would it be authorised to recommend changes that would involve any net loss of revenue from the tax. Mr Gaitskell was rather less specific, however, in defining what the committee would be and do. He required "a very short space of time" to announce its terms of reference, and he did not make it clear whether its membership would be independent, or official, or both. He declared that its scope would be limited to studying the effect of purchase tax on those classes of goods in which utility schemes operate—which vastly narrows its terms of reference in comparison with those the Opposition had in mind, but would still include the cases in which the tax is causing the most awkward anomalies. In this connection the Chancellor mentioned one specific point made

by the tax's foreign critics at Torquay—that its effect as a concealed tariff upon imported goods might run counter to the country's international obligations.

It may be hoped, therefore, that the terms of reference of the new committee will embrace some of the more obvious particular distortions that purchase tax tends to impose upon manufacturing and trading practice. Mr Gaitskell emphasised the "present very great advantages of the utility scheme to consumers," but also conceded that the arbitrary and artificial gap in price between utility products and non-utility products of only slightly higher quality caused difficulties in manufacture and had "rather specially adverse effects upon the export trade." In certain trades, the home market has become almost entirely confined to utility goods, and the manufacturer who attempts to earn foreign custom with high quality must split his production. Within the home market, standards of production tend to be deliberately held down to the mediocre, so that adventurousness in design, which is not a thing that can be risked in export markets alone, is at a discount. The advisory committee envisaged in the Opposition's amendment might possibly have become a magnet for complaints that really concern fiscal policy rather than detailed administration of the tax; and the Chancellor was right to point out that such larger responsibilities cannot be devolved. But the narrow limits within which his own committee appears likely to work suggest that it cannot hope to do more than tinker with the tax.

* * *

Increasingly Full Employment

The increase of 36,000 in the total working population during April to a total of 23,265,000 was, as usual in this month, largely the result of the influx of school-leavers. Similarly, the decrease in the number registered as unemployed from 253,000 at April 16th to 215,700 at May 21st was partly seasonal. Nevertheless there has been a decline of 99,000 in the number of unemployed during the twelve months from May, 1950, when the total of unemployed was 314,700; the rate of unemployment for the whole of Great Britain is now 1 per cent, its lowest level since the war. Unemployment remains concentrated in Wales, Scotland and the Northern area, where it is still just over 2 per cent as against 3 per cent or more at the same time last year.

The partly seasonal increases of 5,000 in employment in both the distributive trades and in professional and miscellaneous services, and of 3,000 in building and contracting were markedly less than last April; on the other hand the influx into agriculture of 18,000 was much bigger than a year previously. The other large increases during April were of 5,000 in the food, drink and tobacco group of industries, 4,000 in the metals, engineering and vehicles group, and 2,000 into clothing. April was too soon to expect any evidence of a shift to meet rearmament requirements. So far this year, both in the decrease in unemployment to below last year's levels and in the increase in the number of women working, there is the expected evidence of an increasingly fully-employed nation fairly generally throughout the economy. When rearmament does make its extra demands, they will have to be met by a switching of labour, rather than from any reserve of women or unemployed.

No ICI Bonus

The logical step to complete the recent revaluation of ICI's fixed assets was to issue ordinary capital corresponding to the capital reserve produced by the revaluation itself. Proposals to capitalise "a substantial part" of the reserve submitted by the company to the Capital Issues Committee have been turned down; on this occasion, it would seem, the Chancellor's new directive has not influenced the CIC to take a favourable view of an operation that would not, on the face

of the matter, appear to conflict with the conditions that it imposes. It was a single operation that ICI proposed, and one that could hardly fail to benefit the financial stability of the undertaking without in any whit reducing its tax liabilities. Was the proposal, then, thought to be inimical to the public interest? Or was the origin of the reserves—as part of a book-keeping operation and not as a fund created from profits—reckoned to be of too unorthodox a character to satisfy purist accounting conceptions? No reasons, as usual, are given. The episode provides a further illustration of the wayward course that the CIC's decisions have so often taken.

Matador Land Offer

Shareholders in Matador Land and Cattle have now received specific details of the offer for their shares made by Lazard Brothers and Company with whom, it is understood in the City, the New York brokers, Model, Roland and Stone, are in this connection associated. Some holders may well feel that the offer has taken an unconscionable time to formulate. The Board announced as long ago as last November that negotiations were taking place for an offer for the company's property in Texas. Then the 5s. shares were around 50s. and they have since soared to around £10. However, this is truly a case where patience is being rewarded, for the offer amounts, in fact, to a price of US \$23.70 or £9 6s. 3d. per share. The sterling price is guaranteed by Lazard Brothers and is based on the dollar price, increased by a London premium of 10 per cent on dollar securities. The sterling price will be of interest primarily to those shareholders who do not wish themselves to retain the dollars for reinvestment in other American securities. The present London premium in the market is around 14 per cent, but holders will get the benefit of any improvement over the 10 per cent realised by Lazard's in disposing of the dollars, subject to a 3 per cent handling charge on the total proceeds (exclusive of the premium). In addition to the cash payment, holders will receive a half interest in the oil and mineral rights owned by Matador in the United States. Although the present estimated value of this interest is reckoned to be only 7s. 6d. to 10s. per share, this value, if oil were in fact discovered on the properties, would be considerably greater. It must be remembered, however, that despite drillings on the properties by one of the leading US oil companies, no indication of oil has yet been found.

The offer is subject to acceptance by not less than 90 per cent of the outstanding shares or such less percentage as Lazard Brothers may decide. All the directors are proposing to accept the offer in respect of their own holdings and they recommend this acceptance by the other shareholders. There can be little doubt that most shareholders will be pleased to accept, since, even on the basis of a full distribution of last year's record earnings of 160 per cent, the yield would be only 4½ per cent. At the company's annual general meeting in April, the chairman stated that the company, as the owner of first-class land and cattle, held the perfect hedge against inflation. Having regard to the rise in the price of their shares, holders will be little inclined to disagree with this view. But the sale of the company, which was established in 1882, is another melancholy step in the process of liquidating British overseas assets.

Hoarding Oils and Fats

Hope that margarine rationing might have been abolished this year has been destroyed by the fantastic rise in the price of oils and fats towards the end of 1950 and in the early months of 1951. The increased demand arose more from the propensity to hoard than the propensity to consume. Mr J. C. A. Faure, of Messrs Unilever and

IRON

THE element iron is the most important of all metals and, next to aluminium, the most widely distributed. It has been estimated that there is an average of one cwt. of iron for every ton of the earth's crust. There are many different forms of iron ore, but only four—haematite, magnetite, limonite and siderite—are of industrial value. Most of the iron ore mined in England comes from the siderite deposits at Corby in Northamptonshire and the Scunthorpe district of Lincolnshire. Iron ore smelted in a blast furnace with coke and limestone becomes pig iron, the raw material from which cast iron, wrought iron and steel are made. Steel, the strongest metal in common use, is iron containing about 1% of carbon. Though iron is a newcomer compared with copper and bronze, more than 3,000 years ago it was used to make implements and weapons. Today it is an essential in the structure of civilization. Without it, there would be no railways, steamships, skyscrapers or machinery. Apart from its use in the construction of chemical plant, iron and some of its compounds are vital in certain chemical processes. I.C.I. uses iron as a catalyst in the production of synthetic ammonia, and iron pyrites—a sulphide of iron—in sulphuric acid manufacture. It also uses some of the oxides of iron to make pigments for the paint and rubber industries.

PENSION SCHEMES

WITH PROFITS

A new development

For particulars apply to The Actuary
**THE PRUDENTIAL
ASSURANCE CO. LTD.**
HOLBORN BARS, LONDON, E.C.1

Lever Bros. Ltd., in his address to the International Association of Seed Crushers Congress, estimated that stocks of oils and fats in Europe (particularly in Western Germany) increased by 493,000 metric tons in 1950, while higher prices encouraged an expansion in world exports of 560,000 tons.

Last year, world production again increased; it was 23,045,000 metric tons, or nearly 1,500,000 tons larger than before the war. World exports, which declined in 1949, rose last year to 5,379,000 tons, but were still 450,000 tons below their prewar level. On the other hand, European supplies, estimated at 7,904,000 tons, were only 24,000 tons smaller than before the war. The problem of oils and fats is twofold. First, despite the increase in world production that has taken place since the end of the war, total world supplies per head of population are still smaller than before the war. Secondly, world exports, particularly from soft currency areas, are still

much below their prewar level. But if last year showed anything, it was that high prices encourage a proportionately greater rise in exports than in production.

The prospects for 1951 offer a little encouragement. Mr Faure has forecast world production at 23,170,000 tons, an increase of 125,000 tons on 1950. World exports at 5,375,000 tons are unlikely to be any larger than last year. The United States is again expected to have an export surplus of 350,000 tons. Nigeria, however, has had a bad groundnut crop for the second successive year; its exports are not expected to exceed 130,000 tons, as there are no stocks of old crop left. But shipments from India, Ceylon, Malaya and Indonesia should be larger this year. The supply of edible oils is put at 1,058,000 tons, 100,000 tons less than last year, the main decline being expected to occur in olive, groundnut and cottonseed oils; palm oils are expected to increase by 130,000 tons to 2,087,000 tons. Industrial oils at 603,000 tons will be some 70,000 tons smaller, while the supply of marine oils may increase by 40,000 tons to 587,000 tons. Supplies of butter, lard and tallow are expected to show little change. If the propensity to hoard has been satiated, the volume of world exports this year might still justify the abolition of the margarine ration within the next twelve months.

Falling Textile Sales?

At the beginning of the month, several of the leading manufacturers of knitting wools, including Paton and Baldwins Ltd., the largest single producer, reduced their prices by between 3d. and 4d. an ounce below the ceiling price of 3s. 1d. an ounce that came into operation in March. The companies explained that the lower prices that they are now paying for raw wool have made these reductions possible. But it is also true that retail sales have fallen sharply since the latest maximum price came into operation, and that numbers of retailers have for some time not been taking

their full "quota" of wools from the manufacturers.

This fall in activity appears to be fairly general throughout the wholesale textile trade. The index of wholesale textile sales, which is based on value, rose from 99 in January (1947=100) to 189 in March. Sales in April fell 16 points, though the level was still 55 points above that reached in April, 1950, but sales in May are expected to show a more marked fall. In the past few weeks, the time of year when orders for winter goods are normally placed, textile wholesalers say that business has been extremely slack. But the explanation may lie in the wholesalers' own activities. Since last September, wholesale sales have been at an exceptionally high level; all except the largest retailers have probably overbought during that period.

The existence of large retail stocks, combined with the sharp fall in retail sales that is said to have taken place in May and June, is certainly acting as a deterrent to further buying. So is the uncertain trend of prices. The majority of manufacturers are generally refusing to quote firm prices for delivery, which offers retailers little inducement to place orders now. The possibility of a fall in cotton, if not also in wool, combined with uncertainty about the reaction of consumers to the increases in nearly all utility prices, are also leading retailers to rely on stocks. What effect this present slackness will have on the textile industry depends on how far it represents a genuine reduction in civilian consumption brought about by high prices, rather than a temporary slump after a period of unnatural activity. A fall in home consumption would make it easier for the textile industries to increase exports this year. But should the same factors be at work in the export markets, a drastic revision of prices may shortly become necessary.

Cleaner Coal

A coal preparation plant at Chislet Colliery in Kent that was "inaugurated" by Mr Noel-Baker and Lord Hyndley last week (it has in fact been operating since the end of 1950) is the first full-scale unit to use the Ridley-Scholes washing process. This is a British example of the "dense-medium" systems for cleaning large coal, in which coal is passed into a thick "cream" (in this case a magnetite suspension in water) that allows the denser shale to sink to the bottom but holds the coal near the surface to be skimmed off. By adjusting the density of the medium a second separation of lower-grade coal can be carried out: such systems allow a sharp grading of coals. This system had been successfully tested before in a prototype washery: Chislet, which will handle 220 tons of coal an hour and prepare the colliery's entire output of 750,000 tons a year on a two-shift basis, is the first operational plant. A standard washery that will incorporate this process for larger sizes of coal, the normal "Baum" washery for smaller coal, and a froth flotation plant to extract the last "fines" has now been designed for the Board with the same output; the first standard plant of this type is being built in Warwickshire.

The Chislet washery cost £185,000, or about £870 "per hourly ton of output," which is slightly above the estimate of capital cost for preparation plant given in the industry's long-term Plan for Coal last October. No operating costs are yet available: the plan estimated preparation costs generally as "of the order of 1s. 6d. to 2s. 6d. a ton," but these, too, may well have been exceeded. The coal industry, since nationalisation, has installed 54 preparation plants to handle 12 million tons of coal a year at a total cost of roughly £3,750,000. It is now cleaning 82 per cent of its total saleable output of coal, about 52 per cent by cleaning plant and 30 per cent by hand; though 16 new washeries handling 5,000,000 tons a year were brought into operation last year, the percentage cleaned showed little change from that in 1940, since total output rose and workers were leaving the hand-picking belts. Installation of plant does not auto-

matically add to the output of cleaner coal. The growing use of water for dust suppression underground means that more and more coal comes up wet nowadays, and existing dry-cleaning plant cannot handle it; apart from normal replacement when it wears out, much of the industry's cleaning plant will have to be changed over. In its recent 1950 report the National Coal Board appeared less concerned to explain deliveries of dirty coal to consumers than in previous years. This does not necessarily mean it is delivering very much less. But whatever the score on that account, it may reasonably argue that the recent graded price structure may somewhat temper the customer's wrath about coal quality. The consumer may still have to accept much coal he would not choose and some he cannot burn. But at least any slate he buys may cost him rather less.

Gas Turbine Developments

For the past week the Admiralty has been demonstrating on the Thames two craft that are not only the first, but are believed to be still the only ones of their kind in the world. They are a harbour launch and a motor torpedo boat, both powered by gas turbines. Their appearance as part of the Festival exhibition culminates a long series of trials carried out by the Admiralty to prove the suitability of gas turbines for marine propulsion. Fuel consumption of these engines is admittedly considerably higher than that of the conventional reciprocating engines they replace. But at the present stage of gas turbine development the impressive fact about them is that they are working to their rated capacity, modest as that may be.

To the Admiralty must go the major part of the credit for developing the marine application of gas turbines. Much of the incentive in this work comes from what has been described as the "major maintenance problem" of servicing

reciprocating engines in the Navy's innumerable small craft: gas turbines should need much less maintenance. The two new craft are conversions undertaken to prove simply that gas turbines could be installed to drive ships. Two fast patrol boats soon to be launched have however been specifically designed for gas turbine propulsion and the gas turbines installed in them specifically designed for marine use. These might well become the prototypes for operational craft.

The harbour launch is powered by an adaptation of the Rover gas turbine car engine. The engines of the M.T.B. and the new patrol boats are being built by Metropolitan-Vickers, while English Electric and Rolls Royce are working on larger engines for a frigate and a gunboat respectively. The Shell Petroleum Company is soon to launch a tanker powered by a gas turbine built by The British Thomson-Houston Company and by three conventional diesel engines. Justification for the use of gas turbines in these heavier ships lies in the lower capital cost of the engine installation and in the big saving of weight for the same power. If the thermal efficiency of the engines can at the same time be improved, which at this early stage seems highly probable, then the arguments for their marine use will become even stronger.

Most of the work on industrial gas turbines being carried out in this country is, like the Admiralty experiments, designed to obtain operating data on installations of all kinds. Several electric generators are now running, and the Rover car has shown that gas turbines can be used for road vehicles, even though the efficiency of the present engine is still too low to make the project economic. Trials of the Metropolitan Vickers gas turbine locomotive would have been under way by now had not strikes delayed work on the engine. These developments cover all but the lowest power ranges: the 200 brake horse power Rover turbine is the smallest so far developed. Companies both inside and outside the motor industry are working on smaller gas turbines; and to give a further stimulus to work in this field the

and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Capital Security

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 24% per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured

upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.

Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 • RESERVES £330,000
OPEN ACCOUNTS 16,000

Investment Dept. F.I.

6/7 NEW BRIDGE STREET, LONDON, E.C.4.

Ministry of Supply is now asking for tenders for turbines of less than 100 bhp, about the same power as that of the average British private car.

British Insurance in 1950

The results of the leading insurance companies for 1950, which can now be surveyed as a group, reveal that the companies enjoyed another good year. The net trading profits, excluding interest on reserves, of the leading composite offices totalled £8,100,000; this, it is true, was a little below the £8,500,000 shown for the bumper year 1949, but was still far ahead of the £4,500,000 for 1948. Underwriting experience as a whole was rather less favourable than in 1949, although aggregate premium income from fire, accident and marine premium business rose by no less than £44.9 million to £347.4 million. All the companies, except the Royal Liverpool & London & Globe group (which still accounts its North American business at \$4.86 to the £), last year converted overseas currencies into sterling at substantially the current rates of exchange. As about 70 per cent of the whole business, other than life assurance, is transacted outside the United Kingdom, most of the big jump in the premium income was thus due to the fact that a full year's North American business was brought into accounts at the new rates of exchange; in 1949 accounting practice had varied widely. There was, however, a further increase in the volume of business last year.

Fire premium income of the leading companies expanded by £20 million, to £154.5 million, and underwriting profits were slightly higher, at £16.0 million (10.3 per cent of premiums) compared with £15.4 million (11.4 per cent) in 1949. This result is particularly satisfactory, for fire insurance business in North America was unprofitable last year. Severe wind storms in the United States culminated in November in a storm in the eastern States of hurricane intensity, and this resulted in claims aggregating some \$150 million—a loss second in magnitude only to that of \$213 million incurred in the San Francisco earthquake of 1906, the greatest single insurance disaster of all time. In Canada there were severe spring floods in Winnipeg, and in addition the town of Rimouski, on the St. Lawrence River, was almost wholly destroyed by fire. Largely as a result of these disasters, the fire underwriting profits of domestic United States insurers last year were less than half those of 1949. The British companies were helped by a more favourable experience at home and elsewhere overseas, demonstrating again the advantage in insurance of a wide geographical spread of risk.

Accident insurance, half of which consists of motor insurance, is now the most important class of business. The aggregate premium income of the leading offices last year was £173.3 million, compared with £147.0 million in 1949. Underwriting profits, however, declined to £7,900,000 (4.6 per cent of premiums)—but the £10.5 million (7.2 per cent of premiums) for 1949 was exceptionally good. Motor insurance throughout the world has been running on a slender profit margin for some time and in the United Kingdom the rates of premium have been increased by 12½ per cent as from June 1st. In the marine field it had been feared that severe competition might force cargo insurance rates down to an unprofitable level; but this has not happened so far, although some rates have been cut to the bone. Marine premium income and profits were both somewhat higher last year than in 1949. Three factors, however, have made it necessary for the companies to retain substantial reserve margins in the marine funds: hull claims continue to come in for several years after the receipt of the relative premiums; the cost of repairs continues to rise; and some repairs now being paid for in hard currencies must be charged against premiums received in sterling before devaluation. Hull premiums are being increased by 10 per

cent from the next renewal date because of the increased cost of repairs.

New ordinary life assurance business was some 10 per cent up on 1949 and easily established a new high record. The buoyancy was, however, much more marked in group and other staff assurance business than in policies sold to individuals. Industrial new business was maintained at substantially the 1949 level. Having scrupulously observed dividend limitation during 1948 and 1949, the insurance companies, with only a few exceptions, have this year increased their dividends. The net amount paid out in ordinary dividends by the leading composite companies for 1950 was £6,300,000, compared with £5,700,000 in 1948 and 1949: the increase is, however, less than one half the rise in the net interest income from £8,000,000 in 1949 to £9,400,000. The net trading profits of the 20 leading composite offices, together with the excess of the interest earnings over dividends paid, amounted last year to £11.2 million; this represents the sum ploughed back into the business as additional reserves.

Shorter Notes

The World Bank has made its first entirely non-dollar loan. Sterling, French francs, Danish and Norwegian kroner to a total value of £875,000 are being lent to Iceland for two hydro-electric projects. These funds, which are drawn from the several Governments' paid-in 18 per cent capital subscriptions, will be used by the Icelanders to purchase equipment in Sweden, the United Kingdom, Western Germany, Denmark and Norway.

Subject to permission and approval of terms by the Capital Issues Committee, the Bank of London and South America proposes to issue £202,000 £5 shares to shareholders, in the proportion of one for every £20 of stock held; the new shares would rank for any interim dividend in 1951. The bank's business has been sensibly increased by the present boom and rapid rate of development in Latin America; in the last three months of 1950 alone its deposits rose by £7,000,000 to £112 million.

At the time *The Economist* went to press, no official details were available of the formula for this year's rates of Entertainment Duty agreed between the Treasury and the film trade—in particular the cinema exhibitors—during the week. Comment in the trade upon the Chancellor's "final offer" on Tuesday suggested that his proposal might involve a total increase in the proceeds of the tax of £11 million, against the original £10 million; from this the Chancellor would take £7,500,000, and the remainder might be divided approximately equally between exhibitors and producers. The proposed new scale of tax might spare the cheaper seats any increase, thus benefiting small cinemas more than the higher-priced halls. Whatever the final terms—which are certainly less favourable than the exhibitors hoped—their acceptance appears to have been influenced by the Chancellor's specific undertaking to inquire this year into the existing incidence and discrimination of the whole Entertainment Duty.

Certain statistical series included in the table "Coal Output and Costs, 1947-50" published on page 1386 of *The Economist* for June 9th were not properly comparable. Figures of total saleable output for 1950 and 1949 were corrected to exclude the output of small mines not operated by the National Coal Board; output figures for 1948 and 1947 included such output. In the case of the newly-separated Northern and Durham Divisions of the NCB, comparable figures of output, manpower, attendance, and financial results were given only for 1950 and 1949; comparable figures for the earlier years also are available in Appendix I of the NCB Report for 1950.

Company Notes

Wiggins, Teape.—In 1949, the fall in woodpulp prices, three successive reductions in the controlled price of paper and the lifting of many controls on paper distribution led to a slump in Wiggins, Teape's profits. The company has now completely recovered from this setback and group trading profits last year more than doubled from £1,039,417 to £2,752,914. Higher prices for paper, greater production from the company's older mills and additional output from three newly built mills have all contributed to this recovery. The advance in profits has enabled the company to raise the tax-free ordinary dividend from 3½ to 4½ per cent.

	Years ended Dec. 31, 1949	Dec. 30, 1950

† Tax free.
£1 ordinary stock at 40s yields £4 10s per cent.

With the end of the Board of Trade scheme for purchasing esparto and woodpulp, paper mills were once again required to finance their own stocks of raw materials. Consequently, stocks have risen from £3,071,094 to £3,589,451, while increased business and prices have led to further investment in working capital, so that total current assets have increased by some £1,800,000 to £7,474,705. This increase has been partly financed by profit retentions and partly by a bank loan of £500,000 and by the use of acceptance credits of £731,739.

The unprecedented demand for paper should ensure a very satisfactory year of trading in 1951, but raw material prices are giving rise to considerable anxiety. Production of woodpulp has fallen so far behind demand that prices have risen to abnormally high levels. These prices bear little or no relation to woodpulp production costs; they add to the considerable burden of financing stocks and they make long term trading prospects vulnerable to any setback in prices.

Burmah Oil.—The market was pleasantly surprised earlier this month when Burmah Oil supplemented the maintained ordinary dividend of 15 per cent by a cash bonus of 6 per cent; the increased dividend is amply covered by earnings, but the chairman points out that this step "carries no implication that it will be repeated in future years." Be that as it may, investors have been cheered by the substantial improvement in group trading profits from £5,617,279 to £6,837,831 [apart from greater income from investments]. The advance in profits owes something to the "improvement in the general level of petroleum product values," as well as to an expansion of business in Burma, Pakistan and India. Higher values for stocks, which are up from £8,619,586 to £10,006,549, and debtors, which have risen from £4,406,338 to £5,159,003, reflect a greater physical volume, but more especially higher costs and prices.

Arrangements between the Burma operating subsidiaries and Indo-Burma and British Burmah Petroleum companies for joint operation in Burma have enabled Burmah Oil to deal with two "now rather unrealistic balance sheet headings," namely, "assets in Burma at date of denial" and "rehabilita-

tion suspense account." The final assessment of loss in Burma of £1,460,262 has been written off from general reserves, while the value of the remaining assets in Burma has been transferred to "concessions, oil wells, buildings, etc." together with £6,427,495 previously standing against the rehabilitation suspense account.

While friendlier relationships have developed between the company and the Burmese Government and an outline scheme for the participation of the Burmese Government in future operations in Burma has been accepted in principle, the repair of the main pipeline cannot be contemplated nor can the rebuilding of the Syrian refinery. Trading elsewhere in the East, however, seems to be well established for some years to come and the company's income from its investments in Shell will be substantially higher this year. As for Burmah Oil's income from its holding in Anglo-Iranian it can at least be said, in mitigation of the present bleak outlook, that Anglo-Iranian have considerable interests outside Persia.

Reckitt and Colman.—Larger sales both at home and abroad, especially after the outbreak of the Korean war, account in part for the advance in Reckitt and Colman group trading profits from £3,962,806 to the record figure of £4,682,645. Part of the increase, however, is due to the conversion of overseas earnings to sterling at more favourable exchange rates. Reckitt and Sons, to whose benefit £1,025,815 accrued from group net profits, have maintained an ordinary dividend of 22½ per cent, while J. and J. Colman, to whose benefit £540,434 accrued from the group net profits, have raised their ordinary dividend from 18 to 20 per cent.

Reckitt £1 ordinary stock at 55s yields £4 10s. per cent.
Colman £1 ordinary stock at 55s yields £4 14s. per cent.

The familiar story of raw material shortages and of the high cost of replacing fixed and working capital finds its place in the report. Reckitt and Colman have had to appropriate £210,000, against £170,000, to fixed assets replacement reserves and the directors comment that "the substantial rise in prices necessitates additional working capital to carry the inventories." Shortages of raw and packing materials—the scarcity of tinplate raises a particularly acute problem—are making it difficult for the group to maintain "production at normal levels."

COMPANY MEETINGS

STEEL BROTHERS AND COMPANY

SUBSTANTIALLY IMPROVED RESULTS

REVIEW OF WIDESPREAD INTERESTS

MR J. K. MICHIE ON THE INCIDENCE OF TAXATION

The sixtieth ordinary general meeting of Steel Brothers and Company, Limited, will be held on June 29th in London.

The following is the statement by the chairman and managing director, Mr J. K. Michie, which has been circulated with the report and accounts for the year ended December 31, 1950:

This year we are able to present to you a consolidated balance-sheet and a consolidated profit and loss account which fully reflect the company's interests and because of the inclusion of the Indo-Burma Petroleum Company, Limited, the figures show a considerable expansion. The comparative figures for 1949 have been adjusted accordingly.

It is right that the shareholders should have a proper appreciation of the scope and variety of our business and I am glad that the technical difficulties which previously handicapped us in setting out our consolidated accounts in this form have been overcome.

In view of the results we have been able to show, you may consider that in writing of prospects in my last report my caution was not justified, but the main activity in trading markets and the large rise in values happened after my remarks were written.

Our profit before tax deduction was £708,130, compared with £563,841 (excluding provisions previously made not required) for the previous twelve months. Taxation takes £415,000, and £147,000 has been set aside for depreciation. Dividends on fixed interest bearing stocks cost £99,900 net. After writing off £22,230 against shares in and advances to subsidiary companies which made losses, the balance has been apportioned between special benevolent fund £3,000 and reserve fund £21,000 bringing the latter up to £380,000.

This year no large writing down of investments is necessary so that a substantial figure goes in reduction of our fixed assets.

In spite of the accretion of funds mentioned last year our banking facilities have again had to be largely used to finance stocks and for advances made as buying agents, and so long as the present high level of commodity prices continues I see no alleviation of this position. As has already so often been said and written this is merely another manifestation of the situation into which merchant shippers like ourselves have been forced by inflation on the one side and taxation on the other. To survive, merchant adventurers must take risks, but the larger part of the fruits of their efforts goes elsewhere, and inadequate amounts are left for additions to working capital.

As is now customary, I comment separately on our activities in the different countries in which we operate.

BURMA

During 1950 the Government made good progress in freeing further parts of the country from the domination of insurgents of various hues and factions and immediately this was reflected in larger exports of rice which in turn considerably improved the financial position of the country. More recently this progress seems to have been checked and one of our rubber estates not far from Rangoon has been overrun. Whether

or not progress will be resumed, as we earnestly hope will happen, may depend on how strong a Government emerges from the forthcoming—and partial—election or on how much extraneous assistance is received by the Communist parties or on both.

We continue to act as agents for certain Colonial Governments for the procurement and shipment of rice, but largely because of the marketing methods adopted by the Government of Burma and its monopoly, the State Agricultural Marketing Board, little or no chance is afforded us of sharing in the overseas marketing of that portion of the crop not earmarked under Government-to-Government contracts.

The methods being adopted may not in a seller's market cause obvious damage to the rice trade of Burma, but we already see movements in consuming markets which are fast becoming habits of looking elsewhere for the qualities and standards which in the past were a continually growing feature of the Burma trade and which, I would add, we had a considerable part in developing. The days of quality and standards of delivery are bound to return and my fear is that the present policy in Burma will leave her with neither, nor with the shippers who made it their object to build and maintain them in the past.

Our saw mills at Rangoon and Moulmein continue silent, but we are trading in timber as opportunity offers.

The oil industry in which we share through the Indo-Burma Petroleum Company, Limited, is expanding its refining operations at the fields as far as this is practicable, but any major recovery must still await the general pacification of the country and the resolving of other important issues.

During the progress made last year, Government forces occupied Thayetmyo, where the works of the Burma Cement Company, Limited, are situated. Despite considerable damage and looting done by the insurgents, the factory is again operating, but it is unlikely we shall get it into full production this year, due to lack of river transport. The production of the factory will all be required and will save considerable foreign currency in the rebuilding of Burma.

Overhead our trading results in Burma were satisfactory, but our valuable shipping and insurance agency business continues to be restricted by circumstances outside our control.

STRAND HOTELS, LIMITED

This subsidiary again had a satisfactory year, and under great difficulties on the supply side has continued to offer first-class service to its patrons. It is our object to maintain these standards and to improve them wherever possible provided the necessary encouragement is there.

INDIA

A considerable part of our business in India arises under our managing and selling agencies for the Indo-Burma Petroleum Company, Limited, which continued to function on normal lines.

Our agency for the procurement of food for the members of the Indian Tea Association continually presents new problems and

the disastrous earthquake and floods in Assam last year coupled with the chronic shortage of rice in India, made the task of our staff and of the governing bodies of the Indian Tea Association with whom we act in concert even more difficult than usual. So far no tea garden has gone wanting, but the cost of running our organisation tends to rise while the income does not.

I have to report a new development in India. Very soon it is hoped to register a company in Calcutta named Khasi Sillimanite, Limited, which will take over the mining and marketing of a Sillimanite deposit in Assam financed up till now by Messrs Pilkington Brothers, Limited. Messrs Pilkington Brothers, Limited, have asked us to become managing agents for the company and we shall also have a small capital interest in it.

Our subsidiary, E. B. Creasy and Company, Limited, I am glad to say, was able to share in the general betterment.

MIDDLE EAST

Due to the effects on its business of the re-orientation of the transport and refining of a considerable part of the oil production of Iraq, our associate company, Messrs Spinney's (1948), Limited, had a somewhat disappointing year, but the necessary re-organisation to cope with this has been carried out and prospects are again satisfactory.

In Israel our business continued on the previous lines, though limited in scope by the financial stringency in that country.

EAST AFRICA

Our associates, Messrs A. Baumann and Company, Limited, again achieved satisfactory results and their steady development continues.

In Tanganyika our timber company proceeds steadily with its preparations towards full-scale operations. Plans for long-term forest extraction are complete. A pilot mill is now in operation and we expect the main saw mill to be erected by August and to be in full production by the end of the year. This will mean that starting from scratch a timber business in new territory will have been fully organised and put into operation within two years of sending our pioneer staff to the territory.

A further development in the field of forest extracting, milling and marketing in Tanganyika is now under consideration. The first surveys made in conjunction with the Government of Tanganyika have been completed and a decision now rests on a technical survey of transport possibilities now being made.

We have another investment in East Africa to report—this time in Uganda, where in association with our friends, Messrs A. Baumann and Company, Limited, we have joined with the Uganda Government in a pilot scheme in agricultural development in the Bunyoro native territory. A company has been formed named The Bunyoro Agricultural Company, Limited, with an authorised capital of £100,000 in which the Uganda Government, Messrs A. Baumann and Company, Limited, and ourselves are partners. Our own capital investment will be £20,000. The land is being made available by the native administration as their contribution to the scheme.

This is a small project at present and the extent of its eventual development will depend on results of the experimental work now being conducted—mainly in tobacco growing.

We are very pleased to be associated in this interesting work, the potentialities of which are considerable, particularly as its objective is to train Africans in up-to-date agricultural methods and later to divide the developed land into small holdings and hand it over to Africans as tenant farmers.

BRITISH GUIANA

A company has now been formed named British Guiana Timbers Limited, to take over the timber interests I referred to last year, previously held by the Colonial Development Corporation in its own name. The issued capital of the new company will be £8,400,000 and the Colonial Development Corporation remain the major shareholders. We have been appointed managing agents and have taken up a holding of £240,000. Messrs Booker Brothers

McConnell and Company, Limited, are also participating.

UNITED KINGDOM

Our general business in London largely reflects the activities of our branches and subsidiaries for whom we act as financiers and buying and selling agents. Last year the volume of trade was satisfactory.

Carbutt and Company (1928) Limited. This milling business in London and Hull which in addition to handling rice and its by-products operates barley mills and grain-drying plants had a busy year and maintained its income.

Mactaggart and Evans Limited, again made a small loss, but results are now distinctly better.

PROSPECTS

In such a rapidly changing world in which all proclaim themselves for peace while preparing for or against war, to prophesy would be pointless.

All I can say is that 1951 has begun well. Our stocks are carried at well under replacement costs, but recently offtake has been disappointing and consuming markets show a distinct resistance to paying present prices.

Should there be no major deterioration in the world situation, and particularly were it to improve materially, I can foresee a certain amount of "reflation" which, while making trading temporarily difficult, would be a salutary happening. Despite the problems which would be involved this is what we must hope for; the alternative means continued inflation and maybe disaster, for which no paper profits would be a compensation.

I have already alluded to the incidence of taxation and will now illustrate how the company, or more correctly its Deferred Ordinary shareholders, are likely to be affected by the new Finance Bill. On the fixed interest bearing stocks alone, which require £183,000 a year, profits tax at 50 per cent. will cost £91,500 gross or about £48,000 net after taking into account the deduction of profits tax in computing the income tax payable. Assuming a dividend on the deferred ordinary capital of 40 per cent. (which would represent the modest rate of 16 per cent. on the actuarial value of the shares) the total net amount of profits tax, after allowing for the income tax deduction, would be about £74,250. The whole of the profits tax must be borne by the equity shareholders, as none of it can be deducted from the fixed interest payments. The result is that out of the 40 per cent. dividend of £100,000 the deferred ordinary shareholders would get 10s. 6d. in the £ or £52,500 and the State would get income tax 9s. 6d. in the £ or £47,500 in addition to profits tax £74,250, or £121,750 in all. In other words, for every £1 which the shareholder received the State would collect over £2 6s. and in addition would collect surtax from shareholders liable to that tax.

Over fifty years ago an eminent judge, commenting on our constitution, praised it as ensuring co-operative effort and said it meant there would be "no drones in the hive." Today the system is fined as for a crime. Has truth altered or only man's attitude to it?

STAFF

Our staff, as always, have lived up to their highest traditions and we wish to thank them all in every country and every grade of the service. Without their loyalty and enthusiasm whether holding the fort in difficult places or breaking ground in new ventures we could not have attained the results we now show.

LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

ANOTHER YEAR OF STEADY PROGRESS

The eighty-second annual general meeting of this company was held on June 20th, in London.

Mr A. H. Dawes, the chairman, in the course of his speech said:

I am pleased to say that the company has enjoyed another year of steady progress. The total income (excluding Fire and General Branch) reached the £7,000,000 mark, having increased during the year by £222,323. The total assets advanced by over £2,000,000 to £42,736,655, having quadrupled in the past 21 years.

ORDINARY BRANCH

In the Ordinary Branch we issued policies for new sums assured totalling £4,486,790, compared with £4,390,328 in the previous year. The total sums assured (inclusive of bonuses) under policies in force in this branch at the end of the year exceeded £50 million.

The ratio of expenses to premium income was 13.6 per cent., compared with 13.5 per cent. for the previous year. At the end of the year the Ordinary Branch life fund stood at £22,022,730, showing the considerable increase of £1,008,596. The gross rate of interest on the fund was £4 4s. 3d. per cent., being 1s. 4d. more than for the previous year, but the net rate at £3 4s. 11d. per cent. was 3d. less.

INDUSTRIAL BRANCH

The new sums assured in the Industrial Branch amounted to £4,545,800, which shows a small increase compared with the previous year. The total sums assured (inclusive of bonuses) in this branch at the end of the year exceeded £55 million.

The ratio of expenses to premium income was 27.8 per cent., compared with 27.5 per cent. a year ago. At the end of the year the Industrial Branch life fund stood at £18,346,129, showing an increase of £870,829. The gross rate of interest on the fund was £4 3s. 7d. per cent., being 1s. 6d. more than for the previous year, and the net rate of £3 13s. 6d. per cent. was 3s. 5d. more.

The directors have again been able to increase the rate of reversionary bonus in the Ordinary Branch—this year to £1 8s. per cent. on the sum assured, compared with £1 6s. per cent. and £1 4s. per cent. for the two preceding years. The cost of this bonus is £452,438.

In the Industrial Branch the bonuses to holders of policies under the tables referred to in the Directors' report have been allocated on the same bases as last year and the cost is £286,249. Policies in the Industrial Branch have no contractual right to share in the profits of the Company, but for many years substantial sums have been utilised to provide bonuses for policyholders.

IMPORTANCE OF INSURANCE INDUSTRY

The importance of this insurance industry in the national life cannot be too strongly emphasised. Life assurance, with its widespread service, which so effectually promotes the habit of thrift in millions of homes throughout the country, is playing an essential and substantial part in the nation's effort to strengthen its economic position. No less important is the contribution made by the overseas earnings of the insurance industry.

While remaining watchful for the slightest indication of the recurrence in any form of the threat to our business, we look forward to a future which will allow us to continue freely to serve the individual citizen and the nation according to the great traditions of British insurance.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £12,235,000

The annual meeting of the Union Insurance Society of Canton, Limited, was held on May 24th at Hongkong, Mr J. F. Macgregor (the chairman) presiding.

The following are extracts from the report and accounts and the chairman's circulated statement:—

Marine.—The net premiums for the year amounted to £2,562,693. After providing £80,000 for taxation and releasing £200,000 to profit and loss account, the marine fund stands at £3,265,192.

Fire.—The net premiums for the year amounted to £2,092,899: £99,552 has been transferred to profit and loss account. The fire fund stands at £1,141,805.

Accident and General.—The net premiums for the year amounted to £875,570: £7,295 has been transferred to profit and loss account. The accident and general fund stands at £450,228.

Dividend.—The directors recommend the payment of a dividend of £1 15s. per share, free of Hongkong Corporation profits tax.

Profit and Loss Account.—Interest and dividends amounted to £269,216 and transfers from underwriting accounts to £306,847.

Consolidated Balance Sheet.—Total assets amount to £12,237,327.

CHAIRMAN'S STATEMENT

The clouds of war again made their appearance during the past year, and whilst the outbreak of hostilities in Korea last June has tended to focus attention on the Far East, repercussions from the rearmament programmes are progressively being felt in all quarters of the globe.

Unsettled conditions in the Federation of Malaya and in Indonesia unfortunately show no discernible improvement, and although this factor naturally limits the development we would seek in our business in those countries in more peaceful circumstances, the statement of accounts and balance sheet for 1950 reflect satisfactory progress in our overall world-wide operations.

A marked feature affecting our cargo marine business, especially in the latter part of 1950, was the increase in valuation of goods of all kinds and the consequent heavier cargo commitments in individual vessels, which we were and are still called upon to cover. This is particularly so where wool, rubber, and tin shipments are concerned.

