A discussion of social phenomena which is based on very extensive reading in psychology.

Economic and Financial Results on Three Arable-Sheep Farms. By Edgar Thomas and C. H. Blagburn. (Reading) University of Reading.

A piece of scientific costing which should prove a useful contribution to agricultural knowledge.

Prospettive Economiche: Carbone. By Professor Giorgio Mortara. (Milan) Opera Edita Sotto Gli Auspici della Università Bocconi.

A survey, in Italian, of the production, trade, and future market prospects of coal.

The Workers' Case Against Socialism. By George W. Gough. (London) Economic League, 2 Millbank House, Wood street, Westminster. 6d.

The mouthpiece of the workers, in this diminutive pamphlet, is a Balliol man. He discusses the presumable effect, on the daily life of the factory worker, of the introduction of a Socialistic system.

Le Centre Européen de la Division des Relations Internationales et de l'Education. (Paris) Centre Européen de la Dotation Carnegie, 173 Boulevard Saint-Germain.

An illustrated account of the work of one of the most interesting of the Carnegie foundations. There are reprinted also two papers on "La vie et l'œuvre d'Andrew Carnegie," by Elihu Root, and "Le développement de l'Esprit International," by Dr Nicholas Murray Butler.

The Problem of Australian Coal. By F. R. E. Mauldon. (Melbourne) University Press.

A reprint from the *Economic Record*.

Das Internationale Uebereinkommen über den Eisenbahnfrachtverkehr I.U.G. By Professor Dr Ludwig Strauss. (Vienna and Leipzig Kommissionsverlag der Sallmayr'schen Buchhandlung.

A concise history in German of the International Railway Goods Traffic Agreement.

Report of the Superintendent of Insurance of the Dominion of Canada for the year ended December 31, 1927. Vol. 1. Insurance Companies Other than Life. (Ottawa) Department of Insurance.

This volume contains detailed and complete statistics of the classes of insurance companies covered.

International Shipping Conference, 1928. (London) 28 St Mary Axe, E.C. 3.

Contains a full account of the proceedings at the Conference held in June, 1928, together with reprints of the memoranda by Scandinavian and Japanese shipowners respectively.

The Mining Journal. Annual Review Number. (London) Mining Journal, 15 George street, Mansion House. 8d.

This interesting number contains a large number of articles by experts, on the various minerals, their problems and their future.

Contabilidad y Finanzas. Enero, 1929. (Habana, Cuba) Empresa Editora "Contabilidad y Finanzas," Apartado 2,552.

This number includes an article on railway finance.

The Stock Exchange.

THE PRICE OF NEW CAPITAL.

THE price of new capital is a matter of prime importance to every Government, municipality, and company desirous of raising money in London, as well as to the investor in "gilt-edged" and a wide range of fixed-interest stocks. For some years past, numerous economists have prophesied a gradual decline in the general rate of interest and, consequently, in the yield obtainable on such securities. How far is this expectation being borne out by events? In order to provide an approximate answer to this crucial question, we propose in the following paragraphs to supplement the figures given in an earlier article (see the *Economist*, December 29, 1928), showing the total and geographical destination of the new issues of capital in London last year, by an analysis of the average yield offered to the investor by borrowers of various classes.

Our first table shows the total public issues of new capital in London in 1913 and the past four years, with the form in which the money was borrowed :—

PUBLIC ISSUES of NEW CAPITAL in LONDON.

	Year 1913.	Year 1925.	Year 1926.	Year 1927.	Year 1928.
	£	£	£	£	£
Debentures, bonds, &c.	139,920,400	137,640,200	145,180,000	228,958,000	212,817,900
Preference stocks and shares	22,955,600	42,802,400	39,393,200	36,836,600	45,062,600
Ordinary stocks and shares	33,661,300	51,771,900	46,209,400	89,371,400	111,177,600
Total	196,537,300	232,214,500	230,782,600	355,166,000	369,058,100

The drop of £16 millions in the total debentures, bonds, &c., offered last year, as compared with 1927, is the resultant of an increase of £18 millions in British Government borrowing, and a decline of £34 millions as regards other borrowers. The total raised in the form of ordinary stocks in 1928 was 24 per cent. higher than in 1927 and 115 per cent. higher than in 1925—a reflection of the activity in the market for industrial company shares, which is the more noteworthy as the fashionable form of capitalisation tended to fix a low denomination on ordinary shares, many of which rose to a substantial premium on the opening of Stock Exchange dealings.

Our next table shows how 29 different categories of borrowers contributed to the various classes of securities issued on the London market :—

NATURE of CAPITAL OFFERED on the LONDON MONEY MARKET.

	1927.	1928.			
	Total.	Ordinary Stocks or Shares.	Pref'r'nce Stocks or Shares.	Debentrs, Bonds, &c.	Total.

Elec. light, power, & telegraph	12,764,700	4,370,200	650,000	10,159,000	15,179,200
Tramway and omnibus	356,000	678,200	200,000	503,500	1,381,700
Motor traction and manufacturing	1,609,200	3,773,600	850,000	..	4,623,600
Gas and water	448,900	219,400	58,300	1,110,300	1,388,000
Hotels, theatres, &c.	4,248,600	4,557,600	5,150,800	4,942,300	14,650,700
Patents & proprietary articles	1,410,000	5,232,800	2,610,000	740,000	8,582,800
Docks, harbours, and shipping	14,765,500	830,000	20,000	2,050,000	2,900,000
Banks and insurance	13,072,500	6,123,400	..	3,281,200	9,404,600
Manuf'cturing & miscellaneous	34,438,100	37,121,300	20,784,500	4,596,300	62,502,700
Total	355,166,000	111,177,800	45,062,600	212,817,900	369,058,100

The main features of the table were discussed in an earlier article, some of the most noteworthy being the increases shown under such categories as "exploration, financial, &c." (which includes about £30 millions raised by investment trusts), "motor traction and manufacturing," "hotels, theatres, &c.," "patents and proprietary articles," and, particularly, the miscellaneous manufacturing group.

We proceed next to show the average rates of interest offered on new borrowings in 1928, and the comparable rates in the last full pre-war year and in 1927. In the tables which follow all rates of interest are shown "subject to tax," the rates on "free of tax" securities having been adjusted in order to provide a comparable figure. Profit on redemption is allowed for where necessary :—

† Includes all borrowing at over 6 %. (a) This total of £52,437,000 includes £26,296,000 by Colonial Governments, at an average yield of 4·15 %, and £26,158,000 by Foreign Governments, at an average yield of 5·31%. The British Government was not in the market.

Our totals of British Government borrowings do not include floating debt operations, the 1928 figure representing the cash subscription of 5 per cent. Treasury bonds at the beginning of the year, *less* £1,200,000 encashments of National Savings Certificates. Foreign Governments, on the average, borrowed on ½ per cent. better terms in 1928 than in 1927, though the drop reflected, in part, a change in the *nature* and standing of the Governments responsible for the larger issues. It will be seen that a "gap" of only 0.2 per cent. separated the average British and the average "Empire" rate of interest, but foreign governments as a whole paid 1.74 per cent. more than Imperial borrowers—a measure, in part, of the benefit accruing to the latter by virtue of their trustee status under the Colonial Stock Act. Turning next to municipal and railway borrowing, the following table shows the average rates paid in the past three years :—

	Amount Borrowed in Years			Average Yield.		
	1926.	1927.	1928.	1926.	1927.	1928.
	£	£	£	%	%	%
British Municipalities	41,833,900	27,114,400	14,871,000	5·02	4·96	4·75
Colonial Municipalities	1,223,000	5,136,700	7,296,100	5·25	5·27	5·25
Foreign Municipalities	6,235,000	5,683,800	4,332,000	6·93	6·68	6·61
British Railways	nil	14,207,500	2,080,900	..	5·27	5·21
Colonial Railways	nil	4,671,800§	nil	..	6·42	..
Foreign Railways	7,072,950†	2,487,500	3,070,000	6·09	5·95	6·34

† Excluding £1,144,250 Trade Facilities issue of African Railway Finance 5 per cent. stock at 99½, which yielded at issue price £5 1s 0d per cent.
§ Excluding £2,170,800 Trade Facilities issue of Gedaref Railway and Development 5 per cent. Debs., at 100½, which yielded at issue price £4 19s 3d.

Municipal borrowings were on a smaller scale, and were carried out at a slightly lower rate than in 1927, comparison of this with the preceding table revealing the close similarity existing between the "credit rating" of Governments and municipalities in the three main groups. Railway issues were of small amount and undistinguished character. Industrial borrowers obtained more advantageous terms, on the average, in 1928 than in any recent year :—

INDUSTRIAL and COMMERCIAL BONDS, DEBENTURES, &c.
(Excluding issues guaranteed by British Government under Trade Facilities Act).

Average yields	5·5%	6·43%	6·48%	6·21%	5·75%

† Includes all capital yielding over 6 per cent.

The downward movement in debenture yields has been continuous for some years past, apart from the period of the coal stoppage in 1926, and has now brought the average figure close to the level of 1913. As in the previous year, the largest amount of borrowing fell into the 5 to 5½ per cent. interest group. Industrial issues under the Trade Facilities Act have now largely petered out, the only emission of this nature last year being the Hungarian Trans-Danubian Electrical issue of 4½ per cent. "A" debenture stock at 97.

In contradistinction to the year's tendency as regards debenture and bond yields, the rate offered on preference stocks showed an appreciable rise, due, in part, to the large number of issues of a more or less speculative type offering high-yielding preference in conjunction with deferred shares of much smaller denomination. Our computations show the following averages over a number of past years :—

PREFERENCE STOCKS and SHARES.

	%		%		%
1913	5·74	1922	7·17	1926	6·7
		1923	6·59	1927	6·67
1920	8·09	1924	6·27	1928	7·37
1921	8·39	1925	6·1		

The above figures do not take account of any participating rights attaching to particular preference shares after payment of a specified ordinary dividend, since there is obviously no means of calculating the amounts these shares may eventually receive.

Our final table gives the average Bank rate, the average three months' bill rate, and the rates paid on all Government borrowings and on industrial debentures in 1913, 1920, and in subsequent years :—

	Average Bank Rate. %	Average 3 Months' Bill Rate. %	Average Rate Paid by all Government Borrowers. %	Average Rate on Issues of Industrial Debentures. %
	£ s d	£ s d		
1913	4 15 5	4 7 5	4·77	5·5
1920	6 16 4	6 7 11	6·05	7·92
1921	6 2 4	5 4 3	6·49	8·09
1922	3 13 10	2 13 0	5·65	6·72
1923	3 9 9	2 14 1	5·34	6·4
1924	4 0 0	3 10 9	5·95	6·61
1925	4 11 0	4 2 0	4·82	6·43
1926	5 0 0	4 10 3	6·01	6·48
1927	4 13 0	4 4 10	5·09	6·21
1928	4 10 0	4 3 0	5·09	5·75

The broad conclusions suggested by this survey may be briefly summarised. The average rate of interest payable in the London capital market has fallen steadily, though not uninterruptedly, from the high level prevailing after the war, and is now little more than in 1913. The rate on British Government stocks, however, has declined much less rapidly than that payable by other borrowers of investment status—a significant feature from many points of view, not least that of the British taxpayer. On the basis of last year's figures, British Government and municipal borrowers were able to borrow on the cheapest terms, Colonial Governments paying an extra ¼ per cent., Colonial municipalities ½ per cent., industrial borrowers ¾ per cent., Foreign Governments and municipalities nearly 2 per cent., and sellers of preference shares 2½ per cent. more than this "datum" level. The preference share appears to be losing popularity with the investor, to whom an increasing yield is being offered year by year. There is no evidence that the "price" at which this type of security can be floated is likely to return to the 1913 level in the near future.

"TIPS" AND THE INVESTOR.—I.

A BY-PRODUCT of the present phase of Stock Exchange activity, accompanied, as it has been, by increased public interest in all matters pertaining to the security markets, has been the daily appearance in many popular Press organs of a column devoted to the "tipping" of particular stocks and shares, for speculation or investment, or both. The significance of this departure lies not in its novelty, for the institution of "tipping" is older than the Stock Exchange itself, but in the widespread extension of its scope as a result of the employment of modern "nation-wide" publicity methods, and the systematic fashion in which its possibilities have been exploited, and its technique perfected by the employment of whole-time experts, responsible for singling out particular stocks and shares, and duly recommending them in the appropriate newspaper columns. We have earlier seen fit to criticise the practice on general grounds, but it would now seem to be necessary to go somewhat farther and ask what, in fact, are the results likely to follow a conscientious adoption of the advice thus gratuitously offered.

Unfortunately, no tables are published of the relative proportions of "winning" and "losing" tips, such as are regularly compiled to measure the prophetic prowess of the "experts" in another part of each day's paper. This omission appears to us particularly regrettable, since the eating is, after all, the pudding's most satisfactory proof. In order to supply the deficiency we have been moved to make our own analysis, the first results of which we now present to our readers. We have endeavoured to make the test as fair as possible by selecting for the purpose the published recommendations of an "adviser" who, by general admission, is rather more conservative in outlook than many of his colleagues, and have ascertained the net gain which would have accrued to a reader who had scrupulously acted on every "tip" given during the last four months—a period of, on the whole, rising values of the Stock Exchange. Incidentally, it may be pointed out that a scrutiny of the actual list of securities reveals many names of recognised investment status, and few of obviously third-rate importance, apart from the unfortunate "tipping" of the shares of a company and its overseas subsidiary at £7 0s 9d and £1 2s 3d, which are now valued respectively at 13s 1½d and 1s 9¾d.

Altogether some 325 securities were "tipped" during the four months over which our analysis extended. Omitting repetitions of previous "tips," and some 52 instances where, for one reason or another, no continuous record could be obtained, our results show that the purchase of £100 nominal of each security at the price mentioned in the paper, i.e., on the day *before* each tip was given would have cost, in all, £80,707, exclusive of charges and commission. A sale 24 hours later, in each case—*i.e.*, before the close of business on the day when the tip appeared—would have realised £81,095 (exclusive of charges)—a profit of 1.2d in the £. In other words, the mere "tipping" of these shares tended to put up their average price—an obvious result, since the dealers inside the "House" were not unaware of the immediate psychological effect of the publicity given to the securities in question. A speculator for the "quick turn" who bought on the day each "tip" appeared, and sold out a week later, would have realised a profit of 0.29 per cent., or, say, rather less than three farthings in the £, exclusive of charges. The investor who purchased every stock and retained his holding would, by the date on which our results were computed (January 21st last), have made a capital profit of 0.78 per cent., or rather more than 1¾d in the £. Actually, the speculative buyer would have obtained a profit of £237 on a "turnover" of £81,095, and the investor a capital increment of £631 on an expenditure of the same amount, exclusive of charges in both cases. The investor's "profit," it should be pointed out, takes no account of any variation in the price of various stocks due to the accruing or payment of dividends during the period in question. In other words, if commission charges and stamp duties were added to the cost, there would have been no profit at all, but a loss.

These results can scarcely be regarded as proving a

case for "tipping" as a permanent institution in the investment market. The value of 5 per cent. War Loan itself has risen by 1.1 per cent. (allowing for accrued interest) during the period covered by our survey.

In fairness to the "adviser," whose recommendations have formed the basis of this analysis, we may admit that our presumption of the purchase of a fixed *nominal* amount of each stock tends to stress the importance of fluctuations in securities of low denomination quoted at a high premium. An examination of the individual items suggests, however, that this feature has, on balance, assisted rather than embarrassed the case of the "selector." We propose to make a second test by assuming the investment of £1,000 cash in each particular stock or share, the results of which will be given in our next issue. Some effort was made by the composer of the original recommendations to differentiate between stocks to be purchased as a short-term speculation, and as a long-term holding, but as no adequate instructions were given as to when and what to sell, we were compelled to fix on arbitrary periods and the exhaustive method of computation. There for the moment we must leave a story which we hope to continue next week.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

Ticket.	Account.
February 5.	February 7.

By contrast with the first week of the current account, the second was subdued, business slowing down in all markets. There was, indeed, no firm, continuing reason for the cheerfulness apparent last week, and as this fact was gradually realised there was a tendency to hesitate, look round, and limit commitments. The further efflux of gold made for doubts and questionings in the gilt-edged market and stimulated interest in the visit of the Governor of the Bank to New York, while the desire to "wait and see" caused gilt-edged prices to slip back. Irregularity developed in two centres of recent activity, Rhodesians and International Nickel letters—the first reflecting the less settled conditions in New York, the second the prospect of technical difficulty in settling in the absence of special arrangements by the Stock Exchange Committee.

The gilt-edged market was affected by unfavourable monetary developments, particularly the week's fresh gold shipment to America, the absence of any resulting improvement in the New York exchange, and the fact that these phenomena occurred precisely at a time when seasonal movements should favour Great Britain. Little selling occurred, but a certain loss of ground was common throughout the list, though investment demand connected with the repayment of maturing Government obligations on Friday subsequently gave a firmer tone to the market. Four Per Cent. Consolidated Loan showed signs of weakness at one time, and Five Per Cent. War Loan was dull, but both showed a fair recovery in mid-week. India Loans were generally steady, but selling took place of the new Four and a-Half Per Cent. scrip. Dominion stocks showed few features, but the new Commonwealth Fives maintained their position around par. The result of the New Zealand conversion offer was announced, some £11,750,000 Four Per Cent. Consolidated stock being converted into Four Per Cent. stock out of a possible total of £12,510,000.

Foreign stocks became quiet after attracting slightly increased business early in the week. Brazilian bonds were again inquired for, and Chinese issues improved. Among European stocks, Czechoslovakia 8 per Cents. were firm, and German 7 per Cents. further hardened. The market for Peruvian Corporation issues, however, continued in an unsettled state.

The approaching dividend announcements failed to stimulate public interest in Home Railway stocks, and a sagging tendency was accentuated by the disappointing character of the week's traffic figures. Both Great Westerns and Midland and Scottish showed weakness, but Southern stocks held their ground, despite the paucity of business. Some realisation of Underground Electric issues was in progress. Irregular conditions, with little business, obtained in the Foreign Railway market. Somewhat disappointing traffic returns had no appreciable effect on the firmness of the leading Argentine lines, but Leopoldina was further sold, and Canadian Pacifics were a dull market on the reaction in New York.

Industrial shares reflected a tendency towards reduced commitments, except in a few special cases, such as General Electric, where further American buying was in evidence, and Radio Corporation, on the announcement of increased profits. A legion of unfavourable rumours helped to reduce Celanese issues to the lowest level for many months, though Courtaulds remained outside the affected area. Other textile shares were consistently dull, the market generally putting a conservative valuation on the results which may be expected from the formation of the Lancashire Cotton Corporation. Nickel issues were erratic, in view of technical difficulties in connection with the Mond-International Exchange. The dividend announcement of the Margarine Union (discussed in a later "Note" this week) was on more conservative lines than had been anticipated, and sharply checked the upward swing in the value of the shares. America gave a qualified support to Columbias, but the gramophone market generally was duller than for some time past. Brewery shares had a reactionary tone, iron and steel shares were irregular, and comparatively slight interest was taken in shipping issues. Imperial Tobacco encountered profit-taking. Newspapers became less active after early firmness. No definite trend was discernible in insurance shares, but banks were a feature of strength on the cautious optimism of the chairmen at the week's meetings.

The Rubber share market again failed to produce any sensational development. The commodity was weaker, on the lead of New York, and a number of share values were marked lower, though business was scarcely sufficient to test the majority of quotations. The recent strength of tea shares had spent its force, a limited number of dealings this week revealing a slight but appreciable downward tendency in prices. Apart from a favourable movement in V.O.C. holdings on the dividend announcement, and some Canadian buying of Mexican and Canadian Eagles, little outside interest found its way to the oil market, where the continued increase in the American crude output remained the dominating factor.

A firm opening in Rhodesian copper shares was speedily followed by profit-taking, lessened American interest, and general unsettlement. The terms of the American Smelting Company's participation in N'changa (dealt with in a subsequent "Investment Note") induced considerable selling by disappointed operators. The Kaffir market relapsed into idleness. Tin shares reflected the further decline in commodity prices, Tin Selection deriving little support from the chairman's sentiments at the annual meeting. Copper descriptions, on the contrary, were helped by the renewed strength of the commodity. Continental interest in Rio Tinto showed signs of a pending revival.

LONDON ACTIVE SECURITIES.

The following tables show the movements of the week in the more active securities of the various markets:—

British and Colonial Government Securities.

PARIS.

The market favourably received the decision of the Caisse d'Amortissement to issue a 4½ per cent. funding and conversion loan at a price which will probably lower the long-term price of money. Rentes, led by the 3 per cent. Perpetual, made an important advance. The strength of the link between public and private security values was once more proved, and almost all French stocks felt the benefit of the rise. Among the most favoured were Crédit Foncier de France, Suez, Chemins de Fer du Nord, and Forges et Aciéries du Nord et de l'Est. On the cash market heavy demands were with difficulty met; cement and electricity shares were particularly sought after.

BERLIN.

After a firm close to the previous week under the influence of Wall street reports, a satisfactory Reichsbank return, and an improvement in December foreign trade returns, the new week began on the 28th with a dull and falling market. Siemens und Halske and Schuckert were sold, but interest for steel securities continued, and there seemed to be systematic changing from the first group into the second. The suicide of a Berlin banker brought about a general collapse on Tuesday. Many high-priced stocks lost 10 points or more. On Wednesday a moderate recovery was seen, which continued in the early part of Thursday, but that day the market ended decidedly weak.

Current prices:—

AMSTERDAM.

Business in most sections continued restricted, with the exception of Industrials. Transactions in Margarine Unie were very active, the shares advancing sharply to 406 on favourable reports. Artificial silk shares showed fair animation and a firm tendency, but Philips slightly reacted. Tobaccos and sugars were firm, the latter without much interest. Rubbers were neglected and easier. Shipping lost a few points, and oils weakened, the market being extremely quiet. The money market remained unchanged.

VIENNA.

Business was chiefly concentrated on individual Hungarian coal-mining shares. Improvement in the coal industry caused a demand for Czechoslovakian shares also. A further fall occurred in Danube Steamship shares, which have sunk almost 50 per cent. since last year. There was some turnover in pre-war Rentes, resulting in considerable fluctuations. In spite of the continued ease in the money market, the National Bank does not contemplate an alteration in the Bank rate.

INVESTMENT NOTES.

Lessons of the Ner-Sag Debacle.—The issue of a warrant against Mr C. A. Brandreth, the former chairman of Ner-Sag, carries the company's chequered story a stage nearer its *dénouement*. At this point it is clearly impossible to offer a final judgment either on the events leading up to the present crisis or on the scope for the company's ultimate success under its new auspices. Many relevant matters in this connection may, indeed, be regarded as to some extent *sub judice* at the moment. The incident, however, has certain broader aspects, of interest to investors generally, which may profitably be commented on. Every period of marked Stock Exchange activity is accompanied by meteoric rises of certain stocks, with a series of more or less catastrophic declines when the speculative "urge," for one reason or another, has passed away. The consequences are invariably regrettable; but it is difficult to see how even the most perfect body of law could possibly protect the markets against such incidents, the basis of which is largely psychological. To discover how or why a particular stock happens to "catch the public fancy" is as difficult as to say why one theatrical play runs for a year while a second, equally meritorious by accepted literary canons, is taken off after a fortnight. In the case of a company proved earning power is clearly not an essential, as is evident from a glance at the list of new concerns, which have never issued a balance-sheet, whose shares command high premiums on the Stock Exchange to-day. The report presented by Ner-Sag in October, 1927, after permission to deal in the ordinary shares had first been obtained, was a modest document, showing a net profit of £16,016 for the twelve months ended the previous September, on an issued capital of £50,000. In April, 1928, a 10 per cent. interim dividend was paid (actually, it would appear, out of capital), but it is nevertheless true to say that those who subsequently bought Ner-Sag £1 shares at prices up to 9 7/16, or the 5s shares of Ner-Sag (Overseas) up to 30s 9d, based their judgment largely on elusive reports of "great expectations" rather than on evidence of solid achievement. They should therefore have been aware of the risk they were taking, though they had, of course, no reason to suppose that the company's management was not being conducted on normal lines. Against such uncalculating public optimism, as we have said, no company law can avail. Whether those connected with the company took steps to fan the growing flame, by countenancing various reports or by personal dealings in the company's shares, is another matter, on which it would be well to await further details. In a general way, however, much may be said by way of criticism of the wisdom, to say the least, of issue arrangements which give to those closely connected with a company's formation and management an interest as individuals—apart from that of the company they represent—in seeing the latter's shares go as high as possible on the Stock Exchange. That such a state of affairs has been implicit in a number of recent flotations will scarcely be denied, and its implications deserve very careful consideration. The Ner-Sag incident finally illustrates the soundness of the principle that while the law is largely powerless to check excessive speculation or directorial misfeasance *in the short run*, it certainly tends to limit the period during which such abuses can obtain. The necessity of publishing a balance-sheet and report last December under the terms of the Companies Acts was the beginning of the train of events which led directly to the exposure of the methods of those in control of the company, who might otherwise have been flourishing at this moment. Various matters in connection with this balance-sheet still call for elucidation—such as, for instance, the manner in which the company's auditors, a firm of qualified accountants, came to append a "clean" certificate to a document which is now alleged to be "unreliable" and based on "fictitious entries" in the books—but it would seem, nevertheless, that in the whole matter the law played the indispensable part of *Nemesis pede claudo*. The question of discovering some method of "speeding up" its inevitability would seem, however, to be urgent, if the scope for similar "incidents" is in future to be limited. It would, of course, be a considerable step forward if companies followed the practice of publishing quarterly accounts, which has been adopted by reputable American companies whose shares are quoted on the New York Stock Exchange. Perhaps the Stock Exchange Committee will bear this point in mind.

Metropolitan Railway Dividend.—The final dividend of 2¼ per cent. in respect of 1928, declared on Thursday last, with the interim of 1¼ per cent. paid last August, brings the total for the year to 3½ per cent., as compared with 3 per cent. in 1926 and 1927 and 5 per cent. in 1924 and 1925, when earnings were swollen by receipts in connection with the British Empire Exhibition. This favourable showing was not entirely unexpected, and it cannot, unfortunately, be regarded as typical of the results to be expected of the larger "group" companies which will make their announcements in a fortnight's time. The Metropolitan is particularly fortunate at the present time in that goods traffic accounts for a comparatively small proportion of its total receipts. Of a total gross revenue of £1,864 millions last year, 89½ per cent. was derived from the passenger and only 10½ per cent. from the goods side of the company's operations. Receipts under the former head showed an increase, as compared with those of 1927, of £65,000, while under the latter a decrease of £7,000 was registered. The company continues to reap the benefit both of the rapid suburban development of the area north-west of London and of its own extended electrification programme. A further reflection of this progress has been the steady increase in the dividends paid on the company's surplus lands stock, which rose by an unbroken ⅛ per cent. every year from 1920 to 1926. A final payment is being made of 2¼ in respect of 1928, making 3⅜ for the year, as compared with 3⅛ per cent. in 1927. At 66 the consolidated ordinary stock yields £5 9s 4d per cent., and the surplus lands stock, at 80, £4 16s 2d per cent.

Netherlands Shipping Union.—This important Continental company has an issued capital of 70 million guilders, against which it holds 26,874,000 guilders nominal in shares of the Navigation Company, "Nederland"; 22,874 guilders of the Rotterdam Lloyd, and 21,874 guilders of the Royal Packet Company. During the last three years profits have been made of 4.8, 5.7, and 6.3 million guilders respectively, and dividends paid of 10.5 per cent., 11.4 per cent., 12.6 per cent. At the present time there are 222 ships on the East Indies service, with a total dead weight tonnage of 874,011 metric tons, and another 23 ships building of 181,720 metric tons. Apart from visible reserves, the book value of the fleets of the three companies appears to be low, while the valuation of the shares of the amalgamated companies at par in the balance-sheet of the holding concerns represents a further substantial reserve, the shares of the "Nederland," "Rotterdam Lloyd," "Royal Packet Company" being at present quoted at about 210, 192, and 248 respectively. The total bonded indebtedness on December 31st last was 3,231,000 guilders in the case of "Nederland," and 2,283,000 guilders in that of the Royal Packet Company. The shares of the Netherlansd Shipping Union fluctuated last year between 219½ highest and 188½ lowest, the present price being 217 per cent.

Scottish American Investment Company.—The fifty-sixth annual report of this trust company shows that it continues to be one of the most successful among the older generation in that line of activity. It would appear that considerable selling of securities and reinvestment were undertaken during 1928, for the net surplus on securities realised during the year amounted to £650,000, which

is credited as usual to the capital reserve fund, more than doubling the latter. Last May the issued capital of the company was increased by offering 50,000 blocks of six £1 preference shares and one "A" £1 ordinary share to holders of the existing "A" ordinary shares, at £7 per block. On the increased capital the ordinary dividend is maintained at 20 per cent., in spite of special expenses being incurred during the year in connection with the capital issue :—

YEARS ENDED DECEMBER 31.

	1926.	1927.	1928.
	£	£	£
Balance of revenue	210,711	221,846	234,824
Preference dividend, less tax	44,800	44,800	50,809
Number of times covered	4·7	4·9	4·6
10 % "B" ordinary dividend, less tax	56,000	56,000	56,000
Number of times covered	2·9	3·1	5·2
"A" Ordinary Earned, less tax	27·4%	27·5%	25·6%
"A" Ordinary Paid, less tax	20%	20%	20%
"A" Ordinary Amount	80,000	88,000	100,000
To reserve fund	25,000	25,000	25,000
Increase in carry forward	+ 4,911	+ 8,046	+ 3,015

In the balance-sheet, a summary of which appears elsewhere, investments, less capital reserve fund (£1,200,000), are put at £5,276,817, but the directors state that the market value of the investments exceeded £7,000,000. Presumably the capital issue transactions explain why a new item, balances due by bankers and brokers (£111,460), appears on the assets side, in conjunction with increases in debentures and deposits from £315,397 to £417,431 and in balances due to bankers from £7,264 to £32,000. During the coming year the effect of the 1928 alterations will make itself felt. At their present price of £7 the £1 "A" ordinary shares yield £2 17s 2d, less tax.

The Nickel Position.—A correspondent writes :—Two years ago Mond Nickel stood at 45s and International Nickel at $60, giving the two concerns a total market capitalisation of £30,000,000. At the present price of $66 for the no par common shares of the International Nickel of Canada, the amalgamated companies have a market capitalisation of over £180,000,000. The magnitude of this figure for one mining company is thrown into prominence by the fact that the market capitalisation of the important Rand gold producers, working on a reef the outcrop of which is 55 miles long, amounts in the aggregate to £100,000,000. The justification for such an immense capitalisation lies in the recent discoveries on the Frood and Frood Extension, which have now been brought under one management by the recent fusion between the International and Mond Nickel. Lord Melchett recently said : "So far as I know, in the history of mining there has never been a mine which has shown such high values over such a large body of ore," and even from the figures available this statement seems to be borne out. The Frood ore may be pictured as an irregular and *non*-continuous body, inclined at an angle of 60 deg. to the surface of the ground, the uppermost edge outcropping on the surface. According to present data, the body is one mile or more long, averages 100 feet in width, and in parts has been developed down to 3,000 feet. That a large body of ore existed has been known for some years, but its importance was not fully realised owing to the fact that down to about 2,000 feet deep values were quite moderate. In fact, it is the values encountered between, roughly, the 2,000 and 3,000 feet levels that have revolutionised the position. Below 3,000 feet exploration work is now proceeding, and though rich ore is being encountered there is, of course, the possibility that it may not go much deeper. Copper, nickel, platinum, palladium, iridium, silver and some gold are present, and the combined values of these metals, based on current prices, average no less than £7 per ton over large quantities of ore, and in smaller patches even exceed £10. Copper nickel ores running from 6 per cent. to 23 per cent. are encountered with precious metal content reaching £5 per ton. No official estimate of any kind has yet been made, but some mining authorities go so far as to suggest that the total volume of Frood ore disclosed is in excess of 150,000,000 tons, containing metals to the gross value, at present prices, of at least £300,000,000. This immense deposit is not the only block of ore owned by the company, as the entirely separate Creighton, Levack and Garson mines, which have been the revenue-earners so far, have reserves of over 25,000,000 tons. There are other mines and ore-bearing ground of great potentialities not yet opened up. In fact, the future profits of the International Nickel of Canada seem to depend mainly on the world's ability to absorb nickel and the precious platinum metals rather than upon the rate at which the ore is treated. In copper, silver and gold the marketing question hardly arises, and it may be a question of policy for the future whether it is advisable to mine ahead of requirements in the other metals. For this reason if for no other any attempt to forecast earnings for several years ahead will probably be very wide of the actual accomplishment.

Margarine Union.—At the extraordinary meeting held to sanction the proposed increase of capital from £3,100,000, of which £2,100,000 has been issued, to £4,100,000, the chairman of Margarine Union took the opportunity to make a preliminary statement on the results of the first year's working. It will be remembered that when the combine was formed in November, 1927, two companies were created, one British and one Dutch, in order to overcome the difficulty of double taxation. Margarine Union and Margarine Unie, between which an agreement exists providing for the equalisation of dividends, together made a profit of £1,680,000 for the year 1928. This means that, after deducting preference dividend, nearly 17 per cent. was earned on the former's ordinary shares. A 4 per cent. interim dividend has already been paid, and it had been thought that 14 per cent. for the year was not unlikely, but Lord Bessborough made it clear that not more than 10 per cent. in all would be paid, £483,000 of the remainder being used for writing off preliminary expenses. Apart from the profit and dividend pronouncement, and the stress that the chairman laid on the real identity of the two companies, the most interesting point that emerged from his speech was the news that agreements had been entered into with two more leading European margarine manufacturers, Schicht and Hartogs Fabriken. The dividend announcement caused a reaction in Margarine Union shares, which at their present price of 75s, offer a yield of £2 13s 4d.

Lautaro Nitrate Extension.—An extraordinary general meeting of the shareholders is to be held on March 28th next to approve the issue of a further 288,000 £5 shares in connection with the acquisition of a further 102 estacas of nitrate grounds each of one million square metres, which have been estimated to contain about 100,000,000 quintals of exportable nitrate of soda. In reaching this decision the local board in Valparaiso appear to have been desirous of seizing a favourable opportunity for a cheap purchase, the price to be paid being 4⅛d per metric quintal, against 8d obtained at the last sale of nitrate grounds by auction by the Chilean Government. A more fundamental object, however, is the reduction of the company's average cost of production, as a result of various economies—particularly

the favourable position of the new grounds as regards probable costs of extraction and manufacture, the employment of material at present lying idle in non-producing oficinas, and the erection of new plant with the latest improvements in mechanical devices, the materials of which are to be imported into Chile free of duty. The new shares are to be held in three blocks of 96,000 each, which will participate in dividends as and when each of the three oficinas to be built on the new grounds, with a minimum capacity of 120,000 tons each, comes into production, though the second and third blocks will in any case rank for dividends after November, 1932, and November, 1933, respectively. Recent steps which have been taken on the production and marketing side by the Chilean nitrate industry have improved the immediate outlook, and it may be taken that the Lautaro Company would not have taken this step, even under the eminently favourable terms indicated, had not the outlook for a profitable disposal of an increasing production been more promising than it was two or three years ago.

Tin Selection Trust.—At the general meeting of the Tin Selection Trust, Sir William Henry reviewed the general tin situation at great length, and drew some remarkable conclusions. In 1927 and 1928, he said, there had come into production the very large quantity of new plant and equipment which had been created as a result of a five-year period of constantly rising tin prices. Sir William gave the increase in world output in 1927 as 10,000 tons over that of 1926, and for 1928 as 20,000 tons over that of 1927. Consumption had expanded remarkably, but did it expand as fast as production? The visible supply returns published by the London Metal Exchange, which comprised warehouse stocks in Great Britain and the United States and metal afloat, showed an increase at 24,563 tons of 8,840 tons. Sir William refused to believe that this was the real increase in stocks in 1928. The visible supply returns are, of course, incomplete because they do not include the stocks of tin held in the Straits or by consumers. It is a fact, as Sir William Henry pointed out, that in a constantly falling market, consumers subsist as far as possible from hand to mouth. Lord Askwith, at the London Tin Syndicate meeting recently, suggested that the invisible stocks of tin in the hands of consumers had decreased in 1928 by as much as visible supply stocks had gone up. This is the vital question. Sir William went so far as to suggest that because the persistent flow of tin into London and Liverpool warehouses in the last quarter of 1928 had caused the visible stocks in this country to become swollen out of all proportion to the world stock situation, there had been a manipulation backwards and forwards between "visible" and "invisible" supply for the purpose of influencing tin prices. It is significant that last year the price of tin fell from £253 a ton in January to £213 a ton by mid-summer, and ended the year at no more than £228 a ton. With regard to the future Sir William Henry estimated a maximum increase of 10 per cent. in production for 1929, making a total world output of 166,000 tons. As regards consumption, Sir William felt it unwise to count upon a further expansion in British requirements which had increased so substantially last year, but he estimated that the United States would consume a very much larger quantity this year, probably as much as 12,000 tons, while other countries should require about 5,000 tons more. This brought his estimate of the increase in demand to 15,000 tons, making the total world consumption for 1929 168,000 tons. In other words, Sir William expects the demand in 1929 to exceed supply by a small margin. Time will show whether Sir William's optimistic views of the tin market are correct, but we entirely agree with him that too much importance is given to the visible supply returns, which do not indicate the true balance between demand and supply.

N'Changa Copper Mines.—The shareholders of this Rhodesian enterprise were informed on Tuesday that the American Smelting and Refining Company had acquired an important financial stake in the company. This should not have surprised them, for American interests have played an outstanding part in the Rhodesian copper boom. The American Metal Company acquired last year a large interest in Roan Antelope, while Mr Chester Beatty and a New York mining house are big shareholders in the Rhodesian Anglo-American Corporation, which now controls Bwana M'Kubwa. But some of the shareholders of N'Changa seem to be surprised at the terms on which the American Smelting and Refining Company has been allowed to participate in the company. The capital of N'Changa is to be increased to £3,000,000 by the creation of 2,400,000 shares of £1, of which 900,000 new shares are to be allocated as follows: to the shareholders, 75,000 shares, being one new share for every eight shares held at 35s; to be under option to shareholders, 225,000 shares at 35s for six months; to be allotted firm to the American Smelting and Refining Company, 118,750 shares at 35s; to be under option to that company, 356,250 shares at 35s for six months; and to the Rhodesian Congo Border Concessions, 125,000 shares fully-paid for 30,000 acres adjoining the N'Changa mine, to be acquired from that company. The taking up of these options will bring the issued capital of N'Changa up to £1,500,000. Further it is announced that if the American Smelting and Refining Company exercises its option over the 356,250 shares, it will be entitled to subscribe for 60 per cent. of the 1,500,000 shares which the company will offer for subscription at £2 per share within two years. We do not know whether the American Smelting and Refining Company has actually acquired control of N'Changa, but the Minerals Separation, Limited, have agreed to relinquish their position of general managers of N'Changa in favour of American Smelting, subject to the exercise of its options. Two representatives of American Smelting are joining the board. The shares of N'Changa, which have been over £3 12s 6d in this week's phase of the Rhodesian boom, have reacted on the announcement of these terms, and at the moment of writing are 3¼. Even so, it will probably be three years before the N'Changa mines are producing copper on a commercial scale.

San Francisco.—In the year ended September 30th last, writes our mining correspondent, the effect of the increase of the mill capacity was considerably more than counterbalanced by the renewed decline in the prices of lead and zinc. At £366,000 the gross profit falls £64,000 short of the 1926-27 total, but as prospecting and miscellaneous expenditure figures at only £20,500, in place of £52,500, the net profit is no more than £37,000 down at £283,000. The difference, however, has entailed a slight reduction in the dividend rate. The final amount of 2s 6d per share —the same as before—makes 3s 9d per share, comparing with 4s, and leaving the slightly reduced balance of £125,300 to go forward. A noteworthy expansion is shown in the ore reserves, though the development footage does not greatly exceed that performed in the preceding period. The fully-developed tonnage of 1,395,000—over four years' supply for the mill—goes against 1,060,000, and the lead value of the sulphide ore —the great bulk of the material—is 1 per cent. up at 8.5, while the zinc percentage of 10.9 indicates some decrease. As a whole the material opened up was lower than in previous years, chiefly due to the work performed being "beyond the lateral limits of the higher-grade ore shoots." A point worthy of attention is that the best ore disclosed during the year was on the lowest levels. The partly blocked out material is estimated at 482,000 tons, an increase of 82,000 tons. On the basis of the past year's dividend total, the yield shown is nearly 12 per cent. The shares may conceivably be introduced on the New York curb market in the near future.

CAPITAL ISSUES.

THE total prospectus issues for the week came to £3,535,000, as compared with £11,338,800 last year, making a total for the year to date of £43,610,116, excluding conversions. The offerings this week were dignified by three investment trust companies out of a total of six issues. The *Nineteen Twenty-nine Investment Trust* made a special appeal to Irish investors, applications from whom are receiving special consideration. The company is, however, not to specialise in Irish investments, but is to be conducted on the usual investment trust company lines. The chairman is Lord Bearsted and the secretaries Messrs M. Samuel and Co., the same group which was responsible for the issue last year of the Nineteen Twenty-Eight Investment Trust. The stock is a sound investment. The same applies to the issue of the *Trust Company of London and Scotland,* whose directors include Mr. Ivory, who manages the successful British Assets Trust, and Mr Alfred Shepherd, who is a director of a number of important and prosperous trust companies. Each of these issues was of 100,000 shares of £10 at par, which will later be split as to 60 per cent. into preference stock and 40 per cent. into ordinary stock. *The National Dominion and General Investment Corporation* made an issue of £150,000, bringing its issued capital up to £250,000. This company was formed in October, 1925, with a capital of £15,000, which was later raised to £100,000. It has been successful, and its management inspires confidence. Of the industrial issues the most important was that of 1,000,000 6½ per cent. preference shares of £1 at a premium of 6d made by *Gallaher, Limited,* the well-known firm of tobacco and cigarette manufacturers. This business was founded in Belfast over 70 years ago, and has remained outside the clutches of the big tobacco groups. Its profits, based on the average for the past five years, were sufficient to cover the dividends on the preference capital nearly three times. The preference capital is secured one and three-quarter times by the net assets. This issue—a sound industrial preference share—was heavily over-subscribed. The inevitable patent issue was provided by *L.G. Automatic Services, Limited.* The public is invited to subscribe 520,000 shares, while the vendor is allotted 380,000 shares, or about 40 per cent. of the equity. It is claimed that the machines which the company intends to manufacture and exploit will deliver a single unit of goods for any number or combination of coins. Liquid, as well as other commodities, can be delivered. Indeed, the "mixomator" is able to mix and deliver a cocktail in a few seconds, or to mix petrol and benzol in the required proportions. It should be added that the machines can automatically lock themselves against use in prohibited hours. This, at any rate, is a lively gamble. A mining speculation was provided by *Sungei Pari Hydraulic Tin, Limited,* with an issue of 920,000 shares of 5s at par. The company acquires a group of four hydraulic sluicing tin mines in Perak, F.M.S., situated near the town of Ipoh, which are being worked at present. The directors are well known in the mining world, but it may be pointed out that the purchase consideration of £157,000 is payable fully in cash, in spite of the appetising estimate of profits which is attached to the shares.

ISSUES OF THE WEEK—

By Prospectus or Offer of Sale.

Net total previously recorded, £39,553,741.
Including conversion total previously recorded, £52,463,741.

National Savings Certificates.

Net sales week ended January 26, 1929, £100,000.
Total receipts April 1, 1928, to January 26, 1929, Dr. 1,200,000.

Total amount of capital introduced to date, 1929, £1,817,450.
Total cash involved in introductions to date, 1929, £4,813,512.

Nineteen Twenty-Nine Investment Trust, Limited.—Issue at par of 100,000 £10 shares, to be converted when fully paid up into £6 5 per cent. cumulative preference and £4 ordinary stock. The company carries on the usual business of an investment trust company.

Trust Company of London and Scotland, Limited.—Issue at par of 100,000 £10 shares, to be converted when fully paid into £6 5 per cent. cumulative preference stock and £4 ordinary stock. The company carries on the business of an investment trust company.

Gallaher, Limited.—Issued capital 1,000,000 6½ per cent. £1 cumulative preference and 1,000,000 £1 ordinary shares. Offer for sale of 1,000,000 £1 preference shares at 20s 6d. The company, incorporated in Ireland in 1896, carries on a business of tobacco, cigarette and snuff manufacturers founded over 70 years ago. Net assets, excluding goodwill, at December 31st last were £1,795,599. Profits have been (to December 31st):—1924, £218,273; 1925, £144,442; 1926, £208,794; 1927, £214,622; 1928, £190,733.

Sungei Pari Hydraulic Tin, Limited.—Offer at par of 920,000 5s shares. The company acquires a group of four hydraulic sluicing tin mines in Perak for the sum of £157,000 in cash. The issue will provide about £48,000 working capital, and the cost of acquiring and installing additional plant is estimated at £30,000.

National Dominion and General Investment Corporation, Limited.—Issue at par of 15,000 £10 shares, to be converted when fully-paid-up into £6 5 per cent. cumulative preference and £4 ordinary stock, ranking *pari passu* with £60,000 preference and £40,000 ordinary stock already issued. The company was formed in 1925 to carry on the business of an investment trust company. For the year ending December 31st last 9¾ per cent. was earned on the ordinary capital and dividends aggregating 8 per cent. were paid.

L.G. Automatic Services, Limited.—Issue at par of 520,000 (out of 1,000,000) 5s ordinary shares. The company will manufacture and exploit automatic machines in the United Kingdom and the British Empire; it acquires a trade mark and patent applications, &c., in connection with certain inventions, on payment of £95,000 wholly in shares. Approximately £100,000 will be provided for working capital.

COMPANY MEETINGS, &c.

WESTMINSTER BANK, LIMITED.

"GRATIFYING INCREASE IN PROFITS."

SUB-DIVISION OF SHARES.

CREDIT FACILITIES AND TRADE EXPANSION.

CHAIRMAN'S EXHAUSTIVE REVIEW OF NATION'S INDUSTRIAL POSITION.

The annual ordinary general meeting of the Westminster Bank, Limited, was held on Wednesday, the 30th ult., at the head office, 41 Lothbury, London, E.C. 2.

Mr R. Hugh Tennant (the chairman) presided.

The notice convening the meeting and the auditors' report having been read by the secretary (Mr F. Mytton), the directors' report, the balance-sheet, and profit and loss account were taken as read.

The Chairman (who was received with cheers) said:

My Lords, Ladies and Gentlemen,—When last I had the pleasure of addressing you, I had to record some important alterations in our directorate owing to the sad losses incurred through the deaths of Mr Leaf and Mr Parr. I am happy to say that during the year now under review its *personnel* has remained unchanged.

ALTERATIONS IN GENERAL MANAGEMENT.

I have, however, to report some important alterations in our general management. In consequence of attaining the age-limit after conspicuous and valued service, Mr J. J. Brown, of head office, and Mr W. J. Woolrich, of Lombard street office, both general managers of the bank, have retired from their duties, and we hope they may both live long to enjoy their well-earned leisure. Mr J. J. Brown was a well-known figure and specially conversant with the London money market, and was, I am sure, as deservedly popular with its members as he was in the bank. In May last he was succeeded by his assistant, Mr F. Lees, whose lengthy experience of the business at Lothbury, with its traditions, marked him out as a worthy successor to Mr J. J. Brown. He entered upon his duties with every promise of running his course, but towards the end of the year his health became seriously impaired, and quite recently we have had the sad intimation of his death. We mourn the loss of an able and lovable member of the general management of the bank.

THE BANK'S BALANCE-SHEET.

Coming now to the bank's balance-sheet: On the liabilities side you will observe one or two movements of note—an increase of fully £13,000,000 in our money lodged and an expansion of some £14,000,000 in our acceptances, &c.

I am glad to say that during the past year the figures of our money lodged have been on the up-grade—an experience common to many of the British banks. But as one of the "Big Five," enjoying the prestige of conducting the accounts of sundry banks and large financial institutions at home and abroad, the end of the year frequently occasions money movements—upwards or downwards—which are of a transitory character, and while we welcome the profitable "turn" which these balances bring, we naturally discriminate as to their suitability for lending purposes.

As regards the expansion in the figures of our acceptances, &c., you will observe that in the current balance-sheet we have described the item (£26,538,039) as "acceptances, endorsements and other engagements on account of customers." Hitherto, with the approval of our auditors, we had included on both sides of the balance-sheet an ample figure to represent the risk on guarantees and confirmed credit transactions. But in view of the more common practice, which has been adopted by other banks, of including the total figures of liabilities under guarantees, credits, and forward exchange contracts as contra items in their balance-sheets, we have thought it well to conform to the more general method; but the alteration in the method of statement imports no material change in the course of business under this heading.

ASSETS.

On the assets side of the balance-sheet you will note a slight variation, compared with the previous statement, in the cash in hand and at call, the principal increase being in the cash portion, which represents 11.9 per cent. of the money lodged. The bills discounted (£36,600,000) are practically the same as a year ago. We do not separate our Treasury bills for the simple reason that it is a mere matter of chance how many we happen to hold at any particular date. As a matter of liquidity, there is no difference between Treasury bills and Bank bills we buy in the market. Our Treasury bills on December 31st were £14,000,000; on January 17th they were nearly £20,000,000. Investments have decreased about £1,500,000. Contrary to our experience in 1927, we have closed the year 1928 with a material increase in the amount of our advances. Last year I explained that a decline of some £4,700,000 under this heading was due to a cessation of borrowing by some of our friends overseas. On this occasion you will note that our advances, standing at £149,000,000, show an increase of some £12,000,000 compared with those of December, 1927.

We welcome the upward trend of our loan business. Some considerable part of the expansion may be of a more or less temporary character, and, as I have indicated when speaking to you of the increase in our deposit moneys, this feature has been kept well in view.

During the year we have opened 42 new banking offices, and we have a considerable number nearing completion or under way. After crediting the bank's premises account with £275,000 from the year's profits, this asset stands at £4,686,000.

We have also set aside from profits £100,000 to the rebuilding account. This we reserve specially towards the completion of the head office where we now are. It has been a long job, but we hope that by this time next year you will see it nearing completion, a building worthy of the bank, and, as I said last year, one which we hope to complete, as has been the case at Threadneedle street, without adding any sum to the premises account in the balance-sheet.

ALLOCATION OF PROFITS.

The Profits for the past year at £2,148,408 show a small but gratifying increase of £15,000. After the allocation to the bank premises which I have explained, and setting aside £200,000 to contingency account and a similar amount necessary to the upbuilding of the officers' pension fund, there remains an amount adequate for a dividend similar to that paid in 1927, and a carry-forward to the next account of £552,000, being an increase of £17,000.

At our meeting here last year one of our friendly critics urged upon banks the importance of increasing the "banking habit." We have not been negligent. In addition to the bank's readiness to accept small deposits—a feature well advertised at all our branch offices—we are instituting a campaign for the conserving of still smaller sums, and to this end, after wide search, we have decided on a form of home safe which gives promise of fruitful results in the domestic realm, attracting, as we hope, potential customers. Specimens of these safes can be seen on the table—they are of very attractive design and can be readily carried in one's pocket.

NIGHT SAFE EXPERIMENT.

For some time the bank has been considering how to meet a desire which has been expressed in many quarters, for what is in effect an extension of business hours. It has generally come from suburban and provincial business localities, and has always sought some means by which coin and other cash may be received by the bank at a comparatively late hour of the day. The provision of a special safe into which customers may convey deposits from the exterior of the building at any hour of the day or night after business hours is therefore being undertaken in a number of branches. Ingenuity and expense have not been spared in making the contrivance safe and the system effective. Our own representative has made an exhaustive investigation in the United States—which is the home of the night safe—and we claim that the system which we have now adopted has advantages over any yet in use; the extension of the service will depend entirely upon the popularity of these experimental installations.

OUR ASSOCIATED INSTITUTIONS.

I am glad to report that the Ulster Bank and the Westminster Foreign Bank continue to progress satisfactorily.

SPECIAL RESOLUTIONS.

At the conclusion of the ordinary business you will be asked to pass special resolutions for the purpose of giving effect to the board's recommendation of a sub-division of the bank's £20 shares (£5 paid) into £4 shares (£1 paid).

We feel that a broader distribution of the capital is not only

In economic terms, the banker's true goal is stability; and his primary duty is to secure that the flow of credit rises or falls in harmony with the volume of the nation's productive activity.

CRITICISMS OF BANK OF ENGLAND.

The Bank of England, however, is the target at which the arrows of the critics are mainly aimed. To our central bank is imputed the blame for the fact that the incipient trade improvement of the first quarter of 1928 failed to develop and continue. *Punch* even, has gone so far as to publish a cartoon depicting the Old Lady of Threadneedle street as standing still in the middle of the street and holding up the country's traffic. The gravamen of the charge, stated in the simplest terms, is that when the Bank of England in the early part of last year was accumulating gold, the opportunity should have been taken to reduce Bank rate and broaden the basis of credit. It is suggested that if this had been done the trade recovery of the early months would not have faded away as it did.

CRITICISMS ANSWERED.

The two outstanding features in the monetary sphere in 1928 were, first, that after gaining £24 millions in the stock of gold in the first eight months, the Bank of England afterwards lost all but a trifle of this amount; and the second is that, in spite of these big movements, the Bank rate was kept stable throughout a year in which the New York rate was twice increased, and was, moreover, maintained at a lower level than rates in most other great monetary centres. What then would have happened if the bank had allowed the early gold influx to exert its normal influence and to lead to a lower Bank rate? Is it not probable that if the Bank of England rate had been reduced the gold drain in the latter part of the year would have been far more severe than it actually was? Is it not likely that if 4 per cent. had been put into operation then, we should by now have been on a 5 per cent. level, or even higher? Had this occurred, manufacturers would have been first unduly elated and then unduly depressed. On a review of probabilities, it appears that the Bank of England has a satisfactory defence for the policy which it has adopted.

The persistence of industrial difficulties, of which chronic large-scale unemployment is the most arresting sign, ought of itself to be sufficient to show that what we are facing is not a temporary slump due to passing causes, but a permanent and profound change in the world's economic scheme and of Britain's place within it.

Unemployment is the all-absorbing topic of the day. Governments, Parliament, and economists search vainly for the cure of this evil. But if the cure eludes them the diagnosis of the trouble is fairly clear. More than half of our present unemployment exists in industries which produce predominantly for export. The prime cause of the depression of our basic export industries lies in the growth in many countries of local production of the goods which we used to export to them. This is a fundamental, far-reaching, and, to some extent, a permanent change. What should be Great Britain's reaction to it? *We* feel it most acutely because it has robbed our country of the semi-monopoly which it enjoyed before the war of some of the heavier, coarser, and less skilled branches of manufacturing. Our new competitors overseas, with great natural resources, with labour content with lower wages and lower standards of living, have found that they can exploit their resources with advantage. That is a development which we cannot arrest.

EFFICIENT LARGE SCALE PRODUCTION.

We must concentrate upon efficient large-scale production, and the attainment of that cheapness combined with quality which ultimately wins the markets of the world. It is perhaps the brightest point about 1928 that our industrial leaders have given clear evidence that these lessons have been learnt. The campaign for rationalisation, which is the key to the efficient organisation of production in many industries, is at last assuming important dimensions; and the co-operation of employers and employed is being promoted in an atmosphere of real goodwill and endeavour by the Melchett-Turner conference. Slowly, and with greater difficulties than those experienced by other nations in which industry is of newer growth, Great Britain is at last bringing herself up to concert pitch.

TWO FAVOURABLE FACTORS.

It is on that note of hope that I should like to conclude. If I have been mainly concerned to-day in stressing the difficulties we have to face and the fact that a long time must be needed before we can overcome them, I should like here to remind you of the real assets upon which we as a nation have the opportunity to construct the framework of a new prosperity. Amid all the changing facets of world life, Britain has two assets at least which have not changed in value. The first is the inherited skill and vigour of our workers by hand and brain; the other, not less important, is the physical advantage of our geographical position—a coast-line studded with unrivalled ports looking out upon the great European continent. If we utilise these assets to the full, in an efficient and determined endeavour, they will carry us through.

The Chairman concluded by moving: "That the report and accounts be received and adopted."

The Hon. Rupert E. Beckett (one of the deputy-chairmen) seconded the resolution.

Mr E. T. Hargraves said that he heartily agreed with the chairman as to the true function of the banker. It was not the business of a bank to provide working capital for industry. Also he was glad to find the chairman urging that industry must look to individual effort rather than to Government support for recuperation and progress. As to the rationalisation of industry, Lord Melchett had done excellent work and much to remove the suspicion which had existed between the working man and the capitalist. He heartily approved of the subdivision of the £20 shares of the bank; it would increase their popularity. Also he urged the adoption of the "Penny Post" and "Penny Cheque."

Mr R. W. Ffennell, quoting several passages from the chairman's speech in regard to unemployment and kindred matters, asked for a pronouncement from the chairman and the board as a whole as to their views on the general fiscal policy of this country.

The Chairman, in reply to Mr Hargraves, said that both the Penny Cheque and the Penny Post were desirable matters, and he wished Mr Hargraves full success in his endeavours to get the changes desired. As to Mr Ffennell's question he, the chairman, had no knowledge of the views of his colleagues on the question referred to, and at the same time he did not consider the subject suitable for open discussion at a bank meeting.

The resolution moved by the Chairman was then unanimously adopted.

The retiring directors and the auditors were re-elected.

EXTRAORDINARY RESOLUTIONS.

Three special resolutions arising out of the proposal to subdivide the £20 shares of the bank (£5 paid) were then put by the Chairman, seconded by the Hon. Rupert E. Beckett, and carried unanimously.

SHAREHOLDERS' THANKS TO THE BOARD.

Mr E. T. Hargraves said it was with great pleasure that he rose to propose: "That the best thanks of the meeting be presented to the board of directors for the able manner in which they have conducted the affairs of the bank." He went on to say that during the current year the country would be faced with a General Election, with an enormous increase in the franchise. It was not at all unlikely that the banks would need the full support of all shareholders.

Mr T. E. Paddon, associating himself with what the mover had said, seconded the resolution, which was passed with acclamation.

The Chairman, in response, said: Ladies and Gentlemen,—My own thanks and that of my colleagues are due to Mr Hargraves and Mr Paddon for the kind way in which they have moved and seconded this vote of thanks. As I have often remarked, without the hearty co-operation of my colleagues it would be impossible to us to show the excellent results recorded to-day. I have now to propose a resolution: "That the thanks of the meeting be presented to the officers of the bank for their zealous and able services." I am sure the zealous and able services of the officers of the bank do not require any encomium from me. We have in our chief officer, Mr John Rae, a tower of strength, and he is supported by a most loyal staff, who are all devoted to the best interests of the bank.

Mr E. C. Jones seconded the resolution, which was unanimously passed.

MR RAE'S REPLY FOR THE STAFF.

Mr John Rae (chief general manager): Ladies and Gentlemen,—It is my pleasant duty once again to respond to this motion. On behalf of the whole staff I desire to express their thanks most cordially for the appreciative references which have been made to their services, and for the most encouraging and gratifying reception which you have accorded to the vote of thanks. I am sure it would be the wish of the staff that they should be associated in the kindly remarks made by our chairman regarding the changes which time has wrought in the constitution of our general management—through retirements and bereavement.

In the staffing arrangements of a large bank one has naturally to look ahead and to provide for the expected and the unexpected. As to the future I am optimistic. I feel that the banking men of to-morrow should come into their responsibilities with better technical knowledge and with wider experience than were generally available in the past. We are working to make it so, and I am particularly pleased that in this we have the friendly co-operation of the bank's guild.

The commendation which you have given to the staff to-day will be another incentive to each and all to maintain that assiduous and efficient service by which the bank's interests and influence may develop, I hope, to your continuing satisfaction.

A cordial vote of thanks was then accorded to the chairman for his able and courteous conduct in the chair.

The proceedings then terminated.

THE CANADIAN BANK OF COMMERCE.

RESOURCES INCREASED BY $186,000,000 DURING THE YEAR.

PROSPERITY OF THE DOMINION OF CANADA.

The 62nd annual meeting of the Canadian Bank of Commerce was held in Toronto on Tuesday, January 8, 1929.

GENERAL MANAGER'S ADDRESS.

Mr S. H. Logan, the general manager, in course of his address, said: The financial statement summarises the results of an outstanding year, in which it has been our good fortune to experience a greater rate of progress than in any previous 12 months' period in the history of the bank. While approximately $100,000,000 of our new business is accounted for by the acquisition of the Standard Bank, it will be noted that our own operations have added a further $86,000,000, making the substantial increase in our total resources of $186,000,000 for the year.

The combined figures show an increase in circulation of approximately $8,000,000, in non-interest-bearing deposits of $22,000,000, and in interest-bearing deposits of $102,000,000, our total deposits thus being increased by the aggregate sum of $124,000,000.

Total liabilities to the public at $694,000,000 compare with $516,000,000 a year ago.

Our holdings of gold and Dominion notes at $68,900,000 show an increase of $19,600,000, and our total cash holdings, including notes and cheques of other banks and bank balances of $128,000,000, compare with $102,700,000 last year. Total liquid assets at $357,300,000 compare with $270,400,000, and represent over 51 per cent. of our liabilities to the public and over 47 per cent. of our total liabilities. Our total resources at $744,682,000 are a record in the history of the bank.

The general business situation continues healthy and active, with no sign whatever of slackening in the near future, and this means, of course, that there will be heavy demands on the banks for money, and, therefore, no appreciable ease in the money situation for some time to come.

Speaking generally of the banks of Canada, I would say that their outstanding object and policy is to give the best possible service to the public. They realise that in so doing they will be rewarded by increased patronage and an increased volume of business. Their interests and those of the general public whom they immediately serve, as safe custodians of savings, or as lenders of funds for productive or commercial purposes, are not adverse, but identical. They are engaged in active co-operation with all others in the great work of building up the agricultural, industrial, and commercial fabric of the Dominion.

PRESIDENT'S SPEECH.

Sir John Aird, the president, in the course of his address, said:—When addressing the shareholders a year ago I had difficulty in restraining myself from speaking too optimistically of the progress that had been made in Canada during the previous twelve months. To-day I find myself in an equally difficult position on account of the actual continuance of those conditions, and of the present satisfactory outlook for business in Canada for the coming year. Remarkable progress has been made during recent years in many ways, but particularly in the development of her forest, mineral, and water power resources.

There is now scarcely a province in the Dominion the value of whose mineral output does not run into millions of dollars, and in some cases we are on the eve of developments which will make the achievements of the past seem petty by comparison. The expansion in the copper output of Canada in the next few years from Ontario, Quebec, and Manitoba promises to be enormous. If the deepening of the St Lawrence waterway should be found feasible, and this great undertaking be carried out, it will in itself add immensely to the population and prosperity of Canada, altogether apart from its beneficial effects upon existing trade.

This review of the progress of Canada brings to our minds once again the importance of the question of immigration, and both Dominion and Provincial Governments seem to have given the subject renewed attention during the past year. If but a tithe of the expansion which looms ahead of this country takes place, we shall be able to find employment for and offer a career to many thousands of new settlers of all kinds.

The barometer of our prosperity is rising steadily, and unless we fail to profit by the warnings of experience, I see no reason why the prosperity of 1929 should not equal—nay, surpass—that of 1928.

THE NATIONAL BANK, LIMITED.

TRADE IMPROVEMENT IN IRELAND.

The annual general meeting of the National Bank, Limited, was held, on the 31st ultimo, at 13, Old Broad street, London, Mr J. B. Meers, C.B. (the chairman), presiding.

The Secretary (Mr E. S. Goadby) having read the notice convening the meeting and the report of the auditors,

The Chairman, after reviewing the accounts, said: I trust that you will recognise in the figures a satisfactory record of the past year's work.

The half-year under review has not been very eventful from the money market point of view. The rates for the employment of money—loans, advances, bills and short money—were about the same as those ruling in the corresponding half-year of 1927. No change has taken place in the bank rate (4½ per cent.) since April, 1927, and although there is a very reasonable desire that the trade of the country should have the benefit of cheap money, it must be remembered that by maintaining a steady rate we have avoided the disturbance which other countries have experienced by reason of frequent alterations in their rates of discount.

The year has been one of exceptional activity on the Stock Exchange, both as regards fresh issues of capital and in the markets for industrial and other shares. There has been a steady increase in the market price of British Government Stocks, notably in 5 per cent. War Loan, which now stands at 103 per cent.—or did when this was written—and in consequence the market value of the Bank's investments shows a material improvement.

AN OUTSTANDING EVENT OF THE YEAR.

The Currency and Bank Notes Act of 1928 came into operation during the year, and was an event of outstanding importance to the banking community. The amalgamation of the British Treasury Notes and Bank of England Notes had been long foreshadowed, and although the issue of Bank of England notes for one pound and ten shillings each to replace the Treasury currency notes was of no great significance to the general public, Clause 2 of the Act which fixed the Fiduciary Note Issue at two hundred and sixty million pounds contained the important provision that the limit could be raised (or lowered) after consultation with the Treasury, thus giving the long-desired measure of elasticity to the regulation of credit and currency, especially in times of undue stringency arising from large withdrawals of gold. Thus, the Currency and Bank Notes Act had a far-reaching effect in still further strengthening confidence both at home and abroad in the sound monetary and banking system of this country.

Although I am not able to point to that trade revival to which we are all so anxiously looking forward, still, there has been a gradual improvement, and the prospects appear better for the future.

It is gratifying to be able to record that progress in Irish trade continues to be satisfactorily maintained. Reports from the country on market conditions and trading generally are, for the most part, optimistic in tone.

Agriculture is, as you are aware, the mainstay of Southern Ireland, and although the harvest, generally speaking, was below expectations, the cattle trade has distinctly improved. Graziers did well, particularly those who bought stores early in the year.

Considerable improvement has taken place in the Belfast shipbuilding industry, and work on hand and in prospect is calculated to give satisfactory employment.

THE BANK'S NOTE ISSUE.

During the half-year the Free State Currency Act of 1927 came partly into operation, and the issue of Free State legal tender notes was begun on September 10th last. The first issue consisted of the three lowest denominations, 10s, £1, and £5. These are now being placed in circulation. The event occasioned considerable interest amongst the public. The higher denominations are in process of being issued. The issue of these notes is responsible for the fall in our own note issue. Further, it is expected that in the coming half-year the Free State Currency Commission will, under the provisions of the Act referred to, fix the "appointed day" for the issue of consolidated bank notes, and on that day the note issues of the present banks of issue—of which we are one—will cease in the Irish Free State and be replaced by (*a*) consolidated bank note issue to an ultimate extent of £6,000,000 divided between all the banks carrying on business in the Free State, our proportion of the same being £1,365,000 and (*b*) the Free State legal tender notes—both issues being under the control of the Currency Commission appointed by the Free State Government.

In Northern Ireland we shall still continue to issue our notes, and our fiduciary limit there has been fixed at £120,000. In the last few weeks the Government of the Free State also issued their own coinage, and the designs thereof have met with general approval.

The report and accounts were unanimously adopted.

MARTINS BANK, LIMITED.

MR HOLLAND-MARTIN REVIEWS CONDITIONS AT HOME AND ABROAD.
SATISFACTORY PROFIT—STRONG POSITION.
DIVIDEND MAINTAINED ON LARGER CAPITAL.
HOPEFUL FEATURES FOR 1929.

The ninety-eighth annual meeting of shareholders of Martins Bank, Limited, was held at the Exchange Hotel, Liverpool, on Tuesday last, the 29th ultimo.

Mr R. M. Holland-Martin, C.B., the chairman, presided over a large attendance.

The notice convening the meeting and the auditors' report having been read,

THE DIRECTORATE.

In moving the adoption of the directors' report and statement of accounts,

The Chairman said: My lords, ladies, and gentlemen, before I commence my remarks on the history of this bank, and of trade during the year 1928, you will, I am sure, expect me to refer to the King's illness, which caused such acute anxiety during the closing weeks of the past year. It is a matter for deep thankfulness that His Majesty is making progress, and it is our heartfelt wish that he may be completely restored to health.

During the past year death has removed from our midst several colleagues whom your board held in high esteem, and amongst them two great Liverpool citizens, both of whom had spent long years in active service for the city that they loved so well. I refer to Sir William Forwood and to Mr John Rankin.

Sir William Forwood, who had been no less than forty years on the board, and had filled the post of chairman, was one to whom the board, despite his great age, always looked for wise advice drawn from an active mind stored with rich experience and sound judgment.

Still more recently, Mr John Rankin, another household name in Liverpool, has passed away, after a long illness, which caused him to resign from our board last January, after a service of 28 years, for three years of which (1906-1908) he was chairman. The work he did for this bank was very great, and of that which he achieved for Liverpool many of you here to-day can testify.

We have to deplore the death of another member of the board, Mr Water Lees, who joined us when we took over the Palatine Bank in 1919, remaining also on our Manchester board. His long-standing knowledge of Manchester trade and his ripe judgment were always of the greatest value, and it was a shock to all of us when within a fortnight of our last annual meeting he and Lord Sackville, whose knowledge of Kent was of considerable service to our London board, both died of pneumonia.

Mr. Richard D. Holt, of Messrs. Alfred Holt and Co., and chairman of the Mersey Docks and Harbour Board, I am glad to say, accepted our invitation to fill the vacancy on the general board caused by the death of Sir William Forwood, and Mr F. A. Szarvasy, the chairman of the British Foreign and Colonial Corporation, whom I am glad to see with us to-day, was chosen to fill the vacancy on the London board.

Our shareholders are much to be congratulated on obtaining the services of Mr Holt and Mr Szarvasy. I ought to mention that Mr Holt's grandfather, father and uncle were also members of the board at different times.

THE AMALGAMATION WITH THE LANCASHIRE & YORKSHIRE.

At last year's meeting we were just entering our amalgamation with the Lancashire and Yorkshire Bank. I am glad to be able to report to you that thanks to the loyal and unstinted help of Mr Ramsbottom, the former general manager, and of Mr Kitchin, then his assistant, the welding together of the two banks has been most successfully carried through. But I am sorry to have to add that unfortunately Mr Ramsbottom's health was not robust enough to stand the extra strain. On medical advice, therefore, he retired in June, thus ante-dating slightly his normal retirement, which would have taken place in August, when he attained the age of 65. We hope that he will regain his health and strength sufficiently to enjoy his well-earned rest. Mr Kitchin has since been appointed district general manager, and I am glad to have this opportunity of acknowledging his services as well as those of Mr Ramsbottom, and indeed the services of all those on the staff of both banks, whose ready help has done so much to make the fusion a real one.

It will doubtless be of interest to the shareholders to know that during the present month the widows' and orphans' funds of the two banks have been amalgamated, our board having decided to pay the extra annual contribution required to bring the Lancashire and Yorkshire staff into line with our own.

NEW BANK PREMISES.

Liverpool shareholders will already have noted that very good progress has been made with our head office building, which we hope to occupy in 1931. In London, in consequence of rebuilding operations on two sides of our Lombard street office, we had no option but to rebuild. This we had intended to do a few years later, because our building was a very old one and much more accommodation could be obtained on the site, but in view of the collapse of the Commercial Union Assurance Company's building just behind our premises, we were able to come to satisfactory terms with the Commercial Union Company and Lloyds Bank, by which it was arranged that we should build at the same time as our neighbours, and thus avoid the real risk of our building failing to stand the strain of the deep excavations being made on two of its sides. As architect, we have been able to secure the services of Sir Herbert Baker, the architect to the Bank of England, whose work in South Africa and in India has won so much praise.

ACCOUNTS.

Let us now turn to the balance-sheet, which, of course, shows the effect of the amalgamation of the two banks, and makes comparison somewhat difficult with the figures of the separate banks given last year. For instance, our deposits on December 31 last stood at £82,932,881, but this is not comparable with the combined figures of the two banks, which totalled £86,917,087, because the latter figure included a very considerable sum deposited with us by the Lancashire and Yorkshire Bank, preparatory to amalgamation, which sum had of necessity to appear in both balance-sheets, and was consequently counted twice over. Loans and overdrafts totalled £42,600,478, as against £46,612,240 previously, a reduction due in the main to the smaller requirements of the Liverpool cotton and other markets.

That no reasonable request for facilities is refused by us is shown by the fact that of our 31,310 loan accounts at the end of 1928 no less than 26,672 were for loans of less than £1,000. In making these loans we are careful, as I have said before, to lend money for seasonal and temporary requirements, for it is not the province of a bank to make mortgage loans or furnish permanent capital.

ENGLISH SKY CLEARER.

Coming to our profit and loss account, our net profits, after providing for all bad and doubtful debts and other charges are £825,434, a figure which, of course, includes a whole year's profits of the Lancashire and Yorkshire section. This may be regarded as satisfactory in a year in which the staple trades of the country have bumped along the trough of depression and never experienced that revival in trade which the favourable signs at the end of 1927 seemed to forecast. In making my speech last year I did not think, from all those signs, that I was too optimistic, but to-day I will content myself with saying that in certain respects the English sky is clearer than for some time past. But this unfortunately does not apply to Lancashire, where much has to be done before the cotton industry can be rebuilt on a sound basis. Such a basis can only be formed by reorganisation, combination, and the elimination of weak mills whose existence, in great measure, has been prolonged by that continuous undercutting of prices which only causes loss to the whole trade.

THE DIVIDEND.

To return to our figures. We brought forward last year £101,671, which, added to our net profit of £825,434, gives a disposable balance of £927,105. From this, we propose to transfer to premises account £150,000 in consequence of our building operations in Liverpool and London. Of the balance the usual dividend of 16 per cent. on the enlarged capital will take £665,606, leaving a slightly increased balance forward of £111,498. This added to our capital and reserves of £7,617,914, gives a total of £7,729,412, for our capital and published reserve accounts. I need hardly say that, like all other banks, we have hidden reserves against any unforeseen contingencies.

In 1927, in order to keep in close touch with trade on the Continent, we appointed Mr H. de Boehtlingk our Continental representative. His office is in Paris. This appointment has been fully justified. Mr de Boehtlingk, whom I welcome here to-day, has shown himself both active and capable. He has travelled to many cities for us, strengthening our relations with Continental banks, and bringing us into touch with many new friends, and I take this opportunity to thank him for his energy and zealous hard work.

NEW DEVELOPMENTS.

At home, the work of combining into one smooth-working unit the equally efficient but different office methods of the two banks has thrown a great deal of extra work on Mr Shawyer and his colleagues. This work was carried out by Mr. Shawyer with all his habitual tact, sympathy, and skill, and I should like to take this opportunity of recording our gratitude to him for all the careful and wise supervision he applies to our affairs. He sets an example which runs right through the staff, and in this is ably supported by Mr Furniss, our assistant general manager.

During the last year economies have been effected by standardisation and other methods. More still remains to be done, for it is obvious that the days of office machinery are only now beginning, and that the well-found office of the future will be equipped with a large number of machines. The bank has lately extended the use of machines by which much work is saved in ledger posting and passbook writing up, and in the near future customers of the larger branches will receive a series of loose sheets instead of a passbook. Such sheets will show all the details that are now given, but they will be in clear typewritten script, and these sheets will fit into special ring-books or folders supplied to the customer, so that unless differences occur there will be no need for the customer to return his book, thus saving much postage. The details he will receive will be the same details as given hitherto of each operation on his account, and, in addition, the credit or debit balance of his account after each operation. Many large firms and customers have signified their approval of the system, but, of course, there may be some customers who will still prefer the old methods, and in such cases their wishes will, of course, have attention.

Like other banks, we are experimenting in certain towns with "night safes" by which such of our customers as may wish to deposit cash after banking hours can, with a key supplied by the Bank, open the revolving door of the night safe, and drop into the safe custody of our vaults their evening's takings.

THE MONEY MARKET.

Leaving the bank's own affairs, I would refer first of all to the money market, which has been skilfully kept on an even keel throughout the year with a bank rate of £4 10s per cent., against the average rate of £4 13s in 1927. The ebb and flow of gold to this country has always been seasonal, the tide running in in the spring and early summer and out again in the autumn In the early part of 1928, the inflow of gold was so strong that a lower rate was expected, yet the bank rate did not move, even though by September 2nd the stock of gold in the issue department reached the record total of £172,907,475. Then the tide turned, and in the later months there were constant heavy withdrawals by France, Germany and the United States, till at the end of the year the gold held was only £2,000,000 above the total at the same date in 1927. It is, I think, clear from this that the Bank of England acted with great wisdom, since it was able to maintain a steady medium rate throughout the year, having accurately gauged the real causes that lay behind the shipments, which were due less to international trade settlements than to financial adjustments resulting from the stabilisation of French and other currencies. This has enabled London to retain and increase her influence as the financial centre of the world. During the past year the currency note issue has been transferred from the Treasury to the Bank of England, and the Bank of England at the same time took advantage of the occasion to make some valuable changes in the accounts of the banking department. Another return which is often scanned as a barometer of trade is the return of the London Bankers Clearing House, but as honorary secretary of that institution, I should like to warn you that the town figures day by day become more swollen by the growing habit, for easier accounting, of using cheques for each transaction, and not for the balances of transactions, so that they are little guide to trade movements. The figures of the Country Clearing and those of the Provincial Clearings are a more reliable guide, but these also tend to be upset if, as happened in one district at the end of last year, the figures were swollen by large cheques passing between firms as the result of sales and purchases of businesses.

EVENTS ABROAD.

The foreign exchanges were, except in the case of Spain, without marked features. In Spain considerable speculation occurred in the peseta, resulting in the Spanish Government being compelled to take measures to protect the value of the peseta by establishing credits in London and New York. Your bank was invited to participate in this credit, and did so, in conjunction with other London banks and houses.

In France the chief event of the year was M. Poincaré's stabilisation of the franc at 124.21, which took place in June. In connection with this stabilisation, France withdrew considerable sums of gold from both London and New York.

During the past year Germany has obtained from New York and London considerable long term loans for her municipalities and industrial companies, which has enabled her to take much gold from London. Aided by this gold, Germany's trade made considerable progress during the year, but in the last few months several labour troubles—notably in the coal and iron industries—have caused a rise in unemployment and a decline of trade.

HOME AFFAIRS: AGRICULTURE.

Let us now turn to affairs at home. During the year, in their desire to help agriculture in this country, the Government have established two schemes which they hope will provide additional credit facilities for farmers. One is for short-term credits, for the Government consider that up to the present the farmer has been too much in the hands of the middleman, and has therefore been unable to hold his crops sufficiently long to realise them to the best advantage. To meet a need for long credits the Government with the aid of the banks have established the Agricultural Mortgage Corporation, to the capital of which we have subscribed.

It is hoped that this new corporation which is just beginning its work, will be of real help to farmers, but I cannot help doubting if it will reach those smaller farmers who are most in need of working capital and have already borrowed as much as their bankers have felt justified in lending. Let us hope that it may, for agriculture in this country is in a bad way, and needs all the help it can get, despite the fact that for most crops, and particularly for grain, the sun in 1928 favoured the farmers to such an extent that by mid-September most of the grain crops were gathered. But the sun shone in other lands too, and the English farmer, whose labour costs have practically doubled since the war, found that his crops of English wheat, well-gathered as they were, were selling at the end of September for only some 20 per cent. more than the pre-war price and for nearly 1s 8d a quarter below last year's price, which followed on a very bad harvest. An industry in such a plight does not attract that new blood and capital which is essential, and in many parts of Southern and Eastern England it is difficult to get new tenants for farms being vacated, or even to retain the old. The time has now come for the country as a whole to make up its mind whether the life of the English countryside is to be preserved or allowed to decay. At the same time, the farmer who should be distinctly the better off for the Rating and Valuation Apportionment Act, must do his utmost to work in conjunction with his neighbours in all schemes for marketing his produce. The Agricultural Produce (Grading and Marketing) Act, now in force, should greatly help to secure the farmers getting the highest possible price for the top grades of the produce, which hitherto he has been apt to throw away, by mixing bad with good.

In talking of co-operation in agriculture, I should like to draw attention to the result of the milk fight, which took place in the autumn, in Cheshire. By arranging for collective selling through a central agency, the producers obtained from 2d to 3d a gallon more than last year.

DIFFICULTY OF SUPPLY AND DEMAND.

Efforts too should be made by farmers in conjunction with the Ministry of Agriculture to make far more exact estimates of the land to be planted with certain crops or of the increase or decrease of various classes of livestock.

At the present time, checked or encouraged by the weather, the chief element beyond his control, the farmer is apt to say, "Look at the money So-and-So made with sprouts or pigs last year," and in consequence acres are planted with sprouts and pigs are bred, till the supply defeats the demand and the crops or beasts are unsaleable. At the present time, the farmer, almost alone among producers, has little or no means of determining the amount of production needed for the country, and, unlike other producers, when his fields are planted and his season half through, he cannot well produce some other product the same year. Sufficient attention has not, I think, been given to this particular difficulty of farmers, yet it is a most important one to surmount if the farmer is ever to produce at a profit.

Though much that I have said about agriculture is not applicable to the bulk of the farmers in our own particular areas, for they are dependent for the most part on stock and not on crops, and have suffered perhaps less than their neighbours in the south and east, the welfare of English agriculture is so all important to the country that I have dealt somewhat fully with it.

WORLD MARKETS.

Turning from home production to world trade, the outstanding feature of the wheat market has been the large supplies and the determined efforts of exporters to hold up prices, in which the Canadian Farmers' Pool have taken the lead. At first, growers were able by their tactics to keep prices at a high level, but after June the weight of supplies forced a steady decline, so that though the quantities handled in Liverpool have been fully as large as ever, the business has been unprofitable.

In the U.S.A. the Government will shortly consider ways and means to help their farmers, who bulk so largely in the vote. It is expected that a Bill will be passed to create a large fund from which loans will be made on farm produce at a low rate of interest.

In the Argentine the President is reported to have expressed an opinion that the fixation of a minimum price for wheat is desirable.

The Liverpool futures market has had a good flow of business, and trade appears to be increasing as millers and merchants at home and abroad realise more fully the facilities and advantages which are provided in respect of hedging and necessary speculation.

In the milling trade there has been a moderate improvement.

COTTON.

The cotton trade has experienced another very bad year, more anxious, indeed, than any which have preceded it. The seven-weeks' lock-out at Nelson had a most serious effect, and on all sides foreign competition has become intense. It is obvious that unless costs of production are reduced even more trade will go abroad, for though there is a tendency in all competing countries for the cost of production—especially that of labour—to increase, the process will be a slow one, and we cannot wait for that day.

This country has already lost much of the cheaper trade, and its once-vaunted safeguards of climate and skill are no longer invulnerable now that machinery can reproduce the qualities of the one and ignore the properties of the other.

Many manufacturers who have turned their mills to the making of cloths of artificial silk, with or without mixtures, have doubtless retained their trade, but that has necessitated additional expense in the replacement of narrow looms by broad looms, and, in the present state of the trade, finance is often no easy matter. By the new treaty with China, which was concluded at the close of the year by the skill of our Minister, Sir Miles Lampson, after most difficult negotiations, we obtained what we had asked for, namely, the most-favoured-nation terms for our goods as well as for our nationals. More active trade should result with that country. This can be realised if our merchants will send representatives to China and interest the Chinese in our goods, for the British position there has greatly changed, and now it is the Japanese, and not ourselves, who are unpopular with the nation. It will be remembered that, next to India, China is our largest customer. Last year Australia took China's place, but this year China is back in the second place. Before the war our cotton exports used to amount to 6·7 thousand million yards, but in the last few years, chiefly owing to Japanese competition, exports had sunk to some 4 thousand million yards. Such a fall could not but cause great loss to the mills. The *Manchester Guardian* has estimated that during the preceding 12 months 207 companies, with an approximate paid-up capital of £45,000,000, had paid out in dividends less than £200,000, while those which had not paid dividends had probably lost on the average £5,000 each. Further, during the last 12 months, demands have been made for the payment of uncalled capital to the extent of nearly £3,500,000, making the aggregate calls since 1920 little short of £20,000,000.

IMMENSE DIFFICULTIES.

The difficulties of this trade have been immense. Bad finance in the immediate post-war years cramped the necessary replacements of machinery and made the mills unable to meet the acute foreign competition, and a complete change of fashion in women's clothing, brought about by the introduction of artificial silk, served to accentuate the crisis.

Now that the real facts are being clearly faced, and it is realised that this depression is in no way akin to other depressions in olden days when foreign competition was hardly felt, it may be hoped that by skilful reconstruction and amalgamation Lancashire may once again become prosperous.