The marine and fire revenue accounts display good results, and I particularly draw attention to the fire net premium income, which, for the first time in our history, exceeds £2,000,000. The strength of the fire fund is also notable at over £1,000,000.

The accident and general revenue account, though profitable, shows a less favourable result than usual. This is mainly attributable to our experience shared with most insurance companies writing motor-car business in Australia, where unusually high awards have been made by the courts to injured third parties. Remedial steps now being taken in that territory are expected to improve the trend of this particular class of business during the current year. An additional factor having a bearing on the result shown in this account is the considerable advance in premium, which calls for a corresponding increase in the amount retained in the accident and general fund for unexpired risks.

Turning to the balance sheet, shareholders will observe that the general reserve in the society's consolidated balance sheet now amounts to £1,000,000.

The report and accounts were adopted.

HARLAND AND WOLFF, LIMITED

IMPORTANCE OF STRONG FINANCIAL POSITION

LARGEST OUTPUT IN THE UNITED KINGDOM

SIR FREDERICK E. REBBECK ON THE SUBSTANTIAL ORDER BOOK

The sixty-sixth annual general meeting of Harland and Wolff, Limited, was held on June 14th at the registered offices of the company, Queen's Island, Belfast.

Sir Frederick E. Rebbeck, D.Sc., D.L., chairman and managing director, presided.

The secretary (Mr F. V. Spark, A.C.A.) read the notice convening the meeting and the report of the auditors.

The chairman said: As the statement of accounts and the directors' report have already been in your hands for some time, I propose, with your permission, to take them as read. (Agreed.)

As you will see from the figures before you the consolidated profit on trading for the year is approximately the same as for the previous year but as the amount brought to credit in respect of settlement on contracts completed in previous years is about £175,000 higher, the net profit after taxation is £98,554 higher at £778,015.

During the year considerable progress has been made in connection with the settlement of our liabilities for taxation and it has been found possible for the group to release a sum of £808,920 which had been provided in previous years.

Since the introduction of initial allowances the company's liability to taxation has been reduced by about £223,140 to the end of December, 1950, but as this is only a temporary benefit which has to be paid for in due course it has been considered advisable to set aside this sum until it will be required to offset the increased taxation which in time will fall to be paid.

In continuation of the policy followed in recent years, and to implement an undertaking given to the older employees at the commencement of the staff pension scheme in 1943, we have set aside the sum of £108,926 practically the whole of which was to augment the pensions of a number of senior executives other than directors.

PRUDENT FINANCIAL POLICY

With the rise in prices that has taken place over recent years and is likely to continue, it is of vital importance to maintain a strong financial position and be able to finance the increasing business of the company. It has, therefore, been considered wise to retain as large a proportion of the profits as possible and, after making the same dividend payment on the ordinary shares that we have made for several years past, the remainder of the profits have been retained in the business.

Once again the output from the company's works was the largest in the United Kingdom, sixteen vessels being launched last year with a total gross tonnage of over 158,000. The vessels launched comprise a passenger and cargo vessel, a refrigerated cargo vessel, a whale factory ship and several oil tankers.

This is the eleventh successive year in which the vessels launched from the company's yards have exceeded 100,000 gross tons.

SUBSTANTIAL CONTRACTS SECURED

As stated in the report of the directors, orders were very scarce in the early part of 1950, but later in the year the position changed, shipowners were placing orders much more freely and your company has secured further substantial contracts.

Many orders have been received for propelling engines to be installed in hulls building by other ship-builders, and also for engines for land installations both at home and abroad. In addition orders have been received for compressor sets which we are building under licence from the Cooper Bessemer Corporation of Mount Vernon, Ohio, U.S.A., while at our Scotstoun works we are continuing in association with The English Electric Company with a large programme of work in connection with the supply of water turbines for the Scottish Hydro-Electric Scheme and other schemes of a similar nature which are being carried out abroad.

Our electrical manufacturing division is booked to capacity with work both for our own ships and for other outside contracts.

STEEL CONSTRUCTION DIVISION FULLY OCCUPIED

The steel construction division has again been fully occupied during the year and there is every prospect that it will continue to be fully employed for a considerable time to come. It is hoped that the position with regard to steel supplies, to which I will refer presently, will not unduly curtail our activities in that division.

The reconditioning of large passenger liners which was necessitated by their war service has now been completed and in consequence, our repair works at Liverpool, London and Southampton were not as fully employed as in 1949; nevertheless, they have carried out a considerable volume of work.

In addition to naval new construction the work now in hand covers a large programme of merchant shipbuilding, comprising large passenger vessels, cargo vessels, a cross channel vessel and tankers for both British and foreign owners, including some of the largest tankers on order in the United Kingdom. The construction of these vessels will keep the shipyards and engineering shops fully employed for some time to come.

The company's property and plant have been well maintained during the year.

MATERIAL SUPPLIES

A year ago it was possible to record that the supply position of essential materials used in shipbuilding was helping to expedite the construction of ships but the position has now changed and for various reasons it is becoming increasingly difficult to obtain deliveries at the appropriate times of certain essential materials. The most important of all these essential materials is steel and, as recently announced in the press, owing to shortages of scrap and iron ore shipbuilders fear they may not be able to count on obtaining their full steel requirements.

On behalf of the Board it gives me great pleasure to thank the employees of the company for the service they have rendered during the year.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr H. R. Humphreys, Mr N. McCallum, Mr C. C. Pounder, Mr John Morrison, Mr F. V. Spark and Dr Denis Rebbeck were re-elected, and Messrs. Price, Waterhouse and Company were re-appointed auditors and the remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the chair.

IMPERIAL CHEMICAL INDUSTRIES LIMITED

INCREASED VOLUME OF BUSINESS

BONUS ISSUE REJECTED BY TREASURY

MR J. ROGERS'S SPEECH

The twenty-fourth annual general meeting of Imperial Chemical Industries Limited, was held on June 14th in London.

Mr J. Rogers, O.B.E., the chairman, in the course of his speech, said:

For the first time in twenty years our annual general meeting is being held without Lord McGowan in the chair. The Board have paid tribute in their annual report to the outstanding services which Lord McGowan has rendered to our company and to British Industry throughout a long and distinguished business career dating back to 1889 when he joined Nobel's Explosives Company Limited in Glasgow. Lord McGowan's resignation at the end of last year from the board of the company and from the office of chairman is a sad loss to the company and to his colleagues on the board. I have been associated with him for over fifty years, and I cannot speak too highly of his personal qualities and leadership which have brought him to the front rank of industrial leaders throughout the world.

TRIBUTE TO LORD MCGOWAN

When Lord McGowan succeeded to the chairmanship on the death of the first Lord Melchett in December, 1930, industry was in the trough of one of the worst trade depressions in the history of this country, but under Lord McGowan's inspiring leadership and wise guidance the company emerged safely, and when he laid down the burdens of office it must have been a source of great pride and pleasure to him to reflect that in 1950, after twenty years under his chairmanship, the Company had achieved the highest turnover and profits in its history.

It is not surprising, after so many years of arduous work and responsibility, that Lord McGowan should seek some respite, but I am pleased to say that he has accepted the board's offer to become the company's honorary president, and it is in that capacity that he is with us on the platform today. On your behalf, and on behalf of the board and of all others who serve the organisation, I should like to thank Lord McGowan for all that he has done for this great company, and I trust that for many years to come he will enjoy good health and happiness in his retirement.

By the unanimous vote of my colleagues I was called upon to assume the duties of chairman of the board from the beginning of this year. With your support and sympathy, which you accorded in such full measure to Lord McGowan as chairman, I shall endeavour to the best of my ability to discharge the onerous duties of that office, and I count myself as fortunate indeed in having such colleagues to assist me and in being able to rely on the devoted and skilful services of all those who work in the organisation.

RECORD TURNOVER

You will notice that the turnover for 1950 was a record. Consolidated sales at £220 million were more than 20 per cent. higher than those in 1949. Although part of the increase is due to increased prices, I am pleased to say that the greater part is attributable to an increase in the physical volume of our business. Exports were 25 per cent. more than in 1949, and were

running at the rate of about £1,000,000 a week during 1950.

You will also have noticed that the revaluation of assets has resulted in a very big increase in the capital reserves shown in the balance sheet. These reserves at December 31, 1950, amounted to £118 million against £17 million a year before. Since we are firmly convinced that realistic figures for assets should be matched by realistic figures for capital, it was the intention of your directors to capitalise a substantial part of these reserves and to make an issue to stockholders of shares credited as fully paid which would have brought the figures for issued capital more into line with reality. An application was accordingly made to the Capital Issues Committee for the issue of such shares under a comprehensive scheme. We have been notified, however, that His Majesty's Treasury is not prepared to give consent to this comprehensive scheme. No reason was given for the refusal.

In the immediate future the company will share with the rest of British Industry those difficulties which arise from the shortage of essential raw materials. Three of the materials in short supply which affect the company's manufacturing operations are sulphur, non-ferrous metals and benzene. So far as sulphur is concerned the immediate position is assured, but there is no margin for expansion and the future is uncertain.

BUDGET CLOUD ON INDUSTRY

Our prospects for 1951 are bright but each year brings its own special problems, and the role of prophet is a dangerous and thankless one. I will not assume it today. I can, however, say that the results for the first quarter of 1951 are encouraging. Turnover for that quarter was 20 per cent. higher than that in 1950.

The introduction of the 1951 Budget has cast a cloud upon British Industry. The raising of the Profits Tax on distributions from 30 per cent. to 50 per cent. means that, to pay a 5 per cent. gross dividend on any form of share capital, profits of 7.7 per cent. on that capital are required, apart altogether from profits which it is prudent to take to reserve. Profits Tax is payable at this high rate of 50 per cent. upon all distributions including preference dividends, and, as it cannot be deducted from dividends, this tax has to be borne at the expense of a company's reserves.

For example, if a company earns profits of £1,000 and wishes to divide £500 (gross before income tax) to its shareholders—a modest enough proportion—it will find that, after paying its shareholders their net cash dividend of £262 10s., it has to pay Profits Tax of £300 and income tax of £332 10s.

We are all in sympathy with any steps taken to prevent the avoidance by taxpayers of burdens placed fairly upon them, but the legal avoidance clauses contained in the Finance Bill go much beyond that. In their present form they appear to cover normal transactions entered into in the ordinary course of business and will seriously hamper the development of the overseas trade of the country. It is to be hoped that the method finally adopted for the prevention of tax evasion will not interfere so seriously with legitimate trading transactions.

The report was adopted.

LICENSES AND GENERAL INSURANCE COMPANY

MR RONALD GILBEY'S ADDRESS

The sixty-first ordinary general meeting of this company was held in London on June 20th.

Mr Ronald Gilbey (the chairman) presided, and in the course of his review of the company's sixtieth year of operations said:

In the first place, let me refer to the Life Department and the quinquennial valuation.

The bonus declaration of 35s. per cent. is essentially a matter for satisfaction and places us in a forward operating position. While 90 per cent. of the profits go to the with-profit policyholders, the shareholders participate in the remaining 10 per cent. The sum of £3,775 thus released this year is small and is reserved against a future distribution to shareholders as it accumulates.

On the general results, the premium income increase this year totals in all £162,114, and with an addition to the earned interest the total income is only short by £66,000 of a round two million figure, while the total assets reach a figure considerably over four million pounds.

The Fire Department disclosed a satisfactory year, with an increased income; a claims percentage of 48.8 and a consequent profit of £30,670.

The general account, which comprises our original license business, burglary, third party, miscellaneous premiums, with a claims percentage of 50.6 again returns a satisfactory profit transfer.

We are very pleased to be able to augment our dividend payment this year by 2½ per cent. and also by a bonus of 5 per cent., making with the interim already paid a total of 40 per cent. for the year.

The report was adopted.

ROTHMANS LIMITED

(Cigarette and Tobacco Manufacturers)

CONTINUED PROGRESS

At the annual meeting of Rothmans Limited, held in London on June 14th, the chairman, Mr Sydney Rothman, said:

The disposable profit of Rothmans Limited of £115,215 (net) is £25,000 better than last year and merits the continuance of a dividend of 12½ per cent. upon the increased Ordinary share capital.

We recommend that £48,000 of reserves be capitalised by the issue of "A" Ordinary shares in the form of a "one in four" bonus. The reserves will then stand at £300,000.

In the home market, the sales of your group increased. I mention but one—Pall Mall De Luxe—which is always in strong demand. Our supplies of leaf tobacco were again insufficient to meet the demand, but by adjusting export and home sales we are now able to sell greater quantities of cigarettes in the home market.

Your export trade continues to be vigorous and profitable. The home and export fancy goods section conducted by our subsidiary, Roy Tallent Limited, has made good progress.

It is always a pleasure to thank all employees for their splendid work. Rothmans has again paid a generous bonus to its employees.

Business done by the group since the year commenced has been satisfactory and, provided that we experienced no unpleasant surprises, I anticipate that the profits of the company for the year will prove adequate for reserves and dividends.

The report and the resolutions were adopted.

RECKITT AND COLMAN LIMITED

IMPROVED VALUE AND VOLUME OF SALES

IMPORTANT PROGRESS IN WORLD MARKETS

MR J. B. UPTON ON THE WIDESPREAD INTERESTS

The annual general meeting of Reckitt and Colman Limited was held on June 6th in London.

Mr J. B. Upton, the chairman, presided.

The following is his statement circulated with the directors' report and accounts:—

The accounts are presented in a form similar to that used last year and show that the consolidated trading profit amounts to £4,202,956, compared with £3,538,174 for 1949. This is the highest figure in the history of the company. Part of the increase is due to larger sales both at home and abroad and part to the conversion to sterling of profits earned in overseas currencies at more favourable rates of exchange. This latter cause had a greater effect than it had in 1949, when these rates operated for a few months only.

Exchange adjustments also occurred, due to the conversion to sterling of net current assets expressed in overseas currencies. These produced no effects comparable with those caused by the devaluation of sterling during 1949, but the same accounting procedure has been adopted in dealing with them as was used in that year. The net result is a loss on exchange of £119,501 instead of the substantial profit revealed last year. Of this sum, £24,647 arose in connection with companies registered in the United Kingdom but operating abroad, while £94,854 arose on the consolidation of the accounts of subsidiaries registered abroad.

The capital reserves now amount to £3,597,622, and the movements during the year are shown in the notes attached to the accounts. We have continued the practice of building a capital reserve for the replacement of fixed assets to supplement the normal depreciation which was £387,614 in 1950, compared with £298,098 in 1949; £210,000 has been transferred to capital reserve for this purpose out of the consolidated taxed profits.

We wish again to draw attention to the handicap to industry of a system of taxation which does not allow full provision for replacement of fixed assets as a charge before arriving at the sum on which income tax and profits tax are payable. Even the slight mitigation of this burden which the initial allowances clauses of the 1945 Income Tax Act provided will be withdrawn next year, while the increase in working capital which inflation requires has also to be found out of taxed profits.

British, Dominion, and foreign taxation amounted to £2,181,000. The reserve for United Kingdom income tax 1951-52 (£968,649) has been calculated at the rate of 9s. 6d. in the £.

The bonus to employees under the prosperity sharing scheme, calculated on the trading profit after appropriate adjustments, is £208,000 this year as compared with £218,000 (£8,000 attributable to 1948) for 1949, when substantial profits on exchange affected the figure. In 1950 exchange losses arose as referred to above.

After transferring £500,000 to general reserve the directors recommend the payment of a final dividend of 5 per cent., less tax, making 20 per cent., less tax, for the year—the same as for 1949.

The consolidated profit and loss account shows that of the £1,566,249 available profit

of the year, £1,016,176 is included in the accounts of Reckitt and Colman Limited, and £550,073 has been retained in the accounts of the subsidiaries. After various adjustments and the appropriations to capital reserves and general reserve already referred to, providing the same dividends as in previous years, and adding the balance brought forward from the previous year, there remains a balance of £1,741,813 to be carried forward to 1951, as shown in the consolidated balance-sheet. Of this sum £597,686 is retained in the accounts of Reckitt and Colman Limited, and £1,144,127 in the accounts of the subsidiaries. The capital needed for the development of our overseas business requires the retention of large balances by some of our subsidiaries, while currency restrictions prevent others from remitting the whole of their profits.

The shareholders' capital and reserves employed in the group have increased by £1,473,692 during the year under review and now amount to £14,755,587.

UNITED KINGDOM

Sales, both in value and in volume, showed further improvement during the year. Nearly all sections of the business contributed to this result.

Towards the end of 1950, however, serious shortages of raw and packing materials began again to make themselves felt and difficulties arose as great as those experienced during the war. In particular, tinplate, which is so important to us for making polish and food containers, was, and still is, very short. Sheet aluminium is a technically possible substitute for tinplate, but the national rearmament programme has seriously reduced the available quantity of this metal. The sulphur shortage from which the world is at present suffering has its repercussions on this company, as it affects nearly the whole chemical industry either directly or indirectly by its impact on the raw material situation. Many of our products will not, as a result of these shortages, be presented in the usual packages, and the production of some may have to be curtailed. Nevertheless, sales during the first part of 1951 were well maintained though shortages and rising costs are being faced.

During 1950, Sanpic, the household disinfectant, was marketed in a new form, packed in a specially designed bottle, and has been well received by the trade and by the public. Disprin Analgesic, introduced at the end of 1949, continues to make good progress and meets a real need for a stable soluble aspirin.

In November negotiations were completed for the purchase of the share capital of Samuel Berger and Company, Limited, starch makers, of Bromley-by-Bow, London. This purchase was made to safeguard the supply of rice starch, having in mind the difficulties connected with the replacement of our starch factories destroyed during the war.

In April, 1950, the Ultramarine section of the business was transferred to a separate subsidiary called Reckitts (Colours) Limited. This company now supplies all the Ultramarine required for making our Laundry Blue and also sells Ultramarine to commercial and industrial users throughout the world. The control of this distinct type of business by a separate board is already proving advantageous.

OVERSEAS TRADE

A year ago we were able to report that our overseas sales in 1949 had reached a record level both in volume and in value; the 1950 results have, however, surpassed those of 1949.

All countries reacted to events in Korea though the rush to buy goods was more noticeable in some markets than in others; our overseas sales in the second half of the year were in consequence higher, but there is no evidence of serious over-stocking as the demand for our products has been well maintained since the close of the year.

The main problem confronting our factories overseas, as at home, is the now common one of securing a steady flow of the necessary raw and packing materials for the maintenance of production at normal levels. We hope to keep abreast of these difficulties, which are under constant review by our managements abroad, though the substantial rise in prices necessitates additional working capital to carry the inventories.

In the United States the sales made by our subsidiary company reached a new record though rising costs prevented a corresponding increase in dollar profits. This market represents such a substantial proportion of our total overseas interests that its progress is of great importance to us. The prospects for our 1951 sales appear to be good but the net benefit will be adversely affected by the increased level of taxation recently introduced in the United States, while the rearmament programme may well affect the supply of raw and packing materials there as it does in other parts of the world. The directors of the American company have decided on further extensions to their factory at Rochester (N.Y.) as soon as these can be undertaken.

The Canadian business made satisfactory progress and has commenced the introduction of Disprin which is being supplied from our Hull factory and thus contributes to an increase in our dollar exports. During the year, our Canadian subsidiary acquired additional properties adjacent to the Montreal factory in order to safeguard future plans for expansion.

In South Africa a subsidiary has been formed to look after our local manufacturing interests and production has already started in the new factory near Durban. In Cape Town, the new office building, to which we referred last year, has been completed and is now in use. Sales have been well maintained and with the easing of import restrictions the prospects for our South African business are satisfactory.

Conditions in Australia and New Zealand have been marked by sharp increases in costs of living and basic wage rates. Despite strikes in the coal and transport industries, we have succeeded in maintaining satisfactory production and distribution of our goods. Building alterations and extensions have commenced at the Sydney and Dunedin factories and we look for further progress in markets which are expanding and should offer scope for development.

In South America our Argentine subsidiary had a difficult year, due to an insufficiency of licences to import the various materials required to maintain production. Its prospects for 1951 are better and additions to the factory in Buenos Aires are being undertaken to provide facilities for the manufacture of new products. The Brazilian business has expanded considerably both in sales and profits, and extensions to our factory are required to cope with present demand. There have also been extensions to our Uruguayan factory in Montevideo. It is not possible to remit to the United Kingdom the whole of the profits earned in Argentina and Brazil, and it is thought to be sound policy to

convert part of the surplus cash into bricks and mortar.

Our trade in India continued to suffer from limitations on the import of finished goods. Work was started on the erection of buildings on our new factory site, and, since the end of the year, permission has been received from the Government of India to form an Indian company. Reckitt and Colman of India, Limited, will accordingly take over our manufacturing interests, but its rate of progress may well depend on factors, such as the supply of raw materials, which are outside our control. We also intend to form a new subsidiary company to carry on our trade in Pakistan.

In Europe further progress has been recorded, particularly in France. In Belgium we have acquired a property adjacent to our existing factory at Melle, near Ghent, and we hope that this will enable us to effect certain economies in our manufacturing activities.

Goods manufactured in our United Kingdom factories have continued to find their way into almost all accessible parts of the world which are not served by our overseas subsidiaries. Sales have been well maintained in spite of the many problems of international trade today. We are glad to report that some of our newer lines are already earning abroad the reputation and the acceptance which have been accorded to them by consumers in this country.

During the year the principal markets overseas have been visited by directors and other senior executives from head office. This is a regular policy and, combined with the normal visits of the senior members of our overseas managements to England maintains the personal touch with men and markets on which so much depends.

Commerce today is so much at the mercy of international affairs and government policy that it is impossible to make accurate forecasts, but our overseas interests are now widely spread and sufficiently firmly based to encourage us to face the future with confidence.

GENERAL

This report would not be complete without a sincere tribute to our employees—staff and workpeople, wherever they may be—whose hard work and loyalty make the progress of the business possible. We are satisfied that the quality of those who serve our company enables us to look forward to further progress.

The report was adopted.

The annual general meetings of Reckitt & Sons, Limited, and J. & J. Colman, Limited, will be held on July 9, 1951.

DENNISTOWN RUBBER ESTATES LIMITED

DISTRIBUTION OF 20 PER CENT.

The eighteenth annual general meeting of Dennistown Rubber Estates Limited was held on June 19th in London, Mr J. L. Milne (the chairman) presiding.

The following is an extract from his circulated review: The working profit for the year ended December 31, 1950, amounted to £88,277, as compared with £28,467 for the previous twelve months. The improvement, amounting to £59,800, was due mainly to an increase in the sale price of our product of just over one shilling per lb.; partially offset by a rise in the cost of production of approximately 4d. per lb.

Last year the dividend was 7½ per cent.; this year the total distribution amounted to 20 per cent. After providing for the dividends there is some £13,000 of profit remaining.

It was considered advisable to transfer the major portion of this, viz., £10,000, to planting reserve. We have also considered it advisable to transfer £1,000 to general reserve, thus bringing this reserve up to the modest figure of £10,000.

The crop harvested during the year amounted to 1,820,382 lb., as compared with 1,956,443 lb. for 1949. Bad weather conditions, shortage of tappers and poor outturn of labour combined to prevent the Kim Seng Estate from obtaining its estimated crop, which it was hoped would show an improvement over 1949. Unfortunately, the labour position is not improving and the first four months of 1951 have brought a further decline in crops.

Another factor which is beginning to make itself felt is the increased rate of export duty which is now payable. At present this amounts to about 8½d. per lb.

The report was adopted.

UNITED NEWSPAPERS

MR H. C. DRAYTON'S ADDRESS

The thirty-second annual ordinary general meeting of United Newspapers Limited was held on June 14th in London.

Mr H. C. Drayton, the chairman, in the course of his speech, said: The gross profit of the group for the year ended December 31, 1950, was £551,000. After deducting depreciation and directors' fees the amount remaining was £470,000. Of that the proportion attributable to the shareholders of United Newspapers was £364,600. If you endorse the directors' recommendation of the final dividend on the ordinary shares, making 20 per cent. for the year, there will be left an amount to carry forward of undistributed profits in both the subsidiary companies and in this company of £154,000.

As you have probably heard all newspapers have had to increase their price, and we along with them have increased our dailies from 1½d. to 2d. We have now reached the position where any increased costs such as wages or materials are going to be directly related to the price of our newspapers. In other words, it looks from now on as if any big increase in costs is going to be paid, as always, by the consumer.

We shall be hit in this company by the incidence of the new 50 per cent. profits tax. In Provincial Newspapers we have two classes of 7 per cent. preference shares, and as we pay this 7 per cent. we have to pay the Chancellor of the Exchequer 50 per cent. extra. In other words, these preference shares are costing us 10½ per cent. Now, ladies and gentlemen, no one minds paying taxes if you think you are getting value for them but today we are burdened both in the Government and in the municipalities by too many bureaucrats.

There is no doubt about it—there are too many Civil Servants today. I think the figure is something over 600,000. It may be if they could be reduced by something like 150-200,000 people it would help solve our shortage of manpower about which we hear so much today, as they would be released for productive work as against their present non-productive work.

I think that for the current year the profit figure should be greater than it was for 1950. The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

GENERAL MINING AND FINANCE CORPORATION

(Incorporated in the Union of South Africa)

DIVIDEND MAINTAINED AT 25 PER CENT.

The fifty-first ordinary general meeting of the General Mining and Finance Corporation Limited was held on June 5th, in Johannesburg.

Mr C. S. McLean, deputy chairman, presided, and in the course of his speech, said:— Revenue for the year at £638,805 was greater by £67,541 than that for the previous year. After deducting administration expenses totalling £125,806, a profit of £513,000 was carried to the appropriation account. When added to the balance of £153,373 brought forward from the previous year, an amount of £666,373 was available for distribution. The dividend distribution for the year was maintained at 25 per cent. which, on the increased capital, absorbed £419,321. The corporation's investments in stocks, shares and Government and Municipal Securities appear in the balance sheet at £4,130,993, an increase of £222,148 when compared with the corresponding figure for the previous year.

As was pointed out at the last annual meeting, the full benefits arising from devaluation could only be maintained if working costs were held at the then existing level. Between the time of devaluation and the month of June last year costs had increased by approximately 21s. 2d. per ounce fine, the greater proportion of which was attributable to an adjustment in the scale of wages and other benefits granted to both European and non-European employees. In June, 1950, working costs per ounce fine averaged 156s. 4d., but the corresponding figure for December, 1950, was 162s. 5d., with an average of 157s. 3d. for the whole of that year. This compares with 136s. 9d. for the year 1949.

The upward trend of costs has continued and for the three months ended March, 1951, these amounted to 164s. 4d. per ounce fine or 31s. 1d. per ton milled, this being an increase of 1s. 6d. per ton milled, equivalent to 7s. 1d. per ounce fine, over the 1950 average.

The additional revenue received by the industry from gold sold for artistic and industrial purposes at enhanced prices, has increased substantially during the current year when compared with 1950, and has been more than sufficient to offset the increased costs.

South Africa's prosperity is so closely bound up with a prosperous gold industry that it is to be hoped that the price of gold will soon be improved to a level more in keeping with its true worth.

OTHER INTERESTS

There are at present 13 mines in various stages of development in the Orange Free State and it is hoped that at least two will reach production this year. Your corporation has interests in all these mines. The results obtained from the intersections of reef through shaftsinking and disclosures from development are distinctly promising.

The chairman then referred to the affairs of the companies in which the corporation is mainly interested, namely: Van Ryn Gold Mines Estate Limited, West Rand Consolidated Mines Limited, East Rand Proprietary Mines Limited, Durban Roodepoort Deep Limited, Crown Mines Limited, South Roodepoort Main Reef Areas Limited, General Exploration Orange Free State Limited, and Consolidated Rand Investment and Trust Company Limited.

The report was adopted. The report of the proceedings of this meeting will not be circulated to shareholders, but copies may be obtained on application to the London Office, Winchester House, Old Broad Street, E.C.2.

SUEZ CANAL COMPANY

YEAR OF APPRECIABLE PROGRESS

REDUCTION OF TRANSIT DUES

The annual general meeting of the Suez Canal Company was held on June 12th in Paris.

M. Francois Charles-Roux, the president, in the course of his speech said:—

A year ago I forecast that the results for 1950 would exceed those for 1949. This forecast has been fulfilled, and to a greater extent than I had anticipated. Traffic receipts and profits last year were very much greater than the year before. Their upward trend, which had started previously, continued at a fast rate. The increase in the company's profits for the year 1950 has enabled us to raise the dividend. This gross dividend reflects a balanced appreciation of the various factors we had to take into account when computing it, among which was, of course, the possibility of maintaining it in the future—given tolerable economic and political circumstances. We believe, furthermore, that the increase in the income from your shares is consistent with the hopes that you could legitimately entertain after having been deprived of dividends throughout the war, and it has been a matter of concern for us that these hopes should not be disappointed.

The shareholders, however, were not the only ones to look forward to some benefit from such increased profits as the year 1950 might show: the users of the Canal were similarly placed. Your board of directors has decided to grant shipping a reduction of the transit dues. It has always been the company's intention and practice to share with its clients—who provide them—the increases in its receipts whenever the financial results of the undertaking allow or justify such action. It would not have been fitting that the company should depart from this wise policy to which it owes the esteem in which it is held in shipping circles. This high reputation is, in fact, with the valued friendship of Egypt and her Government, one of the company's two greatest moral assets and is due, as I have said before, to the concern that the company always shows for the interests of the shipowners, either by alleviating whenever possible, and in the greatest measure possible, the charges imposed upon them, or by placing at their disposal the most perfect possible waterway and the best possible conditions of transit. The company's foremost interests are dependent upon the maintenance of this policy and upon the continuance of the benefits that derive from it. It is for this reason that we embarked upon those great improvement works, in the Canal, which are now well advanced and in certain cases nearing completion: for this reason also we abolished passenger dues last year and we are now reducing the Canal dues on transiting vessels.

During the first five months of the present year the composition of the traffic has remained much the same as in 1950. As regards its volume, the extent of the decrease resulting from the opening of the trans-arabian pipeline has proved below our estimates and, finally, traffic and receipts in the last few weeks have remained at a high level notwithstanding events in the Middle and Far East which appeared likely to affect them.

Our relations with the Egyptian Government are excellent. They are marked by the mutual trust and spirit of co-operation which were at the same time the object and the hallmark of the Convention we signed with it on March 7, 1949. The working of this agreement, with which both contracting parties have reason to be well satisfied, bears

witness to its beneficial effect which conforms to their common desire for an effective and sincere "entente."

DIRECTORS' REPORT

The following are extracts from the directors' report:—

The year 1950 again shows very appreciable progress in comparison with the previous year.

As regards works, the salient feature of 1950 is the importance assumed by the dredging involved in the execution of the 7th Programme of improvements of which you approved the principle in 1949. The volume of excavations amounted to 12,080,000 cubic metres. This outstanding result—a record since the opening of the Canal in 1869—is attributable to the cutting of the Farouk Canal. In addition, the programme of deepening the Canal by 2 ft. is being pursued. Finally, the work of enlarging the docking area and of creating a fishing fleet harbour at Port Said was entrusted to contractors and is progressing normally.

In 1950 shipping through the Canal reached 11,751 transits, representing 81,796,000 net tons. Progress in this field therefore continued, but somewhat more slowly, since the increase of tonnage over the preceding year was only 18.8 per cent., against 25 per cent. in 1949. Goods transiting through the Canal totalled approximately 72,609,000 tons weight—a record figure. The commercial current from south to north totalled nearly 60½ million tons, exceeding by over one quarter the record figure of 1949, and reaching a level treble the prewar yearly average.

Receipts for 1950 amounted to Frs. 28,020,286,230, an increase of Frs. 2,083,340,332 over those of the previous year, whereas expenses, at Frs. 10,705,494,930, showed a reduction of Frs. 334,788,768. After deduction from the gross profit of Frs. 1,152,606,333 for interest and amortisation of capital, the available profit stands at Frs. 16,162,184,967.

To the available profit of Frs. 16,162,184,967, which shows an increase of 18 per cent. on that for 1949, should be added Frs. 59,210,867 brought forward from last year, making a total of Frs. 16,221,395,834.

We first of all propose that Frs. 2,000 million be allocated to improvement works, in order to bring the provision under this head to the full amount required to cover the cost of the 7th Programme. Secondly, we suggest an allotment of Frs. 1,000 million to depreciation and renewal of plant, and Frs. 500 million to depreciation of buildings. Finally, we propose that Frs. 2,500 million should be carried to extraordinary reserve, and Frs. 300 million to the insurance and contingencies fund, thus bringing the total reserves to a level more consistent with your company's receipts and expenses.

After these various allotments, you would have available Frs. 9,921,395,834. The suggested distribution would account for Frs. 9,859,154,930, leaving a balance to be carried forward of Frs. 62,240,904. The proposed distribution brings the gross dividend to Frs. 8,750. To this should be added, for the capital shares, the statutory interest for 1950, amounting to Frs. 1,429.

A copy of the full report in French will be sent on application to the company, 1 rue D'Astorg, Paris 8, or 6 Bishopsgate, London, E.C.2.

J. H. VAVASSEUR AND COMPANY, LIMITED

(East India Merchants)

RECORD TURNOVER AND PROFITS

DIVIDEND 30 PER CENT.

The statement by the chairman, Mr E. J. Mackenzie Hay, presented to the forty-seventh ordinary general meeting of J. H. Vavasour & Company, Limited, held in London on June 20th, reported that both in turnover and trading profits new records were established and the net profit of the company was the highest in its history. Though this outcome was, in large measure, a reflection of the inflationary forces which affected commodities throughout 1950, it was also partly owing to the policy of extending their interests which had been developed in recent years.

PROFITS AND DIVIDENDS

The combined profit of the group amounted to £593,514, compared with £222,301 in 1949, and after taxation and other charges, the available balance was £261,640, against £134,198. The company's share of the group net profit was £208,387, compared with £84,147 in 1949. From its own departments and from dividends received from subsidiaries, the company earned an income of £286,381, compared with £142,885 in 1949, and after taxation there was a net profit of £100,056, against £39,111. With £49,455 brought forward, the available balance was £149,511. After payment of the preference dividend and transferring £25,000 to general reserve, it was proposed to pay a final dividend of 25 per cent. (making, with the interim of 5 per cent. already paid, 30 per cent. for the year) on the ordinary stock and to carry forward the increased sum of £66,198.

Company net assets now totalled £958,270, compared with £884,849 in 1949, and the group net assets had reached the impressive figure of £1,477,411, against £1,283,066 a year earlier.

COMMODITY OUTLOOK

The steadily increasing world population; the higher living standards in primary producing countries which have enabled so much that was formerly available as export surplus to be consumed at home; the policies of full employment in this and other countries which are large consumers; and particularly the enormous expansion in industrial production and consumption in the U.S.A. in the past decade, have all combined to bring about a situation in which current demand, irrespective of rearmament, exceeds current supply. It would appear, therefore, that the present prospect for commodity prices generally is that they will continue to remain at a high level, though there will be important exceptions, due to special causes. The recent recession was an inevitable reaction from a pace that could not possibly be sustained, and prices could well decline further and still leave producers with comfortable profit margins.

Trading in the unsettled market conditions which have prevailed in recent months has presented many problems and difficulties for traders, but the company looked primarily for its profits to the margin it could earn between the buying of commodities and processing them for their specialised uses, and in the current year to date its turnover and profits had been fully maintained.

The report and accounts were unanimously adopted.

LAMBERT BROTHERS LIMITED

SATISFACTORY OUTLOOK

The forty-eighth annual general meeting of Lambert Brothers Limited was held on June 21st in London, Mr R. Rattcliff Steel (the chairman) presiding.

The following is an extract from his circulated statement:—

The consolidated profit and loss account shows a profit of £336,726 before providing for taxation, which absorbs £199,512, leaving a balance of £137,214. After deducting the preference dividend, the interim dividend on the ordinary stock paid last November and providing for the final dividend of 15 per cent., there remains £71,776, which, together with sums totalling £27,024 from provisions no longer required, increases the balance to be carried forward by £98,800 to £509,134. In addition, we repeat our payment of 2½ per cent. from realised capital accretions which does not attract taxation in any form.

The consolidated balance sheet as at December 31, 1950, shows provisions and current liabilities totalling £3,740,887, against current assets totalling £5,181,177—a surplus of £1,440,290.

CHANGED CONDITIONS

Since we last presented our annual accounts, a great political change has taken place in the world which has necessitated all countries turning from improving their general conditions of life to the defence of their very existences. The effect of this change was soon felt in the shipping trade. The freight markets gradually commenced to firm up and soon reached record figures. Although your company, like all others in the shipping trade, benefit by such increases in rates of freight and values in general, we cannot consider the present state of affairs a healthy one, as it brings with it many problems and great risks.

Coal, as a bunker fuel for ships, is unfortunately a dwindling business. The coal business, nevertheless still contributes substantially to the combined results and fortunately we have in the meantime developed in many other trades connected with shipping. To offset the recession in coal, it is gratifying that the progress in our oil activities has been fully maintained.

NEW VESSELS ORDERED

Following the outbreak of war in Korea and the decision to expand the armaments programme, it became apparent that we could expect no decrease in building costs for some years ahead. Therefore, having regard to the age of the fleet, we felt it essential to place orders for two 12½-knot motor vessels of 9,500 tons deadweight for delivery in 1953 and 1954. The cost will be such that considerable faith in the future was required to embark on such an enterprise, and it is regrettable that the Government still persists in hampering the adequate rebuilding of the merchant fleet, an essential part of the defence programme, by penal taxation.

Since we placed these contracts, the Chancellor of the Exchequer has announced the discontinuance of the 40 per cent. initial allowance for new plant. This is a serious blow to those owners who had assumed that these allowances would not be withdrawn at the very moment when, owing to tremendous building costs and the urgent need for strengthening the Merchant Navy, they are most required.

The outlook for your company during this year, so far as we can see it today, is satisfactory, but in the present state of the world it is impossible to predict even the near future.

The report was adopted.

POWER SECURITIES CORPORATION

ANOTHER SUCCESSFUL YEAR

The twenty-eighth annual general meeting of Power Securities Corporation Limited was held on June 15th in London.

Mr William Shearer (chairman and managing director) in the course of his speech, said: We have again had a successful year, but the conditions under which business has to be carried on continue to be difficult. The cumulative adverse effect of constantly rising costs of both labour and materials, and of excessive taxation, was again much in evidence.

The gross profit for the year amounted to £440,166, an increase over the previous year's figure of £29,653, whilst the net profit at £141,625 shows an increase over the 1949 figure of £25,983. To the consolidated net profit for the year must be added taxation over-provided in previous years, £1,472, provisions no longer required, £1,577, and the balance of profit brought forward from 1949 of £113,685, making a total gross profit to be dealt with of £258,359.

Out of this total, the sum of £19,150 has been provided against possible additional taxation on assessments under appeal. The annual instalment for past service benefits of £5,650 has been paid to the pension fund, while £64,335 has been transferred to general reserve and £20,000 to contracts reserve. The amount required for the dividend on the preference shares and the proposed dividend on the ordinary shares is £44,450, leaving a balance of profit to be carried forward to the current year's account of £104,774.

ORGANISATION FULLY ENGAGED

Our organisation has been fully engaged in this country and overseas, the total capital value of the work in hand being about £30 million. We have continued to carry through a large amount of construction on the Staythorpe power station near Newark, and on the Carmarthen Bay power station in South Wales. Our organisation is also responsible for the design and construction of the Carmarthen Bay power station, which will have a total installed capacity of 345,000 kW., derived from 6 turbo-alternators and 18 240,000 lb. per hour boilers.

Work has proceeded steadily during the year on our numerous other engineering contracts in the United Kingdom, the greater part being for high and low tension transmission lines, of which about 600 miles are at present under construction.

I mentioned last year that our organisation had been entrusted by the British Electricity Authority with the construction of the northern half (about 20 miles) of the first 275 kV. transmission line to be built in this country, which, when completed, will form part of a single-circuit line linking Sheffield with the Staythorpe power station, and this construction work is going on satisfactorily.