During last week negotiations were completed for the formation of the Lancashire Cotton Corporation, a combine which it is hoped will restore better conditions to the industry. Though our own interests in mills are not large, we heartily wish it success, for it represents the most determined effort which has yet been made to meet present-day difficulties.

COAL.

Last year was again an exceedingly difficult one for the coal trade, which is still feeling the effects of the national stoppage in 1926, by which coal production abroad—especially in Poland—was so greatly stimulated. Before the stoppage Northumberland and Durham supplied almost all the coal needed by Denmark, Sweden and Norway. Now much of their coal comes from Poland, which exports 6,000,000 tons a year.

Various schemes for marketing and the regulation of output have been introduced, and of these the chief is perhaps the Yorkshire or five counties scheme, which came into operation in April last. No such association has yet been formed for Durham and Northumberland, of which two counties Durham is in the better position, as it supplies gas coal of excellent quality, for which there is a steady demand.

Short time has been general, and there is a great deal of unemployment and distress in the mining districts.

Latterly there has been a more hopeful feeling, but much remains to be done to bring down the cost of production to a price that will compete with other countries. One cause for hopefulness is the reported success of the experiments that have been made with pulverised coal, both on land and sea, though on board ship there are still some difficulties in the way of general use. Those who have tried pulverised coal speak highly of it and say there is general economy in the fuel used, and in the handling of it. Some works claim to have reduced their boiler-room staff by 86 per cent.

IRON AND STEEL.

In the iron and steel trades the outlook is certainly more hopeful. Prices of British iron and steel are now on a more competitive level with foreign material, and costs abroad tend to rise. In the near future British makers will benefit by the new railway rebates, remitted. As the present selling price of British-made steel is now only 12.2 per cent. above pre-war figures, an increase in trade may be expected.

For some reason, probably not unconnected with the rebate scheme introduced by British steel-makers, the import of foreign steel fell during the year from the 4,406,000 tons of 1927 to 3,000,000 tons in 1928.

SHIPBUILDING AND SHIPPING.

Though the yards on the north-east coast are now more fully employed, there are still many berths empty. A comparison of the vessels built on that coast in 1927 and 1928 shows that there were built :—

In 1927—138 vessels, aggregating 675,783 gross tons.
In 1928—171 ,, ,, 701,325 ,, ,,

In the early autumn orders seemed to be dying away, but towards the end of the year a remarkable change ensued and many new vessels were ordered so prospects are more hopeful.

The number of vessels laid up is now less than it was but is still too large. Many of these steamers are of too ancient a type for modern conditions and it would be better for all if many were to be scrapped. In the last three months of the year, chiefly owing to the size of the grain harvests, there was a considerable improvement in chartering, and the possibility of tonnage being dearer in the future has led to owners placing orders for tramp steamers.

WOOL TEXTILE INDUSTRY.

As in most other trades the year has been a disappointing one. At the beginning the world demand for raw material was active, and prices advanced, but later a sharp fall in values caused substantial loses in the trade and engendered that uncertainty regarding prices which hampers business.

Wool values are no longer dictated by users in this country, but by foreign competitors, whose labour and production costs are lower than ours. Foreign competition has been very keen and a good deal of work had to be taken at unremunerative prices in order to keep machinery employed. Nor, with so many home industries depressed, was there a good home trade demand. At the close of the year there was a slightly better tone, due partly to the increase in our exports of woollen and worsteds to China.

FUTURE NOT WITHOUT HOPE.

The recital of the course of trade in 1928 is gloomy reading. It could not be otherwise, for it has undoubtedly been a bad year, yet the future is not without hope. In these post-War years we have learnt much. First and foremost we have learnt that our post-War trade depression cannot be judged or dealt with on the lines of pre-War depressions, for the War has changed the world, and our place in the world is no longer such that trade will come back of itself even if we produce the best goods. The marketing of goods has been developed enormously by our rivals and to sell abroad to-day the manufacturer needs to send out his travellers equipped with a knowledge not only of the life of the country they are visiting, but also with the power to talk to the trader in his own language. It is most advisable, too, that those with authority in their firms should constantly visit those countries in which they market their goods. Personal touch is as necessary with markets as with men.

Our trade at the end of the War suffered because we were war-tired and little capable of vision, with the result that when we suddenly discovered ourselves in a phase of booming trade we too early imagined that all was well again. Again, we often sold our businesses because the offer made was tempting, and its acceptance seemed to be a way of obviating the too heavy excess profits taxation. But in doing so the business of the country was crippled. The price paid by the purchasers was too great for the necessary profits to be earned; insufficient sums, or none were put aside to meet obsolescence and the provision of new machinery, and, what was worse, those who earned their daily living in the business could not but believe that if the figures on which the businesses were sold had been fair, the proportion given to their labour was too small. An utterly wrong scale of values existed everywhere and the great strike followed, with disastrous results to the trade of this country. Since then we have been trying to extricate ourselves from the troubles and now we seem to be winning through. It means much to us that each year we are getting back into our businesses more of that stream of youth which in recent years has failed us owing to the losses of the War. These men are bringing into the working world fresh minds that are capable of viewing the world from the new standpoint, and the nation as a whole, is coming more and more to perceive that a business can only prosper if all conected with it prosper.

INDIVIDUALISM *v.* CO-OPERATION.

The old doctrine of individualism which characterised the nineteenth century is giving place to co-operation. This is visible on all sides—witness the increasing tendency in all businesses to amalgamation, which is only co-operation in another form.

And together with this marked tendency to amalgamation, we see the work of the Mond conference fructifying in the determination of masters and men to combine together to restore British industry. That the restoration should not be delayed is essential to the well-being of this country—indeed, to its existence—and it can only be by whole-hearted co-operation of men and masters that our various industries, once more prosperous, can absorb that unemployed portion of our population now so terribly large, and so sectionalised by reason of the nature of their trades.

It is because this desire for co-operation is so widely felt and because in many trades many concerns have had the dead wood of lost capital cut out of them and have been reconstructed and amalgamated under new and better auspices, that I venture to believe that our trade will improve in 1929, despite the brake that a coming General Election must apply.

And if trade prospers all will participate in that revival, not labour only, not management only, but capital as well, and remember that to-day capital is no longer only in the hands of the wealthy, for small shareholders are daily increasing their holdings in those businesses which create and distribute goods, whether they be food, clothes, transport, or other things essential to the well-being of us all.

Mr A. Allan Paton, C.B., one of the deputy-chairmen, seconded the adoption of the report and accounts, and the motion was carried unanimously.

Sir Aubrey Brocklebank, Bart., Sir F. W. Chance, K.B.E., D.L., Mr J. Arthur Slingsby, and Mr Alfred Watkin were re-elected directors, and the appointment of Mr R. D. Holt as a director was confirmed.

THANKS TO THE DIRECTORS, MANAGEMENT AND STAFF.

Mr Wilfred Turner proposed, and Mr James E. Gordon seconded, a vote of thanks to the directors, the committee of management, and to the general manager and other officers of the bank for their valuable services during the year. This was heartily approved.

Mr A. F. Shawyer, general manager, in reply, said the bank possessed a loyal staff which rendered efficient service, and the thanks of the meeting would be communicated to them. He acknowledged the co-operation and help of the London managing director, Mr G. E. B. Bromley-Martin, especially in the development of the bank's foreign business, and mentioned also the able help and support of Mr J. M. Furniss, assistant general manager, and Mr F. S. Kitchin, Manchester district general manager.

The meeting concluded with a cordial vote of thanks to the chairman.

CONTINUOUS GRAMOPHONES, LIMITED.

RAPID PROGRESS.

The statutory meeting of Continuous Gramophones, Limited, was held, on Tuesday, the 29th ultimo, at River Plate House, London, E.C.

Mr. G. A. Bryan (the chairman) said :—Although the company has only been in existence for three months I am pleased to inform you that we have purchased a freehold factory at Walthamstow which our surveyors report as being on very advantageous terms, and which is eminently suitable for our business, with an abundance of available labour. We only took possession on November 26th last, and it is now in course of being equipped—in fact, we have been for some weeks making and assembling parts in quantities, and are advised by our general manager, Mr Ernest Wainwright, that in the course of another two months not only will the equipment be completed, but the company be in steady production, and by the end of May full production should be obtained in excess of the prospectus estimate.

AHEAD OF TIME SCHEDULE.

As you are aware, we do not propose manufacturing every part ourselves, as we have been able to complete contracts for certain castings and other parts on very favourable terms, which will bring our cost of production of the complete machine below the figure on which the directors made their first budget, and should leave the company a profit per machine in excess of the estimate above mentioned; as a matter of fact progress has been so rapid that we are ahead of our time schedule.

With regard to the sale of products, your directors have every confidence that the whole of the output will be readily disposed of. We have received hundreds of letters and applications not only in respect of the home market from the trade, private users, hotels, and cinemas, but also from practically all parts of the world as to agencies, licences, and in some cases for the purchase of our rights in various countries. The directors feel, however, it is in the best interests of the shareholders to defer actual negotiations for the sale of any patent rights until they have firmly established the Continuous Gramophone on the home market, when they can judge what satisfactory and remunerative arrangements can be made for dealing with other various rights.

Negotiations are proceeding during the organisation of the selling department for the sale of approximately one-half of the company's output to December 31st next at prices which show a profit per machine in excess of the prospectus estimate, and, with regard to the other half of the estimated output this year, it is proposed to meet the requirements so far as possible of the home inquiries already received.

MAIN PATENT SECURED.

As you know, we purchased the world's patent rights (other than for Australia and New Zealand), and you will be pleased to hear that the complete specification in respect of the main patent covering the British patent rights has now been accepted, and the English patent number will be 304,070. It is anticipated that the various other patents will be completed shortly.

Now as to the Continuous Gramophone itself. As a gramophone manufacturer for thirty years, I think it is the most revolutionary and outstanding machine yet invented, and it has the added merit of being cheap and simple in manufacture, with absolute reliability.

BIG TRADE INTEREST.

I am convinced that in the near future all gramophones which change the records and needles automatically must be played vertically, and your company's main invention should prove enormously valuable in respect of licences to other manufacturers both in this country and abroad. Again, the needle-changing device is the subject of other patent rights owned by this company, and we have already found a persistent interest is being taken by the trade therein. So far as this device is concerned, the present machines are fitted with 480 needles to play 240 double-sided records, soft or loud at will, and the number of needles is only limited by the size of the magazine—a few seconds refills the magazine with another 480 needles.

The price at which the machine will be sold has not been definitely determined, but it can be asserted with confidence that a wide market exists for a machine of the calibre of the Continuous Gramophone, which not only plays continuously, but also plays both sides of the records, at a price of about £80, which compares very favourably with the price of machines not possessing its unique merits and advantages.

You will gather from my few remarks that your directors are not only satisfied with the progress already made, but are particularly optimistic as to the future of the business and the value you have acquired.

They, one and all, are satisfied that the Continuous Gramophone has a remarkable and successful future before it.

A resolution providing for the modification of the agreement for sale was carried unanimously, and the meeting closed with a vote of thanks to the chairman and directors.

NATIONAL PROVINCIAL BANK, LIMITED.

RECORD BALANCE-SHEET FIGURES.

SOUND AND LIQUID POSITION.

OPPORTUNITY OF EXTENDING TRADE IN CHINA.

BANKERS AND TRADERS.

SIR HARRY GOSCHEN ON INDICATIONS OF TRADE IMPROVEMENT.

The annual general meeting of the National Provincial Bank, Limited, was held on Thursday, January 31, at the Cannon street Hotel, London, E.C., Sir Harry Goschen, Bt., K.B.E., presiding.

Sir Alfred Lewis, chief general manager, having read the notice convening the meeting and the report of the auditors,

The Chairman, who was received with applause, said:—Gentlemen,—With your permission, before I deal with the accounts, I should like to refer to one or two matters of what I may term domestic interest.

CHANGES ON THE BOARD OF DIRECTORS.

It was with much regret that we had to announce in our report that Mr Lindsay Smith, feeling, that after many years of active service, he would like to enjoy more leisure and freedom than his duties at the bank permitted, has resigned his seat as a director of the bank. The wide experience in banking matters which Mr Smith possesses, gained originally as a partner of Messrs Smith, Payne and Smith, one of the oldest firms of private bankers, as a director of the Union Bank, and finally as a director of this bank, has been of great advantage to our board, and it is a matter of deep regret to us that his intimate knowledge of many sections of our business will no longer be constantly at our service.

We shall ask you later on to confirm the appointment of the new director whom we have elected to a seat on the board in the person of Sir Harcourt Butler. Sir Harcourt Butler has had a very distinguished career, both at home and in other parts of the Empire, and the long experience he has gained of affairs and people as an important administrator both in India and Burma, will be of the greatest service to the bank.

We much regret to announce the loss the bank has suffered by the death of two of our local directors, viz., Mr Wragg and Mr Mauger. Mr Wragg was for many years the general manager of the Sheffield Banking Company, and later, a member of our local board in Sheffield, where his long experience of that district will be much missed; and we must also pay tribute to the value of the services rendered by the late Mr Mauger, a member of our local board in Guernsey. We have appointed his son, Mr William Mauger, a gentleman possessing wide knowledge of Channel Islands business, a local director in his place.

NEW BRANCHES—PRINCES STREET OFFICE.

In continuance of our policy of providing for the wants of our customers and securing new business wherever favourable opportunities present themselves, we have opened 42 new branches during the year, bringing up the total number of our offices in the United Kingdom to 1,262 and in this connection, perhaps I may say a word with regard to our Princes street office.

Some of our shareholders may have noticed, possibly with surprise, the demolition of what appeared to be a fine and solid building at the corner of Princes street, facing the Mansion House. Unfortunately, circumstances over which we had no control obliged us to take this course. After a dramatic collapse of a building in Cornhill, owners of property in the City were much exercised as to the stability of their own buildings, especially those adjacent to sites on which rebuilding, entailing deep excavation, was in progress. Certain indications clearly showed that some movement or settlement in our building at Princes street was taking place, and compelled us to have an examination made of our foundations. This examination disclosed a disturbing, if not alarming, state of affairs and trial borings and excavations revealed the disappearance in many places of the ground on which the foundations of the building originally rested. It is not possible to determine with exactitude whether this subsidence has been caused by neighbouring excavations, extensive pumping or the action of time, but the fact that large cavities existed below the foundations compelled us to take immediate action and the only practical and economical remedy was to demolish the existing structure and rebuild our premises, and this work has accordingly been put in hand. Much work underground will be necessary to secure, as far as is humanly possible, a sound foundation on the blue clay, and considerable expense will be incurred, but we intend to erect on the finest site in the City a building which will not only be thoroughly adapted to the needs of modern banking, but will be a credit to the bank and an ornament to the prominent position it will occupy. We have in the room a sketch of the elevation of the new premises, should any of the shareholders like to take the opportunity of seeing the type of building we propose to erect.

INSTALLATION OF "NIGHT SAFES."

I should like also to refer to the provision of facilities for the safe deposit after banking hours of moneys received by our clients. As a result of careful inquiries regarding the experience gained by our friends both in Europe and the United States, we have decided to instal in such branches where the need appears to be urgent, a system of "night safes," which we trust will prove useful to such of our customers whose hours of business are unduly prolonged, and who are unable to arrange themselves for the safe custody of their evening receipts.

THE ACCOUNTS.

Turning to our accounts, we are pleased to show a satisfactory increase in all our figures, the summation of the balance-sheet reaching £329,698,670 against £305,444,270 last year. The capital and reserve remain the same, but there is a notable increase in the amount of our deposits on December 31st of about £17,000,000, and I am glad to say the sums derived from our smaller account holders and depositors included in this amount show considerable expansion. Our liabilities for acceptances, endorsements, &c., also show an advance over last year's figures of over £7,000,000, while on the assets side of the balance-sheet, the larger figures represented by our cash, balances with other banks, &c., money at call, represent satisfactory and appropriate additions to our most liquid assets.

We have made a change in this year's balance-sheet in the manner in which our bills discounted appear. Our Treasury bills, amounting to £28,765,000, are now shown separately from bills payable by British firms and institutions in the United Kingdom. On December 31, 1927, our holding of British Government Treasury bills amounted to £27,600,000.

The keen Continental demand for English bankers' acceptances, chiefly on behalf of the central banks abroad, has no doubt had a considerable bearing on the comparatively moderate holdings of such bills disclosed this year in the banks' balance-sheets.

INVESTMENTS.

Investments show an increase of about £1,400,000, due chiefly to our increased holdings of Government securities; our holdings in allied banks also show an increase owing to a call of £15 per share necessitated by their expanding business made by Lloyds and National Provincial Foreign Bank, which has raised our holding in this institution from £240,000 to £420,000. I am glad to say that our subsidiary, which we own jointly with Lloyds Bank, is making steady progress, and is dealing with an increased amount of remunerative business.

Our advances to customers again show an increase, and, like our commercial bills, indicate the increased facilities we are affording our customers throughout the country.

PROFIT AND LOSS ACCOUNT.

Our profit and loss account, after providing for all bad and doubtful debts, shows a balance of £2,108,663 16s 11d (against £2,093,452 9s 9d at the end of 1927), and after adding the balance carried forward from the previous account of £863,476 9s 3d, we have now £2,972,140 6s 2d with which to deal.

The interim dividend paid in July has absorbed £853,147 8s 10d, and the final dividend we have declared will require a similar amount; of the sum remaining we propose to transfer £100,000 to the pension fund, £100,000 to bank premises account, and £200,000 to strengthen our contingency fund, leaving us with £865,845 8s 6d to carry forward to the new account.

RECORD BALANCE-SHEET FIGURES.

I am glad to say that not only do the balance-sheet figures we are able to put before you to-day constitute a record in the history of the bank, but we have fully shared in the record figures for turnover of all banks, which the Clearing House report discloses.

It may interest you to know which sections of our business are responsible for the larger figures. There is a gratifying increase in the turnover of the country branches, which gives us ground for belief that the industrial side of the business of the bank as a whole is being maintained. There has been a decrease in the turnover in coal, iron, steel, and in the textile industries, but there has been a satisfactory increase in the volume of business in shipping, leather, hosiery, lace, and pottery, as well as in our agricultural accounts; indeed, all the other sections of the bank's business, with the exception of those mentioned above, show an expansion in turnover. Some of the sub-divisions in these various trades show slightly unfavourable movements, but as a whole there has been expansion which affords considerable encouragement. In referring to iron and steel I have had in mind the raw material end; in some of the branches of the heavy industries progress has been shown. It is interesting to see that according to the public returns of the various sections of trade, the experience of our own business is generally in harmony with the conditions of industry throughout the country.

TRIBUTE TO THE GENERAL MANAGERS AND STAFF.

I should again like to pay due tribute, in which I am sure you will join, to the zeal, energy, and ability which have been displayed by the chief general manager, the general managers, managers, and the staff of the bank in enabling us to place a satisfactory statement before you, and for the sound and liquid position disclosed by the balance-sheet. We are fortunate in having in the bank a body of men whose primary object is to maintain the high traditions of the bank and to further its interests to the utmost of their power.

AFFILIATED BANKS.

We append, as usual, to our report the balance-sheets of our affiliated banks, Messrs Coutts and Co. and Messrs Grindlay and Co., Limited, both of which show progress, and we are pleased again to express the satisfaction the directors feel on the acquisition of these two businesses, the result of which has entirely justified their anticipations.

INTEREST RATES.

The profits of the bank have not been attained without difficulty. The rate of interest obtainable from all the short investments in which our floating funds are employed shows a decline in all directions as compared with 1927. The average rates for call and Stock Exchange money, discount, &c., were all lower. One feature of the year has been the steady figure of 4½ per cent. at which the Bank rate has been maintained, and I venture to say that the greatest credit is due to the Governor of the Bank of England for the skilful and courageous policy he has pursued which has enabled the traders of this country to enjoy lower rates for money than those prevailing generally in other centres, and this notwithstanding the large exports of gold from the Bank of England during the year.

We must, I think, recognise that the comparatively low monetary rates which have prevailed in this country have not only been of great assistance to industry and manufacturers, but they have materially contributed to the re-establishment of this country as the great financial centre and free gold market of the world. Further, London credits, assisted by the cheaper rates of discount, have been in greater demand, and are regaining their pre-eminent position. The volume of British bills has increased and much of the crop finance is returning to what I ventured to describe last year as its "legitimate channels."

IMPORTANT FINANCIAL EVENTS.

Perhaps, however, the most important financial events of the past year have been the transfer of the currency notes to the Bank of England, the amalgamation of that issue with their own, the creation of the £1 and 10s Bank of England notes, and the publication by that institution of a new form of account in which bank balances appear for the first time week by week as a separate item.

The passing of the Currency and Bank Notes Act marks the termination of the last of the financial expedients necessitated by the outbreak of war, and fulfils the last of the principal recommendations of the Cunliffe Committee of 1918 and the Gold Standard Committee of 1924. The Act restores, with one or two exceptions, the principles of our pre-war system. We still adhere to the principle of allocating our gold holding to the service of our note issue and of a fixed though enlarged fiduciary issue; but while an increase in our stock of gold is still the main basis for an expansion of the note issue, simpler machinery has been provided for permitting a temporary excess of the sum of £260,000,000, the normal limit of the fiduciary issue, a provision which may be of great service in times of genuinely increased trade activity.

The new form in which the Bank of England accounts are published will be generally welcomed, and the fuller information given will be of much interest to those who desire to study monetary movements. The disclosure of the total of banks' balances with the Bank of England, which is now included as a separate item in the accounts for the first time since 1878, will afford interesting and useful information to all concerned, and will give the public a better chance of appreciating the actual financial position.

TRADE CONDITIONS.

It is a matter of grave concern that in any survey of the trade of the country during the past year, the picture should be overshadowed by the cloud of depression which still hangs over our great basic industries. We cannot but be impressed with the serious question of unemployment and of the distress which exists in the mining centres of South Wales and the North of England, and we must, unfortunately, realise that we have not yet recovered from the aftermath of the unfortunate events of 1926. As far as the coal trade is concerned, it is true, I believe, that we are slowly recovering our position in some of our old markets, but much remains to be done, and I am afraid there are but few pits which are working at a profit.

IRON AND STEEL INDUSTRY.

In my opinion there are indications that some improvement may have taken place during the past year in the state of our basic iron and steel industry, but the position is still far from satisfactory. The output of steel (8,525,100 tons) for the year 1928 represents a reduction of 6.3 per cent. on the figures for 1927, and gives an average of about 65 per cent. of the country's capacity. As compared with the previous year, however, the year 1928 has included no period of relatively high production due to exceptional causes, such as was experienced in the earlier months of 1927 when production was maintained at high pressure in order to meet demand accumulated during the coal stoppage; on the other hand, in the later months of 1928 the output showed an encouraging increase over the corresponding tonnage for 1927.

From the domestic point of view the belief has gained ground that the continuance of adverse trade conditions might be alleviated, to some extent at least, by concentration of production and by improvements in the machinery of selling; and it is clear that efforts have been made and are being made in many directions to obtain such improvements.

The fundamental factor in this industry continues to be the excess of productive capacity in the world, which affects the situation more acutely in Britain than in any other country, owing to the relatively higher standard of living here, and the consequent higher cost of production; this in its turn accentuates the difficulty of maintaining sales at a sufficiently high level to secure adequate and continuous employment for the workpeople dependent on this trade.

ENGINEERING AND SHIPBUILDING INDUSTRIES.

It is gratifying to observe an improvement in the engineering and shipbuilding industries. The Sheffield trade in high-class steel, steel alloys, engineers' tools, &c., shows expansion especially in the later months of last year, and, generally speaking, business has improved in most of the secondary industries in this section.

COAL AND HEAVY INDUSTRIES.

We are all glad to note the progress which has been made in the efforts put forward for the reorganisation of the coal and heavy industries. Uneconomic pits and out-of-date works are being closed down; amalgamations of similar and even competitive interests are the order of the day, and arrangements are being made for combined selling. Management is being overhauled in order to secure the greatest efficiency and economy, and there has been a distinct advance in sympathetic co-operation between employed and employers. I trust these efforts will be crowned with success. We may expect also that these important industries will benefit in no small degree from the Government's de-rating proposals now before Parliament, and it must be a satisfaction to us all that this effort has been made to relieve productive industry, and especially those branches of our trade which are struggling towards a profit-earning basis, from the heavy burden of rates, to which I have previously referred on more than one occasion. As has been well said, you may tax the profits of industry but you must not tax the tools of industry by which those profits are produced.

TEXTILES.

As far as textiles are concerned, the depression which during the last few years has pervaded the cotton trade shows little signs of dispersion. Institutions engaged on specialities and holding a virtual monopoly, as well as those engaged in the finishing of goods, show a decided improvement over last year. Spinners engaged on fine counts have probably done well, but in the case

of those engaged on coarse yarns, losses are probably more prevalent than profits.

There is a brighter side to the whole industry in the tendency that is evident in this trade, also to closer co-operation between all sections. Manufacturers and merchants are evincing a desire to work together, and to co-ordinate their endeavours to meet foreign competition by mass production and improved and cheaper methods of distribution, but in this, as in every trade, friendly co-operation between workers and employers is essential if we are to improve or even retain our place in the markets of the world.

WOOL TEXTILE INDUSTRY.

As regards the wool textile industry, the year 1928 opened with much optimism, and there was increased activity in most sections, both here and on the Continent of Europe. Wool prices were somewhat high, and continued to rise in the early spring. This was attributed to a fear of a serious shortage in the Australian clip, and to the anticipation of an increased consumption throughout Europe. Both estimates proved to be wrong, and our merchants, spinners, and manufacturers found themselves with dear raw material, and faced with a falling demand for finished products. From Easter onwards there was an increasing decline in activity amongst machinery users, who, in view of the situation, bought their raw material, as it were, from hand to mouth. So much did demand fall away that in order to keep their machinery going and the nucleus of their employees together, much price-cutting was indulged in by producers, with unremunerative results. To-day spinners and manufacturers are not in the mood for speculation.

WHAT IS NEEDED.

There is a longing for a firm market, free from the wide fluctuations which have been experienced in the last few years, and for a bigger outlet for wool products at home and abroad. In this question of overseas demand, however, our wool textile friends are up against the fact that nations which never before made their own yarns and cloths, nor did their own processing, have, in the course of years, become industrialised, have equipped themselves with machinery, and are making goods which, if not of the same quality and craftsmanship, have had a serious effect on this branch of our great staple industries. It is undeniable, too, I think, that the appearance of these manufacturers in the primary market tends to keep up the price of the raw material at a higher level than used to be the case. Our overseas competitors, however, are able to offset this condition of things by their cost of production, which, for well-known reasons, is much lower than that prevailing in the West Riding of Yorkshire. It is a matter for gratification, however, that in the very high-class goods trade our manufacturers have succeeded in surmounting the barriers which have been erected throughout the world to stem the flow of their exports.

TRADE OPPORTUNITIES IN CHINA.

I cannot help thinking that at the present moment great possibilities exist for the development and expansion of all sections of our trade. For some time now China has presented an almost closed door to any development, certainly of our export trade; indeed, during the past few years, it has been seriously curtailed owing to the disturbed conditions in that country. The hostility which existed to British interests arose, I believe, in the main, from gross misunderstandings engendered and fostered by communistic propaganda, but at last there are signs of more settled conditions. The new Anglo-Chinese Tariff Treaty, which was skilfully negotiated by our diplomatic representatives and signed in December of last year, has been followed by the formal recognition of the Nanking Government by H.M. Government. The reports which have reached me from China lead me to believe that, at all events in that part of China, there exists a more friendly attitude to British interests and trade than has been the case for many years, and it is now for us to take advantage of this possible opportunity. China is in need of many of the goods we manufacture, and, I understand, is willing to enter into negotiations as to the terms on which they can be supplied. We must, I think, recognise that great changes have taken place in the last five years in the national sentiment of the Chinese people. They wish to negotiate with European firms direct without the intervention of agents and compradors, a great change and one which will necessitate a radical rearrangement in the methods and practice of our great merchant firms in that country. They are, of course, better able than I to weigh the risks and advantages involved in such a change, but if we do not show ourselves ready to meet our prospective customers, it is certain someone else will. It seems to me that if our manufacturers and merchants are still imbued with the spirit of enterprise and energy which enabled their forefathers to lay the foundation of our vast trade with the Far East, they will seriously consider the position, for, in spite of the great changes and possible risks involved, in spite of the difficulties even of conducting business with the Chinese in their own language, there seems to me to be a great opportunity of extending all sections of our trade with that great country which, if neglected now, may not recur.

AGRICULTURAL INDUSTRY.

The state of our agricultural industry still leaves much to be desired and although speaking generally last season was a good one, I doubt whether farmers, as a whole, have made much money. Cereal crops were good, but without an exceptionally good yield it is almost impossible to grow wheat at a profit at 43s a quarter, with wages at their present level. Sugar beet has in some districts been fairly profitable, but, as a whole, with the high cost of labour and the low level of prices obtainable for farm produce, it is difficult for farmers to make any headway. Still, the fine weather experienced last year was of material assistance in keeping down the cost of harvesting and of great value to the land and cultivation for the next year's crops.

THE AGRICULTURAL MORTGAGE CORPORATION.

In conjunction with nearly all the other clearing banks, we have taken our part in forming, at the request of the Ministry of Agriculture, the Agricultural Mortgage Corporation, for the purpose of granting fixed loans to farmers for long periods in connection with the purchase of land, and the Act under which this institution came into being, also created a new security for short term loans from bankers, in the form of a Chattel Mortgage. The farmers will thus be provided by one method of the other with an easier means of access to the national savings for the purpose of purchasing and becoming the owners of their farms and ensuring the fixity of tenure they have always desired, or, by means of the Chattel Mortgage providing themselves more easily with floating money with which to improve their cultivations or extend their stock. In order to remove a misconception which appears to exist in the minds of some people, I may perhaps point out that the rate of 5½ per cent. at which the institution in question is at the moment prepared to make loans for long periods, includes the sinking fund necessary to redeem the loan in 60 years, while a suggestion that large profits may accrue to the banks and others, is hardly borne out by the fact that the maximum dividend the shareholders can receive, if earned, is 5 per cent., which is the only outgoing of the corporation beyond the necessary expenses of their staff and premises.

BANKS AND TRADE FACILITIES.

From time to time, both in the Press and on the platform, criticisms are made regarding the policy of the English banks, particularly with regard to the facilities they provide for the trading public. These comments are generally more insistent during times of trade depression, and perhaps it might not be inappropriate for me to-day to say a few words on this subject. These criticisms take a varied form; it is said that the banks do not provide sufficient accommodation to meet the requirements of traders generally; that they lend too much money either to financiers in the City or to foreign firms and thus deprive manufacturers and other traders of accommodation. It is difficult to reply to general criticisms in other than general terms, but I would ask those who are inclined to believe ill of the banks to consider the following remarks:—

In our own case, on December 31st last, the total amount of advances made in our principal City offices in London, represented 28 per cent. only of the deposits gathered through those offices, whereas the advances made through the channel of the whole of our other offices represented 60 per cent. of their deposits. In regard to the City advances, it must not be overlooked that they also include loans to important commercial undertakings, and I think you will see from this that there has been no starvation in the facilities granted by our provincial branches to our large agricultural interests and to industrial concerns established throughout the country. The published figures of the joint stock banks provide in themselves striking evidence of the increased facilities which have been afforded to traders in the course of the last few years. In 1913 the advances of English banks were under £500,000,000, while at the end of 1928 this figure was over £1,000,000,000, and the rates at which these advances have been available were considerably lower than those prevalent on the Continent.

FINANCING OF FOREIGN BUSINESS.

References are also made to the financing of foreign business, and whilst I believe that important facilities for overseas transactions are a large contributory factor in the development of our domestic trade, it may be of interest to state that such advances are much more than covered by the deposits held by the bank from its overseas customers.

Moreover, our banking machinery has been the instrument for raising during last year no less than £179,000,000 of new capital for domestic enterprise; an increase of £39,000,000 in comparison with 1927, besides a large amount for development in other directions.

GREATER CONFIDENCE IN THE FUTURE.

We must not, however, ladies and gentlemen, only review the past, but look forward to the future, and I find some difficulty in forming an opinion, and still more in expressing one, as to the likely course of trade this year, for nowadays the political and financial situation throughout the world changes so suddenly and so rapidly that one can hardly forecast the probable course of events from one week to another.

It is a curious phenomenon that in recent times there has been in the closing months of each year a recrudescence in trade and a more optimistic prognosis of the future, which I am sorry to say has not been wholly fulfilled. Our hopes have often been disappointed, but this year I feel greater confidence, in that I believe our manufacturers and industrial leaders seem to have found again that self-confidence which they would almost appear to have temporarily mislaid. There is less inclination to wait for a problematical improvement in trade or to place undue dependence on the prospect of Government assistance than was the case a year ago. On the contrary, in many directions industry seems determined to face things as they are, to arrange matters in their own way, and to take their coats off and make the best of a difficult job. At last we seem to have realised the unpleasant truth that other nations have learnt to manufacture as well as ourselves. We are learning by bitter experience that our industries cannot enjoy restored prosperity so long as production is continued under conditions which not only bring losses to the owners, but militate against the restoration of prosperity to trade as a whole. If our industrial community, both employed and employers, have realised these facts and made up their minds to face the situation, then I believe, by efficiency in management and operation, the scrapping of old and uneconomic plants and by methods of rationalisation, painful though the experience in some directions may be, we shall more rapidly secure restored prosperity to the advantage of all classes of our people.

I now beg to move:—"That the report and accounts, as presented, be received and adopted."

Mr F. C. Le Marchant seconded the motion, which was carried unanimously.

ENTERPRISE!

¶ The intrepid enterprise of Columbus over four centuries ago opened up all the possibilities of an undeveloped Continent.

¶ Since then, the enterprise of succeeding generations has resulted in phenomenal development of the vast resources of the New World.

¶ To-day a great and growing volume of overseas trade is transacted annually by the Latin American Republics, and complete facilities for every description of modern banking business are afforded by

THE ANGLO-SOUTH AMERICAN BANK LTD
117 OLD BROAD ST. LONDON, EC2

RE-ELECTION OF DIRECTORS.

The chairman then proposed the re-election of the directors retiring by rotation, namely, Mr Charles Cave Cave, Mr Charles Gipps Hamilton, Sir William Barclay Peat, C.V.O., and Mr Eustace Abel Smith.

Mr M. O. FitzGerald seconded the motion, which was unanimously adopted.

The chairman further moved that Sir Harcourt Butler, G.C.S.I., G.C.I.E., who had been appointed to a seat on the board during the war, be re-elected.

Sir Felix Schuster, Bt., seconded the motion, and it was unanimously agreed to.

RE-APPOINTMENT OF AUDITORS.

On the proposition of Mr H. J. Mulrenan, seconded by Mr H. C. Scrimgeour, Sir Nicholas Edwin Waterhouse, K.B.E. (of Messrs Price, Waterhouse and Co.), and Sir William Henry Peat, K.B.E. (of Messrs. Peat, Marwick, Mitchell and Co.) were reappointed auditors for the current year.

VOTES OF THANKS.

Mr Cecil Braithwaite moved a vote of thanks to the directors, general managers, branch managers, and other officers of the bank for their efficient management and services.

Mr John Cadogan seconded the vote, which was cordially passed, and a brief acknowledgment was made by the chairman.

A vote of thanks to Sir Harry Goschen for his able conduct in the chair—proposed by Mr. J. Scovell Adams, seconded by Mr A. W. Card, and supported by Mr W. Claude Steggall—concluded the proceedings.

HUNGARIAN COMMERCIAL BANK OF PEST.

INCREASED PROFIT AND DIVIDEND.

The board of directors held a meeting, on January 19, 1929, and approved the balance-sheet for the year 1928. The net profit including the balance of the profit and loss account brought forward from last year is P 5,805,157.60, against P 5,066,365.79 in 1927.

In conformity with the traditional practice of the bank the profit of several already concluded transactions does not appear in the result of the present year.

The board of directors will submit to the 87th ordinary general meeting of stockholders, to be held on February 5, 1929, the following resolutions:—

The distribution of a dividend of P 7 for 1928 per share (last year P 6). The total amount to be paid for dividend will be therefore P 3,500,000. The board will also propose that P 1,200,000 should be added to the different reserves and that P 60,000 should be used for charity funds of the staff of the bank.

The board of directors will ask the ordinary general meeting of stockholders to transfer from the pension fund of the staff which has been put aside in accordance with a former resolution of the general meeting in April, 1926, in the sum of P 6,000,000, and rose since to P 8,285,440, the amount of P 5,000,000 to a pension fund—as authorised and required by law—for the members of the staff still in the employ of the bank. The remaining P 3,285,440 will be reserved for the pension due to the employees already retired.

The figures for 1928 and 1927 compare as follows:—

Deposits in savings accounts increased in 1928 P 17,551,896 to P 94,885,906, against P 77,334,010 in 1927.

Deposits in current accounts rose from P 113,515,164 to P 121,637,825. Other creditors amounted merely to P 7,573,600.

Bills discounted increased from P 81,156,813 to P 90,434,544.

Mortgage loans reached the aggregate amount of P 51,776,189, against P 36,579,412 in 1927.

Securities owned by the bank figure in the balance-sheet according to the usual conservative valuations, the declines of prices of certain categories which occurred in 1928 having been duly considered.

The turnover has also considerably increased.

The total turnover on one side of the general ledger aggregated P 9,282,143,000, against P 8,659,444,000 last year.

The turnover in deposits rose from P 2,613,806,000 to P 2,905,003,000.

The turnover of the cash department increased to P 3,449,846,000 from P 3,120,227,000, and that of the foreign exchange department to P 3,681,845,000 from P 3,656,557,000.

The increase of the salaries is only insignificant. The usual yearly rise of salaries has been more or less balanced through the retirements in pension.

Taxes and duties amounted to P 2,242,213, against P 1,398,893 in 1927, and show an increase of about 60 per cent.

DISTRICT BANK, LIMITED.

SUCCESSFUL RESULTS—INCREASED PROFIT.

STRONG AND LIQUID POSITION.

ISSUE OF BONUS SHARES.

CHAIRMAN'S REVIEW OF TRADE CONDITIONS.

The annual meeting of the shareholders was held on Friday, January 25th, at the head office, Spring Gardens, Manchester, the chairman, Sir Christopher T. Needham, presiding.

The Chairman, in moving the adoption of the report and balance-sheet, said:—

I assume that you will take the report and accounts as read.

TRIBUTE TO LATE DIRECTORS.

We have to report with deep regret the loss by death of two directors in the past year. Mr Myles Kennedy joined the board in 1908 as a representative of the Lancaster Bank immediately after the amalgamation of that bank with the District Bank. Very well known and honoured in the northern half of the country, and in Cumberland and Westmorland, his wide interests made his experience of great value to the bank, and his colleagues mourn the loss of a vivid personality and a friend. Major Robert Barbour, whose untimely death by accident occurred in September last, had been a director since 1919. He was the third of his family to serve upon the board. His grandfather was elected a director in 1831, and his father in 1885. Major Barbour won great regard from his colleagues, and his presence will be greatly missed. It is indeed grievous that so long and happy a connection between his family and the bank should be broken. It extended from the early days of the bank's history, Major Barbour's grandfather in 1834 having laid the foundation-stone of this office in which we are now meeting.

The Directors have elected to seats on the board Mr Samuel Turner, of Rochdale, vice-chairman of Messrs Turner and Newall, Limited, Rochdale, and Mr Francis J. Dickens, of Silverdale, Carnforth, governing director of Messrs I. H. Morris and Co., Limited, Manchester. Their business experience will, we are sure, be of great value to the bank.

THE BANK'S CENTENARY.

Our meeting to-day is notable, for this year we celebrate our centenary. When the bank first opened its doors to the public the Napoleonic Wars were still within the memory of the majority of the inhabitants of this country. At that time our industries (judged by modern standards) were small; transport was extremely difficult, and many of the great industries of to-day, including the manufacture of cotton goods, were in their infancy. The population of Manchester was then under 140,000, and Lancashire had not become that highly organised industrial community which we now see.

Joint-stock banking in the provinces was first permitted by law in 1826. Our bank was established in 1829, and it is the oldest joint-stock bank in England, and consequently the first to celebrate its centenary, an event of which, I think, we may be justly proud. One or two instances of our historical connections will indicate how deeply rooted are our interests. Through the acquisition, in 1863, of the old-established banking house of Loyd, Entwistle, Bury and Jervis, now our King street office, we have local connections extending into the eighteenth century. The Lancaster Bank, which united its fortunes to ours in 1907, was established three years before the District Bank, that is, in the very year in which joint-stock banking was first permitted.

Throughout its 100 years' existence the bank can fairly claim to have adapted itself to the changing conditions of industry, of commerce, and of finance, and has endeavoured to give to the vast trading community which it serves facilities equal to those obtainable in any of the great financial centres.

I should like to mention that this is one of the very few surviving banks having its head office situate in the midst of the industries it has fostered and served, and not the least of the factors contributing to its success has been local knowledge, accessibility and personal relationship. The problems before us to-day are possibly greater than at any previous time, but with the ample resources at its command the bank looks forward with confidence to a continuance of its policy of providing help and assistance as industry and commerce may require.

At a later stage of this meeting I will propose a resolution which, if you approve, will authorise the directors to call the meetings necessary to carry into effect the proposals in connection with the celebration of our centenary which are outlined in the annual report already circulated.

TRADE REVIEW.

A year ago the outlook seemed promising, and, indeed, the first quarter of the year showed a fairly satisfactory activity in trade, but from April onwards a set-back was evident, which continued until the last months of the year, when there were slight signs of increased trade. It is encouraging to find that our exports for the year show the welcome, if not very large, increase of £11,750,000. The re-exports of imported merhandise for 1928 amount to £120,352,000, showing a further decline of £2,600,000, and compared with the year 1925 the diminution is £33,684,000. This re-export trade in the past has proved very valuable to this country, and the considerable decline in value during the last few years shows the changing course of international trade, the cause of which is well worth close investigation. The excess of imports over exports of merchandise in 1928 was £353,000,000, against £386,000,000 in 1927, an improvement in our favour of £33,146,640. Assuming that our "invisible exports" were no greater than in 1927, it would appear that the national income for 1928 from overseas transactions will be not less than £150,000,000, against £99,000,000 for 1927. This considerable increase of income is a valuable addition to our resources.

We have for long been accustomed to the information supplied monthly by the Board of Trade as to the volume and nature of our exports and imports, and we gratefully acknowledge its new departure during 1928 in publishing so quickly information as to industrial production. As time goes on the prompt and regular publication of this class of data will give much more accurate knowledge than has been available hitherto. The published figures relate to about 68 per cent. of the total manufacturing and mining activity of Great Britain and Northern Ireland. The basis of comparison is the year 1924, when the last census of production was taken. Taking the basis at 100, the result estimated for the March quarter of 1928 was 109.5, for June quarter 103.6, and for the September quarter 99.8 per cent.

THE NEW BANK NOTES.

In accordance with the Currency and Bank Notes Act of 1928, on the "appointed day," November 22, Bank of England one pound and ten shilling notes were issued in replacement of the Treasury note issue to which we had grown accustomed since 1914. This very considerable change took place without the slightest difficulty. The Act authorised a fiduciary issue of £260,000,000, as against £18,450,000 before the war. Commencing with the account for the week ended on November 28th last, the Bank of England published a new form of account. Financial critics, quite properly, have often commented on the absence of reliable financial data on which instructed opinion could be formed as to the credit situation of the country. The fuller information now afforded by the weekly accounts of the Bank of England will make it possible to form in the future a much more intelligent view of the position than it was.

THE GOLD POSITION.

The Bank of England gold reserve on December 28, 1927, stood at £151,468,435, and on December 27th last the amount was £153,783,646. The record figure for last year was on September 12th, £176,584,789. There were large withdrawals of gold for export to Germany and the U.S.A. In spite of the variations of the holdings of gold, the Bank rate was maintained steadily at 4½ per cent. throughout the year.

The almost universal adoption of the gold standard and the needs of the various central banks in connection with their currency issues have revived the fears as to the adequacy of the supply of gold. The connection between gold and stability of prices is so intimate that it is of the utmost importance that unnecessary fluctuations in the purchasing power of gold should be avoided. We welcome the decision of the League of Nations to appoint a committee to study these matters.

We are reminded by the forthcoming meeting of distinguished financial experts of the ex-belligerent nations that the question of reparations still calls for settlement. They are asked to formulate "proposals for a complete and final settlement of the reparations problem." Their task demands the utmost skill and courage, and there will be a great feeling of satisfaction and relief over the whole of Europe when a final solution is reached.

THE COTTON TRADE.

The value of British products exported last year was £723,400,000, and of this sum cotton goods and yarns accounted for £145,300,000—that is, 20.1 per cent. Large as this value is, it shows a diminution of £3,491,000 as compared with 1927. The spinning trade which used Egyptian and finer grades of raw cotton had only a moderately good year as compared with 1927. The trade in the finer goods in which Lancashire is pre-eminent was maintained with profitable results. Lancashire made use of artificial silk to a greater extent last year. Our exports of mixed fabrics increased to £7,900,935 in 1928, an advance approximating to 39 per cent. over 1927. The finishing trades have again been prosperous.

The past year has not seen any lifting of the depression which has settled for so long upon the American section of the spinning trade. During the first quarter of the year a larger trade was done, but the demand fell away, and in the summer months production probably did not exceed 60 per cent. In the latter part of the year production was on a much higher scale, running from 80 to 85 per cent. of full capacity. Profits have been made by some of the mills whose capital is on a pre-war basis or only moderately written up; those mills whose capital was reconstructed have, in the main, shown losses. The difficult problem of dealing with the mills whose financial circumstances have caused them to be "weak sellers" still remains. Much thought has been given to this question, and there are welcome signs of definite steps towards reconstruction, and certainly the determination to mend matters has never been stronger or so widespread.

ENQUIRY BY JOINT COMMITTEE OF COTTON TRADE ORGANISATIONS.

For a long time it has seemed essential that a full inquiry into the cotton industry in all its sections should be made. Investigations by groups have been undertaken from time to time, but we welcome the comprehensive inquiry which is now being undertaken by the Joint Committee of Cotton Trade Organisations, which comprises representatives not only of all the trades involved in the production and distribution of cotton goods, but also of the operatives. The secretarial work and the supply of data are being provided by the Cotton Statistical Bureau, which was brought into being owing to the realisation that economic and business information was as vital to the industry as technical research. Several committees have been set up so that every aspect of the industry and trade can be investigated. The first report to be issued is that of the Spinners' Committee, which discusses with thoroughness the questions of financial reorganisation and efficiency. The committee is of the opinion that the "grouping of companies under large-scale amalagamations promises the best basis for financial reorganisation, and for other economies which would follow.

It must be recognised that there are serious difficulties in carrying out this proposal, which implies financial reconstruction, and this, in view of present-day conditions, involves sacrifices. There would also be involved the breaking away from the traditional system of separate ownership and management of the Lancashire spinning trade. But the arguments are convincing as to the economies and advantages which, with adequate financial resources and efficient management, should follow amalgamation. It is common knowledge that during the past months a scheme of amalgamation on a large scale has been in preparation. In general, the proposals of this scheme are such that in the present conditions of the trade, and looking to future developments, the bank has felt it right to give support to them. The alternative of successful reorganisation of the spinning industry seems to be the further closing of mills, with the serious danger of permanent reduction of the cotton trade

TWO ESSENTIALS FOR RECOVERY.

The solution of the spinning industry's difficulties is not to be found merely in financial reorganisation. Two general conclusions reached by the Spinners' Committee have a bearing upon this point. They stress, first, the need for more attention to be given to the cheaper quality of cotton goods if Lancashire is to regain her bulk trade, and, secondly, the possible danger of the loss of much of the trade in finer goods if the industry is not put on a competitive basis. These conclusions are a pertinent reminder of the interdependence of all sections of the industry and of the fact that the organisation of the spinning section alone will not be enough to bring the cotton trade into a state of well-being. The co-operation of every section of the industry is needed if the costs of production are to be lowered sufficiently to recapture our bulk trade.

Some valuable experience of possibilities of co-operation in the nature of vertical combination has been gained from the experiment made last year in which spinners, manufacturers, bleachers, dyers, and merchants combined to produce certain classes of goods for export. The results of this experiment are understood to be encouraging, and though the experience is limited it seems a hopeful direction in which further efforts can be made with success. There is quite clearly at the present time a greater desire for co-operation in the industry than at any time previously, and although progress must necessarily be slow there are grounds in all the circumstances for taking a more hopeful view of the cotton trade than has been possible at any time during the last few years.

The British Cotton Industry Research Association has continued its invaluable research work. That it is warmly appreciated by the industry is shown by the great increase in the number and variety of problems connected with spinning, manufacturing, and finishing of cotton which have been submitted to it for solution.

TRADE'S CONFIDENCE IN EMPIRE GROWN COTTON.

The fact that the cotton trade in a year of depression voluntarily agreed to the levy at the reduced rate of 3d per bale of 500 lb of cotton for a further period of five years shows its confidence is maintained in the policy of developing the growth of cotton within the Empire. What has already been accomplished by the British Cotton-growing Association and the Empire Cotton-growing Corporation is sufficient guarantee that the Empire is capable of producing very large quantities of excellent cotton.

CONDITIONS IN INDIA.

The last monsoon in Indian for the sixth year in succession was a good one, except in regard to a few districts. The balance of trade was again in India's favour, and advantages have accrued from the standardisation of the rupee. Her high credit is shown by the price at which the recent loan was issued in London. The fiscal year 1927-28, according to the report of the British Trade Commissioner in India, was noteworthy if only for the reason that a definite check had been given to the downward trend of the British share of India's imports, which had been such a marked feature of the three previous years. But the Trade Commissioner again calls urgent attention to the necessity of realising the changing conditions of trade and the need for more efficient marketing by British manufacturers and exporters if we are successfully to meet the vigour our and intense foreign competition. The purchasing power of the Indian agriculturist has increased, and we hope that this will be reflected in larger purchases of cotton goods from Lancashire.

The production during 1928 of pig iron and steel showed a diminution of 9 per cent. and 6 per cent. respectively as compared with 1927. Our exports of iron and steel manufactures increased by 148,578 tons, and our imports decreased by 1,524,002 tons on the year.

IRON AND STEEL.

Our steelworks probably did not run more than 65 to 70 per cent. capacity. Much has undoubtedly been done during the past two or three years in reducing costs of production, but the trading results of 1928 were not satisfactory. Competition from the Continent continued to be severe. The trade is alive to the economies which may be expected from reorganisation and amalgamation. Some amalgamations have been announced and others are expected to follow. It is encouraging to note that the December production of steel was nearly 80,000 tons greater than in December, 1927.

Important orders for ships and other constructional work have been placed, and the outlook is thought to be towards an increased demand for steel.

UNEMPLOYMENT.

The end of the first decade since the war finds us with a heavy burden of unemployment, and we cannot fail to have a sense of disappointment that we have not made greater progress. There are, however, at the present time, hopeful signs to be noted. The most obvious and striking of these, perhaps, are the maintenance of industrial peace, the efforts being made by the basic industries towards reorganisation to recover lost ground, the greater appreciation of the value of scientific research in its application to industry, the continued expansion of the newer industries, and the increase in savings; but there are many others. We cannot expect the miracle of an immediate lifting of our depression, but we trust 1929 will show a steady rate of progress in our industrial activities.

THE BALANCE-SHEET.

The report and balance-sheet provide evidence of our strong position. From the figures which are before you, you will see that for the past year our profits, after making full provision for all bad and doubtful debts, were £455,132, and this compares with £452,521 for the previous year. This result, I think you will agree, is very satisfactory. Although trade conditions during the last twelve months have remained unfavourable, these influences have been offset by the fact that the margin between the rates for discounts and short loans on the London money market and the Bank of England rate has been more favourable than in 1927.

After appropriation of £40,000 to the pension fund and payment of dividend which absorbs £347,600, we are carrying forward £325,698, as against £258,166 in 1927.

BANK'S STRONG POSITION.

If you turn to the balance-sheet you will observe that we have maintained our assets in a remarkably liquid state, and that the bank in its long history has never shown a stronger position. Cash, money at call and short notice, and British Government securities together show a ratio of 5 per cent. to our liability on current, deposit, and other accounts, while bills of exchange (including Treasury bills) show an increase of over £1,700,000. I am glad to say that the greater part of this item is represented by fine trade bills discounted by us, our holding of which has also increased during the year. Against this increase there is a decline in our advances to customers and other accounts, which, together with a contraction in the amount of our deposits, may be largely attributed to the continued depression in certain of the important industries operating in the area with which we are associated. You will, however, be interested to know that notwithstanding this depression there is a continuous expansion in the number of customers upon our books.

Liabilities of customers for bank's acceptances, confirmed credits and other obligations, £2,464,878, have increased by £1,435,351. Part of this increase is attributable to a change in method of dealing with certain contingent liabilities incurred on behalf of customers and part to an increase in our acceptances, and at this point I must draw your attention to the liabilities side of the balance-sheet, where you will see that for these items compensating figures now appear under two headings (*a*) acceptances and confirmed credits on account of customers, (*b*) endorsements, guarantees, and other obligations on account of customers, which total £1,807,240 and £657,636 respectively. Acceptances and confirmed credits stand at over £1,800,000, as compared with a little more than £1,000,000 for 1927. The increase represents additional acceptances in relation to the importation of materials, principally raw cotton, and in this connection it is interesting to note that the total imports of cotton into Great Britain from August 1st to December 28th last show an increase of about 460,000 bales as compared with the corresponding period in the previous year.

AGRICULTURAL CREDITS.

The bank has taken part, along with other banks, including the Bank of England, in finding capital for the Agricultural Mortgage Corporation, Limited, which has been created to make long-term loans to farmers under the provisions of the Agricultural Credits Act, 1928. The bank has many branches in country districts, and has always very willingly been at the service of the agricultural industry. This banking assistance will be tendered as formerly, and in addition the bank will help in such special new business as may come forward under the conditions contemplated by this new Act

Before moving the resolution I desire to express to the staff of the bank our appreciation of their valuable and loyal service. In recognition of this service the board have marked the centenary year by a bonus to them and to their colleagues in retirement. I have no doubt that this form of recognition will have the cordial approval of the shareholders.

The Chairman then moved the adoption of the report and balance-sheet. This was seconded and carried.

The retiring directors were re-elected, and the auditors, Messrs Halliday, Pearson and Co., reappointed.

A resolution was passed authorising the directors to carry into effect their proposals in connection with the centenary involving the issue of bonus shares of £1 each, fully paid, carrying a maximum dividend of 10s per cent., in the proportion of one for every two of the existing shares of £15 each, £3 paid, held and also for the sub-division of the existing shares into £5 shares, £1 paid.

The meeting closed with the usual votes of thanks.

TIN SELECTION TRUST, LIMITED.

THE PROBLEM OF VISIBLE STOCKS.

SIR W. D. HENBY REVIEWS THE TIN SITUATION.

The annual general meeting of the Tin Selection Trust, Limited, was held, on the 29th ultimo, at Winchester House, Old Broad street, London.

Sir William D. Henry, Kt., the chairman of the company, who presided, dealt at considerable length with the statistics of the tin market and the prospects of the metal. Although tin producers had been confronted year by year with fresh and often vexatious problems, the tin-consuming industries had furnished at the same time increasing evidence of the insatiable demand of the world for tin. Thus, while in 1927 output had shown the substantial gain of nearly 10,000 tons, due to the stimulus of a constantly rising market price, all the additional metal which accrued in that year found its way straight into the hands of consumers, the world visible supply at the end of that year being rather less than 8,000 tons. Similarly, the output of 1928 had exceeded that in 1927 by nearly 20,000 tons. That was a very notable achievement, but what was even more remarkable, and also most reassuring, was to find that the visible stocks at the end of 1928 had expanded by no more than 4,700 tons. That bore eloquent testimony to the rapid growth of the world's tin-consuming industries.

Moreover, in his recent address to the shareholders of the London Tin Syndicate, Lord Askwith had drawn attention to the probability that invisible stocks of tin in the hands of consuming interests were less substantial than a year ago, even to the possible extent of balancing the increase in the visible stock. Another suggestion which had obtained some currency was that some appreciable portion of the invisible stock was held, not by consumers, but by dealers or speculators, but the opening of the new Metal Exchange in New York coinciding with unusually heavy shipments during December from this side to New York would explain anything that might appear elusive in the stock figures. The fact was, however, that they had a total of 24,563 tons constituting the so-called visible supply of the world at the end of December.

UNECONOMIC SELLING POLICY.

So much for the situation at the end of a year fraught with difficulties and disappointments, and in which the average price had been more than £60 lower than the average of either of the two preceding years. The price difficulty which beset the tin-producing industry lay in the fact that, while buying had always been spasmodic, the basic smelting arrangements compelled daily selling of the metal. The uncertain relationship thus established between producer and consumer was the "causa causans" of all the wild fluctuations witnessed in recent years, and the need for scientific regulations grew ever more insistent.

He would say at once and without fear of contradiction that had the average price not been established in the neighbourhood of £300 per ton during 1926 and 1927, and had the interests concerned with the production of tin failed to show the enterprise and resource symptomatic of those years, then, without a doubt, the industry would have suffered a very severe setback in 1928, there would have been an acute shortage of the metal, and progress in many directions would have been endangered, if not finally cut short, by the forced introduction of substitutes. He would emphasise that, in contradistinction to any of the other non-ferrous mining industries, the tin-producing industry was living to a very considerable extent on its capital. To-day, in Malaya, dredging plant was being designed and constructed at very great cost to dig 100 feet and more from the surface, and half-pound ground was eagerly sought for. Those factors of diminishing reserves, increasing mining difficulties, and more costly and complex machinery were of the most vital consequence to the industry as a whole, and of even greater importance was the constant growth in the demand for tin. For those reasons it appeared to him that a higher price basis was essential in the interests of producers and consumers alike.

CURRENT YEAR'S PROSPECTS.

As to the prospects of the industry for the coming year, while there was thus a good possibility of the demand in 1929 slightly exceeding output, that did not mean that the efforts being made to consolidate the industry could safely undergo any relaxation. Tin was the last of the non-ferrous metals to set its house in order, but, as to the long view, he was confident that everybody connected with the industry was an optimist, while their trust was in a position to profit very largely with every improvement in the situation.

The report and accounts were adopted, and the increase in the authorised capital of 1,000,000 shares of £1 each was also unanimously approved.

WILLIAMS DEACON'S BANK LIMITED.

RESULTS OF A DIFFICULT YEAR.

RATIONALISATION OF INDUSTRY.

MR DEWHURST'S REVIEW OF TRADE CONDITIONS.

The annual meeting of the shareholders of Williams Deacon's Bank Limited was held on Thursday, January 31st, in the board room, Mosley street, Manchester, Mr Gerard Powys Dewhurst (the chairman) presiding.

The Secretary (Mr R. Thorburn) read the notice convening the meeting, and the auditors' report.

The Chairman, in moving the adoption of the directors' report and statement of accounts, said:—

Ladies and gentlemen,—Before proceeding with the business of the meeting I feel sure you would like me to refer to the keen anxiety we have all felt over the serious illness of His Majesty the King. For some two months now we have watched, with the gravest concern, the battle that has been fought at his bedside, and it is with heartfelt gratitude that we have received the reports of improvements contained in te later bulettins, and I think it only fitting that this expression of sympathy with Her Majesty the Queen, and the Royal Family, should be recorded at this meeting.

BALANCE-SHEET ITEMS.

And now, with your permission, I propose to take the report in your hands as read and, if I may, give you my usual résumé of the figures contained in the balance-sheet.

The figures of our capital at £1,875,000 and reserve fund at £1,350,000 show no change, while our deposits are slightly lower by £440,000. On the other hand, acceptances and endorsements on our customers' accounts, taken together, are higher by some £120,000.

ASSETS.

Turning to the other side of the sheet, our cash at £3,635,400 is lower than a year ago by over half a million, and at this figure represents over 11 per cent. on our deposits. Balances with other banks, and our market money are also somewhat reduced, but the next item of bills discounted shows an increase of over a million, more than accounted for by our larger holding of Treasury bills, which, you will appreciate, is our most liquid form of investment. We have also increased our holding in British Government securities by nearly three-quarters of a million, with a corresponding drop in our other investments. Our advances at £17,642,885 show a reduction on the year of over £600,000, while the figure at which our bank premises stand in our books has increased by some £6,000.

As indicated last year would be the case, we have, for the moment, come to the end of our building programme, and I think we have every reason to be satisfied with the value we have obtained for our expenditure in this direction.

PROFIT AND ALLOCATIONS.

Dealing now with the figures of profit and loss, you will see our net profit (after making the usual provisions) gives us a total of £305,340, as compared with £310,583—a decrease of £5,245. This, after transferring £50,000 to contingencies account, enables us to pay a dividend at the rate of 13⅓ per cent. on our "A" shares, and 12½ per cent. on our "B" shares, and to carry forward £27,465 as against £26,031 brought in. If we take into account the conditions prevailing in our heavy industries, and particularly in the cotton spinning trade, the diminution of profit actually earned by the bank is not difficult to appreciate, especially if we realise that all interest has to be foregone in cases where mills are working under schemes of arrangement. At the same time I would like to emphasise the fact that the profit-earning capacity of the bank is distinctly encouraging, whether judged by the Clearing House returns, which show that both in London and Manchester our proportionate figures give us a steady increase year by year, or by the gratifying number of new accounts opened.

TRADE DURING PAST YEAR.

As regards the year under review, I am afraid the position in our heavy industries has shown no improvement during this period, as evidenced by the deplorable figures of unemployment and the diminished goods traffic returns of our railways; in fact, the only satisfactory feature we can look back upon would seem to have been the freedom from labour disputes during the year, owing to the distinctly better spirit prevailing between capital and labour.

RATIONALISATION OF INDUSTRY.

On the other hand, indications have been given in the coal, cotton, iron and steel trades of concerted efforts to deal with the present situation by various methods, all of which have come to be known as the rationalisation of industry. If by this term, we can visualise the amalgamation of a number of units in a distressed industry, mainly occupied hitherto with internal competition, harassed with the incidence of high interest charges, and excessive overhead costs, which, as a preliminary, have decided to cut out from their respective concerns all dead assets and write off unproductive capital, and have further arranged with their existing creditors to make the sacrifices necessary before fresh capital can be raised, then I think we can all appreciate the benefits that should accrue to such an amalgamation, through the bulk purchases of its requirements, economies in administration, concentration of units on their respective specialities, and organised marketing of its production, all devoted to one aim and object, namely, to improve its competitive power in the world's markets—if that, gentlemen, is an accurate definition of rationalisation, then I feel that none should have more sympathy with such a trend of movement in industry than the banks. If I have elaborated this idea somewhat, it is because in Lancashire to-day we have two concrete instances of its possible application, each differing widely in its methods and procedure, but both with the same ultimate objective—the recovery of our export trade.

EASTERN TEXTILE ASSOCIATION.

In the first instance, during the year we have seen the formation of the Eastern Textile Association, a vertical combine formed by the voluntary association of those interested in manufacturing, bleaching, dyeing, and shipping of certain standard makes of piece-goods destined for the Far East, the idea being that the association operating under the guarantees of its constituent members, who, in their turn, perform their respective functions at practically net cost to themselves, will endeavour by continuous shipments to furnish markets abroad with regular supplies at a competitive price. A most interesting experiment, if only for the light it will throw on the vexed question as to whether Japan's big increase of trade with China can be ascribed to her lower costs of production, or to her improved methods of distribution. In the meantime it is good to know that the excellent pioneer work already done in this direction has given encouraging results, and holds a definite promise of further development.

LANCASHIRE COTTON CORPORATION.

The other instance to which I referred is of an entirely different nature, involving a serious attempt to deal on the lines of a large scale amalgamation with those engaged in spinning coarse and medium counts of American yarn. It is to this section of the industry that the conditions of rationalisation to which I have referred are specially applicable, and only last week it was announced by the Yarn Association, as a result of negotiations extending over the whole of the year, that they had registered their new combine under the title of the Lancashire Cotton Corporation, Limited. The principal creditors of the mills concerned have agreed to surrender their secured position and accept securities on which interest is contingent on earnings, and as a consequence it has been possible to arrange the introduction of adequate fresh capital. The first names for the board of directors have been announced, and obviously command our respect, and I feel confident a seat on the executive of this combine will in the near future be an attraction to the best brains in the industry. Individual hardships there will doubtless be, and a common measure of sacrifice demanded from all interests concerned, but I am sanguine enough to believe that for the sake of the industry such sacrifices will be freely made.

TRIBUTE TO CORPORATION'S CHAIRMAN AND DIRECTORS.

One word more on this subject, this scheme has in some quarters been called a bank scheme—nothing could be further from the truth. The progress so far gained has been entirely due to the unwearying efforts of the new chairman and his directors; in fact, I am afraid those labours have been intensified by the attitude we, in common with other creditor banks felt bound to take, on principle, on the question of the surrender of our secured position. Apart from that, of course, our help and advice have always been

at their disposal. Personally, I look forward to this combine including amongst its constituent members others than those who are suffering from financial embarrassment. Firms and businesses who can bring old-established connections and valuable goodwill doubtless will appreciate the advantages of co-operation within its ranks. Nor do I feel that the operatives can fail to recognise the importance to their interests of this conscientious attempt to promote trade and employment by the recapture of lost markets.

COAL TRADE.

With regard to the other main industries of the country in which we are interested we find the coal trade has lost ground, the figures both of production and export showing a decrease during the year, while the numbers of men out of employment in the industry show a deplorable increase. At the same time, determined efforts are being made to deal with the situation, and, amongst others, we may note the conference held to discuss the formation of a national coal marketing scheme, through which it is hoped unnecessary expense incurred between pit head and consumers' prices may be eliminated, while nearer home a Lancashire coal fusion scheme has been announced for the amalgamation of some eleven important undertakings.

IRON AND STEEL TRADES.

Doubtless also, as in the iron and steel trades, material assistance may be anticipated in the future through the operation of the Government's De-Rating Bill by the remission of 75 per cent. of the rates on productive industry, but it appears that in all these heavy industries the crying need is the provision of fresh capital to be applied to the reconditioning of existing plant and machinery, and in this direction surely a lesson can be learnt from France and Germany. On the termination of the war both these countries, for different reasons, were forced under pressure of circumstances to reorganise their heavy industries, which, though involving large expenditure on plant and machinery, enabled them to profit by the latest inventions and most up-to-date methods, with the result that the Agent-General for Reparations reports that Germany has been re-established as a going concern on a relatively high level of economic activity, and we find that France's export of coal, iron and steel, and machinery is much greater in volume than before the war, while her figures for unemployment are negligible. As a contrast, we in this country, with the idea of scaling up the standard of living, have elaborated vast schemes of social services, the cost of which, through the incidence of rates and taxes, has proved a big handicap to our export industries.

During the year further progress has been made in the direction of stabilising foreign exchanges; France, Norway, and Greece having fixed their currencies on gold or gold exchange standard, while London has demonstrated its power to resume its rôle of a free market for gold. In the spring of the year, on account of the exchange, gold came here from New York; but in the autumn, in spite of high money rates in that centre, exchange was kept steady, and the authorities were able not only to avoid the necessity of a rise in Bank rate here, but to meet the demands for gold from Germany and France.

TRIBUTE TO EXECUTIVE AND STAFF.

In conclusion, gentlemen, I trust you will allow me, in your name, to offer our usual vote of thanks to the executive and staff for their loyal and efficient service to the bank during the year. In these difficult times, especially in the higher ranks of service, responsibilities tend to increase and the work become more arduous, and I am sure you will agree that we all owe a debt of gratitude to the officers and members of the staff for their efforts on our behalf.

NEW DIVIDEND DATE.

Before I sit down there is a small matter of domestic routine for which I should like your approval. We propose in the future to vary the date upon which our dividend will be paid, and thereby bring ourselves into line with the other banking companies by issuing our warrants about the end of January and July. When, as happened this year, our first board meeting of the year was within four days of our making-up date we find it more convenient to make our declaration of dividend at our second meeting in the year, this year on the 10th inst. You can easily see what a difficulty this brings about in attempting to pay the dividend on the 16th of the same month, and I am sure you will very willingly grant us the concession of the extra two weeks in order to avoid the difficulties in future.

I have now pleasure in proposing "that the report and accounts now presented be received and approved, and be entered on the minutes of this meeting."

Mr B. G. Wood (the deputy-chairman) seconded the motion, which was put to the meeting and carried unanimously.

Sir Charles Mandleberg then moved, and Mr James Fortune seconded, the re-election of Col. Sir Robert Williams, Bart., and Mr Thomas Frederick Tattersall as directors of this company, which was agreed to.

Mr Walter P. Cobbett moved and Major Murray Marsden seconded the election of Messrs Ashworth, Mosley and Co., Chartered Accountants, as auditors of the company for the year 1929, and it was carried unanimously.

Mr B. G. Wood (deputy-chairman) then took the chair, when, upon the motion of Sir William Barton, seconded by Mr Lewis A. Orford, "the best thanks of the meeting were tendered to the chairman for his conduct in the chair."

The motion was carried with acclamation, and the chairman having briefly responded, the meeting terminated.

SEDENAK RUBBER ESTATES, LIMITED.

STRONG POSITION—FURTHER REDUCTION IN COSTS.

The ordinary general meeting of Sedenak Rubber Estates, Limited, was held, on the 25th ultimo, at Winchester House, London, Mr Philip C. Turnbull, O.B.E. (chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said that notwithstanding the fact that the net profit for the year under review was considerably less than that earned in the 1927 period, he did not think this would surprise them in view of the marked fall in commodity prices that had occurred. The price factor was one over which they had no control, but he thought the most encouraging feature as shown by the accounts was the further reduction in costs that had been achieved. Comparison of the f.o.b. Singapore costs for the last three years was as follows: 1926, 8.79d per pound; 1927, 8.23d per pound; 1928, 7.62d per pound.

It was anticipated that unless unforeseen circumstances arose during the current year, and provided they were able to harvest the estimated crop of 1,236,000 lb, this year would show a continuation of the good work, and would result in the f.o.b. cost per pound being approximately 6d.

The average selling price per pound for the year was 11.09d, equivalent to 1s 0½d per pound London. When it was realised that this price was 6¾d less than the price obtained for 1927, he though they would agree that the working of the company during the last year was satisfactory.

During 1928 they were fortunate in having a forward contract for 12½ tons per month, with a minimum price of 1s 2d per pound, and this naturally proved of material assistance. So far as 1929 was concerned, they had contracted for eight tons monthly during the year of Singapore standard ribbed smoked sheet, with maximum and minimum prices equivalent to London figures of 1s 3d and 9d respectively.

As regards the future, the shareholders might feel confident that so long as rubber did not fall below, say, 8d per pound, the company could work at a profit. The balance-sheet showed their reserve and profit and loss accounts totalled approximately £60,000, against which they had investments in Government securities of £32,511 15s 11d, apart from actual cash at bank and on deposit.

The book cost of their estate was approximately £50 per planted acre while the capital cost was £44 10s. If the above figures were borne in mind, no undue apprehension need be felt when contemplating the future working of the company.

In considering the dividend, the directors had followed their customary conservative policy, and had allocated £2,500 to be transferred to the reserve account, increasing the latter to £32,500, which represented the actual cost of Government securities held.

The report was adopted, and the dividend recommended approved.

NATIONAL MUTUAL LIFE ASSURANCE SOCIETY.

PROPOSED CENTENNIAL BONUS.

A NEW SERIES OF POLICIES.

MR. J. M. KEYNES'S INTERESTING REVIEW.

The annual general meeting of the National Mutual Life Assurance Society was held on Wednesday, January 30th, at the society's house, 39 King street, Cheapside, London, E.C.

Mr J. M. Keynes, C.B. (the chairman), said: Gentlemen,—Our profit of 1927 has been exceeded in 1928 by a comfortable margin, a small reduction in trading profits being more than balanced by increased capital profits. Our gross profits amount to £249,445, compared with £226,481 in 1927 and £150,465 in 1926.

Our total capital assets have yielded over the year, in interest and appreciation, approximately 7 per cent. per annum, free of income-tax. Taking all sources of profit together, we have now earned over a period of no less than 10 consecutive years an average annual bonus in excess of 9½ per cent., whereas the amount which we have actually distributed to with-profit policyholders has been about half this sum. Each year we have hesitated to regard our good success as other than abnormal, and, in particular, we have reserved the whole of our capital gains so that they should be available to meet a possible depreciation of our securities. It is obvious, however, that this piling up of reserves cannot go on indefinitely, and that it would be unfair to the existing generation of policyholders, and indeed contrary to the principles of mutual life assurance, not to divide the excess beyond the reserves (actuarial and otherwise) which are properly required to secure the society's financial stability. I am, therefore, authorised by the board to make to you a preliminary announcement as to our intentions. We are now entering our hundredth year. At the conclusion of this year we propose to distribute a large special centennial bonus in addition to the ordinary bonus of the year. This bonus will not be at a uniform rate, but will be distributed with due regard to all the equities, and I hasten to add that new policies taken out in 1929 will not participate in the special bonus, unless it be in respect of profits earned during 1929.

CELEBRATING THE CENTENARY.

We are also celebrating our entry into the hundredth year of our activities by initiating a new series of policies (in addition to our existing series, which will be continued for the present unchanged) on lines which will, I think, be of high interest to intending policyholders and to the life assurance world generally. We have not revised our rates of premium for with-profit whole-life policies for over 30 years. Yet the diminished rates of mortality, the better initial selection of lives as a result of the progress of medical science, and increased opportunities for employing advantageously the fund represented by the accumulated premiums, have continued to reduce materially the rates of premium which it is necessary to charge to secure a given initial sum assured. The result is that we, in common with other life offices, have drifted into a situation in which too much of the benefit of a given rate of premium is given in the shape of bonuses which will accumulate only in the course of years and too little in the shape of the initial sum assured—too much and too little, that is to say, from the point of view of those whose primary object is protection against the risk of premature decease.

In short, life offices have not revised their terms proportionately to the change of conditions, with the result that the margin between the amount of the policy which they contract at the outset to pay for a given premium, and the amount for which they could afford to contract, has become much greater than is required by considerations of caution. This does not matter in the end to the policyholder who lives a long time, for he gets the excessive margin back again in the form of reversionary bonuses. But it matters very much in the beginning to a policyholder—even though he does in fact live to a ripe old age, who wants security in the years immediately after he takes the policy out.

We propose, therefore, to institute a new series of with-profit policies, the rates of premium on which are calculated with reference to modern life assurance experience. Bonuses on this series will be paid over a period of years in accordance with what the series is able to earn, the rate of bonus for the first year being guaranteed at the rate of 15s per cent. compound. This enables us to offer a whole-life with-profit policy on which the premium to secure a given initial sum assured is from 25 per cent. to 20 per cent. less than for a corresponding policy in the old series, In effect we are offering with-profit policies at rates of premium practically equal to those which were quoted until recently for non-profit policies. Such figures should, I think, impress the young married man with the solid advantages in the shape of security for his family which can be obtained in return for a very modest outlay.

GENERAL ECONOMIC PROSPECTS.

The business of life assurance is so sensitive to economic and industrial conditions that it will not be out of place for me to say a little, as in former years, about the general economic prospects. In 1923 I said "those who are employed are probably producing on the average about 10 per cent. less than formerly for approximately the same real wage. Without great improvements in the technique and intelligence of trade and industry it looks doubtful whether, on these terms, we shall be able to employ the whole employable population except at the very top of the periodic booms." In 1926 I pointed out that almost no progress at all had been made towards the adjustment of gold costs to production which the return to the gold standard had rendered necessary. The question of the relationship of wages to the efficiency of production still seems to me to lie at the heart of our problem.

Recent calculations by Professor Bowley have made possible some very interesting generalisations. Between 1914 and 1924 average real wages for the normal week (full employment) rose by more than 8 per cent. During the same period the weekly hours of work were reduced by more than 10 per cent. The result was that employers were set the task, if they were to maintain their pre-war position, of increasing efficiency by nearly 20 per cent. The Census of Production of 1924 indicates that the increase of efficiency was just about sufficient to balance the shortened hours, but was not able to make, in addition, any contribution towards meeting the increased weekly wage. Thus already in 1924 employers, in those industries in which the increase in efficiency had not been more than above the average, were making heavy weather. Between 1924 and 1928 money wages have remained practically unchanged, whilst the return to the gold standard at the pre-war parity has had the effect of increasing real wages by a further 8 per cent.

TASK OF EMPLOYERS.

It follows that employers have been faced with the task of improving efficiency by 16 per cent. as compared with 1924, before they can recover their pre-war position. Now it is not over-optimistic, I think, to suppose that efficiency is, in fact, being increased at the rate of (say) 1½ per cent. per annum over the average of the whole field of industry—which, if it is the case, is a considerable achievement. This means that to-day, in 1929, the deficiency has been reduced from 16 per cent. to about 10 per cent. But the depressing feature of the situation is the fact that at this rate it may be another five or six years before we are quite straight. The change in the value of our money in 1924-25, coming on the backs of industrialists already weakened by the course of events since 1914, has naturally contributed to prolonged unemployment in all those industries of which the strength is not above the average.

Since it is impracticable and unwise to reduce wages, the only solution is to be found in accelerating the increase of efficiency, and in so conducting our international monetary diplomacy as to avoid a further fall in the level of world prices. But we might also mitigate unemployment if we were to endeavour—for a time—so to conduct our national investment policy as to direct our savings into those channels which are likely to provide immediate employment at home, rather than into those which are likely, in the first instance, to embarrass the reserve position of the Bank of England by the burden which they throw on the foreign exchange.

The chairman concluded by moving the adoption of the report and accounts.

Mr. Charles T. D. Burchell (deputy chairman) seconded the motion, and it was carried unanimously.

The retiring directors, Mr Gordon Leith, C.B., C.B.E., Sir William McLintock, K.B.E., C.V.O., and Mr Geoffrey Marks, C.B.E., F.I.A., were re-elected; the auditors, Mr G. S. Pitt, F.S.A.A., and Messrs Ball, Baker, Ash and Co. were reappointed, and a vote of thanks to the chairman, directors, officials, and staff concluded the proceedings.

THE INVERESK PAPER COMPANY, LIMITED.

GRATIFYING RESULTS.

"PROVINCIAL NEWSPAPERS, LIMITED."

MR WILLIAM HARRISON'S REVIEW OF POSITION AND PROSPECTS.

The sixth annual general meeting of the Inveresk Paper Company, Limited, was held, on the 30th ultimo, at the North British Station Hotel, Edinburgh. Mr William Harrison, LL.B. (chairman), presided.

The Chairman, in the course of his full review, said:—Since our last annual general meeting, held on January 19, 1928, the nominal share capital of the company has been increased by £1,950,000 by the issue of 1,500,000 6½ per cent. first cumulative preference shares, 150,000 7 per cent. second cumulative preference shares of £1 each (which latter shares were distributed among the old 8 per cent. cumulative preference shareholders in consideration (*inter alia*) of their reducing their dividend to 7 per cent.), and 300,000 ordinary shares of £1 each. The old 8 per cent. first cumulative preference shares and the 6½ per cent. "B" preference shares in existence last year were consolidated in October last into 7 per cent. second cumulative preference shares, and the £150,000 6½ per cent. debentures originally issued by the company in 1922 have been redeemed during the course of the year.

The result of this rearrangement of the capital of the company will, in my opinion, prove beneficial to the company, and I think you are well aware of the reasons for this increase of capital, but it might not be out of place if I here reminded you that this increase became necessary to enable us to pay for the controlling interest in the *Daily Chronicle* and the *Hull Daily Mail* groups of newspapers, and in addition to reduce loans which we had incurred for the purpose of paying for large extensions to buildings and plant at various mills owned by our associated companies.

The paper trade, like the general trade of this country throughout 1928, was by no means satisfactory, and I can assure you that the results which we now review are gratifying to us as directors and, I hope, to the shareholders, when it is borne in mind that nearly one half of our present issued share capital was only raised towards the end of our financial year, and was responsible for no part, worth mentioning, of our profits.

Our accounts for 1928 cover a period of one year and five days, and the extension of these five days merely means that we get the benefit of the working of our one mill at Inveresk for this short period.

Last year's accounts covered one year and 24 days, but the extension of 24 days merely meant that we got the benefit of the extra working of this number of days at our Inveresk mill. As you will see from the accounts for 1928, we show a gross profit of £493,950 5s 4d, compared with £375,634 last year, that is to say, there is an increase in profits this year compared to last year of approximately £118,000. After adding the balance brought forward from last year to the profits shown in the accounts, the amount available is £589,388 18s 8d, from which we deduct £15,000 for depreciation on the Inveresk mill, £6,876 13s 2d for debenture interest paid on the debentures now redeemed up to the time of redemption, directors' fees for the year under review £3,335 17s 1d, and bank interest, registrars' fees, &c., £61,286 3s 1d, amounting in all to £86,498 13s 4d, leaving a balance available for distribution of £502,890 5s 4d.

THE DIVIDENDS.

Out of the latter sum we have paid during the year the following dividends—namely:—

The dividend for one year on the 8 per cent. preference shares to June 30, 1928, less tax, amounting to £38,400; the dividend for the same period on the 6½ per cent. "B" preference shares, amounting to £31,155 0s 5d; an interim dividend of 12½ per cent. on the ordinary shares, less tax, amounting to £100,000; and in addition we have paid out of last year's profits a dividend on the old 8 per cent. preference shares from July 1, 1928, to October 4, 1928, being the date of conversion of those shares into 7 per cent. second preference shares, less tax, amounting to £10,000, and a dividend on the 6½ per cent. "B" preference shares for the same period up to the date of their conversion into 7 per cent. second preference shares, less tax, amounting to £8,108 5s 10d, making a total in all of dividends so paid of £187,663 6s 3d, thus leaving available, subject to taxation, £315,226 19s 1d.

I should here like to interpolate and stress the point that out of this year's profits, compared to last year, we have not only paid the full year's dividend on the 8 per cent. and the 6½ per cent. old preference shares, but we have in addition paid £18,108 5s 10d in net dividends for the period from July 1st to October 4th, when the conversion took place in these shares. The result is that out of this year's profits we have paid the two latter dividends, amounting to £18,108 5s 10d, which in the ordinary course of events would have fallen for payment out of our 1929 profits.

Under these circumstances our total net preference dividends payable out of our profits in 1929 will only absorb £109,278, which is an item worthy of consideration so far as our ordinary shareholders are concerned.

Income-tax, which is still a great drain on industry in this country, calls for the large provision of £90,000, which is equivalent to a dividend of nearly 7 per cent. on the present ordinary share capital of the company. In my view, if the income-tax on profits of a company were half the present rate, it would not only play a great part in restoring confidence which industry in this country so much needs, but the Chancellor of the Exchequer would not be the loser in revenue, as prosperity in industry should easily make good such a reduction in taxation.

We recommend to you the payment of a final dividend of 12½ per cent., less tax, on the ordinary shares for the twelve months ended November 30, 1928, making 25 per cent. for the year, calculated so far as the shares recently issued are concerned from due dates of payment. This final ordinary dividend, less tax, calls for £101,027 8s, and we find ourselves left with £124,199 11s 1d to be carried forward to next year, which is an increase of nearly £30,000 over the carry-forward of last year.

PROVINCIAL NEWSPAPERS, LIMITED.

The Chairman then reviewed in detail their various companies, and proceeding, said: I would like to draw your attention to this new company which we are now in process of forming with a nominal capital of £3,000,000, divided as to 1,000,000 6½ per cent. first cumulative preference shares, 1,000,000 7 per cent. second cumulative preference shares, and 1,000,000 ordinary shares, for the purpose of amalgamating and carrying on the businesses of the *Edinburgh Evening News*, the *Yorkshire Evening News*, the *Doncaster Gazette*, the *Lancashire Daily Post*, the *Preston Guardian*, the *Blackburn Times*, the *Burnley News*, the *Daily Mail* (Hull), the *Hull and Yorkshire Times*, the *Hull and Lincolnshire Times*, the *Hull News*, the *Hull Evening News*, the *Eastern Morning News*, and the *Grimsby Telegraph*. These newspapers are controlled either directly or indirectly by us, and the amalgamation is entirely a domestic operation for the purpose of eliminating intermediate holding companies so far as these newspapers are concerned. It will be one of the most powerful groups of provincial newspapers in Great Britain, and, I think, one of the most prosperous. The average yearly profits available for dividend and earned by the various newspapers to be amalgamated into the new company for the four years ended December 31, 1927, were nearly £240,000. The figures have been certified by Messrs Peat, Marwick, Mitchell and Co., the well-known chartered accountants. The profits earned by these various provincial newspapers for 1928 are substantially in excess of the average figure mentioned above, and it is estimated that for 1928 they will be approximately £300,000.

TO SUM UP.

To sum up our various undertakings. I would draw your attention to our reserve fund, which now stands at £1,851,180, and in the next place to our investments. In the opinion of my colleagues and myself, the value of our investments is substantially in excess of our book figures. We have, in accordance with our established practice, allocated for social welfare at our Inveresk Mill for this year £5,000, and we are satisfied that you, as proprietors, will agree to this policy of close association and comradeship with our workers. In the directors' report reference is made to our recent expenditure on extensions to buildings and plant at the works of our associated companies, amounting to over £1,500,000. The last of these large extensions is at Northfleet, and should be completed by the end of March and in full working order by that time. We are now practically at the end, so far as this company is concerned, of capital expenditure, which I am satisfied has been well and truly spent, and will materially add at an early date to the revenue of your company. I have no hesitation in saying that we have equipped our mills during the last two years with new plants which are fully equal to anything in the papermaking industry, not only of this country, but in the world. I am satisfied that with these new plants in full operation we shall be in a position to meet competition from whatever souce it made arise. It will naturally take time for these new plants to settle down, but once this state of things is arrived at, our profits should expand rapidly and permanently.

"DAILY CHRONICLE" GROUP (UNITED NEWSPAPERS LIMITED).

In addition to this large capital expenditure on new plants, from which, I again desire to emphasise, we have derived no revenue in 1928 worth mentioning, I should like to remind you that we locked up, in October last, £1,142,000 for the control of the "Daily Chronicle" group of newspapers from which, this year, quite rightly, we have derived no income whatever, although we have had to meet charges in our profits in respect of money borrowed in relation to this acquisition. I am glad to say that Mr J. C. Akerman, the assistant general manager of "The Times," joined us on the newspaper side of our business on January 1st and has been appointed managing director and vice-chairman of the "Daily Chronicle" group and also of the Provincial Newspapers, Limited, and I am already satisfied from my knowledge of him that with his wide experience of newspapers he will be a tower of strength to our organisation. The profit for the year, subject to income tax, amounts to £245,220 and it is proposed to pay a final dividend of 25 per cent. on the ordinary shares in the United Newspapers, making 30 per cent. for the year, less tax, which is the same as last year. The balance brought forward from 1927 was £201,304 and after the payment of the said dividend the balance carried forward for 1929 will be approximately £206,000.

GENERAL OUTLOOK.

Finally, the Chairman referred to general industrial conditions, observing that there could be no real improvement in the economic position of this country until the heavy trades—coal, iron and steel—were set going again, and perhaps the happiest augury of the future was the small but definite amelioration of conditions in these trades which had begun to show itself. Whatever party found itself in power after the General Election must promptly set about organising work for the unemployed on a large scale, and public work of this character, if conceived and carried out on large lines, must lead to a growing demand for basic materials. Once the machine was started, it should not take long to create the necessary impetus which would bring about a great national revival of industry, of which this country was so much in need.

No questions were asked, and the resolution for the adoption of the report and accounts were passed unanimously.

H. YAGER (LONDON), LIMITED.

INCREASE OF CAPITAL APPROVED.

The first annual general meeting of H. Yager (London), Limited, was held, on the 31st ult., at Winchester House, London.

Mr H. Yager (the chairman) said that as regarded their investment of 200,000 shares of 1s each in Yagerphone, Limited, valued on the Stock Exchange at £35,000, no credit for that increasingly valuable asset had been taken in the accounts. The profit and loss account showed a balance of £48,811, and, after paying the final dividend on the 8 per cent. cumulative participating preference shares to December 31, 1928, together with an additional 2 per cent. for the year ended November 30, 1928, they proposed to pay a dividend of 20 per cent. on the ordinary shares. For the first few months of the company's existence the output at Ponders End had necessarily suffered very largely from reorganisation of the workshops and re-planning of the lay-out of the factory generally and the installation of additional machines, so that, although they were dealing with the profits for 14 months, the factory had only been able to reflect normal profits on the basis of the original capitalisation for about nine or ten months. In view of that it was calculated that, based upon the trading results of the last nine months of the period under review, the profits as estimated in the prospectus at the rate of £75,000 per annum had, in fact, been exceeded during that time.

For some time past it had been impressed upon the directors that additional finance could be extremely profitably utilised. They were continually having offered to them business of much greater volume than they had ever anticipated, and at most favourable prices, and the directors, therefore, strongly advised increasing the capacity of the factory by erecting and equipping additional workshops. Then they also had to consider the giving of extended credit in the case of the hire-purchase section of the trade. He was confident that the additional capital available from the proposed issue would prove to be as fully remunerative as that previously at the command of the company.

The report and accounts were unanimously adopted, and a resolution was passed increasing the capital of the company to £500,000 by the creation of a further 175,000 8 per cent. cumulative participating preference shares of £1 each and 500,000 ordinary shares of 1s each.

GEORGE HODSMAN AND SONS (1928), LIMITED.

EXCELLENT PROSPECTS—DIVIDEND ANNOUNCEMENT.

The statutory meeting of George Hodsman and Sons (1928), Limited, was held, on the 30th ultimo, at the Cannon street Hotel, London, Mr Percy V. Sherwin (the chairman) presiding.

The secretary (Mr James H. Lyden) having read the notice convening the meeting,

The Chairman said that the business acquired by the company has been established for 40 years. The assets acquired comprise High Force Quarries at Middleton-in-Teesdale, estimated to contain upwards of 30,000,000 tons of whinstone—which is generally regarded as the best available material for road-making—the freehold of the Grosmont slag works near Whitby, with reserves of approximately half a million tons of best quality slag, and an enormous dump of best blast furnace slag at Port Clarence, near Middlesbrough, computed at approximately 1,500,000 tons. In addition, we acquired a property at Ipswich with drying, screening, and mixing plant capable of dealing with 50,000 tons of material per annum, the value of which as a distributing depot will be obvious when it is remembered that there is little or no natural stone to be found in East Anglia. Upon these assets there is no mortgage or charge of any kind, and we may, I think, congratulate ourselves that in acquiring for £160,000 the goodwill and business of an undertaking of 40 years' standing, with tangible assets valued at £217,000, we have carried through a very satisfactory business transaction.

CONTRACTS SECURED.

Contracts taken over from the vendors together with those since entered into by your company for the supply of road-making materials comprise contracts with seven county councils, ten urban district councils, 21 rural district councils, six town or city authorities, and six corporations. In addition, the company sells to various railway companies from time to time such quantities of materials as they may require.

We are at the present time tendering for numerous fresh contracts. Total of contracts in hand at the present time is greater than at any time of our public issue, and also greater than at this time last year.

Your directors believe that the British road-making industry is entering upon a period of greater activity than ever before. The enormous growth of motor traffic renders the provision of wider, safer, more durable highways an urgent national necessity. At the present time it is estimated that there are well over 100,000 miles of roads in this country which are unfit for present-day traffic needs, while it has been demonstrated by a popular daily newspaper that the work involved in the provision of only a small proportion of the highways needed would go far to solve the unemployment problem. It is believed that very important measures will be taken in the near future for the provision of more adequate financial facilities to enable large schemes of road construction and improvement to be carried out, and your directors look forward with confidence to securing for your company a full share of the resulting contracts for the supply of road materials.

The transfer of responsibility for road construction and maintenance from rural district councils to county councils, which is now contemplated, is regarded as likely to lead to increased demand for the best quality materials, in which we are principally interested. In addition, we have had during the past few days an announcement by the Chancellor of the Exchequer of increased grants to local authorities from the Road Fund.

HALF-YEAR'S RESULTS.

Now, although this is only the statutory meeting of the company, you will, no doubt, be interested to hear something concerning the position and prospects of your company as a profit-earning enterprise, and I am in the happy position of being able to assure you that the profits for the half-year to December 31, 1928, are regarded by the directors as satisfactory. We acquired this business as from June 30, 1928, and it is proposed that profits earned during the four months prior to the incorporation of the company shall be utilised in writing down preliminary expenses. In view of the results for the complete half-year your directors propose to declare an interim dividend in respect of the period to December 31st last at the rate of 10½ per cent. per annum upon the issued preference share capital and at the rate of 16 per cent. per annum upon the ordinary shares. In arriving at this decision your directors believe that they are not exceeding the limits of prudence and discretion, and that they may reasonably hope at any rate to maintain these rates of distribution in the future.

From what I have told you I think you will agree that we have in this company's business an enterprise which is possessed of excellent prospects for the future, and I personally believe that we hold here an investment which will prove as sound and reliable as the British roadstone in which we trade.

A vote of thanks to the Chairman concluded the proceedings.

ASHANTI GOLDFIELDS CORPORATION, LIMITED.

STEADY PROGRESS.

The 32nd annual general meeting of Ashanti Goldfields Corporation, Limited, was held, on the 30th ult., at the Holborn Restaurant, Holborn, London, Mr Jeremiah Colman, J.P., presiding.

The Chairman, in moving the adoption of the report and accounts, said that in the balance-sheet they would notice that the capital of the company still stood at £250,000, and it was an interesting fact that it had not been increased since the formation of the company 32 years ago.

The reserve account was £200,000, and if the recommendation of the directors was approved, the addition of £50,000 would bring it up to the same figure as their capital. The sum represented by this account had been invested in the undertaking in an exactly similar manner to the share capital.

The creditors' and sundry credit balances in London and West Africa, totalling £59,026, were £5,120 more than the previous year. The remaining item on this side of the balance-sheet was the profit and loss account, with which he proposed to deal in more detail in the course of his remarks. On the other side of the balance-sheet the purchase of their lease and the additional firewood concessions remained the same. The plant, machinery, and works account showed a net increase—after deducting depreciation—of £13,260.

The investments standing at £59,700 included more than three-quarters in Government securities.

The last item on the balance-sheet, viz., cash in hand and bullion (since realised) standing at £175,714, was £13,766 more than at the corresponding period last year.

INCREASED PROFIT.

Turning to the profit and loss account, the profit earned, viz., £163,440, was just over £22,000 more than that of the previous year. The tonnage treated was somewhat larger, but the use of coal in the steam plant, instead of firewood, during the whole of the year was mainly responsible for the increase of 2s 1d in the "cost per ton" figure.

Coming to the disposal of the profit earned, they had already paid an interim dividend of 25 per cent., and they now recommended the payment of a final dividend of 30 per cent., making 55 per cent. for the year, as against 50 per cent. in the previous year. Sanction was also asked for the transfer of £50,000 to the reserve account. This would leave a balance of £59,176 to be carried forward.

STRONG ORE RESERVE.

The outstanding feature of the mining position was the fact that they had over half a million tons of good grade ore in the reserves, or, in other words, sufficient to feed the treatment plant for 5½ years at the present rate of crushing. Being in such a satisfactory position, they could take time and full consideration before making further moves in the direction of prospecting the reefs. This was a point of importance, for the new make was behaving in a somewhat erratic way. At No. 23 level the gold values were disseminated over great widths, and it would not pay to work it. They were still looking for it at No. 19 and No. 20 levels. The latest developments in the south-west ends of both 21 and 22 levels were encouraging, both in respect of widths and values. They had, too, recentiy cut the new make at 24 level, where, at the point of intersection, it gave low values, but they hoped for better results as development proceeded north-east.

In the Obuasi chute, crosscuts at 22 and 23 levels had been put out to test the ore-body, and as they would have gathered from the consulting engineer's report, this reef was now beginning to look up again,. For instance, No. 4 crosscut N.E. on 22 level was 39 feet wide, averaging 40.5 dwt and No. 4 crosscut N.E. on 23 levels was 23 feet, averaging 23.4 dwt per ton. In fact, these two levels showed marked improvement over the results at 20 and 21 levels.

At the last annual meeting he had referred to their interest in Bibiani (1927), Limited, and informed them of the intention to increase the capital of that company, for the purpose of dewatering the mine and carrying out some further development. The authorised capital had been duly increased to £100,000 and the £44,000 offered was readily subscribed by shareholders in the Ashanti Company and the Bibiani Company. The programme of work laid down was proceeding vigorously at Bibiani.

Sir George Lawson Johnston (vice-chairman), in seconding, said that the head of a very important group of newspapers had proclaimed a Socialist Government for this year.

The fear of Socialism might justify a slump in many shares, but not, he thought, in the case of those of a gold producer like their own company. Gold would have its world market quite apart from what happened in England, and, in fact, the more a country's credit was damaged, the larger was the proportion of gold required to bolster up what remained of its credit.

The reports and accounts were unanimously adopted.

KERR, STUART AND COMPANY, LIMITED.

DEVELOPING SPECIALISED LINES.

The 18th annual general meeting of Kerr, Stuart and Co., Limited, was held, on the 28th ult., at Winchester House, London, E.C.

Mr H. Langham Reed (chairman and managing director) said that after setting aside £18,978 for depreciation and interest on bank loan there was a net surplus for the year of £8,808, which, with the balance of £32,125 brought forward, it was proposed to carry forward. The result, although showing a slight improvement as compared with the previous year, was, in fact, a disappointing one. The conditions prevailing in the locomotive industry had been so depressed that it had been absolutely impossible for the company to secure orders of any magnitude at remunerative prices. In addition, Continental competition for the larger orders had to be taken into account, though perhaps this was not now so severe, as latterly there was a tendency for Continental prices to rise and approximate more nearly to our own. In view of the intense competition for orders of the heavier type of locomotives the board had concentrated its efforts on introducing a new type of light Diesel locomotive and a geared steam locomotive. There was a large field for both new types, and their reception had been most encouraging. The general engineering branch of the company's business had been completely reorganised, and every effort had been made to obtain as much outside work as possible.

PRODUCTION OF LOW TEMPERATURE CARBONISATION PLANTS.

Low Temperature Carbonisation, Limited, in which the company had a large holding, had made substantial progress during the past year, and the adoption of the Parker process by the South Metropolitan Gas Company was a remarkable tribute to its efficiency and public utility. The demand for "Coalite," that company's main product, was increasing so rapidly that many plants would have to be erected to cope with it. A further very important point was the progress in the treatment of the oil obtained from the carbonisation of coal at low temperature. Kerr, Stuart and Co., having specialised in the manufacture of low temperature plants, were able to secure orders in open competition, and he believed this class of business would establish a line of profitable new work for the company.

As to the future, there was no immediate sign of any marked recovery in the heavy engineering industry, and the board felt that the salvation of the company rather lay in developing as many new and specialised lines of manufacture as possible.

The report was unanimously adopted.

MORTGAGE COMPANY OF THE RIVER PLATE, LIMITED.

The forty-second ordinary general meeting of the Mortgage Company of the River Plate, Limited, was held, on the 29th ultimo, at 52 Moorgate, London, Mr James Anderson presiding.

The Chairman said that in the year covered by the accounts the board had been able to maintain the high level of prosperity disclosed in the accounts submitted a year ago. The gross profits for the past 12 months amounted to £134,028—an increase of £2,689. The expenses, including debenture interest, amounted to £48,420—an increase of £2,187—due to further liability for income-tax.

The net profits, after deducting all outgoings, amounted to £85,607, an increase of £501 over last year, and enabled the board to recommend (1) a final dividend of 10 per cent. on the ordinary shares, making, with the interim dividend of 8 per cent. paid in October last, a total of 18 per cent. for the year, and (2) the allocation of £15,000 to the reserve fund. This would leave a surplus of £1,816, which it was proposed to add to the carry forward, raising it to £99,791. With the addition of the £15,000 just referred to the reserve would amount to £440,000.

The investments were well spread, and a valuation of them made on the basis of the prices ruling at the close of the year showed a substantial excess of market value over the book cost.

The outlook for the current year was satisfactory. Conditions in the Argentine Republic were more favourable than they had been for years past. The basic industries of the country were in a healthy state. The crops of wheat and linseed recently harvested had been exceptionally abundant, and the prospects of the coming crop of maize were good. Prices had naturally given way somewhat in view of the abundance of the crops, but not to such an extent as to counterbalance the extra yield.

The report was unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS.

The following table shows the national income and expenditure during the week ended January 26, 1929:—

(000's omitted.)

Expenditure.	£	Receipts.	£
Supply Services	4,446	From Revenue	20,686
Interest, &c., on Debt	818		
Sinking Fund	1,514		
Sundries	990		
Decrease in Debt	12,697		
Increases in Balances	221		
	20,686		20,686

The total Ordinary revenue for the week amounted to £20,686,700, as compared with £28,034,600 in the corresponding week last year. Property and Income-tax was lower at £9,735,000, against £10,640,000, and Super-tax at £2,060,000, against £2,230,000. Customs and Excise amounted to £2,587,000 and £1,178,000, against £2,534,000 and £825,000 respectively. Ordinary receipts were lower at £278,600, against £5,761,900, while Special receipts were nil, as compared with £1,070,000. The National Debt was reduced by £12,697,000, as shown below:—

(000's omitted.)

INDIA COUNCIL REMITTANCES.

The total remittances from the Government of India to the Secretary of State for India in Council from April 1 to January 26, 1929, amounted to £22,495,000 by means of purchases of sterling in India. Of this amount £750,000 was remitted on account of the paper currency reserve.

BULLION.

The following statistics of imports and exports of gold for week ended January 31, 1929, are issued by the Statistical Department of H.M. Customs and Excise:—

Imported into Great Britain and Northern Ireland.	£	Exported from Great Britain and Northern Ireland.	£
From—		To—	
Germany	2,000	Norway	137
France	21,946	Poland	3,760

Total declared value of imports	883,344	Total declared value of exports	2,397,617

GOLD MOVEMENTS.

The arrivals and withdrawals of gold during the past week, as announced by the Bank of England, have been as follow:—

1929.	Arrivals.	£	1929.	Withdrawals.	£
Jan. 25	Bars bought	4,805	Jan. 25		nil
,, 26	Sovs from abroad	53,000	,, 26—Bars sold		24,212
,, 28		nil	,, Sovs export		17,000
,, 29	Bars bought	474,300	,, 28—Bars sold		3,451
,, 30		nil	,, 29—Bars sold		827,524
,, 31		nil	,, 30—Sovs export		3,000
			,, 31—Bars sold		3,385
			Sovs,		5,000
			Sovs set aside		500,000
Total		£532,105	Total		£1,383,572

Net withdrawals, £861,467.

Messrs Samuel Montagu and Co. write on January 30th as follows:—

GOLD.

The Bank of England gold reserve against notes amounted to £153,103,414 on the 23rd instant (as compared with £154,171,272 on the previous Wednesday), and represents a decrease of £802,901 since April 29, 1925, when an effective gold standard was resumed. About £817,000 bar gold from South Africa was available in the open market this week. The Bank of England purchased about £475,000, as is shown below, New York £300,000, and India and the trade the balance. There was a net efflux of gold of £394,507 during the week under review. Following are the balance of trade figures for India, in lacs of rupees, for the month of December, 1928—Imports of merchandise on private account, 1,849; exports, including re-exports, of merchandise on private account, 2,695; net imports of gold, 273; net imports of silver, 25; net imports of currency notes, nil; total visible balance of trade, in favour of India, 552; net balance on remittance of funds, against India, 464.

SILVER.

Sellers have been rather reluctant at the lower prices touched during the past week, neither China nor America being disposed to furnish supplies. Although the Indian bazaars have made some re-sales, buying orders from this quarter have predominated, and the market has assumed a steady tone, with subsequent recovery in the quotations. The rates fixed on the 24th instant—viz., 26d for cash and 26 1/8d for two months' delivery—were the lowest fixed for some considerable time—for spot since October 29, 1927, and for forward since March 9, 1928. Purchases by the Indian bazaars for near shipment resulted yesterday in the price for cash silver, which had been at a discount since last November, being quoted level with forward at 26 1/8; a premium of 1/8d on silver for two months' delivery was, however, re-established to-day. The following were the United Kingdom imports and exports of silver registered from mid-day on the 21st instant to mid-day on the 28th instant:—Imports: France, £20,791; other countries, £230; total, £21,921. Exports: Netherlands, £57,400; Irish Free State, £12,058; British India, £23,580; other countries, £4,577; total, £97,615.

NOTICES.

Lloyds Bank, Limited.—It was announced a few days ago that Mr F. A. Beane and Mr G. F. Abell, formerly joint general managers, had been appointed chief general managers of the bank. Mr Beane became a general manager in 1923, after occupying important positions in the bank in London and Newcastle-upon-Tyne and also in Lloyds and National Provincial Foreign Bank, Limited, at Paris. Mr Abell, before he became a general manager, was for some years manager of the City office. Following upon these appointments, it is now announced that Mr R. A. Wilson and Mr S. Parkes, formerly assistant general managers, and Mr S. P. Cherrington, formerly a manager of the City office, have been appointed joint general managers of the bank. The City office will in future be under the joint management of Mr G. L. Potter, Mr G. D. Gold and Mr E. J. Sawtell.

The Westminster Bank announces that its night safe service recently established at the Chesterfield branch has now been extended to its offices at Balham (128 and 130 Balham High road, S.W. 12), Nottingham (3 Thurland street), Croydon (1 High street), and Brixton (369 and 371 Brixton road).

Barclays Bank Limited announce the opening of new subbranches at 203 Portswood road, Portswood, Southampton (under the management of Mr L. D. Ingmire, who is also manager of the Avenue, Southampton, branch), and at Llanegryn (under the management of Mr I. D. Jones, who is also manager of Towyn branch).

The Midland Bank announces the opening of new branches at 19 Grosvenor place, Hyde Park corner, London, S.W. 1, and at 20 The Mall, Edgware, Middlesex, under the management of Mr L. Taylor and Mr V. E. Taperell respectively.

The National Provincial Bank, Limited, announce that a branch of the bank is now open at 36 High street, Streatham, S.W. 16, under the management of Mr C. G. Bird. A branch is also now open at 4 London road, Twickenham, under the management of Mr A. O. Butcher.

A branch of the Bank of Australasia has been opened at Subiaco, Western Australia.

A branch of the Union Bank of Australia, Limited, has been opened at Crows Nest, Sydney, New South Wales.

Reports and Notices.

The board of the Metropolitan-Cammell Carriage Wagon and Finance Co., Limited, which has taken over the carriage and wagon interests of Vickers, Limited, and Cammell, Laird and Co., Limited, has now been constituted as follows:—Mr Tom L. Taylor (chairman), Mr A. S. Bailey, Mr Arch. J. Boyd, Mr J. P. Crouch, Sir Alex. Gracie, K.B.E., Mr W. L. Hichens, Mr R. C. Irwin, Mr G. G. Sim, Mr. Alex. Spencer, Mr Percy Wheeler, Mr Robert Whitehead, Mr Howard Williams.

The General Accident Fire and Life Assurance Corporation, Limited, announce that Mr J. R. Yates, who for 20 years has been chairman of their London board, retires from that office and joins their head office board. Mr E. J. Holland, D.L., J.P., succeeds Mr Yates as chairman of the London board

At a meeting of the Joint Hull Committee, held January 25th, Mr E. L. Jacobs (underwriter of the Alliance Assurance Company, Limited) and Mr F. J. L. Fish, of Lloyd's, were unanimously re-elected chairman and deputy-chairman respectively of the Committee for 1929.

GOVERNMENT STOCKS, &c.

METROPOLITAN WATER BOARD BILLS.—Tenders will be received at the chief cashier's office, at the Bank of England, on Monday, February 4, 1929, at 1 o'clock, for Metropolitan Water Board bills to be issued in conformity with the Metropolitan Water Board Acts, 1906, 1907, and 1915, to the amount of £1,000,000, in replacement of bills falling due on February 10th. The bills will be in amounts of £500, £1,000, £5,000, or £10,000. They will be dated February 9, 1929, and will be payable at 12 months after date, viz., on February 9, 1930.

NEW ZEALAND GOVERNMENT 4 PER CENT. STOCK.—With regard to the conversion offer by the New Zealand Government under the prospectus dated January 8, 1929, to holders of New Zealand Government £4 per cent. consolidated stock, due November 1, 1929, the Bank of England announce that applications have been received for approximately £11,750,000 4½ per cent. stock 1948-1958.

BANKS.

BANQUE FRANCO-SERBE.—It is announced that the Board of directors of the Banque Franco-Serbe has decided to summon an extraordinary general meeting to consider a plan of reorganisation of the company, which will involve a reduction of the capital and a simultaneous increase thereof to its present figure of 20 million francs. We understand that the Ottoman Bank will take the lead in this reorganisation. The Banque de Paris et des Pays-Bas and the Société Financière d'Orient will give their support.

CANADIAN BANK OF COMMERCE.—The statement for the year ended November 30, 1928, is as follows:—Balance at credit of profit and loss account, brought forward from last year, £292,587; net profits for the year ending November 30, 1928, after providing for all bad and doubtful debts, £814,620, against £765,803 for preceding year. Balance transferred Standard Bank of Canada, £106,333. The dividend and bonus is 13 per cent., as before. Dominion and Provincial Government taxes and tax on bank-note circulation, £97,603; donations and subscriptions, £10,274, transferred to pension fund, £42,471; written off bank premises, £51,370; transferred to rest account, £395,219; balance carried forward, £62,535.

DOMINION BANK (CANADA).—The profits of the Dominion Bank for the year 1928 amount to $1,408,088, an increase of $80,000 over the profits for the previous year. Total deposits, $115,340,000, are $6,500,000 higher than in 1927, while the total assets stand at $152,800,000, being an increase of $11,300,000 over 1927. All these figures are the highest shown in the bank's history.

NATIONAL CITY BANK OF NEW YORK.—Shareholders have approved the increase in capital to $100,000,000, and an increase in surplus to $100,000,000; also reduction of the par value of the bank's stock from $100 to $20, and an increase in capital and surplus of the National City Company to $50,000,000 each.

ROYAL BANK OF CANADA.—Profits for the year amounted to $5,881,253, as compared with $5,370,145 in the previous year. Adding amount carried forward makes available for distribution up to $7,691,085. This was applied as follows:—Dividends and bonus, $4,200,000; transferred to officers' pension fund, $200,000; appropriation for bank premises, $400,000; reserve for Dominion Government taxes, $530,000; leaving a balance to be carried forward of $2,361,085, as against $1,809,831 at the end of the previous year. With regard to the accounts of the Royal Bank of Canada, it is interesting to note that commercial loans in Canada of $202,315,472 are up from $225,536,860, an increase for the year of over $66,000,000. Current loans elsewhere than in Canada are down to $145,422,394 from $153,411,835. Savings deposits continue to expand, deposits bearing interest now being $523,651,908, as compared with $514,562,219 a year ago.

MISCELLANEOUS.

BRAZILIAN TRACTION, LIGHT AND POWER COMPANY, LIMITED.—The board announce that the purchase of nearly all the ordinary shares of the City of Santos Improvements Company, Limited (an old-established English company), has recently been completed, and there is thus added a large and growing public utility business to the enterprises controlled by Brazilian Traction Light and Power Company, Limited.

BRITISH AUTOMATIC COMPANY, LIMITED.—The directors of the British Automatic Co., Limited, announce that an offer has been made to purchase the £1 shares of this company at the price of £2 10s per share, subject to deposit of acceptances, transfers and certificates by the holders of a specified minimum number of shares not later than February 5th next.

CANADIAN WESTERN LUMBER COMPANY, LIMITED.—Statement of lumber manufactured, sales and price realised for the month of December, 1928, as received by cable:—

	1927.	1928.	Increase.	Decrease.
	Feet.	Feet.	Feet.	Feet.
Lumber manufactured	6,432,105	5,736,900	..	695,205
Lumber sold	4,092,059	8,914,200	4,822,141	..
Price realised	$85,156	$210,454	$125,298	..
Aggregate lumber manufactured from January 1 to end of December	114,727,184	136,066,706	21,339,522	..
Aggregate lumber sold from January 1 to end of December	126,104,643	132,890,276	7,785,633	..
Aggregate price realised from January 1 to end of December	$2,735,000	$3,032,631	$297,631	..

GRACE NATIONAL COMPANY.—Mr John H. Richardson, European representative of the Grace National Bank of New York, announces the formation of the Grace National Company in New York. This company will take care of the investment requirements of its clients, and will participate in capital issues on the New York market. It will have an initial paid-up capital of $500,000, with adequate reserves, and the president of the company will be Mr F. H. McKnight, who is also president of the Grace National Bank of New York. Mr Richardson further announces the recent election of Mr Ray Morris, a partner of the New York banking house of Brown Bros. and Co., and also the election of Mr R. de F. Boomer, of the New York house of E. H. Rollins and Sons, to seats on the board of the Grace National Bank of New York.

EVER READY COMPANY (GREAT BRITAIN), LIMITED.—In view of the increase in the capital value and earning power of the businesses of the company, the directors, after careful consideration, have decided to recommend that a bonus issue of ordinary shares be made to the ordinary shareholders, in order to bring the issued capital more closely into accord with the value of the assets. It is proposed that a sum of £74,000 (part of £200,000 general reserve) shall be capitalised and applied in paying up in full 296,000 ordinary shares of the company to be distributed to ordinary shareholders in proportion of one fully paid 5s ordinary share for every five ordinary shares held on January 18, 1929. The company has acquired a substantial interest in a large manufacturing business similar to their own, but including the manufacture and sale of numerous other classes of goods. The company propose ind ue course to make an issue to ordinary shareholders for subscription on bonus terms.

LISTER AND CO., LIMITED.—The profit amounted to £112,249 for the year ended November 30, 1928. This compares with £142,061 for the previous year. Including £154,711 brought in and after deducting all preferential charges and an interim dividend on ordinary shares, the balance is £190,986. The directors recommend a final dividend of 2½ per cent., less tax, making 5 per cent. for year, the same as for 1926-27, carrying forward £155,361.

MANCHESTER SHIP CANAL.—The following is the latest monthly approximately traffic return, and for the year 1928, compared with 1927:—

December, 1927.	December, 1928.	Decrease.	Total for Twelve Months. 1927.	1928.	Total Decrease, 1928.
£	£	£	£	£	£
124,725 ..	129,830 ..	5,105 ..	1,576,237 ..	1,517,018 ..	59,219

NORTHERN MEXICO POWER AND DEVELOPMENT COMPANY, LIMITED.—Operating results for the month of November, 1928, are reported as follows:—Gross, $137,979·95; Operating $21,227.40; net, $116,752.55; an increase of $12,479.11 gross, and $14,934.17 net, compared with November, 1927. Net earnings for the first eleven months of 1928 amounted to $1,231,597.80, an increase of $69,748.97, compared with the corresponding period in 1927.

PARA INDUSTRIAL AND COMMERCIAL COMPANY, LIMITED.—Cable from Para:—"Factory during 25 days December washed 249,000 lbs, netting crêpe 164,000 lbs. Shipped New York, Europe, South Brazil 341,000 lbs washed and crude rubber and 3,100 washed Balata. Stock December 31st washed and crude 733,000 lbs, of which 250,000 lbs sold for shipment during January-February. Balance in hand 483,000 lbs. Entries Tapajos 3,200 lbs. Manufacture department produced 505 dozen pairs rubber heels, shipped 2,600 lbs crêpe sole."

RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED.—Net profits of the Rio de Janeiro Flour Mills and Granaries for the year ended September 30, 1928, amounted to £273,260, against £303,689 for 1926-27. The dividend for the year is unchanged at 20 per cent., free of tax, including a bonus of 5 per cent. The balance forward is £88,558, against £88,265 brought in. Cash has been reduced from £467,600 to £192,095. Reserve fund remains at £320,000. The report points out that the anticipated improvement in financial and commercial conditions in Brazil did not materialise, and trading has been done under great difficulties.

Commercial Reports.

THE CORN TRADE.

Mark Lane, Thursday Evening.

Wintry conditions have prevailed, but the weather has now taken a milder turn. Field work is being pushed forward, and owing to recent frosts the ground is in good condition for an early seeding of spring crops. The higher prices lately ruling attracted larger offerings of native wheat on the principal country markets, and a fair business transpired. Imported descriptions, however, were generally obtainable at less money following lower forward quotations. In the floating and forward cargo section buyers were somewhat reserved in face of declining prices and freer offerings, particularly of Argentine qualities, which are now pressing forward in greater volume, while also influenced by improved crop prospects in India. Shipments continue of liberal extent, with a further increase in floating supplies, but arrivals in this country were below estimated requirements. Steamers of Rosafe 64 lbs March sold 44s 6d, Baril 64 lbs loading 44s 9d, and Australian afloat 47s 3d, first half February loading 47s per 480 lbs c.i.f. terms. Feeding-stuffs quiet and prices tended in buyers' favour, especially for maize on improved Argentine crop prospects. Wheat easier. No. 2 Northern Manitoba 50s 9d, No. 3 ditto 49s 9d, No. 4 Manitoba 48s, No. 5 44s 6d, No. 6 38s 6d, No. 2 mixed Durum 43s 9d, Rosafe 62½ lbs 45s 9d, Barusso 62⅛ lbs 45s 9d, Australian 49s, all ex-ship per 496 lbs. English 9s 6d-9s 9d per 112 lbs. Flour quiet. London standard grade 38s 6d, town whites 39s 6d, patents 40s 6d-41s 6d per sack delivered in the Home Counties, with 6d to 1s per sack less for deliveries in the London districts. Of imported, Manitoba patents range from 35s to 38s, Minneapolis 35s-37s Australian 35s 9d ex-store per 280 lbs. Maize easier. Plate ex-ship to arrive 43s 3d, ditto landed 44s 9d, January-February 43s 6d, February-March 44s 6d, March-April 41s 3d, new April-May 39s 9d, May-June 39s 3d, No. 2 mixed also yellow American ex-ship to arrive 42s 6d per 480 lbs. Yellow maize meal £12 ex-wharf, Hominy chop £9 per ton. Barley weaker. Californian ex-ship 42s-52s, Chilian Chevalier 48s-58s, Australian 46s-52s, Smyrna 44s-50s per 448 lbs. Algerian-Tunisian 34s 9d landed, Canadian feed 32s 3d ex-ship to arrive, 32s 9d landed, No. 3 Canadian Western 35s 9d, No. 2 Federal American 31s 6d ex-ship to arrive per 400 lbs. English malting 10s-15s, feed 9s 6d-10s per 112 lbs. Oats quieter. Plate ex-ship to arrive 24s 6d, January 24s 9d, February 25s 6d, March 25s 9d, black Plate landed 25s 6d, No. 3 white clipped American 36 lbs landed 27s 3d, mixed Canadian feed 22s, Chilian white 33s 3d, German landed 28s 9d, ex-ship to arrive 27s 9d per 320 lbs. English 9s-10s per 112 lbs. Scotch landed 29s 9d per 336 lbs. Irish black 26s 6d per 320 lbs.

COMPARATIVE AVERAGES OF GRAIN.

The following table gives the estimated sales of home-grown wheat during the harvest years 1928-29, 1927-28, 1926-27, 1925-26:—

AMERICAN WHEAT MARKETS.

Conditions in the wheat markets have been variable. At first covering took place under the influence of cold weather and fears of crop damage in the winter wheat belt, where snow covering is considered insufficient. Later, absence of speculative support and a poor cash demand weakened the markets, but a recovery followed export inquiry and light country marketings. Quotations :—

Nearest Future.	Jan. 4, 1928.	Feb. 1, 1928.	Jan. 2, 1929.	Jan. 23, 1929.	Jan. 30, 1929.
Winnipeg (No. 1 Manitoba)—Cents per 60 lbs	137	135⅝	122	128¼	128⅞
Chicago (No. 2 Winter)—Cents per 60 lbs	130⅜	130⅜	116⅜	124⅜	124⅛

Visible supplies of wheat in Canada at 80,683,000 bushels show an increase of 1,095,000 bushels as compared with the previous figures. Supplies a year ago stood at 68,964,000 bushels.

COAL.

Our Cardiff correspondent writes :—There has been no abatement during the present week of the strength of the position on the Cardiff coal market. The supply of tonnage has continued abundant, and as the collieries have found it beyond their power to satisfy the immediate demand there have been many detentions of vessels. Prices have advanced for practically all classes of coals, but particularly for Monmouthshire large qualities, which towards the end of the week were quoted at figures equal to those listed for the Best Admiralty qualities, although normally there is a margin of between 1s and 2s per ton between the two grades. At a meeting of the executive committee of the Marketing Association on Tuesday the question of raising the scheduled minimum prices was considered, but a decision was reached to the effect that it would be inexpedient to disturb the schedule at present. Meanwhile, however, some of the idle pits are being restarted, and the most important of the Monmouthshire colliery groups anticipates within the next few weeks an increase in its production of about 3,000 tons per day. It is now reported that the Egyptian State Railways have accepted the contract of South Wales firms for the supply of 200,000 tons at a c.i.f. price of 28s 5¾d per ton, and that no coal has been purchased by the Egyptian authorities from Poland. The following are the current approximate quotations :—Best Admiralties, 19s 4½d to 19s 6d; seconds, 19s to 19s 3d; best drys, 18s 6d to 19s; Black Veins, 19s to 19s 6d; Western Valleys, 18s 6d to 19s; Eastern Valleys, 17s 6d to 18s 3d; best small steams, 13s 9d to 14s; cargo smalls, 12s 6d to 13s; coking smalls, 13s 9d to 14s 3d; anthracite best large, 33s to 35s; Red Vein large, 21s to 25s 6d; machine-made cobbles, 40s to 43s; French nuts, 41s to 43s 6d; stove nuts, 40s to 42s 6d; rubbly culm, 9s to 9s 6d; foundry coke, 25s to 37s; patent fuel, 20s to 21s 6d: pitwood, ex ship, 25s 9d to 26s 3d.

Our Sheffield correspondent writes :—The position of the coal trade has steadily improved since the beginning of the year, especially on the export side. Industrial consumption in this district, however, continues comparatively light; nevertheless, many period contracts have been renewed at sixpence advance. For export, steams are very firm at 16s 6d, f.o.b. The export demand for furnace and foundry coke is brisk, and higher prices for the latter are foreshadowed. The quietude at the light foundries keeps down home consumption of coke to limited proportions. Good brands of furnace coke can be bought at 13s 6d ovens, although the association mininmum is 1s higher.

IRON AND STEEL.

We extract the following from the weekly report of the London Iron and Steel Exchange :—The iron and steel markets appear to have settled down to a period of steady trading, and the meetings on the London Iron and Steel Exchange have reflected the more confident feeling noticeable in the trade. In the pig-iron market the demand seems to be slowly expanding, in spite of the setback caused by the labour dispute in the National Light Castings division of the foundry trades. In the heavy foundry trades, however, business appears to be somewhat brighter, and the demand for pig-iron has improved of late sufficiently to give a slightly firmer tone to the market. There has been a fair amount of business passing in the semi-finished steel department, and the Welsh and Midland works are benefiting from the slackening in Continental competition. Although there is still a steady trade in this description of material with Continental works, the quantities of foreign steel sold in this country have diminished considerably of late, as apparently the Continental works require a greater proportion of their output of semis for the production of finished steel material. As a consequence the prices from the British users' standpoint are high, and the time required for delivery frequently longer than is convenient. The demand for finished steel continues active, and most of the British works are fairly well off for orders. The export it is anticipated that foreign buyers will shortly be in the market again. The home trade continues steady, and of late there has been greater willingness shown by buyers to enter into forward commitments.

HARRISONS & CROSFIELD LTD.
East India Merchants.
With branches in Ceylon, India, Dutch East Indies, Canada, Japan and elsewhere.
1-4 Great Tower Street, London, E.C.3

Our Middlesbrough correspondent writes :—Pig-iron : The market still remains firm. Cleveland pig-iron is still scarce and the quotations are unchanged on the following basis—No. 1 Cleveland, 68s 6d; No. 3 G.M.B., 66s; No. 4 foundry, 65s; No. 4 forge, 64s 6d. Owing to the improvement in the steel trade, basic iron is again being brought in from the Midlands to supplement local production, and we think that very shortly more furnaces will be put in to meet the works' requirements. The hematite market is strong, with stocks practically nil. The production is still low, and more forward business is being done. The price remains at 71s for mixed numbers, but this is a minimum. With regard to manufactured iron and steel, the recent improvement still continues, and the firmness of Continental prices is also having a beneficial effect. Owing to the increased demand, medium steel billets have advanced to £7 5s per ton, and hard billets £7 15s. Steel rivets have been advanced to £11 5s; other quotations are as follow :—Steel ship plates, £8 7s 6d; steel ship angles, £8 17s 6d; iron bars, £10 5s; steel rails, £8 10s. The ore market is still very firm, with best rubio at 22s 6d minimum. Blast furnace coke is still about 17s 6d to 17s 9d. with the inquiry slightly better.

Our Sheffield correspondent writes :—Sheffield does not yet appear to be sharing in the general improvement of the iron and steel industry. The only important branch which is busy is that which supplies special steels for automobile construction. This has become the most valuable section of Sheffield's trade. The upward movement of prices noted last week continues. Local producers of pig-iron have advised an advance of 2s 6d on foundry quantities. Some of the rolling mills have put up the prices of rolled sheets and rods by 10s per ton. Demand continues brisk for the lower grades of semi-steels, but best acid steels are still neglected. There is quietude in the railway branch and in colliery supplies. Overseas trade in steel material is rather weak. The North Lincolnshire iron and steel works are running not far short of capacity, and the outlook for this district has not been so bright for a good many years. It is said that steel can be made there more economically than in any other English centre of the trade.

Our Glasgow correspondent writes :—Business in the iron and steel trade in the West of Scotland remains very much as during the past few months. While there is a gradual improvement in many branches, it continues to be on a very small scale, so that taken week by week it is hardly appreciable. The number of shipbuilding and other contracts recently placed on the Clyde and in the Glasgow district, together with the continued slackening of Continental competition, gives confidence that within the next few months there will be a decided advance in the volume of work done. It is reported this week that Messrs. Bow, McLachlan and Co., Limited, of Paisley, have secured an order from the Clyde Shipping Co., Limited, for a single-screw tug is seriously affected by the dispute in the wrought iron trade, as in this district about 1,000 men engaged in this industry are now idle. As is usual at this season, there is not a great deal of

PLAYER'S WHITE LABEL
NAVY MIXTURE
—smoke it for a change—you won't want to change again.

2oz. POCKET TIN 1/10

business being placed with sheetmakers. Works, however, have plenty on hand, and order books are in a very satisfactory condition. In all branches prices remain unchanged, as follows :—Crown bars, £10 5s d/d Glasgow; ship plates, £8 7s 6d; sections, £7 17s 6d d/d Glasgow and both subject to rebate; galvanised corrugated sheets, 24-gauge, £13 12s 6d f.o.b. for good export lots.

Our Cardiff correspondent writes :—In the South Wales iron and steel trade the position is practically unchanged. For tinplates demand continues fairly active, with prices firm at from 18s to 18s 3d per basis box, although some manufacturers are quoting 3d higher for forward delivery. Galvanised sheets are unaltered at from £13 12s 6d to £13 15s per ton. Tinplate bars, native and foreign, are unaltered in prices. Shipments of tinplates last week totalled 155,191 boxes, compared with 97,902 boxes the previous week, and stocks have been reduced to 234,777 boxes. Messrs. Richard Thomas and Co., have recently inaugurated a system of inland delivery by road.

OTHER METALS.

Tin.—The market presented quiet features, and prices gave way following lower advices from New York and the East, which caused sellers to offer more freely. Small dealings marked a good deal of irregularity at times. Stocks in London and Liverpool warehouses for week ending January 26th were returned at 7,882 tons, compared with 1,969 tons at corresponding period last year. Standard cash changed hands at £221 12s 6d to £220, three months £222 15s to £221 and £221 5s. In the East, sales were reported at £224 5s to £223 10s and £224 per ton, c.i.f. terms.

Copper.—Market firmer, and a good demand was reservedly met. Standard cash sold at £77 to £78, and three months £74 10s to £74 15s and £75 7s 6d.

Lead opened firmer but quieter since on freer offerings. Good soft foreign pig, January, sold £22 5s, February £22 3s 9d to £21 18s 9d and £22, March £22 5s, April £22 6s 3d to £22 8s 9d and £22, May £22 5s ton.

Spelter quiet and easier, with sellers more in evidence, but closed steady. February sold £26 3s 9d to £26 and £26 3s 9d, April £26 7s 6d to £26 and £26 5s, May £26 4s to £26 5s ton.

Antimony slow. English regulus £54 to £55, foreign spot £38, forward £34 ton, c.i.f.

Aluminium steady. Ingots and bars for home delivery, £95 ton.

Wolfram maintained. Chinese also Straits quoted 19s 6d to 20s per unit, c.i.f.

Quicksilver steady. Spot £22 5s to £22 10s per bottle.

Tin Plates quietly steady. I.C. Coke, prompt and forward, 18s to 18s 3d per box, f.o.b. Swansea.

THE COTTON TRADE.

LIVERPOOL, Jan. 30, 1929.

The market continues to be dull and featureless. Spot sales for the week are 29,000 bales, of which 17,730 bales are American, 400 Brazil, 550 Argentine, 6,000 Peru, 1,750 Egyptian, 1,060 African, 1,250 East Indian, and 260 sundries. Imports for the same period are 82,535 bales of 74,977 American, 2,341 Brazil, 55 Argentine, 2,114 Peru. 861 African, 2,152 East Indian, and 35 sundries. Quotations to-day are: American middling, 10.34d; Egyptian Sakel, 18.40d; Egyptian uppers, 11.87d; Brazil fair, 10.69d; Peru G.F. mod-rough, 12.75d; Peru G.F. smooth, 11.44d; West African middling, 10.44d; East African G.F., 12.15d.

MANCHESTER, Jan. 30, 1929.

It has been a disappointing week in the market. Demand has fallen flat, and most spinners and manufacturers have reported a definite decrease in the sales. This change in the attitude of buyers can be partly accounted for by the easier tendency in raw material prices and some nervousness as to the outcome of the dispute between spinning employers and the operatives on the cleaning question. Cloth inquiry for India has been of limited dimensions, sales of any weight being scarce. Less business has been offering for China, and owing to the approaching new year festivities the Shanghai auctions have been suspended for three weeks. Printing and finishing cloths have been sold in moderate lots for the Near East, South America, and the Continent. Demand in American and Egyptian yarns has been slow and spinners have experienced more difficulty in selling and delivering the current output.

THE WOOL TRADE.

Our Bradford correspondent, writing on Wednesday, says :—Neither spinners nor manufacturers show much confidence in wool values, and the fact that a certain amount of irregularity is reported both in the primary markets and in London tends to make users even more cautious. Reading between the lines of the cabled reports from Australia, South Africa, and South America, one gets the impression that wool prices have moved more in buyers' favour during the last few days, and many Bradford importers have been able to "pick up" on limits which a few weeks ago were quite unworkable. Japan, France, and Germany are still buying freely in the primary markets, and the future of values depends almost entirely upon continued foreign support. Meanwhile it is as difficult as ever to obtain remunerative prices for tops and yarns. Demand is more or less of a retail character, and although quotations for tops remain steady, there is no doubt that in most cases concessions would be granted for bulk business. In the yarn trade price-cutting owing to keen competition is still very pronounced, although rather more interest is being shown in botanies. Crossbred yarns, on the other hand, are considered to be too dear, and only a hand-to-mouth trade is being done. For the same reason business on export account was very restricted. A fair amount of business is being done in piece-goods on home and export account.

COLONIAL WOOL.

(FROM A CORRESPONDENT.)

The close of the first series of London sales last Wednesday left values for all classes of wool on a slightly lower basis than in December, and this along with the easier prices cabled from Australia indicates that for the time being prices have passed high-water mark. Even the reduced level in Australia is above the price of the combed article in Bradford, and this indicates that there is not yet likely to be much relief obtained so far as making a profit on tops is concerned. It is equally apparent that the raw material is on a healthy level, for the actual declines in London and Australia are comparatively very small indeed, and judging from what is known about supplies, the remainder of the raw material forthcoming this season will be sold at very little reduction, if any, from the present basis. The keenness of foreign competition in overseas markets is conspicuous. With regard to London, the decline in greasy merinos is around 1d per lb, and in crossbreds 1d to 2d. Greasy crossbred lambs and fine scoured crossbreds are practically the only descriptions in which no decline has taken place, and the utmost fall in medium and coarse scoureds is 1d. Fine slipe lambs have remained fully par, and medium lambs quite steady. Cape merinos are all in favour of the buyer, but greasy wools have lost no more than 1d, and scoureds 1d to 2d. In view of the large quantities of the raw material which have been offered in the various selling centres during the past month, it is remarkable that bigger falls have not had to be recorded. The general soundness of the wool situation has been demonstrated. There is not likely to be any big weight to be carried forward, and even this will consist very largely of inferior wools and certain lots which have been taken in at obviously above a market price.

Financing Shipments to S. America
Through the medium of branches and agencies situated at all strategical points, the Bank of London & South America does everything possible to further trade between Great Britain and Latin-American countries. Shipments are financed, status reports issued on South American firms, and a Monthly Review of existing market and other conditions is supplied free on application.

THE JUTE TRADE.

DUNDEE, January 30.

Fears of a short crop of jute for this season have caused prices of raw jute to advance £3 to £3 10s from the lowest prices which prevailed since the year commenced. The supplies reaching up-country markets have fallen off considerably, and in consequence loose jute has ruled very firm, while the imports into Calcutta are now very small. Reports from Calcutta say that the general expectations of the trade at that centre are that the crop will not reach the estimate of the Director of Agriculture of 9,916,000 bales. This is an insufficient quantity to meet the requirements of the world, which are estimated at 10,500,000 bales. Fortunately, however, the Calcutta mills are carrying huge stocks, which will have a tendency to prevent prices from being pushed up to a prohibitive level. Already values of raw jute are just on the high side compared with the rates ruling for jute yarns and cloth, which spinners and manufacturers have been unable to raise in comparison with the recent advance in the fibre. The increase in the price of the raw material is equivalent to 3d per spindle of yarn, but yarns have only gained to the extent of 1d per spindle, while prices of jute cloth have shown only a very slight increase from the bottom rates accepted. The reluctance of buyers of jute cloth to place their orders with freedom has been a most disappointing feature of the market.

The value of first marks is now £39 per ton and lightnings are quoted at £36 to £37 for February-March shipment. Daisee assortment rules at £34, threes at £33, and fours at £31, while Tossa assortment is at £36 5s, threes at £35, and fours at £33, same shipment. Spinners have shown little interest in shipment material owing to the fact that sellers of spot fibre have been willing to dispose of their holdings at less than the rates ruling for shipment. On spot a fair number of small parcels have changed hands.

Jute yarns have improved from 3s 6d to 3s 7d for common 8-lb cops, and 8-lb spools have risen from 3s 7d to 3s 8d. Spinners would require a greater increase, but buyers refuse to follow any further advance. Other qualities are dearer all round. Twist is from 5⅜d to 5½d for 3-ply 8-lb, and sacking yarns are now quoted at 4d for 24-lb weft and 5⅛d for 8-lb chains. Rove has recovered to £27 10s for 48-lb and £17 10s for 200-lb, after 10s less being done. Fine yarns and carpet qualities are firm.

Manufacturers were badly in need of business when raw jute began to rise, and, though a good business has been done, it was all required to keep the looms running. Sufficient has not been done to enable manufacturers to insist on higher prices, though they are quoting 1/16d more at 4⅜d for 10½-oz 40-in hessians and 3⅛d for 8-oz. Linoleum hessians are quiet, and heavy goods are extremely dull.

HIDE, LEATHER, AND ALLIED TRADES.

Conditions in the leather trades remain very gloomy, and the outlook very uncertain. Stability has not yet been reached in hides or skins, and a further general weakness is recorded. Market hides have fallen in the provinces whilst most classes were withdrawn at the Bermondsey sales held last week. Calfskins share the general depression, and falls of ½d to 1d are common at most markets. Conditions seems equally bad in overseas hides, and this week all prices are again quotably lower with little business passing. Best Argentine fregorifics are now selling at 10½d, whilst lights can be bought as low as 9½d. In saladeros there is little doing, the only item of importance being a sale of 4,000 Bovril ox to Russia at about 9½d. Dry hides share the prevailing weakness, and B.A. Americanos are down to 13½d, and dry Capes to 13d to 12d for best and seconds respectively. Queensland meat-works are lower at 11d to 11½d. Tanners are still reducing input of hides until they have more faith in the market position.

Tanners and merchants are finding trade a very difficult problem as consumers are convinced lower prices of sole leather are inevitable. Tanners are eager sellers, and are cutting prices of both bends and offal to reduce heavy stocks. Dry hide bends are not wanted, but there is a moderate demand for low grade English bends, which in the third selections make as low as 21d-22d per lb. Repairing bends have fallen rather quiet, operators waiting for lower prices. Offal moves very slowly, and here and there one hears of parcels being cleared at reductions.

The demand for upper leathers remains quiet, with a few sampling orders making up a small turnover. Willow and box, calf and sides are selling slowly, with a weak tone in prices. Glace in cheap black moves off steadily, but at a very small margin of profit. Curriers are not well off for orders, the demand for stout leather boots being affected by the depression in the coal areas. Shoe manufacturers are only partially employed, and some Northampton firms are again discharging numbers of their operatives.

VEGETABLE OILS AND OILSEEDS.

Markets on the whole are quieter, and the volume of business small. Consumers of linseed oil having satisfied their immediate requirements, are out of the market, and prices are easier in sympathy with seed. Raw oil ex-Hull mill has declined to £28 5s per ton spot and February-April delivery, later positions being at a small premium. Cotton oil is neglected and lower crude Egyptian offering at £28 5s, and common edible at £32, without attracting buyers. Soya palm kernel and ground nut oils are easier, but castor oil is a shade dearer. In the oilseed section demand for linseed is poor and prices of Plate have a drooping tendency. For seed on passage to Hull £15 16s 3d and £15 17s 6d have been paid, and £15 15s is wanted for February-March shipment. A little business in Calcutta to London, April-May, has been done at £18. The quantity of linseed on passage to Europe has increased to 252,500 tons, or 33,500 tons more than last week, and comparing with 197,500 tons a year ago. Cotton seed has been easier, and for black Egyptian on passage £10 5s has been accepted, and for February and March loading £10 2s 6d. Bombay is also easier, and £9 has been paid for January-February to Hull. Soya beans are lower, and £12 paid for latter half of December shipment. Oilcakes are in good demand, and prices are advanced.

OVERSEAS PRODUCE.

FOOD, BEVERAGES, &c.

SUGAR.—Market remains generally stagnant, as trade buyers will not operate beyond wants of immediate necessity, and as far as the United Kingdom centres are concerned, affairs are held in check by ample quantities of home-grown granulated still available at comparatively low prices. No change occurred in spot quotations. Imported kinds are a dead-letter just now, and some fine parcels of white Mauritius offer at attractive prices. Continental parcels for shipment call for no comment. Foreign 96 per cent. centrifugal, February, quoted, 9s 6¾d, c.i.f., U.K. Terminal sections quiet but steady. Of raws, March, buyers, 8s 10½d; May, 9s 0⅜d; August, sold, 9s 4½d; December, sellers, 9s 7½d. White, March, sold, 12s 3¾d; August, 12s 5½d per cwt. Cuban receipts for the past week 199,700 tons, against 117,610 at corresponding period last year; exports, 99,160, against 60,950; stocks, 386,110, against 177,800. Stocks of raw sugar in the three chief ports of the United Kingdom for week ending January 26th amounted to 161,904 tons, compared with 94,198 at same time last year.

TEA.—Indian auctions during the week totalled 57,860 packages. Competition in the main was decidedly active, a feature being the run on attractive parcels possessing autumnal flavour from the Dooars district. These realised fancy prices. Fine liquoring and tippy Assams sold firmly, medium kinds being steady, with common and plain qualities about unaltered. Ceylon auctions of 24,612 packages also engaged fairly active competition at firm to occasionally higher prices, bearing in mind that quality, especially amongst the finer invoices, marked a further falling off. There was a fair inquiry for new season's China during the week at full recent rates. Java and Sumatra auctions proceeded steadily to ⅛d to ¼d up.

COFFEE.—A good steady demand continues for suitable parcels and in which East India and Kenya qualities prominently figure. Costa Rica steady. Fine bold new crop of the latter, sold, 168s 6d; peas, 169s 6d; East Indian, bold, 149s 6d; Kenya ditto, 132s to 137s; Kilimanjaro ditto, 141s 6d.

COCOA.—Market steady, but spot trade quiet. In auction, fair to good red Ceylon, sold, 100s to 107s; Trinidad, good to fine, 59s to 63s; Grenada, ordinary to fair hard pale, 47s to 50s; fine red, 56s to 57s; St Lucia, ordinary, 48s; fine, 55s. Accra F/F, February-April, sold, 41s 6d to 42s; March-May, 42s to 42s 6d, f.o.b. Terminal, February, sold, 46s 10½d to 47s and 46s 7½d; May, 47s 6d to 47s 9d; July, 48s 3d; September, 48s 9d to 49s and 49s; December, 48s 3d to 48s 9d and 48s 6d.

RICE.—Market quiet, but forward positions steady. Two stars, spot, London, quoted 14s; February-March, sellers, 13s 1½d, c.i.f. Saigon No. 1, 13s 6d, c.i.f. Broken kinds firm at recent advance. Bran slow.

BEANS.—Market fully maintained. Parcels of Madagascar butters, afloat steamer "Clan Macintosh," sold, 33s 4½d, 34s being asked for the "Hesiones," and 33s 3d "Colonne;" January-March, sellers, 33s 3d cwt.

PEAS.—A steady market resulted. Japanese, afloat, 19s 6d to 20s 6d; December-January, 20s; January-February, 19s 3d; February-March, 19s cwt., c.i.f.

SPICE.—Pepper quietly steady. Lampong, October-December, quoted 1s 4¼d; January-March, 1s 4⅛d; March-May, 1s 3½d. Muntok, October-December, sold 2s 4d; January-March, quoted 2s 2½d; March-May, 2s 2¾d per lb. London stocks increased by 38 tons on the week. Tellicherry, January-March, 147s; February-April, 142s; March-May, 140s; Aleppy, 2s cwt less, c.i.f. Cloves steady. Zanzibar, spot, 1s 5⅛d to 1s 5⅜d; December-February, 1s 5d, buyers; March-May, 1s 5d per lb. Pimento unchanged. Sago flour quite nominal. Tapioca steady, but with only feeble response from buyers. African ginger, spot, 53s 6d; February-March, 50s per cwt, c.i.f.

FRUIT (Dried).—Currants: Market quiet. Pyrgos quoted 46s 6d; Patras, 48s; choice up to 52s; Amalias, 47s to 47s 6d; Gulf, 50s to 53s; Vostizza, 51s to 58s. Sultanas steady, with moderate inquiries. Medium to good Smyrna, spot, 39s to 54s; Cretan, 45s to 70s; Greek, 34s to 65s; Australian range from 30s to 48s; Californian, soda bleached, 35s to 38s; unbleached, 29s; Cape unbleached, 33s to 37s; bleached, 45s to 50s. Raisins dull. Valencia quarter boxes, 50s to 54s; Australian sell better at 32s to 36s; Capes neglected. Figs steady. Genuine new, spot, 29s to 32s; layers, 60s to 65s; pulled, 60s to 70s. Dates in fair demand, and market steady. Hallowie, new, spot, 28s to 30s; Khadrowie, 23s; Siar, 15s to 17s. Evaporated fruits: Apple rings met with rather more attention, also medium-size plums, but only a small business is proceeding in other descriptions, and prices show no quotable change. Californian plums 20-30's, 65s; 30-40's, 57s; 60-70's, 44s 6d to 45s. Australian pears range from 60s to 65s, as to quality. Apricots, Royal, 60s to 90s; Cape, 60s to 75s; Californian, new, 90s to 117s 6d. Peaches, Californian, choice, 50s; extra choice, 55s; fancy, 60s. Apples, Californian, spot, sliced, extra choice, 67s 6d. Almonds met a moderate spot demand. Mazagan, 145s; Mogador, 142s 6d; Majorcas, 150s to 165s; bitter, Jordan, 180s to 210s cwt.

CANNED GOODS.

CANNED FRUITS.—There is a moderate volume of business passing in Californian fruits at steady rates. Peaches offer at attractive rates, but pears firmly held, both for spot and shipment parcels. Australian move off steadily. Singapore pines quiet at late rates, but forward parcels very firm, which is likely to influence the spot position. A moderate business is reported in the new South African pack. Hawaiian firm, but quiet. Tomatoes realise full rates, and shipment offers reservedly made.

CANNED FISH.—Sardines steady, but best quality in limited supply. Portuguese clubs quoted 5s per dozen tins. Lobsters quietly steady. Best halves, 140s to 145s; and quarters, 77s 6d to 82s 6d. Salmon, spot, firm, but quiet, while forward quotations are well maintained. Halves in short supply, and realise 78s to 80s; pink met a moderate demand. Talls, spot, 26s to 27s; halves, 30s to 32s. Japanese crab sells steadily for finest quality at 92s 6d to 95s.

CANNED MEATS.—Corned beef quiet, unaltered, but ox tongues very scarce and firmly held. It is reported that the United States is buying in South America. Lunch tongues are selling fairly well at easy rates. Cooked boned hams firm, and large contracts have recently been made for forward delivery.

CONDENSED MILK AND MILK POWDERS. — Market generally steady. Full cream sweetened, English, spot, 45s; Dutch, ditto, 38s 6d; January-March, 38s 6d. Machine-skimmed sweetened, English, spot, 27s; Dutch, ditto, 23s 6d; January-March, 23s 6d, all in 5 cwt barrels. Powders: Spray F.C., 26 per cent., 2 by 56 lb tins, crated, prompt, 96s; M.S. (1 cwt cases) prompt, 41s 6d. Roller process, F.C., 26 per cent., prompt, 78s 6d; M.S., ditto, 30s, all net, duty paid, ex-wharf London. On the grocery side F.C.S., 21s; M.S.S., 10s 3d, basis per case, usual packing.

HONEY.—New Zealand is meeting with increased support in view of the Merchandise Marks Act, particularly popular brands such as "Imperial Bee," and a firm tone governed the market. Dark amber quoted 50s to 55s; medium, 55s to 65s; light, 65s to 85s; whites and water whites, 65s to 87s 6d; Jamaica, 42s 6d to 55s; San Domingo, 42s 6d to 48s 6d; pale set Siberian, 41s 6d per cwt.

RUBBER.

Prices eased slightly, buyers being reserved, but since firmer. Meantime, quantities coming along are decidedly smaller than anticipated some time back. Standard sheet, spot, and February, sold, 10⅝d to 10¾d; March, 10⅞d to 11d; April-June, 10⅞ to 11⅛d; July-September, 11⅛d to 11⅜d; October-December, 11⅜ to 11⅝d per lb.

London stocks increased 867 tons on the week at 24,423, against 66,286 last year. Landings, 2,110; deliveries, 1,234. Liverpool stocks increased 319 tons, landings being 422, deliveries 103; stocks, 3,824.

GENERAL.

JUTE.—Market quiet and barely steady. Firsts, January-February, quoted £34 5s; February-March, £35; March-April, £35 7s 6d; April-May, £36; lightnings, January-February, £32 15s ton, c.i.f. Hessians remain quiet.

HEMP.—With actual spinning demand reduced to a minimum, prices for Manila manifest a sagging tendency. J 2, February-April, sellers, £38; K, quoted £36; L 1, £35 10s; L 2, sellers, £30; M 1, quoted £30 10s; M 2, £27 15s; H, £36; G, £41 10s; C 2, £37; C 3, £33; S 1, £64; S 2, £56 10s; S 3, £48 10s; F, £63. African sisal No. 1, good marks, January-March, buyers, £43 10s; No. 2, £41 10s per ton, c.i.f. Mexican unaltered. Receipts last week, 15,000 bales; deliveries, 2,000; and stocks, 71,000 bales. Manila receipts last week totalled 28,000 bales, against 30,000 at same time last year; estimate for next week, 38,000, and following week, 30,000.

SHELLAC.—Market slow. T.N., spot, 192s 6d; March, 187s; May, 186s 6d cwt.

COPRA.—A colourless market, and quotations in most directions nominal. Straits, S.D., February-March, Rotterdam, quoted £24 16s 3d. Palm kernels dull, and prices easy. January-February, Hamburg, quoted £19 16s 3d ton.

MISCELLANEOUS.—Coconuts quoted 18s to 23s per 100. Coir yarn, Ceylon, £18 5s to £39 10s; Cochin, £23 to £40 10s; Ceylon bristle, £19 to £25; cinnamon leaf oil, 5¾d; citronella, Ceylon, 1s 9d; Java, 2s.

THE STOCK EXCHANGE.

All dealings in Stocks and Shares

and business relating thereto should be transacted through Brokers who are Members of

THE STOCK EXCHANGE.

A list of these can be obtained from the Secretary, Stock Exchange, E.C.2, with, if desired, the authorised Scale of Commissions or be seen at the Bank of England Stock Transfer Offices, Finsbury Circus, E.C.2.

Members of The Stock Exchange are not allowed to advertise for Business purposes or to issue circulars or business communications to other than their own principals.

Persons and Firms therefore who advertise as Stock and Share Brokers or Dealers are not Members of The Stock Exchange, or in any way under the control of the Committee.

UNIVERSITY OF LONDON.

A Course of Two Lectures on SOVIET RUSSIAN PUBLIC FINANCE will be given (in English) by Dr. PAUL HAENSEL, M.A., LL.D. (formerly Professor of Public Finance in the University of Moscow), at THE LONDON SCHOOL OF ECONOMICS (Houghton Street, Aldwych, W.C.2), on MONDAY and WEDNESDAY, FEBRUARY 11th and 13th, at 5 p.m. At the first Lecture the Chair will be taken by Prof. Allyn A. Young, Ph.D. (Professor of Political Economy in the University).
ADMISSION FREE, WITHOUT TICKET.
EDWIN DELLER, Academic Registrar.

INDIA

TENDERS FOR METROPOLITAN WATER BOARD BILLS.

1. The Metropolitan Water Board hereby give notice that Tenders will be received at the Chief Cashier's Office at the Bank of England, on Monday, the 4th February, 1929, at one o'clock, for Metropolitan Water Board Bills to be issued in conformity with the Metropolitan Water Board Acts, 1906, 1907 and 1915, to the amount of £1,000,000 (one million pounds), in replacement of Bills falling due on the 10th proximo.

2. The Bills will be in amounts of £500, £1,000, £5,000 or £10,000. They will be dated the 9th February, 1929, and will be payable at twelve months after date, viz., on the 9th day of February, 1930.

3. The Tenders must specify the net amount per cent. which will be given for the amounts applied for; and the Tenders of Private Individuals must be made through a London Banker.

4. The Bills will be issued and paid at the Bank of England.

5. The persons whose Tenders are accepted will be informed of the same on Tuesday, the 5th February, and payment in full of the amounts of the accepted Tenders must be made to the Bank of England not later than Twelve o'clock, on Saturday, the 9th February, 1929.

6. The Metropolitan Water Board reserve the right of rejecting any Tenders.

7. Tenders should be on the printed form, which can be obtained from the Accountant to the Board at these Offices, and at the Chief Cashier's Office, Bank of England, or at any of the Branches of that Bank.

G. F. STRINGER, Clerk of the Board.
Metropolitan Water Board Offices,

THE MONEY MARKET.

FIVE AND A-HALF PER CENT.

FOLLOWING gold losses which amounted during the week to £3,060,680, the Bank of England raised its rate on Thursday from 4½ to 5½ per cent. The wider implications of the change we discuss elsewhere in a leading article, but

it is abundantly clear that the intrinsic position of the money market had nothing to do with the increase. Conditions, in fact, immediately before the change were relatively easy. On February 1st the War and Treasury Bonds maturing on that date were duly repaid, and the effect was a contraction during the week of £10,878,217 in Public Deposits, accompanied by an increase of £10,290,087 in Bankers' Deposits. The Bank, too, had more than neutralised the week's gold losses by the acquisition of £5,031,261 of Government securities. Thus, despite an increase of £1,874,811 in the note circulation, leading to a total fall of £4,935,491 in the banking department's Reserve, the market was well supplied with funds, and, in fact, repaid £943,130 of its loans from the Bank during the week.

* * * *

As the week progressed, a general sense of nervousness as to the Bank rate outlook became apparent in the market, and this became intensified with the news of each successive loss of gold. By Wednesday the feeling of uncertainty had crystallised to the point where business was actually restricted. Discount rate, it is true, only hardened a trifle, $4\frac{5}{16}$ per cent. being then the ruling rate for three months' bank bills, but the market was disinclined to deal, and preferred to await the outcome of Thursday's decision as to Bank rate. The event showed that this caution was justified.

* * * *

As part of its policy of maintaining its own rate at $4\frac{1}{2}$ per cent., during the time that rate was in force the Bank had more than once made attempts to stabilise market rate on three months' bills, and the $4\frac{5}{16}$ per cent. rate prevalent recently was in part the outcome of this policy. The point of interest at present is the level at which market rate will settle down under the new condition of a $5\frac{1}{2}$ per cent. Bank rate. Early on Thursday afternoon the market had still to take its new bearings, and in the absence of business market rate was variously described as anywhere from 5 to $5\frac{1}{4}$ per cent. By late Thursday afternoon market rate on three months' bills had settled down at $5\frac{1}{8}$ to $5\frac{3}{16}$ per cent.; this represented a bigger margin between Bank rate and market rate than existed before the change.

* * * *

We may, however, point out one or two possibilities. In the first place, money is likely to remain fairly stringent during the next two months, while tax payments continue to come in. To look no further ahead, large transfers of tax money are due at the end of the current week, and so the market may be fortunate if Thursday's rate for short loans of $4\frac{1}{2}$ per cent. persists. Conversely,

	Feb. 7, 1929.	Jan. 31, 1929.	Jan. 24, 1929.	Jan. 17, 1929.	Previous Rate and Date Changed.
	%	%	%	%	%
Bank Rate	$5\frac{1}{2}$	$4\frac{1}{2}$	$4\frac{1}{2}$	$4\frac{1}{2}$	$4\frac{1}{2}$ (Feb.7,'29
Banks' Deposit Rate	$3\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$ (Feb.7,'29
Discount { Call	$3\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$ (Feb.7,'29
Houses { Notice	$3\frac{5}{8}$	$2\frac{3}{4}$	$2\frac{3}{4}$	$2\frac{3}{4}$	$2\frac{3}{4}$ (Feb.7,'29
Market rate (3 months' bills)	$5\frac{5}{8}-\frac{1}{16}$	$4\frac{15}{16}$	$4\frac{15}{16}$	$4\frac{15}{16}$	..

owing to the excess of maturities over fresh issues, the Treasury Bill rate may stand at a fair margin below the new Bank rate. As regards market rate, the Bank is bound to make it "effective," or the increase in Bank rate will fail in its object, but the Bank may be content to see it at a shade over 5 per cent. Finally, there is some suggestion that the banking world does not expect the new Bank rate to last for more than a few months, but this, of course, is pure conjecture at present.

NEW YORK MARKETS.

The weekly statement shows the New York Federal Reserve Bank to be in a strong position, with reserves up, discounts and bills reduced, and the ratio up 1.8 to 78.8. For the system as a whole changes are for the most part nominal; the chief item of interest is an increase of $31 millions in discounts and a reduction of $25 millions in bills. The ratio is down by 0.1. Logically, any advance in rates should start with the banks of the interior where ratios are considerably lower and where there are still four whose discount rates are only $4\frac{1}{2}$ per cent. The Reserve authorities apparently wish to continue indirect methods, but their action is difficult to predict on logical grounds. Apart from these considerations it is felt that a substantial reaction in the share market is due before spring and it is realised that money normally tightens towards the end of February or the beginning of March. Business news continues good except for some indications of a recession in building construction. The Bradstreet indices of commodity prices rose slightly, chiefly owing to a rise in farm products.

THE STOCK MARKETS.

After a cheerful opening day to the new account, hesitation set in, and on Wednesday a sharper drop in gilt-edged stocks than had been experienced for some time showed that the Stock Exchange had come round to the view that a rise in Bank rate could not be long avoided. The actual announcement on Thursday morning was quietly received, and though Government stocks were marked down further, other sections scarcely suffered. Home Railways enjoyed one good day and then relapsed into neglect. Important movements in industrials were limited to isolated shares, mainly those of large companies exercising virtual monopolies. The monetary situation caused Anglo-Americans generally to weaken. The rubber, tea, and oil share markets received scant attention. Activity in Rhodesian coppers burst out again, and Kaffirs were more interesting than of late, while a sudden upward movement in tin shares attracted interest.

THE COMMODITY MARKETS.

Most branches of trade seem to have been marking time this week. Coal prices continue firm, and a slight improvement in export demand is maintained. Activity in iron and steel is patchy and uncertain. Other metals are strong. Manchester cotton goods have met with poor support abroad, but there are faint indications of a revival in home demand. Bradford business is restricted by uncertainty as to the future of wool values, but a moderate business in piece-goods is being transacted. In the hide and leather trades confidence is still lacking, and Northampton factories continue quiet. Oil cakes are firm, but other seed products remain in only moderate demand. Wheat prices are scarcely changed.

FOREIGN EXCHANGES.

The change in the Bank rate at the moment of writing introduced a buzz of activity into the foreign exchanges, but made it impossible to give forward quotations. All Continental currencies naturally moved with the dollar in favour of this country. Berlin, which had been hard throughout, went up still further, and the peseta, as a result of political uncertainties, moved in a wildly erratic manner, reminiscent of the post-war period. New York is now offered at $4.85\frac{11}{16}$; Paris, 124.20; Milan, 92.70; and Madrid, 30.62, after having touched 32.15. Amsterdam (sellers) is at $11\frac{3}{8}$, and Berlin $20.45\frac{1}{2}$ offered. Geneva went to $25.22\frac{1}{4}$; Stockholm, 18.15; Oslo, 19.00; Copenhagen, $19\frac{1}{4}$; and Vienna, 34.51. The South American exchanges were so far unaffected. The rupee fell away slightly at 1s 6d, but the yen was considerably better. Spot silver lost $\frac{3}{16}$d at 26d, as did forward at $26\frac{1}{16}$, as a result of fair China and India selling and lack of support. The China silver exchanges weakened a little in sympathy, Hongkong to 2s $0\frac{5}{16}$d and Shanghai to 2s 7d.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following companies:—Lloyds Bank, London Merchant Bank, Skefko Ball Bearing, United States and General Trust Corporation, United Serdang (Sumatra) Rubber Plantations, Associated Automatic Machines, Everlite, and Ind, Coope. The chairman of Lloyds Bank reviewed the financial and industrial history of 1928, and described trade prospects in cautiously optimistic terms. Mr Eric Miller gave an illuminating review of rubber plantation prospects at the United Serdang meeting.

OUR SIXTY-FIFTH ANNUAL COMMERCIAL HISTORY.
With this number our readers will find a Supplement reviewing the trend of financial and commercial events at home and abroad during the past year. A brief survey of events in the Dominions and foreign countries is followed by detailed reviews of the principal trades and industries of Great Britain.

DEARER MONEY.

After remaining at $4\frac{1}{2}$ per cent. for nearly two years, Bank rate has at last been raised to $5\frac{1}{2}$ per cent. Thus ends a phase in Britain's post-war monetary history which in many ways was of outstanding interest and importance. During this period the main object of the Bank of England has been the maintenance of stability, so as to promote a feeling of confidence and to give the trade and industry of the country a firm basis upon which to found its plans for revival. Even though it may seem, to outward appearance, that to-day the Bank has to confess failure, it should be recognised that not only has the Bank met with a considerable degree of success in its efforts to reach its goal, but that it has only done so at the cost of what at times must have been a considerable sacrifice of its own earning powers. In short, the Bank has followed its traditional policy of putting the needs of the nation ahead of its own interests.

Proof of its partial success in maintaining stability is found in the course of commodity prices and interest rates alike. As regards the former, the *Economist* index number, it is true, reveals a decline of 4.7 per cent. since April, 1927, when the $4\frac{1}{2}$ per cent. rate came into force, but this amounts only to around 0.2 per cent. a month, and this at a time when the world course of prices was on the whole downwards. Moreover, several other British authorities make the decline one of only 2 per cent., or even less. The measure of the Bank's success in the field of interest rates is even clearer. Not only was Bank rate itself maintained unchanged, but discount rates were on occasion "unofficially stabilised" for periods extending over several months. Nor were external circumstances such as to facilitate the policy. The year 1928 alone witnessed an ebb and flow in our gold stocks of over £20 millions, while there is no important foreign centre that has not effected at least one change in its Bank rate during that period. If we take into account, further, repercussions arising from the stabilisation of the franc and the boom conditions on Wall Street, it will be seen that the Bank has had a troubled sea to navigate.

The Bank has achieved its purpose only at considerable cost to itself. As we have already had occasion to point out, all last year it pursued a policy of "neutralisation." When gold came in, it sold earning assets, while later in the year it balanced its gold losses by additions to its earning assets. By pursuing this policy it kept the nation's supplies of credit at a constant level, but this policy meant that last summer, when the Bank's gold stocks were at their peak, its earning assets were far below the level that would have been permissible had the Bank's policy been governed solely by consideration of its ratio of gold to liabilities. It is needless to add that each reduction in the Bank's earning assets means a reduction in its own profits. The Bank itself never gave weight to that consideration, nor would it wish others to do so. Still, it is only proper that we should recognise that in pursuance of its neutralisation policy the Bank last summer deliberately depleted its own earning assets in the general interest of the financial world.

If the Bank has in one sense now to confess defeat, it will be generally conceded that it has been beaten by circumstances beyond its immediate control. Three times last year the boom on Wall Street forced the New York Reserve Bank to raise its rediscount rate, and since July it has stood at 5 per cent. Two years ago no one would have believed that New York could remain half a point above London for more than a few weeks without London being forced to follow suit, and the fact that the Bank of England was able to avoid raising its rate for seven months reveals the narrow margin by which it has failed to achieve permanent success. All through the autumn, even when the outflow of gold from the Bank was at its height, we, in common with other observers, hoped that the Bank would weather the storm. Gold losses in the autumn months were, after all, a seasonal phenomenon, and due preparation for them had been made. In January, when the outflow had definitely slackened, it appeared that the gold exports had reached their end, and that the period of strain had been successfully weathered.

The renewal of gold shipments during the past week finally frustrated these hopes. February is a month in which the Bank ought to be replenishing its autumn losses rather than losing more gold, and it was clear that the continuance of Stock Exchange activity on Wall Street was maintaining New York as the magnet for the world's lenders of short money, and incidentally for London's gold. It is true that to the more prudent lenders a New York call rate of 7 per cent. might not be much of an attraction after they had insured themselves against the risk of exchange losses, but not all lenders take that precaution, and, besides, if there was the fear that call rate might drop to 6 per cent., there was also the hope of a return to the dizzy heights of 10 or 12 per cent.

In any case, for good or for evil, the Bank has felt bound to act, and it remains to consider the new position that a $5\frac{1}{2}$ per cent. rate has brought about. In many respects there is no reason for alarm, whether from the standpoint of the financial or of the industrial world. Suspense is nearly as bad for trade as is the actual occurrence of an untoward event, and we are bound to confess that praiseworthy as have been the efforts of the Bank during the past four months to ward off an increase in its rate, they did create a feeling of uncertainty which was hardly calculated to promote confidence in the business world. Now that the blow has fallen, the business world is at least freed from uncertainty.

Nor need there be much fear at home either of a renewed decline in the price-level or of credit restriction by the banks at the expense of legitimate business. Apprehensions on the first point may be allayed by reference to recent American history, where the three increases made in the New York rediscount rate during last year have had no appreciable effect upon the price-level. As regards the second point, hitherto the Bank of England has tried to preserve stability and keep the situation in hand by means of its open-market policy, and at times this has meant movements in the direction of "restriction." The increase in Bank rate will free the Bank's hands in this respect, and if the increase succeeds in drawing back gold to London, it may well turn out that the credit fund is freer under a $5\frac{1}{2}$ per cent. rate than it was during those months when everything was subordinated to maintaining the rate at $4\frac{1}{2}$ per cent.

Finally, the $5\frac{1}{2}$ per cent. rate comes as a definite signal to America. It must not be supposed that Continental centres will remain indifferent to London's lead, and its cumulative effect may well be a definite pronouncement that Europe is not prepared to stand idly by and see the world's gold stocks sucked into a maelstrom. Wall Street can scarcely remain indifferent to such a pronouncement, especially if the New York Reserve Bank follows by a sharp increase in its own rate. In any case, the establishment of European interest rates upon a new and higher level may well draw gold back from New York before long; and if so the $5\frac{1}{2}$ per cent. rate will have done its work. In short, the Bank of England has raised its rate under the pressure of outside circumstances. By so doing it has brought to an end a period of suspense, and has taken definite action towards the better distribution of the world's stocks of gold. It goes without saying that it will reduce its rate so soon as circumstances permit, and there is ground for hoping that no long time will elapse before a reduction is possible. If so, a difficult situation will have been rectified at a comparatively small cost.

RUSSIA.

THE decision on the part of an important group of British manufacturers to send a delegation to Russia to study Russian needs is significant of reawakening interest among business men in the question of Anglo-Russian trade relations. Future prospects are so largely conditioned by political developments within the U.S.S.R. that it is opportune to inquire what is occurring in Moscow, and whether any changes are discernible in the attitude of the Communist Party leadership. In considering Russia we have been taught by long experience that it is wisest to recognise the limitations of our knowledge and to confess our ignorance rather than yield to the temptation of helping it out with conjectures. At this moment, evidently, "something is happening" in Russia, but it is dangerous to go beyond what we really know. If we are faithful to this sober and cautious rule, we must admit now that we only know two general facts, without knowing their relation to each other.

The fact immediately before us is that the struggle within the bosom of the Communist Party, which we may dub "Trotsky *versus* Others," is not yet over. We know that this struggle began almost immediately after the death of Lenin—the Prophet of Bolshevism—who alone possessed the fire and the magnetism and the practical ability which were needed for keeping his companions together. We know that, since Lenin died, none of the surviving Russian Communist leaders has had the capacity to hold the Russian Communist Party together. If Trotsky had been of Lenin's build, he would have stepped into Lenin's shoes. The struggle began because Trotsky's comrades were strong enough to prevent him from doing that. It is still going on because, though they have got the upper hand over him by weight of numbers, they have not been able to put him out of action. The reason is that Trotsky has a genuine following in the ranks of the Russian Communist Party, and the rank and file of the party—an armed and organised *corps d'élite* of the Russian urban proletariat—is the ultimate depository of power in both the U.S.S.R. and the Third International.

In the world at this moment there are probably few political machines so effective for their immediate purpose as the complicated and sinister mechanism by which the Russian Communist Party maintains its power over about a hundred and fifty times as many non-Communists within the frontiers of the U.S.S.R., not to speak of its influence over Communists outside those frontiers in many parts of the world. But when it is a question, not of the Russian Communist Party versus them that sit in outer darkness, but of one latter-day saint against another, then the very nature of the party organisation makes it extraordinarily difficult for any faction in the party to secure a definite victory over its rivals. In the case in point, Trotsky's opponents drove him into retirement for the first time as long ago as 1925, fairly defeated him in 1926, expelled him from the party in 1927, and finally packed him off in January, 1928, to an ultra-remote place called Vernyi in the "Autonomous Soviet Socialist Republic of Qazagistan," on the borders of Chinese Turkestan. But this method of disposing of the defeated Trotsky gives the measure of his opponents' embarrassment. Why not put him to death? We can hardly suppose that Stalin shrank from shedding fraternal blood; and the answer can only be that public opinion within the Russian Communist Party would not have tolerated it. In effect, Trotsky, in the course of a year, has demonstrated the hold which he still has upon the rank and file by managing, even from so awkward a base of operations as the mid-point of Asia, to stir up something like a Fronde in the Party ranks. This Fronde is evidently so formidable that Stalin and his partisans cannot leave Trotsky to his own devices. But, again—exasperated though they must be—they do not apparently dream of disposing of this awkward customer in the obvious way. They can think of nothing better to do with him than to export him from Turkestan to Turkey—with perhaps a faint hope that a Black Sea gale may rid them of this cat-with-nine-lives on the journey.

This much, then, is certain: The Russian Communist Party remains a house divided against itself; and we are told that such houses cannot stand. But it is quite another matter to predict the date of their fall; as witness the Hapsburg Monarchy, whose fall was persistently and plausibly predicted for about 180 years before it eventually happened ten years ago. Let us eschew prophecy; and let us likewise eschew conjectural combinations of one known fact with another. Our other known fact is that since Lenin's death in 1924 there has been a gradual reversal of the New Economic Policy which Lenin inaugurated in 1921. The N.E.P. was perfectly consonant with the opportunist spirit of the revolutionary transition from the capitalist city of destruction towards the Communist earthly paradise. The gist of the N.E.P. was that certain minor departments of economic activity, which the Communist State was not ready to take over at once, yet which could not be allowed to go out of action, should be handed back, provisionally and "without prejudice," to private enterprise. The land must be cultivated; goods must be exchanged in retail; and accordingly the peasant proprietor and the small tradesman were allowed to raise their heads again—with the warning that these heads would be cut off in due time in any case, and curtailed immediately if they were rash enough to raise them too high. It must be emphasised that the N.E.P. was not a cloak for a return to capitalism. It was a policy of *reculer pour mieux sauter;* and the Communist State never for a moment relaxed its hold upon what it regarded as the key positions—namely, industry and foreign trade.