On the civil engineering side we completed, during the year, the two contracts for the North of Scotland Hydro-Electric Board, namely the Loch Sloy Dam in Argyllshire and the tunnel and intake works at Loch Fannich in Ross-shire, although we are still engaged on ancillary tunnels and aqueducts in connection with the Sloy scheme.

Construction of the double-line tunnel, three miles in length, at Woodhead on the main Manchester-Sheffield line, which we are carrying out for the Railway Executive, has gone on satisfactorily during the year, and the driving of a pilot heading through the whole length of the tunnel was recently completed. In the London area work has continued steadily on the Richmond Main Drainage scheme.

The report was adopted.

SHEFFIELD TWIST DRILL AND STEEL

INCREASED VOLUME OF SALES

The fourth annual general meeting of The Sheffield Twist Drill and Steel Company, Limited, was held on June 20th at Sheffield, Mr Alexander Dormer (acting chairman and joint managing director) presiding.

The following is an extract from his circulated statement:—

I am pleased to be able to report another year of successful trading.

PROFIT AND ALLOCATIONS

For the year 1950 the profit was £491,111, compared with £398,198 for 1949, an increase of £92,913. This increased profit arises from an increase in the volume of sales and still further improved efficiency in production. The increase in the volume of sales is no doubt partly attributable to the requirements of the defence programme. As regards the improved efficiency in production, the completion of our new factory extension enabled us to alter the layout of our plant in various departments, for streamlined production. A further extension to the factory has now been licensed which it is hoped will be completed during the next year.

After providing for taxation amounting to £300,115 we are left with £190,996 and, taking into account the balance brought forward from the previous year of £26,369 (as against £18,332), we have thus to deal with £217,365. Out of this amount we have transferred £100,000 to general reserve account, leaving a balance of £117,365. The dividends on the preference shares and the ordinary stock for the year 1950 absorb £92,583, leaving £24,782 to carry forward.

Turning to the balance sheet, the expenditure on fixed assets during the year was £64,548, and there has been written off in respect of depreciation £41,100. In addition, the balance of the item goodwill (£238,768) has been written off against capital reserves, leaving total fixed assets at £482,473.

Current assets now total £977,893, compared with £725,908, and after deducting current liabilities and provisions the excess of net current assets is now £688,823, an increase over last year of £132,965.

STEEL PRICES

During the second half of the year under review the price of high-speed steel (of which your company consumes many hundreds of tons a year) increased by 57½ per cent. and, since January, 1951, there have been further increases, with the result that we are today paying more than double the price for our steel than we paid at this time last year. This increase is due to the world increase in the price of tungsten, which is a constituent of high-speed steel and is in short supply.

You may be sure that your company, through its products, is making an essential contribution to the defence programme, not only at home but abroad.

At present our entire output is being sold virtually for cash immediately it reaches the warehouse. However, it is possible that a time may come when we shall have to carry substantial stocks of our finished products in order to provide our customers with additional service. For this reason your directors considered the prudent policy was to conserve the liquid resources of the company so that they will be able to deal with this situation when it arises; hence a sum of £100,000 has been placed to general reserve account.

As you know, your directors declared a second interim dividend payable on April 9th last. This second interim dividend was, in fact, the final dividend.

The report and accounts were adopted.

WEBB'S CRYSTAL GLASS

A RECORD YEAR

MR R. E. N. d'ABO'S REVIEW

The annual general meeting of Webb's Crystal Glass Company, Limited, was held in London on June 19th.

Mr R. E. N. d'Abo, the chairman, who presided, in the course of his speech said:

The capital reorganisation scheme envisaged in my speech last year has now been carried through. As a result the company's issued capital is now £284,912, divided into 1,139,648 shares of 5s. each.

I am pleased to report that 1950 was a record year for the company. The net profit before charging taxation amounted to £105,645, against £64,127 for the previous year, but, of this, taxation absorbs £46,558, compared with £23,700 for the previous year, leaving a net profit of £59,087, against £40,427, an increase of £18,660.

Your directors recommend a further transfer of £30,000 (against the previous year's £15,000) to general reserve, making that reserve £150,000.

Your directors also recommend the payment of a dividend of 17½ per cent., less tax, on the whole of the present issued share capital, that is, including the bonus shares. This absorbs the sum of £26,176, against £19,380 the previous year, and leaves the carry-forward to next year at £35,242, an increase of £2,911.

Now that the share capital has been reorganised it is your directors' intention to spread the dividend payments by introducing an interim payment towards the end of the year.

You will remember that for many years past we have been ploughing profits back into the business and investing in new plant and machinery with a view to widening the scope and range, quality and quantity of our production and entering new markets. The direct result of this is a greatly increased production and profits in relation thereto.

OUTLINE OF OPERATIONS

The company has two operating factories, one at Stourbridge and the other at Edinburgh. Both are principally engaged in the production of high quality domestic glass. Their products, known as "Webbs" and "Edinburgh Crystal," are of world-wide repute. We have also four active subsidiary companies:

1. Duroglass, Limited.—The year's result was a record of production. The range of products was widened and now includes

NOTICES

GUTHRIE AND CO., LTD., invite applications for position as Secretary of group of plantation companies operating in Malaya but controlled from London: no accounting responsibility is involved but a secretarial or legal qualification is essential: age group 28-32 preferred but others considered. Salary according to qualifications and experience. Replies, which will be treated confidentially, to Estates Manager, Guthrie and Co., Ltd., 52-54, Gracechurch Street, London, E.C.3.

PERSONAL ASSISTANT of high intelligence and integrity required by owner-manager of retail Radio and Electrical business of good standing. State age and details of career.—Box 670.

PRESS and public relations man (aged 27), seeks change. Academic background, economist (Cantab.), ex-history scholar. Good knowledge of press needs, experienced trade journal writer and sub-editor. Very wide interests.—Box 672.

FRENCHMAN, 28, married, one child. French Diplomas in Law and Political and Economical Science. Three years colonial administrative service. Fluent English and German. Seeks position with initiative anywhere in the world.—Box 671.

THE Renold & Coventry Chain Co., Ltd., require at Renold Works, Didsbury, Manchester, an individual for the Economic Survey and Central Statistics Department.

Candidates should be 25/35 years of age with a University Degree in Economics and/or Statistics and experience in Industry.

Applications, stating Date of Birth, and giving full details of qualifications and experience, should be addressed to Employment Department, Renold Works, Didsbury, Manchester, and quote the Reference No. A3.

industrial, commercial, domestic, radar (television) and agricultural glassware. No crystal ware is made at this factory. We specialise in many other articles which are difficult but profitable to make.

2. Duroray, Limited.—This is a company in which we are a majority shareholder and comes under the management of Duroglass, Limited. The trading results were satisfactory.

The business consists of silvering mirrors and backing glassware by the Duroray process. The main products are: reflectors for shop windows, illuminating reflectors for street lighting and flood lighting.

3. R. Johnston and Company, Limited, which is an old-established marketing company and had a successful year.

4. Henry G. Richardson and Son, Limited.—This is a small company whose business was founded over 130 years ago and is well known for the high quality of its cut glassware. Sales for the year were greatly increased, particularly for the export field.

You will no doubt expect me to say something about the prospects for the current year, and I can inform you that, up to date, trading has been most promising and our output shows a satisfactory increase over the corresponding period of the previous year. We are, in common with industry generally, going through a time of increasing costs and scarcity of certain raw materials and other essential supplies, but the results so far justify us in regarding our immediate prospects with some confidence.

The report and accounts were adopted.

GREEN, HEARN AND COMPANY

(Manufacturers of "Lyndale" Coats and Suits)

CONTINUED TRADING EXPANSION

HIGH STANDARD OF PRODUCTIONS

The thirteenth annual ordinary general meeting of Green, Hearn and Company, Limited, was held on June 15th in London, Mr Michael Marks (one of the joint managing directors) presiding.

The following is his circulated statement:

The accompanying accounts and report of the directors show that the profits of the company and its subsidiary, I. Green and Company (Mantles), Limited, for 1950

amounted to £111,406, the comparative figure for 1949 being £85,235. After deducting directors' fees £200 and making provision for taxation and reserve for future taxation 1951-52, the net balance transferred to profit and loss appropriation account is £49,651, as compared with £39,169 in the previous year.

Including the balance brought forward at the commencement of the year and allowing for the preference dividends paid and accrued, and the interim ordinary dividend of 12½ per cent., the sum of £61,773 remains to the credit of profit and loss account. From this balance your directors recommend the payment of a final ordinary dividend of 20 per cent. (actual), less income tax, which, with the interim dividend, makes 32½ per cent. for the year, as before.

A further appropriation of £10,000 has been transferred to the goodwill account, which, as envisaged in the statement last year, has now been entirely written off. The reserve for equalisation of dividends remains at £13,500 (free of income tax), to which figure it was raised last year, while the amount utilised towards the further redemption of preference shares increased from £19,114 to £22,811. Thus the resultant sum of £42,323 remains to be carried forward, as against £23,122 at the end of 1949.

Current assets show a surplus of £167,867, being greater by £34,477 than in the previous year.

PRUDENT TRADING POLICY

Your directors consider that their prudent trading policy is amply reflected in a continued increase in turnover, not alone in terms of value, accruing from present day increased costs, but substantially in garments produced and sold. This expansion in the production of garments is mainly due to the capacity facilities provided by the subsidiary company's factory, which affords ample proof that the acquisition and expenditure on equipping this ancillary is fully justified and for the benefit of the company now and in the future.

Our trading continues to expand, and it is hoped that the progress evidenced in the first four months of this year will be maintained.

The continued support of the management, staff and operatives, together with their sense of pride in the high standard of "Lyndale" productions, is a source of great satisfaction to your directors.

The report and accounts were unanimously adopted.

A MARKET Research Assistant is required by a firm of national repute manufacturing pet foods, located in Milton Mowbray. Applicants should be under 35 years of age, and have knowledge of field work, simple statistical methods, and be capable of controlling a staff of temporary and permanent field workers. Commanding salary £600 per annum with generous travelling expenses.—Apply with full details to Box 668.

SECRETARY. Experienced Secretary (woman) required as personal assistant to director of public company with international connections in Westmorland. Excellent salary and pension. Allowance for accommodation, including dependant if necessary. Interesting post for person with knowledge of finance. Preference given to candidate with cultural and country interests. First-class experience and references required. Age preferably under 35.—Apply Box 673.

LONG Established City of London firm seeks potential executive of outstanding quality, who will initially be employed as trainee under present departmental Managers; desiderata are (1) high intelligence in conjunction with quick wits; (2) positive personality, verging on the aggressive; (3) complete dependability; (4) obedience; (5) education. Misdemeanors, if plausible enough to be engaged, will certainly be sacked during training and are warned not to apply. Applicants should state present pay. Replies to Box 674.

VERY interesting post for person (either sex) who can take pride in helping to build an organization. Director of small growing company requires secretary-shorthand typist who can deal intelligently with correspondence, callers, sales promotion, etc. 5-day week. Accommodation only fair, but congenial atmosphere. R. S. Waddington Ltd., 85, West Hill, Wandsworth, S.W.18. Tel.: Vandyke 3339.

FOR SALE.—The Economist, 1944-1950 inclusive, unbound.—Offers to Box 678.

EXECUTIVE
Large American firm which has been engaged in business for 90 years and has extensive operations in the fields of industry, transportation, foreign trade, banking, insurance and mining in North and South America wishes to engage highly qualified executive to join its executive staff on a permanent basis. Principal requirement for consideration is for applicant to be in a wholly responsible industrial or financial management position with substantial firm. Applicant must be able to participate in management of existing enterprises and contribute to development of new business. Substantial remuneration will be paid to qualified man. Consideration will be given to candidate up to 50 years of age. Applicants must be willing to travel. All applications will be held in strict confidence. Please submit complete details of background and experience to Box Q.199, c/o Jackson's, 16, Gracechurch St., E.C.3.

DO YOU NEED REPRESENTATION IN BRAZIL?
Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro; Member of the American Chamber of Commerce for Brazil; Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comércio do Rio de Janeiro, etc. Purchasing Agent for: Minerals, raw material, sugar, wood, etc. Selling Agent for: Iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

WELL-KNOWN public Company with Head Offices in London requires a Chief Assistant to the Company Secretary (next in seniority to the Secretary) age 25-35 years; good knowledge of Company Law and practice and extensive experience of procedures of Secretary's Dept. The position demands close liaison with other departments of the Company and its subsidiaries. Salary will be commensurate with experience and qualifications.—Write Box E.975, at 191, Gresham House, E.C.2.

WINE is so easy to enjoy; see if you have a natural palate; enter the wine tasting competition, first prize, a week among the vines; no charge whatever.—Apply, The Friends of Wine, 1, Vintners' Place, London, E.C.4.

APPOINTMENTS Officer vacancy sought, anywhere away from London; resigning after 25 years one employer, national distributors. Special study and experience in selection methods, welfare and staff management (ex Regular and T.A. Senior Officer), available September onwards. Full particulars and highest references.—Box 667.

MALE ECONOMIST wanted, age about 28/30, with good knowledge of commodity statistics and markets, some experience in commercial establishment and/or journalistic experience, to take over and develop established statistical publications. Able to type. Some knowledge of metal trade and languages an advantage. Initial salary £600/£700. Good opening for able and energetic man.—Reply to Box 679.

ARTS GRADUATES—A food manufacturing company in the Greater London area, marketing its well-known products on a large scale, is able, by reason of planned expansion to offer an opportunity for a non-technical graduate to train for an executive appointment within its production division. The successful candidate will be given an intensive and well-planned course of training (6-9 months duration) to equip him for management responsibilities which he will assume immediately on completion of the course. The company looks for qualities of leadership, decision and readiness to shoulder responsibility and can offer opportunities of promotion to higher management posts to a man of the right calibre. The appointment carries a salary well above the average together with non-contributory pension, life assurance and sickness benefits. Graduates (22-25 years) who are determined on a career which allows scope for initiative within an organisation which recognises individual merit, are invited to write in confidence, sending details of education and career to date, to Box 683.

Mr Malik's Crumb

EVEN if the hint dropped by Mr Malik last week-end should bring in Korea a cease-fire, perhaps even a settlement, one thing should be recorded and remembered now: the manner in which it was done. A crumb of conciliatory commonsense was wrapped up in a package of vindictive tirade; a gesture that might now save thousands of lives—and the absence of which has caused the killing of hundreds of thousands—was made casually, in a broadcast talk. Before they scramble over this crumb of comfort, the people of the free world should reflect that the spirit in which peace is offered is no less important than the means suggested for attaining it. They must help their statesmen, so prone to let principle give way to expediency and optimism, to conduct themselves in this matter with realism and dignity. Mr Herbert Morrison's assurance to the House of Commons that he was studying "ways and means of following up this possible opening" was the right blend of inquisitiveness and caution.

Six days have passed and only two things are quite clear. The first is that nothing more is on the agenda as yet than a step towards pacifying the one small sector of world conflict where there has been a full-blooded war. It is only a first step but it may be the one that counts most. What lies ahead will be not on the grand scale of Yalta or Potsdam, but at best Berlin over again; it means little more than a return to a cold war that is really cold—and that is not the same thing as peace. Secondly, it must be assumed that, before even this limited objective can be gained, long and difficult negotiation lies ahead. It is worth remembering that in 1948 three months passed between Mr Malik's first hint that Moscow wished to discuss the blockade of Berlin and the negotiated settlement; and that the issue in Korea is already complicated by national passions and past statements of policy from which the Berlin question was comparatively free. It is true that Mr Malik's hint had attached to it none of the conditions for a cease-fire at or near the 38th parallel that the Chinese had previously laid down: acknowledgment of their claim to Formosa and to the seat in the Security Council, and agreement to withdraw all foreign troops from the peninsula. Indeed, it was the absence of these conditions—and only this—that made the Russian suggestion notable. On some of these conditions, as is notorious, the western countries hold divergent views. If they now start arguing about them, Mr Malik's initiative will have served only to drive a further wedge between Russia's opponents. If any chance it may offer of bringing peace to Korea is to be seized, the obvious cue for the western countries is to emulate Russian discretion about Formosa and the seat at Uno. Let those bridges be crossed when, as and if they are reached.

The firm basis from which opinion in the free world can start is that the United Nations forces have done in a year just what they originally set out to do. They have repelled and punished aggression in thorough and spectacular fashion. It is not helpful to gloat over

1542

this, but it must be realised that this is an entirely new starting-point for the diplomacy of the western alliance. In the wider framework of the free world's strategy, Korea becomes of minor importance once the principle has been established that aggression is unprofitable as well as wicked. The campaign has, it is true, been a stimulus to rearmament and preparedness; but it has also been a drain on precious military and material resources. If the Russians feel, as they might well do, that the returns are diminishing—and if the Chinese are prepared to stop a costly adventure provided too much face is not lost—then there exists a good basis for bargaining. If the campaign has been a test of ability and resolution to restrain the use of force in the cold war, cease-fire negotiations should be a test of the qualities and methods needed to reach limited settlements based, as Mr Acheson once put it, on situations of fact.

There are three points that public opinion should hold firmly in mind, if it is to support and not frustrate the statesmen in the diplomatic test. First is the need for patience; it is useless to expect either quick or extensive results. There has been too much talk in the past of settling everything on the broadest basis around the largest possible table. The time for that method is far from ripe; the failure of the deputies in Paris is evidence of this. What may be possible now is an arrangement in Korea and to try to make it dependent on wider issues may be to miss the chance.

Secondly, even in Korea, it is a truce, not a final solution, that may be possible. The probability is that in this ruined and exhausted land, as in Germany, the price to be paid for a cessation of the fighting is the acceptance, at least for a time, of division into spheres of influence acceptable to the Great Powers but unwelcome to the Korean people themselves. A unified democratic Korea is not now a feasible objective of policy; to unify the country force would have to be used by one side or the other. If the United Nations refuses, as it must, to accept a Communist Korea, it must also refuse to accept President Syngman Rhee's claim that the United Nations is pledged to liberate the North from the Communists and hand it over to him.

The third point that has to be kept in mind—not, one hopes, indefinitely—is the possibility of fraud and deception. It is of the highest importance that in February Stalin personally committed the Chinese and the North Koreans to victory; he declared that they would win because the morale of United Nations troops would not stand the strain of a purposeless campaign. The non-committal form of Mr Malik's hint may, therefore, be a sign that the Russian intervention is nothing more than a new stage of war, a move to break up a game that Stalin finds dangerous because it has become inconclusive. He may feel it is time to begin an exchange of pieces and break up the western defensive position. If the prospect of peace in Korea were to bring about a mood of relaxation in Europe, fresh and deep disagreement between London and Washington, and disarray in the ranks of the United Nations, then Moscow could chalk up yet another point in its game of achieving military ends by political means.

To have this suspicion in mind is not to make negotiation impossible; indeed, it is more likely to make bargaining realistic. If the United Nations secures a return to the *status quo* of June, 1950, with Korea divided by the 38th parallel, it will have done its job for the present. If it can secure serious guarantees that this line will be respected it will have done half its job for the future. The other half is to make such a success of the reconstruction of the South as will show Asia on which side the power and the determination really lie. It is impossible to look much further ahead than this. The decisive factors are all incalculable: the development of Soviet-Chinese relations, the mood of the Americans, the speed with which China and North Korea can repair the vast damage done to their fighting power. The purpose of western policy—working for the United Nations—should be to get an acceptable military settlement by negotiating for limited and well-defined objectives. This would not be appeasement in the sense that Mr Acheson's enemies use the word; it would be appeasement from strength which, in Mr Churchill's words, "is magnanimous and noble and might be the surest and perhaps the only path to world peace."

for success are very different, and the signs seem to be that he is doing fairly well (and may, incidentally, do better if the fighting in Korea stops). The particular policies that the Bevan group expounds are of very slight importance; they would almost certainly be changed if ever it succeeded in winning control of the Labour Party. Mr Bevan's appeal within the party is based primarily not on doctrine but on the offer of enthusiasm. And that is certainly what the rank and file of active Labour Party members most wants.

There is little glamour in "consolidation," and something less in Mr Morrison's latest slogan about "digestion." The older party leaders seem tired and disillusioned; the disappointments of nationalisation are better known in the constituencies and trade union branches than at Westminster; the facts of economic stringency are less bewildering only than the cold war. Mr Bevan alone seems still to ardent Socialists to offer something of the old fires of reforming fervour.

It is hard, indeed, to see that in fact what is left of the reforming amounts to much more than smashing. Professor Cole has recently suggested frankly that perhaps hatred of the Tories is the only traditional impetus of the Labour movement that now survives. Certainly Mr Bevan has made that emotional attitude plain enough. His significance lies in the very fact that he can bid for power on so slight and dangerous a basis. He appeals not on doctrine but on personality. He matters not because he has a coherent policy but because he is the Labour leader who is still a good hater. The task of the official leaders of Labour and of the Conservatives in these circumstances is the same. It is not so much to answer Mr Bevan in detail as to realise that he can threaten them without a coherent policy because they have no policies either. He has at least an emotional attitude and they have nothing. Mr Bevan would not matter if they knew where they were going and had concrete ideas to put before the electors.

It is, of course, the present Labour leaders who are most directly concerned. For twelve years they have been swimming with the tide. They have been taking

their opportunity to adapt and apply the ideas they learned before the war. Keynes, the London Passenger Transport Board, and the theorisations of the beginning of the twentieth century provided their mental furniture. It is now as much as four years since they became aware that the ideas were working out very badly compared with the hopes put in them, and pretty badly by any standard. But ever since 1947 the Labour leaders have been on the defensive without being stimulated to think again. Some of the old theories—most notably the belief that nationalisation could progress from triumph to triumph—have been shed in a half-hearted way, without anyone quite confessing to the heresy. Of any new ideas—and, in particular, of any consistent policy to let private industry work efficiently now that it is not to be rapidly squeezed out by nationalisation—there has been hardly a sign.

The case of the Conservative Party is not much better. It spent the war and early postwar years in catching up, in adjusting its ideas to the new popular insistence that greater security and more equality were possible and desirable. And it has ended by becoming tied up itself, by becoming committed to maintain most of the rigidities built into the new economy of a-little-too-much—the economy of employment too full, of welfare services expanded too fast, of taxation too heavy and of controls too restrictive. Conservatism seems now to be almost as inhibited from fresh thinking, from laying any hand on the trade union utopia inherited from the war, as is Socialism.

The British position is not unique. The same political staleness is to be found, in different forms, throughout Western Europe and in much of the rest of the free world. Mr Bevan's passage into opposition has merely served to emphasise the reality of the vacuum that opposes him. It is not, indeed, a vacuum so complete that he is at all likely to gain power or even the leadership of a defeated Labour Party. But he will certainly remain far more important than he ought to be unless the rest of the political world can soon find some new policies and more wholesome enthusiasms.

The Vacuum

MR BEVAN and his sympathisers in Parliament will shortly project into the political vacuum their views on the "only way" for the Labour Party. They will claim to advocate an alternative policy which could be carried out by the party if it remained in office or won a fresh election; when the pamphlet appears it will have to be examined by those standards. But there is a more important way of looking at it that can best be considered in advance. Some of the contents are not hard to guess. There will be less rearmament and more nationalisation. The "world plan for mutual aid," which was vaguely hinted at in last year's official statement of principles for "Labour and the New Society," will probably be revived with a more dramatic flourish; it is the obvious way of achieving some respectability in anti-Communism, of providing an alternative to armaments more inspiring than free false teeth and spectacles.

No doubt there will be other points, and some will be well made; there is hardly less doubt that as a policy for any British government in 1951 the ideas as a whole can

be dismissed light-heartedly. The mistake would be to imagine that such condemnation is relevant to the real issue. If it were what matters, no one outside the Labour Party need at this stage be concerned about Mr Bevan. He has never been an electoral asset for his party. His followers in Parliament have grown to 24 by the addition in full force of Mr Crossman's "Keep Left" group, which has been conspicuous in the past both for its deviations (followed by what were virtually confessions of error) on foreign policy and for its remarkably unrealistic views on wage policy and on controls. No section of the Labour Party is less likely to produce a policy in which a majority of the British electorate, or even perhaps a majority of British trade unionists, would put their trust.

But that is not Mr Bevan's object, and to point out his failure in it will not weaken him. His concern at this stage is not to win the votes of middle opinion in the country but the support of the active Socialists in the constituency Labour parties. There the requirements

Canada as a World Power

IN all the thinking and planning between the signatories of the North Atlantic Treaty, none is taking a more enthusiastically active share than Canada. And, on the larger view, everyone now knows that Canada's rapid economic development will be of first importance to the Atlantic community. But in spite of these facts, Canadians still doubt whether their true place in the world is properly understood, even in Great Britain or the United States, let alone in other countries. It is not that they are still fearful of being thought a client state within the British Commonwealth. That lesson at least has been learned, and perhaps learned too well, for Britain is now almost excessively careful to show that the future of Canada is none of Britain's business. The Canadian anxiety is rather that, having escaped from British tutelage, they will be thought to have fallen under that of the United States. It is from Washington, fully as much as from London, that the Canadians feel an inner necessity to assert their independence.

Those who are determined to believe that Canada is

an American appendage can find evidence for their belief within Canada itself. The Conservatives, who are the traditional defenders of the British connection, have been looking increasingly towards the United States since Britain turned protectionist and socialist. But the need to find somewhere to lean is a measure of the present weakness of the Conservative Party; it does not indicate the likely policy of any Canadian government. In the policies of the present Government it is difficult to find anything but the most robust independence. There is no doubt at all about the emphasis, the sincerity and the confidence with which Ottawa asserts that it has no intention of exchanging one dependence for another. If in the first half of the twentieth century the dominant theme of Canadian development has been the working out of its political maturity in relation to the United Kingdom, the dominant theme of the second half of the century will be the assertion of maturity, political and economic, in relation to the United States.

Independence and maturity will not mean for Canada,

as they do for so many other countries, a narrow and exclusive nationalism. It is true that there is a movement of "neutrality" in French Canada—but that is the view, and perhaps the natural view, of a minority, which can be accommodated without any marked influence on the majority policy. That majority policy is one of active participation in the community of nations. Perhaps as a means of asserting independence, rather than in pursuit of any real community of interests, there is a tendency in Ottawa to align Canada with the medium powers—that is, within the North Atlantic community, with the countries of the Western European continent. Canada and the Continent are seen, in Ottawa, as a central group within Nato, while the United States and the United Kingdom stand rather on the opposite wings of the line. At some times—as in the months before General MacArthur's dismissal—the Canadian and European influence is joined with that of Britain to prevent the United States getting too far out of line. At other times it may be joined with American influence to keep Britain up to the mark. This is, perhaps, a somewhat fanciful conception. But it reflects one basic interest that Canada has in the North Atlantic Treaty. Canada can maintain its independence only so long as there is a working community of free nations: if ever a sharp divergence of policy, political or economic, were to arise between North America and Europe, Canada would have to choose. There can be no doubt which way the choice would fall; but Canadians would infinitely prefer not to have to make it.

★

It is not, however, on the political plane that Canada will have any difficulty in really being, and being regarded as, an independent power in the world. The giant to the south is, in political matters, tolerant, friendly and completely unaggressive. But it also exerts a formidable economic attraction. If Canada's actual and prospective development were still what they were twelve years ago, the attraction might be irresistible. Even as late as the end of the war, the Canadian economic attitude towards the United States was still fundamentally defensive. A slump in the United States was taken for granted, and a diversified trade with the sterling area and with other countries was regarded as the essential way to mitigate its consequences for Canada. But since 1945 there has been a sharp change in this view. Not only has Canada's trade with the United States increased rapidly, but there is a new confidence in Canada that this is nothing to be afraid of. Canadians have come to look on the United States as the stable market and the sterling area as the unstable market. Even American recessions (provided they are not big ones) are thought to be likely to affect Canada more sharply through their effects on the sterling area's ability to buy dollar goods than through any direct falling-off in American purchases of Canadian products. In 1949, indeed, Canadian exports to the United States were not reduced at all, and they rose sharply in the boom of 1950; whereas a little trade with the rest of the world was lost in 1949 and a great deal in 1950, through the delayed effect of dollar import restrictions.

This change of attitude means that the Canadian Government has not tried to discourage its exporters from finding in the rich market to the south the outlets that were for so long barred to them by dollar shortage in

the soft currency countries. In 1938 more than a half of Canadian exports went to other members of the Commonwealth, and less than a third went to the United States. Last year the total volume of Canadian exports was 60 per cent bigger than in 1938 and the share taken by the United States had risen to nearly two-thirds; the Commonwealth took only just over a fifth of the total. The likelihood that these trends will continue received its sharpest expression recently at the Torquay tariff conference. Canada made an extensive and satisfactory bargain with the United States, and feels that the postwar progress in reducing the American tariff now far exceeds anything that could have been expected; the United Kingdom reached no agreement with the United States.

It is true that the Commonwealth will take more Canadian goods this year, but that is probably a temporary movement. Canadians are inclined to believe that before long the sterling area system will be subjected to sharp strains; Britain will be too busy satisfying the holders of sterling balances for trade with Canada to be enlarged or even maintained, and British imports from Canada are therefore likely soon to be reduced again. The Canadians have, in any case, made their decision that they must live freely with the American economy and they are optimistic about the results. They will trade with the rest of the world as much as the fundamental fact of being a dollar economy allows, and will contribute from their side of the Atlantic liberal policies designed to make that trade as big as possible. The rest depends on the policies pursued on the eastern shore of the Atlantic.

Economically, then, Canada looks like being more closely bound up with the United States than ever before. What deprives this fact, at least in Canadian eyes, of any danger to their political independence is the great and growing confidence they feel in their own strength. The essence of modern Canada lies in its almost unprecedented economic expansion. Geologists are certain that the oil and natural gas fields discovered in Alberta since the war represent merely a tiny fraction of the resources that the present intensive exploration will reveal over the prairies as a whole. The same area contains, in its coal and sulphur, the other essentials for a great chemical industry. Similarly, the iron ore mining now being developed in Labrador is only one specimen of the new mineral wealth—in copper, nickel, lead and zinc, as well as in iron and gold—that is known to be spread over the great Laurentian shield between the prairies and the Atlantic. In developing these resources Canada will become not only economically more mature, but a great power in its own right. It will export both more raw materials and more manufactures (including, if American designs are acceptable, new military equipment); and as its contribution to the resources of the West as a whole develops, Canada will require an increasingly extensive international division of labour, not free trade with the United States alone, to provide all the imports Canadians will be able to buy. If non-American countries fail to share in this trade expansion, it will be the consequence of their own protectionist trade policies rather than of any law of nature or of deliberate North American policy.

It is true that the process of developing Canada's resources in itself tightens, in the short run, the links with the United States. Last year the boom got a little ahead even of Canada. Investment rose to 22 per cent of the gross national product, personal savings declined, and Canada was a net importer of capital for the first

time since 1933. In present circumstances such capital can come only from the United States. Direct American investment in Canada almost doubled last year, to about \$175 million. Though this is small in relation to a total investment of nearly \$4 billion, a great deal of it represents ordinary shares giving a controlling interest to American firms; it is supported by the large part American technicians are playing in Canadian prospecting and mining ventures.

This investment by the United States will no doubt continue, but it is unlikely to become very heavy. It is true that when the opportunities are so rich Canada is under constant pressure to attempt too much, to fall into inflation and an adverse balance of payments that might lead to a rescue operation by the United States. The safeguard lies in the political and financial wisdom of the Canadian Government, which has proved so far to be a more powerful safeguard than most. Decisive fiscal and credit policies have been adopted this year, and there is little doubt that they will for the present succeed in keeping the inflationary boom within bounds.

There are, indeed, difficulties ahead. The present stage of Canadian rearmament involves heavy purchases of new American equipment, which can, if necessary, be comfortably financed from Canada's gold reserve, rather than direct Canadian production. Inflationary pressures may rise again by the end of the year, when Canada is turning out more arms both for itself and, in smaller measure, for the United States. The Canadian technique of disinflation, avoiding such rigidities as direct price

controls, has been developed to prevent prices from being sucked up by excess demand rather than to prevent their being pushed up by rising import and wages costs. It should not be taken for granted that in the conditions of the next few years the liberal economy can retain the confidence of the groups—labour and the farmers—who by excessive demands could destroy it.

For the present, indeed, the government is quite strong enough to stick to unpopular policies in the belief that they will justify themselves in the end. The Liberal Party in Canada has since the war grown on success. Thanks to its own political competence and to the ability of a remarkable Civil Service, the oppositions both on the right and on the left have been squeezed into something near impotence. This is a peculiar political position that may change for reasons now unaccountable. If ever a stronger opposition develops on the left—a new alliance of prairie progressives and labour, perhaps untinged by the socialism that in the present CCF Party has proved inappropriate to the Canadian environment—it may be much harder to keep the Canadian boom within the discipline of liberal economics, and, paradoxically, Canada's place in the world may become much less separable from that of the United States.

These, however, are remoter possibilities that certainly need not concern the other Atlantic allies at present. Canada's material contribution to the prosperity and security of the West will in any case be great; its distinctive political contribution is also worth understanding and valuing.

The New Examination

THIS is the season of the year when wet towels, midnight oil, ink-stained revision notes and dismal post-mortems are in evidence. It is examination time in the schools. This year there is an added anxiety—a new unknown. The old names have passed away. The new General Certificate of Education has taken the place of the old School Certificate and Higher School Certificate examinations. Does the new name conceal a different enemy, or has the old familiar put on a new uniform? So far as the rank and file of the victims are concerned, the differences in the examination room itself are very small, to judge by the experience of those who have already received their baptism of fire. But while the regiments are engaged in their inky interest it is worth examining the positions which their commanding officers have taken up since the Secondary Schools Examinations Council made its recommendations in 1947.

The new examinations differ from the old in three main respects. The most controversial of these is that the new examination cannot be taken by any boy or girl who is not at least sixteen on September 1st in the year of the examination; the old School Certificate could be taken at any age. Secondly, papers are available at three levels—"Ordinary," "Advanced" and "Scholarship," which after this year, when the standard will be slightly lower for the "Ordinary" level, will roughly correspond to the old School Certificate (at "credit" level), the Higher School Certificate, and the State Scholarship examinations respectively. Candidates will only pass or fail, and will no longer be able to show special merit by means of the award of a "distinction" or "very good":

the candidate who only just squeezes through will thus be indistinguishable from the very able. Thirdly, the subjects may be taken singly or in any combination: it is no longer necessary, in order to obtain a certificate, to take one or more subjects from each of a number of groups. No longer will those who are weak in, say, Latin or mathematics (the two main but alternative bugbears) be deprived of a testimonial to their merits in the other subjects. It is thus possible to emerge from school with a General Certificate in as little as a single subject—perhaps music, art or technical drawing—so that the possession of a General Certificate of Education, despite its new name, will not in future in itself be any guide to the prospective employer concerning the general level of education of the applicant for work; it will be necessary for him to inquire what actual subjects were taken and to draw his own conclusions.

Of these three major changes the minimum age-limit has provoked by far the greatest criticism, and the most fundamental objection to it remains unanswered. No convincing defence on educational grounds has yet been advanced for this new and arbitrary interference with the liberty of the schools to decide at what age their pupils are ripe to enter for a public examination. The decision to impose the age limit was, indeed, the more surprising on educational grounds since the tendency of the rest of the report of the Secondary Schools Examinations Council in which it was made was to give the schools more freedom, not less. Now, to make matters worse, even the political justification for the decision is beginning to look foolish. This political justification arose out

of the general policy of bestowing "parity of esteem" upon the new varieties of secondary schools, the modern and technical schools. From this point of view it was thought that if the new examination was, by means of an age limit, put out of the reach of the modern schools—whose pupils, it was assumed, would leave school as soon as they passed the leaving age of 15—derogatory comparisons between their standards of attainment and those of the grammar schools would be avoided. That this was the purpose is shown by the intention to raise the minimum age for entry to the examination to 17 as soon as the school leaving age is raised to 16. In practice this purpose is not being achieved as fully as had been expected. Mr Tomlinson has only recently said that there is no reason why children in the secondary modern schools should not take the new examination. In localities where the proportion of grammar school places is low, or the modern schools are particularly successful in tempting their pupils to stay on after the age of 15, the pressure from parents of modern school children to take the new examination and to enter the fields of employment to which it leads is bound to grow. The numbers are not likely ever to be very large, but the fact that any modern school pupils at all are entering for the new examination makes the original decision more foolish than ever.

The decision is, however, made and does not for the moment look like being altered. The schools have, therefore, had to adapt themselves to it as best they could. Two factors have increased their difficulties. The first is the failure to reach any proper agreement with the universities which would have dovetailed university entrance requirements with the new examination. In fact the new examination seems to have caused the school and university authorities to drift farther apart. The minimum age limit at 16 would have been reasonably workable if the universities had been prepared to accept, as their entrance requirements, two or three subjects, perhaps at a more advanced level, instead of the wide spread of five or six subjects, at a level that many boys and girls have hitherto managed to attain at the age of 15. The universities, however, have not been prepared to leave the general education of their entrants wholly in the hands of the schools and have insisted on a showing in a wide spread of five or six subjects in the General Certificate. Thus the point at which the able boy can dispose of the subjects in which he has no interest is postponed by a year, or even, in the case of able boys who committed the indiscretion of being born in the last four months of the year, by two years. He does not have to attain a higher standard in these subjects; he simply has

to keep them "ticking over" at the ordinary level. Only one concession has been made: where Latin is still a university entrance requirement, an examination in this one subject can be taken before the age of 16. The budding scientist can thus get rid of this particular incubus; but there is no parallel concession for the budding linguist who detests mathematics.

The result of all these cross-currents is to set the schools a very acute problem of organisation in the sixth forms. In the large schools with generous staffing arrangements the adjustments have been made fairly satisfactorily. In the small grammar schools some of the problems are almost insoluble without more staff. In the recent report on the "Training and Supply of Teachers" one of the assumptions on which the demand for graduate teachers was estimated was that the new General Certificate would necessitate an increase of something like 5 per cent in the number of grammar school teachers. This estimate is a rough measure of the reorganisation in these schools.

It was the independent schools who, at the outset, fought most energetically against the age-limit; they resented its interference with their liberty of action and feared the effects on the standards they could reach in specialised subjects. The girls' schools were least vociferous, since girls were accustomed to take School Certificate, on an average, six months later than boys, and specialised less wholeheartedly in the sixth form. In the event it looks as if the boys' independent schools may be able to take the new certificate in their stride, to carry their courses uninterruptedly to the "advanced" level, and to run a few hurried revision courses at the last moment for those boys who must collect a few additional subjects at "ordinary" level to qualify for entrance to the university. The difficulties are going to be much more acute for the schools where the staffing ratios are tighter, and where most pupils leave at 16 and want to have a certificate to leave with. In these schools it will be difficult to provide any teaching beyond the "ordinary" level.

★

The abolition of the old recognitions of merit, which distinguished the very good candidate from the barely adequate, is still harder to justify. Hitherto the school certificate candidate could get a pass, a credit, or a "very good" mention; for higher school certificate he could get a "pass," "good" or "distinction." Now these differences will vanish. Schools will, as in the past, receive information about marks gained by individual pupils, but they will only be able to reveal the marks to individual pupils in confidence, if in a particular case the pupil needs the information—for example to decide the future course of studies. There may perhaps be some justification for not revealing detailed marks, but what good reason can there be for not revealing distinction in particular subjects, and what evil has followed from this practice in the past? Unfortunately, it is impossible to exclude the possibility that the real reason is the bad one of a desire for levelling-down. Any public acknowledgment of the excellence of the good shows up the mediocrity of the rest and must therefore be prevented. Phrased as bluntly as this, the doctrine would have few supporters. But, slightly wrapped up in fine phrases about "parity of esteem," it has been one of the dominant

motives of educational policy in recent years. It inspired the age limit and the abolition of distinctions. That it is still alive and unrepentant has been shown this week by a Labour Party report which favours the so-called "comprehensive" secondary school, partly indeed on educational grounds, but mainly because any distinction leaves some feeling inferior and some feeling superior. This is education for the uniform state.

It is impossible yet to predict the effect of the third major change, the granting of certificates for single subjects rather than for a balanced group of subjects. Here again, however, it seems likely that the larger and richer schools will be less affected than others. In the better schools, no harm will be done; the university entrance requirements will preserve a certain balance and in any case these schools can afford to take a less hurried and vocational view of education than those where the great bulk of the pupils leave school at the age of 16, to enter careers where only a narrow range of subjects is required. It is in these latter cases that the new system may have the effect of unduly narrowing the educational base. To drop weak subjects may be good if it is the means of enabling the pupil to dig deep into other real disciplines; but not if it is the means of converting education into mere vocational training.

NOTES OF THE WEEK

After the Deputies

Last Sunday the Russians found comment and extracts from two speeches side by side in their newspapers. One was Mr Malik's about Korea, and the other was Mr Gromyko's, delivered at the seventy-fourth and final meeting of the Foreign Ministers' deputies in Paris. Now that this marathon is over, the western powers can feel that, after a poor start, they probably got as much out of the whole performance as the Russians did. Moscow has had to work for every penny of its propaganda profit. Indeed, if Mr Malik's hint about peace in Korea proves to be no more than a move in the war of nerves, its timing would suggest that the Kremlin, although it never wanted a Council of Foreign Ministers save in terms that the west could not accept, has shifted its peace propaganda emphasis to the Far East and the opportunity the situation offers of bringing about Five Power talks. The western powers in Paris did none of the three things which the Russians hoped for: there was no yielding on rearmament, there was no division between them, and there was no disposition to have a Foreign Ministers' meeting on disadvantageous terms just for the sake of meeting. The west has gained a good deal, showing public opinion the immense difficulties that obstruct a policy of negotiation.

This is not the moment to mark time; the instinct of the French to switch attention from their elections back to the continuing worry of German rearmament is sound. Detailed decisions will soon have to be made about priorities in demands for arms which will call in question the political shape and extent of the North Atlantic Pact. Even if the problem of German rearmament can be kept on ice for a little while longer—though the conclusion this week of technical discussions between the three High Commissioners and the German Generals Speidel and Heusinger has carried the question a stage further—there are also the two "fringe" problems of Yugoslavia and Spain. The United States wants to arm all three countries, but it is quite clear that only Yugoslavia at present qualifies for equal priority with the major members of Nato.

Relations between France and Germany are still the political crux of European defence; with a new French

It is still too soon to draw any final conclusions about the new examination; only the years will show. The schools have been set a problem of adaptation, and the preliminary judgment must be that they are adapting themselves to the new system more successfully than at one time seemed likely. This is all to the good, for the old system had many patent defects. But there are differences in the degree of adaptation. The independent schools, who protested the most loudly, seem likely to make the adaptation most easily. The small grammar schools, which the change was presumably particularly designed to assist, will have more difficulty, and it is too soon to say that the quality of the education they can give will not be impaired on balance.

There are thus credit and debit entries. But it is difficult not to feel that most of the credit entries arise from the adaptability of the schools and will be achieved as much in spite of the new regulations as because of them. It is not necessary to go as far as Mr Eliot,

The last temptation is the greatest treason

To do the right thing for the wrong reason,

to feel that good ends might have been achieved by better means and with less admixture of social jealousies that ought to find no place in the education of the young.

Assembly, for instance, ratification of the Schuman Plan becomes an urgent question. It is here, on the centre of the alliance, that western statesmen need to concentrate their attention, now that the attempt to negotiate about Europe with Moscow has failed.

★ ★ ★

A Cruiser for Abadan

The first interpretation put upon Dr Mossadegh's letter to President Truman—that it was an appeal for mediation—did not survive the publication of the text. There is nothing in the letter to alter Mr Acheson's verdict of Tuesday that the situation in Persia "is rapidly moving along the road to disaster." Dr Mossadegh, reinforced by an overwhelming vote of confidence from both houses of his parliament, now threatens the British employees of the company with penalties ranging up to death, to be imposed by military courts, for the ill-defined crime of "sabotage." Apparently to his surprise, this has determined the British employees to leave for home rather than become individual targets for Persian spleen, and the process of shutting down the refinery at Abadan has begun. The behaviour of this little band of British subjects has been exemplary; they are doing their duty with dignity and courage and they deserve every sympathy in the plight in which, certainly through no fault of their own, they now find themselves.

By contrast, neither Government nor Opposition distinguished itself in last week's ineffective debate in the House of Commons. But at least both were agreed on one point. If British lives are in danger, either because the Persian Government threatens them with persecution, or because it cannot keep order in the oil province of Khuzistan, then British forces must be landed to see British nationals to safety. A cruiser now lies off Abadan for this excellent purpose.

But beyond this the parties disagreed. Many Conservatives contend that force should also be used to protect British property—the refinery—and to keep it at work, if necessary on crude from the other fields of the Persian Gulf. Two months ago, when the dispute first reached a crucial stage, many people in this country thought that the right

course was an immediate occupation of Abadan, which at that time could probably have been done without bloodshed. But since then the case for using force has been getting weaker and weaker. For one thing, it no longer seems absolutely essential to have the oil at all costs; it now appears that the development of crude oil production in the Middle East and of refining capacity in Western Europe has been proceeding so fast that a total shutting-off of Persian supplies, though certainly a major inconvenience, would not be the disaster for the western world that it would have been at any time before the present. There is, therefore, less compulsion at all costs to protect the Anglo-Iranian Company's properties as an absolutely vital national interest.

Secondly, it is now certain that an occupation of Abadan would not be bloodless and probable that it would not be effective. Once upon a time Asiatics could be cowed by a show of power; but it is far from certain that the same impression would be created now among Abadan's relatively sophisticated workers. They are highly sensitive to the propaganda from Teheran that reviles them for serving foreigners. They might be impossible to handle by an occupying force, and their unrest might affect labour in other oilfields across the gulf. And finally, reflection has served to underline the very unpleasant position in which Britain might find itself if the Persians appealed to Uno, as they certainly would, against British "invasion"; it is highly probable that a majority of the Assembly, made up of the Latin Americans, the Middle Eastern states, the Asian states and the Soviet bloc, would vote to condemn Britain as an aggressor.

*

The Conservatives' clamour for the use of force was therefore somewhat irresponsible. But if one is to judge by Mr Morrison's statements, there is a real risk that the Government, pushed by events from one point to another, will finish up by acquiescing in robbery. No criticisms that can be made of the company's past conduct serve to alter the plain fact that the Persians are committing a crime. The task of dissuading them from committing it now seems almost hopeless. But there still remains the task of seeing that they do not benefit from it—indeed, that they suffer sharply. This result will certainly follow, in time, from any attempt by the Persians to run the industry by themselves. But it is the effect on other Middle Eastern states that matters and for that something more exemplary is required than simply to leave the Persians to stew in their own juice. If the company is compelled to evacuate Abadan, the British Government should make it clear that the whole of its power and influence—and, if necessary, its naval strength—will be used to prevent the Persians from selling a drop of the oil they are stealing.

There is, of course, the argument that chaos in Persia will simply bring in the Tudeh party. But if the Persians are bent on having chaos, there is nothing that the west can do to stop them. And a Tudeh government in Teheran, which is a long way over the mountains from Abadan, might make the inhabitants of southern Persia positively anxious to be rescued from the politicians of the capital—and the United Nations more anxious to rescue them. After all, the 38th parallel runs through Persia too.

* * *

The Foreign Secretary

The debate on Persia last week was a serious personal failure for Mr Morrison. This was the first time that the oil issue had been discussed in the House of Commons since the crisis began; it should have been the opportunity for presenting a calm and reasoned statement of British policy to the world—and, in particular, to Persia. In fact the debate degenerated into a Parliamentary row. In part, it is true, that was the result of sheer bad manners on the Tory back-

benches. But it was also in part the consequence of Mr Morrison's unnecessarily provocative and partisan air, and of his failure to develop any full view either of the past history of this unhappy affair or of future policy.

This is not to suggest that Mr Morrison is, at this stage, a failure at the Foreign Office. He is, by all accounts, handling some of his duties well—better, indeed, than many of his friends as well as critics expected. But so far he seems strangely to have failed to appreciate that for a Foreign Secretary the House of Commons is a place where he represents, to the outside world, the country as a whole, and where he must at times expound to the British public what is in essentials a national policy. On several occasions Mr Morrison has apparently been handicapped by having too little grasp of his subject to comment wisely outside his brief. Perhaps that is still excusable. It is hard to excuse his apparent wish to expose and exasperate his opponents rather than to explain a policy that in moments of crisis should be as bipartisan as possible. A bit of pomp is essential for all leaders—even great cockney leaders.

* * *

The Tshekedi Khama Debate

Discussion in Parliament of the cases of both Tshekedi Khama and Seretse Khama has been vitiated throughout the past fifteen months by the Government's refusal to admit that its policy has been greatly influenced by fear of offending South African opinion. In the House of Commons on Tuesday Mr Gordon-Walker once again steered clear of this particular reef, and as a result brought into the debate an atmosphere of unreality—indeed of half truths—which prevented the House from getting to grips with the problem. Doubt as to the truth of many of the other facts of the case also hampered the argument. Mr Gordon-Walker, for instance, rejected allegations that the *kgotla* which he attended had been stage-managed, yet it is difficult indeed to interpret the District Commissioner's letter, read out by Mr Clement Davies, in any other sense. Mr Churchill also expressed the feelings of most of the House when he said he did not like the "last minute alarmist telegram," which the Minister had read, suggesting that if Tshekedi were allowed to return the tribe would scatter.

On the other hand, the Government was undoubtedly on strong ground in emphasising that the conflicts within the Khama family, and with other dynastic groups in the area, cannot be brushed aside in an effort to regard Tshekedi's case as a simple issue of civil liberties. Mr Attlee was, incidentally, at his best in his winding up speech, displaying that willingness to recognise untractable realities which is one of his hidden strengths. But even he would not face the reality of South Africa's attitude. And the offer of a new *kgotla*, even if it were observed by three British MPs, is hardly satisfactory. Such a gathering could not establish adequately the state of native opinion, and at the worst might be merely a demonstration of a mob veto.

The Liberals rose admirably to the occasion of their prominent part in the debate, but it was hardly surprising that within the two main parties the voting as well as the discussion on Tuesday had an air of unreality. Had the Government's prestige not been at stake, many more Labour members would have remained on the benches with the half dozen who abstained, and many more Tory backbenchers would have joined the 15 who surprised the House by refusing to follow Mr Churchill into the lobbies. This rebellion has some political significance. It was not a move by the older diehards of the Party—Sir Waldron Smithers, for instance, moved enthusiastically into the lobby in the hope of bringing the Government down—but by a group of younger men such as Lord John Hope and Mr Bevin. It represented a dislike both of Mr Churchill's views on Tshekedi in particular and of his leanings towards his former Liberalism in general. Too much may be read into one

incident, but it is a reminder that Mr Churchill cannot rely on blind allegiance for any policy he cares to bring forward, particularly if that policy conflicts with some of the more rigid Tory concepts which have their youthful, as well as their elderly, advocates.

* * *

Following Dr Dalton

It is easy to understand the political reasons why the Minister of Supply is anxious to disavow responsibility for the present state of the steel industry. He wishes to forestall the criticism—largely unfair—that will undoubtedly develop when the first months of public ownership are seen to coincide with a considerable shortage of steel. Mr Strauss also finds it useful to take as many cards as possible from the Bevanites, who can be relied on to think that the Government is not being sufficiently tough with the steel firms and their surviving "capitalist" directors.

But such motives, however strong, cannot excuse the nonsense that Mr Strauss talked last week. He alleged that the Iron and Steel Federation is using every device to "frustrate" the new steel corporation. It is, of course, perfectly true that the federation is resisting the corporation in the sense that it is trying to keep its own organisation together. What else did anyone expect when nationalisation was carried through by the narrowest majority and the Government may change before the processes of recasting the industry can go much further? The Government knowingly undertook an operation in which it would receive no more co-operation than the letter of the law required, and it has only itself to blame for the resulting difficulties.

Moreover, the administrative argument did not content Mr Strauss. He implied that the private industry has also "frustrated" nationalisation by deliberately running down its stocks of materials, so that the poor public corporation was faced with an almost bare cupboard when it took over last February. The facts are discussed in a note on page 1881. It is also relevant to point out that if it were really possible for the steel industry to behave as Mr Strauss alleged, central planning of the economy must be vastly more incompetent than even the Government's sharpest critics had thought. But the Minister's arguments are not to be taken seriously. The disturbing thing is that they have been heard before. On February 1, 1947, Dr Dalton declared that the private coalowners "left us before they flitted with stocks of coal lower than ever before in our history." That was six days before the Friday afternoon when Mr Shinwell announced the fuel crisis. The attempt to blame the former private industry did not succeed then, and it will not succeed with the steel firms now. Mr Strauss may be very worried, but one would have expected from him more sense than to follow Dr Dalton in the sort of irresponsible charges that can only do harm all round.

* * *

Suez and Haifa

It is now inevitable that Egypt's interference with Suez Canal traffic, in order to search for contraband bound for Israel, will be laid before the Security Council. General Riley, United Nations Chief of Staff in Palestine, has laid before it a report that calls this interference an "aggressive and hostile action" undertaken in a spirit of blockade. He cannot deal with it himself, he has publicly said, because in his view the Truce body which he controls is confined by its mandate to hostile acts committed by armed forces. Yet "the matter cannot rest here."

Egypt's answer to the Council will raise a fine point in law; for on legal grounds it has an arguable case. On grounds of common sense about the way the world is going in 1951, it has no case. In the Suez Canal Convention of

1888, two articles conflict. The first, Article I, says that the Canal shall be open in peace and war to the ships—naval and merchant—of all nations, and shall never be used (*assujetti*) for the exercise of blockade. The second, Article X, says that certain foregoing articles (Article I is not specified among them)

shall be no obstacle to any measures which the Khedive may find it necessary to take to secure, by his own means, the defence of Egypt and the maintenance of public order.

Egypt argues that it is still at war with Israel and that the defence of Egypt is at stake. The commonsense retort to this argument is that a state of war must not be turned into perpetual vendetta, particularly if it reduces international security in an important area.

The case is important to the western powers because one of the contraband items on the Egyptian list is oil for the Haifa refinery which, though less than quarter the size of Abadan, assumes a new importance if the world is temporarily to be short of refining capacity. The most satisfactory aspect of the Riley report is that it puts into proper perspective an argument over oil for Haifa that has unwisely been confused with other subjects of Anglo-Egyptian controversy, the sterling balances for instance, or the Anglo-Egyptian treaty of alliance. Egypt can be arraigned for its blockade of Israel on an indictment far wider than the charge of being pig-headed over a British refinery. Much damaging confusion of thought will be avoided if the issue is dealt with on the wider count.

* * *

South African Controversies

South Africa has just completed one of the most unhappy and controversial Parliamentary sessions in its history. The conflict rose to a climax over the Separate Representation of Voters Bill, which contained a direct attack on the very basis of the Constitution. This Bill, in spite of the most bitter protest inside Parliament and out, is now law, but the battle is not yet at an end. The next phase is expected to be fought out in the law courts, after the names of coloured voters have been placed on a separate roll; one of them will then probably apply to the courts for an interdict restraining the Government from such action.

Passions have also been roused by other legislation, such as the Suppression of Communism Amendment Bill, which gives drastic powers over the liberties of private citizens even to the point of interfering with their free choice of radio listening; and the Bantu Authorities Bill, which has some advantages but abolishes the Native Representative Council set up in 1936 as the sole Union-wide body on which Bantu was represented by Bantu. In the emotional clashes which all these measures have engendered something more is at stake than normal political differences on native policy. The real underlying issues are the honour of South Africa, which the Opposition feels has been compromised by a series of broken pledges, and the liberty of the individual, which is now threatened as never before in the Union.

There has been talk that the deepening cleavage within the Union will one day end in civil war. If that is so, competent observers believe that the day is not yet; but it might come over the question of republicanism. This most controversial of all South African issues lurks round every corner. There is fierce resentment against the British criticism of South Africa, with the consequent desire to cut the ties and assert by some dramatic act the independence of the Union before the world. So deep is this sentiment among the more extreme Nationalists that Dr Malan has found it necessary to restate his own position. He has declared that anti-British feeling alone is not a good basis for republicanism. "Even if South Africa became a republic, she must maintain friendly relations with Britain, unless Britain did something to alienate her." But a republic could only come with the acquiescence, not only of the Afrikaners, but of a reasonable

number of the English-speaking people, and "after the will of the people had been properly tested." Dr Malan has also repudiated the draft republican constitution—with its many anti-democratic features—published in 1942. Curiously enough, it now falls to this Afrikaner statesman—as it fell to Smuts and Hertzog before him—to maintain the Commonwealth link and save the less rational of his followers from a descent into Boer isolationism.

* * *

New Party for India

The split in the Indian Congress Party is a very welcome development. No democratic system can function effectively without an opposition. It was of great value to India, in the testing months immediately after the transfer of power and the partition of the country in 1947, that Congress should rule as a kind of coalition, receiving the almost unanimous support of the great mass of politically conscious Indians. But with time the situation has undoubtedly changed. It is not just that accusations of dishonesty and incompetence, levelled at Delhi and at the men appointed by Delhi, may have a substance of truth in them. There is a real need in India for independence of thought and for the stimulation of political controversy to be exercised within the existing constitutional framework, if the central government is to make headway against the tide of economic and political problems tugging against it.

Recently Mr Acharya Kripalani, a former president of the Congress Party and its general secretary for many years, broke away to found a new left-wing organisation to be known as the *Kisan Mazdoor Praja Party*—the Peasants', Workers' and Tenants' Party—or the Praja Party, for short. This title and a programme were evolved at a congress held at Patna in Bihar two weeks ago. Mr Kripalani has already been supported by several men prominent in public life, but most notably by Mr R. A. Kidwai, who has been Mr Nehru's Minister for Communications. Their programme is at present severely practical and limited to the immediate needs of the moment. The Praja Party aims at a secular state in a classless, casteless society. It means to overhaul India's administrative machinery, to stop black marketing and profiteering—in the long run a really grave source of danger to the political as well as the economic basis of national life—to encourage small local industries, to extend education, and to decentralise government. Very little has been said, or yet thought, about foreign policy.

The relationship of Jai Prakash Narain's Socialists to the new party is not yet clear, though it is reported to be close. It would probably be better for the present, however, that the two should not merge, since socialist principles have played no direct part in the events leading up to Mr Kripalani's break with Congress, and it is in India's interest that his appeal should now be as wide as possible. It is hard to see what Mr Nehru's personal position in the Congress Party may eventually become, if its left wing tends to leave and a rightist rump remains round the present president, Mr Tandon. But at present the Prime Minister's position is still so strong in the hearts of the Indian people that he can afford to see the new trend continue for some time to come.

Test Case on Identity Cards

Public thanks are due to Mr C. H. Willcock for testing in the High Court the right of the police to ask a person to produce his identity card. It was too much to expect him to win his case, ingenious though it was. He contended, in brief, that there was only one emergency behind the passing of all the emergency legislation of 1939; thus, since the emergency had been ended by order-in-council for one of the wartime Acts, it was also at an end for the purposes of the National Registration Act, which was therefore no longer

in force. The court held, however, that each Act needed a separate order-in-council to make it inoperative. No order-in-council existed that ended the emergency so far as the National Registration Act was concerned; therefore it was still in force.

But the judgment provided an opportunity for some apt judicial comments on emergency legislation in general and on the liability to produce an identity card in particular. The Master of the Rolls found difficulty in saying that in 1939 Parliament behaved as though there were different and distinct emergencies or that, if there were only one emergency, Parliament intended to deal with different aspects of it. The Lord Chief Justice was even more forthright. Because the police still have powers to ask for identity cards, it does not follow that they should use them as a matter of course whenever they suspect a motoring offence. The National Registration Act was passed as a wartime security measure. If the police wished to use it to obtain evidence of previous convictions against a motorist, they should ask Parliament for the necessary powers.

To use Acts of Parliament passed in wartime for particular purposes now that war had ceased tended to turn law-abiding subjects into law breakers.

It was one thing to demand an identity card if a car were stolen or if a motorist had committed a crime, but quite another where someone left a car too long outside a shop.

All these strictures will be heartily applauded. Perhaps the Post Office, the Ministry of Food and the Ministry of Health, which use identity cards for purely administrative purposes, will take note.

No Gradualism in Equal Pay

It is hardly surprising that the champions of equal pay met last week with another rebuff. Mr Gaitskell rejected not only its immediate application but also the suggestion that differences of pay between men and women in the Civil Service should be gradually reduced over a defined period. He argued that, unless the gradualism was so extreme as to be derisory, the consequences would be as certainly dangerous as those of immediate, full equality. The direct cost of equal pay in the Civil Service would admittedly be small, but the probable "multiplier effect," in the form of other wage demands, might be large. And, as Mr Gaitskell argued, the pressure for higher family allowances—in order to offset part of the effect of equal pay—would be very strong.

The question of dependants, of the number of persons actually living on the wage or salary paid, is the central question involved in what is fair. In its own crude and highly inequitable way, differentiation according to sex has always reflected the public sense of the proper. But the argument from equity does not stand, however shakily and unjustifiably, alone. Workers of either sex do tend to be paid what their employers think they are worth. The employer who values male employees more highly will employ women so long as, but no longer than; their lower pay compensates him for the inconvenience of providing special welfare facilities or for the high turnover due to marriage and domesticity generally. To impose equal pay throughout the economy would thus narrow the opportunities open to women.

This is not to say, however, that the pressure on the Chancellor should cease. One may make allowance for the disabilities of women, for their "meanwhile" attitude to employment, for the extra expenses which that employment consequently imposes; it still remains true that the present almost universal financial penalty of sex is less a reflection of this genuine economic element than of an irrational inertia from which neither equity nor efficiency are gainers. The right policy for the state is to do what it can, by precept and example, to reverse the institutional bias of society and to create a presumption in favour of equality instead of against it; and the Civil Service, where inequality is perhaps

CONSULTATION

Two forms of consultation are frequent at TI. No. 1 is full technical consultation with customers. No. 2 is expert consultation within TI itself, for TI is an organisation of 49 factories in Britain, each with its specialised job. TI companies make cycles, cycle parts, precision steel tubes, electrical appliances, high pressure cylinders, gland packings, paint, aluminium alloy sheet, strip, extrusions. . . . Each feeds the whole TI fund of expert knowledge, available to all TI companies and to customers who consult them.

Assistance Payments and Living Costs

The proposed new scales of national assistance are of little interest in themselves because the Government had already announced that assistance payments would be increased by an amount equal to the increase in old age pensions for the over sixty-fives. If they had not been, people whose old age pensions were being supplemented by national assistance would merely have had their supplement reduced by the amount of the increase in their pensions; they would consequently have gained nothing.

It is, however, worth comparing the increase in the rate of assistance payments since July, 1948, when the present system of national assistance was introduced, with the increase that has taken place in the official interim index of retail prices. The ordinary scale for national assistance roughly measures, or should do, the amount of money that a person requires for subsistence—exclusive of rent, which is provided for separately. In July, 1948, the rate for a person living alone, or who is a householder and therefore "directly responsible for rent and household necessities," was 24s. a week. To this was added a rent allowance normally equal to the amount of rent actually paid. A year ago this scale rate was increased by 2s. and under the proposed regulations will be raised by 4s. This will make an increase of 25 per cent since 1948.

The retail price index shows a rise of 16 per cent between July, 1948, and May this year, if rent is excluded from it. But food and clothing, which must bulk more largely in the expenditure of a person on assistance than in that of a working man, each shows an increase of 25 per cent. The new assistance scales, if approved by Parliament, will come into force on September 3rd, and the Assistance Board states that they take account of current trends in prices as well as changes that have taken place in the last year. Does this mean that the whole index, exclusive of rent, is expected to be 25 per cent over July, 1948, by next September? Food and clothing are certain to show bigger increases by then, and it seems only too likely that this second increase in assistance payments will not be the last.

* * *

Freeing Europe's Trade

Settlement of the delicate problem of German trade has enabled the scheme to liberalise European trade to get once more under weigh. The programme laid down last year enjoined countries of western Europe to free at least 75 per cent of their trade on private account between member countries (based on 1948 figures) by February 1, 1951. It was realised that freeing of 75 per cent of the trade in each of the three main categories—agricultural products, raw materials and manufactures—would create special difficulties for many countries. So the procedure was modified and countries were allowed to keep 60 per cent as a minimum aim for each category, provided that the total trade freed from quota restrictions amounted to 75 per cent. Germany, Austria, Denmark, Greece, Iceland and Norway were not able to achieve the 75 per cent mark and the matter was left in abeyance pending a solution to the German problem.

In the first six months of the European Payments Union, Germany suffered a large deficit on its trade with western Europe. As an emergency measure it was allowed to re-introduce, temporarily, quota restrictions on those goods that it had previously liberalised. The new settlement, which was discussed on page 1523 of last week's issue, is little more than a makeshift programme to ensure that the pattern of German imports this year will conform, approximately, to that of 1950. There was no question of abolishing the tem-

porary quotas; but Germany has had to agree that at least 45 per cent of its monthly imports will be of goods previously "liberalised," and that the temporary quotas granted to member countries of the European Payments Union will be based on their sales to Germany last year. The monthly volume of imports has also been increased from \$150 million to \$170 million.

The emergency measures have been successful in redressing Germany's trade balance. In both April and May it exported more than it imported, and in May it had a net credit in its intra-European trade for the first time since EPU started. It repaid the loan granted by the EPU last March and it received a gold payment for half of its net balance. It cannot yet be claimed that the German trade problem has been overcome, but at least the progress in that direction has been more rapid than the experts thought possible.

* * *

A New Approach

The course of freeing Europe's trade, however, will be far from smooth even when Germany plays its full part. It was recognised in OEEC that, if European trade is to be really freed from import restrictions, countries could no longer be allowed to choose, independently, which commodities they wished to liberalise. It was also recognised that to define objectives as a percentage of trade in the base year, 1948, gave no incentive to abolish restrictions on those commodities of which imports were small in 1948 but have since grown. Conversely, countries were always very willing to free those goods which were imported in large quantities in 1948 but are now imported only in small quantities.

The new method is to prepare a common list of items which, when accepted, all countries would liberalise, irrespective of the proportion those items contributed to total trade in the base year. The items have been chosen not because of their importance in intra-European trade, but because they were the easiest on which to achieve agreement. Textiles and textile machinery figure largely in the list, together with a number of agricultural and chemical products.

The common list was to have come into force this weekend, but it has been postponed for a month or two. Countries retaining quantitative restrictions on these specified goods after the agreed date must justify their action before the steering group, which drew up the common list, and, failing that, before the Council of Ministers of OEEC. The two acceptable grounds for retention are equity and balance of payments positions. The principle of equity covers those goods prohibited from the home market in order to foster the export drive; on this ground, for example, Britain could retain quantitative restrictions on the import of decorated pottery, since domestic manufacturers are not allowed to sell decorated pottery on the home market.

Agreement on the common list has been difficult enough; but the most serious obstacle to further liberalisation is likely to be government trade, which is at present excluded from the scheme. Here Britain is the main offender. The low prices offered by the Ministry of Food to its European

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1

suppliers have had the effect of restricting European trade. Those countries whose trade is entirely, or almost entirely, on private account accuse this country of enjoying an unfair advantage. Britain, on the other hand, claims that its trading departments are willing to buy from any country provided the price is right, and that it cannot agree to pay high prices if it is to stem the rising cost of living. This condition of price is all important, as both Denmark and the Netherlands know to their cost.

Admittedly, Britain has already freed 90 per cent of its trade on private account with European countries; and, since most of its government trading is with countries outside Europe, it is clear that the proportion of its trade liberalised, even if government trading were taken into account, would be over 70 per cent, though possibly not yet up to the necessary 75 per cent. This question of government trading is fundamental, for if intra-European trade is to develop, countries will no longer be able to pursue entirely independent domestic economic policies.

* * *

"De-purging" in Japan

While in this country the Lord Chief Justice and his learned colleagues have been trying to find out whether an emergency still exists here, there can be doubt about its persistence up to this week in the island of Anatahan. There, 18 Japanese soldiers, whose last orders were never to surrender, have been holding out since 1944. They have now at last, it seems, been convinced that the war is over and have hoisted flags of capitulation. When they are repatriated to Japan, the last unit of the old Japanese Imperial Army to lay down its arms (unless, indeed, there are still others on even remoter isles of the Pacific Ocean), they will find that many changes have taken place in their country; but the alteration of the landscape will be less noticeable than it would have been if they had returned two or three years ago. For there has just been a restoration of many old familiar landmarks in Japanese public life by the recent "de-purging" of some 69,000 people formerly banned from politics or important economic positions by the American occupation authorities.

The removal of the ban will bring back into Japanese public life a number of men of undoubted ability, who are not too old to resume political or business activity and have in many cases continued to exert considerable influence from behind the scenes even during their formal exclusion from great affairs. These men vary considerably in the degree of their responsibility for the policies formerly pursued by Japan, and it would perhaps have been easier to continue the ban (if the Japanese Government had wished to do so after the conclusion of a peace treaty) if it had been applied with more discrimination. The task of political purging was in any case more difficult in Japan than in Germany, where membership of the Nazi party or its organisations provided a criterion of undesirability. In Japan, the Americans adopted somewhat rough and ready methods of sorting, with very little knowledge of who had stood for what in Japan before the war; and at the outset they somewhat discredited the seriousness of their judgment in the eyes of the Japanese by applying the ban to two men who had already been dead for some years. The purge has, nevertheless, been useful; it gave the more democratic elements in Japan a chance to make a start with the new constitutional system, and the question is whether the new men and the new system are yet strong enough to hold their own against the return of the old hands.

Punishments in Prison

Most people will agree with the main recommendations (Cmd. 8256) of the committee set up to review punishments other than corporal punishment in prisons and borstals. It takes the sensible attitude that constructive measures to

strengthen discipline are more important than actual punishments, necessary though these are. For instance, it recommends that earnings, forfeiture of which is an effective punishment for some prison offences, should be increased in order to stop tobacco racketeering—a practice graphically described by a prisoner in a letter reproduced in the report. This racketeering is the cause of much indiscipline and crime in prisons, and arises largely from the inability of prisoners to buy even half-an-ounce of tobacco a week with their present earnings.

Another constructive suggestion is that special establishments should be set up for prison and borstal inmates who are particularly depraved and unruly and consequently have a bad influence on their fellow inmates and on the whole atmosphere of the institution. Properly staffed, a corrective institution would be of especial help to the borstal system, which, as the committee found, is going through an exceedingly difficult period.

Two of the committee's recommendations should be regarded more critically. One would deny a prisoner charged with a serious offence the right to be represented when his case is heard by the visiting committee. The right is implicit in a clause of the Criminal Justice Act of 1948, and it is difficult to see why welfare agents like prison visitors cannot act as a prisoner's friend for the purpose. Prisoners are only too likely to feel a grievance—and consequently commit more offences—if they are punished severely without what they consider a fair hearing.

The other dubious recommendation is that borstal absconders should be dealt with by the board of visitors (the superior disciplinary body) instead of the governor. The committee makes this recommendation because

Writing and Renown

The contrast between England and France in the position and treatment of journalists and journalism is very curious. With us, it does not, as in France, raise its chiefs to the peerage or the premiership, but it is treated with much greater respect, is allowed far more freedom, and is probably more really and widely influential. In France the only two roads to political eminence are the Army and the Press, and the latter is an immeasurably surer and more common one than the former. In England, it is true, we have in Parliament, gallant officers, generals, and admirals in abundance, but it is never their professional renown which makes them eminent there; rarely is it that which places them there. They seldom reach the Ministry, except in subordinate departments, and are rarely prominent in debate or in administration. . . . Still more rarely does authorship—scarcely ever does connection, however honourable and renowned, with journalism, open to a man in England the path to political honours. Macaulay is almost the single exception. Here and there we have writers in Parliament; but they are rarely prominent there, and are never made so by their writings. Again, we have talent, at least as eminent as any in France, employed in the service of our periodical Press, but that employment never marks them out for high office or political rewards. Whereas in France, now that the old marshals of Napoleon's day are removed from the stage, there is scarcely a political character of note of eminence who has not become so by his writings. . . . Victor Hugo, Girardin, Victor Cousin, Gustave de Beaumont, Tocqueville, Lamartine, Thiers, Guizot, all owe their position to their writings—some of them to their writings as journalists. In England there is a sort of tacit feeling that success in authorship is a disqualification for public life; in France it is the chief, if not the sole, qualification or proof of such.

The Economist

FRIENDS

ONE of Africa's most important men is now in Britain seeking our help in the development of his country—the Gold Coast.

He is Mr. Kwame Nkrumah, leader of the Gold Coast Parliament, and virtually Prime Minister of this British colony. And he is vitally important as key man in the four months old experiment of giving the people of the Gold Coast a measure of genuine self government.

Africa remains a continent of bitter problems. No wonder, then, that men and women of African race all over the world—including America and the West Indies—should look with burning interest to the progress of a British colony where the removal of bitterness has given co-operation a real chance to flourish.

Britain has in the Gold Coast shown the reality of her desire to see African peoples advance and take on responsibility, whereas Mr. Nkrumah and his colleagues are now discovering and facing the problems which come with responsibility.

The difficulties will not be easily solved, particularly at a time of enormous demand on British resources. But how refreshing it is that we can get together as friends to see what can be done.

There is better hope for Africa if this friendship can grow. And with continued goodwill and understanding on both sides, it will.

OUTSTANDING VALUE IN LIFE ASSURANCE

ESTABLISHED 1854
EQUITY & LAW
LIFE ASSURANCE SOCIETY
20 LINCOLN'S INN FIELDS, LONDON, W.C.2

IS THE "DICTOREL"

This is the machine YOU have been waiting for—but you need wait no longer, because A.C.E.C. can supply you without delay. It is the last word in dictating machines, and has just the features every executive dreams of—unerring efficiency in "taking down" by a secretary who does not interrupt, catches every word and, by the flick of a switch, reads back exactly what you've said in the way you've said it! If you wish to correct your last sentence, you simply re-dictate the improvement you want, and the previous wording is automatically obliterated by recording the new.

And just one other thought—this "Secretary" is not "hard on the eyes"—in fact, it is a styled and elegant piece of office furniture, as you can see from the illustration.

The further details you will no doubt like to have can be obtained from the two addresses given below or from the London Office of A.C.E.C.

absconding has greatly increased since the war and because escaping prisoners are similarly dealt with by visiting justices. But borstal training is essentially different from a prison sentence. Occasional absconding can almost be considered inseparable from this training, and the relations between a governor and the inmates, on which the success of the training largely depends, might be seriously harmed if every case of absconding were taken out of his hands.

The Tourist Boom

Britain is a tourist centre in spite of itself. The latest annual report of the British Travel and Holidays Association reports some impressive figures. A record number of overseas visitors came last year; in Festival Year, in spite of fears of war, it is hoped to reach a new peak of 700,000 tourists. In 1950 the foreign exchange thus earned amounted to £81 million, compared with £65 million in 1949. If incidental transport earnings are included, tourism is Britain's chief dollar-earning "export." Receipts from American visitors alone are estimated to have brought in £25 million, equivalent to almost one-quarter of our visible exports to the United States.

But the Association's "Come to Britain" campaign is at present in danger of creating a demand that it cannot satisfy because of a shortage of suitable accommodation in the peak season, especially of a luxury type at one end of the scale and of an inexpensive kind at the other. In order to spread the heavy traffic of July and August, the Association urges that the bank holidays should be altered: Whit Monday, which now tends to open the holiday season either too early or too late, should be replaced by a Monday in the second week of June, and August bank holiday should be at the

end of the month. The Association also urges that cheap fares should be offered throughout this season—a proposal that the railways, already in the red, find hard to accept.

Fuller use could be made of existing accommodation if the hotel and catering trade were readier to adapt itself to take foreign tourists. Some of the devices to make foreigners uncomfortable, such as inability to get a drink at most times

and in most places, are outside its control. But there is much that is not, especially in the cheaper end of the trade. The type of accommodation that many would-be visitors can afford is now the seaside boarding house with unpromisingly English food and perhaps an antipathy for foreigners. It is perhaps significant of the general British attitude to tourists that six-sevenths of the Association's funds come not from the trade but from the Exchequer.

Letters to the Editor

Free Sweets—and More Sugar

Sir,—In a paragraph in your issue of June 16th, it was alleged that the building up of confectionery stocks was being given precedence over an increase in the sugar ration, and that housewives were being kept short of sugar "while sweet supplies are built up to whatever level may be required in order to meet the demand at the present controlled prices."

Mr Webb wishes me to deny emphatically both these statements. He has said repeatedly that the housewife has first claim on any additional sugar that becomes available. Accordingly, when extra sugar became available towards the end of last year the needs of the housewife received first consideration, and Mr Webb announced on December 13th that the domestic sugar ration would be increased from 8 oz. to 10 oz. from December 31st. At the same time, he said:

I intend also to increase sugar allocations to food manufacturers, and I am considering how far I can restore them to the level at which they stood before the domestic ration was reduced; but anything I can do in that way will have to wait until towards the end of January.

The small amount of sugar that was made available to sweets manufacturers as a result of this decision was just enough to restore the industry's allocation to the level at which it stood before

it was reduced in the autumn of 1950. This allocation of sugar was no more than sufficient to produce a 4 oz. ration of sweets. The increase of the ration to its present level of 6 oz. has been achieved only because manufacturers have made the greatest possible use of unallocated ingredients, such as imported sweetened fat and fondant, which are now available on the open market, and because of the imports of chocolate and confectionery included in the ration.

The extent to which the Ministry puts domestic needs first is best shown by the fact that the domestic supply is now at the rate of 92 per cent. of the prewar rate; the average supply to food manufacturers about 88 per cent; and to manufacturers of chocolate and sweets, 62½ per cent.—Yours faithfully, W. SHELTON SMITH
Ministry of Food, S.W.1

[The argument of our note was that the Ministry in effect gives precedence to sweets compared with the marginal uses of domestic sugar—the home preserving, etc., that is almost impossible with the present size of the ration. Mr Shelton Smith himself shows that in a situation where the sweet ration could have been maintained at 4 oz. with a smaller allowance of sugar to the manufacturers, and the domestic sugar ration improved accordingly, the official preference was for a 50 per cent. increase in the sweet ration. To take previous allocations or consumption as a standard may be most convenient for the Ministry, but the result has no necessary connection whatever with the consumer's present needs.—EDITOR.]

How Much Does Persian Opinion Matter?

Sir,—In his article in your issue of June 2nd your special correspondent makes points which apply to British overseas enterprise elsewhere, particularly in other backward but awakening areas, and particularly in the oil industry. While we lead the world in the ideals of trusteeship in the opening up of resources, we fail too often to overcome our aloofness and apparent condescension, which perhaps makes us unable successfully to lift up the backward "native" to develop his initiative or share responsibility.

We can rightly refute accusations of exploitation and can point to the overwhelming examples of the social services we have created in the deserts and swamps where oil is found. But too often, wrongly, we expect praise and gratitude, forgetting that the uplifted did not ask for the services, but that we had to grant the benefits to ensure physically and mentally healthy labour. In fact our very regulation of their lives for their own benefit irked them and lost us goodwill because our imposed way of life is foreign and away from ancestral custom.

In our industrial relations we tend to forget that work does not fill a man's life and we cannot successfully regiment his private life. In making a too rigid interpretation of the collective labour

contract our main defence against subversive elements, we neglect, in the battles against Communism and expropriationism, to recruit to the side of the company the allies of loyalty, pride and affection. These allies will not be found on the job nor in the pay packet. They can, however, be enlisted off the job, in the community life of the camp. Initiative and a sense of responsibility can most easily be attracted towards activities connected with a man's stomach or his pocket or his comfort. The line of approach lies through the women to start with—better diet, cooking, homemaking—followed by an increasing measure of popular control on all other aspects of community life, including the fostering of secondary industry to employ the other members of the worker's family. Such activities tend to draw the ambitious man away from anti-company groups where unfortunately he is too often to be found and give him the opportunity to develop in the light where he should be seen when selections for promotion are made.

By placing responsibility to order his private life back where it belongs, on the individual, we open up new approaches to the social and economic problems outside the industry which often weigh so heavily on management, and the solution of which may mean survival.—Yours faithfully, J. E. A. BAZALGETTE
Wimborne, Dorset

A Higher Pound?