What, then, is the meaning of the fresh offensive of economic Communism in the U.S.S.R., which has been in progress during the last few years? At first sight it might seem to be a resumption of the advance "according to plan," and therefore a sign of strength. There are indications, however, that it is really a sign of weakness; for the Communists seem to have entered upon this second forward movement for establishing Communism in the U.S.S.R., not because they have felt themselves now ready to communise the entire economic life of that vast country, but because they simply did not dare to allow the N.E.P. to continue. They dared not let it continue because the peasant-proprietor and the retail tradesman were turning the restricted and precarious opportunity which the N.E.P. offered them to such good account that the Communists might wake up one day to find that capitalism, readmitted on sufferance, had come to stay. The rulers of Soviet Russia took alarm and hastily started a Communist offensive again; and apparently this offensive has achieved considerable momentary success. The wings of the "Nepmen" have been clipped. The "kulaks," or prosperous peasants, have been cowed into continuing to exchange their agricultural produce against the manufactures of the urban proletariat at uneconomic rates. This momentary success is not surprising, for the Russian Communist Party is a very formidable engine of social warfare. The question is: Have these gains of ground for Communism in the U.S.S.R. been purchased at too heavy a cost? The cost, of course, must be reckoned in terms of loss of economic efficiency, and if this loss is serious, that will hit the Bolsheviks hard, for they rightly hold that the standard of living of "the labouring masses" in the U.S.S.R. is the acid test of Communism, and that, if Communism results in a notable lowering instead of a notable raising of the standard of living in the long run, then Communism cannot stand. Now this might well be the effect of Communism anyway, but it can hardly fail to be the effect of a Communism, prematurely forced on, for political reasons, before its sponsors themselves are prepared for it.

Here, then, is the second known factor in the Russian situation. Communism is making its second offensive—and this, apparently, not from choice, but under pressure from the enemy. It were well, however, to refrain from attempting to bring this second fact into relation with our first fact, namely, the dissension within the bosom of the Russian Communist Party. In 1927 Trotsky was supposed to be an advocate of the offensive and Stalin an advocate of further compromise. Yet since Trotsky's banishment Stalin has certainly been carrying out the very policy in opposition to which he was alleged to have hurled Trotsky from power. It must be remembered that both Trotsky and Stalin are sincere Communists, and that their theological differences are so subtle that to a mere bourgeois outsider they would scarcely be discernible with the naked eye. If they really did fall out over the question of the offensive against the "kulaks" and the "Nepmen," they were quarrelling over a point, not of principle, but of expediency. It is conceivable that Stalin did regard the offensive as inexpedient, but has since been driven into pursuing it by the logic of the situation—a force which is stronger than Stalin, stronger than Trotsky, and stronger than the Russian Communist Party itself, even if it were not at sixes and sevens as it is to-day.

THE NUMERICAL IMPORTANCE OF FOREIGN TRADE.

The importance of Britain's foreign trade is a fundamental fact which supporters of Protection are inclined dangerously to ignore. At our invitation Dr A. L. Bowley contributes the following estimate of the present relationship between our home and foreign trade.

WITH the completion of the Census of Production for 1924 and Mr Flux's recent presidential address on National Income to the Royal Statistical Society, we have all the material that can be available for an analysis of the relationship of the imports and exports of this country to its total income from all sources in 1924, and the account can be carried on to 1928. On many of the factors only broad estimates are possible, and few of the results are trustworthy within a small percentage; but the principal facts can be brought into the right perspective, and a general judgment formed that will be accurate enough for many purposes.

For 1924, the balance of trade, as estimated in 1925 by the Board of Trade, was as follows:—

DUE to the UNITED KINGDOM.

	Million £.
For exports: British produce	801
„ net exports of bullion	12
„ earnings of shipping, net	140
„ commissions, &c.	75
„ interest from abroad	220
	1,248

DUE from the UNITED KINGDOM.

For imports, less re-exports	1,137
On Government account, net	25
	1,162

The balance, £86 millions, was said to be available for additions to our investment abroad.

The imports are classified in the trade returns as food, drink, and tobacco, £541 millions; raw materials and goods mainly unmanufactured, £324 millions; goods wholly or mainly manufactured, £266 millions; miscellaneous and parcels post, £6 millions. The goods "mainly manufactured" include a very considerable amount of partly-finished products (such as pig-iron, undressed leather), and of other goods, such as motor spirit and other oils, which might as well have been termed "mainly unmanufactured." An analysis on the lines followed by the Board of Trade in a report in 1904 leads to the following classification:—

	Million £.
Raw materials, &c.	324
Manufactures—	
C. Partly manufactured	37
B. Requiring some further process	109
Total of above	470
A. Ready for consumption	120

Pig-iron is an example of goods classified under C, yarns and steel girders of those under B. Of food imports, &c., also, a considerable quantity needs preparation or manufacture before use—for example, tobacco and unrefined sugar—while grain is the raw material of the millers. Mr Flux finds that in all £674 millions of imports were used for industrial or agricultural processes. Of the remaining £463 millions, about one-quarter consisted of completed manufactured goods and nearly three-quarters of food, &c., ready for use. In short, our foreign trade is to a large extent an organisation for supplying us with raw materials and food.

It is not possible to make a valid estimate of the amount of home-produced materials, but we can make some computations about food. The whole value of the production of home agriculture and fisheries in 1924 is estimated at about £330 millions. Part of this is due to imported materials for agriculture, and part (*e.g.*, wool) is not food, but material for manufacture; these items may roughly be balanced against the value of the manufacturing processes, such as cheese-making, applied to home-produced food. The value, at the ports, of food imports (not including wine or tobacco) was £515 millions. Thus, on the basis of wholesale prices, and excluding the preparation or manufacture of imported food, the country depends for food to the extent of 60 per cent. on imports and 40 per cent. on home production. The exact proportion to be allotted depends on intricate definitions, and an estimate of 65 per cent. foreign could be justified.

In a previous article on this subject (*Economist*, November 17, 1923) an estimate was made of working-class expenditure on imported food, and this has been re-examined in the light of recent figures. The method adopted is to divide the standard budget, used by the Ministry of Labour for the calculation of the cost of living index-number, into home and foreign produced goods, and to make allowance in detail for the changes of prices. The result is to allocate 35 per cent. of the food expenditure to imports, as valued at the ports, and about 20 per cent. to the preparation thereof and their distribution to the consumer (Customs excluded); thus 55 per cent. is spent on food of foreign or colonial origin and 45 per cent. on home-produced food. The more general analysis given above relating to the relative values of home and imported food, unmanufactured and at wholesale prices, suggests that this 55 per cent. is an under- rather than an over-estimate. Certainly more than half of working-class expenditure on food is on commodities originating abroad. It may be estimated that of the aggregate of imports of all kinds retained in the United Kingdom, at least £350 millions (as valued at the ports) represents food, or ordinary necessaries or their essential materials, as consumed by the wage-earning classes; and, we may add, the competition of imports in nearly every material and article of food tends to keep down prices to the consumer.

We may now turn to the consideration of the magnitude of manufacture for export. As is well known, the principal statistics given by the Census of Production relate to "net output," or the value added by manufacture, being the excess of the selling value of the goods produced over the value of all the materials and semi-manufactured articles used in production. The "net output" of industry and mines in 1924 is estimated at £1,630 millions, or, including agriculture and fisheries, £1,870 millions, after allowing for goods transferred from industry to agriculture and *vice versa*. The gross value of exports was £800 millions, f.o.b. From this must be subtracted the cost incurred between the factories and the ports and the value of imported raw materials, &c., contained in the exports; and a rough estimate leaves £530 millions as the value of the "net output" for export at the time the goods leave the factories or other places of production. On this basis it appears that between 25 and 30 per cent. of the whole product of industry, mining, and agriculture is exported; of industry and mining alone the proportion is over 30 per cent.

Now, industrial and mineral production for export employs directly some 2,100,000 wage-earners and about 230,000 salaried persons. It accounts for about one-seventh of all wage-earners in the United Kingdom, with an annual wage-bill of £200 millions to £240 millions, and it furnishes directly nearly one-seventh of the whole national income. The values of some services less directly connected with production for export have also to be brought into account. The transport of exports to the ports and of the raw materials used in them from the ports to the factories, with commissions and incidental expenses, may be put at about £125 millions. There are also services at sea, which may be roughly valued as follows: £800

millions exports imply also in the long run £800 millions imports; having regard to the proportion of British ships to all engaged in our foreign trade, to the total estimated earnings of shipping, and to the average cost of sea-transport, it appears that between 4 and 6 per cent. on the £1,600 millions, imports and exports together, is a reasonable estimate for the value of these services—that is £64 millions to £96 millions. Now add together the cost of production and of transport, &c., by land and sea, and we get between £700 millions and £750 millions as the whole amount of income that depended on production for export. This is nearly one-fifth of the national income, which Mr Flux reckons as between £3,750 millions and £4,200 millions in 1924, while the estimate given in "National Income" (Bowley and Stamp) was £3,700 millions to £3,900 millions. A similar calculation for the period before the war shows that the corresponding aggregate then amounted to nearly one-quarter of the national income. If so high a proportion was again attained, there would be additional employment for seven or eight hundred thousand wage-earners, if there were no counterbalancing factors.

Additional sums that might be brought into the reckoning, when we are considering the whole importance of foreign trade, are the inland transport and distribution of all imports (so far only reckoned on raw materials for exported manufactures), which from the ports to the consumer may amount to anything from £150 to £250 millions, and also the services at sea connected with them and the Customs duties on them. Including these factors, it is probably safe to say that as much as one-quarter of the national income depends on the existence of foreign trade. The changes in production, export, and income from 1924 to 1928 have not been sufficient to alter the proportions thus roughly stated.

SHIPBUILDING IN 1928.

JUDGED solely by the criterion of output, 1928 might be accounted the best shipbuilding year since 1921. The annual summary of the world's tonnage production, issued this week by *Lloyd's Register*, shows that during the past year British yards launched 1,445,900 tons, an increase of 220,000 tons in comparison with 1927. Foreign launchings were 194,000 tons higher at 1,253,319 tons, so that the total increase in world production amounted to 414,000 tons, or 18 per cent. During the course of the year, however, the situation of the industry fluctuated considerably. In the case of British yards the year began with a proportion of the arrears accumulated during 1926 still not worked off, and, as the contracts in hand were completed, activity steadily declined to a low level, from which a recovery took place in the last quarter. The following table shows the tonnage of work in hand at the end of each quarter, corresponding figures for earlier dates being added for purposes of comparison :—

TONNAGE under CONSTRUCTION (Thousand Tons Gross).

Date.	United Kingdom.	World.	British Percentage.
Dec. 31, 1913	1,957	3,331	*59*
„ 1920	3,709	7,180	*52*
„ 1927	1,580	3,119	*51*
March 31, 1928	1,441	2,893	*50*
June 30, 1928	1,203	2,660	*45*
Sept 30, 1928	1,090	2521	*43*
Dec. 31, 1928	1,243	2,618	*47*

It will be seen that the work in hand in British yards, which rose steadily from 760,000 tons at the beginning, to 1,580,000 tons at the end of 1927, declined seriously during the first nine months of 1928, under the influence of the acute depression of cargo freights between January and July; and though the heavy grain shipments of the autumn produced a sharp recovery in freights and led to substantial new orders for tonnage (work begun rising from 245,000 tons in the September to 432,000 tons in the December quarter), the volume of British tonnage building at the end of the year was smaller, and represented a lower percentage of the world total, than twelve months earlier.

In order to place the recent situation of the industry in its proper perspective, we give below an analysis of the production figures of the past three years in comparison with those for 1922-25, and for the quinquennium immediately before the war :—

TONNAGE OUTPUT.

Period.	Tons Launched (000's). U.K.	Abroad.	World.	British Percentage.	Output as per Cent. of 1909-13. Britis	Foreign	World.
Average 1909-13	1,522	967	2,489	*61*	100	100	100
„ 1922-25	1,050	1,087	2,137	*49*	69	112	86
1926	640	1,035	1,675	*38*	42	107	67
1927	1,226	1,060	2,286	*54*	80	110	92
1928	1,446	1,253	2,699	*54*	95	130	108

An examination of the post-war figures suggests that there is little ground for hoping that the day will quickly return when Great Britain was building 60 per cent. of the world's shipping. Last year, it will be observed, British output was 5 per cent. lower than in 1909-13, whereas production abroad, stimulated in some instances by State assistance, showed an increase of 30 per cent. in comparison with the pre-war period. Moreover, as may be seen from the following summary of production in certain foreign countries, last year's output abroad represented in few instances the maximum capacity of the yards, as shewn by earlier high records :—

TONNAGE LAUNCHED ABROAD ('000 Tons.)

	High Record since 1920.	1926.	1927.	1928.
Denmark	139	72	72	139
France	211	121	44	81
Germany	526	181	290	376
Holland	232	94	120	167
Italy	220	220	101	59
Japan	227	52	42	104
Sweden	107	54	67	107
U.S.A. (coast)	995	115	124	86

Shipbuilding activity declined in Italy and the United States in 1928, and the work in hand in Germany, whose annual output showed a substantial gain, was not so large at the end as at the beginning of the year. With these exceptions, however, foreign building was well maintained last year, and the expansion of the industry abroad is reflected in the fact that of the tonnage launched in 1928 only 20 per cent. was destined for foreign owners, as compared with an average of over 22 per cent. in 1909-13.

The present returns include a number of interesting features which illustrate tendencies in shipbuilding development. Nearly 44 per cent. of the total tonnage launched in the world during 1928 consisted of motorships, which represented 29.7 per cent. of the British, and nearly 62 per cent. of the aggregate foreign production. Moreover, 560,000 tons of the steam tonnage launched referred to vessels fitted for oil fuel, so that only 34 per cent. of the world's output was exclusively dependent on coal for propulsion. Excluding craft of less than 500 tons, the average size of the vessels launched from British yards was 4,656 tons, as compared with 4,193 tons a year ago, and 3,777 tons in 1924. Notable launches in this country were the "Viceroy of India," a turbo-electric vessel of 19,000 tons, ordered by the P. and O. Company, and three 20,000-ton turbine liners for the Canadian Pacific Steamships, Limited. Abroad, Germany launched the two largest ships of the year, the "Bremen" and "Europa" (46,000 tons), whose entry into the North Atlantic passenger trade has been seriously delayed by labour disputes in the German yards, while a turbo-electric ship slightly larger than the "Viceroy of India" was launched in the United States.

The most important issue, however, suggested by *Lloyd's Register's* annual report is the question whether the recent recovery of British shipbuilding from the depression of last summer is likely to be lasting. The view was expressed in these columns a year ago (*Economist*, January 28, 1928) that the maximum average annual production attainable by the world's yards in 1929-33 would probably not exceed 2¼ million tons a year. In 1928 this figure was exceeded by 450,000 tons, and if the rate of "commencement" recorded in the last quarter of 1928 (681,000 tons) were maintained, production in 1929 would also considerably surpass our estimate. There are, however, several considerations to be borne in mind before more optimistic conclusions as to the future are reached. In the first place, tanker tonnage has represented a considerable proportion of the last two years' output. In 1927, 542,000 tons, and, in 1928, no less than 647,000 tons of this type of vessel were launched—an addition to the world's oil-carrying fleet much in excess of present requirements. The tanker freight market is now in the depths of acute depression, and orders for fresh tankers are being, and are likely to be, placed very sparingly. To make good the probable restriction of this class of building for some time to come, the shipbuilding industry must rely (in the absence of an unexpectedly great acceleration in the rate of normal "liner" replacement) on an increase in demand for new cargo-carrying units of the "tramp" class. Temporarily stimulated by a moderate (and largely seasonal) improvement in whole-cargo freights during the past four months, this demand is of a highly precarious nature, since, apart from periods of seasonal activity, the supply of tonnage is still substantially greater than the flow of cargoes; freights (as measured by the *Economist* Index Number) are no more than 13 per cent. above the level of 1913; and much tonnage is still laid up.

All things considered, there appears as yet to be scant warrant for hoping that our forecast made a year ago was unduly pessimistic, and though prospects for the next six months in British yards are favourable, the further outlook for the industry is not encouraging from the aspect either of employment or of financial results, since recent contract prices have been cut in many cases to a barely remunerative level. Production costs abroad are no longer so low as *per se* to render foreign rivalry abnormally severe, but the British shipbuilding industry is suffering heavily from internal competition between concerns whose aggregate capacity is in excess of existing or probable demand, and whose operating expenses are burdened with top-heavy standing charges on unused plant. The situation is one in which temporary spurts of activity should not be allowed to obscure the need for tackling the still unsolved problem of "rationalising" competition and production in the industry itself.

THE GERMAN NEWSPAPER PRESS.

BY OUR BERLIN CORRESPONDENT.

IN Germany, the country *par excellence* of decentralisation, with its thousands upon thousands of separate and individual opinions, every political party or group, every religious body, every cultural or economic movement, every district, every town thinks it necessary to demand a newspaper as its mouthpiece. In view of this peculiar trait it is not surprising that a close examination of the financial structure of the news industry reveals unmistakably that the idea of such consolidation in the newspaper world as has taken place in England, America and other important countries is bound to encounter in Germany an almost insurmountable barrier in the psychology of the people.

Germany possesses no newspaper amalgamation comparable to the Rothermere and Berry groups in England or to the Hearst group in America. Even the so-called Hugenberg combine, which represents an innovation in German journalism, does not resemble in structure its foreign prototypes. The vast majority of German papers are still run as individual undertakings, faithful to the tradition of family ownership. Thus of approximately 3,250 German papers in 1928 no fewer than 2,650 were family undertakings; of these some 96 per cent. were exclusively family property, and only the small remainder of 4 per cent. had organised themselves under the form of limited liability or joint-stock companies. Apart from these last-mentioned companies, all these ventures were unimportant organs which in few cases achieved a circulation exceeding 2,000. The big papers, on the contrary, have adopted the limited liability or joint-stock form. The more impersonal form of the limited liability company occurs in 200 cases, and only 48 undertakings having between them some 60 to 70 papers have adopted the joint-stock form, which, according to the experience of other countries, offers financially the greatest scope. But it is these very papers, which are numerically the smallest part of the German Press, whose importance and standing in the world at large make them the standard of German journalism. The aggregate circulation of those papers which are conducted by limited liability and joint-stock companies is undoubtedly many times that of the whole of the rest of the Press put together. Unfortunately, however, exact circulation figures of German papers are unobtainable. There is in consequence little publicity in the economics of the German Press. The *Berliner Morgenpost* has the greatest circulation—560,000 copies, in round figures. Among illustrated papers, the *Berliner Illustrierte Zeitung* stands in solitary glory with its 1½ millions. Circulations exceeding 100,000 can be counted on one's fingers; the big papers of the principal cities, which are sold on the streets, and a few representatives of the so-called *Generalanzeigerpresse*, which in politics and general outlook take a very broad view. Thus circulation can hardly be regarded as a criterion of importance, since, for example, the *Berliner Zeitung am Mittag* or the *Berliner Illustrierte Nachtausgabe*, which are among the "*Asphaltzeitungen*" with the largest circulation, cannot be rated so high as representatives of opinion inside or outside the country as, say, the *Vossische Zeitung* or the *Berliner Tageblatt*, which scarcely attain a circulation of 100,000, but play a decided part in political life, and are in the first rank as journals of international reputation. It is thus evident that in Germany it is not amount of circulation, nor crudeness of realism and sensation-mongering, nor the general get-up of the paper, that weighs with the reader, but the representation of his opinion and views, and the reflection of the politics of a definite party. A necessary consequence is a marked stability in the financial structure of the German newspaper industry. The selling of newspapers and of large blocks of newspaper shares is almost unheard of in Germany. Among German newspapers, only the *Deutsche Allegemeine Zeitung*, with which Hugo Stinnes was once connected, has often changed owners, though the *Acht Uhr Abendblatt* also is now alleged to have renounced its independence and come under the control of the "Mosse" Press. Only two of the 48 newspaper companies appear on the Stock Exchange—the *Königsberger Hartungsche Zeitung*, with a small number of shares, generally dealt in on the Königsberg exchange, and the "Gundlach (Papier) Aktiengesellschaft Bielefeld," which publishes in Bielefeld the *Westfälische Neueste Nachrichten*,

Travel and Money

The far too common method—or lack of method—of carrying cash in bulk when abroad, is wholly unsatisfactory. Travellers are invited to consider the arguments of two leaflets issued by the Westminster Bank, *Points before Travelling*, and *Safeguards for the Traveller*, which will be gladly sent by the Secretary of the Bank on application.

WESTMINSTER BANK
LIMITED
Head Office: 41 Lothbury, London, E.C.2

a paper of the *Generalanzeiger* type. In these cases also there can be no question of an easy change of ownership.

These are the fundamental reasons for the non-existence of newspaper organisations of wide scope and importance in Germany, and for the limitation of concentration movements, apart from the Hugenberg organisation (which will be referred to later), to amalgamations of weak undertakings in need of a tonic, which endeavour by sharing editorial, printing and management expenses to keep their heads above water. Apart from small associations of this kind, there are three larger combines among the Press of the Centre Party: in Munich 17 Bavarian local papers of extremely small circulation are united in the "Bayrische Zeitung's block"; 19 papers belong to the "Verbo" combine (Association of Upper-Suabian Newspaper publishers) in Ludwigshafen; and the "Zeno" combine in Münster (Newspaper Publishers' Association of North-West Germany) comprises 28 papers in the Münster district, which all publish the same text and are only distinguished by their titles and their respective local news sections. Although wrongly so designated, the Huck Organisation is not to be regarded as a newspaper combine; the Huck family gave their name to it because they have a controlling interest in the capital of a few papers. It is extraordinarily difficult to give an accurate account of associations of this kind. Besides the *Stettiner Abendpost* and the *Dresdner Neueste Nachrichten*, seven other papers are alleged to belong to it. Similar developments have given rise to the Fuchs organisation, to which four other papers in addition to the *Danziger Neueste Nachrichten* and the *Stuttgarter Neues Tageblatt* are alleged to belong, and, lastly, to the Leonhardt organisation, which controls some seven papers from its headquarters in Brunswick.

These associations, broadly considered, may perhaps be regarded as amalgamations of the combine type, but the designation "combine" is completely inappropriate to the biggest German publishers—"Mosse," "Scherle," and "Ullstein" in Berlin, and "Guardet" in Essen. The extension of these houses is not the result of the absorption of financially weak enterprises, but of growth from within, the constant production of new papers and periodicals. They are typical examples of a concentration whose only resemblance to combination is in its external effects, so that none of these belongs to the category of newspaper combines.

The Hugenberg organisation alone can claim to be a newspaper combine. In attempting to describe its structure one comes up against the difficulty that all details of this new phenomenon in German journalism which achieve publicity are slightly suspect, since it is concerned with a process of concentration which has as its object the bringing of all agents and instruments of "public opinion" under one control, in order to secure a powerful political instrument for the moneyed interests. Along with the *Scherlverlag* the Hagenberg combine owns, among many others, the *Vera Verlag*, the *Telegraphen Union*, nine German papers, including the München Augsburger *Abendzeitung*, the *Bergisch Märkische Zeitung* in Elberfeld, the "Universum Film A.G.," a number of connections of all kinds, and various societies which are in a position to exercise a suitable influence on the formation of public opinion.

Side by side with these few groups with unified capital and the one true newspaper combine there is in Germany the large number of completely independent papers which have made no essential changes in their traditional policy for decades. Besides the big party papers in Berlin, a few important provincial journals are worthy of mention in this connection, as, for example, the *Frankfurter Zeitung*, the *Hannoversche Kurier*, the *Kölnische Zeitung*, the *Kölnische Volkszeitung*, the *Magdeburger Zeitung*, and sundry others. These papers, in spite of their small circulation and local character, play an important part in the significance and influence of the German Press.

It is thus clear that changes of ownership or of policy are rarer among German newspapers than among those of some other countries, and there is no sign of the formation of combines in the news industry. And so matters are likely to remain, for the uniformity of public opinion, which goes hand in hand with combination, will always be too uncongenial to the mentality of the German people, too alien to a pronounced peculiarity of German psychology to make possible a definite abandonment of the decentralisation of German journalism, however clearly development in a single case like that of Hugenberg may seem to point in that direction.

INVESTMENT OVERSEAS.

AMONG the most keenly contested political issues, since the Great War deposed *laissez-faire* from its British throne, have been those concerned with international trade and the greater or less governmental interference therewith—Safeguarding, Imperial Preference, Reparations, the gold standard and the measures necessary to secure it. To the structure of this edifice of argument two general factors have contributed, the indecision of expert theoretical testimony and the want of important statistical data. Especially is this true of the questions raised by the international transfer of capital, so we should be grateful for a work* by four experts in this field which helps to supply both deficiencies. Not that the matter has been finally clinched; the dust of controversy still hangs around even a rather humble Purchasing Power Parity; the definitive fixation of Reparations is still before us; there will be many whom Mr Norton's unashamed *apologia* for military interference on behalf of investors in "backward" countries will merely exasperate; and Professor Gregory would be the least likely to claim that his is the last word on the time-worn controversy: Has Great Britain been borrowing short to lend long?

More timid men than he might have been excused unwillingness to step in where Mr Keynes and Mr Bernard Shaw have trodden arm in arm, but here Dr Gregory boldly offers us an objective analysis of three British schools of thought towards capital exports—the traditional *laissez-faire* or "City" view, the Imperialist Protectionist or Conservative view, and the Economic Nationalist or Liberal Yellow Book view. Charitably forbearing, he spares no words for less coherent and, alas, more popular arguments—including the fetish of "a favourable balance of trade," which Professor Cassel trenchantly demolishes. Perhaps the best answer to those who worship at that time-hallowed shrine is the fact that if anything could give Germany a "favourable" balance to-day it would be her Reparation obligations.

But probably the most valuable part of this book is its discussion of Germany's true economic position, which has enabled her to pay Reparation dues promptly while she still has a net excess of imports over exports. Professor Cassel, like Mr Keynes, has long been a critic of overweening endeavours to make Germany pay. Backed by valuable theoretical arguments concerning the part played by capital movements in international trade, whose conclusion is that governmental interference therewith is almost certain to do harm, he emphasises the fact that, in sum, Germany has paid her public debts only by private borrowing. Later in the book, Dr. Kuczynski gives figures which support this assertion. In the first 45 months of the Dawes plan Germany paid some $1,200 millions, of which only a fraction was transferred in cash. Meanwhile, in spite of official and unofficial embargos in lending countries, she has managed to issue abroad since 1924 loans totalling $1,546 millions, of which New York issues accounted for $1,039 millions and London issues for $171 milions. Thanks to considerable cross-purchase between the various markets, these figures cannot be taken as accurately representing the respective British and American shares in German reconstruction. Nevertheless, the fact remains that America's position as the creditor of the Allies, themselves receiving payments from Germany, has been counter-balanced by a heavy net export of capital from the United States to Germany. The question which Great Britain as well as those two countries have to face is, how long can this go on and what are its consequences?

Investments in Germany, used in the long run, however indirectly, to finance her debts to us, are like any other conversion operation; they transform a present capital obligation into an obligation to pay interest and sinking fund over a number of years. Unless, however, these current payments can themselves be met by a commodity surplus, debts begin to accumulate. No doubt the test of financial soundness will be the willingness of investors to invest further capital; but when, if ever, the day of their reluctance comes, some people fear the inability of Germany to meet her obligations. The probabilities of the case cannot be sounded now, but this fact alone indicates the difficulties which face the new Reparations Committee.

Germany has not been by any means the only receiver of our recently exported capital, for wherever we turn we see evidence of heavy British investment in Europe, and it has yet to be shown that we have lost our position as the world's greatest exporter of capital. Bitter is the controversy over our justification for retaining it, and we are grateful to Dr Gregory for his lucid exposition of the arguments in the field. But his interesting examination of the contention that we have been borrowing short to lend long, with which on the whole he agrees, seems just to lack full consideration of the extent to which new foreign issues are financed by the sale of other securities overseas or are reflected in a commodity export only after a lapse of months. Even if his thesis be true, our international economic position is so dependent on the maintenance of London as a world financier that the bogy must be endured, and will doubtless turn out to be no more than a white sheet and a carved turnip.

On the other hand, should it be proved that we are lending so much abroad that we are starving our own industries of capital, then the restriction of capital exports—should it be feasible—stands vindicated in the eyes of an influential school of opinion. An export of capital must mean a corresponding excess of exports of goods, and in the case of this country almost certainly capital goods, though the intervention of a third party might mean that a loan for the construction of a steel works resulted in an export of motor cars or whisky. The payment of interest means an import of goods—naturally such goods as we require from abroad. The development of a foreign industry or a foreign country may result in a growing market for products of all sorts—such a market as our developments of the Far East have given us. But it may result, it is argued, in the creation or stimulation of a competitive rival, while the alternative investment at home entails just as great a demand, which is quite as certainly directed towards capital goods, markets for which are now so badly depressed. The export of capital may have assisted that shifting of demand which explains the broader aspects of our present unemployment problem.

To this the orthodox reply insists that the test of the most productive direction, economically, for the employment of capital is the rate of return balanced against the risk, wherefore a free market for capital secures its best distribution. The justification of interference, then, requires proof of two things, that general advantages which are not obtained by the specific firm or industry ought to be added to the home rate of return before it can be compared as an economic test with the return obtainable abroad, and that control is politically practicable.

Gregory; "American Loans to Germany," by Robert R. Kuczynski; and "Backward Countries as a Field for Investment," by Henry Kittredge Norton. University of Chicago Press. 15s.

MORE LIGHT.

IT is said that Archimedes, discovering his famous principle at the moment of plunging into his bath, tore naked into the streets proclaiming to an astonished world: "*Eureka.*" We cannot help feeling that the populace of Syracuse were probably moved more by this unusual and diverting spectacle than by the scientific importance of the discovery. Professor Einstein, having, to the best of our knowledge, indulged in no such extravagant displays of philosophic zeal, has aroused comparatively little concern in the bosom of the "evening-newspaper-reading" public, and may yet pass to history unillumined with the glamour of a scandalous fable. But let not that obscure the importance of his latest contribution to the theory of Nature. Since the Aristotelian physics pined in the intellectual hibernation of the Middle Ages, science and philosophy, though too often rivals, have jointly sought to pare their conclusions with Occam's "Razor"—"*entia multiplicanda non sunt præter necessitatem.*" In this elimination of redundant "elements" Descartes and Kant have shared with Newton and Gauss, but perhaps the most sweeping achievements have been made in the present century by the "field-physics" of Maxwell and others, and by Professor Einstein's own reduction of gravitational forces to conformations of a single space-time. Scientists have discarded the notion of force as something different from the spatio-temporal system in which it operates, along with that of the hypothetical "ether" which filled all space, and yet was not that space. But the ultimate goal, a single element or system of which all phenomena should be modifications expressible by mathematical formulas—a system so succinct and simple that only the most highly trained mathematician could achieve knowledge of its intricacies—remained to be reached.

Professor Einstein, by evolving a space-time which combines the property of "parallelism" (hitherto regarded as peculiar to Euclidian space) with the wider capabilities of certain non-Euclidian surfaces, has—it is reported—enabled the spatio-gravitational system to embrace the facts of electro-magnetic fields, and thus brings us to within hailing distance of that scientific El Dorado. Reports yet current leave it uncertain whether he has also succeeded in reconciling the space-time continuum with the discontinuous properties (quanta) discovered by infra-micro-physics. Is the world a single something or an assortment of "manufactured articles"? The heart stands still and the brain turns dizzy at contemplation of such stupendous mysteries. We find ourselves turning with impatience from these grapes beyond our reach to bite on the coarser but more nourishing fruit of every-day affairs. Can we regard the discovery of ultimate truths as an incongruous and irrelevant incident in a material world, or is this strange dissatisfaction of man before incompleteness of knowledge the urge which will bring him to the end for which humanity was created? Perhaps; but a world populated exclusively by a race of Mr. Bernard Shaw's "Ancients" is a prospect from which *les hommes moyen sensuels* in all ages have been apt to revolt. Sad though it be to depreciate neglect of this world in the pursuit of abstract truth, the less intellectual of us can find comfort in the fate of the absent-minded Archimedes, who, at the massacre of Syracuse by Marcellus in 212 B.C., was run through by a Roman soldier while drawing a mathematical diagram on the sand.

THE MERCANTILE BANK OF INDIA, Ltd.

Head Office: 15, Gracechurch Street, London, E.C.3.

Capital Authorised	£3,000,000
Subscribed Capital	1,800,000
Paid-up Capital	1,050,000
Reserve Fund and Undivided Profits	1,584,846

Branches and Agencies:

INDIA, BURMAH, SIAM, CEYLON, STRAITS SETTLEMENTS, CHINA, PORT LOUIS, MAURITIUS and DUTCH EAST INDIES.

The Bank buys and sells Bills of Exchange, issues Letters of Credit and Circular Notes, and conducts every description of Banking Business in Connection with the East.

Fixed Deposit Rates will be quoted on application.

On CURRENT ACCOUNTS interest is allowed at 2 per cent. per annum on daily balances, provided interest for the half-year amounts to £1.

Trusteeships and Executorships Undertaken.

JAMES STEUART, *Chief Manager.*

Notes of the Week.

The Cruiser Bill.—On Tuesday, February 5th, the Cruiser Bill passed the Senate by 68 votes to 12, and with the time-limit clause. That is, fifteen 10,000-ton cruisers are to be laid down at the rate of five a year during three successive years. President Coolidge made it clear that he disliked the time-limit because he feared that it might be prejudicial to the Conference on the Limitation of Naval Armaments, which is due to take place in 1931, but he is unlikely to use his veto. At most he may delay the entry of the programme into operation by deferring the date of his assent until the latest moment constitutionally permissible. From the international point of view, however, the time-limit clause is less important than the Reed amendment, which was passed by 81 votes to 1. This proviso, which has thus become an integral part of the Act, calls for the negotiation—"if practically possible, prior to the meeting of the Conference on the limitation of armaments in 1931"—of "a treaty or treaties with all principal maritime nations regulating the conduct of belligerents and neutrals in war at sea, including the inviolability of private property thereon." The effect of this clause will be to compel us, in the near future, to make up our minds whether we propose to cling to our traditional claims in the matter of belligerent rights at sea or not. This is emphatically not a matter for naval officers or politicians, but for the electorate, since the future trend of our relations with the United States depends on our decision. At the forthcoming general election this ought to be one of the major issues. For the moment we merely draw attention to the fact that both the traditional policy of the British Government and the Reed amendment to the new American Cruiser Act presuppose the international dispensation which existed before the creation of the League of Nations or the negotiation of the Kellogg Pact. In other words, it is assumed that the normal war is a "private war" waged as "an instrument of national policy." Our wisest course will be to dispose of the question of "private wars" by frankly and unconditionally accepting the American *desideratum* in regard to belligerent and neutral rights as far as "private wars" are concerned. It is only when we have got this business out of the way that we can look forward to persuading the Americans to talk over with us a new and quite different question which, in our opinion, will be of far greater practical importance in the future. This question is: What system of international law is to govern the situation arising out of a breach of the Kellogg Pact, in which there will be no such things as "war" or "belligerents" or "neutrals," but simply an international police operation in which some parties to the Kellogg Pact will co-operate actively while others will assist passively, but in which all parties alike will be under a moral obligation at least not to put impediments in the international policemen's path.

The Kellogg Pact in Action.—As this issue goes to press, the latest news is that a protocol bringing the Kellogg Peace Pact into immediate operation as between the U.S.S.R. and the European border States is on the point of being signed at Moscow. This notable step is being taken on the Soviet Government's initiative, the original suggestion having been for a bilateral protocol between the U.S.S.R. and Poland. When first announced, the suggestion seemed to have little prospect of success. The Polish Government showed signs of being surprised and embarrassed and of suspecting a trick—for *timeo Russos et dona ferentes* has long been a maxim of border State diplomacy. However, the Poles, after thinking it over and consulting their friends, made the very reasonable reply that they would be willing to sign the suggested protocol, not alone, *vis-à-vis* the U.S.S.R., but in company with the other border States to north and south of them. Poland could hardly sign without this proviso, considering that she has a mutual insurance treaty with Rumania; and the insistence that Rumania should be admitted to participate in the protocol was a test of Moscow's good faith in making this overture, for the danger of a breach of the peace is greater as between the U.S.S.R. and Rumania than it is as between the U.S.S.R. and Poland. The present frontier between Poland and the U.S.S.R., though it has placed some millions of white Russians and Ukrainians under Polish rule, at least rests on a treaty to which the Moscow Government, as well as the Warsaw Government, has set its hand. The present frontier between Rumania and the U.S.S.R. has been established by a Rumanian military occupation of the ex-Imperial Russian Province of Bessarabia; and though the incorporation of Bessarabia in Greater Rumania has been endorsed by the principal Allied Powers, and has been given a degree of moral sanction by certain rather dubious expressions of the will of the Rumanian majority in the population, it has never been recognised by any Russian Government—Red, White, or Green. Thus a serious danger to peace was sensibly diminished when Moscow accepted Poland's condition, and simply requested in return that Lithuania should be regarded as a border State for the present purpose. To this, in turn, Poland appears to have assented, and though last week it seemed as though Lithuania might be prevented from participating by an internal upheaval against Professor Vildemaras's dictatorship, the dictator seems now to be firm in his saddle and ready to take up the pen and sign the protocol in company with his neighbours. Thus the omens are that, by the time this issue is published, the Kellogg Pact will have come into force as between the U.S.S.R., Estonia, Latvia, Lithuania, Poland, and Rumania. The renunciation of war as an instrument of national policy between the U.S.S.R. and Rumania, and between Poland and Lithuania, is more than we could have ventured to expect, even a few months ago. It robs the Vilna question and the Bessarabia question of many of their terrors, and goes far towards wiping one of the principal danger zones of Europe off the map.

Monsieur Poincaré on Alsace.—Whether or not Monsieur Poincaré goes down to history as "the man who saved the franc," he is making his countrymen pay heavily in some ways for their temerity in having put him into power again. When he returned after his eclipse he was to concentrate on rehabilitating French public finance, and for that task, it was suggested, conservatism could not be too conservative nor rigidity too rigid. After finding his personal political prestige restored *pari passu* with the restoration of the value of the national currency, M. Poincaré is unhappily demonstrating in other fields that he has "learnt nothing and forgotten nothing." For example, his three-days' speech on Alsace in the Chamber during the second half of last week has given the Alsatian question an ominous turn for the worse. Voluminously documented and meticulously argued, it seems to have overlooked nothing except the heart of the matter. The heart of the matter, of course, is that, after ten years of reunion with France, the Alsatians are ill at ease, and are anxious to discuss with their fellow-citizens, in a friendly and reasonable way, what can be done to put their relations on a more comfortable footing. After half a century of separation, some friction in the readjustment of relations between France and Alsace is the most natural thing in the world. Now the moderate Alsatian leaders (and most Alsatians have learnt the lesson of political moderation in a hard school) had hoped that the debate in the Chamber would give just the opportunity for starting a discussion of the real Franco-Alsatian problem on constructive lines. And it is this hope which Monsieur Poincaré, in his monumental speech, has deliberately blighted. The gist of the speech was this: "Here are the statistics of the material benefits which France, in her generosity, has conferred upon you Alsatians. These statistics prove that, in refusing to merge your identity in the body politic of the Republic, One and Indivisible, you are guilty not only of treason, but of ingratitude. For this there are only two possible causes: one is original sin, the other is the artfulness of the Trans-Rhenane *Tempter*." So Monsieur Poincaré kills two fat birds with one stone. He exasperates not only Alsace, but Germany, and starts an international controversy—full of statistics, such as his soul loveth—over the exact allocation of secret service money in the German Budget. At this point Europe has a right to complain, for here Monsieur Poincaré is gratuitously undermining the Pact of Locarno. There is not a shadow of reason for supposing either that the Germans are stirring up trouble in Alsace or that the Alsatians are looking towards Germany. For half a century Germany mismanaged Alsace, and has been repudiated by her; and that is the end of that, as Germany publicly recognised when, in the Locarno Pact, she renounced for ever all aspirations towards changing her present Western frontiers. It would be a humorous and not wholly surprising conclusion if the Alsatians cried "a plague on both your houses," and applied for admission to the Swiss confederation.

The Week in the House.—This week the House of Commons began the labour of passing the Scottish Local Government Bill through Committee. The Scottish Bill has been debated under the shadow of the Government's important and valuable amendment to set up elected district councils having all the chief functions of the abolished parish councils, save that of poor relief, and capable even of that by delegation from the county councils. The Opposition so far has concentrated on pleading for the retention of parish councils and of *ad hoc* education authorities, and for the restoration to the small burghs of their more important functions. Differences in local government structure aside, the debates on the Scottish Bill will probably be not unlike those on the measure for England and Wales. The latter has emerged from Committee substantially unchanged. The Government's own amendments were concerned almost entirely with extending the financial guarantees to local authorities and with reducing the first two grant periods from five years each to three and four years. Attempts to secure the break-up of the Poor Law won no more than a promise from Mr Chamberlain that before the Report stage he would further consider the possibility of making the alternative methods of assistance mandatory. Amendments seeking to exclude prosperous industries, and in particular the drink and tobacco trades, from the benefits of de-rating, failed in spite of Conservative support, and the main structure of the financial provisions emerged unaltered, though some compensation was given to Lancashire by the addition of 10 per cent. of the registered women unemployed to the male unemployment figure for the purpose of determining block grants. In view of the new guarantees, there now seems no reason why, if the Government are not afraid or ashamed of the instrument they have forged, the "formula" should not be allowed to operate in full straight away. An attempt to exclude maternity and child welfare services from the scope of the block grant dashed itself fruitlessly against the implacable determination of the Minister and his vigilant Ariel, Sir Kingsley Wood. But they had to admit defeat over Clause 111, which provides, *inter alia*, that until 1931, "if any difficulty arises, the Minister may by order remove the difficulty, make an appointment, or do any other thing which he thinks necessary." The House would not listen to Mr Chamberlain's list of precedents, and refused such a sweeping abandonment of its own legislative powers.

Reassessment in South Wales.—Throughout the country the first assessments under the Rating and Valuation Act, 1925, are being announced. The result has caused a great deal of surprise in some areas, since it was expected that, although some house property and certain expanding industries would be reassessed at a higher figure, the result of a measure designed to rate hereditaments on their commercial letting value would be substantial benefit to the depressed industries. Instead, it appears that whereas shipyards and many engineering works have generally found themselves better off, many coal-mining concerns are faced with much larger assessments than before. Where the collieries own cottage property, as in Durham and Northumberland, where free house room is provided for every married miner, the result is particularly burdensome, because that property receives no rate reduction under the Local Government Bill. But the biggest increases are reported from South Wales, where some collieries have found their assessments up by more than 80 per cent, a figure which considerably discounts the prospective value of de-rating. A South Wales contemporary gives the following figures for two typical collieries in Caerphilly and Rhondda:—

	£	s	d
Total rates payable on old assessments	44,947	4	0
Relief under de-rating scheme	33,710	8	0
Amount to be paid by collieries (old assessment)	11,236	16	0
Total rates payable on new assessment*	50,328	13	4
Relief under de-rating scheme	37,746	10	0
Amount to be paid by collieries (new assessment)	12,582	3	4
Relief lost through increased assessment	1,345	7	4

* These have been calculated at a rate in the £ much reduced by the operation of other aspects of the local government changes, the actual assessments have increased by around 50 per cent.

A large number of colliery concerns are appealing against these increases, so that the final issue remains doubtful, but it is certainly anomalous that such high assessments should be the lot of an industry which has been showing a gross loss of over eighteen-pence a ton, and the market letting value of whose plant is therefore extremely problematical.

Riots in India and Wales.—The week's news, unhappily, has included reports of more or less grave disorder, arising out of different causes, both in South Wales and India. The dispute between owners and workpeople at Nine Mile Point Colliery, Monmouthshire—a difference for which the colliery management, in the first instance, at least, bears a substantial proportion of the blame—led on Wednesday to hostile demonstrations by crowds which the police dispersed by baton charges. In India and Ceylon the troubles have been much more serious. The tramway strike at Colombo has been attended by an outbreak of rioting, which Mr Gunesinha, the president of the local Labour Union, was unable to restrain, and which necessitated the use of fire-arms by the police. In Bombay, agitators working on credulity and religious fanaticism have succeeded in kindling the flames of racial animosity between Hindu and Mohammedan with disastrous results. Serious loss of life has occurred and a dangerous situation arisen—a reminder of the difficulty of controlling forces of disorder in a country where mob-passions are easier to excite than to allay.

British Broadcasting and Public Finance.—Parliamentary and other discussion indicates that much misunderstanding attends the strict relationship of the British Broadcasting Corporation to the Exchequer. The latest analysis of the wireless receiving licences' management account, to March 31, 1928, the last complete financial year, shows that there were approximately two and a-half million listeners. The cash receipts from licences were nearly £1,235,000. From that the Post Office deducts 12½ per cent. for expenses of management; in this case, subject to a small adjustment, £156,000. As advances to the British Broadcasting Corporation to meet its outlays £824,237 was paid, and the balance which remained to the Exchequer, loosely described as profit or surplus, was £255,000. Strictly speaking, the Post Office did not spend the whole of the 12½ per cent. in expenses of management; there was a surplus of £2,500, and presumably, if that surplus grew to any extent, the percentage basis would be revised. At that point the arrangement might be influenced by the recommendations of a recent committee on the financial adjustment of inter-departmental services. At this stage, therefore, broadcasting may be regarded as providing for the taxpayers an annual surplus of approximately a quarter of a million. The Crawford Committee, whose report led to the present scheme, did not generally consider that licence fees should be reduced below ten shillings, which they regarded as a very moderate figure for the service rendered. The suggestion that income-tax should be imposed is complicated, and may be governed eventually by the recommendations of a committee over which Lord Colwyn presided some years ago. That committee recommended continuance of all the diplomatic immunities in income-tax, subject to the appropriate reciprocal treatment in these matters, and the application of all the ordinary rules of income-tax to ordinary trading concerns. There are, however, factors

in the broadcasting scheme which may lead the Government to leave the financial arrangement on the present basis.

Civil Flying Developments.—A White Paper issued by the Air Ministry last Saturday announced the grant of Government assistance on a modest financial scale to National Flying Services, Limited—an organisation promoted under the chairmanship of Captain F. E. Guest, M.P., with the two-fold object of founding flying clubs, equipped with aerodromes, for the training of civilian pilots, and of developing an air-taxi service, linking up provincial centres with the air-port of Croydon. The scheme is ambitious and has interesting possibilities. We are inclined to doubt whether the air-taxi is likely to become in the near future a much-used form of transport in this country. It will be recalled in this connection that the chairman of Imperial Airways, Limited, whose London-Alexandria-India service is to begin on March 30th, stated in his speech last September, that he considered that the future of British civilian flying lay in the direction of developing long-distance Empire routes rather than cross-country services in a small island whose weather conditions are frequently unfavourable for flying, and which already possesses ample and rapid transport facilities from the centre of cities, where aerodromes obviously cannot be located. This view appears to us well founded; but, regarded primarily as a training organisation, the new company deserves the encouragement which the Government has decided to give it.

Our Index Number.—A further fractional fall took place last month in the general level of wholesale prices, our index number, as will be seen below, declining by slightly more than three-tenths of 1 per cent. The geometric average figure at the end of January was approximately 3.8 per cent. lower than a year ago :—

AVERAGE 1927=100.

	Jan., 1928.	Oct., 1928.	Nov., 1928.	Dec., 1928.	Jan., 1929.
Cereals and meat	100·3	98·2	97·4	97·6	96·7
Other foods	96 6	91·5	90·4	90·2	89 4
Textiles	102·4	100·6	102·3	101·7	101·3
Minerals	92·5	92·9	93·8	94·1	94·8
Miscellaneous	99·9	93·1	92 4	91·4	91·2
Complete index	98·5	95·3	95·3	95·0	94·7

A rise in the minerals group last month was more than offset by lower averages for food, textiles, and "miscellaneous" materials. Price changes of individual commodities, as compared with December, 1928, and January, 1928, are shown in the following table :—

	Inc. (+) or Dec. (—) per Cent. compared with Month Ago.	Year Ago.		Inc. (+) or Dec. (—) per Cent. compared with Month Ago.	Year Ago.		Inc. (+) or Dec. (—) per Cent. compared with Month Ago.	Year Ago.
Wheat—For..	+ 3·5	— 11·8	Cotton, A	— 2·1	+ 4·3	Timber, Eng..	..	..
„ Eng..	+ 1·8	— 11·7	Cotton, E	— 5·4	+ 10·2	Timber, Swed.	..	..

Bacon, Danish	— 7·1	+ 10·3	Textiles.....	— 0·4	— 1·1	Sulph.ammon.	..	..
						Creosote	— 8·0	— 34·2
Cereals & meat	— 0·9	— 3·6	Pig-iron	..	+ 1·5			
			Steel rails....	..	+ 3·0	Miscellaneous	— 0·2	— 8·8
Tea	+ 2·9	+ 9·1	Iron bars	..	..			
Coffee	+ 0·9	— 13·9	Tin plates....	..	..			
Cocoa	+ 0·8	— 14·7	Coal, W'lsh ex.	..	+ 2·0			
Sugar, cane ..	— 1·0	— 22·0	Coal, Dur. Gas	..	— 1·7			
Sugar, ref....	— 5·4	— 21·4	Coal, h'hold..	..	+ 10·5			
Cheese, an...	— 1·0	+ 3·0	Lead	+ 5·6	+ 1·1			
Butter, Dan..	— 5·0	+ 7·3	Tin	— 2·5	— 11·0			
Coco. oil ...	..	— 8·2	Copper	+ 5·3	+ 23·1			
Tobacco.....	..	..	Spelter	— 2·1	+ 0·9			
Other foods ..	— 0·9	— 7·5	Minerals	+ 0·7	+ 2·5			

Grain values appreciated, but the prices of rice, potatoes, English mutton, and bacon were lower. Tea was dearer, but sugar, cheese, and butter fell. Hemp and jute rose, whereas cotton, Australian wool, and flax declined. The chief features in the minerals group were sharp upward movements in lead and copper prices—tin and spelter falling. Among miscellaneous commodities, rubber advanced notably, while hides and leather were cheaper.

The following table gives the figures of our index number converted to a percentage of the average for 1913 :—

AVERAGE 1913 = 100.

Date.	Cereals & Meat.	Other Foods.	Textiles.	Minerals.	Miscel-laneous.	Complete Index.
Average 1924.....	168·5	215·8	214·7	149·3	122·6	166 2
„ 1925.....	168·4	204·2	194·6	139·8	126·2	160·9
„ 1926.....	151·7	195·3	152·6	149·8	120·7	149·6
„ 1927.....	147·6	202·2	157·0	125·1	116·1	143·7
„ 1928.....	152·9	189·7	165·0	115·2	111·2	140·9
End Jan., 1928.....	148·0	195·3	160·7	115·7	116·0	141·5
„ Dec., 1928	144 0	182·4	159·6	117·7	106·1	136·5
„ Jan., 1929.....	142·7	180·8	159·0	118·6	105·9	136·1

Expressed as a percentage of the average for 1924, our index number at the end of January works out at 81.8.

Organised Selling of Coal.—A correspondent writes :—Ever since the loosely described coal-marketing scheme of the Midland Counties came into operation almost a year ago, numerous suggestions have been discussed with a view to remedying several admitted defects. Starting with the rejection of price regulation, as proposed in South Wales, the promoters proceeded on the line that regulation of output was the really important thing, and that, if this were satisfactorily dealt with, price adjustment on a reasonable basis would follow. Experience has, in fact, shown that prices have not been raised to a sufficiently high level to yield a trading profit. The main reason has been that while total output has been regulated, the output of particular classes of coal has not; hence the shortage of some classes at one time and an excessive quantity at another. This fluctuation of output has tended to perpetuate some of the evils which the scheme for regulation of output attempted to remedy. The executive committee of the association has now presented to members two reports relating to this matter. One report says : "It appears that regulation of output is not completely effective, and in order to raise prices sufficiently it is necessary to fix prices." In addition, the committee consider it desirable to provide for the exchange of unraised quotas under the control of the association, so that those members who are able to supply what the market wants may acquire the necessary amount of quota released by those whose quota would permit them to produce more than they are able or willing to sell. It is also proposed to compensate members who fail to find a market for their permitted production; and to pool the benefits to be derived from the regulation of prices. It is suggested that the Central Association shall fix prices at whatever figure the market could bear. Members realising more than the prices applicable to their own coal would pay the difference into a pool, out of which those who received less would have the deficiency made good. The balance remaining in the pool, after deduction of expenses, would be divided among members *pro rata* to the tons of coal sold, and by this distribution of the balance the benefits of co-operation would be pooled. The committee suggests that coal be classified in the following way : locomotive coal, gas coal, public utility coal, industrial coal, house coal, sub-divided according to the district in which it is sold. This drastic report is now under consideration of the various district associations. It is sure to encounter considerable opposition, but some change in the operation of the scheme is almost imperative if the scheme is to attain the desired end.

Egyptian Cotton Mills and Short Time.—Our Manchester correspondent writes :—To people outside Lancashire there must have been some surprise that the employers in the fine cotton spinning section of the Lancashire industry should have decided to consider the question of organised curtailment of production. Throughout the long depression since the boom of 1919-20 this branch of the trade has done fairly well, and only on rare occasions has business been unprofitable. During the last few weeks, however, reports from Bolton and district, where most of the fine mills are situated, have been decidedly worse, there being complaints from spinners of a slack

demand, declining order lists, and increasing stocks. It is understood that last week a few of the leading employers had a private consultation, and this resulted in a special meeting of the Bolton Master Cotton Spinners' Association being held in Manchester on Tuesday last. It was then unanimously decided to recommend all spinners of Egyptian cotton to restrict output by one-third for a period of two months. A ballot on this proposal is now being taken, and it is expected that the result will be announced about the end of next week. For many months employers in this section of the trade have been considerably hampered by the relatively high prices for Sakel cotton, and it has been impossible to get customers to pay the necessary advanced rates. It is hoped that this curtailment of production will keep down the price of raw material and enable spinners to reduce their stocks and stabilise the market. It is generally recognised that organised short time is not economically sound over a long period, and it is some years since there was organised curtailment of output in the Egyptian spinning branch, but action was taken in October, 1920, when it was decided to run the mills 35 hours a week instead of 48. This short-time movement was maintained until the following July. It is fully expected that the employers will support the recommendation of the association, and the short time, when put into force, will affect the earnings of about 50,000 operatives, chiefly in the Bolton district.

New Zealand Politics.—Our New Zealand correspondent writes :—The triennial elections of Members of Parliament held on November 14, 1928, resulted in a marked and unexpected reversal for the Government, which had been in power for 16 years. The previous elections had given the Reform Party, under the leadership of Mr J. G. Coates, a large majority over all other parties. Though the party allegiance of certain members of the new Parliament is somewhat indefinite, there appear now to be 29 Reform, 27 United, 20 Labour, and five Independent members; most of the Independents are regarded as likely to support the United Party. Among Reform members defeated at the polls were four members of the Cabinet, the Ministers of Lands, Labour, Agriculture, and the Attorney-General. It is generally considered that the change was due rather to dissatisfaction with the administration of the Reform Government than to approval of the policies of the other parties. The situation created by the Government's reverses occasioned much discussion as to the course events were likely to take, but the Prime Minister acted promptly and decidedly. Parliament was called together for a brief special session. Sir Joseph Ward moved a no-confidence amendment to the Address, in which he criticised Reform's election tactics rather than their policy, and with the support of the Labour Party and most of the Independents carried the amendment by a substantial majority. The Prime Minister, Mr Coates, then resigned, with those Ministers who had survived the election, and Sir Joseph Ward formed a new Cabinet from the members of the United Party. The House then passed legislation to permit an extension of State borrowing of about £7 millions in excess of existing authorities, to be devoted mainly to railway construction, attended to some minor matters, and adjourned till June next. Thus the situation is settled for the next half-year, but the future remains obscure. It is difficult to find that the United Party has any definite programme beyond common acceptance of the leadership of Sir Joseph Ward. It is even more difficult to find any fundamental differences of policy between the Reform and the United parties. The Reformers are the direct descendants of the Conservatives who opposed Seddon during the long Liberal regime which lasted from 1893 to 1912. But the old Conservative tradition lingers on among a very few members, mainly in the Upper House, and the party as a whole consists of younger men with progressive Liberal views. The United Party is the old Seddon Liberal Party, which has changed its name several times, but it contains many new men with little experience of politics. Both parties would be regarded as decidedly radical in any country where State social services were favoured and developed less than in New Zealand, and probably a large majority of both parties are definitely opposed to the avowed aims of Labour. Perhaps the most commonly held view is that the United Party will remain in power until a difference with Labour occurs, and that then some fusion will be made between Reform and United. Another election is regarded as an extremely remote possibility.

Northern Ireland Affairs.—Our Belfast correspondent writes :—The prolonged campaign for the reform of the Belfast Corporation still continues, and the long-promised reforms appear as far off as ever. Certain of the recommendations of the Lord Mayor's Special Committee required the taking of Parliamentary powers, and a Bill was drafted which it was intended should be presented in the next session of the Northern Ireland Parliament. At a meeting of ratepayers which was held last week, however, the bill was rejected, and the corporation decided to abandon the measure. Meanwhile there is a growing impatience on the part of business organisations in the city to see some tangible evidence of reform. In the political sphere there has been considerable activity recently. The general election for the Northern Ireland Parliament will probably be a little later than that for the Imperial Parliament, since the Northern Government is committed to the abolition of proportional representation and the division of the country into single-member constituencies before appeal to the electorate. At the recent meeting of the Ulster Unionist Council the Prime Minister (Lord Craigavon) made a comprehensive review of the manner in which the Government's programme was being carried out. Within a few years many important features of this programme will have been brought to fruition, viz., land purchase will have been completed; the problem of the drainage of the River Bann area will have been solved; and the fishing harbours around the coast will have been dredged and obstructive rocks removed; while by the end of this year the de-rating scheme will be in full operation. A minor cleavage has, however, occurred in the Unionist Party over the temperance question. Legislation passed by the Government has already had the effect of reducing the number of licences for the sale of wines and spirits by 558, and has reduced the consumption of spirits per head of the population from three pints in 1923 to approximately one-and-a-half pints in 1928. Although the leaders of the Churches are content to leave the decision to initiate further temperance legislation in the hands of the Prime Minister, there appears to be a considerable body of opinion determined, if possible, to force the Government to the introduction of local option as a first step to prohibition.

South African Railways.—Mr J. R. More, the general Manager of the South African Railways in succession to Sir William Hoy, recently presented his first annual report for the year ended March 31, 1928. It appears therein that the total capital invested stands at £134,000,000 (in round figures). Allowing for depreciation and interest, and for various contributions to "betterment fund," pensions, &c., the final net profit was £47,217. The area served by the system is 795,000 square miles, over which 13,000 miles of track are operated. Train mileage for the year was about 48 million miles. Nearly half a million passenger trains were run, over 82 per cent. of which arrived on time; the total loss of time by late arrivals amounted to 2½ minutes per train over all trains. (It has to be borne in mind that floods may delay half a dozen trains for hours or even days in exceptional cases.) The report as a whole indicates the progress and steadily increasing wealth of the country. The auditor's report on the railways tells us that operating expenses absorbed 79.3 per cent. of the gross earnings, being 1.24 per cent. less than in the preceding year. In 1911 the ratio was 60.4 per cent. The Auditor-General makes some stringent comments in regard to the experience of material supplied by Continental manufacturers.

Trade in East Africa.—Following so closely on the publication of the Report of the East African Commission, this year's Report* of the Deputy-Trade Commissioner at Nairobi will be received with more than usual interest. It is on the whole an encouraging document; the outlook in East Africa is reported to be "much more hopeful than it has been for some time past," and the territories are described as "a fertile field for investment generally." With regard to the import trade, competition in certain lines which are of great importance to the United Kingdom is becoming very keen, and British manufacturers are warned to look to their laurels. This necessity is most marked in the case of textiles and certain branches of machinery and of steel goods. The Deputy-Trade Commissioner draws the attention of Manchester merchants to the progressive cartellisation of the channels of trade between Japanese, Dutch, American, and German manufacturers and their clients in East Africa. On the whole, the bulk of the East African market is dominated by considerations of price rather than of quality, so that competition with British goods is bound to be keen in certain classes. Experience shows, however, that there is an important market for goods of British quality, and though that market is at present far from going unchallenged, the evidence is that with more attention to the quality of their local agents, British merchants should be able to take up the challenge with equanimity.

National Mutual Life Assurance Society.—Mr Keynes's pronouncements at the annual meeting of this society generally contribute something notable for the life assurance world or for the wider field of economics. On this occasion he was able to make a preliminary announcement of the board's intentions at the approaching centenary, and stated that it is proposed to distribute, in addition to the normal bonus of the year, a special centennial bonus. The society is in an extraordinarily strong position to do this, for its carry-forward now amounts to £877,000, and the policyholders may now amuse themselves with calculations as to the size of the slice which will come to them from the cutting of this melon. Of great importance and interest is Mr. Keynes's reference to the society's decision to inaugurate a new type of with-profit policy. In common with those of many other offices, the society's rates of premium have not been revised for more than a generation, with the result that they are now completely out of touch with modern conditions and experience. Owing to improvements in mortality and to the higher interest earnings of the funds, the profit-earning capacity of these premiums is now immensely greater than before, so that life offices go through the rather solemn farce of collecting from their policyholders something like 30 per cent. more in premiums than they need do, for the sake of returning to them later on the excess in the form of bonuses. Consequently, the bonus element now occupies a position of wholly disproportionate influence in the choice of a life policy. The society's new type of policy will be subject to a scale of premiums adjusted to the most modern experience, and the bonus element will be reduced to its proper proportions. The bonuses on these new policies are guaranteed for the first year at the rate of 15s per cent. compound, and the annual bonus is to be supplemented by a special quinquennial distribution to the extent that profits earned warrant such a course. Thus the society will offer a new type of with-profit policy, of which the initial sum assured for a given premium is from 20 per cent. to 30 per cent. greater than for a corresponding policy in the high-bonus series. So great an addition to the protection afforded for a given outlay is of great moment in the case of the young married man, and he will still be able to feel that his policy shares, in a modified degree, in the profits earned by his society. The new policy is an important experiment, and a valuable attempt to assist in the provision of more extended insurance protection. "Cheaper life assurance" will encourage more "adequate life assurance."

New Capital Issues in the United States.—Through the courtesy of the New York *Journal of Commerce* we are able to supplement our recently published statistics of British capital issues during the year 1928 with a comparative table for the United States:—

	1925.	1926.	1927.	1928.
	$	$	$	$
Foreign—				
Government .	800,051,000	634,338,500	786,630,000	764,943,000
Corporate ..	515,971,500	725,877,040	601,563,375	811,550,482
Domestic—				
Municipal ..	1,399,637,992	1,922,007,101	1,867,230,449	1,123,940,316
Railroad	474,229,200	360,745,500	791,202,000	668,488,843
Public utility	1,533,356,000	1,667,750,950	2,405,298,382	2,427,790,217
Industrial ..	1,290,055,000	1,230,580,600	2,013,430,220	2,311,350,808
Others	667,580,900	770,520,400	1,132,307,589	1,783,542,833
Totals	6,680,881,592	7,311,818,091	9,597,662,015	9,891,606,499

In commenting on the figures for the first half of 1928, which appeared in the *Economist* of July 14 (p. 67), we drew attention to the large increase in the total lent abroad, and suggested that foreign borrowings during the second half-year would be of considerable interest, conjecturing that responsible financial opinion in New York would not be over-sorry if the stream of foreign loans was partly diverted. It can now be seen that the total of foreign borrowings fell sharply from $1,164,090,482 in the first six months to $412,403,000 in the second. The corresponding figures for internal issues are $4,516,468,420 and $3,798,644,597, a relatively small decline, and largely accounted for by the railroad group.

THE University of London announces that Mr Geoffrey Peto, M.P., will deliver a public lecture on the Local Government Bill and De-rating at University College, London, on Friday, February 15th, at 5.30 p.m.

THE Council of the Royal Statistical Society announces that the Howard Medal of the society will be offered for competition in 1929. The medal was founded in commemoration of John Howard in 1873, but the award has been in abeyance since the war. It is offered this year for the best essay on the subject of "The Statistics of Crime." Essays must be sent in on or before October 31, 1929. The rules of the competition may be obtained from the Assistant Secretary, the Royal Statistical Society, 9 Adelphi terrace, W.C. 2.

Oversea Correspondence.

UNITED STATES.—MONEY—BANKING—STEEL EARNINGS.

(FROM OUR CORRESPONDENT.)

NEW YORK, January 25.

WALL Street has been rather surprised at the ease in the call-money market this week, the rate on the Stock Exchange ruling at 6 per cent., with money sometimes obtainable in the outside market at as low as 5 per cent. This ease has been the more remarkable in the face of firm time money and a rising tendency in acceptance rates. One explanation is furnished by the weekly report on brokers' loans, which showed that while an increase of $48,000,000 had carried the total to a new high for all time, the week's increase was due to additional loaning of funds for the account, not of the member banks, but of "others." What seems to be happening is that great activity in the new issues market, and particularly in investment trust securities, is accumulating capital that is being placed in the call-money market. Ironically enough, many of the investment trusts are keeping liquid with the object of picking up good shares on a break while their diversion of their idle funds to the call-money market is making such a break less likely. In any event, the share market has responded to the cheaper call money by gaining strength and activity and by pushing up to new high levels for the "averages." The advance has been somewhat irregular, the shares that have gained frequently advancing sensationally, while others were sluggish or even sold off. It has been apparent that pools have been very active, and have been bidding strongly for a rather reluctant public following. In fact, there has been considerable public distrust of the market.

On the other hand, there have been some rather constructive market developments. For one thing, there has been, during the past week, a considerable raising of margin requirements. One of the largest brokerage houses in the country, which operates an extensive system of private telegraph wires, has advanced its general minimum margin requirement from 30 to 35 per cent. and has increased to about 20 the number of leading shares on which 50 per cent. margin is required. For another thing, the week's Federal Reserve statements are quite satisfactory, showing that the contraction of credit since the first of the year has gone on more quickly and largely than had been anticipated. For the system as a whole, discounts are another $40,000,000 lower, bringing the total down to $782,000,000, or $371,000,000 less than that for the first January return. The easy tone of the money market evidently allowed the Reserve banks to reduce their holdings of bills purchased in the open market by $27,000,000, and of similarly purchased Government securities by $36,000,000. The total volume of the credit extended shrank $104,000,000, bringing the reduction since early January to $442,000,000. The reserve ratio rose on the week by 2.3 to 69.3 per cent., the latter figure comparing with 75.0 a year ago. The showing of the New York Bank was remarkable, discounts falling $64,000,000 to $153,000,000, and total credit $119,000,000 to $300,000,000, compared with $280,000,000 a year ago. The reserve ratio of the local bank rose from 70.8 to 80.0 per cent., the latter only 0.8 per cent. lower than the corresponding figure of last year. Evidently this is not the kind of statement that forecasts an increase in the discount rate, particularly as gold has been coming in from Canada in large quantities ($8,000,000 being gained in the last week), and as a considerable amount of gold has just been bought by our banks in London, with more such purchases in sight. There has been some talk here to the effect that the Federal Reserve authorities now realise the weakness of their operations a year ago, and see the merits of your system of advancing the discount rate a full 1 per cent. on the advance and lowering by halves on the decline, as compared with the opposite system that has been employed here. On this basis it has been assumed that the Federal Reserve authorities, if they found it necessary to act, would act vigorously. The accomplishments of the past few weeks and the existing circumstances, however, apparently make the necessity for action more remote. However, it is anticipated that a money squeeze may develop in February or March, particularly if industry is as active as now seems likely. The Reserve authorities have followed up the January contraction firmly, and the relatively larger dependance on discounting as a source of Federal Reserve credit will be a brake on expansion when, and if, the larger spring demand for credit arises.

Annual reports for 1928 of industrial companies generally make excellent showing. In this connection attention has been attracted by the action of the Bethlehem Steel Corporation (the country's second largest steel organisation) in resuming common stock dividend payments after a lapse of five years. The stock was placed on a $4 annual basis. Earnings in the last quarter of the year were particularly good, amounting to $2.58 a share. It is expected that the United States Steel Corporation also will make a good showing, probably of a surplus of $20,000,000 or $25,000,000 after payment of the regular $7 dividend. There has been some conjecture that the directors may declare some special dividend, in cash or stock, but the best opinion is that if anything of this kind is decided on it will not become known until the annual meeting in April.

Yielding to the pressure for greater facilities, the governors of the Stock Exchange have asked the members to approve a plan by which the membership will be increased by 275 seats, or 25 per cent. Under the plan each member would have the right to dispose of a quarter of a new membership, and would have three years within which to do so. It is believed that the plan will be adopted.

BANK ESTABLISHED IN 1864.

SKANDINAVISKA KREDITAKTIEBOLAGET

GOTHENBURG, STOCKHOLM, MALMO.

Branches in all parts of Sweden.

Paid-up Capital and Reserves - - Kr.182,000,000

Telegraphic Address: "Kreditbolaget."

THE BANK AFFORDS EVERY FACILITY FOR BANKING BUSINESS WITH SCANDINAVIA.

FRANCE.—REPARATIONS—BANK OF FRANCE—RAILWAY RETURNS—INDUSTRY.

PARIS, February 6.

THE members of the new Committee of Experts, who are to draw up a plan for the purpose of definitely settling the German Reparations problem, are arriving, and their work is to be inaugurated in an informal manner on Saturday afternoon. The presence on the Committee of Mr J. P. Morgan is universally welcomed here, for it is recalled that the Morgan Bank has been for more than half a century associated with French destinies. It was the Morgan Bank which, after the 1870 disaster, financed the greater part of the French foreign debt, and which in 1914-15, well before the United States came into the war, supplied this country with a loan of nearly $1,000,000,000. A Morgan loan of $100,000,000 was an important factor in the steps taken after the war to stay the fall in the franc. Moreover, Mr Morgan is regarded personally as a sincere friend both of this country and of Great Britain, and strong hopes are entertained that he will be able to influence a settlement that will be both practical and satisfactory to all parties.

The annual report of the Bank of France shows that during 1928 commercial bills were discounted amounting to 53,798,000,000f, against 45,291,000,000f in 1927; the amount advanced on securities was 25,067½ millions, against 23,323 millions in 1927; deposits on current accounts totalled 1,240,396,389,000f, against 1,239,496,000,000f; and the net profit for the year amounted to 156,379,298f, of which 63,875,000f was distributed in dividends (at the rate of 350f per 1,000f share), while 62,683,000,000f was carried forward. The Governor's address, which covered the entire programme adopted for the stabilisation of the franc, culminated with the statement that "now, after 14 years of *cours forcé*, the franc has rebecome currency, in the full acceptation of the term, and as solidly secured as the strongest currencies in the world."

Complete returns show that the total gross receipts of the seven French railway undertakings (including the State system) during 1898 amounted to 14,576,975,000f, against 12,992,000,000f in 1927. This increase of 12.10 per cent., however, will be largely, if not entirely, absorbed by heavy increases of taxation during the twelve months. It must also be remembered that the year contained, for bookkeeping purposes, 53 weeks owing to Leap Year. The number of waggons loaded during the year was 23,174,707, against 22,070,122 in 1927 and 23,410,271 in 1926.

Iron and steel production figures for 1928, which are now available, show that the total output of steel was 9,387,000 tons (against 8,306,000 tons in 1927 and 6,976,000 tons, Alsace-Lorraine included, in 1913); that of iron was 10,097,000 tons (against 9,326,000 tons in 1927 and 9,071,000 tons, Alsace-Lorraine included, in 1913). Both steel and iron figures rose consistently throughout the year, the output of steel, which was 753,000 tons in January, rising to 828,000 tons in December, while that of iron, which totalled 809,000 tons in January, was in December 880,000 tons. The year was

*Published by the Department of Overseas Trade. H.M. Stationery Office. 54-22-0-28.

marked by steadily increasing activity throughout the industry, accompanied by steadily rising prices, due partly to better regulation of sales organisation, in consequence of the application of international working arrangements, and partly to constant reduction of production costs by the application of modern methods and the adoption of improved plant. Quotations for iron rose from 425f in January to 450f in December, and rolling-mill steel brought 15of a ton more, these rises being registered both in the home and the export markets.

Coal production figures for 1928 show that the year's output totalled 52,429,468 tons, against 52,845,820 tons in 1927 and 52,477,522 tons in 1926. The year's output of metallurgical coke from the colliery plants was 4,399,932 tons, against 4,068,208 tons in 1927 and 2,940,194 tons (Alsace-Lorraine pits included) in 1913. Production in December dropped off fractionally, owing to the large existing stocks, originally accumulated under the impetus of the British coal strike, and the fall in the consumption level both at home and abroad. The year was marked by a steady reduction of the number of labour units employed, whose total was brought down from the high level of 333,000 drawing wages in 1927 to 316,000 in January, 1928, and further to 297,034 in December last. Much of this reduction of labour charges was due to improved equipment of the pits, the rate of wages having been maintained and in some cases raised.

Support is forthcoming for a proposal to permit German securities once more to be quoted on the Paris Bourse. The practical argument behind the proposition, which would have been unthinkable four or five years ago, lies in the fact that whereas securities of other foreign countries yield not more than 1½ to 2 per cent. to the French holder, owing to the overwhelming burden of taxation imposed on them at present, German industrials yield from 4¼ to 4⅜. Critics here insist, however, that before German shares can be officially quoted in Paris, it is obligatory that the inter-Allied debt question should be definitely settled.

GERMANY. — REPARATIONS — REICHSBANK—CREDIT — CAPITAL MARKET — INDUSTRY —SHIPPING.

(FROM OUR CORRESPONDENT.)

BERLIN, February 5.

THE Reparations Conference is at present the cause of nervousness in business circles and on the Bourse. It is claimed that complete confidence cannot be restored in either quarter until the hoped-for settlement has been reached. While the general demand is that the present annuity must be reduced, it is not claimed that this demand can be put through by proving insufficiency of any of the four contributory sources. The demand, it is affirmed, can be put through in one of two other ways. First, it is assumed that the creditor countries, in particular France, must have as much "commercialisation" as international capital market conditions allow of. It is plain that the much-contested "Transfer Protection" cannot be applied to commercialised bonds, so that the creditors must get rid of the Transfer control system. It is reasoned that Germany can, therefore, obtain the desired heavy annuity reduction by making such reduction a condition for surrendering "Transfer Protection." The other argument is simply that it will be impossible to transfer permanently any annuity of the order of 2,500 million marks, even if the annuity proves to be raisable internally without difficulty.

The Reichsbank, to the disappointment of Bourse speculators, who last year drove up this stock from 190 to 340, announces an unchanged dividend of 12 per cent. The Reichsbank president says that it was not the intention of the Dawes Committee to create a bank which would pay to stockholders large profits originating in the difficult position of industry and trade. He objects to the provision that 20 per cent. of net profits must be added to the reserve fund until the reserve is 12 per cent. of average note circulation, and implies that Germany will demand amendment of the Bank Law. The Republic's share in profits of 1928 is this year a little smaller than in 1927, and there is a general demand that in this respect the law shall be amended. The profit and loss account shows the following state of affairs :—

Marks (000's omitted).

	1927.		1928.
Gross profits	149.060	....	157,670
Whereof from discounts	130,710	....	138,290
Expenditure	123,000	....	132,290
Whereof on administration	75,090	....	87,560
Net profits	26,060	....	25,380
To reserve	5,210	....	5,080
Dividends	14,730	....	15,060
To Republic	5,510	....	5,240

The balance-sheet for December 31, 1928, shows that the Bank's holding of free foreign exchange (not booked as cover for circulation) was 374 million marks, as against 190 million marks a year before, so that the real position is better than appears in the weekly returns. The Gold Discount Bank, all the shares of which are held by the Reichsbank, returns its net profits at £549,227, as against £720,701 in 1927. As for 1927, no dividend is declared. Outstanding export credits declined during the year from £3,070,000 to £2,378,000. The Reichskredit Bank's net profit in 1928 was 6,517,817 marks, and its dividend 8 per cent.

The Reichsbank, it seems, is not considering a new reduction of its discount rate. The January-end return does not show any improvement. Discounts, indeed, increased by only 225½ million marks, advances by 61 million marks, but circulation increased by 645 million marks, and deposits declined by the large sum of 360 million marks. The last fact accounts for the low discount demand. Money for January monthly settlements was plentiful, and there was a big demand for private discounts, despite the fact of the low rate of 5⅝ per cent., which is nearly 1 per cent. below the official rate. Money interest rates, however, are rather higher than has been the case in the first weeks of recent months, day-to-day loans yesterday being 6½-8½ per cent.

The Reichsbank's rate policy will be affected by the large impending credit demand of the Republic. The cash position is unsatisfactory, and nearly 1,000 million marks will be needed at the end of March. The Finance Ministry's return of receipts and expenditure for December 31st shows for the first time a deficit of 156 million marks, the surplus on the ordinary Budget account being 429 million, the deficit on the extraordinary 585 million marks. The Government has borrowed all round; in December, in addition to bringing the Treasury bills circulation almost up to the legal limit of 400 million marks, it increased its other unclassed short-term debts to 314 million marks.

The Commerz-und-Privat and Mitteldeutsche-Kredit banks, both of which rank with the four "D's" as "great banks," have decided to amalgamate on a share-for-share basis. The title will remain with the former institution. The capitals are respectively 60 million marks and 22 million marks. Home loans in January totalled only 34 million marks, foreign loans 27 million marks. Since November about half the foreign loan total has come from Switzerland. The Reichskredit Bank publishes the following summary of capital imports in the four past years :—

(Millions of Marks.)

	Net Capital Imports.		From Long Term Loans.		From Credits, Deposits, Sales of Securities, &c.
1925	3,930	....	1,320	....	2,610
1926	950	....	1,770	....	*Dr. 820*
1927	4,630	....	1,660	....	2,970
1928	4,520	....	1,560	....	2,960
	14,030	....	6,310	....	7,720

The minus figure of 820 million marks in 1926 represents exported capital. Of the total net loans and credits 2,170 million marks was retained for circulation cover, the disposable balance being 11,860 million marks.

The wholesale-prices index number for January 30th is 138.6, as against 139 on the 23rd. Bankruptcies in January numbered 829, against 646 in December. The unemployed drawing insurance pay and crisis relief increased in the first half of January from 1,829,000 to 2,167,000. Activity in January in the iron-producing and consuming branches, and also in most industries which produce goods for consumption, declined; in the chemical branch it increased. The electro-technical industries report a decline in orders on books. The steel industry has now definitely decided not to increase home prices on the ground of the increase of wages which followed the lock-out. The Pig-Iron Syndicate is selling at unchanged prices for March delivery. The steel export market has been firm for billets, bars, and bands, and considerable Swedish orders have been booked for ships' plates. For semi-manufactured products the works have orders for seven weeks to come, for wire rods two months. Tube prices have been firmer as result of the agreement with Great Britain. Export of the Solingen cutlery and allied industries in 1928 was 7,316 metric tons, against 7,015 tons in 1927. The former figure, owing to the October change in trade-statistical methods, is about 200 tons short. In the past year the German commercial fleet increased by roundly 400,000 tons to 3,700,000 tons, and is now about 68 per cent. of the pre-war tonnage, with, however, newer ships and relatively much higher carrying capacity.

Motor-cars imported in 1928 numbered 17,819, against 11,383 in 1927; exported 4,578, against 2,688; and 38,000 cars were assembled from foreign parts, as against 22,000. The 56,000 foreign cars, imported ready or assembled, account for about one-third of the national demand, which is put at around 155,000. There is no improvement in the textile industries. Employment is lowest in linen and cotton, somewhat better in wool, and good in artificial silk and jute. The glass industry is well occupied. Conditions in the pianoforte industry are bad. Before the war around 135,000 pianos were produced and sold in a year, in 1928 an estimated 80,000; in 1913 76,400 pianos were exported; in the first eight months of 1928 only 21,100. Great Britain, formerly some 22,000 pianos a year, has fallen to around 1,500. The once important Russian market has been lost.

NORWAY.—BUDGET—BANK REPORTS—INDUSTRY—FOREIGN TRADE—PRICES.

(FROM OUR CORRESPONDENT.)

TRONDHJEM, January 25.

AMONG the chief items on the agenda of the Storthing, which reassembled as usual on the 11th, was the Finance Bill for 1929-1930. The Budget balances with a total estimated expenditure and revenue of about 366 million kroner, which compares with 327 million kroner for the preceding year. It appears that, while the ordinary expenditure shows a reduction of about 10.7 million kroner, capital expenditure has risen from 38 million kroner to 43 million kroner compared with the fiscal year 1928-1929. It has not been considered practicable to propose any reduction of direct or indirect taxes. The only remissions of public interest are the proposed reductions of telephone and postal rates, but the alleviation thus obtained is, unfortunately, not very significant.

The debate usually following the King's Speech at the reopening of the Storthing did not prove very interesting on this occasion. A want-of-confidence vote from the Labour party on a matter not strictly relevant to the debate on the King's Speech was easily defeated, and the position of the Government is perhaps somewhat firmer now than at the time of its entry into office.

The monetary position as revealed by the Bank returns continues very easy, both Christmas demands and end-of-the-year requirements having proved much less of a strain on the Bank than was anticipated. Notes in circulation, which figured at 315 million kroner at December 31st last, stand at 296.7 million kroner at January 23rd, while loans and discounts have been reduced from 272 million to 260 million kroner. On the other hand, deposits at call show a reduction of some 5 million kroner, and the Bank holdings of foreign exchange have been substantially reduced. The latter fact is also reflected in a hardening of the sterling rate, and may be a reason why the Bank rate is still maintained at 5½ per cent., in spite of the apparent ease in the money market.

Nearly all the big Oslo banks and a number of provincial banks have published their reports for 1928, and most of them bear witness to the brighter conditions that have been ruling during the year. It seems to be the general opinion that bottom has at last been struck, and that a reasonable optimism with regard to banking affairs in Norway is not only warrantable, but is due to the present efficient and careful management of our banks.

In more than one respect the year has started under brighter auspices than many of its predecessors. As regards the industrial outlook, the agreement in the iron industry just before Christmas has already proved of much importance to the shipbuilding industry. During the greater part of last year this branch of industry was suffering from foreign competition and unsettled labour conditions, but lately orders have been placed with the yards, which will keep them running full-handed for some time to come. According to official figures, there are at present in course of building or contracted for by Norwegian shipowners about 24,000 tons in Norway and 260,000 tons abroad. The increase in the Norwegian mercantile fleet during 1928 amounted to 186,000 tons, while there was a decrease of nine in the number of vessels.

Foreign trade figures for December last year reveal an excess of imports over exports of 35.13 million kroner, compared with 24.76 million kroner for the preceding month and 36.83 million kroner for December, 1927. The total value of imports last year amounts to 1,012.8 million kroner, against 976.6 million kroner in 1927, while the total value of exports aggregates 682.1 million kroner, against 684.7 million kroner in 1927. The adverse trade balance consequently increased during 1928 by 38.8 million kroner—a fact which is almost entirely due to larger imports, exports remaining practically on the same level as in 1927.

The cost-of-living index at December 15th shows a reduction to 182 from 184 in November, while in December, 1927, the figure was 193.

The bond and share markets continue very active. Both banking and industrial shares have risen, as have also shipping and whaling shares, after an interval of slackness in the latter.

CANADA.—IMMIGRATION POLICY—BUSINESS—NEWSPRINT SITUATION—ANTI-SMUGGLING CONFERENCE—REVENUES—PRICES.

(FROM OUR CORRESPONDENT.)

OTTAWA, January 15.