Sir,—The advocates of a revaluation of the pound, both in your columns and elsewhere, base their arguments on the supposed advantage which the people of this country would reap from an improvement in the terms of trade of the United Kingdom and from the consequent halt to the rise of prices in this country. In the article in your issue of June 2nd, you questioned the wisdom of calling a halt to the rise in British retail prices at the present time, but welcomed the possible improvement in the terms of trade of the United Kingdom which might be brought about by the revaluation of sterling.

I wonder whether the advocates of revaluation realise that sterling is the currency not only of the United Kingdom but also of a large part of the overseas sterling area and that it is a dominant factor in the monetary policy of all the overseas members of that area. The United Kingdom Treasury is the monetary guardian not only of the British people, but also of the people of the Commonwealth whose money is sterling and of the people of all the other nations which follow the British lead in monetary policy. Their interest has to be taken care of along with ours. This necessity was well understood by the Treasury in the 1930s. A revaluation of sterling may turn the terms of trade in favour of the United Kingdom but it would do so at the expense of the overseas members of the sterling area. They might be content to suffer a worsening in the terms of trade brought about by a change in the commodity markets—by an Act of God as it were—but it is quite a different matter for them to suffer it

at the hands of a monetary authority which manipulates the exchange rates for the benefit of one member of the sterling area only.

I do not wish to take sides in the controversy for or against revaluation at this juncture, but to direct attention to the fact that the interests of the overseas members of the sterling area have as much right to be considered as have the interests of the United Kingdom. It is time to examine this aspect of the problem as it must affect the economic welfare of the primary producing countries of the sterling area and consequently may have a bearing on the future of the sterling area and of the Commonwealth.—Yours faithfully,

FINANCIER

London, E.C.

The Author's Reward

Sir,—Two points in your article in the issue of June 9th seem to call for further comment.

A well-known novelist tells me that he has taken one of his prewar books from a circulating library and checked from the date-stamps the number of times it has been issued. The book cost 7s. 6d. The author's taking from one copy was 9d. The circulating library from one copy (bought at trade rates) has so far taken £5 18s.

The "pulp" publishers of this country, who seem to have no difficulty in getting paper, are paying their authors a minimum of 10s. 6d. and a maximum of £1 per thousand words for an outright sale. For some of the titles so purchased, the publishers are advertising sales of between 50,000 and 100,000 copies per title. It is difficult to understand why authors' professional associations meekly tolerate this sort of thing.—Yours faithfully,

T. M. LINDSAY

Wembley

David Among the Hospitals

Sir,—Your comments in your issue of June 9th, about our venture of starting a new voluntary hospital for Kingston and Malden, have greatly encouraged us. We believe that the collaboration of practitioners and specialists in a first-class hospital should be an essential feature of the future development of the health service. The virtual exclusion of the general practitioner from hospital practice cannot but in the long run lower the standard of medical skill which the practitioner can offer to his patients. Without an enormous and impracticable expansion of the hospital services, the great bulk of the nation's illness must be treated by general practitioners at home, and any deterioration in the standards of general practice must result in very serious hardship—or worse—to the sick. For any doctor hospital work is a constant refreshment of his knowledge and skill. The interchange of views by personal contact between specialist and family doctor in a small hospital is the best way of maintaining the efficiency of the latter, besides affording to the patient in hospital the great comfort and

moral support of the presence of his known doctor and friend.

This ideal arrangement has existed for many years in Kingston and seems to us so valuable that, having lost our long and wearisome struggle to preserve it, we deemed it in the public interest to start a fresh hospital on a voluntary basis where this principle may be preserved.—Yours faithfully,

F. B. LAKE

Chairman, Kingston and Malden
Victoria Medical Foundation

A Decimal Currency

Sir,—Surely Mr Harry Allcock's scheme for decimalising the British currency is unnecessarily confusing. The object, I should think, should be to alter as little as possible, and particularly not to interfere with the pound sterling as the main unit of currency. Apart from its long history, the pound is known and (now once again) respected throughout the world. It would be madness to throw it away for a new "crown."

Decimalisation must, therefore, start from the pound. One-tenth of a pound is a florin, already in existence as a coin and easily usable as a subsidiary unit of account. Let us now skip one decimal place and go to the thousandth part of a pound, which is 0.24 of a penny, or almost exactly a farthing. The only completely new unit that is needed is the one that comes in between, 2.4 pence. It is a unit of convenient value, which would be useful; it might be called a cent.

Calculation would then be in terms of pounds, florins, cents and farthings. With one exception, the other coins would fit in quite easily. The exception is that if the shilling were to remain half a florin and the penny four farthings, then a shilling would be worth 12½ pence. If this were thought to be too awkward, the penny could be shifted to the value of five farthings (i.e., 1.20 times its present value), which might worry the etymologists, but to which the public would very quickly accustom themselves. The coin for half a shilling would then automatically become the fivepence, without changing its present value.

I submit that this is a way of decimalising the British currency with an absolute minimum of inconvenience. Within six months everybody would be wondering how on earth people managed to put up with the old system for so long.—Yours faithfully,

DECIMALIST

Parts

South of the Soviets

Sir,—Your article in your issue of June 16th takes the Tories to task for their failure to make a true case against the Government in foreign policy. To this I offer the footnote: that it is a grave sign of weakness in the Government that they are compelled to employ, as Secretary of State for Foreign Affairs, a Labour leader already too deeply immersed in domestic affairs to be able to steer British policy on its present difficult course in world affairs. It is enough to make Salisbury, Grey and Curzon turn in their graves.—Yours faithfully,

FREDERICK WHYTE

Books and Publications

The Technique of Equilibrium

The Theory of International Economic Policy. Vol. I. The Balance of Payments. By J. E. Meade. Oxford University Press (Geoffrey Cumberlege). 432 pages. 30s.

Professor Meade has summed up the aim and nature of this major work in words which no reviewer can better. "It is," he says in his preface "the work neither of a tool-maker nor of a tool-user, but of a tool-setter. I have attempted, that is to say, to take over the modern techniques of economic analysis and to set them out in a form in which they can subsequently be applied most usefully to the particular issues (such as the dollar shortage, the intra-European payments scheme, the depreciation of sterling, etc.) which may present themselves in balance-of-payment problems." His method is to distinguish, in the first instance in a simple two-country world, the various disturbing factors which may bring about balance-of-payment disequilibrium—for example: shift of demand, change of productivity, spontaneous increase or decrease of domestic expenditure in either country; to trace first the sequence of repercussions following in the absence of deliberate policy adaptation, under various assumed conditions of elastic and inelastic demand or supply; then to analyse the effects of various policies, fiscal and financial, singly or combined, in each of these possible sets of circumstances; and finally to study the results of more particular and direct controls, especially those involving discrimination. His topic, in fact, ramifies and multiplies, through literally hundreds of permutations and combinations, presenting a scheme within whose framework almost any real life situation may be appropriately identified and anatomised.

Professor Meade does not claim that monetary and fiscal authorities have only to hunt through his classifications, and identify that which fits the current situation, in order to find an infallible practical recipe for both internal (full employment) and external (balance-of-

payments) equilibrium. There are too many hypothetical and unmeasured quantities, notably elasticities of demand and supply; too much depends on the actions, spontaneous or induced, of the other countries concerned; and in any case his argument is admittedly static, not dynamic, a comparison of before and after situation, not a study of the path by which the new equilibrium is reached. Nevertheless this meticulous and beautifully reasoned analysis represents a long step forward towards the achievement of rational policy. Reducing to order a mass of muddle and ambiguity, it may some day be judged to bear the same essential relation to that policy as, for instance, the work of Linnaeus bears to modern plant genetics.

Yet to step back and imagine the application in real life of the conclusions reached by the aid of Professor Meade's "tool-setting" activities is to be confronted with the most painful political misgivings. These delicately distinguished complexities are matters on which governments stand or fall. These policies have to be sold, sooner or later, to a mass of voters rather less capable of understanding their rationale than Dr Mossadegh is of running an oil refinery—and about equally inclined to believe that there is anything to be understood. It is almost inconceivable that issues whose proper resolution so closely affects the standards and security of every individual should be "taken out of politics"—and indeed the record on those matters, such as tariffs, which have been nominally "taken out of politics" on similar grounds is about as discouraging as it could be. Yet to leave the experts exposed to the vagaries of popular boneheadedness is to put them in much the same position as a surgeon performing a difficult operation with the patient's family and friends

snatching at his instruments and numbing his fingers. The question is indeed much wider than that of economic expertise; it is bound up with the whole secular advance of science into the social field. Scientific techniques are necessarily understood only by a minority whose decisions the uninstructed must take on trust. This is well enough recognised in the physical sciences—no one thinks of putting to popular vote the question whether a given bridge will carry more or less than a given load. In the social sciences the expert is, with good reason, distrusted; but sooner or later society will have to decide whether this distrust is to be provisional—justifying itself by an inadequacy of expertise in process of elimination—or permanent—a distrust of reason itself and a rejection of its fruits. If the former is the right decision then, sooner or later, the field appropriate to democratic decision, the field in which the majority will be the *ultima ratio*, will begin to shrink, and a revolutionary recasting of political institutions will be needed. If the latter, then the fruits of science must be deliberately foregone. Pointing the way as it does to a very considerable heightening of expertise, Professor Meade's book brings perceptibly nearer the day when that decision will have to be made.

A Mistake was Made

The Katyn Wood Murders. By Joseph Mackiewicz. Hollis and Carter. 252 pages. 15s.

On October 7, 1940, three months after the collapse of France, German troops marched into Rumania, and for the first time there was doubt in the Kremlin about the wisdom of the Nazi-Soviet Pact. On October 30th three colonels of the Polish army, who were prisoners of war in Russia and had been separated from their fellow-prisoners because of their pro-Communist political sympathies, were brought before Beria, the head of the NKVD, and questioned about the possibility of forming Polish

military units under Soviet command. One of the Poles suggested that officers for the force should be recruited from some 9,000 officer prisoners who, together with about 6,000 other ranks, had been confined in three camps in the interior of the Soviet Union; to which Beria replied: "No, not those. We made a big mistake about them. A grave mistake was made."

Beria did not at the time explain in what the mistake had consisted, but events gradually made it clear. Since May, 1940, no communication from any of the prisoners in the three camps had been received by their families in Poland, though previously correspondence had been permitted. After Hitler's invasion of Russia and the resumption of diplomatic relations between the Soviet Union and Poland, as represented by General Sikorski's Government in London, the Poles made persistent efforts to find out what had happened to the missing men, who included about a third of the pre-war officer corps of the Polish army, but the Soviet Government disclaimed any knowledge of them, and Stalin even suggested to Sikorski, when he visited Moscow, that they might have escaped to Manchuria. Then, in April, 1943, the German radio announced the discovery of some thousands of corpses of Polish officers in uniform in mass graves in the forest of Katyn in German-occupied territory near Smolensk.

Mr Mackiewicz, a journalist by profession and a member of the Polish Underground during the German occupation, was authorised to go to Katyn to investigate; in the book now published he has both given an account of his own personal observations there and reviewed the evidence so far available from all sources about the Katyn massacre. The reader can form his own opinion about the conflicting versions of what actually happened. It is not a pleasant story, but then massacres are not the work of pleasant people. A massacre may have been a mistake, but men who make such mistakes are of a special kind; the men who made this one are still alive, though their victims are dead, and it is just as well that the world, for the sake of its own health, should learn all it can about them and their ways.

The Great Illusion

Mémoires d'un Révolutionnaire de 1901 à 1941. By Victor Serge. Editions du Seuil, Paris. 406 pages. 550 francs.

Victor Serge's novel "The Case of Comrade Tulayev" which was published in England a few months ago, and which the literary pundits largely ignored, is not only the best novel ever written about the Soviet Union but in many ways the best book. One felt in reading it that here at least was someone who could feel the situation in human terms, who was neither dazzled by paper achievements nor blankly incomprehending in face of bloody chaos. Serge's posthumous memoirs give one the clue to the personal background of experience and reflection which made this remarkable novel possible. As a document of the history of our times, these memoirs

written in Mexico in the darkest days of the war will long remain unsurpassed.

Serge was the child of Russian political émigrés, who grew up among the revolutionary circles of Brussels and Paris. The war of 1914 found him serving a prison sentence for anarchist activities. He was later released, and was in Barcelona at the time of the unsuccessful revolutionary movement of 1917. After a period in a French concentration camp, he was exchanged with the Bolsheviks, together with some other left-wing personalities, in return for the members of the French military mission whom they had detained after the final breach with the Allies. He thus found himself in Russia in January, 1919. Apart from some missions abroad on the Comintern's behalf, notably to Germany, Serge remained in Russia until 1936.

Throughout most of the period he was in opposition to the ruling group within the Party, being closest in tendency to Trotsky. That he survived at all—and his experiences included three years of deportation in central Asia—was due solely to the fact that he was already well known as a French novelist, and that the Soviet rulers did not think it worth while to affront their western sympathisers by his liquidation. It was intercession from the west that finally procured his release and expulsion from the country. Thereafter, his story is a commoner one—the fall of the Spanish Republic and the fall of France. Once again, Serge's fortune (and his readers') held. Unlike so many of his fellow left-wing intellectuals to whom France had provided asylum, he managed to escape again.

In Mexico while writing these memoirs, Serge was thus doubly a survivor—a survivor of the non-Stalinist wing of the Russian revolution nearly all of whom had perished in the holocaust of the 1930's, and a survivor of the older revolutionary movement of Western Europe. For that movement too has come to an end—not only because of its losses at the hands of the Germans (and of the Russians) but because of the check to its own aspirations, and the changing nature of the times. The fact that Communism has, at least for the time being, captured for a totalitarian cause the energies that in Serge's youth went to a multitude of more generous and more human revolts has emptied Europe of opportunity for men of his stamp. Yet the confidence which fills the concluding pages of his memoirs—a confidence which is deeply moving—is not perhaps altogether misplaced.

Serge was perhaps too much the product of his generation to make the radical re-examination of his assumptions which would be necessary to perceive the ultimate flaw in the old revolutionary movement, the failure to see that the union of economic and political power in the same hands is bound to lead to precisely the same results from the human point of view, as the uncontrolled capitalism against which that movement was a protest. When, therefore, Serge argues that the Russian Revolution went off the rails because the wrong choices were deliberately made—because Lenin preferred the

use of force and the suppression of all dissent to fostering democratic potentialities, one may feel that he should have gone on to ask whether this choice was not the inevitable result of thinking along Marxist lines.

But it cannot be denied that the picture that Serge gives of the degeneration of the regime, once it had made this choice, is wholly convincing. Once the Cheka had been set up, it was the Cheka (in its various guises) that determined the course and nature of the revolution, not the revolution that set bounds to the Cheka. The material misery, particularly the forced collectivisation of agriculture, and the extinction of all independent thought were a part of the same process. Nor are great subtleties needed to explain the "purges." All possibility of changing the hated domination of Stalin could only be extinguished by the physical extinction of all possible rival elements—the nearer war came, the more necessary this was. Serge's account of his own experiences should be enough to destroy the notion that there was anything mysterious about the "confessions." The final shock was his discovery that outside Russia the opposition Communist groups were as sectarian, as doctrinaire, and as prone to use personal slander and abuse, rather than argument, as their Stalinist opponents. The notion that things would in their essentials have been very different if Trotsky had won and Stalin lost is thus disproved by the evidence of a man of near-Trotskyist sympathies. It is not Stalin but Lenin, and behind Lenin, Marx himself, to whom one must look for an explanation of all that is most hateful in the Communism of today.

Communism Disguised

La Chine: du Nationalisme au Communisme. By Jean-Jacques Brieux. Editions du Seuil, Paris. 441 pages. 600 francs.

M. Brieux's book has attracted much attention in France; and its size and seriousness entitle it to such a position, at a time when the topicality of events in China is producing a spate of ephemeral literature. But this does not mean that this book is what it purports to be, an objective study of the Chinese Communist revolution and its causes. The reader may at first be tempted to put down the author's patent enthusiasm for Mao Tse-tung and his party to his youth. M. Brieux is only thirty years old now, and began his study of China on the spot five or six years ago. But this impression disappears on closer study, and it is clear that we have one of the most brilliant and subtle pieces of Communist propaganda that has emerged during the cold war period. This propaganda is not in favour merely of the Chinese Communists, it embraces the whole movement which is determined, under the cloak of a concern for social justice, to bring the world under the Russian yoke. If M. Brieux does not get a Stalin "peace" prize for his efforts, there is no justice in the Kremlin.

Nevertheless, there is no reason to dismiss what he has to say. It is one

of the things that differentiates M. Brieux from the vulgar run of Communist propagandists, that so much of what he says is almost certainly justified. It is harder than it need be to differentiate this part of his writing from the rest, because although there is a bibliography (with some significant omissions) there are few precise references in the text. But by and large, there seems little reason to doubt the picture he gives of the progressive degeneration of the Kuomintang regime; and it seems clear that any policy based on the belief that this particular alternative to Communism can still be made viable is doomed to defeat.

It is rather on the positive side, that M. Brieux's assertions can be questioned. For after rightly testing Kuomintang professions by Kuomintang actions, he is quite content to take Communist professions as being the equivalent of Communist actions. Thus, with all Eastern Europe to learn from, he persists in asserting the genuinely multi-party and coalition nature of the Chinese Communist regime. He denies the existence of a Red terror—a thing which would perhaps be harder to do if he were writing today—but keeps up his sleeve the old argument that one cannot make an omelette without breaking eggs. Is it not time someone answered that particular gambit by asking: "Why have an omelette then?" At least, that is what an egg might say.

The historical account of the Kuomintang-Communist split is totally vitiated by a complete acceptance of the dogma of Stalin's infallibility, so that all errors are automatically ascribed to the local leadership and not to faulty directives. When we come to the developments since 1945 and the Communist rise to power, the narrative is rendered even more difficult to follow by a consistent underplaying of the Soviet role, and a complete unwillingness to consider the aims of the Soviet Union in Asia. Indeed on the international scene, M. Brieux's only formula is abuse of the United States—one Chinese student has the misfortune to be raped by two American marines on two widely separated pages of the book—and of all governments ranging from Mr Attlee's to Pandit Nehru's which do not regard the triumph of Communism as essential to the salvation of Asia. To ask whether Mao can go "Titoist" is a tendentious question unworthy of consideration; despite the Peking conference and the setting up of a Far Eastern Bureau of the World Federation of Trade Unions, to talk of a Far Eastern Cominform is to credit wicked legends. This kind of thing becomes so irritating that one is tempted to overlook a lot of interesting and important material on such matters as the land question in China, where M. Brieux is studying something which excites his sympathies but where the cause of Soviet Communism is not directly involved.

Peril from Pooterdom

The Sixth Column. By Peter Fleming. Rupert Hart-Davis. 224 pages. 9s. 6d.

It is an honourable tradition in secret service fiction that the English country

gentleman is more than a match for the continental back room boy. The tweed jacket wins every time over the lounge suit; and the Director of Military Intelligence gets his best ideas on a day's motoring, which starts with "some intellectual kippers with Brailby at All Souls" and ends with a chat about partridges at Antenor Park. Mr Fleming's novel, at times witty and less often exciting, makes one wonder what would happen if Mr Evelyn Waugh were commissioned to re-write *Greenmantle*. Probably the ironic detachment would spoil the vigour of the plot; and the roughness of the adventure would take the polish off the wit. Something like this happens in this tale of how Plan D and the pernicious activities of the Peace Guild were frustrated by Archie Strume, author of *Hackforth of the Commandos*, between lunches with the DMI—of course in one of those clubs overlooking the Park where high policy is discussed with low seriousness.

Mr Fleming is probably right in thinking that The Enemy has a plan for helping along the "current deterioration of the national character with a view to undermining and eventually eliminating British influence in the affairs of the world." His Sixth Column are, but do not call themselves, partisans of peace; their chief fool, Paul Osney, can frequently be heard and seen about town; Glutervov, the premier dramatist of the Soviet Union and Stalin's Hess, might come over to us any day and spoof an audience in an obscure Bayswater theatre. But what a mixture it is: bland social satire jostling with silly little jokes about M.I.5; current affairs comment holding up the action; and an almost suffocating neo-Edwardian atmosphere of gun-dogs and Mayfair flats. A poor novel, but—make no mistake about it—excellent propaganda against the euthanasia of the rentier and the slow collapse of the British people into Pooterdom.

The Levant Service

The Last of the Dragomans. By Sir Andrew Ryan. Geoffrey Bles. 351 pages. 25s.

This book is primarily autobiographical but the events Sir Andrew Ryan describes form an interesting prelude to the situation in the Near and Middle East today. Unhappily some chapters are so badly and irritatingly written that it is difficult for the reader to concentrate on the entertaining information they contain. Sir Andrew was a worthy civil servant of the old school with a grievance which was shared by many other men in the Levant Service: those who achieved some distinction in early middle age found that, because they were not members of the diplomatic service, they could never rise to be the head of an important mission. The injustice of the situation has since been realised and the Levant Service abolished. But as a result many of the most useful and colourful Englishmen serving abroad have disappeared. Today there are in the foreign service too few men and women who can speak Turkish and Arabic, and what is far more impor-

tant, who understand something of the workings of the oriental mind.

Diplomats and petroleum experts would be well advised to make an effort to read this book because much of what Sir Andrew has to say is useful background for those who now have day-to-day relations with Moslems whether in Rabat or Teheran. The account of personalities in Saudi Arabia, too, is accurate and the most outspoken section of the book. The author was bored with the whole business of oil concessions and says so.

Correspondence about oil became one of the curses of my life during my last couple of years at Jeddah. The only mainland scheme which I saw even on the way to fruition before I left was a concession on the Hasa coast. The possibilities here excited the interests of the Standard Oil Company of California, and the Anglo-Persian. Both sent representatives to Jeddah to negotiate. . . . The Saudi Government were in the happy position of having an unknown quantity to sell, and the question for them was which party would pay the largest down for it. . . . Standard Oil won by a narrow margin.

Thus the British-owned Anglo-Iranian Oil Company lost the field which is now producing greater quantities of crude oil than any other in the Middle East.

Sir Reader Bullard has edited these memoirs and omitted certain portions which were critical of men who still hold official positions. This may be wise but it is a pity that he did not also omit the verse that Sir Andrew appeared to enjoy writing but which no one could appreciate reading.

THE FALCON PRESS

AMERICAN SURVEY

Atomic Empire

Washington, D.C.

THE Soviet Union must by now have assembled a great mass of information on the extent and productivity of the atomic energy industry in the United States—information obtainable without any of the expensive and time-consuming operations of espionage. The recent public speeches of the five members of the Atomic Energy Commission, the press releases and records of press conferences, and occasional interpretative elaborations by the science correspondents of the more reliable newspapers cannot have failed to make it abundantly clear in Moscow that the United States not only has atomic bombs, and aircraft to deliver them, but that it possesses immense atomic energy installations. These are being expanded on an enormous scale and are continuously turning out for the American stockpile weapons which, if they are ever used, will be fantastically destructive.

The Atomic Energy Commission was established in 1946 under an Act which declared it to be United States policy that

the development and utilisation of atomic energy shall, as far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise and promoting world peace.

The bit about strengthening free competition in private industry is of particular interest now, five years after the phrase was devised. In this anti-socialist nation the AEC has become possibly the biggest socialist agency ever devised by any government in any country. Though private firms may in some cases bid for contracts, the system has no more than a nodding acquaintance with free competition. It is a state-owned monopoly, though it could not operate unless some of the biggest business corporations in the country were ready to work for it under contract.

More than 90,000 people are now engaged in America on atomic energy work. A substantial number of them is already housed in three new cities the government owns. The land area now sealed off for atomic energy plants and testing grounds amounts to 2,800 square miles, an area almost as large as the states of Rhode Island and Delaware together. Only two private businesses in America—the United States Steel Corporation and the American Telephone and Telegraph Company—have greater investments in plants and equipment than the AEC; and even their lead may be overtaken before long.

Congress has appropriated altogether something like \$6.5 billion for the commission's work, and the commission has now already spent about \$4.8 billion of this fabulous fortune. Its installations alone have cost \$2.5 billion. It owns the famous plant at Oak Ridge, Tennessee, where uranium 235 is produced, a plant which cost \$500 million to build and is undergoing a \$200 million expansion. It possesses the great plutonium-producing plant at Hanford, Washington, to the original cost of which (\$350 million) is now being added a further \$200 million for enlargement. At Paducah, Kentucky, another \$500 million plant to produce U235 is being built, and work is under way near Aiken,

South Carolina, on a still bigger one, costing \$900 million. Here materials for atomic weapons, hydrogen bombs and nuclear reactors are to be produced. Beyond that there are the nuclear reactor testing station in Idaho, which covers 400,000 acres, huge research centres dotted about the continent from Brookhaven and Schenectady in New York to Los Alamos in New Mexico and Berkeley in California, laboratories and other installations at more than a dozen universities; and all manner of privately operated laboratories and plants.

The size and scope of the AEC's activities is, and long has been, quite staggering; but what it has been doing will probably look quite modest by, say, the summer of 1953. It is calculated that by then production of atomic energy will be consuming something like 2.5 per cent of all the installed electric power in the United States. The present spending plan of the AEC tells the story concisely: in the year ending June 30, 1950, it spent \$550 million; this year it has spent \$850 million; next year it expects to spend \$1,275 million.

Of the 90,000 who are now working on atomic energy in the United States, rather fewer than 5,500 are paid directly by the government. The rest are working for private firms—the 500 or so "prime contractors" and the sub-contractors. All installations are owned by the government; but it is the du Pont Company, which first built and then operated the Hanford plant, which will build and operate the tremendous new plant in South Carolina. It is the Union Carbide and Chemicals Corporation which is producing the U235 at Oak Ridge. The General Electric Company has taken over at the Hanford plutonium plant where the du Pont Company left off. The AEC has contracts with the Monsanto Chemical Company, the Dow Chemical Company, the Mallinckrodt Chemical Works, the Westinghouse Electric Corporation, the Western Electric Company, the Standard Oil Development Company and other leading industrial concerns. And all of the AEC's big laboratories, except the one at Oak Ridge, are operated for it by universities or groups of universities. Dr Henry D. Smyth, who is the scientist of the five-man commission, recently observed that

such co-operation in a vast and largely unexplored field is new in the history of our country.

The Commissioners do not conceal and do not apologise for the fact that about four-fifths of the AEC's work is now dedicated to the provision of weapons; and there is no reason why they should. For apart altogether from any consideration of the American atomic energy programme as a deterrent to war—Mr Churchill, among others, regards

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

the American stockpile of atomic bombs as the keystone of the present semi-peace—the McMahon Act of 1946 makes everything the commission does subject to "the paramount objective of assuring the common defence and security."

The details of the results so far achieved in the military sphere are well hidden behind the security curtain. It is a curtain which seems sometimes to irritate even the members of the commission, who know at least as well as anybody else that progress in the still-uncharted regions would be very much greater if a free exchange of information among the world's nuclear physicists and atomic energy technicians were possible. Nevertheless, the AEC has done enough and said enough to make it plain that there is an immediate prospect not only of atomic bombs of much greater destructiveness than the two which killed well over 150,000 people in Hiroshima and Nagasaki, but also of atomic artillery shells and guided missiles, the use of which against enemy troops might have consequences that no military commander in the field has yet had to deal with.

The most recent tests at the Eniwetok Atoll (in which nearly 9,000 men were engaged) "included experiments contributing to thermonuclear weapons research"; but the question whether a means of exploding a hydrogen bomb 1,000 times as powerful as the Hiroshima bomb has yet been discovered remains, even for the science writers, a matter for cloudy speculation.

There is left the 20 per cent of the programme which is devoted to the products and by-products of atomic energy which have a peacetime application. It is by no means an inconsiderable segment of the work in progress. The doctors and the industrial chemists, provided with radio-isotopes on an increasingly generous scale, already know enough to realise that a tool with wonderful possibilities has been put into their hands. What will come of the two experimental atomic engines that are being devised for naval use and of the less advanced atomic aeroplane engine nobody can yet tell. The experimental breeder reactor, designed to produce more fissionable material than it consumes, could conceivably point the way to a new age of atomic power.

The AEC has been notably reluctant to promise any such development. But it agreed at the beginning of this year to allow approved industrial research workers to study its operating reactors; and last week a special advisory committee—whose chairman, Mr Philip Sporn, of the American Gas and Electric Company, has hitherto been as cautious as anybody—reported that serious attention should now be given by the electrical industry to certain "robust" possibilities in this field. In the new atomic dawn the outlines are still uncertain and indistinct; but they seem likely soon to be much more clearly visible. And this probability is one of the direct and ironic outcomes of the behaviour of the Russians, which has spurred the Americans to spend so much more money and to work so much more intensively on the atom than would have been possible if there had been nothing but peace in sight.

Steak Statistics

[FROM A CORRESPONDENT IN WASHINGTON]

THE American consumer is painfully aware that prices have spiralled upwards since Korea, even though the pain has recently been alleviated a little, but it is the rise in the price of food that hurts the most. It does little good to remind the brave little woman, as she pushes her basket-on-wheels around the supermarket, that the food items tabulated in the

consumers' price index rose by only 11.4 per cent between June, 1950, and March, 1951, while clothing rose by 10 per cent and house furnishings by 14 per cent, or to assure her that people whose earnings have kept up with the average can buy with 19 per cent of their disposable income the same list of groceries that would have taken 23 per cent of their income in 1935-39. She has seen the little tickets with today's prices on them, and the little ticket on beef-steak, putting it at somewhere around \$1.20 (8s. 7d.) a pound, is one of the most unforgettable.

Mr DiSalle, the price stabiliser, in one of his early appearances before Congress, was asked by Senator Benton how, in the face of current apathy about the nation's danger, he expected to make price controls work. To this the imper-turbable Mr DiSalle replied:

Senator, if you think there is current apathy, I must make arrangements for you to see my wife. Faced with many brave little women, equipped with votes and able to use them in November, 1952, many Congressmen are for price controls irrespective of their economic merits.

But the non-urban Congressman finds it more difficult to make up his mind, for in sharp opposition to the brave little woman stands the most persuasive and pervading of American pressure groups, the farm bloc. The Farmers' Union, representing the marginal farmer more than the commercial producer, has followed the trade unions' example, putting the interests of its members as consumers first and supporting price controls. But the American Farm Bureau Federation and the National Grange, representing the minority of farm people who produce the vast majority of farm products, have always opposed the price controls embodied in the Defence Production Act which is now being debated in Congress. Mr Allan Kline, head of the Federation, advocates a programme for checking inflation while leaving prices free, but it is one of fiscal and monetary restraints that appeals to orthodox economists much more than to politicians.

*

The argument has crystallised around that most desirable and most expensive of all farm products, beef. Mr DiSalle has already ordered a reduction of 10 per cent in the prices paid for beef cattle, and an additional 4½ per cent is due to come off in August and again in October. The order has brought anguished howls and a barrage of statistics from cattlemen. The president of the Iowa Farm Bureau Federation, himself a well-known cattle feeder, testified before the House Committee on Agriculture that on March 1st of this year he bought some 500-lb. calves at \$36 a hundredweight. By November 1st he expects to have "fed them out" to about 1,000 lb., using 51 bushels of maize at \$1.60 a bushel, 200 lb. of protein at \$80 a ton, and \$30 worth of hay and brome-grass pasture; he calculated that he must allow another \$30 for each animal for transport, labour and incidental costs. That adds up to \$329.60 invested in each steer when ready to sell. But after August 1st meat packers will only be able to pay \$33.20 a hundredweight for cattle of this grade under Mr DiSalle's price ceilings. The witness pointed out:

That leaves me to make 24 cents per hundred pounds . . . and I certainly do not make a habit of taking the risk involved in feeding out a \$329.60 steer for \$2.40.

The Secretary of Agriculture, sitting on the fence between his loyalties to the Administration and to the farmers, answered that after the initial dislocation prices should soon readjust themselves so as to provide reasonable incentives for cattle feeding, but that during the coming months cattle marketings and production would have to be closely watched to make sure that they did in fact settle down again. The

immediate effect of the first price reduction was a sharp curtailment of cattle slaughtering, but already steers are once more moving to the stockyards in normal numbers. Congress, however, is at the time of writing well on the way to insure against another beef famine by forbidding the further reductions in beef prices that Mr DiSalle proposes, and that he thinks can keep steak on the consumers' plates without either the black markets or the rationing that the cattlemen prophesy. To the Farm Bureau, the controversy over beef prices smells of red herring; it fears that farmers may be induced, by the reversal of this particularly unwelcome, but only limited, attempt at price reduction, to abandon what it believes ought to be an opposition to price controls in general.

Meanwhile, the non-political economists have dug up some longer-term statistics which make it seem probable that politicians will be thinking about steaks for some time to come, whatever happens to the Defence Production Act this week. In 1950 the per capita consumption of red meat in the United States was up by nearly 15 per cent, or 20 lb., over the 1935-39 average. The higher incomes of the post-war period would seem to provide the explanation for, according to a Department of Agriculture study in 1948, families with incomes over \$3,000 consumed a fourth more meat per person than those with incomes of \$2,000 or less.

But while demand for steak has been rising in this way, beef and veal production has been increasing only at about the same rate as the population. There are an estimated 46.5 million head of beef cattle on farms this year as compared with 43 million last year, and a 1935-39 average of 31.4 million. And since it takes three years, from breeding to finishing, to put a steer on the market, any further increase can be only gradual. The rise in beef prices has reflected the competition that takes place when more people, with more money, want more steaks. That competition, moreover, is likely to quicken from now on. By the last quarter of this year, more people will be working for more hours and, since there will be fewer manufactured goods on which to spend the money they bring home at the end of the week, more of it will be likely to go for food.

American Notes

Losing Battle for Controls

Something like a miracle will be needed if the Senate and the House, which only got down in earnest on Wednesday to the task of extending economic controls, are able to pass an agreed new version before the Defence Production Act expires on June 30th. The Administration leaders, who have been fighting for action, may, after a glance at the Bills drawn up by committees in both Houses, be satisfied if Providence fails to intervene, and if they get instead a temporary extension of the present Act. The tide of consumers' protests which the President hoped to set moving has failed to materialise and, alarmed by the piling up of inventories and bombarded by special interest groups, Congress seems determined not only to refuse any new powers to the President, but also to scuttle those he now possesses.

The House and Senate Bills differ in details, but both would prohibit the two cuts in the price of beef scheduled to take place in August and October. The Senate, on the ground that anything which interferes with production is inflationary, would, in addition, prevent Mr DiSalle, the price administrator, from ordering similar "roll-backs" in the price of clothing, machinery, and other articles, which would bring the saving to consumers to \$2.5 billion a year. Businessmen who raised their prices just before the January

freeze would be in clover, and price control, if it survived this crippling, would become a matter of levelling up, rather than levelling down. The strong trade unions, which have adopted the slogan "No meat control, no wage control," could not be left behind.

Where it is their own ox which is gored, however, the unions are on the other side of the fence; their complaints against the restrictions on consumer credit, joined with those of small businessmen, persuaded the Senate Committee to write into the law a provision that would prevent the Federal Reserve Board from reducing the maximum period of instalment credit for cars (which is now 15 months) below 18 months. The House body went further and extended similar reliefs to sellers of television sets, home appliances, and furniture. Rent controls fared a little better; the Administration will be able to reconquer areas where defence production causes the demand for housing to outstrip the supply. But the Senate turned thumbs down on all requests for new powers, and the few approved in committee in the House are not expected to survive the attacks of the conservative Democrats and Republicans on the floor. The President asked for a two years' extension, to 1953, when it is expected that the inflationary pressure of the rearmament drive will be eased; eight months is proposed in the Senate and a year in the House. The Administration must take what comfort it can from the passage, in the House, of a \$7.2 billion tax Bill, which, if it is not sharply reduced in the Senate, will bring tax increases since Korea to \$17 billion. But even such a staggering sum will leave an estimated deficit, next year, of \$8 billion.

* * *

Psychological Warrior

The war of ideas is at last given the recognition and leadership it merits by the creation of a top-level Psychological Strategy Board and the appointment of Mr Gordon Gray as its first director. Mr Gray, now president of the University of North Carolina, will be able to give only two or three days a week to his new job, and the members of the board, the Under-Secretary of State, the Deputy Secretary of Defence, and the Director of the Central Intelligence Agency, are equally busy and important men. But for that very reason the board should have unrivalled authority; it is responsible directly to the National Security Board, and will be able to call upon the resources of all agencies and departments. Its task is to draw up new policies and programmes and evaluate existing ones for the guidance of all those concerned in open and secret psychological warfare.

The forces engaged in the war of ideas have flourished like the green bay tree since the outbreak of the Korean war but, with no more co-ordination than was provided by a rather ineffective State Department board, working at cross purposes and duplication of effort have increased quite as rapidly. The Department of Defence, coming back into the picture with remobilisation, has been very unwilling to accept the guidance of the State Department, and has agitated for an independent board.

Mr Gray's job, however, is not merely to see that the State Department and Defence Department do not rake each others' lines, instead of the enemy's, but to inject some much-needed imagination, flexibility, and energy into the conduct of the struggle for men's minds. For example, critics of the Voice of America, the long radio arm of the information services, are inclined to blame some of India's bitterness over the wheat loan to its projection of America as a country of unlimited wealth. Others protest it has little to offer to listeners overseas beyond visions of plumpness and cars, and a concept of democracy which has hardly any meaning for those living on the verge of starvation. There is a substantial amount of support for the view that propaganda, to be effective, must be freed from the caution of the diplomats.

This the State Department contests, on the ground that the United States must not seem to be speaking with two voices. Conceivably, with Mr Gray to supervise both scripts, this argument might lose some of its force. But at present there is no suggestion that the State Department is to lose control of the Voice of America.

* * *

An Eccles for a Transamerica

Mr Marriner Eccles, who is leaving Washington after 17 years at the Federal Reserve Board, deserves the title of "Last of the New Dealers" better than some to whom it has been awarded. He was largely responsible for the banking reorganisation which in 1935 centralised the open market buying and selling of government securities in Washington and thus increased the FRB's power to regulate credit, one of the New Deal's methods of pouring money into a parched economy. But Mr Eccles, more consistent than some of his colleagues, has always insisted that deficit spending in depression must be accompanied by surplus saving in prosperity, and as a result he has been an outspoken critic of many of the administration's postwar proposals for public works, easy mortgages, farm price supports and so on. In particular he has condemned the government's financial policy, which from 1940 until this spring made the FRB's hard-won right to control inflation through bank credit the prisoner of the Treasury's insistence on cheap servicing for the national debt.

In March Mr Eccles was vindicated, on this point at least, by the restoration of the FRB's power to follow a flexible open market policy and this may be why he now at last feels free to retire from government service. He has also just had another success: an FRB examiner, after nearly three years of inquiry, has asked the board to find his old enemy, the Transamerica Corporation, guilty of violating the anti-

of petroleum. There is plenty of petrol for America's cars at present, but by next winter there is likely to be a shortage of distillate fuel oil for heating America's homes and of heavy residual fuel oil for the wheels of industry. The price controllers have permitted increases of about 15 per cent in the prices of heavy oils, in the hope of encouraging industrial consumers to return to coal (the only basic commodity of which the country has too much today) before fuel oil supplies feel the combined strain of the cold weather and the full defence effort.

Even without the latter, America's appetite for petroleum, growing every year since 1938, has become almost insatiable since Korea. The country is now consuming over 7,000,000 barrels of petroleum a day, with total demand for 1951 estimated at 2,640 million barrels; in the first quarter of this year it was 14 per cent above the comparable period of 1950. Refineries are running all out and plans to increase their capacity by one-seventh, to 8,000,000 barrels a day, are being encouraged by tax concessions. To keep the refineries supplied with crude petroleum, steel is being allocated for equipment sufficient to allow 43,400 new wells to be drilled this year. Even so the United States, now getting 1,000,000 barrels a day from abroad, expects to go on being a net importer of petroleum as it has been since 1948.

Perhaps in order to leave the oil companies more time to devote to this expansion, the Department of Justice has abandoned its eleven-year-old "Mother Hubbard" anti-trust suit and is dealing with the various firms separately instead of in one overall prosecution. And there is little doubt that the Congressional tax-drafters will put the interests of the oil producers before those of the Treasury and refuse to reduce their present depletion allowances of 27½ per cent on gross income. But not even strategic necessity is a sufficiently strong argument to break the deadlock which is preventing the further development of the valuable reserves of petroleum under the Gulf of Mexico and the other coastal waters. A year ago the Supreme Court ruled that the federal government had "paramount rights" to these so-called tidelands, which are in fact the off-shore areas beyond the tidal mark. Since then the southerners and states' righters in Congress, a group which on this occasion includes many of the Administration's leading supporters, have been trying to push through legislation which would restore to the state governments their old powers to grant oil leases for the land under the sea. A Presidential veto for such legislation is as certain as is a Congressional refusal of similar powers to the federal government.

Election Clean-up

The conviction of Mr Jon Jonkel on charges of violating the election law of Maryland is a reminder that no report has yet been made public by the subcommittee which four

months ago opened hearings on the real issue in this notorious campaign: the tactics used by Mr Jonkel's Republican employer, Senator Butler, to unseat Senator Tydings. Mr Jonkel, a public relations expert, was imported from Chicago to sell Mr Butler to voters who had hardly heard of him; the trick was brought off by the distribution of scurrilous pamphlets and pictures, one of the latter a composite photograph ostensibly showing Senator Tydings chatting with Mr Earl Browder, one-time leader of the Communist Party. Mr Jonkel's conviction, however, was on the grounds of financial irregularity, something all too often winked at and usually impossible to prove, because of the weakness of the Corrupt Practices Acts, and the fact that ceilings on expenditure dating from 1925, are so unrealistic as to be unenforceable.

Senator Butler himself was absolved by the grand jury of any violations and held not to be responsible for the acts of his agent. Only the Senate can call him to an accounting, and with him Senator McCarthy who, the hearings showed, helped to prepare his campaign material and was determined to be revenged on Mr Tydings for his investigation of the McCarthy allegations against the State Department. It is not believed that Senator Butler is in danger of losing his seat, whatever hard things may be said. But so shocking a case should stimulate Senators, who may themselves suffer Senator Tydings' fate, to take long overdue steps to make every candidate responsible for expenditures and tactics undertaken on his behalf. In the Ohio campaign in 1950, which the Rules Committee will investigate next, the most deplorable campaign material was circulated against Senator Taft. His Democratic opponent, on the other hand, accuses the Taft forces of having received recorded contributions of over \$2 million. The ceiling on a Senator's own spending is \$25,000, plus substantial exemptions, but there is no limit on what may be spent for him by others. In a recent case, Representative Irving, a Democrat from the President's home State, was found guilty of using his campaign funds of the trade union of which he was the head—a violation both of the Corrupt Practices Act and the Taft-Hartley Act.

Some months ago the Campaign Expenditures Committee of the House recommended that the ceilings on election spending be eliminated altogether, or greatly raised. It would substitute for them the control of public opinion, made effective by adequate reporting and examination of expenditures. In particular, it urged that any group which collects or spends money for a candidate be required to receive his written authorisation—something which would place the responsibility for excessive spending or dishonest campaigning where it belongs.

Shorter Notes

The maritime strike which tied up shipping on both coasts for over a week ended in a victory for the unions. The National Maritime Union won a 40-hour, instead of a 48-hour, working week at sea, which will come into effect on December 15th. Until that date the seamen will work a 44-hour week. This was a major triumph, but other demands granted were an 8 per cent wage increase, longer vacations, an adjustment of inequities by a joint committee, and an increase in subsistence and lodging pay. It is a two-year contract, but has yet to be approved by the Wage Stabilisation Board.

Congress has passed a Bill which, when signed by President Truman, will extend the Displaced Persons Act to the end of the year. This will not admit any more refugees to the United States but will allow time to complete work on some 45,000 visas already authorised; they have been held up by the lengthy clearance procedure.

Behind the Cables—the Company

... and behind the Company—a story of cable and wireless. In this country, when the GPO accept a cable for dispatch overseas the message will probably be flashed over the Company's deep-sea cable network. To maintain this vital service, the Company own 180,000 miles of submarine cable and operate a fleet of cable ships and receiving and transmitting stations in many parts of the world. With the exception of cross-channel and United Kingdom coastal routes, the maintenance and development of the whole of the Commonwealth cable system is the responsibility of Cable and Wireless Ltd.—the Company behind the cables.

Ambassadors at large

WE MAKE NO CLAIM to shape the destiny of world affairs. What we do like to feel is that we help the world's way of living and working to be more efficient, more productive, altogether much more comfortable. If you walk through the tea plantations of Ceylon, India or British East Africa, or watch irrigation work in Australia, or for that matter travel through any of the extensive areas under cultivation throughout the British Empire, then you will see what we mean. You will be seeing products of the Marshall Organisation at work. In 39 different countries you will find Marshall or Fowler equipment—supplying power and heating, rolling out endless ribbons of new road, cultivating new land, beginning vast housing projects—even contributing to your cup of tea!

Each of these products carries and upholds the well-earned reputation of Britain's craftsmen. Each one is an ambassador for Britain whose credentials are respected everywhere.

SCIENTISTS have invented highly ingenious *Mechanical men* which can work out sums, cross a floor without bumping into furniture and answer questions almost as knowledgeably as Professor Brogan. Nevertheless, most of us would rather have real human beings as companions in our daily lives.

It's rather the same with wood. Wood has a *feel* and a character all its own. No matter how it is sawn, carved and planed, it remains somehow *alive*. You can make friends with it.

Naturally, architects specify wood for its traditional purposes wherever they can. The difficulty, these days, is in knowing what timbers are available and in what quantity. A card to the Timber Development Association will bring you details of many excellent woods which have recently come into the market.

There's nothing like **WOOD**

THE WORLD OVERSEAS

Can Persia Refine?

(By Our Special Correspondent Lately in Persia)

THE surest way of touching a Persian on the raw is to suggest to him that running an oil industry is more complicated than he thinks. A nation that has been great in the past has confidence in its capacity to do any job, however technical. Hence the arrogance with which representatives of the Persian Government and Oil Liquidation Commission are imposing an almost intolerable strain on the British staff still in Persia, without thought of how much it is to Persia's advantage that these highly trained technicians should be induced to stay and keep a great machine in gear.

For it is quite certain that the Persians cannot, unaided, operate the whole of the complex industrial unit that they have grabbed. Even the present Government admits this fact implicitly, in its current advertisements for oil technicians in French and German newspapers. At the recent World Petroleum Conference at The Hague, too, Persian representatives were looking for foreign reinforcements to senior staff. Yet some parts of the refinery might possibly be kept going, for the Persians are not entirely without local technicians. Figures for Persian employment in the Abadan office and refinery are:—staff, 3,258, labour, 25,772. Not all "staff" are, of course, technicians. But light from Persian sources is thrown on the proportion of the above numbers that possess this specialist qualification in a memorandum prepared in February-March by the Iranian Oil Company (which was then the body responsible for all oil development in Persia apart from that covered by the Anglo-Iranian's regional concession). This memorandum, prepared in reply to some questions by Dr Mossadegh, contained the following statements:

The number of Iranian engineers is not exactly known, but according to a list prepared there are about 30 Iranian engineers educated in different lines of the oil industry. In any case the number does not exceed 100 altogether, both inside and outside Iran. . . . At present about a thousand specialists are working for the (British) company, so that the total number of Iranian oil specialists does not exceed about 10 per cent of the actual requirements. . . . Oil refining will be much more difficult than oil extraction, for the former will require four times as many personnel as are needed for the latter. Moreover, the diversity of refining operations requires experts in different technical spheres, the selection and engagement of whom will be a very great problem.

In March, therefore, some Persians were still alive to their own limitations. But after the murder of Prime Minister Razmara, who had called for this memorandum, it was withdrawn by its authors, either because they feared a bullet or because they disliked the sensation of swimming against the tide of popular opinion.

The problem before such Persians as are available is not so much whether they can work bits of the refinery—which they can surely do—as whether they can synchronise the parts that they operate. The delicate network of pumps and mixtures that goes to make a refinery depends on synchronisation for its safety. Persians are notoriously unable to trust fellow-Persians and therefore to work together. They say hat: "If companions were to be trusted, Allah would have had a companion." What is doubtful is whether, under management that is both Persian and only partially expert, any one operator will trust another sufficiently to

obey orders. The anti-sabotage law now laid before the Majlis by Dr Mossadegh (though clearly designed chiefly to brand the British as the saboteurs responsible for any accidents) will—as a by-product—increase the Persian tendency to avoid taking responsibility. The outlook for keeping the refinery in smooth operation is not good.

Nevertheless the Liquidation Commission, through the mouth of its extremist rapporteur Hussain Makki, claims that though production may fall to a rate of 8,000,000 tons annually (the present rate is 32 million) "we shall still be making more money than we are making now." Superficially, his calculation looks impressive. The Anglo-Iranian at present pays more than half its profits in tax to the British exchequer. If the Persians were to draw the whole profits from a plant working at quarter strength, they might earn a sum comparable to that which they at present receive in royalties. But the calculation leaves right out of account the other benefits which accrue to the Persian exchequer from the higher rate of production. Notably, it forgets the factor of employment. A reduction to quarter the present rate would throw great numbers of the staff and labour force out of work. Social consequences apart, this unemployment would cause a heavy net loss to the Treasury; in 1949, the tax paid to it by company employees (including Persian contractors engaged by the company for constructional work, who, in Abadan alone, earned £4,000,000 in 1949 and over £3,000,000 in 1950) amounted to 15 per cent of Persia's national revenue other than revenue from oil. To this loss of revenue must be added the unemployment pay which will be necessary if workers are turned off at short notice.

High Cost of Maintenance

There are other financial liabilities which may well not have entered into Mr Makki's calculations. Obviously, if the Persians are working with impounded plant, ordinary problems of cost-of-production will not at once arise. (In normal circumstances, refining costs rise rapidly in the event of dropping capacity). The Persians will also for a time be unaffected by the fact that, in the refining industry, capital charges are extremely high in relation to the processing costs. But they are likely rapidly to feel the pinch created by the high cost and slow speed of repair and of the maintenance that is constantly necessary; these costs are much higher in Middle Eastern refineries than in those which lie closer to manufacturers of petroleum equipment and to reservoirs of skilled labour. The site-cost element of construction or repair is now, for the same operation, at least 100 per cent higher in the Middle East than in Europe.

It follows that even the part of the refinery process that depends entirely on performance inside Persia raises problems—technical and financial—that few Persians envisage. These problems increase as soon as the question of refining for a few outside markets is approached. Every crude oil has a "natural" yield of products into which it breaks down when it is refined. Refining costs are lowest when market requirements most closely correspond to the natural yield. The economic yield for an average Middle Eastern crude is, for every 100 tons of motor spirit produced, up to 50 tons of kerosene and between 250 and 300 tons of gas diesel and fuel oil. Costs rise rapidly if this yield has to be tailored

to meet market needs—for instance, to increase the yield of motor spirit above the natural yield by 50 per cent can easily double the cost of refining the crude oil. Though world markets in the aggregate are fairly closely in balance with the "natural" yield, a seller to a few individual markets may find himself left with a glut of one product on his hands, or else saddled with costly refining complications. Apart from the question of tankers, the Persians have set themselves some refining and selling problems that few experienced oil men would care to have to tackle. More and more is it apparent to any but Persians that, if they must seize something to satisfy their nationalism, their sensible course would have been to impound the wells only and to keep in being—at least for the present—the foreign refinery that was both a convenient and a sure market for their oil.

General de Gaulle's Prescription

[FROM OUR PARIS CORRESPONDENT]

GENERAL DE GAULLE has declared that the *Rassemblement du Peuple Français*, a body of men who have undertaken in writing to act together as a group in the National Assembly, will withhold its votes from the investiture of any *président du conseil* emanating from a coalition of "the parties." The General's position is that the RPF, France's largest party in the Assembly, should lead all elements that are willing to help govern the country. However, as it was certain, said the General, that the parties would attempt (and fail) to govern on their own, the RPF would stand by propounding constructive policies, until either the parties gave up their hopeless quest or the people demanded their removal. "The parties prefer to govern without us: we shall not prevent them by force," said General de Gaulle. In this manner the field is left open to some 390 politicians of the middle to begin the consultations and bargaining that normally attend the making of a Fourth Republican coalition. For the moment at least France is sticking firmly to its own brand of democracy, eschewing authoritarian republicanism and all other unknown devils.

However, de Gaulle's own theories on the remedy for French weakness deserve consideration apart from the immediate political scene. For, while the party politicians offer no real criticism of the institutions revived or created in 1946, de Gaulle at least attacks the problem at its root. Whatever his defects as a national leader—and an archaic style is not the least of them—he has much of value to say on the fate of French republics. It was at Bayeux in 1946 that the General most clearly described what he had in mind in regard to constitutional reform. At the time when the constitutional committee was struggling with contending drafts of the new Republic, de Gaulle emerged from his retirement in Marly forest and delivered an oration which caused almost a panic among politicians of the Left. The General said:

Certainly it is of the essence of democracy that opinions should be expressed and that, by the suffrage, they should orientate public affairs and legislation. But all principles and all experience have shown that the powers—legislative, executive, judicial—should be clearly separated and firmly balanced and that, above all political contingencies, there must be a national arbitration which assures continuity throughout diversity (*au milieu des combinaisons*).

General de Gaulle went on to outline his own constitution for France: a national assembly to vote the laws and the budget; a senate, differently elected and differently composed, to act as a check on the assembly—this second house to act as "the administrative factor, which a purely political house has a natural tendency to neglect." Then came the thunder-clap. "It is obvious," pursued the General, "that the executive power cannot be derived from a parliament of

two legislative chambers. For were it so, there would result a confusion of authority that would render the government nothing but a jumble of delegations." There should therefore be a Head of State who was above the parties and was elected by a college far larger than parliament. The President, who would also be President of the French Union, would have the following executive powers: he would, "avec l'orientation qui se dégage du parlement," nominate ministers, including the prime minister, who would "direct the policy and work of the government." The President of the Republic would serve as arbiter at cabinet meetings; in troubled times he would initiate a referendum to the electorate, and in case of national danger would be "the guarantor of national independence and of the treaties to which France was a party."

De Gaulle later criticised the draft constitution of the Fourth Republic in that it made no mention either of "government" or of "executive power," referring only to the cabinet (*conseil des ministres*). "The Prime Minister," he complained, "although theoretically chosen by the President of the Republic, cannot, according to the draft, form a cabinet without his being invested by the Assembly. In these conditions his nomination by the President of the Republic can only be a formality—unless, that is, the Head of the State is willing to run the outrageous risk of being contradicted by the Assembly. So, in fact, the prime minister emanates from the Assembly and we are brought back to the fact that it is the Assembly that governs." This is certainly a fair enough description of the workings of the last legislature.

It has never been quite clear whether de Gaulle wishes to place effective power with the President or with the Prime Minister. The concept of federation demands that government should be executed independently of particular assemblies, and there is no doubt that de Gaulle envisages a presidential sweep of authority over the whole of the French Union. But to advocate the removal of executive power from the Palais Bourbon in the mid-twentieth century, where it has already lain for eighty years, is a bold step. On the other hand, the strengthening of the prime minister as leader of the government can hardly be done by a constitution; only a simplified and more loyal party-system could create a stronger cabinet and give France a modern parliamentary democracy. General de Gaulle seems, however, wholly to reject this type of evolution, preferring a strong President of the Republic who will, in various ways, guarantee the efficacy of the government against its worse self. As at the constitution of the Second Republic, the theory persists among authoritarian Frenchmen that assemblies are always suspect; and that a strong minority must therefore not exercise direct control over the executive. The nation, on the other hand, remains, in Lamartine's phrase, "as incorruptible as the ocean"; so it is the nation which must be consulted by referendum in time of crisis. Obviously Rousseau has a large hand in all this.

Napoleonic Memories

The hey-day of the presidential system was, surely, the Second Empire during which Louis Napoleon, having, by a neat *coup d'état*, transformed himself from President of the Second Republic to Emperor of the French *tout court*, managed to dominate a political chaos of Republicanism, Papism, Socialism, Communism, Orleanism, Legitimism (not to mention Parisian journalism), and so give the country eighteen years of prosperity. But it is now a far cry from the gay days of the "Prince-President" with their political ebullience and huge economic expansion. Somebody has said that the French are passionately interested in politics but not in their results. This was true enough of the mid-nineteenth century when France was still in revolutionary and Napoleonic vein. Then, perhaps, the prime need was for order from the centre, to be imposed externally by presidents and prefects. Now one might rather say that the

country is tired of politics but anxious for their results. It is this circumstance which makes the parties, with their tenaciously held verbal theories, obsolete. For the prime need now is for a common, minimal national programme. If the Socialists, MRP, Radicals and Independents were to establish one, they would undoubtedly lose much of their philosophical identity and, in the course of time, the number of parties would be reduced. The way would then be paved for a stronger executive. The presidential solution, it can be argued, is more practical because more in keeping with the national temperament. The problem then would be to find a president who could use the constitution in a progressive spirit and not merely cherish it as a thing of beauty and a joy for ever. In either case the nation might break out of the present paralysis.

Belgian Mines and the Schuman Plan

[FROM OUR BELGIAN CORRESPONDENT]

THE coal industry is, together with agriculture, one of the weak points of the Belgian economy, and therefore one of the chief obstacles to a complete freeing of the international movement of goods between Belgium and other countries. In the postwar years the difficulties of the coal industry led to a system of compensation and official subsidies which reached BF 2 milliards on a yearly basis in September, 1949. This regime of generalised subsidies and compensation was abolished in October, 1949, by M. Duveusart, then Minister of Economic Affairs, and replaced by gradually falling subsidies to selected mines. More opportunities for the financing of investment were also provided.

Public interest over the future of the coal industry has been revived by the discussions over the Schuman Plan. These have led to the publication of several pamphlets by opponents and supporters of the present organisation of the industry. In April, for instance, Mr van Offelen, an economist and lecturer at the "Université Coloniale" at Antwerp, published a booklet in which he argued that the stability of the Belgian franc was not endangered by the high level of wages but by the high price of coal. In May the *Fédération des Associations Charbonnières de Belgique* published a pamphlet which contended that the most pressing problem in Belgium was one of quantity, i.e. to supply industry with the coal it must have even at a high price.

All these discussions refer to the Robinson Report which was the result of a tour of 48 Belgian coal mines made in January, 1950, by an American ECA expert. This report was kept strictly confidential, but some weeks ago parts of it leaked out in several Belgian and foreign newspapers. These leakages, however, came from the first version of the

report; Mr Robinson in fact produced a new version at the beginning of this year, in which he eliminated some errors and amended some of his interpretations.

The main criticisms in the report refer to the great amount of manpower employed at the surface of the Belgian mines, and to the insufficient mechanisation of extraction and especially of transport inside the mines. According to the report, the labour force employed in the mines could be reduced by several tens of thousands of workers without affecting total production. It points out that better organisation might make it possible to reduce the cost of production per ton from \$14 where it stands at present, to \$11 and even to \$9 in some special cases. These figures, however, are not the result of a detailed study of the whole industry but of a rather rapid generalisation on some particular cases. After examining one particular coal mine, the report reached the conclusion that through mechanisation and centralisation the labour cost per ton of coal could be reduced from BF 472, as at present, to BF 232.

Belgian coal circles have found several inaccuracies in the report, which seems to have been drawn up a little hastily. It has been pointed out that the particular colliery selected for estimating the possibility of cost reduction is a rather backward mine which was just then facing special difficulties and which has recently had to be merged with a neighbouring mine. Moreover, when answering the questions put by Mr Robinson during his tour, the Belgians were anxious to emphasise the deficiencies in the present organisation of the coal industry, in the hope that his report might lead to some ECA help. Now Mr Robinson has been given a chance to put his ideas into practice, as he has agreed to organise the working of a coal mine in the Liège area.

The attitude of the Belgian coal industry towards the Schuman Plan is based first on the appalling discrepancy between the costs of production in Belgium and neighbouring countries, which is illustrated by the following figures:—

	Belgium	Germany	Netherlands	France	Great Britain
Productivity per man-shift (end 1950)	720	1,080	1,430	820	1,240
Wages + social contributions (April, 1951)	323	223	227	255	279
Internal price of coal: coking fines (April, 1951)	710	445	580	590	330

The low productivity per man can be attributed largely to the physical nature of the Belgian coal deposits; the seams are narrower, deeper, more irregular, and more affected by fire-damp, than in other countries. The insufficient modernisation could be explained by the relatively low prices fixed for coal and the absence of foreign financial help for the collieries. On the other hand coalminers' wages are very high compared with those in other countries and with

other trades. That is why the Belgian delegates to the Schuman Plan discussions insisted first on the equalisation of wages and social benefits among members of the pool. Their suggestions have been resisted because everyone knows that they would be difficult to carry out without imposing a general rise in prices throughout the whole of industry in some of the member countries. The Belgian coal industry still does not feel that the various schemes proposed in Paris to compensate these inequalities are completely satisfactory, especially where they refer to the situation after the five-year transition period.

The second main objection to entering the Schuman pool is the threat of a reduction in production and of the rapid closing down of a great many marginal mines. The news that the plan would imply a 5,000,000 tons cut in the total productive capacity of around 30 million tons has aroused much anxiety, which was reflected even in the market quotations of coal shares. Belgian industrialists are pressing the Government to make sure that a minimum productive capacity of 25 to 30 million tons is assured, even at the cost of official subsidies. Everyone is aware of the importance of extracting within the country the coal needed by its industry, especially when there is a threat of war or when heavy industry is entering a boom period. This would imply that no upper limit should be placed on extraction in Belgium when demand is expanding. In the circumstances there is strong opposition to the very large powers given to the High Authority which might permit it to close some marginal pits.

A sense of industrial solidarity has led Belgian industrialists in general to support the arguments of the coal industry although they stand to benefit from the lower prices of coal and the opening of larger markets. But if industrial circles raise their voices against the plan, it is important to note that it finds much support in political, trade union and independent circles. These point to the necessity of building a European community by opening larger markets, of progressively eliminating the less efficient pits and of improving working conditions which are still unsatisfactory in this industry. Moreover, it is certainly possible to modernise industry still further, possibly with international financing and co-operation, and to improve productivity under the pressure of market prices. In fact, productivity has improved by more than 15 per cent since the middle of 1949 and has not yet reached the prewar level. Altogether it has been becoming much clearer to the general public that, whatever the ultimate fate of the Schuman Plan in Belgium some reforms must be carried out in the coal industry.

Coal Allocation Fails

[FROM OUR GENEVA CORRESPONDENT]

THE latest meeting of the Coal Committee of the Economic Commission for Europe, which took place in Geneva on June 14th and 15th, revealed a sad falling-off in international co-operation in a field in which since the end of the war it had previously been remarkably successful. For this deterioration two factors are chiefly responsible. The first is that the Committee's own authority has been weakened. In the earlier period of shortage, though its decisions were taken unanimously, it did in practice allocate between the importing countries the quantities of coal declared to it by the exporting countries as available for export to European destinations. It relinquished this power in 1950, however, as a result of American pressure to restore a free market in European coal at a time when the immediate prospects were of a surplus. Now that the shortage has returned, the Committee's decisions, which are still taken unanimously, have only the status of recommendations.

The second factor is the return to German hands of the management of German trade, while the level of German coal exports is still determined by the International Authority for the Ruhr. As a result, the Germans, who strongly resent

being compelled to export coal which is needed for German industry and households, feel no responsibility for seeing that the distribution of their exports, which they do control, fits into an equitable European pattern. The Ruhr Authority has declared an export of 6,200,000 tons for the third quarter; but at Geneva the Germans have been saying that this figure should only be regarded as provisional, pending the result of an approach which they have made to the High Commission. This stresses the increase in domestic requirements owing to the arrival of more Allied soldiers in Western Germany and the Allied decision to build up a stockpile in Berlin. Meanwhile, the German trade authorities have been committing much of their coal in bilateral agreements.

Since the Coal Committee's recommendations no longer take precedence over trade agreements, the importing countries at Geneva have split into two camps: those who expect to do better through bilateral negotiations, and those who expect to benefit from international allocation. The former pay lip-service to the principle of equitable distribution, but sabotage it by refusing to surrender any quantities they have already contracted for. If necessary, they submit inflated estimates of their requirements; the Swiss estimate for the third quarter of 1951, for example, was twice as high as their imports for any of the last ten quarters, though it claimed to make no allowance for stocking.

The only foreseeable result is that the pretence of international allocation will soon have to be abandoned. The artificially cheap Ruhr coal will go to the countries which are strongly placed for bargaining with Germany, i.e., the Schuman Plan countries, Sweden and Switzerland. The dearer coal, and the shortages will be left over for the others, in particular, Greece, Yugoslavia, Austria, Portugal and Norway. If the Schuman Plan should not go through, they will be joined in their unhappy boat by the Netherlands and Luxemburg. Since the Committee estimates the shortage of European coal in the third quarter at ten million tons, and shipping will probably limit imports from the United States to 6,000,000 tons, the winter prospects for these countries seem exceedingly bleak. Stocks are low, and there is little prospect that the supply situation in the fourth quarter will be better than the third.

Land Reform in China—II

[FROM A CORRESPONDENT RECENTLY IN CHINA]

WHEN he introduced the draft of the Agrarian Reform Law to the second session of the National Committee of the Chinese People's Political Consultative Conference twelve months ago, Liu Shao-Chi, Vice-Chairman of the Central People's Government, claimed it as "the greatest and most thorough reform in thousands of years of Chinese history." Though the evidence is scanty, it is possible to take stock over the past year and to see approximately how far the programme has been implemented what results are claimed.

Up to June, 1950, land reform had been carried out in a total area containing a rural population of 145 million, mainly around the big cities, in parts of the north and north-east and in half of Honan province. In the winter of 1950-51 further re-distributions were carried out in many provinces of the middle and lower reaches of the Yangtze, including the greater parts of Hupeh, Hunan and Kiangsi, the entire areas of Anhwei, Kiangsu and Chekiang and in parts of Fukien, Kwangtung, Kwangsi, Shantung, Honan, Shansi and Szechuan. In these areas, with a rural population of 130 million, about 80 million poor peasants are officially stated to have received 25 million acres of re-distributed land. Thus the total area so far covered has a rural population of 270 million, two-thirds of the whole Chinese rural population. The remaining areas, with a rural population of 135 million, are to be dealt with mainly in the coming winter, and by 1952 the land reform is scheduled to be largely completed.

So well remembered... by A.E.C.

CORONATION SUMMER, 1911

All the gaiety of Edwardian London blossomed into full flower in that glorious summer of 1911. It was a city of smiles, of fetes, of pageantry. In the sunny afternoons the crowds thronged to the Exhibitions at the White City and Earls Court or crowded into the West End to watch the processions, staying as dusk fell to see the new electric lights twinkle above the theatre porticos. And through the happy crowds the first 'B' type motor omnibuses nosed their busy way. Here was a new means of transport for the Londoner—speedy, reliable,

cheap—soon to be as familiar as the very pavements themselves. It was in 1910 that the L.G.O.C., quick to realise the essential need for a standard type of vehicle, first operated the immortal 'B' type double-decker: an omnibus which was the first of a great and distinguished assembly, built by A.E.C., which has given faithful service to millions of London citizens ever since.

A.C.V. SALES LTD., 49 BERKELEY SQUARE LONDON, W.1.

The Agrarian Reform Law does not apply to the border regions, which contain the bulk of the national minorities of 20 million. This is for two main reasons. Firstly, the Central Government is well aware that traditionally most of these minorities have little love for the Chinese and so it is pursuing the relatively long-term and cautious policy of training cadres from among these races, who will help to carry out Peking policy from within. Secondly, and no less important, the conditions of economic development in these areas are different, since they are predominantly pastoral, as distinct from the arable nature of China proper.

The effect of the reform where it has been put into effect is, of course, already making itself felt. On the negative side can be quoted the numerous reports from Chinese sources of the arrests and executions of "dissident elements" opposed to the re-distribution. On the other hand it is stated officially that in thousands of villages in Hopei, Shansi and Chahar (all in the Peking region) the proportion of middle peasants, previously only 20 per cent of the total, has now increased to 80 per cent, because the economic status of so many poor peasants and labourers has been raised.

It is also claimed that the reform has increased the purchasing power of the peasant; thus, in the state-owned shops of the North-East Area (Manchuria), sales of cloth in 1950 were 255 per cent of those of 1949 and 750 per cent of 1948. (It must, however, be remembered that State shops do not reflect the situation in private trade and that Manchuria is not typical of the other regions.) In addition, it is said, more is being spent by the peasants on purchasing farm equipment. These increases may not indicate a fundamental change in the peasant's purchasing power. They may merely reflect a better supply position in 1950 compared with the still disturbed year of 1949; or it may be that the peasants are more willing to spend instead of hoarding. But this increase in the purchasing power is claimed and it is seen as an important factor in the expansion of industrial production. Recently Li Liu Lien, Director of the Counsellor's Office of the Government Administration Council, stated that the development of agricultural and civilian light industries contained the best possibilities of accumulating capital with which gradually to expand the fundamental heavy industries, thus ensuring the gradual industrialisation of China. This suggestion that the satisfaction of the peasants' current demands is to take priority over the desire for heavy industrial investment is an interesting and perhaps significant reversal of the policy carried out in the prewar Soviet Union.

After the last harvest it was claimed that for the first time China had produced an exportable surplus of grain, due in the main to the latent forces of the peasants released by the land reform. In support of this China has offered large quantities of rice to India in recent months and Chinese

officials have stated that grain is being fed extensively to pigs. Whether this surplus is a true one in the sense that all domestic consumption needs are satisfied is not clear. That this might not be so is suggested by some production figures of the Wu Hsiang district in Shansi. Here, it is said, 3 per cent of the families have produced 10 Chinese *tan** of surplus grain each, 10 per cent of the families 5-10 *tan*, 34 per cent 1-5 *tan*, while 46 per cent produced enough for their own consumption needs without any surplus. The remaining 8 per cent did not produce enough grain for personal consumption, although this was partly due to their own increased consumption over the pre-reform days. The quantitatively small amounts of even the largest surplus and the fact that over half the peasants were producing at or below subsistence level suggest that the claimed exportable surplus may be an artificial one, made at the expense of home consumption. It is, of course, true that production has increased, though how much of this is due to normal recovery trends after wartime dislocations and to other technological factors, and how much is due to the reform cannot be said. The greatest need of Chinese agriculture is for improvements in technique and equipment and in practice the principal effect—and purpose—of the reform appears to be political; it seems to have resulted primarily in a transfer to the peasants of the title-deeds of the land they had previously tilled, rather than in a wholesale re-allocation of the actual land.

The size of most holdings is still very small and although peasant co-operatives and similar bodies are being developed, there are as yet only a few state or collective farms, mainly in the "old liberation areas" of the north and the north-east. But it is significant that the large holdings that do exist as single units are not being broken up, but are being preserved, either in the hands of the rich peasants or of the state or state-controlled bodies. Liu Shao-Chi has clearly stated that increased production is "the basic reason for, and the basic aim of, agrarian reform."

For some time now a great and increasing campaign has been going on among the peasants to make them "politically conscious" and to prepare them for changes to come. That collectivisation is envisaged in the unstated future has only been hinted at by Liu, but it has been more definitely and equally authoritatively postulated by Li Liu-Lien, who stated a few weeks ago: "it is only at the time when agriculture is collectivised that the problem of poverty on the part of the Chinese peasant can be basically solved and the Chinese peasant can be liberated forever from poverty and backwardness and walk on the road to Socialism."

(Concluded.)

Storm Over the Åland Islands

[BY A CORRESPONDENT]

A NEW Autonomy Bill for the Åland Islands recently received its second reading in the Finnish Diet. To judge by the number and tenor of the articles which were devoted to the matter in the Soviet press, it would appear that the Åland Islands are one of the greatest danger spots threatening world peace. There were frequent references to "war hysterics in Scandinavia" and it was argued that Finland wanted "the Ålands to share the fate of Greenland and Iceland." Their strategic importance is, indeed, obvious. From a military base on the islands, Stockholm, Helsinki and Leningrad can all be threatened, and it has been said that "who owns the Ålands, owns the Baltic." The Russian outcry is only explicable if the Russians really believe that what they call "Western interference" is the prelude to the creation of an anti-Soviet base on the Ålands, or if they hope that in the

* The Chinese *tan* is an elastic term of measurement. In this area it is about 2 cwt.

long run they may themselves be able to control the islands.

But, on the face of it, Article 6 of the first draft of the new Autonomy Bill, against which most of the Soviet wrath was directed, merely provided a guarantee of certain liberties for the Swedes who form 90 per cent of the population of these Finnish-owned islands. These rights included local voting, election of the Governor, and the provision of Swedish schools, and were guaranteed to the Swedes after the first World War when the League Council decided that it could not agree to their wish, expressed through plebiscites, to be reunited with Sweden.

The new Autonomy Bill originated in a request by the islanders in 1946 for certain improvements in their status. When the Bill was first introduced by the Government in 1948 the Finnish Communists and the Soviet Union at once emerged as the champions of Finnish sovereignty. They claimed that both Article 6 and paragraph 19 of Article 11 (which requires the approval by the Ålands Landtag of any

Finnish international treaties referring to the islands) were contrary to the Peace Treaties and unfriendly to the Soviet Union. When the Finnish Great Commission approved the Bill in August 1950, General Sovenkov, then the Soviet Ambassador to Helsinki, intervened, and the Finnish Premier, Mr Kekkonen, advised Parliament to drop Article 6.

This did not, however, prevent the Finnish Diet from taking up the Bill again in its original form this year. But this time the Soviet press campaign seems to have been sufficient warning to the Finnish Government and the new Soviet ambassador, Mr Lebedev, did not, apparently, find it necessary to intervene. Although the Great Commission again approved the Bill in its entirety, it later reversed its decision and, on the advice of the Government, dropped Article 6, while retaining Article 11. In this compromise form the Bill got through its second reading, with the Communists voting against Article 11 and the Swedish People's Party and some others voting against the dropping of Article 6. The final reading of the Bill will have to await the new Diet, which is to be elected next week, but it seems likely that it will pass into law in its present compromise form.

An Asian View of American Policy

[FROM OUR HONGKONG CORRESPONDENT]

WHITEHALL has now imposed a complete licensing system on all United Kingdom exports to China and Hongkong, and to this may be added full import licensing in Hongkong, as a double check. This step should presumably satisfy American opinion. Otherwise, the measure has little practical significance, because elaborate and extensive controls on all articles of any "warlike" use are already applied. Since the summer of 1950, China has received nothing of this kind through Hongkong. American policy and opinion may, how-

ever, not be content with this latest gesture from Britain. It still seems, when seen from Hongkong, to be thrusting in the direction of a total blockade of China: not merely control, but stoppage. In this situation, the safety of the world may depend on the extent to which the United States government and public appreciate the effect their own actions have on other people.

It is perhaps on the desirability of a blockade that Asian opinion most completely departs from the American trend. Contemporary Asia, with the possible exception of Japan, is in a most unaccommodating mood. It is simply not going to be "put upon" for any reason, good or bad. It would be an error, fatal to the prospects of the western powers retaining their position or influence in the eastern hemisphere, to allow a feeling to arise that some course of action was being imposed from the West, with hastiness or coercion. That would play effectively into the hands of communist propaganda, which, as regards international relations, is heavily based on the dogma that Uno is an apparatus for the dictatorship of the imperialists under American control.

Unfortunately, United States' policy has already, to a considerable and totally unnecessary extent, given that sort of impression. Even in doing the right things, the Americans seem to have done them in the wrong way. There has often been support—much wider perhaps than they themselves imagined—for their aims; but their methods and manner have often been objectionable in the eyes of local people. This is especially the case where there has been unilateral action by the United States without prior consultation with the other countries most intimately concerned, without any evidence of careful marshalling of the facts, or even any advance warning of the action contemplated. The "embargo" on Hongkong last December, for example, was arbitrarily and somewhat melodramatically imposed.

Is Hongkong Expendable?

Asian opinion in general, considers that the United States is forcing the pace, on any and every occasion, to such an extent that it actually hastens to meet possible crises, long before they really arise. The present proposals for a blockade, if implemented, would bring up new issues affecting the alignment of the various countries in the United Nations. Between these states, certain differences naturally and inevitably exist, which could and would be bridged or adjusted, given reasonable time. But haste can only serve to enlarge and embitter these differences.

Most immediately, perhaps, the suggested blockade would force an issue, not yet imminent under the present conditions, regarding Hongkong. Is Hongkong expendable? Some people in Tokyo and Taipeh, appear to think that it is. Is Hongkong, in its present role and status, not of more value to the free world than to the Communists? Most of those who know the real facts would answer very definitely that it is. Can it become a bridgehead, or be "the Berlin of the Far East"? Technically, an air-lift, or a sea-lift might be a feasible though costly operation; but few see any necessity for such an extreme and adventurous course of action at this juncture.

The Communists, whose main aim is to propagate chaos, uncertainty and disharmony, might even welcome this doubtful experiment. Just when a general revulsion is setting in, among Chinese and others, against their aims and methods, it would distract attention on to the foreign field. A blockade, which would do them little harm materially, would justify their accusations of aggression, cause disunity in the democratic front, and allow them to blame on "enemy action" all the hardships and cruelties their policies may impose on the Chinese people. The proposals for a blockade, in their cruder forms especially, are therefore arousing the gravest fears in Asia; they are hastening a process by which America risks losing all support or co-operation from the local populations of the eastern hemisphere.

Aspects of enterprise

No. 3

Since the war an imposing range of new buildings has been erected at Cheadle Heath to provide first-class facilities for specialised research and development. Under ideal conditions engineers and scientists tackle many problems in coal cleaning, carbonisation and combustion, chemical plant design, materials handling, and the milling of wheat and other cereals. The 90-foot tower (housing an experimental flour mill) which dominates the site, though flippantly known as "the Simon Hippodrome," symbolises a determination to maintain leadership in the Simon fields of engineering design and contracting.

THE BUSINESS WORLD

Exchange Control Reviewed

A PASSAGE from the International Monetary Fund's second annual report on exchange restrictions has been widely accepted as being aimed more directly at this country than at any other member:

It is the belief of the Fund that, although caution is required, many member countries can and should make further progress towards the achievement . . . of a multi-lateral system of payments in respect of current transactions between members and in the elimination of foreign exchange restrictions which hamper the growth of world trade.

This assumption is supported by the intervention of the IMF at the last meeting of the contracting parties of the General Agreement on Tariffs and Trade at Torquay, where Britain and a number of other members of the sterling area were specifically named as countries that might with due caution begin to relax their restrictions on current payments. Such criticism, and the heated debate that has revolved round it, caused some resentment in London, for critics of British exchange control policy abroad (and at home) do not always take account of the appreciable easing of exchange controls that has been attempted by this country in the recent past. Since the debate on this subject is likely to grow more acute in coming months, it is desirable to record in some detail the relaxations that Britain has made in the past eighteen months, and to examine—with some sympathy, but in no mood of complete justification—the reasons for the caution that at present governs official British thinking on this question.

As it happens, the most complete summary of relaxations of British exchange controls in the calendar year 1950 has been recently compiled by the IMF itself—in the survey of developments in individual countries that was attached to its latest report. Here, in chronological order, are the relaxations in United Kingdom exchange restrictions in 1950 recorded in the survey:—

January 10.—A system was introduced by which any new capital investments by non-residents that are approved by the exchange control authorities can be repatriated at any time.

February-March.—Restrictions on invisible (and on some capital) transactions with the Scandinavian countries were relaxed.

May 1.—The basic twelve month tourist allowance of £50, which already covered travel in most European countries, was extended to include travel in Argentina, Brazil, Chile, Cyrenaica, Egypt, Ethiopia, Finland, Iran, Israel, Paraguay, Peru, Saudi Arabia, Italian Somaliland, Sudan, Trieste, Tripolitania, Uruguay and Yugoslavia.

July 17.—Certain restrictions on invisible transactions with Belgium-Luxembourg were relaxed, and the Belgian Monetary Area was included in the category of countries from which a certain range of imports is freely permitted.

September 4.—Non-residents were authorised to switch out of their existing sterling area securities into any other quoted sterling area securities maturing more than 10 years after the date of purchase.