THE most important event in Canada since the New Year began has been a drastic change in her immigration policy. Public opinion has been deeply disturbed for some time over the revelations of recent immigration returns, which showed an alarming preponderance of foreign-born over British immigrants, and the Toronto Globe and other influential papers have been campaigning for an alteration of policy which would curtail the influx of foreigners. There has also developed in the prairie provinces a widespread agitation of a fiercely Protestant character, which was directed primarily against Roman Catholic claims in educational matters, but also found substantial ammunition in the foreign problem, and influential supporters of the Government have been coming to Ottawa and warning Ministers that unless the agitation was checked it boded ill for the future of the Liberal party on the prairies. A decree has now gone forth from Ottawa to the colonisation departments

of the railways that what is virtually a quota system must be established for "non-preferred" immigrants. Henceforth only 30 per cent. of the total number of "non-preferred" immigrants admitted in 1928 are to be admitted each year, and none at all will be admitted after May 31st. Simultaneously the Government has also proclaimed its intention of giving greater encouragement to British immigration, and as a start it has intimated its willingness to place this year on Canadian farms 6,000 British workers, who before sailing will have received at training farms in Britain careful instruction in Canadian farm methods. The majority of these men are likely to be unemployed industrial workers, and although the transference of 6,000 unemployed per annum will not go far to solve the British Government's industrial problem, the move should be welcomed as a beginning.

The weather since the New Year began has been continuously cold, and last week-end the thermometer over a large part of the central provinces dipped to 20 and even 25 degrees below zero—a point which it does not often reach in these regions. There has also been a succession of snowfalls, which are helpful to forestry operations and yet have not handicapped transport. Wholesale houses report that their volume of orders compares very favourably with that of January in other years. The public is for the moment in an economical mood after its heavy Christmas purchases, and retail trade has dropped off considerably; but many stores are putting on special sales to stimulate buying, and are meeting with a satisfactory response. The carloading figure for the week ending January 5th, at 46,192 cars, showed a gain of 1,950 cars compared with the previous week, but was down by 5,568 cars from the total for the corresponding week of 1927, the chief source of the decline being in grain, which is lower by 3,608 cars. Most factories are amply provided with orders, and the railway equipment and farm implement firms are particularly busy. The cold weather, however, is inimical to outdoor work, and for the first time this winter the problem of unemployment is beginning to assume serious dimensions.

The newsprint industry has not yet reached a comfortable position, and the price situation in the pulp and paper industry, which is an all-important factor, continues to be the subject of negotiations and conferences. The newsprint manufacturers insist that the profitable operation of their mills is only possible with a minimum price of $55 per ton, and it is alleged that the chief obstacle to general stabilisation at this figure is formed by the contracts made by the Hearst interests for newsprint supplies at $51 per ton and even lower. Other newspapers in the United States have an intelligible objection to paying higher prices for their newsprint than do their Hearst competitors, and the Canadian newsprint companies are said to be trying to induce the Hearst combination to waive its favoured position. There are also rumours that Canadian newsprint interests have begun to buy up papers in the United States in order to ensure a regular market for their products at adequate prices. In the lumber industry proper the British Columbia mills are indulging in their normal winter curtailment of operations, but the lumbermen of Eastern Canada are busy at their annual cut, which will probably be as large as its predecessor. The coal mines are having a slack time, but there is no cessation of other mining activities, and winter, although it handicaps prospecting work, helps transportation of supplies to the remoter camps when rivers and lakes have to be crossed. News from British Columbia of very promising mining developments has revived speculative interest among the public, which had a bitter lesson last summer, and many mining stocks have experienced good rises since the New Year.

The Anti-Smuggling Conference between officials of the Canadian and American Governments, which was held at Ottawa last week, has yielded no tangible results. The chief demand of the American delegates was that Canada should refuse clearance papers to all cargoes of liquor consigned to the United States, but the Canadians could not see their way to agree to this. They argued that such a policy would only drive the traffic into subterranean channels, and it was also pointed out that Canada's exports of alcohol to the U.S. were only a small contribution to the aggregate amount of liquor which was being consumed in defiance of the Volstead Act. The Canadian delegates, however, agreed to recommend the adoption of any suggestions that Washington might care to submit for the improvement of the present system where the U.S. authorities are supplied with information about export liquor cargoes leaving Canada.

The stock markets have been fairly active during the past week, with International Nickel, Brazilian Traction, and the railway equipment stocks taking the lead; but money is still tight, and the banks are continuing their policy of discouraging speculation. Plans now being laid for the spring and summer show a widespread confidence that the prosperity of 1928 will be repeated this year, and may even be improved upon.

The revenues of the Federal Government continue to show wonderful buoyancy, especially in light of the reductions in taxation which were decreed by the last Budget. For the first three-quarters of the current fiscal year ending December 31st the total of the ordinary and special revenue collected amounted to $347,838,102, as compared with a total of $325,551,698 for the parallel period of the previous year. The greatest gain was in Customs, which rose from 117 to 139 million dollars, but there was also an increase of 3½ million dollars in the income-tax returns; the only serious decline was in Excise taxes, which, as the result of their reduction in rate, fell from 63 to 57 millions. During the same period ordinary, special and capital expenditures are placed at $269,591,304, which is an increase of roughly 10 million dollars over the parallel period of 1927; but there is still left a margin for a very comfortable surplus, especially as the Canadian National Railway, in view of the expansion of its net earnings, is not likely to make any heavy drain upon the Treasury. On December 31st the net national debt was placed at $2,218,603,434, as compared with $2,281,479,535 on December 31, 1927.

Commodity prices are showing a slight downward tendency, the wholesale index number of the Bureau of Statistics for December being 146.7, as compared with 148.6 for November. Forty price quotations were lower, 27 higher, and 69 unchanged.

Books and Publications.

THE ECONOMIC HISTORY OF EUROPE.*

THERE is no good one-volume outline of the economic development of Europe during modern times, and the co-operative work of three American professors which has just become available to English readers should find a ready welcome.

It is obviously a very difficult task to compress into some 550 pages a survey of the five centuries in which Europe has revolutionised the material condition of mankind. The authors have done the only thing possible in the circumstances by wisely planning their work "as a key to the main ideas and the most important literature."

The salient features of the commercial, industrial, and agricultural "revolutions" which ushered in modern times are dealt with generally, and then with rather more detail in separate chapters devoted to the several more important countries. Useful lists of books follow each chapter. The authors have made a courageous attempt to take account of the chief post-war developments, although necessarily in a summary fashion. A greater emphasis on the revolutionary effects of improved means of transport and on the reactions of the tendencies generally labelled as "economic imperialism" would improve the treatment of these sections.

* "The Economic History of Europe. Part II. In Modern Times." By M. M. Knigh , Ph.D., H. E. Barnes, Ph.D., and F. Flugel, Ph.D. 8vo. pp. vii. + 551. Allen and Unwin. 15s ne

AMERICAN INDUSTRIES.*

THIS book is a compilation designed, according to the preface, to enable "the men who have helped to bring about" the development of industry in the United States, "who understand its processes, and who are really an integral part of the development itself," to tell their story. It is to these men, in the editor's opinion, that "we must look for the most competent exposition of the difficulties and growth of individual American industries. Economists and journalists may be better qualified to weave the raw material from such contributions into a general pattern; but for a specific and detailed analysis of his own business it would seem that the best qualified person is the man who has spent his life in that business."

A book of this sort runs the risk of suffering from lack of balance, and, indeed, "Representative Industries in the United States" does not escape unharmed from this danger. It is undoubtedly a bad apportionment of space, when the aluminium industry occupies 69 pages, whereas the automobile industry is dealt with in only 32 pages, and the iron and steel industry in only 20 pages. Nevertheless, as a work of reference, the book is not without value, for it contains a large number of useful facts which are not otherwise conveniently accessible.

BOOKS RECEIVED.

[Brief mention of a book in this column does not necessarily mean that it will not receive fuller notice in a subsequent issue.]

The Railway Industry of Great Britain, 1927. By W. V. Wood and C. E. R. Sherrington. (London) Royal Economic Society, 9 Adelphi terrace.

Twenty-seven pages of more than usual interest, both to the economist and to the stockholder.

A New Index-Number of Wages. By A. L. Bowley. (London) Royal Economic Society, 9 Adelphi terrace.

Professor Bowley has completely revised his index number in the light of several years' experience of its working, and with the aid of the fuller statistics now available.

Russia in the Economic War. By Baron Boris E. Molde. (London) Oxford University Press, Warwick square. 11s 6d net.

This is a publication of the Carnegie Endowment for International Peace. It is an interesting account of the part played by Russia in the economic war of 1914-18.

The Netherlands and the World War. Volume IV. *The Effect of the War upon Banking and Currency.* By Dr G. Vissering and Dr J. Westerman Holstijn. *War Finances in the Netherlands, 1918-1922: The Cost of the War.* By Professor Dr H. W. C. Borderwyk. (London) Oxford University Press, Warwick square. 14s net.

These three monographs on the Netherlands and the World War are published in one volume under the auspices of the Carnegie Endowment for International Peace.

Stabilisation Hearings before the Committee on Banking and Currency, House of Representatives. Seventieth Congress. (Washington) Government Printing Office.

The evidence before this Committee constitutes a valuable body of expert opinion on stabilisation and allied questions, called forth by the Strong Bill to amend the Federal Reserve Act. It is here reproduced in convenient form, and well indexed.

Eléments de Statistique. Par Arthur L. Bowley. (Paris) Marcel Giard, 16 rue Soufflot. 100f.

This translation of the fifth edition of Professor Bowley's textbook makes his work accessible to readers who are more at home in the French than in the English language.

Economic Nationalism of the Danubian States. By Leo Pasvolsky. (London) George Allen and Unwin, Limited, 40 Museum street. 12s 6d net.

This is the English edition of the American publication noticed in our issue of January 26th.

THE CHINESE REVOLUTION
1926-1927

Truth:—"The whole case for the Nationalist Government is admirably set out by Mr. Chapman: no more enlightening and opportune book on modern China has appeared."

By
H. OWEN CHAPMAN
M.B., Ch.M. (Syd.), D.T.M. (L'pool.)

The Stock Exchange.

TIPS AND THE INVESTOR.—II.

In our last issue we gave the results of a brief statistical test of the results achieved by a hypothetical follower of the tips given over a period of four months in the investment column of a daily newspaper with a national circulation. The method adopted was based on a comparison of the results of purchasing £100 nominal of each security "tipped," and showed that, as at January 21st last, the investor who followed these tips for the preceding four months would have suffered a net loss on his investment, after paying commission charges and stamp duties.

It may be argued that the purchase of £100 nominal of each security did not provide an adequate test, as no investor would normally act on those lines. We have therefore conducted a second examination on the assumption that the reader of these investment tips actually invested £1,000 in cash in each particular stock or share mentioned. In order to compare like with like, we have taken the middle price ruling on the day on which the tip appeared in the newspaper and the middle price ruling on January 21st. This in reality gives a slight advantage to the "tipster," since the buying and selling prices would be "the turn" less favourable to the investor than the figures on which we have based our results. The "run" given to the securities varies from four months in the case of the earliest mentioned in the newspaper down to a day in the case of the last mentioned. This condition does not, however, affect the main point of our investigation, which is to show the investor whether he would have scored or lost up to a recent date by following this particular "expert's" tips.

The investment of approximately £1,000 (£50 more or less was taken in order to avoid odd fractions of shares or stock) in each of the 273 securities tipped in the period in question (apart from 52 instances where no continuous record could be obtained) would have cost £281,255, inclusive of commissions and the 1 per cent. stamp duty. The value of these investments as at January 21st last amounted to £281,775—in other words, an appreciation was shown of £520, or of 0.18 per cent. on the capital invested. If the securities had been sold and commission charges on the sales deducted from the values as at January 21st, there would have been a loss of £2,024, or 0.7 per cent., on the capital invested. After so much time and trouble had been spent on these tips, both "expert" adviser and advised may well join in dubbing the result a pitiful anti-climax.

The expert in question may argue that we have not allowed his tips a sufficiently long run, but to this argument we would reply that he has had the benefit of active markets over a period when the "Bankers' Magazine" index number showed a rise of 1.25 per cent., and that in the next three or four months he might have the disadvantage of falling markets. Moreover, it is obvious that an expert who is selecting stocks for purchase should show, if his expenditure of time and trouble is worth while, a better average result than the appreciation shown in an index number which takes a number of securities purely as representative of the *average* movements in the Stock Exchange field as a whole. The readers of the daily newspaper in question would, in fact, have done better if they had saved themselves the trouble of following these tips, and put their money into 5 per cent. War Loan, which increased, net, by 1.1 per cent. in the period covered by this investigation.

This test, which we have been at pains to make as accurate as possible, shows up the difficulties of a daily newspaper trying to benefit its readers by giving Stock Exchange tips. The plan simply does not work. It is no fault of the expert who has to write the investment hints; it is rather a matter for the newspaper proprietors who insist that three or four Stock Exchange tips shall be given to their readers every single working day. The truth is that there are not anything like 1,000 tips open to the expert each year, even if he were omniscient. The expert in question whose tips we analysed was, as we have said, more conservative in outlook than many of his colleagues. In the majority of cases he has given tips of recognised investment status. But he has been asked to undertake an impossible task, even if he has wisely lessened the burden by the device of repeating his good tips week after week. What would his colleague, the racing tipster, say if he were asked to tip four horses to win each day even if there were no horses running? We hope our figures may suggest to the newspaper powers-that-be that in featuring the Stock Exchange tipping column in a daily newspaper they are not only setting an impossible task to the experts, but doing no real service to the cause of sound investment generally.

There is another general consideration which we should like to bring forward. The remarkable growth of the investment trust in recent years has been a feature of investment practice, both in London and New York. Provided the management is in the hands of men of experience and probity there is every reason to welcome the increase in the numbers of investment trust companies, seeing that they provide a means for the small investor to take advantage of active Stock Exchange markets without incurring individual risks. But all the good that investment trust companies can do in the way of protection for the small investor will be undone if the popular daily newspaper continues to "boost" its investment tips and encourages the small investor to speculate on his own initiative. We have shown that even to follow the conservative expert "does not pay." The losses which the small speculator must have incurred in following the tips of the less conservative tipsters is even less satisfactory to contemplate. The popular daily newspaper can do much more towards the financial education of the public by analysing company reports and by presenting financial information in an intelligible and accurate form.

There is no denying that public interest in Stock Exchange markets has greatly increased in recent years. But that does not mean that the average reader of the daily newspaper wants to see a tip every morning while he eats his breakfast. More often than not he has no opportunity of acting on the tip even if he believes it to be a good one, and sooner or later he will become alive to the fact that the chances are all against his winning if he acts religiously on the expert's advice. In any case, the expert invariably neglects to tell him when to sell or take his profit. Buying is only one-half of a Stock Exchange transaction, and if the daily newspaper is not prepared to recommend its clients when to sell as often as when to buy, it should not undertake the impossible task of being its readers' broker. It may well be that Stock Exchange "tipping" is as unsatisfactory a way of increasing the circulation of a newspaper as is the running of football competitions, while the facts which we have discussed show that it may hardly be worth while for the reader himself.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

Ticket.	Account.
February 19.	February 21.

The day before it occurred the Stock Exchange decided that a rise in Bank rate was a likely event, and the prices of gilt-edged stocks experienced the worst day that they have had for months. The tone of quiet cheerfulness with which on Monday the Account had opened barely lasted into the following day, and as the disquieting fears about the monetary situation gathered strength, a general dullness came over most sections of the House. We deal with the rise in Bank rate in a leading article on page 275.

The amount of selling induced in the gilt-edged market appeared to be relatively small, but quotations were lowered from Wednesday onwards as a protective measure. The firmness of prices at the beginning of the week, especially of the two Conversion Loans, gave no indication at all of what was to follow. News of industrial and political disturbances in Bombay further damaged India loans, some realisations on a large scale being effected. The new Australia scrip established itself at a premium, but on the whole Dominion stocks moved in sympathy with British issues.

Foreign stocks were unperturbed, and tended to be a rising market. There was continued inquiry for Rumanian loans, and others to register improvements were the various Greek bonds, Japanese (especially the Four per Cent. of 1905), Russian Fours, and certain Brazilians. Peru Corporation preference and ordinary were inclined to fall back.

After one excellent day, Home Railways passed out of favour and lost much of their gains. Traffic receipts, other than for coal, showed fresh losses, and the apparent inclination was to wait for the dividend announcements. Foreign Railways were an idle market most of the week, except for a strong advance in San Paulo. Canadian Pacific were easier.

Among industrial shares important movements were confined to special securities or groups. The strain of the monetary position as between London and New York told against Anglo-American issues, and as New York turned seller those shares in which she had been carrying on active operations recently, such as General Electric, lost ground heavily. Gramophone shares eased, apart from Vocalion, which benefited by a wholly unconfirmed rumour that the company was to be absorbed by Victor Talking Machine. We referred last week to the technical difficulties anticipated when the abundance of transactions in International Nickel letters become due for settlement. On Wednesday the Stock Exchange Committee decided to allow a making-up price for quondam Mond Nickel shares to be fixed on February 15th, on which date they can be carried over, while for the International Nickel themselves a making-up price will be fixed on February 18th. The Settlement Department is not to undertake the settlement of either category at the February 21st account.

From their lowly position of last week Celanese made a temporary recovery, but could not maintain it, while Courtaulds showed a tendency to weaken. Other textiles began to show signs of improvement, though the drastic capital reconstruction naturally caused a fall in Jute Industries. Second thoughts about Margarine were more optimistic than the first impressions created by the Union dividend announcement, strong buying sending up the shares to prices offering an obvious inducement to profit-taking. Imperial Chemicals were in demand, and so for

a time were Swedish Match, while an isolated stock in favour was Triplex Safety Glass. As might be expected, such shares as had been most sought after in recent days were most sharply shaken by Thursday's change in Bank rate, especially those generally regarded as being of an investment character, including insurance and bank shares.

Business in rubber shares was quiet and uninteresting, with more losses than gains reported, though speculative interest in certain companies showed signs of developing and the position of Rubber Trusts was improved. The downward tendency of tea shares was checked, but not much importance was attached to such price changes as did occur, for it was clear that transactions all the week were on a small scale. Oils did not attract much interest, and news of still increasing crude oil production from America was discouraging to buyers. Continental operations in Royal Dutch were perhaps the leading feature of a dull week.

Rhodesian copper shares continued to hold the centre of the mining stage, and the new N'Changa offer, which is dealt with in an "Investment Note," served to quicken the already active interest. After an irregular period when the causes of different movements were altogether obscure, Rhodesians too, having by now taken their place among the recognised "international" favourites, were infected by the monetary uncertainty, and with one or two exceptions prices slipped back all round. Kaffirs enjoyed distinctly greater attention than of late, first Paris and then Johannesburg coming in as buyers. A new interest sprang up for tin shares, and dealers appeared to be anticipating that they were likely to attract special favour from the public within the near future. Whatever the foundation for that view, substantial gains were marked in many cases. The majority of copper shares also tended upwards, in belated sympathy with the price of the metal, but this movement lacked the special and significant character that was apparent in the tin advance.

FOREIGN STOCK EXCHANGES.

NEW YORK.

The advance in the English Bank rate, together with the Federal Reserve "warning," caught the share market in a vulnerable position and brought about a sharp reaction. The Bank of England's action is felt to have been fully justified by the circumstances, but the Federal Reserve authorities' warnings are disliked. It is felt that they are not only ineffective and undignified, but that they may also be politically dangerous. An ounce of action is believed to be better than pounds of words, and it is realised here that much of the present trouble is attributable to the weakness of the Federal Reserve authorities last year. However, it is generally recognised that in any case a reaction in the share market is likely to occur before spring, and it is realised that money usually tightens towards the end of February or the beginning of March.

PARIS.

The ease with which speculative positions were carried over at the month-end settlement, the rate being 4½ per cent. on the Parquet and 7½ per cent. on the Coulisse, came as a fresh proof of the abundance of loanable funds. The supply of money had a most encouraging influence on French securities, which continued to make appreciable gains. If Rentes or chemical products were quieter, by contrast banks, coal and electricity shares and Suez took a new step upwards. Influenced by the price of the metal, copper shares were in great demand. As the week went on falls began to occur, but the undertone remained firm.

BERLIN.

A week ago the Bourse underwent a slight recovery, but it was in general nervous and undecided. Some buyers were frightened by a new rise in the dollar exchange. On Monday dealing was mainly under the influence of sharp fluctuations in Glanzstoffe, which dropped from 443 to 426 before rising again to 437 on intervention purchases by an interested bank. Attention was given to banking stocks. Tuesday and Wednesday were dull and unsettled days, with some foreign buying of electricals. The advance in the London bank rate on Thursday resulted in a moderate decline.

AMSTERDAM.

Generally the Bourse was firm, but business remained inactive. To this last Margarine Unie was the sole exception, the shares advancing nearly 50 points in a few days. Sugar shares reacted, after a rise on the reported formation of a Cuban sugar pool. Netherland Shipping Union experienced a moderate inquiry. Oils were irregular. In sympathy with New York American shares showed more activity. General dullness in the market followed on the news of the rise in London Bank rate. Margarine Unie reacted sharply. The money market was firm.

INVESTMENT NOTES.

The Roumanian Stabilisation Loan.—An agreement has now been reached between the new Roumanian Government and the banking group, which had originally conducted the negotiations with the Bratianu Ministry, for the issue of a foreign loan amounting to no less than £20,700,000. We understand that the scheme of stabilisation has been prepared by the Bank of France. Associated with the latter are Blair and Co., of Wall Street, who originally secured the loan, Hambros Bank, Lazard Brothers, and Higginson and Co., the last three named being responsible for the issue in London. Franc bonds are being offered in Paris to the amount of 561,638,000f, and dollar bonds in New York, Austria, Belgium, Czechoslovakia, Germany, Holland, Italy, Roumania, and Switzerland to the amount of $69,000,000. The English portion of the loan is £2,000,000. The loan takes the form of 7 per cent. sterling bonds, guaranteed as to principal, interest, and sinking fund by the Government of Roumania, redeemable by 1959 by means of half-yearly drawings at par. The price of issue is 88 per cent. Apart from the unconditional guarantee of the Government of Roumania, the bonds are secured by a first charge on the gross receipts of a new Monopolies Institute, which has been granted the sole right, until all the bonds of the loan are redeemed, to exploit the following monopolies—tobacco, matches, salt, playing cards, commercial explosives, and cigarette paper. The Monopolies Institute has entered into a contract with the Swedish Match Company whereby the Company has agreed to operate the match monopoly for a period of 30 years through a Roumanian subsidiary, and to guarantee payment of a minimum annual royalty equivalent to $3,000,000 (say £600,000). The net receipts of the monopolies transferred to the Institute have been as follows :—1926, £3,841,000; 1927, £4,748,000; 1928 (11 months), £5,211,000. The net receipts from the match monopolies during the first eleven months of 1928 were approximately $2,000,000 (say £400,000). No further bonds are to be issued ranking *pari passu* with this loan unless the net revenues of the Institute have been at least equal to twice the maximum annual service of all the bonds outstanding after such further issue. The plan of stabilisation contains the following provisions :—(1) The gold value of the leu is to be fixed, in fact, near the current rate. (2) The National Bank undertakes to maintain the stability of the leu, and the Bank statutes will require it to maintain against all demand liabilities a minimum reserve of 35 per cent. in gold or gold exchange. (3) The equilibrium of the Budget is to be strictly maintained. (4) The Treasury can borrow on current account from the National Bank amounts not exceeding £2,500,000 in anticipation of tax receipts, but the advance must be repaid during the second half of each fiscal year, and cannot be extended from one year to another. The participation of the State in the capital of the National Bank is limited to 10 per cent. (5) The National Bank will appoint a foreign adviser for a period of three years to collaborate with its board in the carrying out of the stabilisation plan. M. Charles Rist, a member of the Transfer Committee under the Dawes Plan, has been appointed adviser, and will issue quarterly reports. (6) The net proceeds of the loan will be applied as to £5,000,000 to the stabilisation of the Roumanian currency, as to £2,200,000 in repayment of certain advances due to the Treasury, as to £1,800,000 in working capital for the State railways, as to £2,000,000 in productive works authorised by Parliament, and the balance in the reconditioning of the State railway system. The bankers may be congratulated as much as the Roumanian Government upon the plan of stabilisation and the security assigned to the stabilisation loan. The participation of the Swedish Match Company will no doubt have an influence with the investor. Apart from the royalty which it guarantees, the Swedish Match Company has taken firm $30,000,000 of the dollar bonds, which it has agreed not to market for three years, except with the consent of the banking group. At the price of issue of 88 (or 87½), allowing for the ½ per cent. in the first coupon) the bonds return a running yield of 8 per cent., and a yield to final redemption in 1959 of 8.15 per cent. Allowing for half-yearly drawings at par the yield on the average life of the bonds works out at £8 4s 9d per cent.

Increased Railway Charges?—On the eve of the declaration of dividends which can scarcely be expected to satisfy the aspirations of all stockholders in the four great British railways, it may be well to remind our readers that, under the terms of the Railways Act of 1921, the Railway Rates Tribunal has power to review the present level of railway charges forthwith, on the ground that they did not last year produce the "standard of revenue" prescribed by the Act. Any changes recommended by the Tribunal would, in the ordinary way, come into force next July. The extent to which they are likely to use their powers is obviously a matter of interest to the investor in railway stocks. In this connection it is necessary to point out that the proper adjustment of passenger fares presents quite a different problem to that of freight rates. In the former case (leaving season tickets out of account for the moment) any increase or decrease usually meets with an almost immediate response; but in the latter, although the loss of traffic due to an unduly high level of rates may ultimately be both serious and irretrievable, its effects are likely to be slow, and for a period of a month or a year may even appear to be "good business" for the railway. So far as the coming year is concerned, the main problem before the Railway Rates Tribunal will be to select those traffics which will bear higher charges with a minimum of disturbance to industry. Necessarily their choice must lie amongst those traffics—rapidly diminishing in number—not susceptible to road competition, and these are concerned precisely with those industries already weakened by misfortune, where higher rates would be liable to stifle tonnage altogether. Further, in the cases of iron and steel, coal, and agriculture, the provisions of the Government's freight rebate scheme are already in operation, and it would seem unlikely either that the Rates Tribunal or public opinion would permit the railways to "counter" the Government's endeavour to assist these selected trades. In other words, it is just where charges might have been raised that the Government has stepped in and enforced a reduction. The policy may, admittedly, after a while reduce the costs of these industries, increase the tonnage of their products transported, and so bring revenue to the railway companies. For the present, however, the railways will be compelled to examine the possibilities as regards such traffics as bricks, stone, cement, and other materials required for house-building and road construction. But here road competition is by no means absent, since these materials are often required along the best-constructed roads. For the longer hauls, coastwise traffic is always liable to be a danger in both cases. In the case of passenger traffic, with exception of season-ticket traffic, competition from the road has presented the railway companies with no alternative to the making of further reductions by way of cheap facilities. A large share of the total traffic, as a result of these reductions, is now carried at a price nearer 1d than 1½d a mile, and it may well be that consideration has been given to the lowering of ordinary fares to the former level. A field where increased charges might bring in additional revenue is that of season-ticket traffic or of workmen's fares; but in all probability the penalisation of those who have based their decision to live at considerable distance from their place of employment on the level of the existing scales would be regarded as outside the range of practical policy for those responsible for the greatest of all public utilities. At no time in railway history has the industry been faced with a greater degree of competition, or have the special obligations and responsibilities resulting from its public control borne more heavily upon it. The efforts of the companies, in collaboration with the Rates Tribunal, to discover those traffics which can support higher charges are likely to be anything but easy, and the investor would probably do well to await definite results before building unduly on the prospect of improvement from this source.

New Capital Issues in January.—In the table below we show the new capital raised in London by issue to the public or shareholders in January, 1929; comparative

January 1929....	650	14,080	24,897	2,983	42,610

For the first time for several years no British Government issue falls to be included in the January total. The Government figure of £650,000 is made up entirely by the excess of purchases of National Savings Certificates over encashments, an encouraging start to the year. Not much change is apparent in the amount raised for use at home, other than by the Treasury. India borrowed £7½ millions, as a year ago; New Zealand obtained £7 millions, and the Commonwealth of Australia made an £8,000,000 issue. No foreign Government entered the market, but an Austrian electric power company tried to borrow £2 millions, and the Buenos Ayres anl Pacific Railway made a £1,000,000 issue to its shareholders. It is interesting to note that during the month dealings on the Stock Exchange began in shares of the nominal value of £1,817,450 which had been introduced by the method of advertisement "for public information only," and the total cash involved in these introductions, calculated on the opening price in each case, amounted to £4,813,512.

London Gas Companies.—The reports of both the Gas Light and Coke Company and the South Metropolitan Gas Company were made available on Monday, and they show similarity in many points. In each case the expenditure on coal fell by over one-quarter, but through the same causes a marked reduction occurred in the prices received for by-products. The Gas Light company increased its sale of gas by just over 1 per cent. during the year, but the lower price charged brought down the receipts on that count from £9,487,972 to £8,171,786. It was possible, notwithstanding, to increase the ordinary dividend and to put £90,000 to reserve, as against £35,000 in recent years, thanks to the economy effected on coal :—

Years Ended December 31.	1926.	1927.	1928.
	£	£	£
Net revenue	1,337,846	1,736,989	1,853,520

Ordinary dividend, amount	944,673	942,635	1,037,285
,, ,, rate per cent.	(£5/0/8)	(£5/0/8)	(£5/11 0)
To redemption fund	35,000	35,000	40,000
Increase or decrease in carry forward	— 43,342	+ 56,930	+ 37,080

During the year £2,000,000 of 5 per cent. redeemable debenture stock was issued. A temporary loan of £875,000 from bankers has disappeared from the balance-sheet, and £550,000 on deposit now appears on the assets side. The total of reserve funds is raised from £813,242 to £893,377. A Bill is going forward to provide for the acquisition of two local gas undertakings, and naturally the report mentions the event of the Holborn explosion. At the 1928 rate of dividend the ordinary stock at 20s 3d yields £5 8s. The South Metropolitan revenue would have fallen slightly short of the 1927 figure, but for the receipt of £32,500 as dividend on South Suburban Gas stock, with which company an agreement was concluded during the previous year. The sale of gas shows a decrease of ½ per cent., causing at the lower price a shrinkage in value from £3,412,202 to £3,099,738. Dividend on £500,000 preference stock became payable for the first time during 1928, so that on balance almost the same sum was earned on the ordinary stock as in 1927, and that dividend remained unchanged :—

Increase or decrease in carry forward	— 5,969	+ 1,233	— 947

* £98,000 taken from special purposes fund.

On account of considerable expenditure out of the special purposes fund on replacements, visible reserves have diminished from £431,435 to £372,523. Two different plants for the manufacture of low temperature fuel are being erected, so that the company will be able to try their relative merits and test the markets for the resultant products. This is a far-sighted and interesting development. The company's ordinary stock at 109 yields £5 14s 8d. The balance-sheets of both concerns will be found summarised on a later page.

Tilling and British Automobile Traction.—Early in 1928 the British Automobile Traction Company, which was itself controlled by Thomas Tilling and the British Electric Traction Company, acquired large holdings in those two and in other associated companies. Its name was adapted and its ordinary share capital increased from £400,000 to £1,600,000. Of the new shares, 331,704 were issued to shareholders at 22s 6d. They are now dealt in at 43s 9d, yielding £4 11s 5d per cent. at the current rate of dividend, which has been maintained at 10 per cent. on the swollen capital :—

Years Ended December 31.	1926.	1927.	1928.
	£	£	£
Profit, after charging debenture interest	55,423	75,623	167,206
Participating pref. div.(8% + 2%)..	20,000	20,000	20,000
Ordinary dividend (10%)	30,000	34,583	135,736
To reserve	10,000	10,000	10,000
Increase or decrease in carry-forward	— 4,577	+ 11,040	+ 1,570

The balance-sheet, which is summarised elsewhere, discloses an entirely liquid position. Shareholders would be better able to judge the financial strength of the company if "investments in transport undertakings, and rolling stock, plant, machinery, and stores" were not grouped into one huge item that furnishes 88 per cent. of the gross assets. The confusion of two radically different classes of assets is actually more objectionable than the mere size of the one item, which at £2,043,188 shows an increase of £1,126,999 on the year. In that connection, the nominal value of the shares issued in exchange for the principal holdings acquired was £868,296. The reserve, strengthened by £41,463 from share premiums, stands at £110,081, but the share and loan capital together now exceed £2,000,000, on which the true earning power of the company over a whole 12 months will not be apparent until this time next year.

Rylands and Sons.—The difficulties of Lancashire are inevitably reflected in the accounts of this great Manchester firm. The recovery registered in 1927 has not continued; on the contrary, profits for the past 12 months fell away by 16 per cent. The ordinary dividend was maintained at 8 per cent. Half-yearly meetings have only lately been abandoned by this company in favour of yearly ones, so that in the following table the figures for 1926 and 1927 represent in each case the sum of two half-yearly statements. The final dividends of 1928 were paid less income-tax at 3s 9¼d in the £ :—

	Years Ended December 31.		
	1926.	1927.	1928.
	£	£	£
Profit	151,763	237,630	199,351
Preference dividend, after tax	96,000	96,438	96,687
No. of times covered	*1·5*	*2·4*	*2·0*
Ordinary — Earned	4·3%	8·6%	6·6%
Ordinary — Paid, less tax	8%	8%	8%
Ordinary — Amount, after tax	128,000	128,583	128,917
Increase or decrease in carry-forward	— 72,237	+ 12,609	— 26,253

The balance-sheet, a summary of which will be found on a later page, incorporates the assets and liabilities of Rylands and Sons (Colonial), Limited, the trading result of the subsidiary being included in the profit statement of the parent company. It is impressive to see fully one-third of the gross assets represented by British Government, railway, and corporation stocks. Fixed assets are valued at £829,573, against £769,679 a year ago. Some slackening in turnover would seem to be indicated by an all-round drop of 6 to 8 per cent. in creditors, debtors, and stock-in-trade. The company appears to keep its financial position admirably liquid. Visible reserves remain at a total of £600,000. At their present price of 1¼ the £1 ordinary shares yield £5 18s, less tax, and the preference at 1⅜ yield £5 16s 3d.

Jute Industries.—Details of a step the necessity for which has long been foreseen are now announced by the directors of this company, which was formed in 1920 and took over a number of businesses at the inflated prices then current. After discussion with Sir William Plender, the directors advise that the investments acquired at that time, which stood in the books at their cost price of £5,635,595, be revalued on the basis of probable earning capacity. Accordingly they are to be written down by no less than £2,834,000, and as a result of certain other adjustments the share capital has to be reduced by £2,850,000 in all, which exceeds the total issued ordinary share capital. Whether preference shareholders in a company should be asked to submit to any sacrifice until the ordinary shareholders have paid the uttermost farthing is a question at present in the melting-pot of financial thought, but in this case it is obviously inevitable, whatever the scheme, that the former should suffer some loss. It is proposed to write 18s off the £1 ordinary and 10s off the £1 preference shares, and to reduce the dividend on the latter from a participating cumulative 9 per cent. to a non-cumulative 8 per cent., with better participation rights in that four-fifths of the surplus will be assigned to them, leaving only one-fifth to the ordinary. It can at least be said that these proposals are fairer to preference holders than certain other schemes that have been determined on recently. Further information from the annual report will be found in "Summaries of Balance-Sheets" and "Reports and Notices" on later pages.

Decca Gramophone.—The shareholders of the Decca Gramophone Company, which made a public issue of 320,000 ordinary 10s shares on August 25, 1928, at 24s 9d per share, and has now an ordinary share capital of £160,000, have received from a firm of solicitors, acting on behalf of unnamed clients, an offer to purchase their shares at £2, to be satisfied as to £1 7s 6d in cash and as to 12s 6d by five-eighths of a fully-paid 7 per cent. cumulative preference share of £1 in a new company to be formed for the purpose (*inter alia*) of manufacturing gramophones and records. The new company will issue in all 231,250 preference shares, with no other shares taking priority to or ranking *pari passu* with them, and will have at least £750,000 in cash subscribed for ordinary shares. When the Decca shares purchased are transferred to the new company, it will have an income therefrom sufficient to pay dividends on its preference shares nearly four times over on the basis of the profits for the last year, namely, £61,000. The offer is void if it is not accepted by holders of at least 51 per cent. of the shares, and the purchasers are to have the option of avoiding or confirming the offer if it is accepted by holders of between 51 per cent. and 80 per cent. of the shares. As Decca shares are at present quoted at 1 1/16, the offer is not unattractive for shareholders, but Decca shares were understood to have prospects, and it seems regrettable that the solicitors do not see their way to provide the shareholders with more information. Apart from the fact that the solicitors' letter does not reveal how fractions of preference shares are to be disposed of, the shareholders are left in entire ignorance of the nature of the new company, its prospects and its expenses. There is no point in declaring that the income from Decca shares will cover the preference dividends of the new company unless it is shown that there is no possibility of the operating expenditure of the latter eating up the income from the Decca shares. It has been stated in a contemporary that the offer of the solicitors is being made on behalf of the New Malden Holding Company, which was formed recently to take over the Duophone factory and plant at New Malden. This point is of interest because it is understood at one time last year that the Duophone directors had received some offer from the Decca Gramophone Company. If there is any truth in these reports it is desirable that the solicitors should disclose their clients and lay the whole of their proposals before the Decca shareholders so that the details of their offer may be fully appraised.

Tin Share Yields.—It is noticeable that sentiment in the tin share market is generally decided week by week by the rise or fall in the price of tin. Recently the daily fluctuations in the price of the metal had been small, until the recent spurt of £4 in one day. If an upward tendency sets in, it is not unlikely that the market in tin shares will begin to value prices rather more on the dividend-yield basis. Of course, if the price of tin is still unstable, there is no point in considering dividends which may have to be reduced, but it may be recalled that at the beginning of 1927 the downward trend in prices set in, and continued for eighteen months to the middle of 1928. Some recovery followed, then a slight reaction, and finally some show of stability. As the investor is therefore examining tin share prices after a depression lasting nearly two years, it is not altogether surprising that the yields shown on a dividend and earnings' basis are among the highest obtainable on the Stock Exchange. The following table gives the yields on tin shares of three Malayan, two Nigerian, and one Bolivian concern :—

	Year Ending.	Earned.	Divs.	Price. Feb. 4	Yield on Divs.	Yield in Earnings.
		%	%		%	%
1. Malayan Tin Dredging, 5s	June, '28	*94·7	65	28/	11·6	16·9
2. Kamunting Tin Dredging,5s	,,	38·7	40 free	17/3	11·6 free	11·2
3. Tavoy Tin Dredging, 4s....	Dec., '27	*55·5	35½	17/6	8·1	12·7
4. North Nigerian (Bauchi), 10s Pref.	June, '28	56·1	50	27/10½	16·1	20·1
5. Associated Tin Mines, 5s ...	,, '27	..	30	12/3	12·2	..
6. Aramayo, 25 fr	Dec., '27	35·4	26¼	¾	8·15	10·9

* Include interest and profits on sale of investments.

The highest yield is obtainable on Northern Nigerian (Bauchi) 10s preference shares, standing at 27s 10½d. Even if the dividends were reduced in the current year to, say, 45 per cent., the dividend yield would still be over 16 per cent. The lowest yield is returned by Aramayo Mines. In this case the yield is difficult to calculate as for the year ending December, 1927, 20 per cent. was paid on the old capital, and 10 per cent. on the new capital, after the issue of a 20 per cent. capital bonus. We have calculated the actual cash received as a percentage dividend on the new capital. The comparatively

low yield obtainable may reflect the confidence felt by the market in Guggenheim Brothers, who have now taken over the management of the Aramayo mines. There remains the question of the life of the properties. The investor is generally at a loss to know how to allow for redemption of capital seeing that the alluvial tin properties in the East and in Nigeria do not admit of exact calculation of ore bodies as in the case of a lode mine. It will be observed that developing tin companies generally acquire additional acreage each year to make good the acreage worked. Thus the Northern Nigeria (Bauchi) *each year* estimates its reserves at seven years, by extending its acreage laterally as it works through the ground. There is therefore no great significance in calculating that "reserves" for Malayan Tin Dredging are estimated at twenty years, for Kamunting at fifteen years, or for Tavoy at possibly eight years. Moreover, these companies have subsidiaries which are developing new ground. In the case of Associated Tin Mines of Nigeria, the recent absorption by this company of other companies in Nigeria makes it impossible to estimate life or earnings, but further developments are obviously in prospect, in view of the hydro-electrification of the Bauchi plateau. If the estimates of tin production and consumption recently given by Sir William Henry at the general meeting of the Tin Selection Trust (reported in the *Economist* last week) are realised, an upward move in tin prices is not outside the bounds of possibility, though tin trade statistics are notoriously difficult to obtain, and still more difficult to interpret. The "deliveries" of tin in the United States in January, however, lend a certain colour to Sir William Henry's view of American consumption this year, the figure reported being 8,795 tons, against 7,155 tons in December, 1928, and 5,400 tons in January, 1928.

N'Changa Copper Mines.—The American Smelting and Refining Company has withdrawn its offer to finance the further development of the N'Changa Copper Mines in view of a more favourable offer made by an influential British group. The American company's terms, which were reported fully in the last issue of the *Economist*, had already been accepted by the directors of N'Changa, and were to have been put before the shareholders this week. The British offer is made jointly by the Rhodesian Anglo-American, British South Africa Company, British Metal Corporation, Johannesburg Consolidated, Rio Tinto, and Union Corporation, who undertake to subscribe for 50,000 shares in N'Changa at £2 10s per share, and to guarantee, free of commission, the subscription of 150,000 similar shares at £2 10s, which are to be offered to N'Changa shareholders *pro rata* to their present holdings. If any further issues of shares are made, the group is to have the right to subscribe for 25 per cent., provided it guarantees, free of commission, the subscription of the remaining 75 per cent., which must be offered to the shareholders. It is a condition of the offer that N'Changa acquire from the Rhodesian Congo Border Concession, subject to the approval of the British South Africa Company, the rights over the 30,000 acres for 200,000 fully-paid shares in N'Changa. The British group point out that if the American offer had been accepted the buying of the concession and the raising of £500,000 of capital would have cost N'Changa 410,000 shares with calls on enormous blocks of shares at low prices, whereas their attractive offer gives them the concession and £500,000 of capital at a cost of 400,000 shares without giving away any cheap options on shares and without giving up virtual control of the company. The British group further offer to the Rhodesian Congo Border Concession to subscribe immediately for 37,500 Congo Border shares at £3 10s each, and to guarantee, free of commission, a simultaneous offer to shareholders to subscribe for 112,500 shares at the same price, with a view, in the case of the acceptance of this offer, to the Congo Border taking the place of the British group in financing the N'Changa. There is little doubt that these offers will be accepted by the shareholders of N'Changa and Congo Border, although some of the shareholders of N'Changa may personally deplore losing the offer to subscribe, under the American proposals, for one new share for every eight at 35s. There may be a feeling among some N'Changa shareholders that the directors acted a little hastily in accepting the terms of the American company when, as events proved, there was a possibility of an advantageous British offer, though this feeling did not find prominent expression at Wednesday's meeting.

Company Law.—It has been successfully brought to the notice of the Government that important schemes of industrial reorganisation are being held up by the delay in bringing the new Companies Act into force, with the result that an Order in Council was made during the week whereby the section that bears most directly on reconstructions—that which provides for simplification of the necessary procedure in order to obtain the sanction of the court and the consent of creditors and shareholders—was brought into operation as from February 7.

Paris Bourse Changes.—An interesting reform in the Rente market of the Paris Bourse came into operation at the end of January, writes our Paris correspondent, when the Chambre Syndicale applied the new rule reducing from 30 per cent. to 20 per cent. the amount of cover required for loans advanced to purchasers of Rentes. Another change which appears likely to be adopted in the near future is the re-establishment of the old system of monthly settlements in the Rente market, in place of the fortnightly settlements that have been the practice since the War began. A third proposal which has received favourable consideration is for the transfer of the various French War Loans to the list of Rentes which are officially allowed to be dealt in for the account. Hitherto these War issues have been dealt in only by the cash market. The principal argument used in favour of monthly settlements for dealings in Rentes is that it would render them much more attractive to investors, since less frequent settlements would reduce both commissions and taxation charges.

CAPITAL ISSUES.

CONSIDERING that no Government or corporation loans were announced, the week was a heavy one for prospectus issues, which amounted to £8,850,949, excluding conversions, as compared with £7,256,250 for the corresponding week last year, making a total for the year to date of £52,935,823. Issues to shareholders totalling £324,758 were also announced, and new securities coming into the market after gaining introduction through notices "for public information" accounted for a further £392,809 on the basis of the opening price. Foremost among the prospectuses come two important debenture issues, each for £3,000,000. The *London Power Company*, which through ten constituent companies supplies electricity for various London and suburban districts, issued at 99½ stock to rank *pari passu* with its existing 5 per cent. stock. Considering that the price of the latter, including about four months' accrued interest, has not been under 102 lately, the new issue was an attractive as well as a sound investment. *Debenhams* offered 5 per cent. stock at 96, part of which was to be used to repay £664,551 of 5½ per cent. debentures. The company is too well known to need comment, and the price of the issue appears not ungenerous. The prospectus states that the recent acquisition of control of the Drapery Trust has yielded satisfactory results, and is expected to be of increasing advantage in the future. Another large industrial firm, *J. Sears and Co.*, the boot manufacturers, who have lately bought control of Freeman, Hardy and Willis from the Charterhouse Investment Trust, issued £2,000,000 in 7 per cent. "A" cumulative preference shares, which, together with £1,750,000 6 per cent. debenture stock placed privately at 97½, will be used to finance that purchase. The preference shares,

which rank after the old 7 per cent. preference but before the new bonus 12½ per cent. preference shares, were heavily oversubscribed. More uncertain, but a fair industrial risk, is *Leicestershire (L. and N.) Coal Distillation*, an enterprise which will undertake coal treatment on a considerable scale at an up-to-date Leicestershire colliery. *Thames River Grit* proposes to amalgamate five private companies which for some years have been successfully exploiting sand and gravel deposits; again the work is out of the ordinary run, but in this case good past profits can be shown. The purchase price of nearly £300,000 is payable in cash. Another public flotation of a private concern is *Ballington Hosiery*, which hopes that future profits will more than justify considerable expenditure on new machinery. Less than one-seventh of the purchase price is credited to goodwill, and the increase in the demand for silk hosiery referred to by the prospectus is indisputable. Competition, however, is keen, so that everything depends on the ability of those in control. What is described as "a development company engaged.....in evolving improved and patented forms of motor-car bodies," is taken over by *Gordon England* (1929). Its prospects would appear to depend a good deal on its powers of "evolution"; it may at least be said that the directors have allowed for a reasonable period of development before appealing for public participation. Of an interesting character is the only investment trust issue of the week, *Aberdeen, Ceylon, and Eastern Trust*, which intends to turn its attention specially to the tea and rubber industries, its directors having qualifications for such business. Certainly it has opportunities, but it is venturing on difficult ground. *Continental Tintex and Dye Products* has acquired rights for many parts of the Old World in patent articles which have been successfully exploited in the U.S.A., but whether "the well-known partiality of the Continental peoples for bright and varied colours" will justify the birth of this offspring company remains to be seen. *Dim-Dazzle (Parent)* is an admitted speculation, proposing to acquire the world rights to apply for patents; possibly a litter of offspring is to be apprehended. *Truphonic Radio*, on the other hand, is content with a small capital, and though it is entering a highly speculative field, and estimates its future profits generously, the manufacture and sale of its products has at least passed the experimental stage. Two small mining propositions close the list. *Naraguta Durumi Areas* acquires tin properties in Nigeria from another company on whose board sit three of the four directors of the new company. The vendors take their consideration in shares, but receive a relatively large option. Tin is already being produced, but the enterprise is definitely speculative. The *Star Emerald Mining Syndicate* has apparently been carrying out development work for a good many years in Western Australia, and requires another £12,000 to sink a shaft; a report from its mining engineer is referred to but not published.

ISSUES OF THE WEEK—

By Prospectus or Offer of Sale.

Net total previously recorded, £43,610,116.
Including conversion total previously recorded, £56,520,116.
National Savings Certificates.
Net sales week ended February 2, 1929, £150,000.
Total receipts April 1, 1928, to February 2, 1929, Dr. £1,050,000.

London Power Company, Limited.—Issue of £3,000,000 5 per cent. redeemable debenture stock at 99½, a charge on the undertaking and revenues, ranking *pari passu* with the existing stock, of which £10,858,400 is outstanding. An amount equal to not less than 1 per cent. per annum on all stock outstanding will be applied out of statutory sinking funds in purchase of stock at or below par or in drawings at par; also the company may redeem all or any of the stock after 1952 on three months' notice. The company was formed to promote the development of the electricity supply in London, Middlesex, &c., and supplies ten constituent companies with electricity in bulk. Output in B.O.T. units of the company's stations has been:—1926, 421,766,503; 1927, 506,387,796; 1928, 593,915,537. Share capital is £50,000 in £1 6 per cent. shares. Proceeds of present issue are required to provide for certain extensions of the company's business.

Debenhams, Limited.—Issue at £96 of £3,000,000 5 per cent. first mortgage debenture stock 1940-79, a first floating charge subject only to a small mortgage. A ½ per cent. sinking fund will operate by purchase at or below par or by drawings at par; the whole issue may be repaid at 102 in or after 1940 at company's option. Issued share capital amounts to £5,000,000 in preference and £1,700,000 in ordinary shares; £664,551 debenture stock outstanding will be repaid on August 1st. Net assets at January 12, 1928, were valued at £5,794,947; proceeds of a subsequent share issue amounted to £2,278,006. Profits have been (to January 31st):—1924, £707,425; 1925, £772,820; 1926, £789,904; 1927, £771,520; 1928, £817,557.

J. Sears and Co. (True-Form Boot Co.), Limited.—Issue at par of 2,000,000 £1 7 per cent. "A" cumulative preference shares, ranking after the existing 300,000 £1 7 per cent. cumulative preference shares and before the 498,280 £1 12½ per cent. cumulative preference shares. Remaining capital consists of 2,125,000 5s ordinary and 25,000 £1 "A" shares.

and £1,750,000 6 per cent. first mortgage debenture stock, 1962, has been placed at 97½. The company recently acquired over 99 per cent. of the ordinary share capital of Freeman, Hardy and Willis, and now owns 722 shops and depots. Net assets on December 31, 1928, were £5,217,126 (including the said shares at cost, £4,086,053), and combined profits have been :—1924, £604,268; 1925, £584,953; 1926, £624,007; 1927, £636,474; 1928, £635,453.

Leicestershire (L. and N.) Coal Distillation, Limited.—Issue at par of 330,000 (out of 450,000) £1 ordinary and 330,000 (out of 1,800,000) 5s deferred shares, the former entitled to an 8 per cent. non-cumulative preferential dividend and one-quarter of the remaining distributable profits, after payment of 8 per cent. on the deferred. The company, which was incorporated as a private company in 1928, acquires "L. and N." rights for Leicestershire, the whole ordinary capital of a colliery company, and plant erected or to be erected, at a total purchase price of £713,000, including £288,000 in cash, £120,000 in ordinary and £305,000 in deferred shares.

Thames River Grit Company, Limited.—Issue of 150,000 £1 7½ per cent. cumulative preference shares at par and 300,000 10s ordinary shares at 15s. The company purchases all the shares of five private companies, two working gravel and sand deposits, three providing river and road transport, and wharfage. Net assets at September 30, 1928, were £181,404, excluding leases and goodwill. The purchase price is £291,070 10s in cash, the company obtaining the benefit of all profits earned since June 30, 1928. Combined profits have been (to September 30th):—1925, £43,049; 1926, £70,205; 1927, £66,703; 1928, £71,980. The present issue will provide £46,429 for working capital additional to liquid assets of the subsidiary companies amounting to £56,212.

Aberdeen, Ceylon, and Eastern Trust, Limited.—Issue at par of 250,000 (out of 300,000) £1 shares. The company carries on the business of an investment trust company, special attention being given to investment in plantation companies.

Ballington Hosiery, Limited.—Issue at par of 140,000 8 per cent. £1 participating preference and 140,000 (out of 540,000) 5s ordinary shares, the former entitled to one-fifth of the balance available for distribution after payment of 8 per cent. on the ordinary. The company acquires two businesses of hosiery mills and hosiery merchants respectively, with net assets valued at £129,497, excluding goodwill. The purchase price is £150,000, payable as to £50,000 in cash and £100,000 in ordinary shares. Combined profits have been :—1925-6, £10,033; 1926-7, £10,961. Working capital is estimated at £49,000.

Gordon England (1929), Limited.—Issue at par of 648,000 (out of 1,000,000) 5s ordinary shares. The company acquires the undertaking and assets of a firm engaged for the last four years in evolving improved motor-car bodies. Net assets are valued at £90,243. The purchase price is £88,000 in shares; the company also provides £80,536 to redeem debentures and discharge liabilities. Working capital is estimated at £56,000.

Continental Tintex and Dye Products, Limited.—Issue at par of 580,000 (out of 800,000) 5s shares. The company will manufacture and sell patent dyes, &c., in Europe, Asia, and Africa (excluding all parts of the British Empire), as the sole licensee of an American company. The purchase consideration for the rights, trade marks and existing organisation is $300,000 in cash, 82,472 5s shares, and a royalty. A further 120,000 shares are under option at par. About £51,000 will be available for the acquisition of a factory and for working capital.

Dim-Dazzle (Parent) Company, Limited.—Issue at par of 1,250,000 2s shares. The company acquires world rights of application for patents in respect of an anti-dazzle screen for the sum of £75,000 in cash or shares at company's option. Working capital is estimated at £35,000.

Truphonic Radio, Limited.—Issue at par of 425,000 (out of 750,000) 2s shares. The company acquires an existing business of wireless and gramophone manufacturers, valued at £11,620 (excluding goodwill), together with patents and patent applications. The purchase price is £17,500 for the business and £5,000 for the patents, all in shares. Working capital is estimated at £30,000.

Naraguta Durumi Areas, Limited.—Issue at par of 120,000 (out of 600,000) 5s shares. The company acquires tin-producing properties in Nigeria at a purchase price of £65,000 in shares. A further 220,000 shares are under option at par. Working capital is estimated at £30,000, subject to preliminary expenses, &c.

Star Emerald Mining Syndicate, Limited.— Issue at par of 48,000 5s shares (out of 320,000, of which 183,900 have been already issued). The company, registered in 1910, requires additional capital for the sinking of a new shaft on its leases in Western Australia. A further 88,000 shares are under option at par.

Particulars of the following have been issued for public information only in connection with Stock Exchange "introductions":—**W. G. Clarke and Sons (1929), Limited,** issued capital 250,000 £1 7½ per cent. cumulative preference and 400,000 £1 ordinary shares; the company acquires assets, valued at £203,514, goodwill and trade marks of a business of dog, game, and poultry food manufacturers, for £600,000 in cash; profits have been recently: 1926, £76,681; 1927, £75,065; 1928, £78,151. **Romney Trust, Limited,** issued capital £250,000 5 per cent. cumulative preference and £250,000 ordinary stock; £250,000 5 per cent. redeemable debenture stock, 1960-70, is now issued, a floating charge on the whole undertaking. **United Kingdom Tobacco Company (1929), Limited,** issued capital 200,000 £1 7½ per cent. cumulative preference and 600,000 10s ordinary shares, each preference being convertible until 1933 into two ordinary; two old-established businesses are acquired, whose combined profits have averaged £62,273 over five years; purchase consideration is £333,331 (£68,551 for goodwill), payable as to £300,000 in shares and £33,331 in cash. **Scottish Agricultural Industries, Limited,** authorised capital 552,000 £1 6 per cent. cumulative preference shares, 800,000 £1 (6 per cent. plus half the deferred dividend, if any) ordinary shares, 321,500 £1 deferred shares, and 76,500 £1 shares which can be issued either as preference, ordinary, or deferred at the board's discretion; incorporated in Edinburgh to consolidate the fertiliser and feeding stuffs industry in Scotland, and to acquire all or any of the shares of six existing companies; preference dividends is guaranteed by Imperial Chemical Industries, Limited, to which shareholders in the merging companies contract to sell five-eights of the ordinary shares issued to them under the terms of exchange. **Societe Financiere de Transports et d'Entreprises Industrielles (Sofina), S.A.,** issued capital 200,000 5 per cent. preference and 200,000 ordinary shares of Belgian francs 500 each; incorporated to take over the business of the old "Sofina" company; reserves of the company amount to over £8,000,000, and cash resources to over £9,000,000.

COMPANY MEETINGS, &c.

LLOYDS BANK LIMITED.

FURTHER STEADY PROGRESS DURING THE YEAR.
INCREASED PROFITS—ANALYSIS OF ADVANCES.
DEFENCE OF NATION'S MONETARY POLICY.
GENERAL TRADE CONDITIONS—FOREIGN COMPETITION.
OPTIMISTIC REVIEW BY MR J. BEAUMONT PEASE.

The seventy-first ordinary general meeting of the shareholders of Lloyds Bank Limited was held, on the 1st inst., at the Cannon street Hotel, London.

Mr J. Beaumont Pease (chairman of the bank) presided.

The auditors' report having been read by Sir Gilbert Garnsey, K.B.E.,

The Chairman, in moving the adoption of the directors' report, said :—Before considering the report and balance-sheet, which I presume you will take as read, I shall as usual refer to those changes which have occurred either through death or retirement in the ranks of our directors or general management during the past year. I am glad to say the number is less than usual.

Mr E. D. Vaisey's retirement from our board I referred to at our meeting two years ago. He died in May of last year, and I should like again to put on record our appreciation of his character and of his services to the two banks he served so faithfully and so long.

The only addition to our board during the year was caused by the election of Lord Weir last October. His ability in business and his devotion to the public service are so well known to you all, that I am sure you will be delighted that he found himself able to accept our invitation.

RETIREMENT OF MR. W. S. DRAPER.

Mr W. S. Draper, our senior general manager, has asked to be relieved a little before the date fixed by our rules for his retirement, in order that he may take up other duties. We were looking forward with greot regret to September, when in the ordinary course he would have left us, and we are all the more sorry that this date has been anticipated by some months. No one could work with Mr. Draper without being impressed by his wide knowledge of all banking affairs and his whole-hearted sincerity in the loyal performance of his duties. To be deserving of confidence is the prime requisite of a banker. No banker could have been better furnished in this fundamental qualification than Mr Draper. I know that all his colleagues would be glad to pay their tribute to the conscientious services which he has rendered to the bank and will join with me in hoping that he may have many years of prosperity and pleasure in his new activities.

We have appointed Mr F. A. Beane and Mr G. F. Abell as chief general managers, and we have promoted Mr R. A. Wilson, Mr S. Parkes, and Mr S. P. Cherrington to be joint general managers.

THE BALANCE-SHEET.

In going through the balance-sheet you will not find any marked changes calling for special comment as compared with the figures presented to you last year. On the liabilities side the items for capital and the reserve fund remain the same. Our current, deposit, and other accounts show a reduction of about £5,000,000. This may, perhaps, be a matter of some surprise to you. The reduction occurs wholly in the City. Our figures outside this area show a material and satisfactory increase. It is true that we had offers of large but apparently transitory floating balances in the City towards the end of the year, but they were subject to such high rates that we preferred not to take them, as we were unable to see in what way they could be profitably employed in this country at the rates suggested. You will no doubt agree with me that, merely for the sake of increasing our figures, it is not desirable to take unprofitable business. "Window dressing" in deposits is no more desirable than is "window dressing" in cash. It must also be remembered that unduly high rates for deposits would eventually tend in the direction of forcing up rates charged to customers in trade advances.

The number of new accounts opened during the year show a net increase over last year of more than 50,000.

Our acceptances are more than double the figure at which they appeared last year. This is an undoubted sign of increasing trade for this country, and it is, perhaps, partly caused by the higher rates ruling in the United States of America. This item includes nothing but acceptances. All other engagements, such as endorsements, guarantees, confirmed credits, &c., appear under the next heading, which also shows a considerable increase as compared with last year. There is no particular significance attaching to this.

ASSETS.

On the assets side of our balance-sheet our cash shows a percentage to our public liabilities of 12.0, as compared with a percentage last year of 12.6. This percentage is within 0.4 per cent. of the amount of our weekly average percentage of cash held throughout the year.

Of our money at call and short notice only 17 per cent. represents Stock Exchange fortnightly loans.

The next few items show very little variation as compared with last year, with the exception of Treasury bills, which are £5,000,000 down. An apparent increase of £3,000,000 in Colonial and foreign bills requires explanation. It is due to the fact that last year the Colonial and foreign bills held by our branches were not included in this total, whereas this year the analysis has been made more complete.

There is also some reduction in our investment figure, which has resulted in the realisation of a handsome profit.

There is a small increase in the valuation of our holding in the National Bank of Scotland Limited, due to the fact that this bank during the last year added to its reserve fund, and, as you will see from the note in the balance-sheet, our holding is valued on the basis of the capital paid up, the reserve fund, and undivided profits, without taking any credit for goodwill.

Our holding in Lloyds and National Provincial Foreign Bank Limited has been increased owing to a fresh issue of capital by that bank.

Our loans and advances remain very near the old figure, and I shall in a moment give you some closer analysis of the amounts coming under this heading. I do not think I need trouble you with any other of our assets.

PROFIT AND LOSS.

Our profit and loss account, as you will see, shows that the net amount brought in, after making even fuller provision than usual for bad debts, is about £52,000 more than it was last year, and appears at the figure of £2,528,000.

You will see from our report that we have placed £250,000 to bank premises, an amount of £300,00 to staff superannuation fund, and that we recommend the payment of a final dividend on the "A" shares at the rate of 16⅔ per cent. per annum, and a final dividend on the "B" shares at the rate of 5 per cent. per annum. These amounts absorb respectively £958,197 1s 4d and £28,745 18s 5d. This will leave to be carried forward to the profit and loss account of the current year £490,036 13s 2d—a few thousands more than last year.

The profit figure for the year I think you will consider a satisfactory one, especially when you realise, as I have already indicated, that the provision which we have made for bad debts has been this year heavier than we have experienced recently. Bankers are no more free from the inevitable economic results of such a disastrous year as 1926 than are other trading concerns.

GENEROUS HELP TO TRADE.

It should be a matter for congratulation to every individual in the country that the prudent policy of bankers in the past of building up large reserves enables them to continue to give generous help to trade even when times are not so good, and that these reserves themselves, by adding to the profit-earning capacity of the bank, help to maintain a satisfactory stability in the level of profits.

It may be interesting for you to hear that on an average for the last three years, out of every pound earned by the bank a third, roughly speaking, goes to its depositors by way of interest. Another third goes to the staff in payment of salaries, pensions, and other benefits, including yearly allocations to the superannuation fund, leaving only one-third to meet all other expenses, such as rent, rates and taxes, stationery, special allocations to premises and other accounts, provision for bad debts, and, lastly, dividends for shareholders.

NEW BRANCHES.

The bank continues to make good progress, and the branches which we have recently opened are fulfilling their expectations. You will see that during the year we have opened 51 new branches. This country is now more fully supplied with banking facilities per head of the population than any in Europe, with the possible exception of Switzerland.

BUSINESS IN INDIA.

At the time of our general meeting last year I was in India visiting our branches in that country, and I was therefore unavoidably prevented from having the pleasure of meeting you here as usual. I am glad to be able to tell you that I was much pleased with the progress which our business has made in that country. The working profits are steadily increasing, and we are encouraged to find that the facilities and conveniences afforded by our Indian branches are becoming more generally known and appreciated by our customers on this side, and the total figures of advance bills on India passing through the Eastern department of the bank in London show a steady and satisfactory increase. The total of deposits received in that country largely exceeds the amount of our advances, and no portion of our deposits at home is used for the purpose of making loans in India.

ADVANCES.

Following the practice of the last two years, I give you some of the more important results of the analysis of this item. The classification which we adopt is that employed by the Federation of British Industries, and you will realise that the analysis was made in October, and that therefore the figures do not coincide exactly with those which are summarised in our balance-sheet, but they are a sufficiently accurate indication of the general trend. The biggest item, both in the number of accounts and the extent of the loans, appears under the heading "Personal and professional." But it must be remembered that this heading is of an omnibus character, and includes many accounts which on a more rigid analysis would come in some other category. For instance, if a private individual borrows money to build a house, or to improve his land, or to put into his business, such advances ought strictly to be classified under building, agriculture, or the appropriate trade concerned. But we have not found it practicable to analyse so fully this group of accounts. This section shows an increase over last year of over two millions and a-quarter.

Under the headings of "Wool," "Oils and fats," "Paper and printing," "Banking, insurance, and finance," we find increases as compared with last year of sums varying between £600,000 and £800,000, and in the case of "Silk, linen, lace, clothing, carpets," &c., there is an increase of nearly half a million.

On the other hand, there are reductions of about £1,000,000 under each of the headings, "Engineering," "Shipping and shipbuilding," "Coal," and "Miscellaneous," and a reduction of £1,750,000 under the heading of "Cotton."

"Agriculture," which borrows more from us than any category with the exception of "Personal and professional," is £200,000 down, and there is a similar reduction in the case of "Brewing and distilling."

In nearly all other cases the variation is under £100,000, with the exception of "Retail" and "Theatres and hotels," which both show an increase of about £300,000, while "Foodstuffs and tobacco" and "Public utility" are each about £400,000 down.

I would again like to point out, as I did when reviewing our 1926 figures, that in the case of nearly 85 per cent. of the total number of our overdrafts the average overdraft is only about £600, which shows not only how well spread our advances are, but also indicates that the "small man" is by no means neglected by us.

GENERAL TENDENCIES.

It is usual on these occasions, after considering our own figures, to review some of the general tendencies of trade throughout the country, and here we are confronted by considerable difficulty in arriving at a definite conclusion.

Unemployment is still a matter of grave anxiety, not only to those most directly concerned, but also to politicians and the country generally. In my opinion it is to the former, to the joint efforts of employers and employed, to whom we should chiefly look for amelioration of the present position. Fortunately, there are welcome signs of a desire on both sides to come together and work out a way of salvation.

The four great industries chiefly affected are those of iron and steel, coal, textile, and agriculture. To what extent the present figures of unemployment are altogether abnormal I find it difficult to determine, owing to the fact that in past years they were not kept with the same accuracy or on the same basis as they are now, and there are many more women employed now than used to be the case. In fact, if we look at the question from the positive rather than the negative side, the total number of people in employment is greater than it used to be. This, however, is cold comfort when we are confronted with the present figures of unemployment, and I confess I do not see any speedy method of improving the position. I am much afraid that the process will be painful and slow. It is true that prospects of improved trade for the four great industries mentioned are brighter, but I doubt whether an increase in employment will immediately follow better trade.

The methods which are being pursued of amalgamation, the elimination of superfluous units, rationalisation, reduction of overhead charges, and better organisation, not only on the productive, but perhaps more especially on the distributive side, provide helpful auguries for the increased prosperity of the industries themselves, but these processes may in some cases mean temporarily an actual increase in the numbers of unemployed in the immediate future, and we may have to wait a little time before the results of present proposals have materialised, and before those industries which are now passing through difficult days are in a position to offer greater employment.

In the meantime, markets which we have lost are slowly being regained. The prospects of greater consumption in India and China are improving, according to the reports of the Commercial Counsellor at Peking and the Trade Commissioners of India.

FOREIGN CURRENCIES.

The unfair competition of depreciated currencies has been lessened and the difficulties of fluctuating exchanges have been reduced. During the past year we have witnessed the stabilisation of the Italian lira. This was followed by Estonia adopting a new unit of currency on a gold basis. In February Luxemburg followed the example of Belgium by stabilising its franc. In April Norway and Siam both reverted to the gold standard, and in May Greece legalised a new parity for its drachma. After careful and unhurried preparations, France in June passed an Act revising the gold value of the franc and fixing the new parity at the then exchange value of 124.21; while in November Bulgaria settled the new parity of the leva at 673.58. The currencies of most other European countries have been distinguished by a more satisfactory stability, and it is a matter of general congratulation that this one great obstruction to trade has been removed to so great an extent during the past year.

ENCOURAGING FACTORS.

I have touched on those industries the condition of which gives us the greater concern, and I have given you some reasons why I think we may hope for improvement in these cases. Let us look also for a moment at other factors which give us greater encouragement and hope for the future.

Industry, outside the four great exceptions which I have mentioned, appears to be undoubtedly prosperous, and the general standard of living is higher than it was. The total of trustee savings banks deposits is £114,000,000, an increase during the year of £3,000,000.

Since the introduction of National Health Insurance the independent membership of friendly societies has grown from 6,709,188 to 7,500,000, and the capital and reserves have expanded from £50,000,000 to £93,000,000.

The returns of our foreign trade during 1928 show that our exports are increasing, and suggest, according to reliable estimates which have been published, that the total amount available for investment abroad will come out at £169,000,000, against £96,000,000 in 1927.

The report of the National Savings Committee for 1928 shows that the amount of savings certificates sold was £37,400,000, as against £31,900,000 in the preceding year.

The Bankers' Clearing House turnover has increased during the year by £2,654,000,000.

If we glance at the record of Stock Exchange values of representative securities, given in the January number of the *Bankers' Magazine*, we find there has been a gain over last year of £258,000,000, in spite of a loss in British Railway ordinary stocks of £43,500,000.

In the commercial and industrial group there has been a rise of £58,000,000, while the earnings announced by industrial joint stock companies in 1928 show an increase of £11,000,000 over 1927, although it must be remembered that some of this belongs, strictly, to the latter year.

New capital issues for 1928 reached a total of £362,500,000, an increase of £48,000,000 over 1927. The geographical distribution of the issues was as follows:—United Kingdom, £219,000,000; India and Ceylon, £7,750,000; other British countries, £78,000,000; and foreign countries, £57,000,000.

BANKERS AND PROSPECTUSES.

This record does not show any sign of poverty, but a less pleasing factor connected with these issues is that a considerable portion was destined for luxury trades, and in some instances for the exploitation of patents of a speculative character. In this

connection I should like to remark that considerable responsibility rests on bankers in deciding whether they are justified in lending their names to prospectuses of a certain class. The decision is not always an easy one. When a person of repute comes to his banker with a *bonâ-fide* issue, even though it may seem highly speculative, it is difficult to refuse to have anything to do with it, though, of course, the mere appearance of a bank's name on a prospectus is no guarantee as to the prospects of the venture. I believe banks as a whole feel their moral responsibility in this matter, and I can assure you we scrutinise all prospectuses very carefully and refuse to pass anything of an ambiguous or misleading character. The question is a serious one, and any check on improper appeals to the public which can be practically applied should be welcomed.

The facts and figures which I have given you do not seem to me to call for any undue pessimism. In spite of dark spots the picture as a whole is a fair one, and if we were to look at it as representing the position in another country and apply to it the impartial judgment which for some obscure reason we frequently fail to employ in regarding the affairs of our own country, we would conclude, I feel sure, that the people enjoying these conditions were in the main to be envied rather than pitied.

DIFFICULT PROBLEMS.

It is my business to try to look at the picture as a whole, and that is my judgment in regard to it. At the same time I do not want to seem to belittle the importance of those dark spots which I have mentioned. The problems which they represent are very baffling.

Everyone will admit, I think, that what we are producing and what we are capable of producing are things of which the world has need, and which it would like to buy. If that is so, and if, in spite of willingness on the part of buyers, the amount of our production is not satisfactory and a long way below our capacity, it must be due to one of two causes. Either the world cannot afford to purchase what it requires, or it cannot do so at our price.

For some years after the war, owing to the great financial losses and depreciated currencies which followed in the wake of that upheaval, the first reason did apply with much force, but as exchanges have become stabilised, and as the destruction of the war has been partially replaced, the capacity to buy throughout the world has become greater. This tendency will receive considerable impetus from the good harvests enjoyed last year in nearly every country, with one notable execption, for you will agree with me that prosperity to the greatest industry in the world must largely increase the consuming power of its inhabitants. I hope, therefore, that the first reason for our inadequate trade in some industries may be regarded as a diminishing one.

WAGES AND PRICES IN ENGLAND AND ABROAD.

I cannot pretend to very expert knowledge in regard to the alternate reason, that is the price of our products, but I should like to draw your attention to the following figures which have recently been brought to my notice.

Wool fabrics in the lower-grade qualities are reported to cost from 6d to 9d per yard more when made in the West Riding of Yorkshire than when made in Roubaix, and similar differences are said to run all through the qualities of fabrics which Roubaix is offering in competition with Yorkshire producers. It may, therefore, be useful to compare the relative conditions and equipments in the two districts.

In the wool textile industry there are 7,980,000 spindles in England, against 3,100,000 in France; 114,000 looms in England, against 67,000 in France; and 263,000 operatives in England, against 150,000 in France.

Measured in terms of an English working week of 48 hours it is found that the machinery is only running a weekly average in the combing section of England of 34 hours; in the worsted spinning section 37 hours; and in the weaving mills 32 hours, against a nominal 48 hours and an actual of 51 hours in France.

Wages on the 48-hours basis are as follows:—

	Bradford.		Roubaix and Turcoing.	
	Women.	Men.	Women.	Men.
	s. d.	s. d.	s. d.	s. d.
Combers ...	38 0	56 0	19 6	30 0
Spinners ...	32 0	59 0	24 0	35 0
Weavers ...	42 0	59 0	27 0	33 0

In England the average weekly wage for all wool textile workers is 45s and in France 28s. I think I ought to mention that this discrepancy in wages is likely to be lessened as the internal value of the franc accommodates itself more nearly to the new stabilised exchange value.

COMPETITION IN THE ARGENTINE.

The same industry has to meet severe competition also in the Argentine. Locally woven all-wool fabric, styled "tropical," particularly suited to summer wear, and in some ways similar to the American cotton-mohair product known as "Palm Beach," is being used as a material for men's suits. It is woven into a variety of attractive patterns, and sold at $45-$50, whereas an ordinary lounge suit of the finest Yorkshire cloth of a similar weave costs between $150-$200. It is not, of course, suggested that the wearing qualities of the two fabrics are comparable, but it may well be that our manufacturers are inclined to make what they think they ought to sell, rather than that which the purchasers are prepared to buy.

It is quite clear in both cases that our prices are too high. I have picked out these two instances, which illustrate some of the handicaps from which this particular trade is suffering, not because I have any expert solution in regard to them, but the facts in both cases happened to be brought under my special notice, and it seems to me that they call for careful investigation by those chiefly concerned. The proper people to deal with all these questions, and to meet the many difficulties with which some of our trades are now faced, are those who are daily engaged themselves in all the ramifications of the businesses concerned. It is, as I have already remarked, a hopeful sign that employed and employers are much more willing to put their heads together and co-operate in finding possible methods of reducing costs and improving output than was the case a short time ago.

COTTON.

I am also glad to think that in the cotton industry, after very long discussions and difficult negotiations, agreed steps have been taken in order to put that industry on a sounder basis, to prevent suicidal competition at home, and to improve its chances of competing successfully with its rivals in other countries. This bank has taken no direct part in these negotiations, its connection with cotton mills being very slight, but as far as I am able to judge the action was necessary, and the results should be beneficial.

AGRICULTURE.

Agriculture, in spite of a good harvest, is finding it very difficult to make both ends meet. It will receive much-needed assistance from the De-Rating Bill, in common with other productive enterprises, and this bank is one of several which have joined together at the request of the Government to form an Agricultural Credits Corporation, with the object of providing long-term mortgages for the purchase and improvement of land.

THE CONTROL OF THE NOTE ISSUE.

No banker can very well refer to the events of 1928 without some allusion to the date of November 22nd, when the amalgamation of the currency note issue with that of the Bank of England took place. The bank's fiduciary issue has been raised from £19,750,000 to £260,000,000, and all notes in excess of that amount must be covered by gold pound for pound. Some elasticity is provided for an expansion of this limit with the consent of the Treasury in cases where it is desirable. The Act returns the control of our currency to the Bank of England and definitely removes it from political interference, thus conforming with a principle laid down by the International Conferences at Brussels in 1920 and Genoa in 1922, as also in the Dawes Report.

This measure was a natural corollary to our resumption of the gold standard, and, like that operation, provided an occasion for some criticism of our monetary policy.

This criticism received a curious and unreasoned support in some quarters. On examination of the actual facts the accusation brought against the Bank of England and the banks appears to be based on grounds which are found to be a complete vindication against the charges. The Bank of England is accused of being the cause of depression in industry since March because it did not create an expansion of credit based on its temporary increased holding of gold early in the year, while bankers generally are blamed for not giving to industry the full support it required.

Subsequent events amply justified this restraint on the part of the Bank of England, and by its foresight it was enabled to contemplate with equanimity the loss of gold which followed in the autumn, and instead of subjecting trade to the handicap of fluctuating rates of interest and unstable conditions, it enabled us to enjoy the benefit of an unchanged Bank rate through the entire year.

CRITICISMS ANSWERED.

In old days we were accustomed to the complaint against our monetary system that we had much greater fluctuations in our Bank rate than our neighbours. Now, apparently, we are asked to believe that uncertainty as to outlook and changes in the Bank rate are a positive advantage.

The figures published by the clearings banks of the totals of

their advances are also a complete refutation of the charge that they failed to give industry the support it required. I give them as follows without further comment :—

(000's omitted.)

1924.	1925.	1926.	1927.	1928.
845,933	891,368	935,409	946,527	967,908

The whole question has been very fully and effectively dealt with by the Press and by responsible opinion, and I do not wish to say anything further than to register my regret that, at a moment when it was highly desirable that nothing should have been done to disturb the atmosphere which was undoubtedly favourable to an improvement in our trade, attempts should have been made to create doubts in the minds of the uninformed that there was something radically wrong with our whole monetary system. The Cunliffe Commission has had its inquiry and made its report. This was followed by the Bradbury Commission, which confirmed the findings of the former. The gold standard has been definitely resumed. The Bank of England has been given control of the note issue, and to have the whole of these questions again thrown into the melting pot by holding another inquiry is the last thing which our poor harassed commercial community requires. The partially concealed motive behind all these suggestions and intrigues is the desire to see some form of inflation. I had hoped that a final verdict had already been given on these doctrines and quack remedies.

I now beg to move: "That the report just taken as read be received and adopted, and that, in accordance with the recommendation of the directors therein, a dividend be declared for the half-year ended December 31 last on the paid-up capital of the company at the rate of 16 2-3 per cent. per annum on the "A" shares, and at the rate of 5 per cent. per annum on the "B" shares, payable, less income-tax, on and after February 2, 1929."

The resolution was seconded by Sir Austin E. Harris, K.B.E., the deputy chairman, and carried unanimously.

The retiring directors were re-elected, and Messrs Price, Waterhouse and Co. were re-appointed auditors for the year 1929.

Votes of thanks to the directors for their services during the past year, to the joint general managers and staff for their excellent work, and to the chairman for presiding were carried unanimously, and the proceedings then terminated.

IND, COOPE, AND COMPANY, LIMITED.

INCREASE OF CAPITAL APPROVED—PREFERENCE SHARE BONUS

An extraordinary general meeting of Ind, Coope and Co., Limited, was held, on the 7th instant, at the Cannon street Hotel, London, to consider resolutions increasing the capital and making certain alterations in the articles of association.

Mr Louis E. Walker (chairman and joint managing director) said that for some considerable time past the board had realised that the existing position as to the debenture debts of the company was both cumbersome and detrimental. The resolutions which would be submitted to the meeting were to increase the authorised capital from £1,000,000 to £2,000,000, and to alter the articles of association so as to increase the borrowing powers of the company from £2,000,000 to £3,000,000, and to make certain consequential amendments in the articles of association, including a new article empowering the company to issue bonus shares. The only cash received by the company in respect of issues of shares since its formation amounted to £552,996. In the meantime, since 1913, the date when the first balance-sheet of the reconstructed company was issued, the assets had increased by over £2,000,000.

With regard to the second resolution, the aggregate amount of the three existing debenture stocks of the company was £1,615,520, to which must be added the £200,000 perpetual mortgage debenture stock of Robinson's Brewery, Limited. It was proposed in substitution for those stocks to issue £1,538,545 of the new 5 per cent. debenture stock of the company, and in the near future a further £211,455 of the same stock for subscription, making a total of £1,750,000; but it would be observed that the new stock to be issued was £65,520 less than the present total debenture debt of the two companies. As to the terms offered to the debenture stockholders on their exchanging their present holding for the new stock, the 5 per cent. prior lien stockholders would receive £110 of the new stock for each £100 held in the present stock; the 4 per cent. mortgage debenture stockholders would get £88 for each £100, the 4 per cent. income debenture stockholders £85 for each £100, and the Robinson stockholders £100 for each £100. All four classes of debenture-holders benefited.

With regard to the bonus distribution, it was proposed to issue one £1 6 per cent. non-cumulative preference share for every two ordinary shares, those preference shares being subject to the payment in cash of 10s per share. That amounted to a bonus of the difference of 10s, which was equivalent to a 25 per cent. bonus, and was also equivalent to a sound 12 per cent. investment on the cash to be provided by the shareholders.

The resolutions submitted were carried unanimously, and the board's proposals were also approved at subsequent separate meetings of the holders of the various securities concerned.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED.

POSITION AND PROSPECTS OF RUBBER INDUSTRY.

The 21st annual general meeting of the United Serdang (Sumatra) Rubber Plantations, Limited, was held, on the 5th instant, at Winchester House, Old Broad street, London.

The Chairman (Mr H. Eric Miller) said: In attempting to arrive at the prospects of the rubber market it is advisable first to review events during the past twelve months. No useful purpose would be served by my again referring to the manner in which the Government abandoned the Stevenson scheme or by counting up the losses sustained by all sections of the industry as a result thereof. Fortunately, the absorption of rubber in the U.S.A. during 1928 showed a phenomenal increase of nearly 70,000 tons, due to a record output of some 4,350,000 motor vehicles, and to a large tyre-replacement business consequent on the wearing out of numbers of inferior tyres which were sold in 1926 and 1927. The automobile manufacturers of the U.S.A. are planning for a huge output in 1929, and it looks as if absorption of rubber in the U.S.A. during 1929 would exceed the 440,000 tons used during 1928.

RUBBER STOCKS IN 1929.

Everything points to absorption during 1929 being well over 700,000 tons, the 1928 absorption, which I mentioned just now, being 680,000. I foresee, therefore, a further contraction in available stocks during 1929, following on a contraction of at least 30,000 tons during 1928. World stocks of rubber to-day are really no more than the minimum necessary for comfort at the existing rate of absorption. There is no prospect of any material increase in the annual output from the planted area of the European-owned estates, any young areas which come into bearing being offset by the flagging of some of the oldest areas, and the only source in the East from which additional supplies may be forthcoming is the native area in the Dutch East Indies, about which so much has been heard in the last year or two.

I am very sceptical about the grandiose figures which have been current. It is very desirable that the whole question of Dutch native rubber be further studied, so that more accurate and up-to-date information as to the real state of affairs may be available for the industry. Personally, I look upon this source of supply not as a menace to the plantation side of the industry, but as a safety valve to prevent undue scarcity of supplies.

About 80 per cent. of all rubber produced is used in the automobile industry, and you all know the rate at which this is expanding throughout the world. You are also familiar with the difficulty road engineers find in surfacing highways to withstand the strain of the ever-increasing heavy and fast-moving traffic. The annual expenditure on the improvement and maintenance of roads in this country now amounts to over £50,000,000, and I think everyone will agree how rapidly even the best newly-made road deteriorates under heavy loads on solid tyres. Manufacturers have learnt how to produce giant pneumatics which will stand up under heavy fast-moving loads. The authorities have recognised the advantage of the pneumatic tyre by abating 20 per cent. of the annual tax on heavy motor vehicles fitted with pneumatic tyres, and one already sees the effect of this in the increased number of giant pneumatics on the road. There ought to be a nation-wide campaign to speed up the fitting of pneumatic tyres to every vehicle which can be adapted to use them.

I would also make a further suggestion, and that is that a licence should be refused for every vehicle which is inadequately tyred. There are a great many vehicles on the road to-day carrying heavy loads on wheels which have a totally inadequate cushion of rubber on them, and the damage which each one of these imperfectly-shod vehicles is doing to every mile of road it covers is enormous.

RUBBER ROADWAYS.

In conclusion, I would like to say a word or two about rubber roadways. The existing experimental areas have proved that rubber can be properly anchored to the road, and we have known for years that it would stand up in a remarkable way to wear and tear, whilst possessing the unique property of absorbing 50 per cent. of the vibration arising from traffic impact. The first cost of a rubber roadway, however, is necessarily much greater than that of other surfacing materials, and this has been a bar to progress. It would be inequitable to expect the general body of ratepayers to defray the extra cost of a rubber roadway, which would mainly benefit the owners of properties abutting on to it. The obvious solution, therefore, is to convince the property owners that it is a commercial proposition for them to make an appropriate contribution to the greater cost of the rubber roadway, receiving in return the benefit of a very material reduction in traffic vibration and noise, to say nothing of the advantage of having a roadway requiring none of those frequent repairs which at present cause so much inconvenience to the public and loss to shopkeepers.