September 26.—Western Germany was included in the category of countries from which a certain range of imports is freely permitted.

October 10.—Uruguay was included in the category of countries from which a certain range of imports is freely permitted.

October 16.—Commercial banks were allowed to deal in Canadian dollars as principals instead of as mere agents. This meant that publication of an official exchange rate for the Canadian dollar ceased and that banks were allowed to deal with customers and among themselves at market rates.

November 1.—Switzerland and Liechtenstein were included in the category of countries from which a certain range of imports is freely permitted; later, on November 14, certain restrictions on invisible transactions with these two countries were relaxed.

December 6.—Denmark was listed as a Transferable Account country and the obligation on residents to surrender receipts of Scandinavian currencies was removed.

December 18.—For the year ending April 30, 1951, the basic twelve month tourist allowance available in certain countries was raised from £50 to £100.

This, it should be added, is not an exhaustive list of all the relevant developments in 1950. The most important omission from it is the adhesion, not merely of the United Kingdom, but of the whole of the sterling area, to the European Payments Union, which began functioning effectively from July 1st of last year. Since that date sterling has been freely transferable among the members of the EPU, and surpluses and deficits between the sterling area on the one hand and other member countries on the other have been automatically compensated under the rules of this new payments mechanism. Following the launching of EPU, Britain invited all other members that were not already in the sterling transferable account system to avail themselves of its facilities. The response has not been overwhelming but the fault for this, if any there be, lies with the other countries and not with the British authorities whose invitations have been pressed with considerable persistence.

The good work of easing exchange controls has continued in 1951. Last February for example, there was a further relaxation of switching regulations and of the controls exercised over the investment of funds held in blocked sterling accounts; this measure absolved from specific Bank of England sanction a wide range of transactions in securities held by non-residents and continued the progress already made in delegating responsibility to the authorised banks. Another significant example of progress towards a freer market occurred last April when the banks were given permission to operate freely in foreign notes and coin. This business, like the dealing in Canadian dollars, is now transacted by the banks as principals instead of as agents; the banks are free to quote what rates they wish, and they can replenish their tills by imports from foreign correspondents in overseas countries and get rid of any surplus holdings by exports to their correspondents abroad—subject, of course, to the regulations on the import of notes and coin in the countries concerned. Together with the freely moving market in Canadian dollars, this modest free market in

foreign notes is providing the London market with a valuable re-education in the arts of dealing. Finally, it was announced only this week that emigrants from Britain to Canada and the United States will now be allowed to take with them not only the £1,000 of capital hitherto permitted, but a further £250 per child (up to a maximum of £1,000 for four children). The Chancellor of the Exchequer, announcing this concession, added that he would be prepared to consider applications by emigrants to purchase with funds in Britain any personal effects and tools of their trade; the Canadian Government has undertaken to allow such articles to enter duty free.

In addition to these specific measures, there has undoubtedly been some easing of British exchange controls in the past year by purely *ad hoc* administrative methods. As a result of the substantial strengthening of the gold and dollar reserve, the exchange control authorities have been far more lenient in sanctioning exemptions from the strict writ of its regulations; special cases of hardship, notably those involving transfers of funds to the dollar countries, have been treated with greater sympathy. Controls over the use of sterling earned by countries with which bilateral payments agreements are in operation have also been "administratively" relaxed.

It is true that any bare recounting of the relaxations made in the exchange control mechanism can tell less than half the story of Britain's progress towards the sort of the world that IMF rightly wants. In the United Kingdom, as in all countries of the sterling area, the restrictive system rests mainly on import licensing and on the discriminatory manner in which it operates. Foreign exchange is automatically provided for any transaction for which an import licence has been granted. The true measure of exchange control relaxation over the past year can therefore only be gauged by reference to the liberalisation of import trade. Here, unfortunately, the story tells of uneven progress. One of the main benefits derived from the launching of the European Payments Union has been the wide measure of trade liberalisation and the disappearance of discrimination against the former "hard currency countries of Europe"—Belgium, Switzerland and Luxembourg. The loosening of restrictions over imports from the dollar world has, however, been a far more halting process and has not achieved a pace sufficient to satisfy these countries. But there is reason to believe that restrictions are gradually being eased, especially on imports from

Radio Awaits Rearmament

THE radio industry is one of the key defence industries for its products supply the vital mechanisms of an ever-growing number of military items. At this stage, however, it is impossible to calculate the burden of military orders that will eventually be placed upon it. A rough estimate of a total of £80 million during the next three years was made early in the year by Ministry of Supply witnesses giving evidence on rearmament to the Select Committee on Estimates; the Radio Industry Council produced comparable figures based on an expenditure of £18,400,000 during the current financial year, £29,600,000 in 1952-53 and £34,600,000 in 1953-54. An estimate made today would probably put the total figure at least 50 per cent higher. Since actual

Canada; licences are now being granted for such items as fruit, dairy produce and newsprint, where a year ago they were being refused.

The record of exchange relaxation for the past year might have been far more impressive had it not been for the emergence of the Korean crisis and all that ensued from it. It is no secret that towards the middle of last year plans were well advanced for an impressive dismantling of exchange control. Broadly speaking, the objective that was sought was the virtual elimination of all restrictions on current transactions except those with the dollar area. For all other areas, the mechanism of exchange control would have remained ready for use in case of emergency, but its fettering formalities would have been largely set aside. It is also probable that a wide easing of capital movements would have been introduced by generalising for all countries, other than those in the dollar area, the concessions already made to the Scandinavian countries under the "Uniscan" arrangements announced in February, 1950.

These ambitious and praiseworthy plans were pigeon-holed when the Korean war broke out. The reaction of the authorities to the uncertainties introduced by rearmament was to retreat rapidly, though possibly only temporarily, into their shell. It is possible that, had it not been for the Persian oil crisis, they would now be beginning to emerge again. The effect of the Korean outbreak on Britain's own balance of payments has been at least as bad as most observers originally feared, but the position of the sterling area as a whole up to March proceeded from strength to strength; in a few days' time the gold and dollar figures will show whether this advance has since been maintained. There are, however, one or two less happy features in the situation. The impact that the Persian crisis is likely to have on sterling's prospects should not be minimised. The value of the oil products of the Abadan refinery and of the crude oil exported from Persia, probably exceeds £500 million per annum. If any appreciable part of that oil has to be replaced by dollar oil the effect on the gold and dollar reserves will not be long in making its appearance. Secondly, it remains to be seen how far the reaction in prices of basic commodities may affect the sterling area's dollar earnings. The immediate outlook, therefore, is not unduly propitious for any further spectacular relaxation of sterling exchange control. That fact, however, should not be allowed to hide the welcome progress that has been made towards relaxation during the past year.

expenditure this year seems unlikely to exceed the industry's estimate, military orders in the later years may prove to be considerably heavier than was first expected.

Last year the output of the four main sections of the industry, heavy electronic equipment, domestic receiver assembly, components and valve production, amounted to £75 million, divided thus: domestic receivers £42 million, exports £18 million, defence £6,000,000, BBC £1,000,000 and the Post Office, the merchant navy and other industrial users about £8,000,000. The Ministry of Supply has told the industry that its present capacity would be needed to meet service requirements in the event of war and must be kept intact. It seems probable that considerably more than half of it will be employed

FINANCE AND OVERSEAS TRADE

The financial arrangements involved in trading with countries overseas can present many complications. The Three Banks Group has wide experience of this aspect of modern Banking practice, and with many important contacts overseas is particularly well placed to handle such problems and tender advice based on accurate knowledge of local conditions. The need for increased exports is leading to considerable expansion of the Group's activities in this direction.

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C. I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Full particulars of the facilities offered may be obtained from

on defence orders at the peak of rearmament with a progressive running-down of civilian production, particularly of the domestic receivers that last year accounted for a high proportion of the industry's output. This "capacity" consists largely of trained labour totalling about 125,000 workers with slightly more women than men. To retain these men and women, the industry would need to maintain normal commercial production until the factories could be switched to defence output. In most sections of the industry, plant and labour could make the change from civil to military production without re-tooling or re-training, but there are several difficulties in the way of a smooth transition.

To discuss the supply of electronic equipment to the services simply in money terms can be misleading. The final products of the industry fall roughly into two classes: capital equipment such as radar installations or broadcasting and television transmitters, and the small receiving (and for service purposes transmitting) sets. One company frequently makes both types of product, and both incorporate valves and components from the other sections of the industry: but the two are made by different methods and with different kinds of labour. The first comes in the category of heavy electrical engineering and is generally tailor-made by skilled electrical engineers (nearly all men). The sets are mass-produced products assembled, usually by women, from standard components: though these women are not skilled engineers, the work requires a manual dexterity that can be acquired only by training and experience, and such women lost to the industry are not readily replaceable. At the moment, it appears to be largely the capital equipment section of the industry that is working on defence orders. And there is some danger that through shortages of materials—and perhaps slackening of consumer demand—production of domestic radio and television sets may be curtailed some time before this set assembly section of the industry can start production of military equipment. Such an interval would also have repercussions upon the makers of components and valves.

The Select Committee seems to have been impressed by the evidence of the radio industry on this point. It recommended that the Ministry of Supply should accelerate the placing of defence orders with the radio industry in order to "take up any slack in output." For two reasons, this may not be easy. Official witnesses explained that it took the Air Ministry, for example, at least six months from the time that an aircraft programme was drawn up to work out its requirements of radio and other electronic accessories for that programme. Only the Admiralty, which orders direct from the industry, has been able to give radio manufacturers a clear idea of its requirements over the whole three-year period. The other services have not worked out such details yet; consequently the Ministry of Supply cannot "know the

real impact on the electronics industry." The second reason is a factor inherent in the present nature and scale of defence planning: the desire to include the latest equipment available. The most important example of this is already causing concern in the radio and the aircraft industries. The Air Ministry lays such emphasis on putting the most advanced equipment into new RAF aircraft that the machines often go into production, and even into service, before ancillary equipment designs have been settled. Even when this basically excellent principle is not carried to excess, it tends to delay the placing of orders for aircraft transmitters and receivers that could otherwise be produced fairly quickly. Unless there is a change in purchasing policy it might well be another eighteen months before production of the electronic equipment for the new aircraft begins; and the principle may impose similar delays upon ordering such equipment for other armaments.

Given the strategic importance of keeping the capacity of the radio industry intact, manufacturers assumed that production of domestic radio and television receivers would be allowed to continue at the rate planned until such times as individual companies received defence orders in some twelve to eighteen months' time. On the set-making side, the change from domestic to military orders could then be made almost without interruption to production. The prospect was attractive. Holm Moss television station, due to open later this year, has a potential audience representing about one-twentieth of the country's population. This is about the same size as the audience in

the London area nearly double that of the Sutton Coldfield station. An output of 900,000 television receivers was planned this year to meet the demands of this new area as well as the steadily increasing sales in the London and Birmingham areas. Development of a television relay service promised to increase the potential audience on the fringe of these areas, and the export prospects for radio and television equipment and components were also good.

The Budget is not likely to have materially altered these prospects. The Radio Industry Council, in a memorandum to the Select Committee estimated that Mr Gaitskell's doubling of purchase tax on receivers would reduce sales by one-third. Even if this is true—there is little evidence yet to prove it—radio rather than television sales might be expected to bear the brunt. This might harm the industry less than the figure of one-third would suggest. A television receiver contains about 200 components compared with between 20 and 30 in a radio receiver, and about 15 valves against five in a radio set. A fall in radio sales is thus less important to the industry than a fall in television sales; and a smaller proportionate increase in the latter might easily counteract it. This governs the home market for radio components; the heavy radio equipment now

RADIO AND TELEVISION

being ordered for defence makes only small demands in proportion to its total value upon mass-produced components.

Shortages of materials have now compelled the industry to lower its sights. Television receiver production may now reach only 600,000 sets in the year, the same as last year. Output in the industry has not fallen, but it is not increasing at what had become its normal rate. For some time set makers have been living on their stocks; batches of receivers have been held up from time to time awaiting delivery of a single component, but there has been no serious interruption of production. The materials in question are nickel, copper, and zinc. None can easily be replaced and deliveries have been deteriorating for the past six months. The Ministry of Supply estimates that the industry is now getting about 80 per cent of its material requirements but some component makers say they are getting 10 per cent of their needs of nickel. Other manufacturers told the Select Committee that they were receiving only one ton of brass for every ton of scrap, which means a steadily declining rate of deliveries. Sooner or later, this must affect the rate of component deliveries to the manufacturers' assembly lines.

Component makers, apart from valve manufacturers, can switch labour from one item to another according to the flow of materials; but the non-arrival of a single component can stop work on domestic receivers. This might lead to dismissal of some of the trained workers who would become essential when defence orders are eventually placed. The valve makers, who use most of the nickel consumed by the radio industry, face the same possibility. Valves are at the heart of every piece of electronic equipment; but witnesses for the industry spoke of a "halo of mystery" surrounding probable valve requirements for rearmament. Output of normal commercial valves is now between 25 and 30 million a year and is just keeping pace with demand. Ministry of Supply witnesses said that capacity was adequate for military requirements—the industry estimated that it could easily be increased by 50 per cent—and one company has recently been discouraged by the Ministry from laying down new valve-making lines. Like radio assembly, valve making employs numbers of highly trained workers; if manufacturers are driven because of shortage of materials

to dismiss some of the workers, its potential machine capacity cannot be put to use.

As defence plans stand at present, the heaviest calls upon the industry will not come until late next year and the year after. Although orders for up to £50 million have been placed with manufacturers, a big proportion of these are not intended for immediate production. Will material supplies in the meantime permit of a level of domestic set production and output of components and valves sufficient to retain the trained workers that defence orders will then need? The evidence presented to the Select Committee was cogent and clearly impressed its members; yet the industry's future may not be quite as black at it was painted. Radio manufacturers have been getting no special allocations of materials for defence orders and their evidence of material shortages combined the requirements of military and domestic programmes. If armament production, however limited at present, is being superimposed on the present rate of civilian production, then supplies of materials must inevitably become inadequate. It must be remembered that there is no unemployment yet in any branch of the radio industry. There are delays in production; there is a levelling off of the rising curve of output; but there has been no fall in output. Witnesses said that they dealt in "grammes and ounces" of materials: the very smallness of the quantities required must make it easier for the industry to live from hand to mouth, and unless deliveries deteriorate further, the industry might get away with nothing worse than under-employment. The industry as yet is not canvassing for special allocations of scarce materials, but it can always quote the Minister of Supply as saying early in the year that "we are most anxious that civilian production should be continued by everyone concerned, on the largest possible scale, for as long as possible and that all skilled labour should be retained in full employment in order that no existing capacities of resources shall be dispersed," and this might be the only way to fulfil the Minister's request. The other way—and the preferable way—would be for the Ministry of Supply to impress on the Service ministries the need for accepting earlier delivery dates for at any rate a large proportion of their electronic requirements. The highest refinements in specification will be of no avail if, when orders come to be placed, the industry has lost a part of its productive capacity.

Business Notes

Symbolical Allocation for Steel

Even the Minister of Supply seems to attach rather limited importance to the two-tier priority scheme for distribution of steel, copper, zinc and their alloys that is due to come into operation within the next few days. The "Defence Order" and "Preferential Treatment" symbols for metal orders are merely interim measures pending the introduction of detailed steel allocation and regulation of the distribution of the other metals. The priorities will have no statutory force. Mr Strauss claimed only that the schemes would allow suppliers to identify their most essential orders: he argued that metal-using industries had been asking for "some such schemes" for some time.

Detailed allocation and distribution schemes, the Minister estimated, could not come into force "much before the end of the year." In the meantime, manufacturers who have secured and those securing specific defence contracts will

receive a "DO number," on production of which their suppliers will fill their orders from a proportion of stocks specifically set aside for such contracts. This "DO number" may be passed on by such manufacturers to their sub-contractors and component manufacturers, who will also qualify for these guaranteed supplies. Essential civilian production "in various categories," including dollar and sterling exports and equipment for the fuel and power programme, may be granted "PT" symbols to assist in securing them marginal metal requirements in the absence of which production might be held up. Such "PT" orders will receive priority in the filling of orders from the metal suppliers' ordinary stocks. The Ministry of Supply and the Admiralty will issue "DO" numbers: but all production departments will receive a quarterly "allocation" of metals, within the limits of which they may grant "PT" priorities to the industries for which they are responsible. The total "PT" priorities are not expected to cover more than 6 or

7 per cent of the metal supplies: the proportion covered by "DO" priorities was naturally not disclosed, but was described as "not large in general," except in the case of alloy steels. Other qualities of steel (apart from sheet and tinplate, for which an allocation scheme is still operating) will be purchased by firms in the normal way.

The initials "DO" have a ring of American practice—in which such materials priority licences were recently summed up as "hunting licences." Their use will be "checked" by regional offices of the Ministry, but there will be no specific policing powers, apart from the obvious sanctions of determining contracts. The value of the symbol in "identifying" materials for defence components, however, may well be limited. The "PT" priority will obviously bring a flood of applications to the Ministries concerned; and as specific products receive priority for scarce materials, so the scramble is likely to spread to other industries pushed back in the queue. Mr Strauss did not appear to reject the idea of granting a "PT" priority if production of cars for the home market were to be held up; and there are few industries that cannot drum up a claim to be essential to something or other. The schemes promise to give the departments much trouble. They may be of some use in isolated cases in clearing particular obstacles to production. But if the need for allocation is definitely accepted, the Ministry would do well to accelerate its arrangements; these interim measures are unlikely to do much good for long, and might increase the present confusion.

Steel Polemics

Mr Strauss's exposition of the priority scheme was at least more reasonably phrased than his earlier polemic upon the operations of the steel industry. In this he finally aired in public the accusation at which he has been prepared to hint for some time—that in the last months of private ownership of the British steel industry its leaders deliberately ran down its stocks of raw materials to an unsafe level in order to embarrass the new state management. When the nationalised Steel Corporation arrived, asserted Mr Strauss, "the cupboard was nearly bare."

The timing and violence of the Minister's outburst suggest that he may have been more concerned to divert the criticism of nationalised industries that several trade union leaders had recently been voicing than to make any reasoned contribution to the argument about the future control of the steel industry. One of the principals in that dispute, Mr Steven Hardie, was peacefully fishing in Sweden, and his Corporation offered no comments: the other, the British Iron and Steel Federation, replied reasonably and somewhat crushingly that stocks in February, 1951, were higher than at the same time in 1948 and 1949 (though not than in 1950), and that although for years the Ministry's Iron and Steel Division had received weekly reports of stocks of steel-making materials, at no time had they suggested that the industry was acting wrongly in conserving or consuming those stocks. The Minister, incidentally, did not directly suggest that the proper course when consumers sought to build up their stocks late last year would have been to cut steel output.

A politician arguing the case for a nationalised industry might seem singularly ill-advised to select the current shortage of imported iron ore as a stick with which to beat private enterprise. It is true that the steel industry did not secure enough shipping last winter to carry to Britain all the ore that it had contracted in good time to buy. But the reasons for this are well known. The National Coal Board was unable to produce enough coal to meet the needs of home and foreign consumers, and a considerable tonnage of shipping had suddenly to be diverted from other uses to bring American coal to Europe; ships normally used for iron ore were particularly affected, and the diversion occurred at a moment of extreme scarcity of tonnage.

Mr Hardie's Intentions

The dispute to which Mr Strauss referred is fundamental. Mr Hardie's intention is that the Iron and Steel Corporation should acquire control of the non-profit-making companies through which the Federation buys all imported iron ore, scrap, and other steel materials. The Federation will not agree to this major proposal, just as it has not agreed to certain earlier requests of the Corporation for representation (other than through its publicly-owned companies) upon the Federation's general council and certain other committees. Mr Hardie points out that the publicly owned steel-making companies consume almost all the raw materials imported by the Federation's procurement companies, and of the small quantities of semi-finished steel products, such as billets, which they purchase. He argues that these companies are maintained in being almost entirely by financial levies upon publicly-owned steel makers; and that those still remaining in private hands, together with the outside consumers (of, for example, imported sheet steel) have a limited direct interest in imported materials for steel.

All this may be true. But it is beside the point of the main issue. Mr Hardie conceives it to be his duty to set up an organisation for the steel industry to suit the provisions of the Steel Act; the leaders of the Federation equally conceive it to be their duty to delay that reorganisation until another election takes place. Mr Hardie may argue that those leaders, controlling a theoretically non-political trade association, ought to represent the interests of the publicly owned companies that preponderate in its membership. His next move, by one means or another, may be to seek to emphasise that most of the individuals concerned hold office in the Federation's conferences, if not its council, by virtue of their employment by companies that the Corporation controls. The leaders of the Federation, however, still regard themselves as trustees of a form of ownership for the steel industry that may soon be endorsed at the polls and should be preserved against that expectation by the use of all such delaying tactics that offer themselves. The position adopted by each side follows logically enough from the Government's wrong decision to bring in a fundamental industrial change for which its mandate was worse than dubious. Tactically, the Federation has won the first sparring rounds; and it may be that its leaders would like to tempt Mr Hardie into really intemperate action. They may even succeed in this. But the consequences would be a damaging illustration of the folly of the Government in making the steel industry the plaything of politics.

Confused Markets

This week's movements in the security markets have been more confused than most—which is to say a good deal after so many weeks of uncertainty. If the markets needed any reminder of how completely they are dominated by international politics they certainly received one on Monday when they came to assess Mr Malik's proposal or suggestion—or at least mention—of a truce in Korea. Down came the commodity shares, led by rubber and copper issues; up bounded the gilt-edged market, at least at first, for it did not by any means hold its full gains. If this could happen as a response to the most equivocal of suggestions for a truce in Korea (which is only one of the points of disturbance, though it is the most violent one), what might come from a lasting relaxation of tension?

Almost immediately, events elsewhere showed that the question was indeed premature. Gilt-edged lost their impetus, though not the whole of their improvement, partly as a result of the Foreign Secretary's cautious assessment of Mr Malik's speech and partly because of the mounting gravity of the Persian oil crisis. Nor were commodity shares restored to favour; rubber and base metal shares seemed as much concerned about the possibility of lower prices, even

granted the continuation of political tension, as they had been depressed by first thoughts of a sudden outbreak of peace. As for industrial equities, it was difficult to perceive any clear trend by the middle of the week, and such buying that occurred mainly concentrated its modest force upon the leaders. All told, the market this week has lost neither its head nor its heart; but its present confusion is certainly understandable.

Truce and Commodities

Mr Malik's weekend proposal had less effect on commodity prices, as distinct from commodity share prices, than might have been expected. Rubber, tin, shellac and sugar prices reacted at first, but there has since been a recovery, except in sugar, which fell from 8.05 to 7.10 cents per lb. On Monday, spot rubber lost $\frac{1}{4}$ d. to 3s. 9d. per lb., and tin fell £22 10s. to £910 per ton. Both commodities more than regained their falls on Tuesday. Flax has also fallen in the last week, as have other agricultural commodities, but this is largely explained by the seasonal influence of the new crop. Although the fall in the price of tallow, which has been evident during the last two months, was slightly more rapid this week, it results primarily from abundant supplies.

Rubber and tin are the most sensitive commodities at present, but this is not a new situation. Towards the end of last September when the United Nations forces were in full advance, and the end of hostilities seemed in sight, they reacted unmistakably; both rubber and tin have been

affected more directly than any other commodities by American stockpiling, and the trend in their prices since February can be directly traced to the change in stockpiling policy.

Wolfram, antimony, and tung oil might have been expected to fall at the hint of a truce with China, for China in the past has been the world's major producer. But antimony and tung oil remained firm, whereas wolfram continued the steady advance that has been evident since the beginning of May. It is doubtful, even assuming that fighting in Korea were to cease, whether China would export any substantial quantities of tungsten and antimony to the west except perhaps in return for free shipments of key materials to China.

Fluctuations in Tin

In the last few days, tin has been subject to conflicting influences; Monday's low point of £910 had by Wednesday been followed by a recovery to £950. These responses to weekend truce talk and mid-week alarm about Persia have

at least temporarily obscured the depressing effect of the successive reductions from \$1.39 to \$1.06 per lb. in the American domestic price of tin imposed by the Reconstruction Finance Corporation. The first setback from the fantastic levels of the beginning of the year became evident in the middle of February, when the American Government ceased to add to the stockpile. The RFC, which acts as the agent of the American General Service Administration in buying for the tin stockpile, has been in control of the American tin market since March 12th. For a time, the RFC was content to follow the world market, but early in June it adopted a clear policy of cutting the American domestic price in order to influence the course of tin prices on the world market.

The RFC's aim, it would seem, is to bring the world price to the equivalent of \$1.03 per lb. (in sterling terms, £824 per ton). This is the maximum price in the agreements between the United States and Belgium, Holland and

Production figures: Ministry of Supply. Sales index: Radio and Television Retailers Association; there are between 8,000 and 10,000 retailers.

Indonesia, although the United States has been prepared on occasion to pay more, as for example late last year and in January when it was intent on obtaining tin. If the United States were to continue to hold off the market, the world price of tin would fall further. The long-term agreements for the supply of tin and ore from Belgium, Holland and Indonesia, assure an important contribution to meet American needs; and the American stockpile is estimated at between 150,000 and 180,000 tons, which is no meagre reserve for defence. Yet, even given its determination and its ability to bring the price of tin to what it considers a more reasonable level, the United States must to some extent consider the interests of producers and the impact of lower prices on social conditions in Bolivia and the Far East. Bolivian and Indonesian producers have already protested at the American policy. The manoeuvre is the climax of a long conflict of view between the United States and producers, particularly in Malaya, on what is a reasonable price for a long-term international agreement. Conferences have failed; the United States is now relying on its power as the largest consumer, fortified with reserves and having a certain part of its supplies guaranteed by agreement.

Investment Programme for 1951

The Chancellor's guarded statement on the investment "programme" last week said little that readers of the Economic Survey did not already know. Mr Gaitskell repeated the Survey's forecast that fixed investment in 1951 might be about £2,230 million (at end-1950 prices), compared with £2,162 million in 1950 and he indicated again that a considerable part of this apparent increase of £68 million would be due to the excess of end-1950 prices over average 1950 prices. Within the total of

£2,230 million, Mr Gaitskell estimated that supplies of plant and machinery to home industry should be about the same as in 1950 (when the national income statisticians estimated them at £880 million); he added, however, that a "much larger share must from now on go to firms engaged in defence production, so that, even in 1951, there will be some fall in supplies for purely civil purposes." In 1952 and 1953, as more and more of the engineering industry switches over to armaments, domestic investment in plant and machinery will have to be much more severely reduced.

The greater part of fixed investment outlay in 1950 consisted of expenditure on works and buildings; the National Income White Paper estimated this at £1,282 million (including £585 million of expenditure on repairs). Mr Gaitskell was rather more optimistic about the prospects for an increase in this sort of investment than for investment in plant and machinery; he pinned his hopes on the forecast that output in the building and construction engineering industries should continue to rise by about 5 per cent a year—that is, presumably, by about £65 million at 1950 prices. A substantial part of this increase, however, will also be drawn off for defence purposes; for the financial year, 1951-52, in fact, the Economic Survey estimated that building and engineering work for the defence programme would increase by £63 million, to £185 million—although only £30 million of this (representing expenditure on Government-owned factories, research establishments and storage for strategic stockpiling) is included in the estimate of £2,230 million for the fixed investment programme in 1951.

* * *

Jostling in the Queue

In view of what Mr Gaitskell called the "uncertainty" surrounding all these figures, the Government has wisely decided not to publish a detailed investment programme for individual industries in 1951 and 1952. It has, however, plainly been subjected to the usual pressure for a favourable place in the queue from the various claimants to scarce investment resources now congregated under its wing. It was the broad, though not the statistical, result of the bargaining with these claimants—euphemistically called a "recent review of the programme"—that provided the main new feature of Mr Gaitskell's statement. As a result of this bargaining, investment in coal, electricity, gas, coke ovens, railways, roads and petroleum will actually be higher in 1951 than in 1950—in the first two cases "substantially higher." Education will also get more, though less than was intended a year ago; investment in the health services, in some local Government services, and university building "will be less than it would otherwise have been," though only "in some cases" less than in 1950. The housing programme remains nominally sacrosanct at 200,000 houses a year, but may be subject to "some local interference." Government building as a whole will be brought down below the 1950 level—though not, apparently, until 1952. Among the Cinderellas, industrial building for manufacturing industry, which the Government controls by licence, will continue at about the same rate as in 1950, but fewer licences will be available for projects unconnected with defence production; private building for agricultural purposes will also be reduced. The distribution between industries of that part of the investment programme that takes the form of installation of plant and machinery, instead of new building, cannot be so easily controlled through the licensing system; in view of the way in which the cuts in new building seem to have been distributed, this is perhaps not a matter for regret.

At the end of his statement, Mr Gaitskell announced "two special measures." The first of these is that the building of all new offices will be prohibited—except where work "has already been authorised or in other very special circumstances" (there will, for instance, be a reprieve for office building in blitzed towns). The second special measure

is a ban on building projects for entertainment that cost more than £5,000; less expensive forms of building in the entertainment industry will also, apparently, henceforth be viewed by the licensing authorities with a jaundiced eye. Mr Gaitskell announced that "these particular restrictions and the general reduction in the level of civil investment will unfortunately have to be continued for some time." Apart from other scarcities, architects, engineers and other professional and technical staff are now urgently required for the planning of defence projects. It may be doubted whether the new "programme"—with its usual features of mild restrictions on the ebullience of favourite children and outright bans only on projects that are already licensed down to vanishing point—will set very many of these scarce experts free.

BEA's Open Diplomacy

It is an odd coincidence that on the very day that the Chancellor of the Exchequer announced that capital investment in the electricity supply industry would be "substantially higher" this year, the chairman of the British Electricity Authority made public an attack upon "certain people euphemistically described as planners" for endeavouring to limit BEA's building of power stations. Whatever else might be said about BEA's essay in open diplomacy, it was probably not mistimed. Both Lord Citrine and Sir Henry Self, the deputy chairman, who said much the same thing but more suavely, presumably had a clear idea of how much BEA would be allowed to spend on construction in 1951. They are not so worried about their share of investment in 1951 or even in 1952—except to defend it against the competing claims of rearmament and exports, over both of which, Sir Henry believes, the generating programme should take priority for materials. Their concern is with the rate of plant commissioning in 1955-56.

Since generating plant takes several years to manufacture and install the electricity supply industry has to prepare its commissioning programmes and place its orders some years in advance. This emphasis upon future plant installation, and the BEA's anxiety that the pace of development should not be slackened, explains the complaints about the Government's decision to limit new installations of generating capacity to 1,500,000 kW in any year. BEA's own hope is that by 1956 the commissioning of new plant should reach some 1,800,000 kW annually. At present, with about a million kW of new capacity a year coming into service, the gap between available capacity and peak load is still widening. Power cuts or voltage reductions were necessary twice as often last year as in 1949-50.

Characteristically, the chairman and deputy chairman of BEA expressed their dismay differently. Lord Citrine severely admonished all who offer "ludicrous" criticism. Sir Henry Self offered an elaborate statistical analysis of the electricity supply industry's place in the national economy, informative and only occasionally tempted into overstatement such as:

... in three years Britain's industrial production grew by 30 per cent. This was only achieved by increased use of electric power. ...

His final conclusion, that the competing claims of electric, gas, and solid fuel equipment demand a long-term national fuel policy, applies very directly to the allocation of capital resources for developing the separate fuel industries. Yet neither of these eminent spokesmen demonstrated that cuts in programmes or limits on new capacity had so far prevented the installation of a single kilowatt of generating capacity: as much plant is being installed as the manufacturers—particularly boiler makers—can supply. Official limitations may in future affect the placing of orders for generating plant; but it is doubtful whether this has happened yet. Although the capacity of the plant industries will be increasing in the

A word about deeds

"DEEDS NOT WORDS" is a good motto for business. Yet some words have great power to influence deeds.

The name of Laing stands for many fine structures—factories, power stations, steelworks, cement works, aerodromes and schools—completed efficiently and on time, and for a century-old tradition of team work and craftsmanship. The name sets a standard which the firm's employees are ambitious to live up to, and so it is a great begueter of deeds.

Furthermore it guarantees that same high standard of work for those who entrust their construction to John Laing and Son Ltd.

For speed and efficiency in building and civil engineering

Controls or Tariffs?

Though the BEA's ambition to match the growing demand for electricity by installing ever more plant has in no way abated, the authority has begun to think afresh about the extended interim period during which capacity will not meet peak demand—last week Lord Citrine feared this might persist for a decade. Since last autumn, when Lord Citrine was waving away suggestions that it might be possible to reduce peak load by means other than unselective power cuts, there seems to have been something of a minor revolution in BEA's thinking on this matter. Extensive studies have been made of various load control devices that might be centrally operated to limit the demand of some, but not all, consumers during peak periods. Despite the industry's traditional dislike of such methods, the authority is now contemplating the ordering of quantities of such control equipment without waiting for final conclusions from its trials, and has asked all Area Boards to set tests in motion.

Lord Citrine, as might be expected, emphasised the risk of embarking upon unproved measures of this kind. He added:

There is little doubt in my mind that we are coming nearer to the position where arbitrary action, enforceable by law, may have to be taken by the Government, to secure a substantial reduction in domestic, commercial, and possibly certain kinds of industrial consumption.

He shared, he said, the industry's repugnance to such "rough justice," inequitable between consumer and consumer.

It is true that the most difficult part of testing load control systems has so far been to induce consumers to accept a maximum figure above which they will not receive power during peak periods. Lord Citrine clearly wishes to place the responsibility for imposing such limits upon the Government: the industry's tradition is to encourage, not to discourage, the use of electricity at all times. The fact remains, however, that the growth of peak demand—and thus of arbitrary power cuts—is at least partly due to the fact that the industry's tariff policy has never been framed in ways that recognise the heavy cost of capacity to meet the top layer of peak demand and charge appropriately for it. Sir Henry Self doubts whether in present inflationary conditions control by price could be effective; and Lord Citrine agrees, "except possibly on long-term policy." Most of the questions about the BEA's investment policy, however, turn on the apparent contrast between the heavy cost of new installations and the encouragement to demand electricity at critical periods because it is on offer at an uneconomic price at those times. Only when it can be established that the utmost efforts are being made to improve the industry's load factor, whether by the "arbitrary" measures that BEA may accept or by the economic measures that it seems reluctant to contemplate, will it be possible properly to assess the right pace of expansion of electricity supply that the economy can afford.

German Debt Talks

The preliminary discussions on German debts opened in London at the beginning of this week. These discussions fall in two parts. The first, which has occupied the whole of this week, is an exclusively intra-creditor affair with representatives of the United Kingdom, French and the United States Governments, observers appointed by the Belgian, Dutch, Swedish and Swiss Governments, and, at certain sessions, representatives of the private British, French and American creditors of Germany. The object of the three

governments which called the meeting was defined by Sir George Rendel, the head of the British delegation and the chairman of the meeting, as being "to secure the working out of an international agreement on a governmental level which would provide for the eventual settlement of the problem of German debts and lay down the general lines along which debtors and creditors would be enabled to reach individual settlements." The second part of this series of preliminary discussions will open on July 5 when the talks will include representatives of the German Federal Government. The preliminary discussions are intended to prepare the ground for full negotiations which, it is hoped, will take place in the autumn of this year. When the German delegation arrives it is expected to bring with it detailed statistical material that should provide a clearer picture than has hitherto been available of the exact sums and claims involved.

Among the important points of principle that are being discussed are the questions of German ability to pay, of settlement of foreign currency claims in Deutschmarks, and of the problems that may arise from the discrepancy between the debtor's readiness to pay Deutschmarks and German ability to transfer these payments into foreign currencies. A number of intricate technical questions will also have to be considered, including German responsibility for Austrian debts following the Anschluss and the problems created by the attachment of a gold clause to a number of the loan contracts. Dominating the discussions are two contrasted but by no means irreconcilable principles. The first is that a satisfactory settlement of these German external debts is an essential condition of Germany's readmission to the normal channels of international credit and capital. The second is that the arrangements to be made will have to provide a reasonable assurance that Germany will be able to service her debts without running into a foreign exchange crisis. The lessons of the 1920's must not be ignored; but at the same time Germany must not be allowed to use these memories as a means of dodging obligations that can and must be honoured.

Agreement on Cinema Duty

Details of the amendments to Entertainments Duty agreed between the film trade and the Treasury—which were due to come before the Commons in the report stage of the Finance Bill as *The Economist* went to press—suggest that certain sections of the film exhibitors, at any rate, have fared better than had been expected. So far, only the bare scales of revised admission prices and duty payable have been issued, without any official estimate of the total proceeds these may bring to the participants in the bargain. It seems likely, however, that if the present pattern of attendance continues, cinema patrons may have to pay almost £12 million more a year at the box-office. Of this, nearly £2,000,000 would be passed—through the "Eady system" of "voluntary" levies upon exhibitors—back to film producers, in addition to the £1,500,000 that the present levy is intended to bring in annually. The exhibitors would retain about £3,500,000 from the increased proceeds—less than they hoped, but far more than the Treasury originally proposed. The Exchequer would collect the remainder—some £6,500,000—in Entertainment Duty.

One important result of the agreement is that the exhibitors' representatives accepted as a condition the continuance of the Eady levy at the increased rate for the next three years. This should guarantee the film producers £10½ million in addition to their ordinary film revenue during the period. The Government presumably expects that this special assistance—in conjunction possibly with a further loan to the National Film Finance Corporation—can in three years put British film production on its feet financially, and could then cease. It offers a significant increase in the revenue that producers are entitled to expect from any reasonably successful film: but certain exhibitors are already criticising the agree-

ment since it binds them to pay special contributions based on attendance, which might be maintained, and not box-office revenue, which might still go down if customers transferred into cheaper seats. If business does hold up, however, the new scale of seat prices, including duty, might help quite considerably the profits of those cinemas in which the bulk of seats now cost 1s. 10d., which include most owned by the larger circuits.

*

Ministry of Materials Debated

The debate in the House of Commons last Wednesday on the Ministry of Materials hardly came up to expectations. The Lord Privy Seal described the functions of his new department in more general terms than were set down in the White Paper published a fortnight ago, which was discussed in last week's issue. Mr Stokes stressed the need to have all the major raw materials under one control, particularly in view of the international negotiations now proceeding in Washington. Only two new developments were revealed; first, the Government's proposal to call a meeting later this year of representatives of Commonwealth Governments and of the Colonial Empire to consider problems connected with the procurement and supply of raw materials and manufactured goods, and, secondly, the responsibility of the new Ministry to explore Britain for raw materials.

The Opposition's debating attack was not finally convincing. It is true that the new Ministry could give rise to numerous interdepartmental squabbles, though not to half the number that would arise if the Minister, whose task was to ensure an adequate supply of raw materials for Britain, were denied the power of procurement—as was, indeed, suggested by the Opposition. It may be more important that Mr Stokes should be a good "trouble-shooter" than that he should be a good administrator, but that is not a final argument against setting up the new Ministry. But he might at least have been spared Mr Harold Wilson's bitter criticisms of United States policy; these would have carried more weight had Mr Wilson shown himself more alive to the dangers of raw material shortages when he was President of the Board of Trade. He claimed that the problem that the new Minister would have to deal with was the inability of the Americans to control their domestic consumption. How successful was he in restricting British consumption or in forecasting the trend of demand for, and prices of, primary commodities a year ago?

Some progress has been made towards mitigating the scarcity of raw materials. Eighteen new sulphuric acid plants using pyrites or anhydrite are already under construction or conversion; and in four years the present requirements of imported elemental sulphur will have been halved. Britain is to receive sufficient tungsten and molybdenum in the third quarter of this year to keep industry going, though less than it had asked for. Imports of iron ore will increase considerably next month and there should be a larger allocation of American cotton next season. This is welcome news. But the real pinch in supplies is likely to come next year and later. The Chancellor of the Exchequer's remarks that the new Ministry would make "a vital contribution to acquiring these raw materials and to price stabilisation generally," were at least comforting, but they have still to be proved in fact.

Government Accounting as Before

After a year of cogitation, the Government has announced its "substantial agreement" with the views of the Crick Committee on Government accounting (published as Cmd. 7969 in June, 1950) but has hastened to add that this agreement extends "in particular" to those of the committee's conclusions that advocated no change. In a written

ABRIDGED PARTICULARS.