The report was adopted unanimously.

ASSOCIATED AUTOMATIC MACHINE CORPORATION, LIMITED.

CONTROL OF BRITISH AUTOMATIC AND OTHER COMPANIES SECURED.

PARAMOUNT IMPORTANCE OF SITES.

An extraordinary general meeting of the Associated Automatic Machine Corporation, Limited, was held, on the 6th instant, at Winchester House, Old Broad street, London, E.C., for the purpose of considering and, if thought fit, passing resolutions increasing the capital of the company to £1,500,000 by the creation of 2,000,000 new ordinary shares of 5s each and 500,000 new 7 per cent. cumulative convertible preference shares of £1 each, determining the rights of the latter and sanctioning the directors borrowing moneys for the purposes of the company up to an amount not exceeding twice the amount of the nominal capital for the time being.

Lt.-Col. Sir W. E. G. Archibald Weigall, K.C.M.G. (the chairman), presided.

The secretary (Mr J. W. Bland) having read the notice convening the meeting and the resolutions,

The Chairman said that the present authorised and issued capital of the company was £500,000, divided into 2,000,000 ordinary shares of 5s each, of which 1,257,007 had been issued at par and 724,993 at a premium of 5s per share, which, after writing off all formation and preliminary expenses, provided a reserve of approximately £165,000. The company had been formed to acquire the whole of the share and debenture capital of Coin Operated Machines, Limited; London Automatic Machine Company, Limited; Snape, Hargreaves and Co., Limited, and Mechanical Amusements (1928), Limited. Further interests—including a substantial one in the Peerless Weighing Machine Company—had also been acquired since, and those various companies were to-day earning for the corporation a net profit at the rate of approximately £90,000 per annum.

The liquid cash resources of the company amounted to over £200,000, which sum it was the intention of the board to utilise for the purpose of purchasing and installing further machines during the current year to make up a total of 8,000 machines.

A report made by the well-known chartered accountants, Messrs Peat, Marwick, Mitchell and Co., showed that for the year ended December 31, 1928, 1,061 machines were operating, and that their net average earnings, after charging site rentals, collection, and all other expenses, had amounted to £27 12s 9d per machine; that the total number of machines now owned was 2,450, and that of the 1,061 machines operated last year 242 of a modern type had shown an average net profit of £65 per machine, the rest being machines taken over from the subsidiary companies purchased, averaging not more than £11 per machine per annum. Of the 2,450 machines now owned by the corporation a large precentage were of the latest type, and therefore the board had every reason to expect a higher net average profit during the current year than the average of £27 12s 9d per machine shown last year.

VALUABLE SITES ACQUIRED.

The joint managing directors, Mr Granville Bradshaw and Mr H. Taylor White, had obtained for the company sites probably equal in value, from an earning point of view, to those now enjoyed, which would enable about 8,000 machines to be installed. Therefore, without being unduly optimistic, the board had every reason to believe that the company's 8,000 machines will earn for them in a full year's working profit at least three times as great as the 2,450 machines now in operation. The question of sites brought him to the object of the meeting—namely, the board's decision to acquire the controlling interest in the British Automatic Company.

The latter company formed over 40 years ago, had for many years shown very steady profits, the average over the past ten years exceeding £70,000 per annum. The board of this company had recently made an offer to purchase the 400,000 issued shares of £1 each in the British Automatic Company, at £2 10s per share, and it would interest shareholders to hear that up to the time of the meeting acceptances had been received for over 92 per cent.

Sir George Touche, one of the ablest chairmen of investment trust companies in the country, had always adopted a sound, though cautious, policy in conducting the affairs of the British Automatic Company, as was borne out by an examination of their balance-sheets. Shareholders would appreciate that point all the more readily when he said that there was a considerable margin between the market value of the gilt-edged investments and the figures published, and that they, with the cash in hand, alone equalled in value practically one-half of the total purchase price.

THE BRITISH AUTOMATIC ASSETS.

Taking the automatic machines, of which there were about 30,000, at the reasonable average value of £7, and the investments at to-day's market value, and then deducting all liabilities, the actual value of the net assets was £760,000, and to that had to be added the surplus value of the factory and plant in Glasgow—at least £100,000. They thus got a value in net assets of between £860,000 and £900,000, leaving a little over £100,000 on the agreed purchase price to cover good will or the extraordinary value to their company of some 30,000 sites in all the railway stations, and on piers and in other prominent places throughout the country.

When he said that only a fortnight ago they were seriously contemplating paying a sum of £15,000 for the exclusive right to have their own machines on one of the principal piers on the South Coast for a period of only ten years—and then only a seasonal trade—they would understand what it cost to-day to locate slot machines on remunerative sites.

From these facts it was clear that the market price of British Automatic shares, which, prior to the offer, had been between 30s and 35s, must have been based on the regular dividends paid and not on asset values, and certainly not on the potential earning power of the company as an automatic machine company.

Incidentally, he should mention that they had secured options and valuable patents from the leading manufacturers and others in the U.S.A.

SCOPE FOR INCREASED PROFITS.

To turn attention more particularly to the profits of the British Automatic Company, it was to be found that, eliminating dividends from investments, the actual net profits earned by the company's 30,000 machines was under £1 10s per machine per annum. That figure compared with the certified average of £27 odd per annum earned by the machines owned and worked by the Associated Automatic Machine Corporation, which average it was confidently expected would be quite largely increased. Many of the machines owned by the British Automatic Company were old-fashioned, and he could not too strongly emphasise that one of the main reasons which had influenced the directors in making their offer to the British Automatic Company was the fact that that company had the practical monopoly of railway sites throughout the British Isles. It will be the policy of the company gradually to replace many of the present machines by the latest up-to-date types, and, when that had been accomplished, with energetic management the directors were satisfied that the £1 10s per machine per annum at present being earned could be subsequently increased.

NEW CAPITAL PROPOSALS.

After the capital of their company had been increased, it was proposed in due course to issue privately 400,000 7 per cent. cumulative convertible preference shares of £1 each at par, provisional arrangement for which had already been made, and, further, at a later date, to issue on bonus terms to the existing ordinary shareholders new ordinary shares of 5s each to provide the balance of the purchase price. When that had been done the total liquid resources of the two companies would exceed £700,000, and a considerable portion would be employed without delay in the acquisition and installation of the latest type of automatic machines similar to those employed in the U.S.A., and capable of earning anything from £10 to £100 per machine per annum. They would then have in this combination an amalgamation of some seven or eight sound and established businesses with efficient and progressive management.

MR GRANVILLE BRADSHAW'S SPEEECH.

Mr Granville Bradshaw (the managing director), in seconding the motion, said that their company was a new one, but it was incorrect to say that they were newcomers. They had been formed to combine half a dozen of the best automatic machinemen and businesses in the country. The primary object in their combination was to compete with the British Automatic Machine Company, and although they were competing most successfully, he was pleased to say that that competition had been solved in a more desirable manner. Whilst they had thousands of the best locations before they embraced the British Automatic Machine Company, they now had tens of thousands, and a great number of their big profit-earning locations were tied up to them for periods of from 10 to 15 years.

As to prospects, he could say with every confidence that their investments were perfectly safe. The British Automatic Machine Company in 1928 owned 10 times as many machines as they did and 20 times as many sites. Yet the combined earnings of their group of small companies reached a rate amounting to nearly double the earnings of the machines owned by the British Automatic Machine Company. They would undoubtedly increase the profits of the British Automatic Company, and they would increase from the present time onwards. In order to look after the manufacturing part of their programme they had acquired five of the oldest and most experienced automatic-machine manufacturers in the country. They had secured their entire output for themselves, and already their stocks were accumulating.

As to the amusement machines on piers and seaside amusement parks, good machines in good locations were big money-earners. The company had thousands of new electrically-lighted amusement machines on hand and ready for a vigorous campaign to provide

the public with every desirable commodity and every form of amusement. Competition they need not fear, and they were embarking on no wild and untried schemes. Their policy was one of steady improvement based upon accumulated experience so as to achieve the biggest earning powers for every penny that had been expended in the manufacture and installation of their automatic machines.

The resolutions were unanimously approved with one minor amendment in one section.

LONDON MERCHANT BANK, LIMITED.

SUCCESSFUL YEAR—INCREASED PROFIT.

The 57th ordinary general meeting of the London Merchant Bank, Limited, was held, on the 7th inst., at 38 Lombard street, London, E.C.

Mr Edward H. Tootal, who presided, said that, in reviewing the main events of the past year in their bearing on merchant banking in general, it could be stated at the outset that the number of occurrences of a disturbing nature in the economic and financial field was decreasing from year to year. That was an indication that gradually a more normal state of affairs was being reached in industry and commerce at home and abroad, notwithstanding the untoward conditions which still obtained in some of our important export trades.

If it was thus not possible to refer to the year 1928 as a prosperous one at home and elsewhere generally, a satisfactory feature consisted of abundant crops in most parts of the world. The good harvests in overseas countries had brought a better demand for shipping space, and indirectly a larger volume of work for shipbuilders. Another favourable effect should be increased exports of European manufactures, although the quantitative result of overseas crops was to some extent counterbalanced by a fall in the price of cereals and other primary Colonial exports. When it was considered that the purchasing power of a number of countries was still reduced, and that Customs barriers were in many instances higher than formerly, Great Britain's export figures were, perhaps, slightly more satisfactory than a cursory comparison with pre-war years might suggest.

The unsettlement caused to international trade in the post-war period by wide exchange fluctuations had been further reduced during the past year by legal or virtual stabilisation of the currencies of several countries. The most important event in that connection was the attainment of legal currency stabilisation in France. There was little doubt that the Paris markets would become once more an important centre for the issuing of foreign loans. In Belgium, too, industry and commerce on the whole looked back upon a satisfactory year, aided by the progressive development of the Congo.

German industrial activity had been at a high level during the first half of the year, while subsequently, especially towards the end of the year, a general reduction of business had taken place. In other countries in Central and South-Eastern Europe further progress had been made in the consolidation of economic and financial conditions. Deficits in Governmental finances had made, or were making, room for orderly budgeting, facilitated by the various reconstruction loans in which the London market had taken an early interest.

In South America developments pointed to progress in a number of countries, which thus afforded a widening market for European and North American industries. The United States were taking an increasing interest in South America by loans to Governments and municipalities, and by direct investments in public utility and other industries. The course of the London money market during the year had been characterised by steadiness, and he was pleased to say that they had been able to take advantage of the conditions.

With regard to the accounts, the net profit for the year amounted to £71,845, compared with £67,011 for 1927; £20,000 had been transferred to contingency account, and they recommended a final dividend of 3 per cent. on the "B" shares, making 5 per cent. for the year, 7 per cent. having already been paid on the "A" shares, both less tax.

Regarding the prospects of foreign trade in the current year, there were some indications which would seem to justify the expectation of a gradual improvement. The reorganisation in process of being carried out in important industries, particularly in the cotton industry, and the country's progressive electrification should reduce the cost of production of some of Great Britain's export goods, while in the foreign field a definite arrangement of the method of Reparation payments should be conducive to stability in trading and financial relations generally.

The report and accounts were unanimously adopted, and at a subsequent ex-general meeting a resolution was passed making certain alterations in the articles of association.

The proceedings terminated with a cordial vote of thanks to the chairman, directors, and staff.

UNITED STATES AND GENERAL TRUST CORPORATION, LIMITED.

DIVIDEND AND RESERVES INCREASED.

The 39th ordinary general meeting of the United States and General Trust Corporation, Limited, was held, on the 5th instant, at the registered office, Gresham House, Old Broad street, London, Mr M. Balfour, M.C. (the chairman), presiding.

Mr H. Carlisle (director and secretary) having read the notice convening the meeting and the report of the auditors,

The Chairman said: Gentlemen,—Our gross and net revenue again shows a satisfactory increase, owing largely to our having issued, during the past year, additional share capital and a corresponding amount of debenture stock, as shown in the report, realising in all some £450,000, though, at the same time, we have not had a full year's benefit from this new money. Nevertheless, the income from the year, amounting to £168,405, equals 6¼ per cent. on the book cost of the investments.

As you will see from the report, the premium in respect of the deferred shares issued has been transferred to reserve account, together with £7,970 from revenue, bringing the reserve up to £125,000.

We carry forward a sum equivalent to approximately 4½ per cent. on the deferred stocks, and our total earnings last year were 17½ per cent., which is equal to over 26 per cent. on the original capital as it was before we distributed the 50 per cent. bonus.

The valuation of our securities is again some several hundred thousand pounds in excess of book cost, and greater than it was last year. We can, however, hardly expect this increase to continue for an indefinite period.

There is no appreciable difference in the classification of our securities, as given on page 2 of the report. I note, however, that one financial paper draws attention to the fact that the amount held in ordinary shares and stocks has advanced from 31.1 last year to 33.9 this year. This increase is no doubt largely due to an appreciation in the value of such stocks, and I do not, myself, think this calls for adverse comment, as a company of this strength is justified in having about one-third of its capital in stocks which really represent ownership of properties, and there are certain disadvantages in having one's investments entirely in what may be described as "money" stocks. As a matter of fact, such of our securities as are not paying dividends at the present time—and there are but few—come more within the latter category than in ordinary stocks.

DISTRIBUTION OF INVESTMENTS.

There has been a slight increase in the amount invested in the United States and in Continental Europe. Our investments in the United States have been profitable, although the rate of interest obtainable is comparatively low. There is a wave of optimism and speculation in the United States which is based on a very real prosperity, but a population of some 90,000,000, drawn from all nationalities of the world, when in optimistic vein, cannot very well be controlled by any financial or political code, with the result that there are periodical and unpleasant spasms which are reflected in the market price of securities. As we, however, only hold what may be described as "investment" stocks, we do not think we need view the future with alarm.

As regards our European investments, we have been successful in resisting to a large extent the extremely high yields obtainable, especially in Germany, amounting in some cases to 8 or even 10 per cent. on municipal and other securities which, on the face of it, appear to carry sufficient security; but an investment which returns such a rate as this must obviously be open to a certain number of unforeseen risks, which are as much political as financial, and in Europe especially we have to reckon with the political aspect of an investment as much as with the financial. With reference to the German issues which have been made in this market there is one outstanding feature—namely, that there is little or no real public in this country for German investments, and I question rather whether the situation differs very much in New York.

The total number of our investments is 392, which spells an average of approximately £6,400 in each security, and the larger proportion thereof is still in Great Britain—nearly 45 per cent. being in Great Britain and the Dominions.

I now propose "That the report and accounts, as presented, be and they are hereby received, approved, and adopted, and that dividends of £2 10s per cent., less tax, on the preferred stock, making with the interim dividend 5 per cent. for the year, and £8 per cent., less tax, on the deferred stock, making with the interim dividend 13 per cent. for the year ended December 31, 1928, and 5 per cent. per annum, less tax, on the instalments, including premium, from their due dates on the deferred shares, be and the same are hereby declared."

Mr F. H. Ramsden seconded the motion, which was carried unanimously.

A cordial vote of thanks was given to the chairman, directors, and staff, and the meeting terminated.

THE SKEFKO BALL BEARING COMPANY, LIMITED.

GOOD RESULTS AND PROSPECTS.

The nineteenth ordinary general meeting of the Skefko Ball Bearing Company, Limited, was held, on the 7th instant, at the Skefko Works, Luton.

Mr H. Bendixson, in moving the adoption of the report and statement of accounts at December 31, 1928, said:—

It is a well-known fact that ball and roller bearings are to an increasing degree being incorporated in all kinds of machinery and vehicles produced in Great Britain. A few remarks about the ball bearing industry may, therefore, be of general interest.

I should first of all like to emphasise the fact that the principal function of high precision ball and roller bearings is to increase efficiency by reducing power consumption and maintenance costs in every kind of industry where machinery is used. In this connection it is a pleasing fact to record that our sales to such British industries as are generally regarded as depressed—the textile, the iron and steel, and the coal—have considerably increased during last year and I think that that may be taken as proof of the tendency to modernise plant and methods in these industries.

Your company has recently made a rather comprehensive investigation regarding the movement of prices in their particular field, and that investigation has revealed the fact that prices to-day are very far below pre-war prices. As a matter of fact, if the selling price of high-grade ball and roller bearings in 1913 is put down as 100, the price to-day is about 60. As the general price level for commodities such as machinery, is, of course, very much higher—probably about 150—I think that the ball bearing industry may be proud of having done its duty in helping to reduce the cost of the products of British industry.

This achievement is—I think I can say this without exaggeration—startling, and to the layman it may be difficult to understand how it has been accomplished

IMPROVED MANUFACTURING METHODS—NEW MACHINERY.

The principal reason is, that in hardly any kind of industry has there been made such progress in the way of improved methods and efficiency of machinery as in the ball bearing industry. I believe I can illustrate the progress made by some statistics from our works. If the production at Luton in number of bearings per man per day in 1913—for the purposes of comparison—is put down as 1, the production in 1924 rose to 1.92, and in 1928 to 4.90. It is obvious, of course, that this tremendous increase in production per man per day should largely off-set the higher costs of labour, raw material, rates and taxes, and so forth. Under these circumstances it is perhaps only natural that the average hourly earnings of the employees in the works at Luton are higher than they have ever been since 1924. But it is remarkable and—in view of the unemployment situation—pleasing that we can now give employment to more people than we have ever done, with the exception of a short period in 1925.

The results achieved in this direction are highly complimentary to the management of our works, but they depend also to a great extent on the invaluable connections of your company abroad, which enables it to profit from manufacturing experiences gained in other countries.

When speaking of our connections abroad, I am pleased to put on record that during the past year the International SKF concern, to which your company is affiliated, has made an issue of shares on the London Stock Exchange. The result of this issue is that at present there is more than £1,000,000 of British share capital working in the SKF organisation.

During the past year your company has carried on a very extensive propaganda with the object of increasing the use of ball and roller bearings, and I think that this propaganda is, in no small measure, the reason for the extended use of SKF bearings. I may perhaps be permitted to draw attention especially to our periodical publication—the *Ball-Bearing Journal*—of which the total circulation is 250,000 copies, which I am inclined to believe constitutes a record for a purely technical publication.

FURTHER EXTENSIONS.

The number of bearings produced at the works at Luton and delivered to customers has increased from January, 1927, to the end of 1928 by more than one-third. It is, however, a fact that even this increase has not been sufficient to meet the demand for our products, and we have during 1928 been completing new buildings and installing new machinery of the most up-to-date design, which will enable us in the near future to increase our production at Luton by, roughly speaking, 40 per cent.

It is gratifying to note that these important additions to buildings and plant at Luton have been acquired without the necessity of obtaining new capital. As a matter of fact, in spite of these additions to capital assets, the bank overdraft has during the past year been reduced from £37,801 to £21,603.

BALANCE-SHEET.

The principal items of the 1928 balance-sheet will be seen from the following table, which also shows the changes as compared with the position at the end of 1927.

	1928	1927
	£	£
Net profit for the year*	40,930	28,652
Bank overdraft	21,603	37,801
Creditors and bills payable	70,793	73,294
Plant and properties (less reserves)	236,842	240,513
Debtors (less reserves)	95,264	83,709
Stocks	302,437	286,372
*After charging depreciation, reserves, &c., amounting to	42,867	26,951

The increase in the stock figures is accounted for by the increased turnover—which also finds expression in the higher figure of debtors. A contributing reason is also that for the first time for some years it has been possible to work up a stock against orders and contracts to be delivered during the first months of the year when your company has its "boom" period.

While speaking of the balance-sheet, it may, perhaps, be of interest to note that the total reserves for depreciation on buildings, plant, machinery, tools, &c., at present is equal to no less than 69 per cent. of the cost value of those items.

INCREASED PROFITS.

Our net profit, after charging depreciation, reserves, taxes, directors' and auditors' fees, &c., for the last two years has been:—

	£
1927	28,652
1928	40,930

For the present year the net earnings before charging depreciation, reserves, &c., is about £84,000, which represents 16 per cent. of the total capital working in your company, so that I think you will agree with me that the net profit is conservatively calculated.

At this time of the year it seems to be fairly usual to come forward with optimistic prophecies about the prospects of British industry. It is not my intention to try to remove the veil from the future of industry in general, but I think I am perfectly safe in saying that even if the production of British industry in general in 1929 should be no better than in 1928, the prospects of your company increasing its sales are very good indeed.

The report was unanimously adopted.

The retiring directors were re-elected, and Messrs Price, Waterhouse and Company were reappointed auditors.

EVERLITE, LIMITED.

SATISFACTORY PROGRESS.

The statutory meeting of Everlite, Limited, was held, on the 4th inst., at Winchester House, Old Broad street, London, the Most Hon. the Marquis of Winchester (chairman of the company) presiding.

The Chairman said :—The statement, which has been in your hands, shows that the total number of shares allotted was 2,000,000 ordinary shares of 1s each. The inventor received £17,500 for the world rights, with the exception of the United States and Canada, which was satisfied by the allotment to him of 350,000 shares. The total receipts, including premiums on shares issued, amount to £112,000. No commission has been paid on the placing of the shares. The preliminary expenses were estimated at £3,500, of which £1,017 has been paid. The cash at bankers on fixed deposit is shown at £76,000.

Your company, through the Metropole Developments, have been able to conserve the whole of their cash resources by not having to incur the expenditure in the purchase of a factory, but we have acquired, on very favourable terms, ample accommodation in the factory at Waltham Abbey which has been acquired by Metropole Developments from the Imperial Chemical Industries.

THE SMALLER LAMPS.

For the manufacture of the smaller lamps we have made arrangements with a very responsible and one of the largest concerns in the country, with a life-long experience in making lamps in metal, and our programme in the smaller lamp will be carried out in time to make deliveries of these lamps from the month of April onwards.

In that connection I think I will read to you a letter which we have received from that firm. It is as follows :—

"Dear Sirs,—With reference to our negotiations for some time past regarding a contract for the manufacture of Everlite Lamps in the following types:—Bicycle Lamps including rear lights; Boy Scout Lamps; Postmen's and Policemen's Lamps; Auxiliary Motor Car Lamps; Lamps for general use and in the House in the form of Flash Lamps.

"We have carefully gone into your designs and are also making up counter designs. Having regard to past experience in the lamp industry, we feel sure that working arrangements between our two companies will be of the utmost benefit to all parties interested.

"We therefore have pleasure in stating that we will definitely undertake to manufacture various lamps enumerated above, and can commence to deliver within three weeks from the date of passing the final models (which should be within the next six days) in large and increasing quantities, the minimum to be 40,000 lamps per week, and we can safely undertake to supply you with as many as 100,000 in weekly deliveries.

"The price of the various types will, of course, vary as to the number of parts contained in each model, but you may rest assured that they will be very competitive, that we are prepared to go through our costs with you, and to accept a profit on the whole transaction, which will be fair and could not be improved upon even with your own complete plant being available."

I think, gentlemen, that makes it quite clear that it is safe to say we shall be able to sell the lamps in April.

DOMESTIC LAMPS.

With regard to the supply of domestic lamps which will be made chiefly out of Metduro, these, as originally contemplated, will be available during the coming autumn. You must remember that we are embarking on a new trade, and we have always refrained, from the inception of the undertaking, from making any estimates as to results and profits. With the large and world-wide interest displayed in this new invention, and the satisfactory arrangements concluded for marketing your products in almost every part of the world, we may look forward to a very prosperous future.

The chairman then referred to the events which had led up to the resignation from the board of Mr S. R. Mullard, and continued :—We have, I am glad to say, secured in the person of Mr G. Langford a man fully competent to carry out the important duties of factory manager, and he will be installed at Waltham Abbey from to-day week. Mr. Langford, during his career, has occupied very important positions. At a very early stage he was made manager of the Gas Station in Coventry responsible for street lighting. He next served a term as general manager of the Para Gas Works. On the outbreak of the war he returned to this country and was at once made second in control of the filling factory at Hayes in Middlesex, employing some 15,000 hands throughout the war. At the closing down of these works Mr Langford was engaged by the Radiation Co. of Warrington, and up to the period of his engagement with us he has been in the service of that company.

I also want to add this: You must remember that in the Everlite lamp we have the only hermetically sealed wet battery in existence, and we have the utmost confidence in the future of that discovery.

After the Chairman had replied to questions the proceedings terminated.

PHILLIPS RUBBER SOLES, LIMITED.

ANOTHER SUCCESSFUL YEAR.

The ordinary general meeting of Phillips Rubber Soles, Limited, was held, on the 7th inst, at Winchester House, Old Broad street, London.

Mr Walter W. Phillips, who presided, moved the adoption of the report and accounts for the year ended November 30, 1928, and said that the net profit for the year amounted to £123,066. This was about £7,700 below the profit for the previous year, but the difference was mainly accounted for by increased advertising expenditure by a subsidiary company. As compared with two years ago, the net profit for the past year showed an increase of about £20,000. The directors regarded the results as very satisfactory, particularly in view of the general state of trade in the country and the high percentage of unemployment.

After adding the amount brought forward from the previous year, and deducting income-tax, preference dividend for the year and interim dividend of 5 per cent. paid on the ordinary shares, and placing £16,000 to raw materials reserve, there was a balance available for further dividend on the ordinary shares, reserves, &c., of £72,265.

Dealing with the balance-sheet, the Chairman said that investments in subsidiary companies, £354,140, remained unaltered from the previous year.

The item of £125,000 5 per cent. war loan was most useful, and the amount of cash at bank, £27,906, was a satisfactory figure.

As regarded the item, "Patents and designs at cost, £90,406," the slight increase of £152 represented the cost of registration of new designs during the year. These designs might be regarded as having a value far in excess of the cost of their registration, but he wished to make it clear that sooner or later provision would have to be made for writing down this item of £90,406. The directors did not recommend that any step be taken in that direction at present, for the reason that the amounts placed to general reserve a year ago and in the appropriation now submitted might be regarded as sufficient cover for patents and designs amortisation until such time, presumably in the near future, when the item preliminary expenses would have been completely written off and larger sums would become available for other purposes.

DIVIDEND OF 15 PER CENT.

Referring to the appropriation account, he stated that the directors recommended writing off preliminary expenses a further sum of £15,695 (making a total of £40,000 written off this item), placing to general reserve a sum of £10,000, and paying a final dividend of 10 per cent. (making 15 per cent. for the year) on the ordinary shares, which required £36,000. That would leave a balance to carry forward of £10,571.

The balance of net profit, after providing for all dividend on preference shares, was equal to 29 per cent. on the ordinary share capital.

He mentioned that the directors were in favour of building up a strong reserve position, and he felt sure that the wisdom and soundness of that policy would be agreed upon.

The business, in every way, was being kept up to date. The turnover had been maintained, and the reputation of Phillips' productions, for quality and general excellence, now stood higher than ever. During the past year there had been a development in this country owing to the use in many shoe factories of other materials, instead of the customary leather, for the soles of boots and shoes. The very excellent soleing material that the company was manufacturing and selling under the registered trade mark "Durata" had rapidly won for itself the very highest reputation, and he felt confident that the company might hope to secure a very large share of the trade in this class of goods.

The two new directors, Mr John Cunningham and Mr W. H. Mather, were members of the staff, and had both been engaged in the business for the past ten years. He was quite sure that the company would be well served by its new directors.

THE OUTLOOK.

As regarded trade outlook, present indications were that the company would have a normal year, but everyone would do his best with a view to achieving something even better than normal.

Relations with all the workpeople were extremely cordial and satisfactory, and he expressed the directors' hearty appreciation of the excellent services and assistance rendered by the staff and workpeople of the company and its subsidiaries during the year.

The report and accounts were unanimously adopted, and a final dividend of 10 per cent. was declared on the ordinary shares.

The retiring directors, Messrs G. Phillips, A. J. Drywood, J. Cunningham, and W. H. Mather were re-elected.

The auditors, Messrs Davie, Parsons and Co., chartered accountants, were re-appointed, and a vote of thanks to the chairman closed the meeting.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS.

The following table shows the national income and expenditure during the week ended February 2, 1929 :—

(000's omitted.)

Expenditure.	£	Receipts.	£
Supply Services	6,960	From Revenue	30,118
Interest, &c., on Debt	15,224	Decreases in Balances	122
Sinking Fund	3,538		
Sundries	352		
Decrease in Debt	4,166		
	30,240		30,240

The Revenue for the week amounted to £30,118,400, as compared with £28,337,500 in the corresponding week last year. Property and Income-tax amounted to £17,462,000, against £15,558,000 and Super Tax to £3,440,000, against £3,340,000. Customs brought in £1,803,000, against £1,903,000, while Excise at £817,000 showed no change. Ordinary Receipts were lower at £19,700, against £779,000, and Special Receipts were higher at £35,000, against £1,250,000. The National Debt was reduced by £4,166,400, as shown below :—

(000's omitted.)

	£		£
Treasury Bonds	— 11,800	Treasury Bills	+ 22,300

INDIA COUNCIL REMITTANCES.

The total remittances from the Government of India to the Secretary of State for India in Council from April 1, 1928, to February 2, 1929, amounted to £23,362,000 by means of purchases of sterling in India. Of this amount £750,000 was remitted on account of the Paper Currency Reserve.

BULLION.

The following statistics of imports and exports of gold for week ended February 7, 1929, are issued by the Statistical Department of H.M. Customs and Excise:—

Imported into Great Britain and Northern Ireland. From—	£	Exported from Great Britain and Northern Ireland. To—	£
France	12,679	Poland, inc. Dantzig	3,660

Total		£254,071	Total		£2,856,504

Net withdrawals, £2,602,433.

Messrs Samuel Montagu and Co write on February 6th as follows:—

GOLD.

The Bank of England gold reserve against notes amounted to £152,714,393 on the 30th ultimo (as compared with £153,103,414 on the previous Wednesday), and represents a decrease of £1,191,922 since April 29, 1925—when an effective gold standard was resumed. The exchange with New York being still favourable to the export of gold to that centre, there was a keen demand for the South African consignment offered in the open market yesterday. Of the £782,000 available, £119,000 was taken for Indian and trade requirements, whilst £663,000 was secured for shipment by the s.s. "Mauretania" to the United States of America. Substantial withdrawals have also been made from the Bank of England for the latter quarter, as will be seen from the movements recorded below. Further shipments were made by the French steamer to-day, making a total export of about £3,500,000.

There was a net efflux of gold of £3,091,745 during the week under review.

SILVER.

The market has experienced an absence of demand and prices were unable to withstand the substantial offers of resales from China. The Indian bazaars, which had hitherto exercised some steadying influence, have lent little support, but on the contrary have contributed somewhat to the supplies.

The week has been noteworthy in that cash silver on the 1st instant was quoted at a premium, prices being fixed at 26 5/16d and 26¼d for cash and two months' delivery respectively; this was the first occasion since July 26, 1928, that spot silver had commanded a premium. The circumstance was due to some special inquiry for prompt supplies, which, however, was not maintained, prices being quoted level on the following day.

Another feature was the sharp drop which occurred yesterday, when supplies pressed on a poorly supported market caused a fall of ⅛d in both quotations. The figure thus reached —25 15/16d—attracted some inquiry, and there was in consequence a reaction to-day of 1/16d for cash and ⅛d for two months, thus re-establishing a premium of 1/16d on the latter delivery.

The following were the United Kingdom imports and exports of silver registered from mid-day on the 28th ultimo to mid-day on the 4th instant:—Imports.—Germany, £30,500; British West Africa, £13,092; other countries, £16,441; total, £60,033. Exports.—Irish Free State, £24,116; British India, £103,723, Egypt, £26,513; other countries, £2,733; total, £157,085.

NOTICES.

The Midland Bank announces that the night safe service which it introduced into this country in August last year, and has since extended to 78 of its branches in London and the provinces, has been brought into operation at the following offices during the past fortnight:—39 High street, Islington, London, N. 1; 165 High road, Kilburn, London, N.W. 6; 150 and 152 High street, Stoke Newington, London, N.16; Walham Green, 567 and 569 Fulham road, London, S.W. 6; 5 Market hill, Barnsley; 2 Cloth Hall street, Huddersfield; 8 Library place, St Helier, Jersey; 3 High street, Kettering; 100 South road, Waterloo, Liverpool; Imperial buildings, 15 Oxford road, Manchester; Exchange place, Middlesbrough; 37 Grainger street, Newcastle-on-Tyne; 42 and 44 Grey street, Newcastle-on-Tyne; 7 High street, Sheffield; 165-8 High street, Southampton; 328 High street, West Bromwich; and 38 Church street, West Hartlepool.

We are informed that the Bank of Scotland have secured commodious premises, occupying a prominent position, at 16-18 Piccadilly, within a few yards of Piccadilly circus, for a new branch, to meet the convenience of their customers in the West End. The City London office of the bank was opened in 1867, but with the tendency of business houses to move westwards additional facilities by means of another branch in that part of London have become necessary. The new premises will be opened when the internal reconstruction has been carried through.

Lloyds Bank Limited announce that, commencing on February 4th, the Bitterne sub-office will be open daily (except Saturdays) from 10 till 12.

The National Provincial Bank, Limited, announce that an office of the bank is now open at 302 Holderness road, Hull.

Westminster Bank announce the opening of a new branch at The Swingbridge, Latchford, under the management of Mr J. M. Gibson, of Warrington.

The Standard Bank of South Africa, Limited, announce that agencies will be opened on February 4th at Mashaba, near Fort Victoria, Southern Rhodesia, and Nkana, near Ndola, Northern Rhodesia.

The Banca Commerciale Italiana announce that their associate, the Banque Française et Italienne pour L'Amerique du Sud, have opened an office at Barranquilla (Colombia).

Mr Robert E. de B. Bate and Mr Charles S. Fowler have been appointed assistant sub-managers of National Discount Company, Limited.

quish the latter office on February 28, 1929; he will, however, continue to act as consulting mining engineer to Bolckow, Vaughan and Co., Limited. Mr Hedley has acquired an interest in certain coal royalties near Shildon, in the Bishop Auckland district, and he is now engaged in developing them.

The directors of Madame Tussaud's (1926), Limited, announce that Mr. John Maxwell, the chairman of British International Pictures, Limited, Associated British Cinemas, Limited, &c., has joined the board of the company, and, at the request of the directors, has accepted the chairmanship.

GOVERNMENT STOCKS, &c.

AUSTRIAN 4 PER CENT. GOLD RENTES.—The Council of Foreign Bondholders give notice that they are prepared to pay on and after February 1st Coupon No. 52 (year 1928) on bonds recouponed $1.2352 for coupons from bonds of florins, 200; $6.176 for coupons from bonds of florins, 1,000; $61.76 for coupons from bonds of florins, 10,000; less a deduction of ⅝ths per cent. commission by paying agents. Coupons must be left three clear days for examination. Coupons for payment must be presented personally or through a London agent or bank. Under the Accord of Prague coupons are prescribed five years after their due date of payment.

HONDURAS EXTERNAL DEBT.—The Council of Foreign Bondholders, 17 Moorgate, E.C. 2, have, in accordance with the arrangement ratified by the Congress of Honduras on March 9, 1926, received from the National City Bank of New York the stipulated sum of £20,000 for the redemption of the debt in respect of the half-year ending January 31, 1929. The above-named sum will be applied to the purchase of the council's certificates issued in respect of deposited bonds.

OLD GREEK GOLD LOANS.—The Council of Foreign Bondholders announce that the additions to the minimum values of interest and sinking fund of the above loans of the Greek External Debt shown below will be payable in 1929 in respect of 1928. The percentages are in all cases percentages of the original interest :—

BANKS.

COMMERZ-UND PRIVAT-BANK, A/G., BERLIN.—At a board meeting held on February 1 a fusion with the Mitteldeutsche Creditbank was decided upon, whose shareholders will receive one Commerzbank share for each share in the Mitteldeutsche. The Commerzbank will increase the capital by 15 million marks to 75 million marks, the new shares to rank for dividend from January 1, 1929.

CHASE NATIONAL BANK OF NEW YORK.—Total resources of the Chase National Bank of New York reached the new high record of $1,430,308,237 during 1928, according to the bank's statement of condition as on December 31, 1928. This represents an increase of $429,015,510 over total resources at the end of 1927. Corresponding with the increase in resources, deposits showed a similarly striking gain, rising from $792,339,491 a year ago to $1,126,781,646 at the end of 1928. During the year the capital of the bank was raised from $50,000,000 to $60,000,000, and surplus from $40,000,000 to $60,000,000, while $10,000,000 was added to the capital of the bank's investment affiliate, Chase Securities Corporation. At the close of 1928 undivided profits of the bank amounted to $17,498,445, against $15,674,848 a year ago. Dividends totalling $7,700,000 were declared during the year. During the same period Chase Securities Corporation distributed $2,200,000 in dividends.

MISCELLANEOUS.

BRITISH AUTOMATIC COMPANY, LIMITED. — The directors announce that the agreement by Associated Automatic Machine Corporation, Limited, to purchase the shares in the company, is now binding, over 90 per cent. of acceptances of the offer having been received. On February 12 the date fixed for completion of the sale, the purchase money is to be paid over for distribution amongst the accepting shareholders who have complied with the offer.

BRITISH COLUMBIA POWER CORPORATION, LIMITED.—We are informed that the figures for the 11 months to November 30, 1928, showed an increase in the aggregate net earnings of £43,214 sterling, not dollars.

HODDERS, LIMITED.—Hodders, Limited, who recently acquired another chain of chemists' shops in Bristol district, have now also purchased "Hedges," a very old-established wholesale and retail chemist's business with about 16 branches in Birmingham and district. Hodders now control more than 40 chemists' shops.

S.T.D. MOTORS, LIMITED.—The report for the year ended September 30, 1928, reveals a net profit of £163,483, which compares with a net profit of £145,053 for preceding year. The preferred ordinary dividend of 7 per cent. per annum absorbed £128,086 as before. The sum of £25,000 is again put to reserve. The carry forward is £168,258. The general reserve now stands at £789,867. A meeting of holders of 8 per cent. guaranteed notes will be held immediately preceding the company's meeting at Winchester House on February 12 at noon, when a scheme for modification of repayments by annual drawings will be laid before them. The amount of notes outstanding is £375,000. The object of this scheme will be to secure holders' consent for a reduction in the amount of annual payments, thereby conserving the cash resources for the development of the business of the company. The directors have under consideration a scheme for dealing with the arrears of preference dividends which will be indicated at the meeting.

LONDON GENERAL CAB COMPANY, LIMITED.—The statutory meeting will be held at Winchester House, London, on February 12th at noon. The statutory report shows that the number of ordinary shares allotted as fully paid up otherwise than in cash in part satisfaction of the purchase price of properties and assets of the Red Motor Cab Company, Limited, in pursuance of an agreement dated November 15, 1928, between the Red Motor Cab Company, Limited, and Henry Alfred Thomas and adopted by the company by an agreement dated November 19, 1928. On each of the remaining 250,000 ordinary shares the sum of 10s. has been paid or is payable in cash. The total amount of cash received to January 31, 1929, by the company in respect of shares issued for cash is £124,559 5s.

COOK SON AND CO. (ST. PAUL'S), LIMITED.—The profit for 1928 amounts to £195,663 against £216,099 in preceding year. The ordinary shareholders receive 5 per cent., against 7 per cent., while the deferred shareholders nothing against 100 per cent. The carry forward is £39,863, subject to provision for the three months' preference dividend to end of 1928. Total assets are £3,551,813. Goodwill remains at £325,000. Cash is reduced from £229,993 to £210,139. The company shows in its balance-sheet a list of its investments, which are all in British Government securities except £169,803, cost of 267,222 ordinary shares (£1) fully paid in John Howell and Co., Limited. The total amount of investments at cost is £917,968, against £832,169 in preceding balance-sheet. Debtors are at £1,038,872, against £1,091,837. Stocks are at £586,334, against £605,812. General reserve account remains at £200,000.

JUTE INDUSTRIES, LIMITED. — The profit for year ended September 30, 1928, is £46,446, against a profit of £2,271 for preceding year. Deducting a debit of £27,410 brought in, there is a credit balance of £19,037 to go forward. A summary of the balance-sheet appears in another column.

BRITISH & HUNGARIAN BANK, LTD., BUDAPEST

Main items of the Balance Sheet on December 31st, 1928. (The respective figures for 1927 are quoted in parenthesis).

According to the Balance Sheet for 1928, Gross Profits amounted to 7.3 (5.5) millions Pengo. Net Profits:—3.477,339.-Pengo (2.232,818.-Pengo), of which a dividend of 14% (13%), i.e., 7.- Pengo (6.5 Pengo) per share, i.e., altogether Pengo 2.520,000.- (Pengo 1.560,000.-) will be paid. Allocations:—to Reserve Fund Pengo 250,000.-, to Pension Reserve Fund, Pengo 300,000.- (Pengo 100,000.-). Balance carried forward to 1929:—Pengo 164,225.- (Pengo 146,190.-).

Own Capital:—31.5 million Pengo. Deposits and Creditors:—120.6 million Pengo (90.6 million Pengo). Own Dollar and Pound Sterling Mortgage Bonds outstanding:—11.4 million Pengo (5.7 million Pengo). Cash in Hand:—7.5 million Pengo (5.6 million Pengo). Bills:—61.3 million Pengo (48.6 million Pengo). Bills Discounted:—285.1 million Pengo (190.4 million Pengo). Advances on Securities quoted on the Stock Exchange:—8.7 million Pengo (10 million Pengo). Sinking Debtors:—53.6 million Pengo (42.8 million Pengo). Sinking Fund Mortgage Loans:—12.7 million Pengo (5.8 million Pengo). Total of Balance:—173 million Pengo (136 million Pengo).

Both the holdings of securities and of real-estate property have been included in the Balance Sheet also on this occasion on a very conservative basis and thus these items include very considerable hidden reserves.

VENEZUELAN OIL CONCESSIONS, LIMITED.—The profit for the year 1927 was £1,237,848, as compared with £715,325 for 1926. The sum of £71,487 is brought in, making £1,309,335 available, against £717,831. The directors are placing to taxation reserve account £146,000, and are paying 106½ per cent. dividend, less tax, on the paid-up capital of the company, absorbing £1,064,883. For 1926 the dividend was 55½ per cent., less tax, absorbing £554,939. The carry forward to 1928 is £98,452. Total production in 1927 was 2,978,219 metric tons, against 1,802,943 metric tons produced in 1926. Shipments of crude oil were 2,930,017 metric tons, as against 1,716,772 metric tons for 1926. Preliminary expenses and underwriting commission have all been written off. Debtors are higher at £453,374, against £377,174. Cash is at £23,950, against £52,412.

V.O.C. HOLDING COMPANY, LIMITED.—The profit for 1927 is £863,213, to which is added £3,850 brought in, making £867,063 available. A dividend of 20 per cent., less tax, is paid on preference and ordinary shares, absorbing £863,714, leaving £3,349 to carry forward. For 1926 the dividend was 15 per cent. on both classes of shares. Total assets are £6,925,733. Cash is at £1,353,161. Treasury bonds and bills at cost stand at £470,141.

Commercial Reports.

THE CORN TRADE.

Mark Lane, Thursday Evening.

Climatic conditions generally were favourable to agricultural operations, and with the ground in good condition an early start is anticipated in spring sowings. Larger offerings of native wheat were available at the principal statute markets, and prices tended in buyers' favour. Imported descriptions, however, experienced a rather better movement, and a generally firm tone governed the market. In the floating and forward cargo section United Kingdom millers showed more disposition to replenish stocks, while Continental and Mediterranean consumers were also more in evidence of late. The undertone is firm, owing to unfavourable North American crop reports, but shipments continue heavy, and both Canadian and Plate descriptions are freely offered, while it is feared that the increasing crop movement from the Argentine may have a depressing effect on values in the near future. Steamers of Rosafe 64 lbs loading sold 43s 10½d to 44s 1½d, ditto 64½ lbs afloat 44s 3d, New South Wales afloat 47s 3d bags and 46s 9d bulk, part cargoes of Australian afloat 47s 3d, February shipment 47s, white Pacific mid-February 47s 3d, and March 47s per 480 lbs c.i.f. terms. Feeding stuffs were steady, but buyers rather indifferent, consequently business was somewhat restricted. Wheat firmer. No. 2 Northern Manitoba 51s 6d, No. 3 ditto 50s 6d, No. 4 Manitoba 49s, No. 5 45s, No. 6 39s 6d, No. 2 mixed Durum 44s 9d, Rosafe 62½ lbs 46s 3d, Barusso 62½ lbs 46s 3d, Australian 49s 6d, all ex-ship, per 496 lbs. English 9s 6d to 9s 9d per 112 lbs. Flour steady. London standard grade 38s 6d, town whites 39s 6d, patents 40s 6d to 41s 6d per sack delivered in the Home Counties, with 6d to 1s per sack less for deliveries in the London districts. Of imported, Manitoba patents range from 35s to 38s, Minneapolis 35s to 37s 6d, Australian 36s ex-store per 280 lbs. Maize steady. Plate landed 44s 9d, ditto arrived 43s 3d, ex-ship to arrive 43s 6d, February-March 44s 3d, March-April 41s 3d, new April-May 39s 9d, May-June 39s 3d, No. 2 mixed American ex-ship to arrive 42s, ditto yellow 42s, No. 2 white flat African 44s landed per 480 lbs. Yellow maize meal £11 15s ex-wharf, Hominy chop £9 per ton. Barley quiet. Californian ex-ship 45s to 52s, Chilian Chevalier 48s to 58s, Australian 45s to 49s, Smyrna 44s to 47s per 448 lbs. Algerian/Tunisian ex-ship 34s 6d, Canadian feed 32s ex-ship to arrive, 33s landed, No. 3 Canadian Western 35s 9d, No. 2 Federal American 31s ex-ship to arrive per 400 lbs. English malting 10s to 15s, feed 9s 3d to 10s per 112 lbs. Oats steady. Plate ex-ship to arrive 24s 6d, February 25s 6d, March 25s 9d, black Plate landed 25s 3d, No. 3 white clipped American 36 lbs landed 27s 3d, mixed Canadian feed 21s 9d, Chilian white 33s 3d, German landed 28s 9d, ex-ship to arrive 27s 9d per 320 lbs. English 9s to 10s per 112 lbs. Scotch landed 30s per 336 lbs. Irish black 26s 6d per 320 lbs.

COMPARATIVE AVERAGES OF GRAIN.

The following table gives the estimated sales of home-grown wheat during the harvest years 1928-29, 1927-28, 1926-27, 1925-26:—

	1928-1929.	1927-1928.	1926-1927.	1925-1926.
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to February 2	327,012	335,937	289,882	304,818
20 weeks to February 2	5,941,793	5,516,277	7,867,168	8,971,107
Average price of English wheat per cwt.	s d 9 10	s d 9 10	s d 11 10	s d 11 10

The following is a statement showing the Quantities Sold and the Average Price of British Corn in the past two weeks, and for the corresponding week in each of the years from 1925 to 1928:—

Weeks Ended.	Quantities Sold.			Average Price per Cwt.		
	Wheat.	Barley.	Oats.	Wheat.	Barley.	Oats.
1929.	Cwts.	Cwts.	Cwts.	s d	s d	s d

Feb. 4, 1928	335,937	353,027	103,125	9 10	11 0	10 0

AMERICAN WHEAT MARKETS.

Values show little change, though markets have fluctuated during the week. Reports of dryness in Australia, which is retarding ploughing operations, light receipts and country offerings gave strength to the markets, but this was more or less counterbalanced by selling by commission houses. Some speculative support was encouraged by renewed talk of farm relief measures. Quotations:—

Nearest Future.	Jan. 4, 1928.	Feb. 8, 1928.	Jan 2, 1929.	Jan. 30, 1929.	Feb. 6, 1929.
Winnipeg (No. 1 Manitoba)—Cents per 60 lbs	137	134⅛	122	128⅞	128⅜
Chicago (No. 2 Winter)—Cents per 60 lbs	130⅜	129½	116⅜	124⅛	124⅝

Visible supplies of wheat in Canada at 81,217,000 bushels show an increase of 534,000 bushels as compared with the previous figures. Supplies a year ago stood at 70,212,000 bushels.

COAL.

Our Cardiff correspondent writes:—Although the pressure of tonnage at the South Wales docks has not been as great as it was last week the greatly improved tone on the Cardiff coal market has been firmly maintained. Current quotations for some of the Monmouthshire large grades have been increased by about 3d per ton, but for all the Cardiff large and small steam coals prices are unaltered. Inquiries have been fairly active, and the forward steaming lists of the great majority of the collieries have been further strengthened. Any shortage in the supply of tonnage would, however, react unfavourably on the prompt market position. There is also a danger as the result of unco-ordinated action on the part of the colliery companies in the reopening of pits, of the supply again exceeding the demand, for reports have been issued during the week of the impending resumption of work at collieries other than those to which reference has already been made. Difficulties have arisen over the condition of employment at the Nine Mile Point pit of the Ocean Coal Company, but hopes are entertained that these will be adjusted, though the possibility remains of the company abandoning its intention of restarting this colliery unless the management is satisfied that there would be a reduction in the costs of working. The following are the current approximate quotations:—Best Admiralties, 19s 4½d to 19s 6d; seconds, 19s to 19s 3d; best drys, 19s 6d to 19s; Black Veins, 19s to 19s 6d; Western Valleys, 18s 9d to 19s; Eastern Valleys, 17s 9d to 18s 3d; best small steams, 13s 9d to 14s; cargo smalls, 12s 6d to 13s; coking smalls, 13s 9d to 14s; anthracite, best large, 33s to 35s; Red Vein, large, 21s to 25s 6d; machine-made cobbles, 40s to 43s; French nuts, 41s to 43s 6d; stove nuts, 40s to 42s 6d; rubbly culm, 9s 3d to 9s 9d; foundry coke, 25s to 37s; patent fuel, 20s to 21s 6d; pitwood, ex ship, 25s 9d to 26s.

Our Glasgow correspondent writes:—With output restricted and home demands active, there is little coal available for export until about the end of the month, and any odd parcels coming on to the market are readily disposed of at firm prices. The threat of labour troubles in Poland has brought an increased inquiry from foreign countries, especially the Scandinavian, which have recently drawn much smaller supplies from Great Britain. Shipment prices (f.o.b. district ports):—Lanarkshire: Ell best, 18s; splint best, 18s 6d; splint second, 17s 6d to 18s; navigation, 17s 6d; navigation second, 15s; steam, 14s 6d; Hartley, 18s; trebles, 15s 6d; doubles, 14s; singles, 13s; pearls, 11s 9d to 12s; dross, 10s 6d. Fife: Screened navigation, 18s; first-class steam, 16s; third-class steam, 14s 6d; trebles, 16s 6d; doubles, 14s 6d to 15s; singles, 13s 9d; pearls, 11s 6d to 11s 9d. Lothians; Prime steam, 15s; secondary steam, 14s 6d; trebles, 16s to 16s 3d; doubles, 15s; singles, 13s 9d to 14s; pearls, 11s 9d.

Our Sheffield correspondent writes:—The expansion of the demand in the export market conditions, and supplies are on the short side, while prices have firmed. Several of the idle pits in South Yorkshire are being restarted; others are working more regularly. The call for industrial fuel is rather better, especially as regards secondary qualities. Business in house coal keeps moderately brisk, but below the normal level. Blast furnace coke is in demand at from 13s 6d to 14s 6d for best brands. Home consumption for foundry coke is poor, whereas exports are exceptionally active. Best South Yorkshire hards fetch 16s 6d f.o.b.

IRON AND STEEL.

We extract the following from the weekly report of the London Iron and Steel Exchange:—Steady conditions continue to rule in the iron and steel markets. Prices have shown a firm tendency for some time, and reports from most districts indicate that the British works are fairly well off for orders. As a result of these conditions there is a distinct note of optimism apparent in the trade, and this leads to greater confidence in dealings. In the pig-iron department the Midland makers recently attempted to advance their prices, but apparently the effort was only partially successful. The demand for pig-iron which has improved of late is not altogether satisfactory; but there are indications that consumption will expand in the near future. A favourable factor is the adjustment of the labour dispute in the light casting trade. The demand for semi-finished steel products has broadened considerably, and the British steel works have transacted a good business, their ability to give near delivery being a great advantage in competing with foreign competitors. Recently a considerable business in semis has been transacted with Continental works, orders totalling many thousands of tons having been placed for forward delivery. Business has proceeded on steady lines in the finished steel department. The inquiry from foreign markets generally is quite good, and a fair amount has materialised into actual business. Home buyers continue their policy of buying from hand to mouth, but business is on a moderately good scale.

Our Middlesbrough correspondent writes:—Pig-iron.—The better tone which has prevailed during the last few weeks is still maintained. The pig-iron position is better, and the demand keeps up with the production. With the improved conditions in the steel works there is a heavy demand for basic iron; in fact, the local make is not sufficient for the works' needs, and this quality of iron has been imported from the Midlands. It is confidently expected that more furnaces on this class of iron will be blown in shortly to supply the works' own needs. *Cleveland iron still remains firm* at 66s per ton for No. 3 G.M.B., with no very great quantity available. The hematite market is better, with more inquiry. The production is small, and consumers are more inclined to contract for forward quantities. There has been a distinct stiffening in prices, and mixed numbers are now called 71s 6d per ton. Manufactured Iron and Steel.—The recent improvement over the last few weeks is still continuing, and the various works are in a more healthy condition as regards forward orders. Quotations are unchanged from last week. Steel ship plates, £8 7s 6d; steel ship angles, £7 17s 6d; iron bars, £10 5s; steel rails, £8 10s. Iron Ore.—The market still remains very firm, with best Rubio at about 22s 6d per ton, but this is a minimum price. Blast furnace coke also shows a slight improvement, and average qualities are asking about 18s delivered furnaces.

Our Sheffield correspondent writes:—There has been further expansion in a few sections. The output of open-hearth steel corresponds to that of three months ago; basic steel has increased, and acid steel has fallen off. Competition, due to insufficient business to keep plants operating, is abnormally keen in heavy steel castings and forgings for engineering and shipbuilding, and the level of prices for such material is lower than last year. The same remark applies to alloy steels. The call for the highest grades of tool steel is poor, whereas the medium qualities are selling rather more freely. Pig-iron prices are irregular. The advance of 2s 6d on Derbyshire foundry sorts announced last week is being enforced in some cases. Unfortunately, demand does not expand, most of the foundries being quiet. The market for basic steel scrap tends to harden, and prices are 6s higher than *six months ago. Railways* are ordering only small quantities of steel material, and no privately-owned railway waggons are being built. Axle, tyre, and spring contracts for the British railways have been concluded at reduced figures. The light and finished trades of the city are dull. The unemployment figures are unfavourable, the total on the registers to-day being nearly 2,000 more than when the works closed for the Christmas holidays.

Our Glasgow correspondent writes:—No settlement has yet been reached in the Scottish iron trade dispute, and the men in the Coatbridge and Airdrie district, where most of the workers concerned are employed, at a meeting this week confirmed their decision not to accept the employers' terms. The most important development in the steel trade this week in the West of Scotland is the increased demand for semis, Continental prices for which have advanced considerably within the past few weeks so that home producers are able to meet the competition. There are also more inquiries for rails and structural material, so that steel makers, while by no means fully employed, are finding some expansion in several departments. In the galvanised sheet trade there has been a little more buying for forward delivery, and prices are firm, to-day's basis for 24-gauge galvanised and corrugated sheets being £13 12s 6d f.o.b. for export lots. There has not been the same increased demand for black sheets, but makers have well-filled order-books meantime. Prices generally remain at the levels quoted a week ago.

Our Cardiff correspondent writes:—Market conditions in the South Wales steel and tinplate trades remain practically unchanged. There are inquiries for export supplies, but they are not materialising to any substantial extent, although works are stated to be well placed with orders for several months ahead. Mr. H. C. Bond, of Messrs. Richard Thomas and Co., has repudiated a statement made by the chairman of the Canadian Tariff Board to the effect that Canada had been allotted to United States manufacturers under the recent Pact. Quotations for tinplates, galvanised sheets, and local tinplate bars are unaltered, but foreign bars are firmer at £5 12s 6d per ton. Shipments last week totalled 155,345 boxes of tinplates, but stocks, owing to larger consignments from works, have increased to 244,076 boxes.

OTHER METALS.

TIN.—Marked stability governed proceedings in the standard market, and prices responded sharply to a better demand, together with higher Eastern and American advices, though dealings were attended by considerable irregularity, especially for forward dates. Stocks in London and Liverpool warehouses for week ending February 2nd amounted to 8,201 tons, compared with 2,131 tons at same period last year. Visible supplies at the end of January were given as 23,129 tons, and U.K. stocks 8,458 tons. Standard cash changed hands at £221 to £230 5s and £226 10s, three months £222 10s, £230 15s and £226 10s. In the East business was reported at £224 7s 6d to £231 and £228 10s c.i.f.

COPPER.—The market gained further strength in face of a keen demand and a further advance in New York export quotations, with spot and early dates reservedly offered. Standard cash sold at £80 15s to £80 5s and £80 3s 9d, three months fluctuating between £77 10s, £78 10s and £77 15s.

LEAD irregular, but firmer on balance, with a good business in force. Good soft foreign pig February sold £22 10s to £23. March £22 8s 9d to £22 18s 9d, April £22 12s 6d to £22 18s 9d, May £22 15s to £22 18s 9d.

SPELTER opened firmer, but later a quieter tone prevailed. February sold £26 11s 3d to £26 7s 6d, March £26 10s, April £26 11s 3d, May £26 15s to £26 10s, July £26 11s 3d ton.

ANTIMONY dull. English regulus quoted £54 to £55, foreign ditto spot £37 10s to £38 ton.

ALUMINIUM steady. Ingots and bars for home delivery £95 ton.

WOLFRAM maintained. Chinese, also Straits, quality for shipment 19s 6d to 20s per unit c.i.f. terms.

QUICKSILVER steady. Spot £22 5s to £22 10s per bottle.

TIN PLATES steady. I.C. coke prompt and forward 18s to 18s 3d f.o.b. Swansea.

THE COTTON TRADE.

LIVERPOOL, Feb. 6, 1929.

Spot sales for the week January 31 to February 6 (inclusive) are 29,000 bales, of which 21,520 are American, 400 Brazil, 800 Argentine, 3,500 Peru, 1,410 Egyptian, 850 African, 400 East Indian, and 120 sundries.

Imports for the same period are 67,203 bales, of which 41,144 are American, 1,000 Brazil, 213 Argentine, 2,539 Peru, 13,761 Egyptian, 1,890 African, 6,310 East Indian and 346 sundries.

Quotations to-day are:—American middling, 10.28; Egyptian F.G.F. sakel, 18.15; Egyptian F.G.F. uppers, 11.92; Brazil fair, 10.58; Peru G.F. mod.-rough, 12.75; Peru G.F. smooth, 11.23; East African G.F. 12; West African middling, 11.33.

MANCHESTER, Feb. 6, 1929.

Trading in the market continues much quieter. The attitude of buyers has again been affected by the tendency towards easier rates for the raw material, and as demand has fallen off there are fears of spinners and manufacturers weakening in price. The conditions at the moment are rather depressing and the future is very uncertain. Only a retail business has been done in piece-goods for abroad. Cable and mail advices from India are discouraging. There are some hopes of a revival of China demand after New Year celebrations. Manufacturers have met with very restricted support from most of the smaller markets, and there are indications of order lists running down. Some reports from the home trade, however, have been rather better. Demand for American yarns has been sluggish and prices have tended to favour buyers. Much interest has been taken in the short-time movement in the Egyptian section, and the trade position continues very unsatisfactory.

THE WOOL TRADE.

Our Bradford correspondent writes:—Reports of an easier tendency in wool values in the primary markets continue to exercise a restraining influence on spinners and manufacturers, and business in tops and yarns is accordingly very restricted. It would seem that competition is still fairly general in the Colonies, and prices this week have been somewhat steadier, but the recent irregularity has destroyed confidence, for the time being, and users everywhere are now waiting for the new basis to be established. The demand for tops is very disappointing, and in the absence of bulk business to test the market it is difficult to say how quotations stand, but it is fairly evident that topmakers are prepared to make concessions, and for any bulk business prices, especially for merinos, are distinctly easier. Crossbreds are considered to be too dear at current rates, but sellers are not quite so ready to make marked reductions in these qualities, although here, also, the position favours buyers. Yarns remain very irregular, owing to the keen competition for the comparatively small amount of business on offer, and stocks of standard counts tend to accumulate. A moderate amount of business is being done in piece-goods for home and export.

COLONIAL WOOL.

(FROM A CORRESPONDENT.)

The principal immediate means of testing wool values is the course of the sales in Australia, and, judging from the position revealed in this way, raw material values have not shown any serious tendency to fall to a lower level. Cable information from Sydney has indicated slight irregularity, but home-trade users still find that the cost of merinos is above a parity with Bradford. A clean scoured cost of 40d for average 64's needs a price in the top which cannot be realised in Bradford. Topmakers appear to have been overtaken by an unnecessary fit of depression. They admit that there are no large stocks of any class of raw material in this country, and though there are big imports in front of the trade, these should not be too large considering the capacity of the machinery.

Any serious decline in wool is also largely precluded by the probability of continued active competition on Continental and Japanese account, and America is having to be reckoned with in Australian centres. Further quantities of wool have been bought for that destination in Sydney. The best wools offered at Perth have been bought for America, and the basis of prices in Melbourne has also been influenced by competition from the same source. Bradford is understood to have been the principal operator at Perth, good 64's having cost around 39d clean scoured. Melbourne has also been a more favourable market for Bradford buyers than Sydney. On the basis of cabled clean-scoured costs, average 64's have been costing 3s 9d, a price which is obviously above Bradford market to-day. All the evidence points in the direction of wool holding its own almost, if not quite, as well during the next few weeks as at any time within the past month. The absence of business in Bradford and the decline in Coleman Street has no doubt been the chief influence in depressing the tone of the former market. While it may be desirable, judging from the prices spinners are prepared to pay to-day to get both merino and cross-bred wool cheaper, this is a rather remote possibility. The pace seems likely to be kept up by Continental and Japanese buyers.

HIDE, LEATHER, AND ALLIED TRADES.

Conditions in the hide and leather trades remain very unstable, and there is a lack of confidence all round. At most provincial auctions declines of another ½d. per lb have been recorded, best ox hides now selling from 7½d to 7⅝d per lb, with further falls probable. Most hides were withdrawn from sale at last week's Bermondsey auctions in the absence of suitable bids. Calfskins are also lower in price, and have dropped ¼d to ½d at many auctions. All classes of oversea hides are still falling in value, and even at the reduced quotations merchants are only doing a small trade with tanners. Argentine ox are lower, and recent sales have been on a basis of 9⅛d for fregorific ox. In saladero hides the only item of importance has been the sale by inscription of 18,000 Leibig Colon hides, which were sold at 9⅛d to 10⅛d for heavy, and 9¼d to 9⅛d for light. Dry River Plates are without interest, except to report the better grades show a further decline, B.A. Americanos now selling at 12⅜d. Cape hides are also lower, and are selling at 12⅜-12¼d for firsts and seconds respectively. Australians share the prevailing weakness, and dry salted Queensland meatworks are offered at 10½d. The Chicago market is cabled as weak, with best heavy packers still selling at 17 cents.

Merchants and tanners all report a dull demand for sole leather, although the latter profess that matters show a slight improvement. Dry hide bends are not much wanted, but there is a fair trade passing in manufacturers' light wet-salted and repairers' bends, values being slightly lower. Offal is a shade weaker in price, and there are now some cheap parcels available. Upper stock sells in quite small parcels, curriers of wax butts being rather quiet. Semi-chrome sells in the cheaper grades, but the demand for colours and linings is poor. Glacé kid sells fairly well in blacks, but there has been a falling-off in browns, and spring shades seem as yet undecided. Boot manufacturers are quiet, and it is stated there have been more discharges of operatives this week from Northampton factories.

VEGETABLE OILS AND OILSEEDS.

Markets have been only moderately active, and only a small volume of business is reported. Consumers have been steady buyers of linseed oil, and supplies have been readily absorbed. Prices have advanced somewhat in the absence of Continental competition, current value of raw oil naked ex Hull mill being around £28 10s spot and February-April delivery, later positions being at a small premium. Cotton oils are neglected and easier, crude Egyptian ex Hull now offering at £27 15s, and common edible at £31 10s spot and February-April delivery. Other seed oils are quiet and practically unchanged with the exception of castor oil, which has been advanced 10s per ton.

In the oilseed section the easier tendency of linseed is again in evidence, but crushers both here and on the Continent are only small buyers, except at reduced figures, in view of the exceptionally heavy quantities afloat for Europe. For Plate on passage to Hull, £15 16s 3d and to the Continent £15 12s were paid earlier in the week, but business has since been done at slightly less, with shipment worth about £15 15s. The quantity on passage to Europe (including 4,400 tons from India) is 258,400 tons, or 5,900 tons more than a week ago. Cottonseed is easier, and for black Egyptian on passage £10 has been accepted, this being also the value for shipment. Bombay to Hull has been done at £8 17s 6d February. Oil cakes are in fair demand and prices are firm.

OVERSEAS PRODUCE.

FOOD, BEVERAGES, &c.

SUGAR.—No apparent signs of improvement in this market. On the contrary, trade drags along wearily, and with large supplies of the commodity on all sides, a weak undertone is the natural sequel. No change in prices of British refined or home-grown granulated. There is only a small up-take of imported foreign refined by exporting manufacturers. Dutch J, spot, London, 24s. White Mauritius form an attractive selection, and range from 21s to 21s 9d, as to sample. Home-grown granulated varies from 22s 3d to 22s 9d. Czecho granulated, February-March, sellers, 11s 6d; April-June, 11s 6¾d; July-August, 11s 9d; Nov.-Dec., 11s 6¾d, f.o.b., Hamburg. Dutch J, ready, 11s 10½d, f.o.b. Polish crystals, Feb.-March 11s 4½d, f.o.b. White Java sugars quiet, unaltered, both to Europe and Eastern ports. Foreign 96 per cent. centrifugal, afloat, 9s 3¾d; February-March, 9s 6d, c.i.f., U.K. Terminal sections easier with moderate dealings. Of raws, March sold, 8s 9d; May, 8s 11¼d; August, 9s 3d; December, 9s 5¼d to 9s 4½d. White, March, done, 11s 11¼d; May, 11s 7½d; August, 11s 11¼d to 11s 10½d cwt. Cuban receipts last week 188,140 tons, against 195,920 last year; exports, 88,250, against 63,020; stocks, 476,910, against 306,020. Stocks of raw sugar in the three chief ports of the United Kingdom for week ending February 2nd amounted to 173,272 tons, compared with 94,299 at corresponding period last year.

OVERSEAS PRODUCE.

FOOD, BEVERAGES, &c.

COFFEE.—A good steady demand continues for all really desirable qualities, and these realise quite full prices. Kenya, East India, and some Costa Rica figure largely in the patronage. Costa Rica, fine bold colourv, sold, 177s; peas, up to 170s 6d; Kenya, bold, 128s 6d to 143s; Usumbara, 149s; Kilimanjaro, 120s 6d to 135s 6d.

COCOA.—Market firmer, and a fair demand prevailed in forward positions. Accra F/F, February-April, sold, 42s 6d to 43s; March-May, 43s to 43s 9d f.o.b. Terminal, February, sold, 47s to 48s 3d; March, 47s to 48s; May, 48s to 47s 9d and 49s 1½d; July, 48s 9d to 49s 6d; September, 49s 6d to 50s 6d and 50s; December, 48s 9d to 49s 6d and 48s 3d.

TEA.—Indian sales during the week totalled 56,790 packages. There was a brisk demand, and for some time the sales went with quite a swing, but towards the close common kinds became less active and may be quoted slightly weaker in some cases. Good medium grades quite steady, while excellent prices were secured for some tippy teas and those possessing attractive autumnal character. Ceylon sales embraced some 19,740 packages, which soon cleared to a strong demand at firm to frequently dearer prices. Useful medium liquoring broken mostly ½d dearer, with low medium and common ½d up. A good export demand prevailed, especially for fine leaf. New season's China in fair demand at full rates. Fine Keemuns, sold, 2s 10d to 3s. Siftings wanted at 6½d to 7d lb. Java and Sumatra auctions met a good demand and firm market resulted. London landings during last month, 51,657,396 lbs, against 53,695,038 last year; deliveries, 38,764,151, against 36,045,906; stocks, 233,415,788, against 202,614,649.

RICE.—With new crop parcels of Two stars, Rangoon, due end of present month, holders of last crop still anxious to quit, and sales made at 13s 9d to 14s 3d as to quality. Spanish, spot, London, sold 19s 9d to 20s 3d. Californian, March, quoted 19s 3d, c.i.f., London. Seeta, March, selling at 17s 3d cwt, c.i.f., London/continent.

BEANS.—Butters again firmer, good demand. Parcels afloat "Hesiones" and "Clan Macintosh," sold, 35s; "Tasmanic" at 34s 9d; also per "Ville de Rouen," with parcels per "Marechal Gallini" at 34s 7½d, c.i.f., London. Rangoon haricots, spot, London, 26s to 26s 6d; March-April, sold 16s 3d; Ohtenashi, spot, 39s cwt. Forward nominal.

PEAS.—Steady, quiet. Japanese, February-March, sold 18s 1½d, afloat lots, 19s 3d to 20s, as to position. Dutch marrowfat on f.o.b. terms, 17s 6d cwt.

SPICE.—Pepper in demand, and firm forward. Lampong, January-March, sold, 1s 4¼d; March-May, 1s 3¼d; August-October, quoted 1s 0⅛d; Muntok, white, January-March, sold, 2s 2⅜d; March-May, 2s 2⅛d lb. London stocks for the week reduced 16 tons. Tellicherry, January-March, 143s cwt. Cloves dull. Zanzibar, spot, 1s 4½d; December-February, January-March, 1s 4⅝d; and March-May, 1s 4⅝d lb, c.i.f. Pimento unaltered. Sago flour tapioca slow on former terms. Dutch Farina, 12s 1½d cwt, f.o.b. African ginger, spot, 53s 6d; February-April, London, 49s; New York, 51s, cwt, c.i.f.

FRUIT (Dried).—Currants: Market remained quiet. Pyrgos quoted 45s 9d to 46s; Patras, 48s; choice up to 52s; Amalias, 46s 6d to 47s; Gulf, 50s to 53s; Vostizza, 51s to 58s. London stocks of Greek currants at the end of January totalled 5,291, against 5,442 tons last year. Sultanas in fair request, and market steady. Medium to good Smyrna, spot, 41s to 55s; Cretan, 45s to 70s; Greek, 34s to 65s; Australian range from 32s to 50s; Californian, soda bleached, 35s to 38s; unbleached, 29s; Cape unbleached, 33s to 37s; bleached, 45s to 50s. Stocks of Smyrna sultanas on January 31st totalled 1,999 tons, against 2,253 last year; Greek, 614 tons, against 221; Australian, 7,095, against 7,114; Californian, 1,762, against 1,621; Cape, 23, against 13 tons last year. Raisins slow. Valencia quarter boxes, 50s to 55s; Australian, 32s to 36s; Capes dull. Stocks of Valencia and Denia raisins on January 31st amounted to 165 tons, against 858 last year; Australian, 687 tons, against 201 tons. Figs quiet. Genuine new, spot, 28s to 30s; layers, 60s to 65s; pulled, 60s to 70s. Dates in good demand. Hallowie, new, spot, 28s to 30s; Khadrowie, 23s; Siar, 15s to 17s. Evaporated fruits: Market generally firm, with a moderate demand for most descriptions. Californian plums 20-30's, 65s; 30-40's, 57s; 60-70's, 42s 6d to 43s. Australian pears range from 57s 6d to 65s, as to quality. Apricots, South African, new crop, Royal, 60s to 117s 6d; Cape, 72s 6d to 80s; Californian, new, 85s to 117s 6d. Peaches, Californian, choice, 50s; extra choice, 53s; fancy, 58s. Apples, Californian, spot, sliced, extra choice, 67s 6d. Almonds met a moderate spot demand, at rather easier rates. Mazagan, 142s 6d; Mogador, 140s; Majorcas, 150s 6d; bitter, Jordan, 185s to 210s cwt.

CANNED GOODS.

CANNED FRUITS.—A better demand has been dealt with for Californian fruits, and a firm tone governed the market, with pears tending dearer, especially for the lower grades. Peaches move off freely, also fruit salad. Australian descriptions continue to sell steadily. Singapore pines met a quiet spot trade, while buyers are also indifferent regarding shipment parcels. Tomatoes firmly held, both spot and forward.

CANNED FISH.—Sardines quiet of sale, the assortment available being somewhat unattractive. Portuguese clubs quoted 5s per dozen tins. Lobsters dull. Best halves, 140s to 145s; and quarters, 77s 6d to 82s 6d. Salmon: A moderate spot trade, and forward position firm. Red talls, spot, 42s 6d to 45s. Pink steady. Talls, spot, 26s to 27s; halves, 31s 6d to 33s 6d. Japanese crab scarce and brings full rates. Finest quality, 95s to 97s 6d.

CANNED MEATS.—Corned beef quiet and tendency easier, but ox tongues held for firm rates on scanty offerings. Lunch tongues in fair request, but prices without improvement. Cooked boned hams firm, with a good business for forward delivery.

CONDENSED MILK AND MILK POWDERS. — Market remained steady. Full cream sweetened, English, spot, 45s; Dutch, ditto, 39s; February-March, 39s. Machine-skimmed sweetened, English, spot, 27s; Dutch, ditto, 23s 6d; February-March, 23s 6d, all in 5 cwt barrels. Powders: Spray F.C., 26 per cent., 2 by 56 lb tins, crated, prompt, 94s; M.S. (1 cwt cases) prompt, 41s 6d. Roller process, F.C., 26 per cent., prompt, 78s; M.S., ditto, 31s, all net, duty paid, ex-wharf London. On the grocery side F.C.S., 21s; M.S.S., 10s, basis per case, usual packing.

HONEY.—Market firm for best qualities, which are sparingly offered, but medium grades obtainable on slightly easier terms. Palish set Jamaica, sold, 54s; amber set, 48s; and manufacturing kinds, 42s 6d. San Domingo practically cleared. Haitian yellow palish set, quoted 50s. New Zealand, dark amber 50s to 55s; medium, 55s to 65s; light, 65s to 85s; whites and water whites, 65s to 87s 6d cwt.

RUBBER.

Market furnishes very little matter for comment, trade being quiet and price changes only fractional. Sheet, spot, and February, sold, 10⅜d; March, 11⅛d to 10⅜d; April, 11⅛d; April-June, 11 5/16d to 11d; July-September, 11¼d; October-December, 11⅜d to 11⅛d; and January-December, 1930, at 1s to 1s 0⅛d per lb. London stocks increased by 966 tons on the week; landings being 2,222; deliveries, 1,256; stocks, 25,389, against 65,960 last year. Liverpool stocks increased 36 tons, at 3,860 tons. Straits shipments during last month totalled 52,420 tons.

GENERAL.

JUTE.—Again reservedly held and firmer. Firsts, January-February, sellers, £33 12s 6d; February-March quoted £34 15s; March-April, £35 5s; April-May, £36 ton.

HEMP.—Quiet conditions governed the market for Manila, and which fails to reach a settled basis, in the strict sense of the term, K grade, April-June, quoted, £34; M 1, £29 10s. Others nominal. African sisal, unaltered, also Mexican. Of the latter, receipts last week, 12,000; deliveries, 11,000; stocks, 72,000 bales. Manila

MONETARY STABILITY and the GOLD STANDARD

By Sir HENRY STRAKOSCH, G.B.E.

Reprinted from "The Economist," Price 1/-

A NEW INDEX OF BRITISH NATIONAL PROSPERITY.

By G. D. ROKELING,

With a foreword by SIR JOSIAH STAMP

Reprinted from "The Economist." This booklet contains an attempt to construct from existing published data a measure of the real national income of Great Britain and of the income per head. The Index is based upon a new calculation of industrial production, the statistics of employment and the income from national investments.

Sir Josiah Stamp writes:—"*For some important purposes a single statistical indication of the state of total national well-being is desirable. For a first attempt in this field the effort made by Mr. Rokeling is very thorough and commendable.*"

PRELIMINARY NOTICE.

ENGLISH & INTERNATIONAL TRUST
LIMITED

(Incorporated under the Companies Acts, 1908 to 1917.)

AUTHORISED SHARE CAPITAL - £1,000,000
Divided into 100,000 Shares of £10 each.

Directors:

JULIAN DAY, M.C., Director of The Mid-European Corporation, Limited.
HENRY MAXWELL ANDREWS, Director of The Continental and Industrial Trust, Limited.
HON. JOHN MULHOLLAND, Partner in Edward de Stein & Co.
FELIX VICTOR SCHUSTER, Partner in Schuster, Son & Co.
MAJOR STEPHEN KEITH THORBURN, M.C., Partner in Sheppards & Co.
WILLIARD HUDSON BOTSFORD, Formerly Engineer with the Societe Financiere de Transport et d'Entreprises Industrielles (Sefina).
MARS CHAVANNES, Managing Director, Compagnie Francaise de Placement, S.A.

THE SUBSCRIPTION LISTS WILL OPEN ON TUESDAY NEXT FOR
AN ISSUE AT PAR OF
100,000 SHARES OF £10 EACH.

Each Share will, when fully paid after 1st July, 1929, be converted into £5 of 5½ per cent. Cumulative Preferred Stock entitled to rank for Dividend as from 1st July, 1929, and £5 of Ordinary Stock.

THE PROSPECTUS WILL SHOW THAT:—

1. The Company will form one link in a chain of Trust Companies which are being or have been created by a group of Bankers in the principal European countries, having for their object the widening of the International Market for the employment of capital.

2. The foreign Companies concerned are:—

COMPAGNIE FRANCAISE DE PLACEMENT, S.A., PARIS
(Established 30th April, 1928.)
Authorised and Issued Capital ... ... French Fcs. 100,000,000

COMPAGNIE CONTINENTALE DE VALEURS (THESAURUS), ZURICH
(Established February, 1927.)
Authorised and Issued Capital ... ... Swiss Fcs. 20,000,000
5 per cent. Debentures ... ... Swiss Fcs. 5,000,000

COMPAGNIE BELGE ET INTERNATIONALE DE PLACEMENT, S.A., BRUXELLES.
Authorised Capital (presently to be issued), Belgian Fcs, 50,000,000

Negotiations are in progress for the formation of similar Companies in the United States of America and in Germany.

3. The affiliated Trust Companies will work closely together through personal contact between their Directors and an understanding has been reached whereby each Company will be entitled to participate in important investments which may be undertaken by any other member of the group, although there will be no obligation to accept offers of business thus proposed.

4. The Directors are already aware of applications for more than 75,000 shares, which will be allotted in full.

Prospectuses and Forms of Application can be obtained from:—

Bankers:
NATIONAL PROVINCIAL BANK LIMITED, 15, Bishopsgate, E.C.2, and Branches.

Brokers:
SHEPPARDS & CO., Gresham House, Old Broad Street, E.C.2;
and from

THE MONEY MARKET.

FOLLOWING a rise in Bank rate to 5½ per cent., money was comparatively easy on Friday and Saturday of last week, but on Monday of this week stringent conditions developed, and on the following day a small amount had to be borrowed at the Bank. On Wednesday a full 4½ per cent. was paid for short money, and the market largely escaped further resort to the Bank, while on the

following day when the market again found itself "in the Bank," the rate rose to 6¾ per cent. for night money, the highest it has been for years. There was no definite explanation of this stringency in the market, but there are certain factors, whose existence is more or less known, which between them go some way to explain it.

* * * *

To begin with, this is a time of year when the inflow of revenue normally creates stringency, and the upheaval of a week ago should not make the market lose sight of this fact. This week it is known that large sums are being transferred to the Treasury's account at the Bank, and the latest Bank return indeed shows an increase of £11,284,341 in Public Deposits. It is true, of course, that, as revenue comes in, so Treasury bills are gradually redeemed, and that normally the market could expect to be supplied with funds from this source. This year, however, a fair number of February maturities are already held by the Bank itself, and so their repayment brings no benefit to the market.

* * * *

It is possibly because of the last factor that Government securities held by the Bank show a decline on the week of £6,979,471, a decline which far outweighs the small amount of £1,732,562 which the increase in the item Discounts and Advances shows the market to have borrowed during the week. In any case the net result of tax payments and Treasury bill maturities is clear. The former transfers money from the clearing banks to Public Deposits at the Bank—witness the contraction of £10,300,984 in Bankers' Deposits, as against the increase of £11,284,341 in Public Deposits; this year the latter has simply caused money which normally would have been available in the market to disappear into the Bank.

* * * *

So far the rise in Bank rate has had the desired effect upon the Bank's gold stocks, which this week have risen by £236,929. The New York exchange, however, is still lower than is desirable. The banking department's reserve has expanded by £5,058,158, and its proportion to 50¼ per cent., but these changes are due to the return of £4,821,229 of notes from circulation—possibly the result of tax payments by those who prefer to make them in currency. It is clear from the Bank return as a whole that the Bank has not used this accession to its reserve as a ground for easing the monetary situation through its open-market policy.

	Feb. 14, 1929.	Feb. 7, 1929.	Jan. 31, 1929.	Jan. 24, 1929.	Previous Rate and Date Changed.
	%	%	%	%	%
Bank Rate.....	5½	5½	4½	4½	4½ (Feb. 7,'29)
Banks' Deposit Rate..	3½	3½	2½	2½	2½ (Feb. 7,'29)
Discount Call.....	3½	3½	2½	2½	2½ (Feb. 7,'29)
Houses Notice.....	3¾	3¾	2¾	2¾	2¾ (Feb. 7,'29)
Market rate (3 months' bills)	5¼	5⅛–⅛	4 5/16	4 5/16	...

This suggests that now the Bank feels that its immediate duty is to make its new rate effective. At the end of last week market rate was only a shade over 5 per cent. This week's stringency has driven it up to a full 5¼ per cent., which is possibly more in accordance with the level the Bank thinks advisable. Even so, Thursday's degree of stringency appears a little extreme, though the weakening of the New York exchange to 4.85¼—*i.e.*, nearly back to the gold point—possibly justifies the exercise of a firm control. Meanwhile, the discount market is noticing a slightly better foreign demand for bills as the result of the higher rates now in force, but on the other hand fears are being expressed lest the same cause may divert a certain amount of acceptance business from London to other centres, particularly to Amsterdam.

NEW YORK MARKETS.

Our New York correspondent cables:—The Federal Reserve statements show continued sales of bills, and, this week, of Government securities. The discounts of the whole system have risen by $52 million. Gold imports of $22 million are recorded, which have temporarily eased the rate for call money and lifted the ratio by one-half per cent., despite an increase in circulation. The New York Bank is responsible for all the rise in discounts. There are some indications of a movement of funds to the interior, with brokers' loans down by $100 million. The maintenance of the 5 per cent. discount rate is anticipated in New York, any change being expected to be made in other districts first. Business shows a normal spring gain, with railroad traffic higher than a year ago, steel output near record levels, and the activity of the motor industry increasing.

THE STOCK MARKETS.

The change in Bank rate continued to exercise a dominating influence on the course of prices. All securities of an investment character slowly fell back, led by British Government stocks. The three Home Railway dividends announced on Wednesday on the whole satisfied expectations, but the immediate improvement in price quotations did not last long. Industrials were quiet and generally dull, a "bearish" statement by the chairman of Courtaulds being a feature of the week. Few buying orders came over from America. Rubber and oil shares improved somewhat, but teas weakened. Mines were less active than of late, quietude enveloping even Rhodesians, and the upward movement of tin shares, reported a week ago, entirely ceased.

THE COMMODITY MARKETS.

Market reports this week, though uneven, are on the whole encouraging. Coal prices continue to be very firm, and most branches of the iron and steel trade report increased activity. Manchester is suffering from poor export trade, though the improvement in the home market is maintained. The wool trade is badly hampered by lack of confidence in wool values coupled with slackness in manufacturing demand. Raw jute is firm, and the position of spinners and manufacturers is satisfactory. Hides are falling and the leather and allied trades are in consequence unsteady. Oil seeds are firm and oils have risen. Wheat is substantially dearer.

FOREIGN EXCHANGES.

Greater activity was noticeable, accompanied by irregularity in the movements of most foreign exchanges, but although there was some reaction from the best levels, the effect of the change in the Bank Rate was evident in the strength of sterling against the Continent and America. New York stood at 4·85⅝ after being 4·85⅞ on Friday, and Montreal at 4·86⅝. Paris went to 124·28 after touching 124·35, and Brussels lost over three points at 34·92½. Madrid was again erratic at 30·85, as was Amsterdam at 12·11¼. Berlin was weakish at 20·45⅜ after being both higher and lower, and so was Geneva at 25·23½. The Scandinavian currencies all lost fractionally on balance, and Vienna moved from 34·51 to 34·55. The South American exchanges remained unaffected, but in the Far East the rupee showed weakness at under 1s. 6d., although it came back on Thursday to that level. The yen was also weak, having lost 3/32d. at 1s. 10 13/32d., and Batavia lost ⅝ at 12·14⅝. A readjustment of forward quotations inevitably followed the Bank Rate change, Paris being now at premia of 9 and 16 centimes, Brussels of ½ and 1½ centimes, and Amsterdam of ⅝ cents and 1¼ cents for the two periods. The silver market was quiet with China closed for holidays and India inactive through political disturbances, and both spot and forward prices lost 3/16d. in the absence of support. Both Hongkong and Shanghai reacted in sympathy, the former losing 3/16d. at 2s. 0⅛d. and the latter ⅛d. at 2s. 6⅞d.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following companies:—Sun Life Assurance Society, Gas Light and Coke Co., South Metropolitan Gas, Wandsworth, Wimbledon and Epsom District Gas, Tilling and British Automobile Traction, Sterling Trust, Standard Trust, Railway Debenture and General Trust, Railway Share Trust and Agency, Ampat (Sumatra) Rubber Estates, V.O.C. Holdings, S.T.D. Motors, Whittaker Automatic Looms, Aeonic Radio, and San Francisco Mines of Mexico. The Governor of the Gas Light and Coke Co. referred to the possibilities of low-temperature carbonisation. The Sun Life Assurance chairman's speech dealt with the growing popularity of staff schemes of superannuation by means of endowment insurance.

THE MINORITY DILEMMA.

The amount of attention attracted by recent speeches of Sir Herbert Samuel, in which he explained what the Liberal Party would not do in the next Parliament, is in one sense disproportionate to the significance of his much-discussed pronouncements. Whether or not his statement "That in any eventuality the Liberal Party would not again lend support to the installation and maintenance in office of a Socialist Government" represented a slight modification of Mr. Lloyd George's declaration at Yarmouth that the party would not repeat the "disastrous experiment of 1924," or meant quite simply (and, it may be added, obviously) that the party would never again give a Labour Government a blank cheque, it is possible to agree with Sir Herbert Samuel's view that "a discussion of a wholly problematical character dealing with circumstances which will very possibly never arise" is at the present juncture somewhat premature. The practicability of a pre-election pact is not in question, and each of the three political parties will fight the approaching General Election in a position of complete independence, with the attainment of a self-contained majority in the next Parliament as their objective.

Yet, in another sense, the interest which Sir Herbert Samuel awakened is a measure of the concern with which the potential results of the General Election are being regarded by the more thoughtful sections of the electorate. The House of Commons, as the public knows, is furnished with only two lobbies; and, with due respect to Sir Herbert Samuel, "circumstances" may very probably arise in which no single party in the next Parliament can command a clear majority of its own. What then? Clearly, if the King's Government is to be carried on, there must either be a coalition (ill-sounding word in English ears) between two of the three parties, or one party must be installed in office as a minority Government dependent on the support—unconditional or on terms—lent to it by one of the two other parties. Viewing the field of politics, as we do, not from the standpoint of party strategy or advantage, but solely from the aspect, as we see it, of the public interest, we consider that the issues involved in Government by minority are a matter on which it is right and proper that opinion should be fully exercised before the General Election fever robs the country of proper opportunity for sober consideration.

The problem, however, has wider implications than those with which Sir Herbert Samuel was concerned. "*Suave mari magno*"—the Conservative and Labour parties, both standing at present on the *terra firma* of relative numerical superiority, are well content that Liberal candidates, as members of the party most likely, it may be thought, to be in the position after the General Election of holding the balance of power, should be placed in the dilemma of having to answer the edged question: "Into which Lobby will you go if you are elected, and if another party holds office?" In reality, however, the dilemma confronts all three parties in the State, and the question, hypothetical though it be, might equally well be addressed to every candidate. Given three parties, and the vagaries of our electoral system, the Conservative and Labour parties may possibly each in turn have to determine sooner or later whether or not to turn out of office a Government from whose policy they dissent, and whether or not to co-operate in Parliament, or in office, with a party whose tenets are in some degree repugnant to their own.

This being so, the extent and limits of what Mr. Lloyd George described as the "vast and fertile territory common to men of progressive minds in all parties," becomes a question for careful examination before "circumstances," in which rapid decisions have to be taken, arise. Our distinguished contemporary, the *Manchester Guardian*, which has recently envisaged the formation of "a great middle party of the progressive forces of the country," published last week an interesting series of articles by Mr. J. A. Hobson, the thesis of which was that between the Liberal and Labour parties there is sufficient common ground, in the sphere not only of domestic and foreign "politics" but of economic action, to make co-operation between them both practicable and, certainly, preferable to a "three-party stalemate" whose continuance might endanger our Parliamentary institutions and our well-being as a nation. It is a thesis from which a number of Liberals—keenly apprehensive of the doctrinaire Socialism of the Labour Left—will dissent. Unobjectionable, also, as they may consider Labour's foreign policy likely to be, they will not only want to be reassured that self-protection of Labour by Trade Unionism does not lead to insidious demands for Protection by tariffs, but will feel that, though the day for rigid *laisser faire* individualism may long have passed, and though the majority of the Labour Party may be steadily retreating from the extravagances of revolutionary Socialism, a closer affinity may still be found between Liberalism and the attitude of modern Conservatism, as exemplified by certain of Mr. Baldwin's more progressive supporters, not only in respect to the relationship between the State and industry, but in the still more fundamental conception of the individual right to liberty.

On the other hand, there is an impassable gulf between Liberalism and the tariff policy to which Mr. Baldwin is increasingly committing his party, while the purely negative view of the economic functions of the State, which the Conservative Party as a whole—setting aside the spirit of complete reaction crystallised in the Right Wing—tends to entertain, is quite alien to the constructive programme on which Liberals are basing their appeal to the electorate. There are, moreover, some Liberals who are inclined to argue that, if this programme cannot be realised by their party unaided, better an alliance, for the programme's fulfilment, with a party who would "go further," if they could, than a *mariage blanc* with a Conservatism reluctant to move at all. It is clear, therefore, that short of one party obtaining a clear majority in the House of Commons, the "stabilisation" of the next Parliament is likely to be precarious and difficult. The formation of a "Centre Bloc" appears to us to involve so sweeping a departure from our traditional party system as to be almost incapable, under existing conditions, of realisation, and to afford small prospects of enduring, if such a break-up of party homogeneity were brought about. Failing such a "Bloc," and since we may dismiss the idea of a Conservative-Labour *rapprochement*, there remain the possibilities, firstly, that Government might be carried on by a Liberal Cabinet, tolerated grudgingly by two Opposition parties, each dissenting (for different reasons) from Liberalism's distinctive principles; secondly, that the Liberal Party might agree to support conditionally either a Conservative Cabinet pledged to reverse its policy of "encroaching Protection," or a Labour Ministry sworn to refrain from Socialism. The first alternative, involving, as it would do, the repeal at the earliest possible date of every existing protective duty, would be unacceptable to large numbers of the Conservative Party; the second would be rejected in all probability by the more impetuous elements on Mr. MacDonald's Left. Neither alternative is suggestive of stable Government or the pursuance of consistent, constructive policy, since both imply a Cabinet hesitatingly carrying out on sufferance a programme emasculated as the price of office.

In sum, it is idle to pretend that the country is not faced with possible, even probable, political eventualities which will test severely our capacity both for commonsense and clear thinking. While it is needless to speculate too closely on Election chances, there are real prospects, as parties are now aligned, of a situation arising pregnant with confusion and complicated by the fact that, as we have seen, both in economic and "political" spheres (if the distinction may be allowed), party tenets in many ways interlock and divide, to the electorate's further mystification. Amid a welter of uncertainties there are three things which seem to us so probable as to amount almost to certainties. They are these:—That the Three-Party system has come to stay;

that the political genius of the British people should not find it impossible to solve the problems which that system creates; and that first among the measures leading to such solution will be a radical reform of the present method by which the House of Commons is elected by the people.

THE FREEDOM OF THE SEAS.

LAST week we drew attention to the Reed Amendment which was incorporated in the Cruiser Act as the Act passed the Senate at Washington. This clause calls for the negotiation of treaties to establish the inviolability of private property in war-time at sea. In commenting on this, we remarked that it presupposed the conditions of international life which obtained before the conclusion of the Kellogg Pact—conditions under which any sovereign state had the right to make war against any other for its own purposes and at its own discretion, so long as it did not incidentally make itself an intolerable nuisance to those third parties who remained "neutrals." Under this old international dispensation, which has just been superseded, the rights of "neutrals" were the necessary corollary to the right of private belligerency for national ends; and we suggested that, with the abolition of the right of war as an instrument of national policy, the rights of neutrality would cease automatically to be what they formerly were. We might put the same point in another way by suggesting that the former separate and antagonistic rights of belligerents and neutrals in a world in which war-making was lawful will now give place, in case of any future war, to a single system of obligations all arising out of the Kellogg Pact.

In past wars there have been only two juridical categories of States, the neutrals and the belligerents; and there was no distinction between the belligerents on the two sides which placed them in different positions *vis-à-vis* the neutrals juridically. Under the new dispensation there will be, in case of war, not two categories of States but three—the differences between their positions being determined by their conduct in regard to the Kellogg Pact, to which they will all be parties. There will be one party, or group of parties, to the Kellogg Pact which will have violated the Pact by resorting to war as an instrument of national policy; there will be another party or group of parties which will be at war without having violated the Pact, because they will be either exercising the right of self-defence which the Pact allows or else assisting in the defence of their neighbours; and, finally, there will be a third group of parties who will be in the same camp as the second group inasmuch as they will be abiding by the Pact, but will be in a different position inasmuch as they do not find themselves called upon to join in opposing the violator of the Pact by force of arms.

Will the members of this third group be "neutrals" in the old sense of the term? Hardly, since it is the essence of neutrality to make no juridical distinction between the belligerents on the two sides, and it is impossible to see how, under the Kellogg Pact, this juridical ban upon discrimination between the two sets of belligerents can obtain. If a war arises, it can only arise through some party to the Kellogg Pact having violated it; and other parties to the Pact, who are fortunate enough to find themselves not directly and immediately involved in the war, will be bound to ask themselves the question: Which of the parties now at war is guilty of having caused the war by violating this Pact of which we are co-signatories? The country which is not at war, if it happens not to be a member of the League of Nations, will not, of course, accept *a priori* the decision of the Council of the League as to which of the fighting parties has committed the breach of the Pact; but it can hardly refrain from coming to a decision on this question on its own account, whether that decision happens or not to agree with the Council's.

The reason why it will be bound to make up its mind on this matter is that, having become a party to the Pact, it has incurred an obligation to do everything within reason to see that the Pact is kept and that violators of the Pact are brought to book. In any given case of violation, it may not be reasonable that this or that State should go the length of taking up arms in defence of the Pact; but there can presumably be no circumstances in which it would be reasonable for a party to the Pact to treat a State which it believed to have violated the Pact on the same juridical footing as a State or States which it believed to be fighting either in self-defence or in the defence of victims of violation of the Pact, and in resistance to the Pact-breaker. Any party to the Pact, when it had made up its mind as to which of the belligerents was the culprit, would logically be obliged to take sides, at least passively, by refusing to extend to the outlaw the same treatment as it gave to the parties which were at war without having violated the Pact. This obligation would be important in proportion to the importance of the behaviour of the non-belligerent States in deciding the issue of the war; and clearly in certain circumstances, the importance of their behaviour would be capital. The concrete question is whether, in case of a violation of the Kellogg Pact, a non-belligerent State shall claim the same rights against, and therefore impose the same restrictions upon the action of, the non-violators and the violators of the Pact when these are at war with each other because a violation has been committed.

This question is very much in our minds in Great Britain; but it has also exercised the minds of statesmen in the United States, and Senator Capper's resolution is an attempt to solve the problem which it raises. It is therefore interesting that the Senator has brought his resolution before the Senate again in a new form, immediately after the passage of the Cruiser Act containing the Reed Amendment above-mentioned. The gist of the Capper resolution is that, in case of a violation of the Kellogg Pact which does not involve the United States in belligerency, the United States should, nevertheless, not behave as a neutral in the old sense, but should discriminate against that belligerent which she considers to have been the violator of the Pact and in favour of the other belligerent or belligerents whom she considers to be acting within the four corners of the Pact either by exercising the right of self-defence or by assisting a party which has been attacked to defend itself against the violator.

Senator Capper proposes that the American Government should place an embargo on the export of war material from the United States to any country which the United States regards as a violator of the Pact, and, further, that it should not support private American citizens who give "aid or comfort" to the violator State. Presumably this means that the American Government would not intervene on behalf of such private American citizens if, in aiding the violator, they exposed themselves to sanctions at the hands of the belligerents in the opposite camp. Such American citizens would, indeed, be acting against the policy of their own Government, and it would therefore only be natural that their own Government should wash its hands of them if they got into trouble with other Governments in this bad cause.

In effect, Senator Capper says to Senator Reed: "Whenever it is a case of neutrality in the old sense, I agree with your demand for the inviolability of private property at sea; but I do this on one condition: whenever it is a case of a violation of the Kellogg Pact, the old rights of neutrality ought not to be insisted upon if insistence on them means treating the violator of the Pact and the parties who are up in arms against the violator on a footing of equality. For in this situation the two belligerents are not on an equal footing juridically. *Ex hypothesi*, one has brought on the war by violating the Kellogg Pact, and the other has not; and it is the duty of third parties to discriminate between them, since these third parties are also signatories of the Pact and are therefore under an obligation to do all that they can reasonably be expected to do in order to see that the Pact is upheld."

This is the issue which has just been raised in the Senate at Washington by the introduction of the Capper Resolution immediately after the passage of the Reed Amendment in the Cruiser Act. The Senate's actions are harder to predict than those of almost any other legislative body in the world, and prophecy is therefore idle. It may merely be noted that Senator Borah has declared himself against the Resolution; and this is rather a bad omen for its fortunes. Yet, whatever the fate of the Capper Resolution

may be, it is all to the good that it has been brought forward, because it will cause the issue which it raises to be closely debated and considered. Sooner or later, this issue will have to be discussed between the United States and Great Britain; and this future international discussion is much more likely to have fruitful results if the ground has been prepared by previous discussions in each country.

THE DIRECTION OF OVERSEAS TRADE.

WITH the January returns of overseas trade, to which reference is made on a later page, are published the customary statistics showing the countries of origin of imports and of destination of exports and re-exports for the past year. In the "Board of Trade Journal" these figures are supplemented by an analysis showing the proportions of our trade with various parts of the world to that total, trade with the Irish Free State being omitted:—

	Imports from		Exports to		Re-exports to	
	Foreign Countries	British Empire.	Foreign Countries	British Empire.	Foreign Countries	British Empire.
	%	%	%	%	%	%
1913	75·13	24·87	62·82	37·18	87·58	12·42
1925	70·37	29·63	60·82	39·18	89·40	10·60
1927	73·13	26·87	57·44	42·56	88·92	11·08
1928	72·98	27·02	58·05	41·95	88·23	11·77

In comparing 1928 with the preceding year, regard must be paid to the abnormal conditions prevailing in the early months of 1927. During those months our imports of coal were still considerable, as contracts entered into during the closing months of the coal stoppage had not expired. Partly for the same reason, imports of iron and steel were also unusually large during those months. As all these imports came from foreign countries, the result was an artificial depression of the Empire percentage and an inflation of the foreign percentage. The changes in both percentages recorded between 1927 and 1928 are partly a measure of the disappearance of this artificial factor, though a comparison of the 1925 and 1928 import percentages shows a distinct swing in favour of foreign countries. The same tendency is noticeable in the export percentages, and the day is still far distant when Empire trade is likely to become an adequate substitute for trade with the world at large.

In the next table, which summarises the distribution of our trade geographically, trade with the Irish Free State is also omitted:—

Class of Trade.	Europe.	Africa.	Asia.	North America.	South America.	Oceania, etc.	Total.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Imports:							
1913	40·53	6·10	12·71	23·86	9·06	7·74	100·00
1927	37·01	7·16	13·45	24·19	9·59	8·60	100·00
1928	36·61	7·86	12·30	24·10	10·10	9·03	100·00
Exports (British Produce):							
1913	34·64	9·87	25·20	11·99	9·59	8·71	100·00
1927	30·27	11·99	23·58	13·15	8·93	12·08	100·00
1928	29·95	11·82	23·64	13·90	9·67	11·02	100·00
Exports (Imported Merchandise)							
1913	56·02	3·31	2·48	32·26	1·97	3·96	100·00
1927	68·27	3·51	2·63	21·30	1·31	2·98	100·00
1928	66·43	3·83	2·49	22·98	1·49	2·78	100·00

The decline of 1.15 per cent. in imports from Asia reflects mainly the fall in rubber prices, for all these percentages are based on the value, not the volume, of imports. The slight recession in the European import percentage is possibly due to the decline in our iron and steel imports noted above. On the export side, the most encouraging feature is the increase in both the American percentages, that for North America being in 1928 practically two points greater than it was in 1913.

A more detailed analysis of the figures shows the fluctuations in trade with various countries. The appended table compares imports and and British exports to the principal European countries with those of 1927, 1925 and 1913:—

* Including Esthonia, Latvia and Lithuania.

The totals show that the balance of trade between Great Britain and Europe has moved unmistakably in favour of this country. Imports between 1927 and 1928 fell by £13.8 million, and exports rose by £7.0 million, making a total gain on balance of £208.8 million. The

The next table gives similar details for trade between Great Britain and America:—

(000's omitted.)

	Imports from.				Exports to.			
	1913.	1925.	1927.	1928.	1913.	1925.	1927.	1928.

Total	257,812	451,087	395,279	390,127	136,000	184,457	159,910	166,319

Here again there has been a distinct movement in favour of Great Britain, imports having fallen by £5.1 million and exports risen by £6.4 million.

The next table deals with purely Imperial trade. Here imports have fallen by £2.4 million. This is due entirely to the rubber situation, as imports from Malaya and the Straits Settlements have shrunk by £9.0 million. Apart from this factor, imports from the Empire have definitely increased. Exports show a slight improvement of less than a million pounds:—

	Imports from.				Exports to.			
	1913.	1925.	1926.	1927.	1913.	1925.	1927.	1928.

Irish Free State	...	43,394	43,247	45,144	...	40,162	36,200	35,136
Other Possessions	6,955	24,374	23,658	24,852	14,249	29,916	24,125	25,834
Total from Possessions	191,516	429,721	366,661	364,215	195,307	334,921	326,650	327,560

The final table deals with re-exports. Here 1928 is not quite so good as the previous year, but inasmuch as one of our principal re-export trades is that of raw rubber it is clear that these figures, too, have been given an unfavourable bias by last year's collapse in rubber prices:—

RE-EXPORTS (000's omitted.)

It remains to consider the conclusions suggested by these returns. The first is the old lesson that all statistics need very careful interpretation. The abnormal coal and steel imports of 1927, and the distortion caused by the slump in rubber prices in 1928, both emphasise the need for care. The second emphasises the extreme difficulty of moving the world's trade from its accustomed channels. Despite the intervention of the greatest war in the history of the world, the 1928 percentages of British trade with the six continents are little different from those of 1913. A slight contraction in the European figures, with the consequent increase spread over the rest of the world is the most striking change in the direction of trade which the figures show. This suggests in its turn another lesson, and that is that it is far easier to arrest the stream of trade than to divert its flow. It is a lesson that has been known for many years, but which Governments all the world over have been prone to ignore. It is that a barrier to check trade can easily be made effective. A barrier to divert or to conserve trade is almost certain to fail.

IRON AND STEEL IN 1928.

THE production of British steel in 1928 reached 8,525,100 tons, and was higher than in any other post-war year except 1920 and 1927. Any complacency which the latter comparison may suggest, however, quickly disappears when the year's output is considered in relation to the ruling factors in the industry at the present time, such as the steel-making capacity of Great Britain, the increased production of other countries, the prevailing level of prices, the amount of unemployment in the industry, and the financial results achieved by representative concerns.

The capacity of the industry was so greatly expanded during the war that a production exceeding that of 1913 by only 11 per cent. leaves the industry operating at less than 70 per cent. of capacity, a state of affairs which tends to maintain costs at a relatively high level. The increase of 11 per cent., moreover, compares with a rise of 60 per cent. in the United States, and 28 per cent. in the countries of Western Europe taken as a whole. Another cause of dissatisfaction to manufacturers is the low prices obtained for iron and steel products. Largely owing to Continental competition, prices have been driven down until in August last they were on the average no more than 11.7 per cent. above 1913. The most satisfactory feature of the year was, in fact, the gradual hardening of prices in the autumn, until in December they were 12.3 per cent. above the pre-war level, with a tendency to rise still further. The Ministry of Labour's figures showed that unemployment averaged 20.9 per cent. throughout the year, while our quarterly analyses of industrial profits afford a testimony of the meagre financial results obtained by many of the largest companies in the industry.

December	132	540·4	683·1	183·6	358·7

If the position with regard to steel production is unsatisfactory, that of pig iron is worse, production in 1928 amounting to only 6,611,300 tons, an amount 36 per cent. less than in 1913, and no higher than in 1871. This state of affairs was due partly to a decline in exports, partly to the increased use of scrap in steel making and in iron foundries, partly to the depression in the wrought-iron trade, and partly to the depression in the shipbuilding and other iron-using industries.

Imports of iron and steel, though lower by some 1,510,000 tons than in 1927, when they were abnormally high owing to the results of the coal stoppage of 1926, were higher than in any previous normal year. Two bright spots in an otherwise depressing picture were that total imports of iron and steel in the last quarter of the year were 164,500 tons less than in the first quarter, and that imports of pig iron, which reached the very high total of 579,300 tons in 1927, were reduced to 93,700 tons in 1928, and were, in fact, little more than half the imports of 1913. This suggests that British makers are able to hold their own in those cases where the labour element in the cost is low. Imports of semi-finished steel were 36 per cent. above those of 1913 and of finished products 40 per cent. Although imports of pig iron have been so substantially reduced, prices have not fallen sufficiently to stimulate exports, and the fall in the total exports of iron and steel between 1913 and 1928 of 700,000 tons is very largely accounted for by the decline in pig-iron exports. If pig iron be excluded, exports of other kinds of iron and steel compare not unfavourably with 1913. A large part of the decline in the exports of pig iron is due to reduced exports to Continental markets, and there is no doubt that, but for tariff barriers, substantial quantities of pig iron would again be exported to France and Germany, since the Press of both countries is constantly complaining of the competition of British pig iron, which tends to keep down prices. It is significant that Belgium, where the tariff on pig iron is very small, imported as much pig iron from Great Britain in 1928 as in 1913. Other markets consuming less British pig iron are India and Australia, who are now self-supporting, Japan, who now supplements her home production from India instead of from Great Britain, and the United States, from which we are largely excluded by the tariff.

The reasons for the continued depression in the industry continue mainly to be those set out in these columns in previous years. Among these may be specially mentioned the advantages Continental producers possess in lower capital charges, lower charges for rates, taxes and social services, the disparity in the internal and external purchasing power of the French and Belgian currencies, and, especially, the lower wages and longer hours worked on the Continent. Wages on the Continent have a tendency to rise, but even now the rates paid in the United Kingdom are 33 per cent. higher than those prevailing in Germany, which, in turn, are 50 per cent. higher than in France and Belgium. Although rationalisation and increased efficiency can scarcely overcome all these disadvantages, the industry is taking noteworthy steps in this direction, as is evidenced by the arrangements already made between Vickers-Armstrongs and Cammell Laird and Cargo Fleet and South Durham; the negotiations now pending between Bolckow Vaughan and Dorman Long, and between the Wigan Coal and Iron Co. and other interests, to mention only the most outstanding examples.

A further measure which will tend to reduce the difference between British and Continental costs is the reform in the archaic rating system, which, as from October 1st next, will relieve productive industry of 75 per cent. of its local rates. The industry will also benefit to some extent from the provision which requires the railway companies to pass on the benefits which they secure from the derating measure to certain selected traffics, including materials for the iron and steel industry. Among movements initiated by the steel makers themselves, the Rebate Scheme—whereby, in return for price concessions, shipbuilders undertake to purchase nothing but British steel—is having good results, and is now subscribed to by practically the whole of the shipbuilders of the country. In the sphere of export trade, Mr. A. Dorman informed the shareholders of his company in December last that "an export selling committee has been formed in an endeavour to meet foreign competition," and it is understood that this committee is obtaining useful results. In the international sphere the chief feature of 1928 was the agreement arrived at between the tinplate manufacturers in South Wales and those of the United States, whereby the combined exports of the two countries were shared in the proportions of 70 per cent. to the United Kingdom and 30 per cent. to the United States. This agreement is supported by 415 out of the 438 tinplate mills in South Wales, and should be of substantial benefit to the tinplate trade.

A NEW INDEX NUMBER OF WAGES.

A new series of index numbers, compiled by Dr A. L. Bowley, has been published by the London and Cambridge Economic Service. It is designed to provide a measurement of the movements of average wages in this country month by month since December, 1924, in relation to their level both at that date and at July, 1914. Estimates have from time to time been published by the Ministry of Labour of the average increase in weekly rates of wages since July, 1914, but these estimates have avowedly made no attempt to reflect changes in average earnings resulting from the operation of such factors as increases in the efficiency of machinery, the extension of payment at piece-rates, and changes in the proportions of workpeople employed in different occupations and industries. Index numbers hitherto published by the London and Cambridge Economic Service have taken partial account of some of these factors, and thereby shown a somewhat higher percentage of increase than the Ministry of Labour estimates. Professor Bowley's new series is intended to measure, at December, 1924, the change since July, 1914, in the average level of a week's earnings of all fully or partially employed manual workers, and for subsequent dates to reflect the average change in rates of wages, month by month, until it can be rectified by further information upon earnings. The belief is expressed that since 1924 the movement of earnings cannot have differed significantly from the movement of rates of wages.

The 1914 level of earnings is arrived at by adjusting, industry by industry, the results of the 1906 official census of wages in correspondence with the recorded changes in rates of wages between 1906 and 1914. For the 1924 earnings the results of the 1924 official enquiry into earnings are used. Comparison of these two estimates yields increases in average weekly earnings, between 1914 and 1924, ranging from 63 per cent. in coalmining to 147 per cent. for printers, the general (weighted) average being approximately 95 per cent. The index numbers of subsequent changes are based on a comparison of rates of wages at December, 1924, and later dates, in a selection of twenty occupational groups.

The figures for selected dates related to the level of wages (a) in December, 1924, and (b) in July, 1914, taken in each case as 100, are reproduced below, together with the Ministry of Labour cost-of-living index numbers for the same dates:—

	Base: Dec. 1924 = 100.		Base: July, 1914 = 100.	
	Wages.	Cost of Living.	Wages.	Cost of Living.
1924—Dec. 1	100	100	195	181
1925—March 1	101	99	196½	179
Nov. 1	100½	97	196	176
1926—March 1	10 ½	95	196	172
1927—March1	101	94½	197	171
Nov. 1	100½	94	196	169
1928—March 1	100	91	194½	164
Nov. 1	99½	92	194	167

On this computation average "real" weekly earnings for workpeople in employment had risen about 6 per cent. between July, 1914 and December, 1924, and 16 per cent. between July, 1914, and November, 1928. These are, of course, the increases in weekly earnings; in view of the shortening of the working week the hourly increases are greater.

The bearing of such statistics on questions affecting the conditions of the workers gives these conclusions a more than academic interest, and special attention is likely to be focussed on the difference between the increase of 94 per cent. in average earnings between 1914 and the end of 1928, as measured by these index numbers, and that of 70 to 75 per cent. in weekly rates of wages, as estimated by the Ministry of Labour. The movements in wages between 1924 and 1928, which have been very slight on the average, show a close correspondence in both series of figures, and the origins of the wide margin between the levels of the two sets of estimates in relation to July, 1914, are to be sought in the increase of earnings, as compared with time rates, between 1914 and 1924. Professor Bowley states that certain assumptions have been neccesary for the purposes of these comparisons, e.g., as to the changes in earnings between 1906 and 1914 in industries included in the official enquiries into earnings in 1906 and 1924, and as to the increases in industries covering about one-fourth of the men and more than half the women, for which no definite information exists. The

proportions of increase which he records for different industries certainly show some surprising disparities, and he notes that there is a doubt as to the accuracy of some of the figures. The opinion is expressed, however, that the general average for all industries is more accurate than some of the averages for individual industries, and that after consideration of all the sources of error the increase of 95 per cent. is the best estimate that can be made for 1924. The publication in greater detail of the calculations leading up to this figure, including the average earnings for each industry in 1914 and 1924, from which the percentages of increase have been computed, would be of considerable interest to students of wages problems, and it is much to be hoped that Professor Bowley may find an opportunity to expound his detailed treatment. In the meantime it is important to note that the estimated increases in earnings of 95 per cent. in 1924 and 94 per cent. at the end of 1928 are expressly stated to take no account of the effects of increased complete unemployment since 1914. An allowance for this factor would, of course, materially reduce the figure.

Professor Bowley very appositely remarks that a variety of purposes is served by measurements of average wages, and to each purpose corresponds an appropriate definition and method of computation. It is important that this warning should be borne in mind in any use to which his new series of figures may be put. Their primary object is to measure the changes in the average earnings of all manual workers, from whatever causes these changes may arise, and they therefore include within their scope changes in the average wage resulting, for example, from the upgrading of workers, from alterations in the proportions of males and females, adults and juveniles, in employment. Whilst index numbers on this basis are specially adapted for use in measurements of changes in the total income of employed wage-earners or in connection with computations of the national income, they are perhaps less suitable for application in the solution of problems as to the adequacy of the remuneration of particular classes of workpeople. In the consideration of such questions index numbers designed to measure the amount of changes in rates of wages unaffected by variation in average earnings resulting, for example, from the abolition of the half-time system and the raising of the school-leaving age, will still retain their value.

THE PLIGHT OF MARINE INSURANCE.

(BY AN INSURANCE CORRESPONDENT.)

THIS is the stocktaking time of the year for the marine underwriter, when his thoughts are busied with hopes, fears, calculations, comparisons, first year, second year, and third year settlements. If he is a Lloyd's underwriter, he is thinking of the balance sheet that he will be presenting to his "names," of what they will say to the distribution that he may or may not be going to make, and of how much he can put to reserve out of the profits, or how much he must take from reserves to make good his loss. If he is a company underwriter, he is thinking of his directors and the published balance sheet for which he will be responsible, and of what the market will think of his figures when they are made known.

Not many underwriters this year can look forward with any cheerfulness to this disclosure. The year 1926, which has just been closed at Lloyd's, was a thoroughly bad year, and only here and there is an underwriter to be found who will finish it on the right side, while there are not many companies who will show any good result for 1927—a year closed by most of them in their published balance sheets at the end of 1928. The Indemnity Company, which published its balance sheet at the end of January, has a poor tale to tell, and there are rumours of still worse results to come when other companies offer their marine figures to the world. The dividend of the Indemnity, which was reduced last year from 34s. to 32s., is reduced this year from 32s. to 28s. and, so far as the figures can be traced, neither 1926 nor 1927 nor 1928 can result in anything but a loss. The actual loss cannot be ascertained because the figures are shown only for the first two years. For those two years, like the Serpentine in Kensington Gardens and Hyde Park, they run on the surface and then, like the Serpentine, they dive underground and are seen no more. For 1926, 1927, and 1928 the settlement percentages shown in the accounts are as follows :—

SETTLEMENTS.

	First Year.	Second Year.
1926	31·6 per cent.	89·7 per cent.
1927	38·1 per cent.	89·3 per cent.
1928	35·3 per cent.	...

In an account that is made up largely of time business these percentages are very depressing; with nearly 90 per cent. gone at the end of the second year, the final result cannot be anything but a heavy loss, for in time underwriting a 10 per cent. balance is not more than enough to cover the fourth and fifth year settlements. With figures such as these coming from their marine departments it is no wonder that the company managers are concerned and distressed about the marine drain on the companies' profits. Sorely perplexed, they put to themselves the question: "Is there any prospect of this sick marine market recovering within a reasonable period, or are we to go on year after year either losing money or patting ourselves on the back because we have just not lost it?" If the sick man does not recover it will not be for want of consultations and advisers, for there never was a time when remedies were so much under discussion and the consultants so numerous and so vocal. But with all the discussion the market cannot settle down to a single remedy, and the pull of divergent forces and opinions is still dragging it all ways at once.

There are in marine insurance two schools of thought, that for convenience may be classed as the co-operative and the individualist. They are always more or less at issue with one another and their strength usually varies with the prosperity of the market. In good times, when rates are reasonably high and profits not difficult to make, the individualist generally has things all his own way; but in bad times the instinct to hang together for fear of hanging separately reasserts itself; men band themselves into agreements and fix as best they may the rates, terms and conditions on which they are prepared to write. Within the past twelve months the co-operative school has made a desperate attempt to capture the marine market, and in time business particularly (which has been far more unprofitable than voyage) its efforts have been tremendous. The movement has been directed mainly towards two points, (1) a 10 per cent. rise in all time rates; (2) the respecting of the lead. It cannot be claimed that the movement has been either a full success or a complete failure. The co-operative school has not been strong enough to force, as it hoped to do, an increase of 10 per cent. on all time renewals, for it has been found impracticable to make the best class of owner submit to this automatic increase, and one concession after another has had to be made in the last two or three months on those fleets whose record is either clean or almost clean. But in spite of this apparent failure the movement has produced solid results; the indiscriminate renewal of fleets at the old rates without respect to their past figures has practically disappeared, and the increase of rates is probably on the whole a good deal higher than 10 per cent. Time underwriters have been forced, either by circumstance or by the watchfulness of the individualist school which stands outside agreements, to discriminate between good and bad, and to measure the rise in rates according to the record of the owner. The respecting of the lead (in so far as it is respected) has greatly helped in the rise of rates, but there is a danger, which current events are emphasising, that the leading underwriter may find his lead respected on bad business that nobody hankers after, and neglected on good business that everybody is happy to write.

In voyage business the co-operative school has been less active mainly because voyage (written with care and judgment) can even now show a profit in a normal year and because agreements for voyage underwriting are far more difficult both to frame and to enforce. The recent unhappy experience of the Plate grain rates is a warning that no underwriter is likely soon to forget. In this case a world-wide agreement, embracing England, France, Germany, Holland and America, was solemnly ratified by underwriters, who bound themselves to a scale of rates for all grain cargoes from the Plate, and was broken—almost before the ink was dry—because the independent underwriters proved to be strong enough to write the largest cover of all and wrote it so effectively that the foreign underwriters who had held the business lost it to the market in London. This sort of thing does not encourage the co-operative spirit among foreign underwriters, and in the voyage market at any rate the individualist is not likely to be driven off the field.

The truth is that under present-day conditions agreements in the marine market are extraordinarily difficult to enforce. The market is big; it is widely scattered; it is very hungry; it is very jealous for its local business; it is made up largely of agencies that are difficult to control; and there is no one body that can speak with the voice of authority for all its constituent members. There probably never was a team more difficult to drive than a team of marine underwriters, and while we may respect and admire their sturdy spirit of self-reliance and independence, we cannot withhold our sympathy from those whose official duty it is to draft agreements for them, and when drafted to see that they are enforced. Whatever the usefulness of these agreements may be, the recovery of the market depends in the long run on the common sense of underwriters and on the strength of mind required to keep off a risk when everyone knows that it cannot pay at the rate.

POLITICS AND THE NATIVE IN SOUTH AFRICA.

(BY A CORRESPONDENT.)

THERE is no feature more striking, or, indeed, more ominous, in the recent history of the Union, than the growth of a definite anti-native feeling. The phenomenon has its roots, undoubtedly, in the economic changes which have been brought about by the growth of large-scale industry in the Union. So long as the economy of the country was mainly agrarian—and largely on a subsistence basis—the native, whether he continued to dwell under tribal conditions in the reserves, or worked on the farms as servant or squatter, had a settled, if lowly, agrarian status, accepted as a matter of course. Even when the mines began to attract large masses of native labour, these stable, quasi-predial conditions persisted, for the native workers took service only on short contracts and returned to the reserves when the service was completed. Servants and squatters remained plentiful on the farms, and the settled worker of the towns, white or coloured, found his field of employment largely unaffected by the mass of temporarily migrant natives. Indeed, he derived a good deal of benefit from it in the shape of widened scope of employment afforded by the new developments which native labour rendered possible, and by the needs of the maintenance of the natives themselves. There was a real segregation of fields of labour, temporarily, at least, to the advantage of black and white alike.

To-day, however, the rapid advance of industrial production is profoundly disturbing this equilibrium. Natives are entering new fields of employment; in large numbers they are becoming permanent residents of the towns; many are showing capacity for forms of labour well above that of sheer unskilled manual toil, and contact has been established once for all with white and coloured labour in fields in which these latter, until recently, held a monopoly. Meanwhile, the demand for native labour steadily grows, and in some branches of labour natives have established a definite superiority, even at rates which are considerably higher than those usually paid to natives, rates which in some cases have been deliberately fixed in the hope of offering a chance to the established coloured or white urban worker.

A Government which had pledged itself deeply to the white worker—a "poor man's Government," as it claims to be—could not ignore such tendencies. The Colour Bar Act was passed, but is not really in operation outside the Rand mines. More effective is the "civilised labour" policy which consists essentially in a preference to white labour in all Government employment, and in the use of Government pressure to extend the range of such employment elsewhere. No great trouble is taken to determine the extra cost this involves. Wage Board awards, whether intentionally or as the result of sheer pressure of circumstance, have much the same effect. The rate next above the lowest in any industry is usually fixed at such a level as, it is hoped, will encourage employment of the white or "civilised" coloured man. The whole tendency of Wage Board awards is thus in the direction of marking off a sphere of low-paid native labour from the rest, and confining the employment of natives to the lowest level.

Nevertheless, the sheer economic value of the native continues to have its effect, and his penetration into the higher ranks of labour seems likely to take place in spite of all obstacles. Inevitably he is driven to adopt trade union methods, clumsily and confusedly enough, but with promise of ever-increasing effect as the influence of white guidance and assistance makes itself felt. Disposition to industrial organisation on the part of the native, and the steady attraction of the towns for farm-workers have, in turn, aroused the farmers and their pressure upon Government is added to that of the civilised town workers.

The net result of all these tendencies, fully exploited as they are by the vote-hunting politician, is an alarmed condition of popular feeling which can easily be transformed into definite hostility towards the native as such. It is natural, therefore, that a ready ear should be turned towards proposals which, while purporting to be directed towards the saving of white civilisation, involve, in effect, an invitation to the white man to buttress the weaknesses of his economic position—real or supposed—by the use of his political advantages as against the native. This is the real meaning of the appeal which General Hertzog has made recently for support for his declared native policy. And a desire to secure for his own party a monopoly of the driving power which is afforded by the state of feeling that has been described, is sufficient to account for the systematic effort now being made to represent the Opposition as opposed to all measures for the protection of the white man. Week by week the chance is seized to portray General Smuts as the bringer of a "Black Dominion" and as the avowed enemy of the poor white worker. The main motive is, beyond a doubt, electoral, and it would appear that the stage-setting for the coming General Election which the Government Party would like the country to accept is that of General Hertzog as the St. George of White Civilisation facing the dragon of a Black Dominion as represented by General Smuts.

Modern democratic electorates are notoriously susceptible to the operation of what may fairly be called "cinema" methods, and such a picture, painted in lurid colours and strong lines, will have its effect, in spite of the fact that General Smuts' Party is, in the mass, quite as much opposed to a liberal native policy as is the rank and file of the Government Party.

The tactics are clear enough, and truth of facts will have little enough to do with them. The main attack will be on the idea of an extended native franchise throughout the Union, beyond the strictly limited communal franchise which General Hertzog's Bill proposes. The present Cape franchise will come to an end, even though existing native voters are left undisturbed. The fight will thus be directed against a supposedly "Unionist"-dominated Opposition. The inevitable result must be to throw the whole native question into a disastrous chaos of party cross-purposes and partisan irrelevancies, and to delay indefinitely both a direct approach to the native question as such and the reconstruction of parties so as to accord more closely with the real dividing issues. At the same time, the thinly-disguised appeal to the less efficient white to eke out his economic insufficiency by the use of his political advantage, and the systematic playing upon his fears for the future, must tend to induce a state of mind in which all calm consideration of the real facts becomes quite impossible. General Hertzog, who is leader of a party keen to win an election, and who finds himself driven by party exigencies to employ such dangerous weapons for the purpose, is also Minister of Native Affairs. He is, beyond all question, a sincere and conscientious man, so the situation into

which he now finds himself forced, may well compel one to ask anxiously whether an ordinary white democracy can ever be expected to take intelligent control of such a problem as South Africa presents.

But no alterative seems possible, and the only hope lies in the education of the governing whites to a better understanding of the real forces at work.

A larger sense of African politics will have to come if the common destinies of black and white are ever to emerge from the swamps of party in which they are now so deeply plunged. Otherwise the native will come, though slowly, to the point where he is himself capable of taking charge of the situation—directly or indirectly—and then measures for the "protection of white civilisation" may wear a melancholy appearance in retrospect.

Notes of the Week.

The King.—Although the King's medical advisers have not yet been able to announce that their patient can be considered as convalescent, His Majesty's ability to travel, even though it was by ambulance, to the South Coast has marked, we may hope, the passing of yet another milestone on the long and painful road to complete recovery. The demonstrations of popular interest and esteem which attended his journey last Saturday were a fitting and eloquent testimony to the admiration which the King's brave fight in his sickroom at Buckingham Palace has won throughout the country, and to the whole nation's heartfelt wish that for His Majesty health and the Sussex spring may come hand in hand.

The Employers' Reply—The answer of the National Confederation of Employers' Organisations and the Federation of British Industries to the proposals of the Melchett–Turner Conference was announced on Wednesday. Over a year ago, when Mr. Hicks's speech at the Edinburgh Trade Union Congress opened the door for co-operation in industry, it was left to an individual employer, Lord Melchett, to evolve informal means whereby the machinery of co-operation could be brought into being. On 1st July the Melchett–Turner Conference issued an Interim Report which added to the declarations of the conference on "victimisation," trade union recognition, rationalisation, and the relation of the gold reserve to industry, the important proposal that a National Industrial Council should be formally set up to hold regular meetings for "general consultation" on industrial progress, to establish machinery for "continuous investigations into industrial problems," and to provide joint conciliation boards for use in cases where an individual industry failed of itself to settle a dispute. These proposals were accepted last September by a sweeping majority of the Trade Union Congress, whereas the two national bodies of employers who were invited to represent their side on the proposed Council have spent seven months in making up their minds. As it is, their reply is ambiguous and disappointing. They invite the General Council to meet them for the purpose of hearing an explanation of "the difficulties which stand in the way of consultation . . . through a National Industrial Council," and of examining the possibility of the three bodies, "within the limits of their respective representative capacities and powers, usefully consulting together upon matters of common interest to British industry." They express their desire for industrial peace, and "a better mutual understanding in industry generally"; but in the same breath they intimate that the Confederation and the Federation alike "cannot accept the report" of the Melchett–Turner Conference. It is regrettable that a decision of such paramount public importance should have been announced without a reasoned statement of the grounds for rejection. The initial impression made by this *ex cathedra* negative is singularly unfortunate. In default of further explanation, which, we urge, should be made public with the minimum of delay, it is difficult to appraise finally the employers' attitude. The long delay in coming to a decision, the terms of the lamentable manifesto of the British Engineers' Association, and the known opposition on the part of other Employers' Associations to the principle of "national," as opposed to "sectional" negotiations with organised labour, had already served as a warning that serious obstacles lay in the path of complete agreement on the Interim Report. The best that can be said of the present development is that the door leading to the co-operation which we believe to be vital to the future of British industry is at least not shut. The proposed meeting between the three national bodies will be a meeting for the first time officially representative on the employers' side, and though the cautious terms of the letter published on Wednesday are indicative of an industrial conservatism for which the day has passed, we hope that no feelings of disappointment will prevent the General Council accepting the new invitation. It is a critical moment when all whose words carry weight should refrain from hasty comment. Deep disappointment at the loss of an immense opportunity must not be allowed to cloud our perspective, or to shut out of mind the possibilities that still remain. If the two groups of employers will publish their reasons and motives quickly, if the Trade Union leaders will show a little more of that patience which they have so admirably displayed, if the Melchett group, eschewing pique at the rebuff dealt to them, will use their good offices in *liaison*, we may yet see an admittedly dangerous situation turned to good. But let employers reflect upon the undeniable fact that if the Melchett conference is in reality to be nullified and its valuable pioneer work thrown away, the difficulties of Trade Union leaders who attempt to promote industrial peace and co-operation will be gravely enhanced.

The Bye-Elections.—Perhaps the most disquieting feature of the recent series of bye-elections is the revelation of a certain apathy on the part of the electorate. In one sense this is easily understood, for the members now returned will only enjoy a brief span of life before they have once more to put their fortunes to the test, and so those who elected them may well have felt that they were not bound to waste their time over what was only a dress rehearsal. On the other hand, party feeling at the fag-end of a long Parliament should be running high, and so the present apathy is a phenomenon which should seriously concern all three parties alike. Turning to the actual results, the Labour Party alone has cause for rejoicing, for their feat in winning "all four." There was little merit in their holding Bishop Auckland and Wansbeck, but in recovering North Midlothian from the Government they have shown their power to regain seats of a wavering record, while in winning South Battersea they have broken a long Conservative tradition. The main lesson for the two older parties is one that is already well known to everyone engaged in organisation work in the constituencies. It is that when a party has failed to contest a seat at one election it finds itself faced with overwhelming adverse odds at the next. In South Battersea the Liberal candidate had this lesson driven home to him by the forfeiture of his deposit, and in Bishop Auckland the Conservative candidate only escaped a similar admonition by the skin of his teeth. Finally, to judge from Ministerial comments, the Conservative Party have yet to develop a sense of proportion. Once again Ministerial complaints have been heard that the Liberal Party, by fighting a seat, "has let the Socialists in." An examination of the results of these four contests, however, reveals the fact that in the aggregate 54,901 votes were cast for Labour, 31,147 for Conservative, and 18,896 for Loberal candidates; that in Wansbeck and Bishop Auckland Labour had a clear majority over the other two parties' votes combined; and that in North Midlothian the Labour margin over the Conservative vote was sufficient to leave little ground for supposing, on any probable division of Liberal voting, that, had there been no Liberal candidate, the Conservative would have won.

The Pact of the Lateran.—At midday on Monday, February 11th, in the Papal Palace of the Lateran at Rome, Cardinal Gasparri and Signor Mussolini, on behalf of the Holy See and of the Kingdom of Italy, signed three instruments which together constitute a complete settlement of "the Roman Question." The first instrument is a political treaty, the second a concordat regulating the status of the Roman Church in Italian territory, the third a financial convention. The actual texts have not yet been published, but an official summary gives a fairly exact idea of what the terms of settlement are. In the political treaty, the Vatican, "as at present constituted," is recognised as a territory under the sovereignty of the Pope and not of the Italian Government. The Italian State is to provide the Vatican City with a railway station and with direct connection with third states by telegraphic, telephonic, wireless, broadcasting and postal services; and there is to be an agreement regarding the circulation on Italian territory of Vatican vehicles and aircraft. Persons residing permanently in the Vatican City are to be Papal subjects, and Papal officials and public buildings outside the boundaries of the Vatican are to enjoy certain extra-territorial privileges. Diplomatic relations are to be established between the two parties, and Italy recognises the Vatican's right to maintain ordinary diplomatic relations with other Governments. There is an extradition clause to obviate the danger that the Vatican enclave might become a kind of "Alsatia"; and there is also a provision by which Italy will undertake the administration, in Italian territory, of criminal justice in respect of crimes committed in Vatican territory, if the Holy See so requests. The Vatican will take no part in "temporal competitions between other States," though it reserves the right to the exercise of its moral and spiritual power. In consideration of this, Italy will regard the Vatican territory as neutral and inviolable. The most important passage in the treaty is a declaration in which the Holy See, after expressing its satisfaction with the agreements, "declares the Roman Question definitely and irrevocably settled, and therefore eliminated, and recognises the Kingdom of Italy under the Dynasty of the House of Savoy with Rome as the capital of the Italian State," while Italy, on her part, "recognises the State of the Vatican City under the sovereignty of the Supreme Pontiff." The uni-lateral Italian "Law of Guarantees" of 1870 and any other law or act contrary to the treaty is declared abrogated. It will be seen that the Vatican plays here the rôle of a local territorial state and not of a world-wide society living on a higher plane than the political and the territorial. Thus Italy re-establishes the temporal power of the Pope seven years after Turkey, following Italy's example of 1870, had abolished the temporal power of the Caliph. It may be noted further that, meanwhile, the Turks have secularised their education and their law, whereas the Italians have re-established compulsory religious instruction and the regulation of marriage by Canon Law in the concordat which is the second of the three instruments signed on Monday. Are we to understand that in Italy, henceforth, divorce and re-marriage will be legally impossible? If so, this will be the most searching test of its power to which the Fascist régime has yet submitted itself.

China and Japan.—Last week, it seemed as though the Sino–Japanese negotiations in Nanking were at last on a fair way towards resulting in agreement, and the prospect was hailed with relief by all the friends of peace and stability in the Far East. It is true that the Nanking Government has already arrived at settlements with all the other foreign Powers—except the U.S.S.R.—with which China is in close relations. Yet so long as a disagreement between China and Japan remains unresolved, the international situation in the Far East cannot be regarded as secure; for these two neighbours are divided by too acute differences of material interest in the present, and by too bitter memories of conflicts in the past, for any relation between them short of a complete and precise agreement to be indulged in with safety. This being so, it was disappointing to hear from Tokyo last Sunday the news that a hitch in the negotiations had occurred since the Japanese delegate at Nanking had reported progress to Baron Tanaka. The outstanding question, of course, is that of settling the Tsinanfu incident of last year, in which Kuomintang soldiery of General Chiang Kai-shek's command attacked the Japanese residents in the capital of Shantung, and thereafter the Japanese forces stationed there shelled and stormed the Chinese city. Is there only to be Chinese compensation for Japanese losses, or is the compensation to be mutual? This seems to be the point on which the hitch has occurred. Baron Tanaka is apparently unwilling to accept the principle of reciprocity, on the ground that the Chinese started the mischief. The Chinese might feel tempted to answer that their soldiery were provoked by the unwarrantable presence of a Japanese force in the interior of a foreign country with which Japan was not at war. In any case, it is obvious that it is far less difficult for the Chinese to comply with Japanese *desiderata* if the principle of reciprocity is recognised in some form. Intransigence would not appear to be either in the best interests of Japan or in the wider international interest (from which Japanese interests are inseparable) of peace and stability in the Far East. Incidentally, we may thank our stars that no similar complication has been imported into Sino–British relations by the presence of the British Defence Force at Shanghai.

The Reparation Experts' Conference.—This week has seen the first sessions in Paris of the Committee of Experts appointed for the purpose of drawing up proposals for a final settlement of the problem of Reparations. The work of the Committee, which has elected Mr. Owen Young as president—the British representatives being Lord Revelstoke and Sir Josiah Stamp—will be watched with anxious interest, though their decision to hold their deliberations *in camera* debars us from having material on which to base an estimate of the extent of progress being achieved. It is understood that on Tuesday, Dr. Schacht, Director of the Reichsbank, presented the German view, and that on the following day he amplified his statement in the light of various questions and points raised by the other delegates. In view of the complexity of the far-reaching problems which this advisory committee of experts has to consider, there need be no disposition on the part of the public in any country to be impatient if the proceedings have to extend over a substantial period.

The Week in Parliament.—On Monday the Ministry of Labour's Supplementary Estimate of £366,000 on account of "transference" and training centres for the unemployed led to a debate in which the House listened wearily to automatic criticism from the Labour benches that the Government was doing no more than nibble at the edge of a problem for which the critics themselves had no practicable solution. Tuesday saw the rejection of the Corporation of London (Bridges) Bill, and the end, it may be hoped, of a proposal which was generally regarded as likely to aggravate rather than to ease the London traffic problem. The abandonment of the scheme to build the St. Paul's bridge leaves the way open for early progress with the more important projects at Charing Cross and Waterloo. For the rest, Parliament has been glumly occupied with the Report Stage of the Local Government Bill. Amendments by the Government included one providing for an extension of the maximum membership of guardians' committees from 24 to 36, the abolition of disqualification from membership of a county or county borough council solely by reason that the candidate or a member of his family has entered an institution as a pauper lunatic, and an amendment enabling the Minister to reduce any council's annual block grant should he be satisfied that it is neglecting its public health duties. The chief rejected proposals of the Opposition were the omission of the clause compelling recovery of the expenses of medical treatment, and an amendment to enforce consultation with voluntary hospitals in the drawing up of an administrative scheme. Mr. Chamberlain, who announced that elected guardians are once more to take office in Bedwellty and Chester-le-Street (but not in West Ham), embodied his personal desire for the break-up of the deterrent poor law in an amendment declaring that councils, in preparing administrative schemes, "shall have regard to the desirability of securing that all assistance which can lawfully be provided otherwise than by way of poor relief shall be so provided." The insertion of such pious declarations in Acts of Parliament does not endow them with operative force, we may remark, however admirable be the intention.

January Overseas Trade.—As was the case a year ago, the January returns contain distinct elements of hope. Imports are £14·6 million higher than in December, and £15·7 million higher than in January last year. Exports, too, reveal an improvement, amounting to £6·5 millions, when compared with December, and £7·1 million against January last year. Re-exports are not quite so satisfactory, as although they are £731,000 above the December level, they are £496,000 below those of January a year ago. In interpreting the changes between December and January, account must be taken of the fact that the former was a "holiday month," but even so, the figures are encouraging, especially as raw material imports alone have increased by £8·3 million.

MONTH OF JANUARY.

	1929.	Increase or Decrease compared with 1928.	
	£	£	%
Imports	116,064,145	+ 15,670,572	+15·6
British exports	66,879,607	+ 7,136,874	+11·9
Re-exports	9,810,682	− 496,103	− 4·8
Total exports	76,690,289	+ 6,640,771	+ 9·5
Excess of imports over total exports	39,373,856	+ 9,029,801	+29·8

Considering raw material imports in detail, last month's results are distinctly encouraging. If January last be compared with January, 1927, increases were recorded in such important items as Iron Ore, Timber, Cotton, Flax Hemp and Jute, and Rubber. The chief decreases are in raw Silk and dry and dry-salted Hides. As the following table shows, in the case of some items the 1929 figures are the best of the three years given :—

SOME LEADING RAW MATERIAL IMPORTS.

(Quantity Retained.)

		Month of January.		
		1927.	1928.	1929.
Iron ore	tons	144,296	371,098	490,465
Wood and timber, soft sawn	loads	281,337	183,196	299,151
Cotton, raw	centals	2,242,935	825,051	2,349,873
Wool, sheep's and lambs'	centals	800,640	697,157	694,787
Silk, raw	lbs.	380,853	487,774	352,164
Flax, hemp and jute	tons	43,712	47,527	60,476
Cotton seed	tons	47,648	44,574	71,241
Flax or linseed	tons	14,992	21,153	17,339
Petroleum, crude	thous. gals.	28,350	36,927	36,557
Hides, wet	cwts.	76,667	39,907	40,185
Hides, dry	cwts.	56,271	78,028	31,893
Wood pulp	tons	2,162	1,965	3,447
Rubber	centals	228,291	43,039	267,693

Exports, too, are encouraging. Coal is up to 4·5 million tons, and iron and steel to 421,000 tons, or nearly double the 1927 figure. The cotton and wool figures show a decided improvement, and with one or two exceptions the whole table bears a favourable aspect.

SOME LEADING EXPORTS.

		Month of January.		
		1927.	1928.	1929.
Coal	tons	4,092,879	3,904 700	4,472.631
Pig iron	tons	2,429	20,670	40,421
Railway material	tons	10,144	63,807	51,635
Total of iron and steel manufactures	tons	219,369	332,185	421,191
Total machinery	tons	39,572	50,176	52,175
Cotton yarns	lbs.	14.361,400	13,276,900	15,152,500
Cotton piece goods	sq. yds.	322,344,800	337,406,100	379,342.300
Wool tops	centals	29,614	28,025	31,245
Woollen tissues	sq. yds.	11,468,800	13,105,200	12,424,600
Worsted tissues	sq. yds.	4,437,800	3,813,900	6,138,300
Linen piece goods	sq. yds.	6,378,300	7,693,000	6,411,200
Boots and shoes	doz. prs.	62,088	71,848	67,711
Leather	cwts.	33,951	40,636	27,016
Paper and cardboard	cwts.	377,323	374,516	491,851
Locomotives	tons	698	1,903	4,218
Motor cars and chassis	number	3,826	2,673	4, 58

Too much must not be made of a single month's results, but the general impression of the January trade returns is that 1929 has made a good start. Unless the rise in Bank rate has an untoward effect, there seems every likelihood that the current quarter may prove relatively good. The testing time, however, will come after Easter, when it will have to be seen if trade can escape the usual summer set-back and the uncertointies caused by the General Election.

Shipping Freight Index Number.—The average level of whole-cargo shipping freights, as measured by our Index Number, was 3.1 per cent. lower in January than in the previous month. The total figure of the Index Number for last month works out at 127.6, as compared with 114.6 a year ago, while the mean for the month of January in the four years 1924-27 was 131.1. The recent movements of the various groups in the Index are summarised below:—

(Average 1898-1913=100.)

	Average 1913.	Jan., 1928.	Nov., 1928.	Dec., 1928.	Jan., 1929.
European Waters	110·0	106·7	121·9	122·1	119·2
North America	113·1	106·9	133·0	131·3	128·6
South America	123·4	111·4	123·5	125·6	125·2
India	106·3	113·6	117·8	126·8	123·7
Far East and Pacific	117·4	121·4	125·1	127·4	126·2
Australia	127·9	127·3	153·1	156·7	142·4
Total	116·3	114·6	129·1	131·7	127·6

The month's changes in the Index of each group and sub-group are shown in the following table, the figure 100 representing in each case the average rate during the basic period 1898-1913:—

	Index Number	Inc. or Dec. Points.		Index Number	Inc. or Dec. Points.
Home trade	94·1	−5·4	South America—Outwards	94·9	− 2·5
Bay—outwards	130·3	−7·3	South America—homewards	155·4	+ 1·6
Bay—homewards	140·3	+3·2	India—outwards	124·2	− 2·1
Mediterranean—outwards	146·0	−1·1	India—homewards	123·2	− 4·2
Mediterranean—homewards	110·4	−1·2	Far East, etc.	126·2	− 1·2
North America	128·6	−2·7	Australia	142·4	−14·2

Outward coal freights last month had a weaker tendency in all directions. Demand for space on grain account was fairly well maintained, but on the whole less active than in December. The Plate market was firm, but rates from Australia broke sharply as the result of an announcement of lower freights to be charged by the Conference lines. North America and the East were quiet. Converted to a percentage of the average for 1913 the total figure of our Index Number for January is 109.6 (1913=100), as compared with 113.2 in December, and 98.5 a year ago.

Rubber Prospects.—The rise in rubber prices has proved less temporary in character than was expected by some observers, having now been maintained for the best part of a month. A firm of Mincing Lane produce brokers, Messrs. Wm., Jas., and Hy. Thompson, in the current issue of "The Rubber Quarterly," suggest that the coming year may see something like equilibrium in world production and consumption of the commodity, despite the additional supplies from British areas under a *régime* of unrestricted production. Their figures are as follows :—

RUBBER PRODUCTION AND CONSUMPTION.

	1926.	1927.	1928.	1929 (Estimated).
Production (Thous. tons)—				
British controlled areas	413	380	424	483
Rest of world	208	225	222	224
Total	621	605	646	707
Consumption (Thous. tons)—				
U.S.A.	366	370	441	445
Rest of world	175	210	238	260
Total	541	580	679	705

Note.—The "British controlled" production figures include the output of British-owned estates in the Dutch East Indies.

Last year's increase of American consumption was, to say the least, opportune, coinciding as it did with the British Government's decision to abolish the restriction scheme. As regards the recent enhancement of prices, an American correspondent writes to us criticising the market for its lack of foresight. He declares that a sense of proportion was wanting among producers and traders, so

that many individuals who could never see the top of the dizzy heights of 4s. 6d. in 1925 were equally unable to understand that 9d. in 1929 might be too low. It has frequently been remarked that the law of supply and demand is almost invariably suspended in the rubber market, and that the principal factor influencing prices is merely the current market "sentiment." What, asks this correspondent, can be said in favour of basing such an important factor on the opinion of operators who are themselves so unstable? While Mincing Lane and New York markets were in despair over the further price slump which was to follow the arrival of enormous estate accumulations, manufacturers were rapidly increasing consumption and available stocks were diminished almost to vanishing point. The markets are now beginning to realise that the accumulations will not more than serve to replenish the depleted visible stocks, while the volume of production and consumption this year is expected approximately to balance. One might therefore expect a more or less stable market around present levels; but speculators in London and New York are believed to own some 40,000-50,000 tons, mostly at low prices. That speculators should have been permitted to assume a position of such great power, at a time when the technical position of the market appears to be in their favour, is unfortunate, and it is not improbable that we may in consequence have to face periods of wider fluctuations than we have experienced for some considerable time. These remarks are scarcely likely to find universal acceptance, but we print them as representing the views of an informed and critical observer in the United States, where two-thirds of the world's rubber is at present consumed.

Wheat in 1927-28.—We have received from the Food Research Institute of Stanford University, California, the December number of "Wheat Studies," which gives a statistical review of the World Wheat Situation in the crop year 1927–28. The main features of last year's wheat history were described in the *Economist* of January 12th, but some fresh figures have been collected in this useful journal. The approximate value to the farmers of wheat crops in the United States, Canada, the Argentine and Australia appears to have been $2,051 million, against $2,066 million in 1926-27, and $2,037 million in 1925-26, while farmers in Great Britain, France, Germany and Italy together received some $1,107 million for their crops, against $3,132 million in 1926-27, and $1,256 in the previous year. British farmers did particularly badly, thanks to the unmillable quality of much of their1927 crop. These values should be compared with the total yields which they account for. The 1927 crop in the four great exporting countries totalled 1,667 million bushels, compared with 1,620 million in 1926 and 1,377 million in 1925. The corresponding figures for the above four European countries were 650 million, 600 million, and 743 million bushels. These figures reveal the very low elasticity of demand for wheat, since the larger the aggregate crop the less the total price obtained for it. The low prices which ruled in the latter half of 1928, largely on account of big crops in Canada, and in spite of the retention of heavy supplies in that country over the end of the year, will probably bear out this contention even further. Figures of wheat consumption indicate that although the total quantity consumed in this country has remained fairly constant, the consumption per head has slightly declined in the last four years; we suspect that the peculiar conditions of 1926–27 may have accounted for this, rather than any secular causes. Per-capita consumption in Western Europe generally seems to have increased, a particularly large rise being shown by Germany, presumably through the improvement of her economic condition after the 1924 settlement. The work of reconstruction is also reflected in the greatly increased consumption per head in Eastern Europe.

Canadian Trade Relations with the United States.—Our Ottawa correspondent writes:—Events and developments at Washington are being followed with keen attention by Canadians for the intelligible reason that they sense the possibility of serious repercussions on their own economic fortunes from changes in American fiscal policy. They are evincing particular interest in the hearings of the Ways and Means Committee of the House of Representatives, and have carefully noted the almost complete unanimity of the demands for higher duties on farm products on the part of the agrarian organisations of the United States. It is quite plain to intelligent Canadians that, if the tariff schedules submitted to the Committee on behalf of the American Farm Bureau Federation are translated into legislation, the interests of the Canadian farming community are bound to be seriously affected. If the outflow of farm produce to the United States is checked by higher duties, a decline in rural purchasing power is inevitable, and business will be adversely affected in many directions. Canadians are bound to feel a certain measure of resentment at this, and undoubtedly there will arise a demand for retaliatory measures in the shape of higher duties on American imports. Herein lies a possibility of the restoration of the fortunes of the Conservative Party, which has shewn no sign of making any headway in the country during the past year. Its leaders will exploit the situation to the best of their ability by arguing that they alone are willing to put in force the drastic remedies necessary to meet American fiscal aggression. It is considered significant that Mr. A. E. Darby, the secretary of the Canadian Council of Agriculture, which has been the chief centre of the anti-protectionist elements, seemed, in some observations which he recently made before the Tariff Advisory Board at Ottawa, to contemplate with equanimity the possibility of a retaliatory fiscal policy. If the farmers of Canada were in a mood to support higher tariffs, the Liberal leaders might decide to fall into line with national sentiment; but such a course would involve an abandonment of the traditional party policy of reciprocity with the United States, and the country might still prefer to entrust the responsibility for a policy of fiscal warfare with the United States to the party which honestly advocates it. The Liberals are naturally full of apprehensions about developments at Washington, and are hoping that influential American voices will yet make themselves heard against any upward revision of the tariff which would seriously affect trade relations between the United States and her best customer. One great American dairy corporation, for instance, has millions of dollars invested in Canada, and it would be hard hit by any tariff which raised the duties on milk and cream. Altogether, there are some five billion dollars of American capital invested in Canada, and many American-owned plants and industries would be greatly inconvenienced if, as the result of higher tariffs decreed at Washington, a Canadian Government increased the duties on American imports and increased the price of the machinery and raw material which they import from the United States. The Canadian Liberals therefore believe that, although some duties will be raised, the final results of the tariff revision now planned at Washington will not be as harsh as present appearances indicate.

Trade in East Africa.—Following so closely on the publication of the Report of the East African Commission, this year's Report* of the Deputy-Trade Commissioner at Nairobi will be received with more than usual interest. It is on the whole an encouraging document; the outlook in East Africa is reported to be "much more hopeful than it has been for some time past," and the territories are described as "a fertile field for investment generally." With regard to the import trade, competition in certain lines which are of great importance to the United Kingdom is becoming very keen, and British manufacturers are warned to look to their laurels. This necessity is most marked in the case of textiles and certain branches of machinery and of steel goods. The Deputy-Trade Commissioner draws the attention of Manchester merchants to the progressive cartellisation of the channels of trade between Japanese, Dutch, American, and German manufacturers and their clients in East Africa. On the whole, the bulk of the East African market is dominated by considerations of price rather

* Published by the Department of Overseas Trade. H.M. Stationery Office. 54-22-0-28.

than of quality, so that competition with British goods is bound to be keen in certain classes. Experience shows, however, that there is an important market for goods of British quality, and though that market is at present far from going unchallenged, the evidence is that with more attention to the quality of their local agents, British merchants should be able to take up the challenge with equanimity.

British Trade with Argentina.—Two of the points which emerge most conspicuously from a study of this year's Report of the Department of Overseas Trade on Commercial, Economic, and Financial Conditions in the Argentine Republic* are the strength of the position of the United States in the Argentine import market and the growth of Italian competition in certain departments of that trade. In cotton yarns and piece goods and woollen piece goods Italian trade is growing, particularly in those classes which used formerly to be supplied by Great Britain. American competition is most marked in machinery, electrical materials, radio apparatus, hardware and rubber goods, while the motor-car market is completely dominated by the United States. In 1924 23.6 per cent. of total imports into the Argentine were from Great Britain and 23 per cent. from the United States. A slight but steady diminution in the one and increase in the other has reversed the position, and in 1927 the proportions were 19.9 per cent. from the United Kingdom and 26.5 per cent. from U.S.A. The position of the principal Continental competitors—Germany, Italy, France, and Belgium—is scarcely changed. In view of the keenness of competition, it is important to draw the lesson which is clearly brought out by the detailed discussion in the Report of the markets for the various classes of goods. Where British producers have lost ground it has often been because of their reluctance to depart from their standard specifications, and where they have improved their position it has been largely as the result of willingness to make concessions to peculiarities of local taste. For example, the reasons for the improved British trade in manufactured stationery are given as " specialisation and concentration, direct and more efficient representation, and greater adaptability of the British mills in making the necessary alterations from their particular standards." If other British industries would imitate the stationery manufacturers, not only in their adaptability, but in their " direct and efficient representation," there is no reason why the United Kingdom should not resume her rank as the leading exporter of goods to the Argentine.

American Anti-Trust Legislation.—Complaints against interference with the business rights of others and collusive agreements among competitors have played a considerably greater part in the actions brought under the anti-trust law in the United States than complaints against consolidations as such, according to the analysis of cases decided in the courts. A report by the National Industrial Conference Board, New York, states that during the first 37 years since anti-trust legislation came into force, out of 436 decisions 262 were private suits for damages or injunctions. The remaining 174 cases were governmental actions to curb aggressive interference with the business rights of competitive enterprise, in about half of which injunctions were sought by the Government against labour organisations to protect employers from impairment of their property rights by strikes or organised boycotts. Of these governmental actions only 38 were found to have been " predicated primarily upon consolidation "; and in less than 9 per cent. of all cases, including private suits, were the defendants attacked simply as mergers. It is the Board's conclusion that in not more than 10 per cent. of the cases in which the penalties of the anti-trust acts have been invoked in the courts, have industrial mergers as such been the occasion of complaint. Moreover, only seven of the total of 38 merger cases were instituted during the decade 1917-1927, which shows that the need for Government action against trusts has lately become less. The report of the Board admits that confusion and controversy occasioned by conflicting court decisions under the anti-trust law have created much uncertainty among business men as to what policy to pursue in respect to contemplated mergers. It emphasises the difficulties existing in this respect in the field of railroad transportation, where consolidation in principle has official sanction by special Congressional enactment. Existing anti-trust legislation, however, as interpreted and administered by the courts, is declared as neither excessively severe nor repressive. It is pointed out that evils that might come from an inflexible and inelastic rule, either of narrow restriction or of broad licence, would certainly outweigh any ill effects that attend the operation of the anti-trust law as now enforced.

* H.M. Stationery Office. 3s. net.

Prudential Assurance Company.—The Directors of the " Prudential " announce that the following rates of reversionary bonus have been declared on participating policies in the ordinary branch of the company for the year 1928: £2 6s. per cent. on endowment assurances and £2 10s. per cent. on whole-life assurances. This is an increase over the rate declared last year of 2s. per cent. in the case of endowment assurances and 6s. per cent. in the case of whole-life assurances. These are imposing bonuses, and emphasise the fact that the " Prudential " is now a formidable competitor of the ordinary life offices. The company's bonus has been increased in successive stages since the war from 28s. per cent. in 1919, to 32s. per cent. in 1922, and to 42s. per cent. in 1925. The most interesting part of the present announcement is the fact that the company has decided to follow the lead first set three years ago by the " National Mutual " in granting a differential rate of bonus to whole-life policyholders. There is no doubt at all that under present conditions the rates of premium charged by the majority of offices earn higher bonuses for whole-life policyholders than for endowment assurance policyholders, and consequently that in these circumstances there is no justification for continuing to allot the same rate of bonus to both classes of policy. The bonus announcement has been quickly succeeded by an intimation of the rates of dividend declared for 1928. as follows: " A " shares of £1 fully paid, 94⅛ per cent.; " B " shares of £1 with 4s. paid up, 25 per cent. In recent years the " A " shareholders, who are interested mainly in the life branch, have been accustomed to receive an increase in dividend of 2½ per cent. per annum and the 1927 dividend was at the rate of 90 per cent. The extra 1⅝ per cent. on this occasion is due to the right of " A " shareholders to receive one-third of any dividend paid on the " B " shares. These " B " shares were created in 1919 when the company commenced fire and general business, and the dividend now declared is a maiden one. For this long period of waiting the marine losses have been mainly responsible, and it may be assumed, in view of the dividend declaration, that the marine branch is no longer a cause for anxiety. It may be noted that 25 per cent. on the " B " shares will cost £50,000, and that this sum is well within the interest earnings amounting to £72,251. At the present price of 27 the " A " shares yield 3⅛ per cent. net, while at 45s. the " B " shares yield 2¼ per cent. net.

National Provident Institution.—The report for the year ended November 20th, 1928, shows that the Institution issued in that year new policies for a total net sum assured of £1,511,950, compared with £1,190,497 in the preceding financial year. Included in these amounts were policies effected for single premiums totalling £187,914 last year and £67,516 in the year 1926-27. The National Provident has been rather lagging behind in recent years in new business, and the increase now recorded is all the more gratifying, although the Institution's history and organisation equip it to transact a much larger business even than the present amount. The net rate of interest earned on the life assurance funds works out at £4 14s. 2d. per cent., compared with £4 13s. 7d. per cent., while the expense ratio, excluding the special expenses of the quinquennial valuation, was 11.4 per cent., compared with 12 per cent. The accounts are evidently under the influence of the aftermath of the quinquennial valuation, for the amount paid out in cash bonuses is almost £200,000. The report states that the amount distributed for the quinquennium in bonuses was £1,249,714. As already stated, £199,425 was paid in cash, £1,319,705 was added as reversionary bonuses to policies, and reductions of premium amounting to £17,140 were granted. The terms for cash surrender of bonuses offered by the Institution are generous, and a characteristic of the quinquennial valuation has always been an unusually large proportion of bonus surrendered in cash. The amount paid in surrenders last year was £77,782, compared with only £28,975 in the preceding year. As so often happens in a year following a quinquennial distribution, a number of policyholders surrendered their policies.

Scottish Widows' Fund.—After strengthening the basis of arriving at the actuarial reserves by reducing the rate of interest assumed in the calculations from 3 per cent. to 2¾ per cent., the directors have declared, out of the resulting surplus, a reversionary bonus at the rate of 42s. per cent. per annum compound for the quinquennium ended December 31, 1928. This bonus compares with 40s. per cent. declared for the preceding five years ended December 31, 1923.

Life Office Bonus Announcements.—The Pearl have decided to declare in respect of the year 1928 a reversionary bonus of 46s. per cent. simple on all with-profit policies in the ordinary branch. This bonus represents an increase of 4s. per cent. on that for 1927. The Refuge announce for the year 1928 a reversionary bonus at the rate of 44s. per cent. simple in respect of with-profit policies in the ordinary branch. This bonus is at the same rate as that for the preceding year.

Transvaal Output in January.—A good start has been made for 1929 in the Rand gold-mining industry. The output for January is better than any output for that month shown in our table below. The output for January amounted to 876,452 ozs. of fine gold. For January, 1928, the output was 843,857 ozs. of fine gold. The following table shows the monthly output since the beginning of 1923:—

Months of	1923.	1924.	1925.	1926.	1927.	1928.	1929.
	Fine Ozs.	Fine Ozs.	Fine Ozs.	Fine Ozs.	Fine Ozs.	Fine Ozs.	Fine Ozs.
January ...	764,469	796,768	823,692	796,270	839,782	843,857	876,452
February	704,970	760,617	753,925	753,924	779,339	816,133	...
March ...	761,586	795,671	825,479	834,340	860,511	877,380	...
April	743,651	768,923	787,519	803,303	824,014	825,907	...
May.....	786,564	809,003	813,249	849,214	859,479	886,186	...
June	755,309	773,053	780,251	852,145	855,154	862,363	...
July	754,306	829,437	818,202	860,134	851,861	867,211	...
August ...	769,371	809,571	808,218	843,854	863,345	891,863	...
September	739,504	799,422	797,247	839,939	842,118	857,731	...
October ...	793,842	827,583	812,832	853,296	855,743	897,720	...
November	780,639	802,313	787,633	840,276	848,059	872,484	...
December	778,849	825,273	791,455	836,157	851,225	859,761	...
Total ...	9,133,060	9,597,634	9,599,702	9,962,852	10,130,630	10,358,596	876,452

The number of natives employed by members of the Witwatersrand Native Labour Association and Contractors over the past few months was as follows:—

	June, 1928.	July, 1928.	Aug., 1928.	Sept., 1928.	Oct., 1928.	Nov., 1928.	Dec., 1928.	Jan., 1929.
Gold mines	197,186	194,584	194,788	194,936	193,147	190,870	187,970	192,526
Coal mines	16,533	16,724	16,767	16,803	16,506	16,241	16,059	15,845
Diamond mines	4,839	4,535	4,807	4,889	4,762	4,481	4,444	5,056
	218,578	215,843	216,362	216,628	214,415	211,592	208,473	213,427

The number of natives employed at the gold and diamond mines showed an increase in January. There was, however, a decline in the number employed at the coal mines.

The Royal Statistical Society announces that at a meeting of the society, on February 19th, Dr. A. Bradford Hill will read a paper on " The Investigation of Sickness in Various Industrial Occupations." The meeting will be held at 5.15 p.m. in the Hall of the Royal Society of Arts, John Street, Adelphi, W.C.2.

UNITED STATES. — SHARE MARKET — CAPITAL ISSUES—RAILROADS—PRODUCTION.

(FROM OUR CORRESPONDENT.)

New York, February 1.

The share market continues to disappoint the hopes of its enemies and to prove groundless the fears of its friends. After a period of striking irregularity—during which individual favourites advanced sharply, other shares fell back, and the market as a whole made little progress, while margin requirements were increased and apprehensions rose as to the stability of the price structure—the market showed uniform strength to-day and pushed ahead vigorously to new high average levels for both industrials and rails. This advance occurred despite an increase during the past week of $116,000,000 in brokers' loans, which carried the total for this item up to a new record level. It also occurred in the face of a rise in the call money rate, probably occasioned by first-of-the-month demands, to 8 per cent. Under the circumstances it would appear that the technical position of the market must have been weakened less during the past few weeks than most observers had believed. Among the factors that have contributed to the advance is a realisation that the month-end money squeeze was milder than had been anticipated. It is now generally recognised that the credit situation developed satisfactorily during January, the contraction at the Federal Reserve Bank being considerably greater than had been expected and the strengthening of its position (as reflected in the rise of its reserve ratio to 80 per cent.) being such as to make any advance in its discount rate quite improbable. In addition, the continued import of gold—$10,000,000 being gained in the week—the absence of further French earmarking, and the additional purchases of the metal in London were reassuring as to monetary conditions. No one expects that money is about to become cheap; but it has turned out to be less hard to get than had been expected. There is also the feeling that the money market may continue its present character for a few weeks more—or until the usual demands for funds in anticipation of spring trade arise—which is generally late in February or early in March. It is also possible that official attempts to scare out the market have been overdone.

One of the most interesting features of the present situation is the great activity in the new capital issues market, which, incidentally, contributes materially to the current rise in brokers' loans. During January the new offerings aggregated approximately $750 million, and of this total perhaps $600,000,000 were accounted for during the past two weeks. In this flood of new capital issues, convertible bonds have been very popular, while a surprisingly large part of the total has represented securities issued for the account of investment trusts. This large amount of new investment trust money has had a sustaining effect on the share market in two ways. On the one hand, it has furnished buying power to support the market; on the other, it has supplied call money which has kept the rate for that kind of accommodation down.

Railroad shares, which had been somewhat disappointing recently, have been better, and this in part may be attributed to the Interstate Commerce Commission's decision in the application of the New York Central to lease the Big Four, Michigan Central and certain other subsidiaries. The Commission did not issue an order authorising the lease, but it did declare that the lease is in the public interest and did indicate that it would grant

such an order provided the Central made satisfactory arrangements during the next six months for certain tributary " short lines." This was encouraging, as it indicated that the Commission at last is prepared to meet the railroads halfway and approve desirable features of a consolidation plan, at the same time indicating what steps are necessary to obtain full approval. The Commission also indicated that it would not itself determine the price at which minority holdings were to be taken over; it merely insisted that the plan include suitable arrangements for arbitrating or otherwise determining such values. This will diminish the attempts of obstructive minorities to " hold up " lesser roads. The Commission also stated that the " short lines " should be taken over at their " commercial value " as determined in a manner similar to that for determining the value of minority interests. Altogether, the decision did much to create the impression that the Commission has abandoned an attitude which many considered obstructive and which President Coolidge is reported to have considered dilatory, and that it is now disposed to get ahead with consolidations in a businesslike manner.

Industrial news continues generally good, with steel output at between 85 and 90 per cent. of capacity. There is, however, some slight weakening of iron prices, though those of steel remain firm. Results of corporation operations for 1928, as represented by annual reports now being published, are quite satisfactory.

FRANCE. — ALSACE — FOREIGN TRADE—PRICES — REPARATION DELIVERIES.

(FROM OUR CORRESPONDENT.)

PARIS, February 13th.

THE long debate in the Chamber on the Alsatian situation was brought to a close on Saturday with the voting of a resolution (Ayes 461, Noes 17) expressing confidence in " the patriotic attachment of the Alsace-Lorraine population to the Republic." The minority, with the exception of two votes, consisted entirely of the ten Communist deputies not undergoing imprisonment and five so-called " independent " Alsatian deputies of separatist tendencies. The debate clearly showed that the alleged separatist movement is largely the result of the discontent of a substantial section of the population of the recovered provinces, due to the publicly announced intentions of the Cartellist Government, which came into power in 1924, to enforce in Alsace-Lorraine the policy of laicism in education which prevails in the rest of France. This situation was promptly and skilfully manipulated by Communist energy, in alliance with a section of the priests, the movement being largely helped by too drastic efforts on the part of the French Government to replace German by French as the national language. So far as can be seen there is little likelihood of Alsace-Lorraine developing into " another Ireland," and there is reason to believe that the thorough ventilation given to the matter in the Chamber has already removed much of the dissatisfaction that was undoubtedly felt by the population. The Government has still to test the feeling of the Chamber in regard to its proposals to permit the return of certain of the monastic missionary orders, which it considers necessary for the purpose of maintaining French influence abroad. The debate will no doubt be unusually bitter, in view of the deep dissatisfaction of the whole of the parties of the Left in regard to the restoration of temporal power to the Pope, but the victory of the Government may be considered as assured in advance.

French foreign trade figures for 1928, which are now available by countries, show that although this country's exchanges with the principal other nations were in many cases lower than in 1927, both as to imports and exports, trade between the colonies and the Mother Country increased appreciably during the past twelve months. French exports to the colonies totalled 8,324,517,000 francs (of which 3,918 millions went to Algeria), as against 7,717,435,000 francs in 1927, while imports from the various colonies amounted to 6,727,922,000 francs (2,796 millions from Algeria), against 6,058,248,000 francs in the previous year. The comparative situation in regard to exchanges between France and the ten principal countries was as follows :—

	Exports to France.		Imports from France.	
	1927	(In thousands of francs). 1928	1927	1928
Great Britain	6,472,729	5,447,365	10,190,600	8,165,746
United States	7,065,836	6,200,346	3,610,148	3,331,481
Germany	4,204,299	4,961,318	6,551,899	5,669,207
Belgium and Luxemburg	3,790,014	3,826,531	7,584,214	7,246,785
Argentine	2,338,405	2,046,949	1,139,468	1,146,168
Italy	1,608,577	1,575,599	2,045,472	2,150,475
Brazil	1,068,660	1,162,022	538,960	563,068
Spain	1,420,464	1,623,255	1,713,499	1,752,978
Holland	1,997,158	1,678,239	1,775,171	1,302,060
Switzerland	777,341	964,778	3,424,025	3,378,318
Canada	72 4,289	620,374	703,417	674,765

Swedish, Norwegian, Czechoslovakian, Serbian, Portuguese and Japanese exports into France showed an increase, while those from Poland and Greece fell away slightly. Franch exports to Sweden and Greece increased fractionally, while those to Norway, Poland, Czechoslovakia, Serbia, Portugal and Japan were smaller.

The index figure representing wholesale prices at the end of January is returned by the Statistique Générale as 644, equivalent to a rise of seven points on the month, but of five only since the end of November. The detailed figures, based on 100 as representing the corresponding prices in 1913, are as follows :—

	Articles.	End of the month of		
		November	December	January
General index figure	45	639	637	644
French products	29	631	631	639
Imported products	16	653	646	651
Foodstuffs, general figure	20	595	589	599
Vegetable foods	8	601	589	599
Meats	8	580	579	580
Sugar, coffee, cacao	4	614	607	603
Raw materials, general figure	25	678	679	683
Minerals and metals	7	613	609	610
Textiles	6	761	762	775
Various	12	668	673	672

The outstanding features of the table are the sharp rises of 19 points in vegetable foods and of 13 points in textiles, the whole of the other categories of commodities having remained practically stationary. Reduced to gold, for comparative purposes, the French index figure for January works out at within a shade under 129, as against 143 in Great Britain (for December), 140 in Germany, 145 in Switzerland, 464 (or 126) in Italy and 855 (or 122) in Belgium. Retail prices in Paris for January, based on 13 articles of common necessity, are given an index figure of 599 (as compared with 100 in 1913), or a rise of 3 points on the month.