SAMUEL HOLDEN OF BARROWFORD LIMITED

(Incorporated under the Companies Act, 1948.)

The Holding Company of SAMUEL HOLDEN LIMITED,
Cotton and Rayon Weavers

Authorised : CAPITAL Issued :
£630,000 in 2,520,000 Ordinary Shares of 5s. each £630,000
Neither the Company nor any of its subsidiaries has any
Mortgages, Debentures or Loan Capital outstanding.

The LIST OF APPLICATIONS WILL OPEN and CLOSE on
THURSDAY, 5th JULY, 1951, for an

OFFER FOR SALE OF
650,000 Ordinary Shares of 5s. each at 8s. per
Share

The following are extracts from a letter from Mrs. Beatrice Hindley, Chairman of the Company, which is printed in full in the Offer for Sale:—

1. The Operating Company is one of the largest British producers of high quality colour woven shirtings, and its dress and lining cloth trade is also well established. In the last financial year approximately two-thirds of the yardage produced was cotton and one-third rayon, nylon and mixture cloths. No difficulties are anticipated in the supply of cotton and there has to date been no cut in the overall supply of raw materials.
2. The whole production is sold to merchant converters for finishing and distribution. In terms of yardage about 50 per cent. of the shirtings and about 40 per cent. each of the dress goods and linings are ultimately exported.
3. In the opinion of the Board the current level of profits would fully justify the payment of dividends in excess of 11 per cent. per annum. The Directors, however, intend for the time being to limit dividends to that rate which it should be possible to maintain whilst at the same time making reasonable allocations to reserves.
4. Combined profits for the last three-and-a-half years averaged £440,995 per annum. After providing for Directors' remuneration on the new basis and deducting 10 per cent. Profits Tax there remains £389,513, which covers the 11 per cent. dividend with 40 per cent. Profits Tax thereon, together totalling £97,020, more than four times.
5. At the Offer price of 8s. per share the yield on the proposed 11 per cent. dividend is £6 7s. 6d. per cent. It is the Directors' intention to recommend the payment of a dividend of 5½ per cent. actual in respect of the period ending 1st December, 1951.

Copies of the full Offer for Sale, on the terms of which alone applications will be considered, and Forms of Application will be obtainable on Monday from:—

BANKERS:

LLOYDS BANK LIMITED, 39, Threadneedle Street, London, E.C.2, and Branches.
MARTINS BANK LIMITED, New Issue Department, 68, Lombard Street, London, E.C.3, and Branches.

BROKERS:

FIELDING SON & MACLEOD, 117, Old Broad Street, London, E.C.2, and The Stock Exchange, London.

J. W. NICHOLSON & SONS, Telephone Buildings, Sheffield, 1, and The Stock Exchange, Sheffield

and from

THE CHARTERHOUSE FINANCE CORPORATION
LIMITED

15, ST. SWITHIN'S LANE, LONDON, E.C.4.

Parliamentary answer last week Mr Jay announced that the Government accepted unreservedly nine of the Committee's thirty-two "summarised conclusions"; these nine turn out, however, to be the conclusions that supported the maintenance of Government accounts as a whole on a "cash" rather than on an "accruals" basis. On balance, a good case can be made out for this decision. Although accounting on an "accruals" basis would have the advantage of drawing a clear line between current and capital transactions, the accounts published by the Exchequer are a record of stewardship over funds voted—and votes are made in terms of cash.

The Crick Committee's other main recommendations were, first, that trading funds should be established, by legislation, for trading operations by the Ministry of Food and similar Government departments; and, secondly, that the output of Government statistics should be extended and improved. Mr Jay described the recommendation about trading funds as an "interesting proposal"—but, in view of certain "practical difficulties," returned it to the pigeon-hole for "further study." He announced that thirteen of the summarised recommendations for improvements in statistical returns would be put into effect "as opportunity offered"; these, however, were all minor recommendations that called for such reforms as the speedier publication of accounts and for methods of presentation that would minimise the analyst's present labour of chasing from one account to another. (Rather oddly, however, the National Debt Commissioners seem to have successfully held out even against reforms of this sort in their own particular field). But three of the committee's four major recommendations for improvement of statistical output—those calling for an annual statement of departmental assets and liabilities, for a similar statement of Government assets and liabilities as a whole (i.e., excluding inter-departmental items but including official holdings of securities and shares), and for a statement of telephone and telegraph charges incurred by individual departments—have met with a dusty Government answer. The Government has also sent back to the pigeon-hole again, "for further study," the Crick Committee's fourth major statistical recommendation—that for a quarterly consolidated statement of all the transactions of the Central Government and allied agencies (such as the national insurance fund). This last decision is perhaps the most disappointing feature of a stonewalling statement.

Report on Barcelona Traction

The tangled affairs of Barcelona Traction find much-needed clarification in the joint British, Canadian and Spanish Government statement that has been published this week. The company's prior lien sterling bonds fell into default in 1936 when the civil war broke out in Spain. They have remained in default ever since, but in 1945 the company propounded a Plan of Compromise that invited bondholders to agree to a substantial sacrifice of their claims. The Spanish Government, which would have had to find some £3,000,000 to implement this scheme, refused to give its consent, and from that moment controversy broke loose. The company alleged that the reason for the default was its inability to obtain the necessary foreign exchange from the Spanish Government; the latter retorted that the company would not supply the required evidence to support its application. In the upshot, the company in 1948 was declared bankrupt in Spain at the suit of certain bondholders and a subsequent inquiry into the affairs of the company by the committee formed by the prior lien bondholders resulted in a public statement by that committee which was critical of the conduct of the company's business.

The Spanish Government last year invited the British and Canadian Governments to appoint experts to investigate, with Spanish experts, the whole position of the

company. This joint body has completed its report and the three Governments, after examining the report, have now issued a joint Minute. This Minute finds that the Spanish Government was fully justified in refusing to authorise the transfer of foreign currency because of the failure of the company to produce the necessary supporting evidence. It also finds "in the light of the reports submitted by the experts and with the detailed knowledge of the activities of the group of companies furnished by these reports" that the decision of the Spanish Government was fully justified. It will be interesting to see how the company replies to this declaration.

But the renewal of controversy is less relevant than the possibility of settlement of the bondholders' claims. The Spanish Government, which has also published an official commentary on the Minute, is sensitive to the suggestions to which the affair has given rise "that Spain is a country which does not respect its foreign interests and does not comply with its international engagements." Accordingly, the Minute records official Spanish assurances that legitimate interests will always find the necessary protection within the framework of Spanish legislation. It is not quite clear what this assurance means in this particular instance, but since the bondholders' committee gives this statement particular emphasis, it may be permissible for bondholders to hope that a final solution can now be negotiated between the company and its creditors.

* * *

No Targets for Textiles

Although the textile industries have been asked to expand their exports this year, it is unlikely that the Board of Trade will at this late stage publish any proposed "targets" for 1951. Statements made in London about the need for still higher exports have already aroused resentment in Bradford and Lancashire, where local opinion feels that the textile industries are exporting to the limit. Discussions between the various sections of the industry and the Board of Trade about the projected level of exports for 1952—the first critical year of rearmament—have not yet started. When they do take place, these local views may be accepted.

Exports during the first five months of the year have shown a gratifying increase on those for the same period of 1950. Shipments of rayon piece goods, including knitted fabrics, have risen from 81 million to 103 million square yards; those of cotton cloth from 331 million to 386 million square yards; and woollen and worsted exports from 46 million to 55 million square yards. The size of the order books in all sections of the industry suggest that exports will continue at about these levels throughout the summer and autumn. Beyond that, everything depends on the rate at which new orders are forthcoming, and at present this is slow.

In the case of wool, the slackening in the rate of orders has been sharpest in North American markets; ceiling prices operate in the United States and credit restrictions in Canada. The reduced rate of rayon output will not begin to affect cloth production, and hence export deliveries, until the end of the year, but the demand for rayon is in any case not expected to continue at its present high level. Nearly a quarter of the total quantity of rayon cloth exported in the first five months of this year went to South Africa, where buying has been on such a scale since import restrictions were removed late last year that the Union is now believed to be considerably overstocked; a sharp fall in South African orders therefore seems inevitable. Over-buying on a smaller scale may also have taken place in other markets. The future trend of cotton exports, which have not expanded as sharply as might have been expected at the beginning of the year, appears more assured. Most firms have full order books, but the cloth that they are now producing is made from yarn bought when prices were at their

peak. Now that more plentiful supplies are predicted, and with them lower prices, there is no means of knowing whether buyers may not refuse to take delivery of such high-priced cloth. Such action would not be without its precedents in recent years. On the other hand, a fall in cotton prices might easily lead to the placing of orders that are at present being withheld.

The question of export targets for 1952 will therefore need to be approached with considerable caution. Over-buying almost certainly took place at the end of last year, when there was some degree of panic about future supplies. If the present slackness is a sign of the long-overdue reappearance of a buyers' market, then a return to normal seasonal buying should lead to a resumption of ordering round about September, when manufacturers will be in a position to quote more reasonable delivery dates than they can at present offer. Without such a recovery it may be difficult to maintain the level of textile exports in 1952.

* * *

Japan and the Wheat Agreement

Japan has at last been admitted to the international wheat agreement, and the arrival of its documents of ratification in Washington will end sporadic negotiations that have lasted well over eighteen months. Japan was first proposed for membership by the United States in the autumn of 1949 with an eye to increasing America's own export quota. Britain opposed this step on the grounds that Japan would compete for the limited supplies of sterling wheat. Under the wheat agreement, consuming countries are not tied to any particular exporter and Japan would be free to buy from Australia's export quota.

Britain's objections no longer obtain, first because of the less urgent need to conserve dollars, and secondly because Japan's guaranteed purchase has been scaled down from the 1,200,000 metric tons a year originally proposed to 500,000 tons. Australia's guaranteed annual sale is 2,177,000 tons. The American position has also changed. Since the American domestic price of wheat has been around \$2.40-\$2.50 a bushel, compared with the maximum under the agreement of US \$1.80, the Government has had to pay a subsidy on all wheat agreement sales. The inclusion of Japan as an additional buyer will entail a corresponding increase in the total export quota, and of this additional quantity the United States is likely to take the lion's share. The American Government has, nevertheless, continued to back Japan's application even though its acceptance involves increasing its total subsidy bill, which in 1950-51 amounted to well over \$150 million.

The United States regards this expenditure as the cost of maintaining high internal wheat prices. But the other exporting countries, which do not guarantee a minimum price to their producers, feel that their farmers are making too great a sacrifice in keeping to the maximum price under the agreement. Consequently they have proposed that the maximum limit should be raised. The international agreement has completed half of its four-year span of life and importers have probably gained more from it than have the exporters. But the scheme was intended to be an insurance policy for the exporting countries, for it guaranteed them a minimum price for each season easily capable of covering their costs of production. The premium that exporters paid for this insurance policy was to guarantee sales at a maximum price which, admittedly, has since proved to be on the low side though at the beginning of the agreement it looked likely to be rather high. A certain element of chance was part of the bargain. Under the terms of the agreement, the wheat council has power to alter the upper and lower price limits, though the proposal must first be passed by a two-thirds majority of both exporters and importers each voting separately. Britain holds 37 per cent of the importers' votes.

Record Bank Advances

In the three months to May, advances made by all members of the British Bankers' Association rose by £88 million, to a new peak of £1,895 million; this compares with an increase of £69 million in the same period twelve months ago. As a result, possibly, of the recent check to the rise in raw material prices, the textile and non-ferrous metal industries are shown to have slowed down their rate of bank borrowing and so have the "iron and steel and allied trades." Advances to the leather and rubber industries, however, continued to expand—by £5,500,000 to £23.1 million in the three months. Among the biggest individual increases in borrowing between March and May were those by public utilities (£22.2 million), retailers (£18.2 million), the food, drink and tobacco group (£16 million), agriculture and fishing (£6,500,000), and builders and contractors (£5,500,000); most of these groups customarily increase their borrowing at this season of the year. Advances to the "other financial" group—which includes advances to the two Finance Corporations, the I.C.F.C. and F.C.I.—continued their recent steady expansion, by another £7,000,000 to £201 million; "personal and professional" borrowing, however, declined in relative importance, from 23.8 to 22.8 per cent of total bank borrowing, while the proportion of bank advances going to the engineering industry also declined—rather surprisingly—from 5.5 to 5.3 per cent of the whole. The dominant impression left by the latest classification of advances is, in short, that those industries that tend to increase their borrowing from the banks in the spring did so this year more than usually sharply. Of the redistribution of the industrial effort consequent upon the defence programme, there is no evident sign.

* * *

New Mining Finance

The annual statement of Sir Ernest Oppenheimer to shareholders of Anglo-American Corporation contains the heartening suggestion that the major part of financing the Orange Free State goldfield is completed. This is tempered by the reminder that much remains to be done. Certainly Sir Ernest is well qualified to judge, for of the thirteen mines in the OFS area, seven are being developed under the aegis of Anglo-American. It is reckoned that over £65 million have been subscribed in various ways for the development of these new mines. It is rather odd that the richness of the OFS field should still be in doubt when it is expected that the first mines will start milling ore this year: this uncertainty arises because borehole cores taken from this area have often been friable and are therefore likely to give conservative ore values. Calculations of the possible output of gold from the OFS are equally reserved, and the extent of future development depends upon the profitability of mining gold. Working costs are still rising sharply, but sales of gold at premium prices have helped to offset the increase in costs; such sales now account for about one-seventh of the mining industry's net earnings, but they are uncertain, in that they tend to vary directly with the state of international tension. The mining industry as a whole would not be prudent to count on the continuance of such sales at the present level: the outcome of the International Money Fund's inquiry into sales of gold at premium prices is still awaited. As for a higher selling price for gold, there was an impression of hope long deferred in this week's meetings of the Transvaal Chamber of Mines, despite the suggestions that revaluation of gold throughout the world might eventually be inevitable.

Rising mining costs have been reflected for the past eighteen months in an uncertain trend in gold mining share prices. The justification for this caution is found in the admission that though Anglo-American's revenue from the Witwatersrand rose by £30.8 million in 1950, as compared with the previous year, no less than 36 per cent of that increase was absorbed by higher working costs. This is a

high proportion and it goes a long way to explain why the recent batch of Kaffir dividends was hardly calculated to hearten investors. Meanwhile, there is further evidence of ingenuity and enterprise in the arrangements for new loan finance of £2,500,000 to be provided by Anglo-American to Stilfontein, on the Far West Rand; this sum will be repayable, broadly speaking, in 1954 and 1955, and will finance Stilfontein to the production stage. Two new companies are to be formed to exploit the "Lucas Block" at the southern limit of the Stilfontein property, under the aegis of the Anglo-American and Strathmore groups.

* * *

Hongkong's Trade Controls

As Sir Hartley Shawcross foreshadowed in the House of Commons a week ago, the Government of Hongkong has imposed export and import licences on all goods covered by the British Government's order. A wide variety of commodities (some on the British list) were already under import and export control. For instance, tin, tinplate, coal, coke, lead, iron and steel, zinc and zinc manufactures, and rubber, all of which have strategic significance, were already subject to import licensing. In addition there was a fairly close control of exports, and certain items were already prohibited—including arms, ammunition and explosives, tinplates and black plates and various steel manufactures.

Control of imports and exports in Hongkong is not new and has been strengthened since the Korean war and especially since the Chinese participation. But the modest import and export licensing sections of the Department of Commerce and Industry will now have to be expanded. Since November last year an Essential Supplies Certificate has been required for all items for which foreign exporting governments have required assurance. The importer has to make an affidavit before a Justice of the Peace that the item is to be

used in Hongkong, and how long it is likely to last, to obtain a certificate; the manufacturer who wants the item also has to make a declaration. On arrival the goods are checked and inspectors can visit factories in the Colony to see whether the stated use is being made of any item. Exporters have to certify that goods under control are going to approved destinations; in the period between certification and shipment the goods are put in a special store. Thus, machinery exists for close and detailed control both of imports and exports. Its effectiveness remains to be proved; when an apparatus for trade control is suddenly expanded it is unlikely to work perfectly for a time at least.

Shorter Notes

In order to take the place of the Dollar Exports Board, which ceases from July 1st, a Dollar Exports Advisory Council has been set up which will take over the task of promoting increased trade between North America and the United Kingdom. The chairman of the advisory council will be Sir William Rootes, and there will be eight other members. An Executive Committee of the Council has been formed to set up relations with Canadian and American organisations. The new council will be a more informal arrangement than the board, but it should be able to give equivalent guidance, where required, to manufacturers.

*

The annual report and accounts of the British Phosphate Commission for the year ending June, 1950, have just been issued. Phosphate production during that year was a record, and after meeting demand for consumption reserve stocks were set aside. Shipments from Nauru were 1,009,266 tons, and from Ocean Island were 276,732 tons during the year.

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

The Barcelona Traction Prior Lien Bondholders' Committee has considered the text of the Minute signed in Madrid by the Minister of Industry and Commerce on behalf of the Spanish Government and by H.M. Ambassador on behalf of the British and Canadian Governments which text together with the Spanish Government's official commentary has been published in the London press.

In February, 1949, the Committee publicly stated that the affairs of Barcelona Traction and its Subsidiaries warranted a full and complete investigation and it is satisfactory to know that an investigation has at length been conducted under the highest auspices.

The inter-Governmental Minute and the Spanish Government's official commentary show:—

1. The reasons why the Spanish Government refused in 1946 to sanction the Plan of Compromise.
2. That the Spanish Government considers that the investigation discloses that irregularities have occurred.
3. That the Spanish Government has been fully justified in refusing foreign exchange.
4. That the Spanish Government has announced and the British and Canadian Governments have taken note that no remittances will be made until the position is regularised.
5. That the Spanish Government has taken no part in the Spanish bankruptcy proceedings.
6. That the Spanish Government confirms that legitimate interests will be protected.

The Committee considers that this announcement has done much to clarify the position and that therefore the Bondholders have reasonable grounds for expecting that a final solution can now be negotiated between the Company and its creditors. In view of certain comments which have been made in the press, the Committee stresses that the important question, whether in the light of all the facts Barcelona Traction was carrying on business in Spain and was subject to Spanish jurisdiction, is *sub judice* in legal proceedings both in Spain and in England.

26th June, 1951.

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

The Spanish Embassy has issued the following translation of the Note published by the Spanish Government at the conclusion of the meeting of the Council of Ministers held on 15th June, 1951, relating to the Minute (a translation of which is quoted verbatim below) concerning the affairs of Barcelona Traction signed in Madrid jointly by the British Ambassador and the Spanish Minister of Industry and Commerce:

The Minister of Industry and Commerce informed the Cabinet about the Minute concerning the affairs of Barcelona Traction signed on 11th June with the British Ambassador in the presence of representatives of the British Treasury and the Canadian Government, and summarised the following facts:

Barcelona Traction, Light & Power Company, Limited, the head of a group of Companies which, under the name "La Canadiense," owns important electrical undertakings in Spain and which since 1936 has suspended payment of interest on its sterling bonds, submitted to the Spanish Government in 1945 a "Plan of Compromise," whereby those bonds would have been totally cancelled with a loss to the bondholders representing approximately 50% of the amount owing to them. The purported justification of the Plan to the bondholders was the alleged conviction that the Spanish State would not in the future, because of shortage of foreign exchange, be able to make available the foreign exchange necessary for the normal satisfaction of the bonds.

At the same time nevertheless the Spanish Government was asked to make available a very important part of the sterling necessary for the carrying out of the Plan, it being represented to the Spanish Government that the operation was a means of finally cancelling debts which it was stated the Companies of the Barcelona Traction group operating in Spain had contracted abroad.

Position of the Government

The Government repeatedly and in conformity with the law made it a condition of making any foreign exchange available to the Group that it should first be supplied with full evidence of the origin and genuineness of the alleged debts; this requirement was not satisfied, but the Government compiled sufficient data and information to reject the proposed Plan on the ground that it was considered harmful to the national economy and exceedingly prejudicial to the foreign interests involved in a manner which affected the credit of our country and afforded a clue to certain unusual abnormalities which could not be approved.

A full and detailed explanation of the matter was given by the Minister of Industry and Commerce to the Spanish Cortes on 12th December, 1946, in connection with a question there raised.

The British Government also refused to approve the Plan because it had not been authorised in Spain and for other reasons, probably of the same character which had led to the Spanish refusal.

Both in the course of this operation, and after it had been rejected, an intense propaganda campaign was waged abroad, whose theme consisted in stating that the Company could not comply with its obligations because Spain was not in a position to allow the foreign exchange to which the Company was entitled.

In February, 1948, by due process of law and independently of any Governmental action, Barcelona Traction was declared bankrupt at the instance of bondholders.

The world campaign referred to above was then intensified in terms which merit no comment; it was repeated in the daily and financial press and in statements, speeches and the like, which were very widely publicised.

The Spanish Government was accused then, as always, of having caused the situation in which the Company was placed and of having brought about the bankruptcy by not allowing the foreign exchange to which it was said the Company was entitled; it was even insinuated that the Government was interested in the bankruptcy, whose results, it was suggested, would be beneficial to the Spanish economy at the cost of sacrificing legitimate foreign interests. The campaign by its virulence even impressed certain foreign governments which, no doubt misinformed, echoed it.

Spanish Invitation

The Spanish Government, which, because of the very character of the campaign, thought it should not be fought on the same plane, limited itself to making available officially the data and facts at its disposal, which demonstrated the justice of its position; in view of the pertinacity of the campaign the Spanish Government invited the Governments of Great Britain (the country in which the greater part of the bonds were held) and of Canada (the country in which the Company was registered) to appoint experts, who, together with Spanish experts, should investigate and verify the truth of the situation and of the facts known to the Spanish Government.

The invitation was accepted, the international Commission was appointed and it recently finished its work.

Vindication of the Spanish Government's Standpoint

After the Reports prepared by the Commission had been made known and examined a meeting was held in Madrid as a result of which the Minute referred to above was signed by the Minister of Industry and Commerce and by the British Ambassador.

In the Minute the position adopted by the Spanish Government is unanimously recognised as completely justified; it finds, too, that the campaign referred to was ill-founded because it recognises that the action of the Spanish Administration in refusing to allow the transfer of the foreign exchange asked for by the Companies of the Barcelona Traction Group was fully justified. Apart from this main aspect, the Reports of the experts throw into relief irregularities of all kinds in the behaviour of the Companies, which it is not necessary to specify on this occasion.

There is this last aspect of the question to consider. It has given rise to suggestions abroad that Spain is a country which does not respect foreign interests and does not comply with its international engagements in such matters.

The reality, which is proved by documents, is that the behaviour in Spain of the "Canadiense" has violated universally recognised codes of international economic relationship as they have been recently defined by important international bodies.

Spain now, as always, knows how to honour its foreign engagements and recognises once again the advantage which results from foreign investments, which will always receive the rewards, the treatment and the attention which they deserve, provided they are used in the way which is recognised as normal throughout the world.

MINUTE

At a meeting in Madrid on 11th June, 1951, between on the one part the Minister of Industry and Commerce, representing the Spanish Government, and on the other His Britannic Majesty's Ambassador and Messrs. Henry H. Eggers, of His Britannic Majesty's Treasury, and E. A. Coté, the Delegate of the Canadian Government, representing their respective Governments, to deal with the matter of the "BARCELONA TRACTION, LIGHT & POWER COMPANY, LTD., and its subsidiary companies," the undermentioned statement was made, by common agreement, after examination of the reports prepared by the Spanish, British and Canadian members of the Commission of Experts appointed to investigate the activities of the said Group:

1. That the Experts have unanimously agreed that RIEGOS Y FUERZA DEL EBRO S.A., the head of the Barcelona Traction group of subsidiary companies in Spain has not made available the information called for on various occasions to justify the origin, destination and basis of the financial obligations claimed to be the ground of their applications, and the British and Canadian Governments consider that in such circumstances the attitude of the Spanish Administration during recent years in not authorising the transfers of foreign currency applied for is fully justified.

2. That, in the light of the reports submitted by the Experts and with the detailed knowledge of the activities of the group of Companies furnished by these reports, the decision of the Spanish Government to declare the applications in question ineligible, has now been fully justified, thus confirming the correctness of the decision previously taken when authorisation for the transfers of foreign currency was refused. Moreover, the British and Canadian representatives have taken note of the Spanish Government's decision for the same reasons, not to authorise future transfers of foreign currency abroad in favour of the said Companies until such time as the position of the Companies vis-à-vis Spain has been regularised.

3. That the British and Canadian representatives have been informed of the statement made by the Spanish Minister of Industry and Commerce to the effect that, as a result of irregularities of all kinds as regards the Spanish economy and law noted in the conduct of this group of Companies, appropriate proceedings will be instituted to determine, and if necessary to enforce, whatever liabilities may arise therefrom.

4. That, without prejudice to all the foregoing, the Spanish Minister of Industry and Commerce, in response to the wishes expressed by the British and Canadian representatives—which he also shares—on behalf of the legitimate interests which may be affected by the conduct and by the position of the Company, gives his assurance that they will always find the necessary protection within the framework of Spanish legislation; nevertheless, he again repeats the statements made by the Spanish Government on various occasions concerning the absolute independence of the Spanish judiciary and the fact that the Spanish Government considers inadmissible any intervention in questions within the legal framework which may arise between private parties or interests.

The Spanish Minister of Industry and Commerce

Signed: JUAN ANTONIO SUANCES.

His Britannic Majesty's Ambassador

Signed: JOHN BALFOUR.

Company Notes

Boots Pure Drug.—Record sales at home and abroad and a record number of prescriptions dispensed contributed to the improvement in Boots' trading profits from £3,147,761 to £3,785,738, although it is clear that some part of this 20 per cent increase came from the manufacturing side of the business. Higher prices no doubt played their part in these results, but Boots did, in fact, sell a greater volume of goods. Dispensing is perhaps the backbone of the company's retail activities, and the chairman comments that if a considerable sum of money had not been spent in enlarging a number of dispensaries "it is difficult to see how the business could have been dealt with"; the least satisfactory aspect of this side of the business is the delay in re-embursing the company for National Health prescriptions; at the end of the financial year some £1,700,000 was owed to Boots from Health Service funds. An ordinary dividend of 40 per cent is to be paid on £1,920,000 capital, against an interim of 20 per cent on £1,600,000 capital and a final of 20 per cent on the increased capital of £1,920,000 in 1949. The 100 per cent scrip bonus, by the capitalisation of £1,920,000 from the share premium account of £2,080,836, puts the company's capital structure on a more realistic footing, for the parent company's reserves stand at £6,559,564 and subsidiaries' reserves amount to £3,179,499.

	Years to March 31, 1950	1951
Consolidated Earnings:—		
Trading profit	3,147,761	3,785,738
Total income	3,148,558	3,840,977
Depreciation	434,408	508,429
Taxation	1,050,498	1,361,199
Group Earnings for Ordinary Stock	699,573	973,350
Ordinary dividends	387,200	412,800
Ordinary dividends (per cent.) ..	40	40
Retained by subsidiaries	276,512	368,808
Added to general reserves and carry forward	6,221	248,142
Parent Co. Bal. Sheet Analysis:—		
Fixed assets, less depreciation ..	6,604,949	7,307,372
Net current assets	2,135,321	2,822,038
Stocks	5,034,520	5,983,374
Reserves	5,514,712	6,559,564
Ordinary capital	1,760,000	1,920,000

5s. ordinary stock at 57s. yields £3 10s. per cent.

The substantial increase in stocks held by the group is to ensure "continuity in manufacturing processes"; the parent company's stocks have risen from £5,034,520 to £5,983,374 and those of the subsidiaries have increased from £5,451,069 to £5,803,291. One encouraging pointer for the future is the expansion of export sales by 20 per cent. With 1,297 shops in Britain—21 new branches were opened in the latest year—the group's earnings must come substantially from the domestic retail trade. After the CIC had consented to the scrip bonus, Boots' ordinary advanced against the prevailing trend of falling prices to the year's highest bid of 58s. 6d.; a yield of 3½ per cent at the current price of 57s. suggests that shareholders are hoping for something more than a 20 per cent dividend on the doubled capital.

Fine Spinners.—Peak postwar levels of output, both in the spinning and weaving sections of the cotton industry, were achieved in 1950; even in these circumstances, however, the jump in Fine Spinners' trading profits from £2,943,197 to £4,865,184 can only be described as remarkable. Greater earnings from the company's considerable interests overseas may perhaps be the key to this achievement. Textile shares have been active in the recent boom in equities, and the raising of Fine Spinners' ordinary dividend from 8 to 12½ per cent helped to give the advance a further fillip. Increased commitments in stocks, which have risen from £6,583,750 to £7,356,199, and in debtors, which are up from £1,923,382 to £2,771,279, reflect higher trading and

prices. Retentions of profits of some £1,200,000 by the group have strengthened its liquid resources; cash has more than doubled from £808,297 to £1,664,003 and a further £1,000,000 is held in tax reserve certificates.

	Years to March 31, 1950	1951
Consolidated Earnings:—		
Trading profit	2,943,197	4,865,184
Total income	2,967,448	4,879,418
Depreciation, etc.	667,164	714,721
Taxation	1,090,335	2,400,657
Group Earnings for Ordinary Stock	862,363	1,501,314
Ordinary dividends	245,959	366,842
Ordinary dividends (per cent.) ..	12½	12½
Retained by subsidiaries	372,701	608,930
Added to general reserves and carry forward	253,480	615,542
Cons. Balance Sheet Analysis:—		
Fixed assets, less depreciation ..	12,637,694	12,798,800
Net current assets	6,253,679	7,589,602
Stocks	6,583,750	7,356,199
Cash	808,297	1,664,003
Reserves	8,008,789	9,289,745
Ordinary capital	5,589,979	5,589,979

£1 ordinary stock at 34s. 4½d. x½ yields £1 6s. per cent.

Dogmatism about the immediate prospects in the cotton industry might be unwise. The cut in sulphur supplies, for example, may raise difficulties for these companies, of which Fine Spinners is one, which produce rayon yarn, and some concerns have been conscious of a slight slackening in demand in the last few weeks. But if the industry fulfils the expectations that the Government has formed about its export tasks, Fine Spinners will play an important part in their achievement.

Pye.—The latest accounts indicate an appreciable expansion in business, and trading profits have risen from £494,693 to £666,107. A dividend of 18 per cent is to be paid on £432,133 deferred ordinary capital as doubled by the hundred per cent scrip bonus in January; in the previous year a dividend of 35 per cent was paid on the original capital of £216,066. Increased turnover and higher prices are reflected in the rise in stocks from £1,094,807 to £1,940,693, in debtors from £962,290 to £1,374,366, and in hire purchase debts from £71,358 to £240,094. Further investment in fixed and working capital has imposed some strain on the company's resources, for despite the new issue of £750,000 5 per cent preference stock in the year, cash has fallen from £347,422 to £234,932, and bank overdrafts have risen substantially from £36,936 to £108,752.

	Years to March 31st 1950	1951
Consolidated Earnings:—		
Trading profit	494,693	666,107
Total income	503,152	695,829
Depreciation	34,599	56,641
Taxation	229,069	353,887
Group Earnings for Ordinary Stock	130,990	180,090
Ordinary dividends (a)	41,593	40,837
Ordinary dividends (per cent.) ..	35	18
Retained by subsidiaries	41,422	69,732
Added to dividend reserve and carry forward	65,918	59,331
Cons. Balance Sheet Analysis:—		
Fixed assets, less depreciation ..	406,803	560,065
Net current assets	1,267,939	2,114,738
Stocks	1,094,807	1,940,693
Cash	347,422	234,932
Reserves	1,419,236	1,518,706
Deferred ordinary capital	216,066	432,133

(a) Paid from dividend reserve: 1949, £11,884; 1950, £12,478. 5s. deferred stock at 22s. 6d. yields 4½ per cent.

When the purchase tax on radio and television sets was doubled, there was an immediate rush to buy sets taken into stocks at pre-budget prices; these stocks are now practically exhausted and sales have fallen. Presumably, while the 66½ per cent purchase tax is in force, demand will remain at a lower level, but defence orders for radio and radar components will eventually make good the loss of domestic orders. Whether this substitution of defence output for civilian output will proceed quickly enough for the industry's satisfaction is a matter discussed in an earlier article.

EXCHEQUER RETURNS

For the week ended June 23, 1951, total ordinary revenue was £40,887,000, against ordinary expenditure of £56,620,000 and issues to sinking funds £290,000. Thus, including sinking fund allocations of £2,610,000 the surplus accrued since April 1, 1951, is £4,841,000 compared with a surplus of £28,216,000 for the corresponding period of the previous year.

OTTOMAN BANK

WIDESPREAD BUSINESS RELATIONS

LORD LATYMER'S REVIEW

The eighty-fourth annual general meeting of Ottoman Bank was held on June 20th in London, the Right Hon. Lord Latymer (the chairman) presiding.

The chairman, in the course of his speech, said:—

When we met last year I was able to tell you that we had signed a new agreement with the Turkish Government and I then hoped that that agreement would shortly be ratified by the Grand National Assembly of Turkey.

However, the signature of that agreement was followed almost immediately by a General Election in Turkey, which resulted in a change of Government. The new Government has been fully occupied in the intervening year with many urgent tasks; consequently our new agreement has not been placed before the National Assembly for ratification.

We are, of course, anxious not to add to the preoccupations of the Government, and in the circumstances have naturally contented ourselves with seeing that the Ministers concerned are fully aware of the position.

TURKEY

Industrial production is still insufficient for the country's needs. The Government, while maintaining the existing state enterprises, is now doing everything in its power to encourage private development. With this object, the Industrial and Development Bank of Turkey has been formed, with the support of the International Bank for Reconstruction and Development, and will play an important part in assisting new industries.

With many natural resources and with a people of proved courage and tenacity, Turkey will certainly continue to progress.

EGYPT: Our branches were most active, and the tension in the cotton market naturally increased the responsibilities of our management and the work of our staff.

SUDAN: It is scarcely more than two years since we extended our activities to the Sudan, where we now have a satisfactory business.

ISRAEL: Our overhead expenses in Israel are increasingly heavy but our branches were able to hold their own and maintain their services.

JORDAN

In May, 1950, our new and enlarged premises in Amman were opened by H.M. King Abdullah.

Further developments, either in hand or planned, include an oil refinery, a cement works, and important improvements to the Red Sea port of Akaba.

Our branches continued to play an important part in the commercial life of the country, to enjoy a satisfactory share of its banking business, and to assist a number of municipalities with their improvement and development schemes. It was not an easy year, but it was a busy and encouraging one.

IRAQ: It was an eventful year for Iraq with considerable impact upon the economic life of the country.

The Lake Habbaniyah Scheme, where the Dhibban Channel to the Euphrates is already functioning, and the Wadi Tharthar (Tigris) Scheme, for which the International Bank for Reconstruction and Development accorded a £12,800,000 loan, should not only reduce flood risk but should increase, and even double

the area under cultivation. It is difficult to understand that the year and in debt, at difficulties for our branches, to £2,771,271

CYPRUS

For Cyprus the year 1950 was, in the main, a peaceful and a prosperous one. Trade was steady and the Government was able to make considerable headway with its programme for irrigation and water-supply, for power generation and for improved public health.

It was an encouraging year for your Bank. Competition is keen but an active policy has been pursued.

MOROCCO: There was a remarkable increase of business in Morocco in 1950 in which your branch took its full share, achieving a satisfactory level of deposits and attracting a clientèle of importers and exporters, many with business contacts in countries where the bank is already established. This promises well for the future.

THE LEBANON

The year 1950 saw marked economic development in the Lebanon, from the point of view both of transit trade and of arbitrage. Beyrouth has become the centre of substantial dealings in gold and foreign exchange.

SYRIA: In Syria, an outstanding factor has been the remarkable increase in the cotton harvest, compared with previous years. The crop amounted to over 35,000 tons of ginned cotton. This satisfactory result has led to increased planting, and estimates for the 1951 campaign exceed 100,000 tons.

LONDON AND PARIS: Our Paris and London offices have made every effort to facilitate and develop business with Turkey, with the Middle East, and with the other countries within our sphere.

BALANCE SHEET

May I now turn to the balance sheet before you. The total shows an increase of £11 million over the previous year, and has reached a record figure of £77 million. On the liabilities side this increase is reflected almost entirely in the item "Current deposit, and other accounts," and is due to a general expansion of business which is well spread over the countries in which we operate.

Our assets show a liquid position with "Cash" and "Money at call," together up by nearly £5,000,000. Investments, which consist mainly of short-dated British Government securities, are down by £3,000,000, whilst employments in "Bills receivable" and "Advances to customers" have increased by more than £8,000,000.

The profit and loss account shows a result for the year of £320,474, as compared with £175,307 in 1949. Adding the remittances of profit of previous years of £151,559 and the balance brought forward from 1949, there is a total available of £510,886.

From this amount, as you will notice from the accounts before you, we have increased the appropriation to "Reserve for contingencies" to £250,000. Your general committee have thought this step desirable as part of a considered policy of building up the reserves of the bank. In these inflationary and uncertain days, and particularly for your bank, which operates in so many different countries, such a policy is considered to be essential.

The balance remaining therefore on profit and loss account is £260,886, and the committee propose that a dividend of 8s. per share be paid this year, absorbing £200,000 and leaving £60,886 to be carried forward into 1951.

The report was adopted.

BRITISH BANK OF IRAN AND THE MIDDLE EAST

INCREASED NET PROFIT

The sixty-second ordinary general meeting of the British Bank of Iran and the Middle East will be held on July 18th in London.

The following is an extract from the statement by the chairman, The Rt. Hon. Lord Kennet of the Dene, P.C., G.B.E., D.S.O., D.S.C., circulated with the report and accounts for the year ended March 20, 1951:

With an increase in our net profit, we have no reason to be dissatisfied with our business for the year. The increased total, of £108,089, is after providing for all taxation due, but the increased rate of tax on distributed profits has been paid on a portion only of our profits for the year. This year, as last year, no profits have been earned in Iran. Its increase has been due to our increased business at those other branches. Our business in Iran has about paid its way, no more.

Our deposits have increased by £6,600,000 to £33,600,000, a peak in our history. That is an increase of 25 per cent. over last year. Our deposits in Iran have declined. The increase in their total elsewhere is not confined to any one branch; it has been well spread. That is satisfactory evidence of the demand for the services which we supply with our expanding organisation. The increase, for instance, of over £5,000,000 in credits and guarantees on behalf of our customers, which is more than double the amount outstanding a year ago, is good evidence of the need for such services in financing the foreign trade of the Middle East.

Our investments are up £2,000,000 and the increase in bills discounted and advances of £3,500,000 is largely the concomitant of our increased business in opening the documentary credits already mentioned. Our fixed assets show an increase of £25,000 which represents a part of our capital expenditure on premises during the year. Our policy of carrying our overseas properties at a token figure is unchanged.

The increases to which I have referred in the figures of our balance sheet are not, it will be understood, wholly the result of increased activity in our business. World-wide inflation with us, as with others, contributes to the increase.

TRADING CONDITIONS

A year ago I referred to the heavy burdens laid upon a foreign bank in Iran by the decree of March, 1949. We trust that, before long, by further legislation, the position may be so modified as to enable a foreign bank to contemplate the initiation or continuance of business in Iran without dubiety.

In Iraq our branches have had a satisfactory year and the country continues to make economic progress. The prosperity of Kuwait continues to grow, and this and the varied nature of its mercantile activities illustrate the utility to the community of the services which we provide there. At Muscat and Dubai our branches are engaged upon regular commercial business, in a manner which establishes the need of those communities for banking services. In Saudi Arabia we have two branches. In Syria we have opened a branch at Aleppo. Our branch at Amman, the capital of Jordan, is proving its utility.

In the Republic of Lebanon our branches at Beirut and Tripoli continue to prosper. There are in that country fewer trading and exchange restrictions than in most parts of the world today. It is relatively free from labour difficulties and, thanks to the enterprise and energy of its traders, it enjoys a prosperity largely due to its entrepôt trade.

In the Middle East as a whole standards of living, assisted by oil royalties, are rising, and may be expected to continue to rise.