The general index figure for production in December is returned as 134 (based on 100 as representing productive activity in 1913), or a rise of 2 points on the month. This improvement is almost entirely due to a sharp rise of 58 points on the month in motor car production, which figure is returned at 657, against 599 for November and 562 for October. Engineering industry is up 6 points (from 143 to 149), and metallurgical activity 3 points, but the textile trades are shown to have again dropped a point below their pre-war level and the building trade 2 points below, while extractive industries fell 3 points (to 119) during the month, and rubber industries 19 (to 618).

Contracts approved by the Committee of Transfers for execution under the system of reparation payments in kind have risen from a total value of 667 million gold marks in the second year of the Dawes Plan to 968 million in the fourth year. The principal French contracts in 1927-28 included 95 for the delivery of coal, coke and lignite to the value of 192,418,000 gold marks, another to the value of 59,328,000 marks for the delivery of material for installing continuous brakes in French railway trucks, and others for machinery, 113,539,000 marks; manure and other chemical products, 52,342,000 marks; river and canal shipping, 46,075,000 marks; horses, cattle and sheep, 41,451,000 marks; various public works, 32,278,000 marks; iron, steel and other metals, 30,300,000 marks; and deliveries of sugar, wood pulp, paper, coal by-products, cinematograph films, bricks, telegraph poles, etc.

GERMANY.—REPARATIONS—CREDIT—PUBLIC DEBT—WAGES—INDUSTRY.

(FROM OUR CORRESPONDENT.)

BERLIN, February 12th.

THE nervousness shown in business circles in connection with the Reparations Conference, referred to last week, continues. The conviction is growing that a large reduction of the annual liability, the only matter in which the public shows interest, is very unlikely, and that the mobilisation of any considerable portion of the bonds, which seems to be the chief French interest, is impracticable. The attitude of Great Britain is represented as one of indifference if only the terms of the Balfour Note are observed. The Press is full of unreasonably pessimistic accounts of economic conditions. The notion of a new provisional settlement which seems possible, though inconsistent with the Geneva decisions, is unpopular. That, however, a provisional settlement would be preferred to any final settlement which left the annuity near the present level may be inferred from the increasing emphasis laid on the chief merit from the German viewpoint of the Dawes Plan, that is, its elasticity. From the transfers clauses, under which the internal burden might be reduced, to the provision for altering the annuity in the event of price-changes, the Plan contains numerous possibilities of relief and re-adjustment. The Plan is also consistent with Article 234 of the Treaty, under which Germany's payment-capacity is to be tested from time to time. Finally, as the " Frankfurter Zeitung " remarks, " a political debt between state and state itself involves a possibility of future reductions." All these advantages, it is claimed, will be lost if the final settlement imposes a fixed debt destined to become ultimately a debt to private capital.

The advance in the Bank of England discount rate was not expected here, and the amount of the advance caused surprise. An advance was indeed predicted months ago, but the long delay led to the belief that it might be altogether avoided. On the Berlin money market the advance had no effect. The exchange market had already been turning, but the advance led to a new sharp rise in sterling against Berlin. Both day-to-day and month money rates fell last week, and to-day loans were very plentiful at 3½–5½ per cent., month loans 6¾–7½ per cent. The rate for private discounts remains unchanged at 5⅝ per cent—a nominal rate, because practically none are offered. The sterling exchange rate, which on December 31st was 20.356, and on February 7th 20.432, rose on the 8th to 20·467, but was to-day back at 20·459. The German gold-export point, which is here calculated at about 20·47, was nearly reached on the 8th, and the possibility of gold export was discussed. The recall of American funds and the voluntary repayment of credits by banks which wished to take advantage of the low home rates and the general fluidity have already led to a decline in the Reichsbank's exchange reserve, which is now only 140¼ million marks, and it seems that a good deal of foreign exchange has been purchased for Reparations transfers. This movement, however, antedated the London rate advance. The Reichsbank's return for February 7th shows only a moderate decline in credits and circulation, discounts falling by 67 million marks, advances by 57½ million marks, and circulation by 218 million marks. The easy money-market condition is best reflected in an increase of deposits by 78 million marks.

The Prussian State Bank (Seehandlung) annual report for 1928 shows net profits of 5,114,871 marks, as against 5,139,077 marks in 1927. To reserve is allocated 1,000,000 marks, as against 2,000,000 marks in 1927; to increase of capital 3,000,000 marks, as against 2,000,000 marks; so that the bank begins 1929 with 15,000,000 marks capital. The policy of increasing the capital out of the relatively large net profits, is a consequence of the lack of any other means of replenishing the capital lost in the inflation. The Berliner Handelsgesellschaft Bank repeats its 12 per cent. dividend.

The federal debt return for December 31, 1928, shows an increase during the year of roughly half a milliard marks, due mainly to short-term borrowing, and in part to booking of recognised claims for compensation by native losers through the war. The movement of the whole federal debt in 1928 was :—

	Millions of Marks. Dec., 1927	Dec., 1928
Valorised loans, loan of 1927, and compensation claims	5,717·8	5,859·7
Treasury Bills	20·7	97·7
Bank debts	1,018·5	876·9
International loan	903·5	873·9
Various short-term debts	323·7	780·4
	7,984·2	8,488·6

The wholesale prices index number for February 6th is 138·9, as against 138·6 on January 30th. The cost of living index number for January is 153·1, and with the exception of August, 1928, is the highest so far. The average wage both for skilled and unskilled workers is still slowly rising. The salaries of clerical and non-manual technical employees were of late raised all round, but are still extremely low. Coal production in the last report week shows a sharp decline. The coal foreign trade-balance for 1928 and earlier years was :—

(Tons, 000's omitted)

	Import.	Export.
1928	7,504	23,895
1927	5,333	26,878
1913	10,540	34,598

Imports from Great Britain in 1928 were 4,567,000 tons as against 3,267,000 tons in 1927. The active balance on foreign trade in coal, coke, and lignite in 1928 was 537 million marks against 745 million marks. The home iron and steel market is quiet, and the pig-iron production of Prussian Silesia is being reduced; export is still active, and prices are firm. The demand for scrap iron has increased. The Siegerland iron ore output in 1928 shows a sharp decline. As a consequence of the recent steel lockout, the Metalworkers' Trade Union has put forth a programme for representative control, somewhat on the lines of that of the coal industry, of the whole pig-iron, steel, scrap, rolling-mill, and railway materials industries. Such control involves equal representation of Capital and Labour in a governing council. In regard to the differences in the International Rails Cartel, connected with the exceeding by Great Britain of her export quota, Berlin newspapers state that two alternative schemes have been worked out by the commission entrusted with proposals; that one scheme proposes that the over-quota penalty be raised from 12s. 6d. to £1 per ton, and that the British negotiators have refused to agree to such a big increase. A plan for general co-operation in the Solingen cutlery industry has been rejected, apparently because the larger and richer concerns prefer to remain independent. The plan provided for joint buying of raw materials, reduction of the number of patterns, various measures for reduction of working cost, and joint propaganda.

The Bemberg (artificial silk) company has declared an unchanged dividend of 14 per cent. for the business year 1927-28. The capital is to be raised by 12 million marks to 40 million marks. The turnover in 1927-28 increased 25 per cent. The shareholders' meeting was informed that there is no ground for anxiety as to the development of the artificial silk industry, at least as far as the large companies are concerned. The Potash Syndicate's sales, home and export, in January totalled 167,740 metric tons (of pure potash) as against 202,010 tons in January, 1928. Net

import of oil and oil products in 1928 was 2,358,378 metric tons as against 2,050,345 tons in 1927—an increase of around 15 per cent., whereas the value return shows an increase of only ½ per cent. Of the total import 990,822 tons as against 844,823 tons were benzine and benzol. Imports of boots and shoes in 1928 were 4,219,000 pairs (whereof 3,106,000 from Czechoslovakia) as against 2,990,000 pairs in 1927; exports 2,061,000 pairs. The agitation for an increase in the duty as against Czechoslovakia continues.

HUNGARY.—MINORITY RIGHTS—PUBLIC FINANCE—TRADE BALANCE—NATIONAL BANK.

(FROM OUR CORRESPONDENT.)

BUDAPEST, February 10.

THE next session of the League's Council is awaited here with keen interest, for, owing to the fact that more than three and a half million Hungarians live under the sovereignty of the Little Entente, Hungary is keenly interested in the question of the rights of minorities. In official circles great importance is attached to the decision of the Mixed Tribunal set up by virtue of the Treaty of Trianon, declaring its competence to deal with the case of the Hungarian nationals whose property was confiscated by the application of the Agrarian Law in Czechoslovakia. It is pointed out that the International Court accepted the Hungarian legal standpoint, not only in the case of Roumania, but in that of Jugo-Slavia and Czechoslovakia.

The Budget for 1929-30 is in preparation and will be laid before Parliament in March. Considering that the finances of the country have been stationary in the last year, the Budget will not differ materially from the previous one. In the light of experience it is easy to forecast that expenditure will be somewhat over 900 millions. Considering that revenue in the fiscal year ending on June 30, 1928, amounted to 961.4 million pengös there will be a sufficient margin for extraordinary expenditures, which were hitherto mostly spent on productive capital investments. Revenue in the first six months of the present fiscal year amounted to 515.2 million pengös, as against 500.5 million pengös in the same period of 1927 (July-December). The surplus over estimates amounted to 35.9 million pengös, substantially less than last year, owing to the increased pay and higher rent allowances of the civil servants and pensioners. The analysis of the revenue in the first half-year reveals that, although receipts were 14.7 million pengös higher than a year ago, only some 2 million pengös were derived from taxation, the rest being obtained from other public revenues. Another favourable feature of the revenue returns is the increase of direct taxes and the decrease of the turnover tax and Custom receipts. Although imports were increased in 1928 as compared with 1927, the Custom receipts declined from 81 million to 68 million pengös, but the loss of revenue was more than offset by the rise of direct taxes, stamps and dues, sugar and tobacco receipts. This development of the public finances is very salutary because the rural population suffers very much from the high protective duties on industrial staple commodities.

The adverse balance of payments in 1928 is estimated by the annual report of the National Bank of Hungary at approximately 500 million pengös. The deficit of the merchandise balance amounted to 366 million pengös, the annual service of the foreign indebtedness of the country is estimated at 120 million pengös, and other invisible items of minor importance are adverse. The economic recovery of the country in the last three years necessitated big foreign loans to finance building and capital works, as the savings of the country are proceeding very slowly and are as yet unable to meet the urgent requirements of expanding business. Savings deposits increased from 364 million to 496 million pengös during the year 1928; deposits on current account have risen from 682 millions to 892 millions, an increase of more than 300 million pengös. A considerable part of this, however, represents foreign monies deposited with Hungarian banks and cannot be attributed to internal savings. Of the foreign commitments of Hungary, totalling 500 millions during 1928, about 280 million pengös were contracted in the form of long-term debts, of which more than 90 per cent. was taken up by private enterprises and banks. Estates and landed property contracted 120 million pengös in the form of mortgage loans, as against 100 millions in 1927; industrial loans amounted to 130 million pengös, the bulk of which was raised in London for the financing of a large electric power station near Budapest. The increase of short-term debts as compared with 1927 was on a much smaller scale, the increase being about 100 million pengös, as against an estimated increase of 150 to 200 millions experienced in 1927. The rest of the foreign commitments, totalling 500 millions, is covered by the placing of Hungarian shares and securities abroad, by the participation of foreign interests in the capital increases of Hungarian joint stock companies, and, finally, by the decrease of Hungarian balances abroad. The dividend of the National Bank was increased to 12½ per cent., and a considerable part of its profits were devoted, as prescribed by the Statutes, to the paying off of the State debts to the Bank. The Governor of the National Bank, Dr. Popovico, who has managed the Institution ever since the reconstruction scheme began to operate, was reappointed for another term of five years.

The money market is easier. Rates for prime commercial paper have declined more than a half per cent. since the end of last year and are now about 7⅜-7½ per cent., as against 8-8¼ per cent. in December, 1928. It is as yet difficult to say whether the increase of the discount rate of the Bank of England will have a pronounced effect on money rates here. Although the demand for accommodation is smaller in the first months of the year, the fact remains that Hungary's short-term loans are mainly supplied by London. In order to facilitate the export trade of the country, the Minister of Economic Affairs, Dr. Bud, has arranged a credit of five million dollars at the rate of 7¼ per cent., of which two millions are available for industrial and three millions for agricultural purposes. It is hoped that the cheap export credit will stimulate the exports of the country, as other facilities, such as railway tariff reductions, etc., have also been granted on grain and flour exports. The first part of the Swedish Match Loan, amounting to $11 million net, has been placed at the disposal of the country, and an institution has been formed to carry out the financial part of the land reform, which is to be financed from the $36 million loan of the Swedish Match Trust.

JUGOSLAVIA. — POLITICS — TRADE BALANCE — INDUSTRY AND SHIPPING.

(FROM OUR CORRESPONDENT.)

BELGRADE, January 29.

WHATEVER may have been the feeling of the politicians responsible for the Zagreb and Belgrade conflict which produced the Royal proclamation of January 6th, there cannot be the slightest doubt as to the reception of the new *régime* by business circles. It is significant that the Zagreb Bourse was the first to register its approval by an immediate rise in the price of all State securities. Thus, the 2½ per cent. reparation bonds, which on January 6th were quoted in Zagreb at 444 dinars for a nominal 1,000, rose the very first day by two points, continued firm under the lead of Zagreb, and reached 460 on January 26th. Business people regard the suppression of political parties and party organs as a sign that greater attention will henceforward be paid to long-neglected economic needs. Emphasis, however, is placed on the repeated declaration by the King that the new *régime* is only of a temporary character.

The first pronouncements of the new *régime* are indeed far-reaching. All legislation is to be radically revised; administration reformed and cleansed of corruption; the cadre of officials reduced; the budget made smaller by 10-14 per cent.; and Customs tariffs entirely changed. Even more important is the declaration that all State undertakings, and particularly railways, telegraph and telephones, will be placed on a commercial basis and

partly handed over to private enterprise. In practice the Government has started with a wholesale dismissal of superfluous officials, the reduction of the budget, and the promulgation of several laws, whose full effect can only be judged after some time.

Of the need of drastic reforms there can be no doubt. The past year has not been easy for Jugoslavia, although better than 1927. The trade deficit for 11 months reached the sum of 1,411 million dinars (£5.2 million), imports having been 7,286 million dinars, against exports 5,876, a ratio which can be only slightly modified by the December figures. It is true that the deficit is not due to a fall in exports, which have been 44.5 million dinars larger in 1928 than in 1927, but to a rise in imports; also that the higher imports relate not to articles of consumption, but to railway material, rolling stock, industrial plant and hardware, which are all necessary for works of construction. Nevertheless, the trade deficit has put a heavy strain on the National Bank, whose covering of 452 million gold dinars at the end of 1927 declined to 339 at the end of 1928. The rest of the balance of payment has been covered from foreign loans, viz., from the instalment of the Blair loan, 400 million dinars, the Swedish match loan, 280 million, the Tobacco Monopoly loan with the Anglo-International Bank, 270 million, and the State Mortgage Bank loan, 113 million dinars—a total of 1,063 million dinars (£4 million). This strain is likely to continue during 1929 until the harvest, in view of the poor prospects of maize export. The expected trade deficit of the next eight months will, therefore, have to be covered from the further three instalments of the Swedish match loan, 840 million dinars, and the remaining parts of the Tobacco Monopoly loan, 810 million; while the stability of the dinar is further assured by a revolving credit of 300 million dinars, and, it is believed, by a credit of 15 million Swiss francs.

The year has been most satisfactory from the point of view of industry, which has not only recovered from the deflation crisis, but, supplied as it is with cheap labour as a result of the agricultural depression, is showing signs of expansion. The best placed is the wood industry, which has entered upon a period of activity likely to continue for some time. With prices 30-40 per cent. higher than last year, and wages and freights the same, it has been able not only to write off former losses, but also to create reserves for future development. The textile industry has also progressed. Most of the knitted material required is now supplied by home production, while other branches are also improving, and the establishment of an artificial silk factory with British capital is imminent. The chemical industry is expanding with the help of foreign capital, and so is the sugar industry, which fully supplies home consumption, and can even produce for export. Satisfaction is also felt at the development of the Adriatic merchant marine, which, from 114,000 registered tons in 1921, has increased to around 300,000 at the end of 1928. Two large maritime companies, the Atlantska Plovidba Ivo Racic and the Jugoslavenska Amerikanska Plovidba, have amalgamated recently under the name of "Jugoslavenski Lojd," with headquarters in London and a capital of £7 million which incidentally makes them financially the most powerful enterprise of the country. The Dubrovacka Paraplovidba is increasing its capital from 21.5 million dinars to 100 million, most of the new capital to be used for shipbuilding. Finally, the Jadranska Plovidba, which serves coastal traffic, plans the construction of 18 vessels in view of the increasing number of tourists visiting the Dalmatian coast.

RUSSIA. — AGRICULTURE — INDUSTRY — TRADE—BUDGET—CREDIT.

(FROM OUR CORRESPONDENT.)

THE food position has not improved, and in many towns special control of distribution has been reintroduced. The autumn sowing campaign developed unsatisfactorily, and as the area under winter crops is below the programme, special measures have to be taken to increase the area sown in the spring. Large loans of seed are to be made. The plans of the Trade Commissariat and of the Centrosoyuz provide also for a big increase in sales of manufactured goods to farmers in the grain-collecting provinces, but this is made possible only by reducing the supply of manufactures to the grain-consuming provinces and to the towns. The Government announces new measures for increasing the flax crop. The flax area recovered to 1,179,000 hectares in 1925-26, but declined again to 1,158,000 hectares in 1927-28; and the yield fell from 309,000 to 254,000 tons.

The official retail prices index number rose further to 2.16 (1913=1) on January 1st. In the past year retail prices rose 7.6 per cent., the agricultural group 16.5 per cent., and the industrial group 2.5 per cent. Wholesale prices have also further risen slightly to 1,768 (1913=1,000) on January 1st. The Council of Economy reports that the average industrial production cost in 1927-28 fell 5.5 per cent., as against 6 per cent. required by the programme for that business year. The plans for reduction of production cost of coal, oil, iron ore, machinery, and some other products were not realised. The best results were attained in chemistry and in non-ferrous metals. The productivity of labour generally increased. The Plan for 1928-29 assumes that industrial production cost will decline 7 per cent., but the results in the completed first quarter of the business year were not so satisfactory.

Industry is facing many difficulties. In the Urals and South Russia there is a shortage of high-grade iron ore and of coke. Official complaint is made of shortage of basic chemicals, zinc, lead, tin, and in some districts wood. The manufacturing branches which produce goods for consumption are also short of materials. Labour discipline is bad, particularly in the collieries and in engineering. In the first quarter of 1928-29 industrial output is returned at 20.5 per cent. above that of the same quarter of 1927-28; this exactly fulfils the programme. The output of coal was 9,607,000 metric tons; that of pig iron 880,100 metric tons, and of ingot steel 1,147,000 metric tons. The coal output fell below the programme. The Communications Commissary complains that railway-car construction and shipbuilding are delayed by shortage of materials. Plans for increasing the iron output are still being launched. Two milliards of roubles are to be spent in the next five years in building new and renovating old metallurgical works. Oil output in December is returned at 1,117,000 tons, as against 1,079,000 tons in November. The revised foreign trade return for 1927-28 shows oil product exports at 2,728,300 tons, against 2,038,800 tons in 1926-27, 663,200 tons being petroleum, 760,500 tons benzine, 183,000 tons lubricating oils, 221,500 tons motor oils and gas oil, and 692,900 tons mazut. Italy bought 496,900 tons, Great Britain 387,400 tons, and France 354,800 tons.

The local authorities in White Russia and the Ukraine have been given new orders to "curtail the excessive activity of private initiative in retail trade." This is being done chiefly to the benefit of the Co-operatives. The Moscow Press publishes criticisms of the Customs Tariff of 1927. It is alleged that the import duties, though very high, are inoperative owing to the enormous difference between home and foreign prices, and that the only effective protection is the State Foreign Trade Monopoly. Imports over Asiatic frontiers in 1927-28 totalled 124,600,000 roubles, exports 138,100,000 roubles. In the first quarter of 1928-29 (October-December, 1928) imports over European frontiers were 166,800,000 roubles, exports 179,600,000 roubles. Import of goods for consumption again fell heavily, being only 80 per cent. of that of the same quarter of 1927-28. Export of agricultural products also declined, but export of agricultural products other than grain increased; and the industrial export increased 51 per cent.

The Budget for 1928-29 has been sanctioned by the Central Executive Committee. The chief figures, as

compared with the Budget of 1927-28, are:—

REVENUE.	Thousands o 1927-28.	Roubles 1928-29.
Direct taxes	1,495,277	1,700,287
Indirect	1,640,900	1,990,500
Stamp duties, etc.	105,117	138,049
All taxation	3,241,294	3,828,836
Non-tax sources	2,633,210	2,987,687
Whereof:		
Posts	171,900	190,000
Communications	1,685,000	1,904,459
State property and undertakings ...	686,288	784,814
Loans	525,000	800,000
	6,399,504	7,616,523
Budget surplus	50,000	115,000
Total revenue	6,449,504	7,731,523
EXPENDITURE.		
Defence and administration	3,604,084	4,029,060
Whereof:		
Defence	742,427	850,742
Communications	1,876,994	2,069,465
Posts	178,412	190,003
Education	171,332	215,831
Health	52,278	59,050
Agriculture	126,941	150,451
Financing of business	1,316,041	2,055,766
Whereof:		
Industry	632,138	949,209
Electrification	135,660	184,000
Agriculture	131,252	334,150
Trade	108,060	181,100
Railway construction	68,000	127,600
Special funds	184,018	157,642
Service of loans	247,500	293,000
To local budgets	942,795	1,050,623
Expenditure of R.S.F.S.R. autonomous Republics	83,066	95,435
State grain fund	22,000	—
State cash reserve	50,000	50,000
Total expenditure	6,449,504	7,731,523

The estimated revenue is nearly 1,300 million roubles over the 1927-28 estimate, but only approximately 1,000 million roubles over the realised revenue (6,796 million roubles) of that year. The increase in receipts from loans in 1928-29 is less than appears from the table, because loans in 1927-28 realised 180 million roubles more than the 525 million roubles estimated. Of the increase in expenditure very little falls to administration. Communications (gross expenditure) and Defence account for a great part of the increase; but in the main expenditure is swollen by an addition of over 700 million roubles for financing national business. Here agriculture claims the largest percentage increase, in part owing to the proposed big development of " Soviet " and " collective " farms. The investment in new railway construction is doubled. Altogether, over 26 per cent. of the Budget total falls to financing of business, as against 20 per cent. in 1927-28. In the first quarter of 1928-29 total revenue received was 1,849 million roubles. The agricultural tax yield and receipts from transport exceeded the quarter's share, but there was a deficit on the income and industrial taxes, due, according to the official statement, to " the shrinkage of private trading."

The short-term credit position is reported somewhat better; the capital market worse. The short credit demand towards the end of last year was smaller than at the same period of 1927. Long-term indebtedness increased; and during the whole of the first quarter of the new business year the Long-term Credit Bank was faced with difficulties through the failure of borrowing concerns to meet their engagements. Total circulation on January 1st was 2,028 million roubles, against 2,025 million roubles on December 1, 1928, and 1,668 million roubles on January 1, 1928. The State Bank's return for February 1st shows a circulation of 1,065,051,730 tchervonetz-roubles.

JAPAN. — TAX REFORM — TRADE — BANKING — PRICES.

(FROM OUR CORRESPONDENT.)

TOKIO, January 14.

THE Imperial Diet will reassemble next week after the New Year recess. The main work of the current session is undoubtedly to give legislative sanction to a rather complex taxation reform Bill. The Government measure is, in rough outline, to transfer the land and business profits taxes to local governments as rating relief, and to make for loss of national revenue consequent upon the proposed transfer by increasing rates of tax on higher incomes and imposing new normal rates on investment income and business profits. Parliamentary controversy promises to rage around the Government proposal, which, however, is in itself essentially a dull and heavy legislative task. Immediate attention will surely be turned, as is already clear, to affairs of foreign policy. The present Government's China policy now foreshadows a whole-hearted indictment from many sections of the Opposition. Commanding, as it does, no clear majority in the House, the Government is not altogether safe from surprise and defeat. It will be hard put to it to get through the session.

The trade returns for 1928 show that imports at 2,192,858,000 yen were 15.5 million yen higher than in 1927, while exports at 1,971,689,000 yen were 20.4 millions lower, the excess of imports over exports at 221,169,000 yen being 35.9 millions higher. The first half-year's improvement in trade was so marked as to suggest that the apparent adverse balance might shrink to a very comfortable sum, but these expectations have not been fulfilled, the recovery having been arrested during the last six months. Japan's imports from China during 1928 amounted to 372,741,000 yen, and her exports to China to 530,926,000 yen, showing a balance of 155,185,000 yen in favour of exports. As compared with the preceding year, both imports and exports reveal an expansion of 39.9 and 46.4 million yen respectively. The better result in the trade with China shows that the anti-Japanese agitation did not affect the trade so seriously as a whole, and a falling-off in trade in the boycott-infested regions was more than offset by a compensatory expansion in other parts of the Republic. Korea's foreign trade returns for 1928 disclose that imports totalled 118,151,000 yen, and exports 32,149,000 yen, showing an adverse balance of 86,002,000 yen, against 85,809,000 yen in 1927. Formosa's imports during last year amounted to 58,332,000 yen, and exports to 33,894,000 yen, an excess of imports over exports totalling 24,438,000 yen, against 20,963,000 yen in the preceding year. Japan's adverse balance on the visible trade figures for the whole year 1928, including Korea and Formosa, thus amounted in the aggregate to 331.6 million yen, as compared with 292 millions for 1927.

The 1928 merchandise excess of imports of 331 million yen is reduced to 152 millions by net invisible exports, income in the international transactions amounting to 537 millions and expenditure to 358 millions, according to the chairman of the Yokohama Specie Bank's private estimate of the trade balance for last year. As compared with 1927, income rose by 73 millions, while expenditure fell by 11 millions. But it should be noted that proceeds of the water-power companies' loans raised in London and New York, and the loss of specie held at foreign centres, are included in the bank chairman's calculations. Japan's position in international payments, therefore, cannot be regarded as having improved.

Despite the fact that a few bank failures were reported from the North at the middle of last month, the year-end was negotiated without much difficulty. But the Bank return for December 29th showed that the note issue and advances expanded to 1,773.4 and 918.6 million yen respectively, the highest for any year-end period. The explanation was the calling on the big banks for meeting the pressure in anticipation of a particularly difficult year-end, and the consequent rise of market indebtedness to the Bank. After the turn of the year, however, both note circulation and advances contracted rapidly. The yen exchange has developed a weakening tendency since the opening of the year. The Hankow agitation and the unsettled outlook of Sino-Japanese affairs, the abnormally heavy imports in the first ten days of the month, and the depletion of Japan's foreign balances, all serve to depress the yen. Under the shadow of the Chinese agitation the stock market is rather hesitant, though the general tone remains firm, supported by the monetary ease. Commodity prices have again turned upward. The Bank of Japan's wholesale index number for last month registered a rise of 0.68 points, the total being 229.75, against 229.07 for November, and 222.43 a year ago.

Letters to the Editor.

STABILISATION OF PRICES.

TO THE EDITOR OF THE ECONOMIST.

SIR,—The stabilisation of prices is frequently mentioned in the Press nowadays as if it were a function that currency should perform. Is that correct otherwise than in a strictly limited manner?

Modern currency systems confronted with sensitive local or world conditions may justifiably call for temporary arrest or acceleration such as the finger may give to the weighing scale, but can prices be stabilised in the long run?

What really rules prices from decade to decade and century to century is the " standard of living." That has been revolutionised by the applied use of steam and electricity. It is continuously being revolutionised by the increasing freedom of communications between the nations of the earth and by the harnessing of the forces of Nature as scientific knowledge advances. The cinema, for instance, is raising the standard of life, for almost the poorest of families provide their children with the means of enjoying it.

Certainly, at any moment sources of power may be derived from the ether or the atom which would raise " the standard of life " immeasurably higher.

Apart from such contingencies, the trend of events is bringing about factors which cannot fail permanently to affect prices to a surprising degree, and that is the awakening of the populous nations of the Far East to Western civilization. In other words, half of the people of the world are on the eve of a great advance in their standard of living, with a consequent effect upon world prices.

In the writer's experience the wages of Indian workers have risen at least twofold and must continue to do so. When the myriads of Central Asia, China and Japan add their powerful impetus, no manipulation of the present currency systems will be able to hold it in check. Mrs. Partington set herself to sweep the sea out of her parlour, but the Atlantic won. Until the currency systems of the world are based upon common agreement and a common standard of living—which to most of us seems a fantastic dream—the utmost currency systems can do is to ease the strain of seasonal and exceptional interference with prices.

After all, save in countries independent of foreign trade—now few, and soon, probably, to be non-existent—world prices will affect more or less the internal prices of each individual nation.—Yours faithfully, BENJAMIN WHITE.

The Holt, Rustwick, Tunbridge Wells, February 12th, 1929.

Books and Publications.

A NEW VIEW OF WAGE THEORY.*

MR. J. W. F. ROWE has produced a re-statement of current wage theory which merits recognition as a definite landmark in the history of the subject. It embodies conclusions which contain the germ of real originality and are expounded in a lucid and vivid literary style which will commend the work to the general reader as well as to the specialised student.

The book falls into three parts. The first comprises a study of actual wage movements between 1886 and 1926 in five particular industries: building, coal, cotton, engineering and railways. This is a good selection, illustrative of widely varying conditions as regards security of tenure, overtime, unemployment and short time, dependence upon export trade, statutory control and labour organisation. Book II. follows up the fortunes of these industries in respect to collective bargaining, and concludes with the interesting suggestion that the constant drain of trade union officials to the Parliamentary arena is mainly responsible for slow progress in the improvement of trade union organisation and the absence of constructive leadership.

Book III. opens with a masterly exposition of the Marginal Productivity theory, as Marshall left it, followed by a brief summary of the elaborations of that theory which later writers have developed. To this recapitulation Mr. Rowe adds two conclusions of his own, drawn from his preceding study of facts and tendencies. The first is that the conception of a general rate of wages may be, under modern conditions, an unsupported theoretical abstraction; the second that existing wage theories ignore the implications of a powerful trade unionism, and its causation of changes in the whole structure of wages. It is here that we approach the constructive part of his thesis. In substitution for the Marshallian conception of specific collective bargains as short period oscillations round a normal equilibrium, the author offers his own view of the specific collective bargain as itself a determinant of normal equilibrium, operating through continued pressure on the technique and organisation of production. Thus he is led to demand the frank recognition of collective bargaining as a determinant of the value of labour; and in his concluding chapter he discusses some of the practical implications of his view. They involve a series of ingenious economic paradoxes. " Capital is, as it were, the pursued, and labour the pursuer " —a curious reversal of the view of collective bargaining crystallised in Part III. (Chapter II.) of Mr. and Mrs. Webb's " Industrial Democracy." The function of trade unionism thus expands from an attempt to equate wages with marginal productivity to an attempt to increase marginal productivity by reinforcing, or if necessary replacing, competition as a spur to progress. It follows that a high level of intelligence and knowledge is required of the trade union leader, who is called upon to make an accurate valuation of the potential response of any particular industry to a forward thrust of wages, since overvaluation may have serious reactions on employment.

* " Wages in Practice and Theory." By J. W. F. Rowe. Routledge, pp. 277–x. 12s. 6d.

EAST OF SUEZ.*

THE authoress of " The Trade of the Indian Ocean " must, it would seem, have shut herself up, as did Thomas Moore a century ago, with a library of books upon the East; but the result is very different. Instead of a contribution to literature wearing the garb of oriental romance, we have an utterly matter-of-fact compilation, the object of which, it is explained on the opening page, is " to give a brief account of the present-day commerce and commercial problems of the Indian Ocean." It is difficult to believe, on reading " Lalla Rookh," that Moore wrote of what he had never seen. This writer, on the contrary, if she has sailed the Indian Ocean, has not allowed her experiences to influence her pen. No vision is here, such as the title of the book might suggest, of the gorgeous East, lavish with pearl and gold; no coral reefs, surf boats, ships; no men toiling in the heat; no great sea stretching into a limitless distance. On the other hand, the account of things as they are, according to economic works and statistical records, is very well done. The facts, well up to date, have been brought together with diligence, and are presented in orderly fashion. But this is a picture of a vast machine. Even the Suez Canal was not made—it is simply there—with its traffic to be coldly analysed. The impact of European civilisation upon the East, the scramble for new markets and new sources of raw materials, have no doubt happened, but the reactions discussed are mainly industrial and commercial activities, as represented by figures and percentages. The narrative is no more tense with life than are the official reports whose materials it so admirably condenses. The book is a valuable compendium for reference purposes, and a really wonderful mass of information is packed into its pages. Perhaps it is too much, in the circumstances, to expect more than a text book, yet it is difficult to avoid disappointment that the seeming promise of the title is not more amply fulfilled.

* The Trade of the Indian Ocean. By V. Anstey. (London) Longmans Green & Co., 1929. 8s. 6d.

GOVERNMENT AND MUNICIPAL SECURITIES.*

THERE are this year 2,330 pages in the "Government Manual," the chief of the five volumes packed full of enlightenment which Moody's Investment Service annually makes available. The remaining four deal respectively with bank and finance, industrial, public utility, and railroad stocks. Apart from its value to the investor, there can hardly exist a more concentrated accumulation of exhaustive knowledge about almost every stable government and city in the world than this euphemistically titled tome. By those who, without being experts themselves, make use of it for financial information a new feature will be appreciated, for in the 1929 edition a brief editorial note on the fiscal policy and national economy of each of the principal nations is appended to the pages of detailed facts and figures concerning each nation's resources.

* "Moody's Manual of Investments, American and Foreign: Government Securities, 1929." Moody's Investment Service, New York and London (33, King William Street, E.C. 4). £5 5s.

BOOKS RECEIVED.

[Brief mention of a book in this column does not necessarily mean that it will not receive fuller notice in a subsequent issue.]

Select Statistics, Documents and Reports Relating to British Banking. By T. E. Gregory. Oxford University Press. Two volumes, 21s. net.

Volume I. (1832-1844) deals with the Bank of England before the Bank Act of 1844. Volume II. (1847-1928) is divided into three parts: The Bank of England after the Bank Act of 1844; Joint Stock Banking; and the War and Post-War Periods.

Economic Foreign Policy of the United States. By Benjamin H. Williams. (New York) McGraw-Hill Book Co., Inc., 370 Seventh Avenue. 20s.

This critical history, by a Pittsburgh professor, of the economic diplomacy of the United States, forms an interesting and important contribution in a little worked field.

How to Abolish the Slums. By E. D. Simon. (London) Longmans, Green and Co., Limited. 4s. 6d. net.

This welcome volume consists of a survey of the present position and of concrete suggestions for improvement. The appendices contain a collection of useful miscellaneous information on housing matters, included for the light it throws on the probable cost of carrying out the author's suggestions.

Agricultural Economics. By George O'Brien. (London) Longmans, Green and Co., Limited, 39 Paternoster Row. 10s. 6d. net.

Starting from a definition of economics as "The science of prices," the author has divided his book into three sections, dealing respectievly with general agricultural price movements; the prices of particular commodities; and the means by which State intervention may affect prices.

Stabilization of Prices. By Joseph Stagg Lawrence. (London) Macmillan and Co., St. Martin's Street. 21s. net.

This is the London edition of the publication noticed in our issue of December 29th.

Goodwill in Industry. A symposium by five practical men. (London) London General Press, 8 Bouverie Street, E.C. 4. 1s. net.

These five prize-winning essays in a competition organised by the Glasgow and West of Scotland Association of Foremen constitute a contribution hot from the oven to the discussion of one of the pressing problems of the day.

Road versus Rail. By Christopher T. Brunner. (London) Ernest Benn, Limited, Bouverie House, E.C. 4. 2s. 6d. net.

A frankly *ex parte* statement of the case for motor transport.

Cost of Government in the United States, 1926-1927. (New York) National Industrial Conference Board, Inc., 27 Park Avenue. $2.50.

To most readers the value of this volume will lie in the usefulness, for purposes of reference, of its extremely complete equipment of statistical tables.

Annals of the American Academy of Political and Social Science. Vol. CXLI. Tariff Problems of the United States. (Philadelphia) The American Academy of Political and Social Science, 3,622-24 Locust Street. $2 net.

The contents of this volume are more comprehensive than the title implies. It includes general articles on foreign trade, and articles on tariff making in other countries, as well as discussions of a large variety of problems peculiar to the United States tariff.

Prospettive Economiche: Lana; Petrolio. By Giorgio Mortara. (Milan) Università Bocconi.

Two surveys in Italian of world production of, and trade in, wool and petroleum respectively, with an attempt to forecast future tendencies.

Sulla Construzione di Barometri Economici in Italia. By Riccardo Bachi. (Milan) Tipografiia Sociale de Cav. Carlo Sironi.

An untranslated reprint of an article on economic barometers which originally appeared in "Annali di Economia."

La Politica della Conziuntura. By Riccardo Bachi. (Rome) Libreria Fratelli Bocca.

This is a discussion, by a distinguished Italian economist, of the effects of trade cycles and the possibility of controlling them.

Lloyd's List of Law Reports. Digest No. 3. London (Lloyd's), E.C. 3. £2 2s.

This volume covers the Hilary Sittings, 1925, to Hilary Sittings, 1928, inclusive.

Das Osterreichische Steuersystem des Bundes, der Länder und Gemeinden und die Kapitalbildung. By Dr. Alexander Spitzmüller. (München) Verlag Duncker und Humblot. 2 marks.

An essay in German on the relation between the tax system and capital accumulation in Austria.

Das Erdöl Band III. Teil 2. (Leipzig) S. Hirzel, Konigstrasse, 2. 26 marks.

This volume, which belongs to a German five-volume series in the chemistry, geology, technology and economics of mineral oil, is devoted to the storage and transport of oil and its products.

General Review from "The World Markets and Denmark" during 1928. By Jens Vestberg. (Copenhagen) H. H. Thiele.

A reprint in English of a Danish annual review.

The Estonian Year Book, 1929. (Tallin) Government Printing Office.

A useful illustrated book of reference on Estonian affairs. In addition to the usual economic sections, there are chapters on Estonian Geography, History and Culture.

The Institute of Actuaries Year Book. (London) Charles and Edwin Layton, 56 Farringdon Street. 2s. 6d. net.

Contains a variety of general information about the Society of Actuaries and about the profession in general.

Health Service Bureau Leaflets. (Birmingham) Wesleyan and General Assurance Society, Steelhouse Lane. Free.

A bound collection of leaflets on chemistry, hygiene and first aid.

Indian Automatic Exchange Tables. Compiled by L. S. Dee. (London) Crosby Lockwood and Son, Stationers' Hall Court, Ludgate Hill. 5s. net.

These convenient tables make it possible to convert at a glance any sum in sterling to rupees, and *vice versa* at rates of exchange from 1s. 5¾d. to 1s. 6¼d

The Bankers' Magazine. (London) Waterlow and Sons, Limited, London Wall. 2s. 6d. net.

Special articles in this number include: "Bank Profits and Balance Sheets."; "Credit and Trade in 1928"; "The New Agricultural Bank."

OFFICIAL PUBLICATIONS RECEIVED.

The following may be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2.

Statement Exhibiting the Moral and Material Progress of India during the year 1927-28. 37. 4s. 6d. net.

This annual report, issued with the authority and general approval of the Secretary of State for India, is amply illustrated by maps, diagrams, tables and photographs. It affords an unrivalled wealth of information for the study of present conditions in India.

The Stock Exchange.

THE ARMSTRONG WHITWORTH RECONSTRUCTION SCHEME

IT is nearly three years since the unhappy position of the finances of Sir W. G. Armstrong, Whitworth and Co. was first revealed, and though that event was not the first intimation that our heavy industries were in trouble, yet, on looking back, the publication of Armstrong's losses seems to stand as a landmark. The present scheme, again, though by no means the first reconstruction measure announced in the industry, serves to focus general attention, not merely on the somewhat sombre accounting question of how best to write off lost capital, but on the practical difficulties of our great industries. With the Vickers-Cammell Laird fusion and the Dorman Long-Bolckow Vaughan negotiations, it will soon be possible to see into what forms the rationalised steel industry of Britain is crystallising. On the financial side, the Armstrong proposals create history. They show that whatever views may be held on principle about the duty of bankers to industry, certain businesses have attained so great a size as to endow them, willy nilly, with national importance. Had Armstrong's been a small firm, it is difficult to avoid the conclusion that a receiver would have been put in. As things are, it is of interest that the big experiment—"precedent" would be too suggestive a word—happens to have fallen to the lot, not of one of the "Big Five," but of the Bank of England. If this scheme goes through, as seems probable, it will be the greatest achievement of financial salvage ever recorded. Losses amounting to £14,117,536 need to be written off, but the share capital is only £10,012,500. Whatever shareholders receive, therefore, must necessarily be *ex gratia*. The second and third debenture holders are faced with a clear choice—either to force a receivership, which would inevitably bring heavy losses on themselves, since, among other things, the Bank would then claim its rights, or to accept the proposals and trust that the reconstituted board of directors and the advisory committee of stockholders have apportioned to them a fair stake in the real earning capacity of the company.

The work of the new directors since they took up office in 1926 has been thorough. They had the company's properties revalued last year, and a decrease of 50 per cent. on 1920 values was reported. Concerning the Newfoundland paper venture, they say that part of the development was premature, and in many respects the work done was more costly than it might have been. These are firm words. The new board recovered £2,000,000, more than was expected at one time, out of this £5,000,000 investment. The drop in newsprint prices would have made the situation even more perilous had the operation of ridding themselves of this investment been further postponed. Little can be hoped for from the wreck of the Pozzuoli Co., now disposed of, though tax liabilities of 57 million lire have been finally agreed at only 4 million lire. On the Pearson and Knowles situation the directors say: "It is obvious that the judgment used in the purchase of the control of this group of companies has not been justified." Here a drastic reconstruction has been carried through, and it is hoped that by intensive effort and development the group "will be operated more successfully than in the past." In view of the doubtful armament situation, a substantial reserve is to be created against holdings in Vickers-Armstrongs, besides the provision set up in respect of general investments, including loss anticipated on the Glasgow company. The new board deserves credit, not only for such gains as have been made, as in the case of the Armstrong-Siddeley Co., but for its activity in ridding the company of onerous "assets." Contingent liabilities, again, have been cut down by nine-tenths in two years.

The total of £14,117,536 for losses has been endorsed by Messrs. Deloitte, Plender, and Griffiths, and there is no reason now to suppose that any item in the valuation of assets errs on the optimistic side. Of the loss, £4,885,814 is attributed to reduced values of works and machinery, and £6,598,853 to losses on investments (including £2,864,184 in Newfoundland, £1,312,102 in Italy, and £1,510,143 in the Pearson and Knowles group); for further depreciation of investments still owned £1,940,060 is provided, and the remainder represents the deficit on profit and loss account. In devising a method of writing-down it must obviously have been necessary, firstly, to gain and keep the goodwill of the Bank; secondly, to give the company a fresh start as free as possible from bonded indebtedness, while treating debenture holders with all possible consideration; and, thirdly, to try to preserve an interest for the shareholders, whose strict rights were *nil*, except that their consent had to be obtained to the final arrangements. By those three tests exclusively we must judge the financial proposals, which cannot be set out here in full; a summary of them will be found on page 373. The Bank agrees to cancel £4,871,986 debenture stock, together with some £450,000 of interest owing on the last two years. In return, it receives a special class of ordinary shares, entitled, in effect, to nothing out of the first £145,441 of profits, but to nine-tenths of the distributed profits thereafter. A calculation based on the published terms suggests that the company will need to earn and pay £460,000 in interest and dividends before the Bank receives as large an annual sum as it received before the moratorium. The other first debenture holders appear to have slight cause for complaint. The remaining notes and second and third debentures are replaced by income stock and shares in two trusts to which various investments are transferred, as well as new classes of preference shares in the company that are intended to be redeemable. Interest on these notes and second debentures formerly required over £207,000, and could only be paid in full when the company had £373,000 available to meet its first and second charges. From this new trust about the same sum will be available annually if and when the transferred assets earn their full interest (*inter alia*, if and when the company can distribute £104,000 after meeting debenture charges—and it must be remembered, here as well as with reference to the Bank's chances, that assets to a nominal value of over £3,000,000 are transferred from Armstrong's to the new trusts). Interest on the third debentures not held by the Bank required £168,480, and could only be paid in full if the company had £698,000 in earnings, but their new trust will only furnish £90,000 a year at most. All the same, this is better treatment, we believe, than the holders concerned could hope to receive under any practicable alternative. The ordinary and the three classes of preference shareholders receive shilling ordinary shares in various proportions. Their relative treatment could be examined in detail, but where all four classes were so indefinitely far off from receiving any dividend, or even any repayment of capital on liquidation, whatever allotment is now made to them can be little more than arbitrary. At least they all have the satisfaction of seeing a moral right granted them to a small but not-too-deferred share in the equity of the company, and that is a principle of far-reaching importance. The Bank, of course, has the last word, and has certainly made large concessions. Everyone will hope that Armstrong's may so recover that the Bank will eventually receive some compensation for its sacrifice.

With regard to the future, Armstrong's directors are studiously cautious. The results of the financial "clearing-up" should, however, be considerable. Fixed charges are to be reduced from nearly £700,000 a year to under £42,000. The company makes a fresh start with no millstones around its neck. We refer not merely to the financial weight of losses unprovided for and interest unpaid and accumulating, but to the depressing effect on the minds of the *personnel* that such burdens have, and, further, to the severe trade handicap under which a company carrying on a business of this character suffers, particularly in the obtaining of large orders and contracts—we believe that Armstrong's was no exception—when it is known to have been granted a moratorium in consequence of its precarious financial position. For this reason alone it was highly desirable to act at once, and not to allow the moratorium to run its full course to 1931. The clearing-up process, again, has cut away hindrances and carved the new company, Armstrong Whitworth Securities, in the form best adapted to take advantage of genuine opportunities. It is to be entirely a holding company. The manufacturing activities will be divided between two subsidiary companies controlled by the parent and in a position to take immediate advantage of any favourable chances of "rationalising" development that may occur. As an indication of present policy, we would draw attention to a passage where the directors state that two more Tyneside shipyards have lately been acquired. "A reasonable amount of development" is being undertaken to make the yards thoroughly effective. "But here a word of warning is necessary. Shipbuilding at the present time is unprofitable through unnecessary competition . . . efforts must be made to restore a sane business policy to the shipbuilding as well as to any other heavy engineering industry."

Once again the vertical combine has been discredited. Not in the aggregation of many businesses of diverse and sometimes speculative characters, each requiring specialised knowledge and management, but in the recasting of great firms with a view to economical concentration on each differentiated objective lies, so it seems, the future. Questions spring to the mind as to the places which Armstrong's, Vickers, and Cammell Laird will finally occupy in rationalised British industry, but they cannot be answered yet. Recognising fully that financial reorganisation by itself is not enough, that success depends in the long run on the measure in which the industrial administration of Armstrong's can be permanently improved, we welcome these capital proposals as a necessary prelude. We have reason to understand, indeed, that it was primarily to expedite them that last week's Order in Council was made, bringing into effect Section 53 of the new Companies Act. The outlook now, for the Bank and for all other Armstrong security holders, is conditioned less by the special burden of the company's past misfortunes than by the universal difficulties of the heavy industries.

RAILWAY GROUPING IN THE UNITED STATES.

THE news that the Baltimore and Ohio Railroad has openly expressed its intention of asking the Interstate Commerce Commission to give it permission to control the Reading Railroad and the New Jersey Central is a landmark of no mean importance in American railroad finance. It would appear to be a direct outcome of the favourable decision recently recorded in the case of the New York Central's application to control or lease the Cleveland, Cincinnati, Chicago and St. Louis Railroad—commonly known as the "Big Four"—and the Michigan Central Railroad. For many years these two latter have acted as part of the New York Central's route to the West, the "Big Four" forming the link south of Lake Erie from Cleveland to St. Louis and Chicago, whilst the Michigan Central, crossing from New York State to Canada near Buffalo, runs through Ontario and Detroit to Chicago, north of Lake Erie.

Those who have followed the efforts towards consolidation amongst the American railways in recent years will recall that the Interstate Commerce Commission turned down this application some two or three years back for the somewhat curious reason that it made no provision for the inclusion of small and financially weak lines in the territory served. Best informed opinion regarded the decision as implying that the Interstate Commerce Commission was not at that time favourable to any degree of consolidation which might not fit in with a wholesale programme of grouping, as possibly provided for in the Bills aiming at that objective presented to Congress each session.

The definite refusal to allow the original Nickel Plate scheme, embracing the Chesapeake and Ohio, the Père Marquette, and the Erie, to materialise, as well as the complete defeat of the Loree project to combine the Missouri, Kansas and Texas, the Kansas City Southern, and the St. Louis-South Western—usually known as the Cotton Belt—seemed to show that the Interstate Commerce Commission were definitely opposed to the whole conception of grouping at that time. Although in May, 1928, the prospects for consolidation brightened materially because the Interstate Commerce Commission authorised the Chesapeake and Ohio to purchase a controlling interest in the Père Marquette, it refused to give a similar permission in relation to the Erie. Last summer, when plans were being completed for the application of the Great Northern, the Northern Pacific, and the Chicago, Burlington, and Quincy Railroads to combine as the Great Northern Pacific, expert opinion throughout America regarded the successful chances of the scheme as somewhat slight.

The latest news concerning the Baltimore and Ohio, however, relates to the competitive manœuvres in the "trunk line" territory. Attempts for some years now have centred round the formation of four great systems between New York and Chicago of fairly equal competitive power. The formation of the Nickel Plate system by the Van Sweringens added to the previously existing Pennsylvania, New York Central, and Baltimore and Ohio systems, a fourth of no mean size and power, including the Erie, which has grown largely in importance since the accession of J. J. Bernet to its presidential chair.

Loree's Delaware and Hudson proved the dark horse, with an attempt to build up a fifth great trunk line through control of the Lehigh Valley, the Buffalo, Rochester, and Pittsburg, and the Wabash. If his South Western line combination had been permitted, Loree would then have built up a system from New York to Texas, a plan bolder than any engineered by Hill or Harriman in the last generation. Loree's sale of his Delaware and Hudson, Lehigh Valley and Wabash stock to the Pennsylvania at a very high profit in 1928 definitely eliminated the prospect of a fifth great system, and the next move has now come about by the attempt of the Baltimore and Ohio to obtain permission to control the Reading and the New Jersey Railroads, by running powers over which it reaches the Hudson River and obtains a share of the New York traffic.

The change of heart within the Interstate Commerce Commission, possibly created by change of its membership, may lead to favourable consideration of the Baltimore and Ohio's request, and it is presumed to be only practicable through the agreed transfer of the New York Central's stock holding in the Central of New Jersey. The strongest opposition to the scheme is likely to arise not only from the Pennsylvania but also from the Erie, as representative of Van Sweringen interests, and it would be rash to speculate on the result of this battle of the giants. The main importance of the move would appear to be the realisation that consolidation must take place if operating costs are to be reduced; and it may prove a further step in the progress towards a four-system organisation in the East. Stocks of the remaining independent lines in this area are, therefore, likely to be considerably affected.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

TICKET.	ACCOUNT.
February 19.	February 21.

THE change in Bank rate continued to trouble Stock Exchange prices all through the week, and restricted business was the rule every day and everywhere. It forced a gradual cheapening of all securities of high investment class, and the end of this movement has not yet come in sight. The direct effect of 5½ per cent. on Industrials was slighter than might have been expected, and produced far less painful results here than on the corresponding class of security in Wall Street, thus proving what has always been felt, that the upward movement of Industrials in London during recent months has avoided that speculative excess which well-informed authorities suspect in the New York boom. The news that the New York re-discount rate was not to be raised helped to steady and reassure the Stock Exchange for a time, but the irregular tone persisted. The dividend announcements of three of the four great Home Railways, which we discuss in a subsequent "Investment Note," lent importance to that market on Wednesday.

There was little desire either to sell or buy British Government stocks, but periods of weakness predominated on balance, and there was little sign of a permanent hardening on a definite level. After maintaining itself at first better than the others, War Loan declined on Wednesday to 102. With the continuance of disorders in Bombay India loans were unsettled, and Dominion loans did not altogether escape infection from the general course of gilt-edged prices.

The foreign market was decidedly heavy, though here, too, there was little doing. Roumanian Consols were adversely affected by the issue of the new loan, but even without a special cause most European stocks were marked down. South Americans also were generally easier, Peru Corporation experiencing another sharp fall.

Home Railways prepared for dividend news by a unanimous fall on Monday and a quiet Tuesday. The immediate effect of the announcements was to strengthen prices, the Midland and Scottish result being particularly well received, but irregularity followed and, as the day went on, the improvement was not maintained. On Thursday the slight excitement caused by the announcements entirely disappeared, the market resuming its wonted listlessness, both Midland and Great Western giving way.

After a weak start Argentine lines rallied and were mostly higher on balance, but San Paulo fell back and International Railways of Central America fluctuated sharply. Canadian Pacifics were pulled up on Tuesday by the better tone of Wall Street.

Not many good features appeared among Industrials. New York did not take a hand, and there was nothing to encourage either bulls or bears to speculative operations. Apart from Bank rate, the most influential event of the week was the publication of a letter from Mr. Courtauld (referred to in a later "Note") critically reviewing the state of the artificial silk industry. Optimistic dividend rumours continued, but it was evident, on the whole that the way was being prepared for the adoption of the more conservative policy in distributing profits. Other textile shares were idle. The belief that aero-engine works are doing well caused Rolls-Royce and Napiers to make a good showing, in contrast to the rest of the motor group. Except for an occasional spurt at America's caprice, gramophones were off colour, though H.M.V. had the benefit of some support. International Nickel letters have laid behind them some of their old activity, but did not go along without considerable undecided fluctuations. Interest in the Home and Colonial report and forthcoming expansion of the business caused a temporary improvement in the price of the shares, but the dividend declarations did no good to Harrods or Bovril. Carreras found favour, and match and margarine issues, after a weak start, tended to move upwards. The heavy industries did not attract much attention, but reflected

LONDON ACTIVE SECURITIES.

The following tables show the movements of the week in the more active securities of the various markets:—

the prevailing dullness of the whole market. Bank and insurance shares were easier.

Rubber shares were firm, without any great volume of business passing, but a fractional improvement in the price of the commodity caused some advances. Anglo-Dutch and Rubber Trusts in particular benefited thereby. In tea the movement was just the other way, very little interest being shown. But oils took a turn for the worse by reason of adverse rumours about the oil situation in America, where the production of crude oil is breaking new high records. Paris was a seller of Eagle issues, but investment demand in London sufficed to counteract that, and Royal Dutch were well bought. V.O.C. were slightly easier on the meeting.

It is a long time since mines have remained so quiet, even Rhodesian coppers fading out of the limelight. For a time these were encouraged by a renewal of American demand, but only for a time, and, when Wall Street showed a desire to withdraw, prices slipped back all round, only Loangwa, on various vague tales, standing out. Paris sold Chartered heavily on Monday. Sub Nigels were prominent in the Kaffir market, Johannesburg at first buying freely, but selling orders followed, and the activity was probably engineered by speculation there. The movement in tin shares that was referred to last week came to a dead stop, the market being irregular and dull. Tharsis, Tintos and Arizonas experienced quick ups and down. Other features were strong buying of Burma Corporation, apparently on behalf of a trust company, and constant inquiries for Russo-Asiatics.

FOREIGN STOCK EXCHANGES.

NEW YORK.

The share market showed a fair rally after the break on the rise in the British Bank rate, and the warning from the Federal Reserve authorities, but real driving force was lacking. Meanwhile, it is apparent that there has been moderate liquidation, and the feeling in conservative quarters is that the money situation is now too unfavourable for activity, a further reaction in share values being looked for. There are some indications of a movement of funds to the interior, and brokers' loans are $100,000,000 lower. It is expected that the New York Federal Reserve Bank will maintain the 5 per cent. discount rate, other districts making the first change, if necessary. Business activity shows the normal seasonal gain.

PARIS.

The advance in Bank rate and threats of a rise in New York re-discount rate or restriction of brokers' loans led to profit-taking and bear selling. Further, liquidations were effected on account of two or three firms whose engagements were embarrassing. The result was an appreciable all-round fall. Bank and copper shares were affected most. Foreign stocks suffered an equal setback. The firmness of Mines des Lens, Norvégienne de l'Azote and phosphate shares was noteworthy by way of contrast.

BERLIN.

In the first days after the advance in the London Bank rate the Bourse was very weak and inactive, mainly owing to a fear of advances in the Amsterdam, Zurich and New York rates. German stock with a Dutch market were particularly weak. Prices on Monday were depressed by American selling, and there was general selling of Reichsbank. Potash stocks, which, after a big rise in 1928, have been weak this year, declined further. On Tuesday a moderate recovery was made. Artificial silk shares hardened, and Reichsbank rose sharply. Wednesday and Thursday were fairly firm, but very dull. Steel, electrical and shipping shares were in chief demand.

AMSTERDAM.

Despite the rise in Bank rate, the Bourse was firm and active the following day, but on Saturday the further relapse on Wall Street and the higher money rates in Amsterdam caused a reaction. The expectation of a rise in the Netherlands Bank rate kept business very quiet. Industrials were weak. Margarine Unie and Philips experienced a sharp setback, and artificial silks were dull. Rubber shares were firm.

INVESTMENT NOTES.

Dearer Money and the Stock Exchange.—A decided check to business was felt on the Stock Exchange as a result of the increase in Bank rate last week. Markets had not really prepared themselves for the change, in spite of the warnings received in the continued outflow of gold, and the fall in prices in the gilt-edged section was somewhat severe. The feeling of uncertainty as to the next move of the Federal Reserve authorities kept support away from the market even when the first wave of selling had ended. No improvement on balance was seen this week. The following table shows the prices of leading Government stocks before and after the rise in Bank rate:—

	Feb. 5.	Feb. 11.	Feb. 14.
Conversion 3½%	80⅛	77⅛	77⅛
Funding 4%	91⅜	88⅛	88⅛
Consols 4%	87⅞	85⅛	85⅛
War Loan 5%	102¼	102⅛	101⅞
Treasury 5½%	101	100½	100½
Treasury 4½%	98⅞	98	97⅞

The long-dated stocks have, of course, proved more sensitive to the rise in Bank rate than have the short-dated, but apart from the monetary influence the coming elections have probably cast their shadow on the whole gilt-edged market. The speculative "Anglo-American" shares suffered severely for a time, especially in view of the scare of dearer money in New York, but some small recovery was made, as the next table will show:—

	Feb. 5.	Feb. 11.	Feb. 14.
International Nickel	$64⅛	$59⅛	$61⅛
Columbia Graphophone	$16	$14⅛	$14⅛
Victor Talking	$160	$150½	$151
Canadian Pacific	$268½	$254½	$255

The leading industrial shares showed only a slight reaction, and in the case of Courtaulds there were special reasons for the fall. The following are the prices for six representative shares:—

	Feb. 5.	Feb. 11.	Feb. 14.
Imperial Tobacco	134/9	133/–	132/9
Courtaulds	4⅜	4⅜	4⅛
Gramophone	15⅜	14⅛	14⅛
Swedish Match	24⅛	23⅛	23⅛
Shell	4⅛	4⅛	4⅛
Marconi	81/6	78/6	80/–

The full effects of the 5½ per cent. Bank rate on Stock Exhange markets will not be seen for some time. There must be a number of investment trust companies which will decide to liquidate in part their overdrafts at their bankers by the sale of fixed-interest securities yielding less than 6 per cent. A gradual reaction in the prices of low-yielding debentures and preference stocks and shares may continue for some time, unless the market begins to discount a reduction in Bank rate. Ordinary shares of leading industrial companies, which are held mainly for the prospect of capital appreciation, should not be greatly affected. The more speculative shares may even come back into favour. But there is not likely to be much revival of business on the Stock Exchange until the feeling of uncertainty about the monetary position in London and New York is removed.

Home Railway Dividends. — Three of the four "group" lines announced their final dividends in respect of 1928 on Wednesday last, the London, Midland and Scottish Railway paying 2¼ per cent., and the Great Western 3½ per cent. on their ordinary stock, while the Southern is paying 2 per cent. on its deferred stock for the year. The North-Eastern declaration will not be made before Friday next, February 22nd. The following table shows the total dividends paid by these companies in each of the last four years, together with the net earnings for the years 1925 to 1927:—

	Net Earnings (000's omitted).			Dividends.				
	1925.	1926.	1927.	Stock.	'25.	'26.	'27.	'28.
	£	£	£		%	%	%	%
L.M.S.	14,164	6,598	16,230	Ord.	6	3	4¼	3½
G.W.R.	5,784	3,105	7,156	Ord.	7	3	7	5
S.R.	5,197	3,951	5,162	Def.	3½	1½	2	2

The Southern has fully maintained last year's position, but the rates of dividend of the other two lines are lower than in any year since the "groups" came into being, with the exception of the abnormal period of the coal stoppage of 1926. It is probable, however, that net earnings will compare favourably with those of 1925, when much higher dividends were paid in all three cases, the essential difference being that the railways are now relying for their distributions on the profits of each year's operations, whereas in 1925 they were still drawing on their reserves in order to maintain dividends at an artificially high level. The distributions for 1928 must be considered as, on the whole, gratifying, in view of the fact that the London, Midland and Scottish showed a decline in gross receipts of £4,300,000, the Great Western of £1,387,000, and the Southern of £695,000. Economies in the second half of the year must needs have been considerable, since the three lines have covered their dividends with £100,000, £47,000 and £30,000 to spare respectively. No appropriation from reserve is mentioned in any of the three statements, so that the Midland and Scottish would seem to have made economies in working expenditure of approximately £3,200,000, and the Great Western of £500,000. Following our usual custom, we hope to examine the year's results in detail in a few weeks' time, when the complete accounts are available. The year has been a disastrous one for holders of home railway junior securities, though, as the following table shows, present prices are well above the lowest of 1928, and do not show so great a variation from the "bottom" levels of 1927 as is generally imagined:—

	Highest and Lowest Prices.						Present Price.	Yield at Present Price.*
	1926.		1927.		1928.			
	High.	Low.	High.	Low.	High.	Low.		
								£ s. d.
L.M.S. Ord.	78½	69½	79½	67	76⅛	49⅛	57	6 7 9
G.W.R. Ord.	92	82½	97½	83	105½	77½	84½	6 3 6
S.R. Def.	46½	41⅛	45½	34½	40	29	32½	6 11 3

* After deducting final dividend.

The prospects of the great British railways are bound up with those of British trade and industry as a whole during the next few years. As we have previously suggested, trade depression was a primary, and increased road competition but a secondary, cause of the drop in earnings and dividends last year. The considerable economies effected in working expenses during recent months are the most gratifying omen for the near future. Representing, as they do, the fruits of a series of measures incepted, in many cases, several months or even years ago, there is no reason to expect that their effects will not be progressively felt in the coming year. The 2½ per cent. "cut" in wages and salaries, again, operative only in the later months of 1928, will be effective throughout the year 1929.

THE SET OF THE PRESENT — AND THE FUTURE.

Underground Railway Results.—This year's reports of eight groups of companies operating the London underground railway system and kindred undertakings make comparatively cheerful reading. Gross receipts from traffic show an increase of £1,206,000, and net receipts one of £266,000. As miscellaneous receipts have also risen by £27,000, the group has this year £293,000 more of net income in hand. £183,000 of this increase is required for interest, rentals, etc., which have expanded by this amount, but contingencies and renewals require £33,000 less, and as dividends on guaranteed and preference stocks are unchanged, the balance available for the common fund has increased by £143,000. The balance brought forward at the beginning of the year's account is also £108,000 higher than a year ago, so that the group has £251,000 more available for ordinary dividends. The sum actually allocated to ordinary dividends this year is £1,127,000. This is £46,000 more than was paid last year, so that the carry-forward is increased by £205,000. The effect on the rate of dividend of the allocation of the extra £46,000 is shown below:—

	Dividends.			Prices of 1928.			Yield at Present Price.
	1926.	1927.	1928.	Highest.	Lowest.	Present Price.	
	%	%	%				£ s. d.
Metrop. District	3½	4	5	81	67½	80½	6 4 3
London Electric	3½	4	5	75½	64½	75½	6 12 6
City and S. London	3	4	5	70	52	70	7 2 9
Central London	4	4	6	70½	54½	82½	7 5 6
London Gen. Omnibus	6†	7†	8†	...	...	...	...
Associated Equipment	8†	8†	8†	...	...	...	...
Underground Elec. Rlys. (£1)	1½	5	7	1⅛	1⅛	1⅛	5 9 0

† Free of income tax.

It is clear from these results that the volume of traffic continues to expand, and that the outlook in the London group is for the time being more assured than that of the main trunk railways. The fundamental fact to be remembered by the investor is that the system is meeting an urgent and expanding public need.

Mr. Courtauld on Artificial Silk.—A final dividend of 10 per cent. tax free was declared this week by Courtauld's. Last year the interim was 7½ per cent., and the final 17½ per cent., both tax free. This year on the capital increased by the 100 per cent. share bonus an interim dividend of 5 per cent. tax free has been paid and the final of 10 per cent. tax free brings the total for the year to 15 per cent. tax free. Recently, opinion was more "bullish"; a final dividend of 15 per cent. tax free was rumoured, together with a share bonus, and the shares rose from 4¼ to 5. But a more cautious view was taken later as a result of a letter written by Mr. Samuel Courtauld which appeared in "The Times" of February 12th. Mr. Courtauld is anxious to correct undue optimism in the artificial silk industry. He points out that, while sales exceeded production in Great Britain in 1927 by some 2 to 3 million pounds, production must have exceeded consumption in 1928 by at least 5 million lbs. This fall in prices, in Mr. Courtauld's opinion, need never have arisen if promoters in the last two years had been more modest in this promises and less modest in the amount of working capital provided. We have examined the prospectuses of 12 new artificial silk companies which raised capital by public subscription in the last two years. These companies have an issued capital of

£8,404,489. Three of them gave no estimates of output in their prospectuses, but the remaining nine budgeted for an output of 33,700,000 lbs. of artificial silk yarn a year. The total production of artificial silk in Great Britain last year is estimated at nearly 51,000,000 lbs., so that the potential output of the nine new companies would increase the country's capacity by 66 per cent. The outlook is less serious than these figures suggest, because it is certain that some of the new companies will not reach their "prospectus" programme for many years, if at all. Mr. Courtauld concludes that if those concerned in the financing and working of the industry would realise how serious the present difficulties are, it may prove to be a blessing in disguise, but "it would be disastrous if any blindness to the facts should lead to another outburst of ill-founded optimism."

Atlas Light and Power.—The American invasion of the public utility field in South America continues. It has been announced this week that the directors of the Atlas Light and Power Company have entered into an agreement with the American and Foreign Power Company of New York (the holding company for the operating interests outside the United States of the Electric Bond and Share Company), which provides for the sale of all the Atlas Company's holdings in electric supply and traction companies operating in Argentina. The purchase price is £8,500,000 (of which £850,000 has been paid as deposit) payable in instalments in addition to a sum to cover revenue balances. The total amount payable is well in excess of the amount (£8,380,437) at which the company's investments and loans to subsidiary companies stand in the last balance sheet. Moreover, the company's holdings outside Argentina are to be retained. In recommending the acceptance of this offer the directors point out fairly enough that the cash realised can be reinvested and spread over a wide field of investments to the great advantage of the shareholders. The latter will appreciate that their profits have been steadily rising in the last seven years and that for all they know they may be parting with their best earning assets. One of the terms of the purchase is that British manufacturers will continue for at least ten years to be given preference for the bulk of the orders for equipment for the operating companies transferred—but that is of remote interest to individual shareholders. The Electric Bond and Share Company, has been showing great enterprise in the British controlled preserves of South America.

Selfridge and Harrods.—The past twelve months have proved not unsatisfactory to the great London departmental stores, though it was commonly said at one time that the illness of the King was having a severe effect on business. Selfridge maintains its dividend at 20 per cent. on the privately-held ordinary shares, profits (£476,416) showing the small rise of £1,225 on the year. At 1$\frac{7}{32}$ the £1 6 per cent. preference shares yield £4 18s. 6d. tax free. Harrods' profits are augmented by an interim dividend of £29,840 on ordinary shares of D. H. Evans and Co., 92 per cent. of whose ordinary capital was acquired during the year. The transaction involved increasing Harrods' ordinary capital from £1,915,000 to £2,204,981, but the 1927 rate of dividend was maintained thereon and fully earned. In fact, profits constitute a record even if the amount from D. H. Evans be omitted. These are Harrod's figures:—

Year ended January 31st.	1926–7.	1927–8.	1928–9.
	£	£	£
Net profits	701,624	721,751	775,156
Preference dividend	300,000	300,000	300,000
No. of times covered	2·3	2·4	2·5
Ordinary — Earned	20%	22%	21¼%
Ordinary — Paid less tax	18¼%	20%	20%
Ordinary — Amount	354,275	383,000	447,679*
To reserves	25,000	25,000	25,000
Increase in carry-forward	+22,349	+ 13,751	+ 2,477

* Estimate from information in dividend statement.

The considerable sum of £116,033 is now carried forward. At their present price of 76s. 6d. the £1 ordinary shares yield £5 4s. 6d., less tax.

Maple.—If the experience of Maple's proves typical of the furnishing business, the year 1928 must have been a difficult one. It appears at first sight that this firm had a better year than 1926, but a decidedly worse one than 1927. But a statement in the report that "the franc having been stabilised in June last, the amount of £50,000 held in suspense for contingencies has now been brought into account" makes the position more obscure. In the balance sheet this item has merely disappeared from the liabilities side, and cannot be traced further. The ordinary dividend is maintained at 15 per cent. at the cost of a smaller allocation to reserve and a considerable diminution in the carry-forward.

Year ended December 31.	1926.	1927.	1928.
	£	£	£
Profits	353,004	391,570	364,559
Debenture interest	37,500	37,500	37,500
Net earnings	315,504	354,070	327,059
Preference dividend	60,000	60,000	60,000
Number of times covered	5·2	5·9	5·4
Ordinary — Earned	14·1%	16·3%	14·8%
Ordinary — Paid	14%	15%	15%
Ordinary — Amount	252,000	270,000	270,000
To reserves, etc.	1,500	23,083	9,907
Increase or decrease in carry-forward	+ 2,004	+ 987	− 12,848

The principal feature of the balance sheet (summarised elsewhere), other than the one mentioned above, is a decrease in "cash" from £267,184 to £166,108. It may be that the £50,000 has disappeared into a miscellaneous heading which includes such heterogeneous assets as stocks-in-trade, goodwill, and shares in oversea subsidiaries, as this item has increased from £1,700,800 to £1,742,678. Depreciation is not mentioned, but the reserve now stands at £650,572. At their present price of 2¼ the £1 ordinary shares yield £6 13s. 3d., less tax.

Borax Consolidated.—A decline of 4 per cent. in profits is reported by the Borax directors, who state that the competition became intensified during 1928, though they claim to have made every effort to deal with the situation and to stabilise the industry. Prices of the company's products averaged the lowest ever recorded. Satisfaction is expressed with the results being attained from a new mineral, the development of which on the company's property was referred to a year ago; a very large body of it has now been developed, and has helped in meeting the emergency. Clearly, however, the crisis is not yet past, and nothing in the report suggests that any way to avoid the competitive lowering of prices has yet been discovered. The deferred ordinary dividend is maintained at the rate to which it was wisely (as the sequel shows) reduced last year, and it is still fully covered by earnings. But profits have fallen to about two-thirds of their height five years ago, and the future is still uncertain.

	Years ended September 30.		
	1926.	1927.	1928.
	£	£	£
Profits	387,858	320,738	307,188
Debenture interest	99,641	99,641	99,641
Depreciation reserve	30,000	30,000	30,000
Debenture sinking fund	5,825	5,825	5,825
Net earnings	252,392	185,272	171,722
Preference dividends	44,000	44,000	44,000
No. of times covered	5·7	4·6	4·4
Preferred ordinary dividends	36,000	36,000	36,000
No. of times covered	5·7	3·9	3·5
Deferred ordinary — earned	14·9%	9·1%	7·9%
Deferred ordinary — paid	10%	7½%	7½%
Deferred ordinary — amount	115,000	86,250	86,250
To reserves, etc.	35,000	5,000	5,000
Increase in carry-forward	+ 23,393	+14,022	+ 472

In the balance sheet, which we summarise elsewhere, "stocks" show a falling off from £462,560 to £396,195, and "creditors" a similar reduction, but "debtors . . . including current accounts with allied companies" at £313,627, are up by £50,803. Investments in the Death Valley Railway Company stand now at £56,458, instead of £83,506. The position at the date of the accounts was entirely liquid. At 1$\frac{3}{32}$ the £1 deferred ordinary shares yield £6 17s. 3d., less tax.

Allgemeine Elektricitäts-Gesellschaft.—Of late the German electrical manufacturing industry has been the best occupied among the mechanical trades, and increasing profits have been the rule. The A.E.G. (General Electricity Co.) reports for the business year 1927–28 a considerable increase in net profits, writes our Berlin correspondent, and in gross profits a very large increase which is partly unreal, owing to the fact that taxes, totalling 9,780,526m. were not first deducted as was the case with the gross profits given below for 1926–27. The profit and loss account shows (in marks) the following figures:—

	Years ended September 30,		
	1926.	1927.	1928.
Gross profit (without carry-over)	14,670,935	17,305,079	34,934,668
Net profit	10,302,620	11,886,000	16,023,683
Pref. dividend	1,050,000	1,050,000	1,050,000
Pref. "B" dividend	937,500	937,500	937,500
Ordinary dividend	8,096,375	9,525,000	11,612,928

On 4,838,400m. ordinary shares in the company's hand no dividend is paid. The preference dividend, as in the former two years, is 6 per cent., and the preference "B" dividend 5 per cent., while the ordinary dividend in the last two years has been 8 per cent., as against 7 per cent. in 1925–26. As regards fixed assets the only material change shown in the balance sheet is an increase under "buildings" from 58,265,754m. to 65,583,980m. Wares in stock increased from 54,745,446m. to 75,804,420m., bank deposits from 56,500,036m. to 71,789,857m., and bank debts from 30,075,116m. to 33,794,927m. The reserve fund is increased by 500,000m. to 22,620,000m. The turnover, including that of companies whose entire capital is owned, increased by 100 million marks to 500 million marks, the increase being attributed to expansion of the company's works. For financing pending operations and for strengthening of working capital a loan of $15,000,000, 6 per cent., at 94½–95 per cent. was concluded through the National City Co. of New York. The report is, in general, favourable in regard to the position and prospects of the company. The increasing use of electricity for lighting and power is commented upon. Business in steam turbines continued satisfactory. The company was well occupied with orders for electric locomotives, and for equipment for mines, and it made large deliveries to native and foreign chemical concerns. In general sales to foreign countries increased, but prices were not satisfactory. Conditions in the controlled and associated companies were good. The reconstruction of the A.E.G.'s works may for the most part be considered complete.

Company Reorganisation.—The immediate alteration in one branch of company law, brought about by the Order in Council as from February 6th, will facilitate reorganisation schemes which have been held up pending this change. A legal correspondent writes:—Since the passing of the Companies Act, 1907, it had in most cases been possible to vary the rights of different classes of shareholders under Section 120 of the Companies Consolidation Act, 1908. Difficulties arose, however, owing to Section 45 of that Act. This section was designed to protect interference with the rights of members where the capital was divided into different classes, and where the company sought either to consolidate shares of different classes or to divide the existing shares into shares of different classes. In such cases it was necessary to have a resolution passed by a majority in number of shareholders of each particular class holding three-fourths of the share capital of that class and duly confirmed as a special resolution. Legal problems arose in any important scheme of arrangement, and it was difficult to decide whether the scheme did or did not modify the conditions in the memorandum, "and whether or no it interfered with preferential rights." Even when this was decided there still remained the question whether or no there was a consolidation of shares or a division into different classes. These difficulties are illustrated in the case of *re Schweppes, Ltd.* (1914, 1 Ch. 322). It is true that the Courts ultimately decided that Section 45 only applied where there was such a consolidation or division of classes of shares and where the terms of the Memorandum were varied under the scheme; but there was a sufficient number of cases in which that section certainly applied, and the more difficult procedure under it had to be adopted rather than that under Section 120. The trouble was the difficulty of beating up the number of shareholders necessary to secure the three-quarters majority required if the scheme were to go through. The Companies Act, 1928, Section 53, provides a simpler procedure. Under this section the expression "arrangement" in Section 120 of the Act of 1908 (as now slightly amended) is to extend to the re-organisation of share capital by the consolidation of shares of different classes, or by the division of shares into shares of different classes, or by both those methods. The present alteration should prove beneficial to companies who have suffered from trade depression and who for this or other reasons are taking steps to strengthen their business, whether by reorganising their own capital or by amalgamating with other companies of the same standing. The remainder of the Act of 1928 will not come into force until either another Order in Council appoints a day for the purpose or a general Act is passed consolidating the whole of the existing statute law.

Imperial Tobacco Company.—The publication of the report and accounts for 1927-28 adds little to the information given in these columns on January 26th (page 170), after the dividend and bonus announcement. The exact profit made is revealed as £9,599,706, and the increase in the carry-forward, as compared with a year ago, is £210,056. Gross assets amount to £79,217,743, against £77,642,933; "Government and other securities" at £12,939,952 are up by £960,082, and "investments in associated companies," the market value of which is largely in excess of the book value, have increased from £8,380,108 to £8,811,034. The balance-sheet, unfortunately, is less rather than more informative than its predecessors, the assets, "stock-in-trade" and "payments on account of leaf in transit," last year shown separately at £28,670,470 and £2,265,062 respectively, being fixed under a single heading at £30,495,433. The great omnibus item on the liabilities side, "Creditors . . . . marine and other funds," is higher than a year ago by £302,124, after allowing for the £4,000,000 transferred to the general reserve for bonus purposes. A summary of the balance-sheet will be found on a later page.

The V.O.C. Holding Company.—The accounts for the V.O.C. Holding Company for 1927, which have been held up pending the arbitration on the purchase of oil agreement, show net profits of £863,213. The company holds over 99 per cent. of the capital of Venezuelan Oil Concessions, which declared in 1927 a dividend of 106½ per cent., against 55½ per cent. in the preceding year. The dividend received by V.O.C. Holding Company, less tax, amounted to £851,691, which brought its gross revenue, including interest and transfer fees, to £894,952. A dividend of 20 per cent. is paid, as against 15 per cent. in the previous year, which absorbs £863,713. The carry-forward is £3,349, against £8,350. The report of the Venezuelan Oil Concessions, Limited, contains the facts which are of importance to shareholders of V.O.C. Holding. The production for 1927 shows a remarkable rise in the production of the operating company under the management of the Shell group. A comparison of the year's production with that of previous years is as follows:—

1924	391,134 metric tons.	1926	1,802,943 metric tons.
1925	692,485 „	1927	2,978,219 „

For 1928 its production is estimated at nearly 5,000,000 tons. This enormous production has come from the foreshore fields on the north-east side of Lake Maracaibo. The light-oil fields of La Paz and Concepcion on the north-west side of Lake Maracaibo have been entirely closed down as they cannot be offset by any competitive drilling. The company has, therefore, large reserves to draw upon. Under the terms of the 1924 contract the price payable for the oil delivered to the Shell group is subject to revision every three years. The first of these periods expired on June 30, 1927, and the buyers, the Asiatic Petroleum Co., requested a revision. As the company and the Asiatic Co. failed to agree the matter was referred to arbitration, the results of which were not disclosed by Lord Bearsted

at the general meeting this week. The quantity of oil which has been the subject of arbitration is the first 20,000,000 barrels. The next 5,000,000 barrels have been sold to the Canadian Eagle Oil Co. for the next eight years, and the price under this contract varies according to world parity. Any surplus over the 35 million barrels goes to the Royal Dutch-Shell group on the same terms as to the Canadian Eagle. That the revised price of the first 20 million barrels fixed under the arbitration is not unfavourable to the V.O.C. may be assumed by the fact that the directors decided to increase their dividends in respect of 1927. An interesting dividend in respect of 1928 should be declared by V.O.C. Holding this year.

CAPITAL ISSUES.

PROSPECTUS issues for the week came to £4,251,500, as compared with £4,125,179 last year, making a total for the year to date of £58,726,426, excluding conversions. Issues to shareholders totalling £1,289,105 were also announced, and shares coming on to the market by way of notices "for public information" accounted for a further £1,358,750 on the basis of the opening price. The outstanding issue this week was the £2,000,000 tranche of the *Roumanian Stabilisation and Development Loan* issued in the form of 7 per cent. sterling bonds guaranteed as to principal, interest and sinking fund by the Government of Roumania, and specially secured on the revenues of the new Monopolies Institute. The price of issue was 88, and allowing for the ½ per cent. concession in the first coupon, the current yield works out at 8 per cent. The security behind this loan was fully discussed in the *Economist* of last week. The issue was fully-subscribed. Three investment trust issues were made, the most interesting being the *English and International Trust* formed under the auspices of international finance houses, including J. Henry Schroder & Co. This company is to be one link in a chain of trust companies which a group of bankers is forming in the chief European countries. Each company will be independently controlled by its own directors, but all will co-operate together and will maintain a joint statistical department. The issue took the form of 100,000 shares of £10, which will be converted later into 50 per cent. preferred and 50 per cent. ordinary stock. *The Monks Investment Trust* is a new member of the im Thurn group of trust companies. The other companies in this group are Friars Investment Trust and Abbots Investment Trust, and in each case Sir Auckland Geddes is chairman. This issue takes the form of 600,000 shares of £1, which are not to be split. *The Bankside Investment Trust* issued £700,000 5 per cent. first mortgage debenture stock at 97½. This company was formed in 1920 under the auspices of the City of London Electric Lighting Co. to acquire and develop land and buildings in the City. The present issue of debentures is being made to provide for the erection of large offices in Leadenhall Street. The properties on which the debenture stock is secured are valued at £1,310,000, from which a net income of about 6¼ per cent. is expected. There were two speculative commercial issues, *Automatic Confections, Ltd.*, and *Fourwheel Jacks, Ltd.* The first is yet another company dealing with automatic machines selling confectionery, and enters into a contract to purchase French nougat and other confectionery from James Rogall & Sons. There are 2,800,000 shares of 1s., of which 800,000 are allotted to the vendor. *Fourwheel Jacks, Ltd.*, has granted a sole licence for the manufacture and sale of its jacking sets to S. Smith & Sons (Motor Accessories), Ltd. The issue to the public consists of 880,000 shares of 1s., 570,000 shares go to the vendors in part satisfaction of the purchase price and 200,000 shares are allotted fully paid to the Scottish Finance Company and S.S. Trust, Ltd., for underwriting and promotion services. These companies are also granted an option to subscribe at par, up to 31st December, 1930, up to 50,000 and 300,000 respectively of the unissued balance of 350,000 shares. Most of the features associated with the typical 1s. share issue seem to be contained in this prospectus. The patent speculation of the week was provided by the *Harwood Self-Winding Watch Company Ltd.*, which claims to have a watch that winds itself whilst being worn, and that will revolutionise the watch-making industry. Two points stand out in the prospectus—first, that the watch is to be manufactured in Switzerland; secondly, that the vendors are paid £15,000 in cash and £50,000 in 200,000 shares of 5s., plus a royalty of 2s. 6d. per watch or watch movement manufactured and sold, and plus an allotment of 400,000 fully-paid shares of 5s. (£100,000) for granting a year's option of the Dominion and Colonial rights, or possibly for the rights themselves if the option is exercised—the wording of the prospectus is not clear. The public is asked to subscribe 260,000 shares, in other words, it may be receiving only 30 per cent. of the equity. The watch may be a good invention, but the vendor has made an extremely good bargain for himself.

ISSUES OF THE WEEK—

Roumanian Stabilisation and Development Loan.—Issue at £88 of £2,000,000 Monopolies Institute 7 per cent guaranteed sterling bonds, 1937-59, part of a total issue which includes $69,000,000 and Frs. 561,638,000 bonds, unconditionally guaranteed as to principal, interest and sinking fund by the Government of Roumania. The bonds are secured by a first charge on the gross receipts of the monopolies operated by the Institute (viz., tobacco, matches, salt, playing cards, explosives, cigarette paper) and on all other revenues of the Institute, including a royalty guaranteed by the Swedish Match Co. Net revenue from these monopolies has been approximately: 1926, £3,841,000; 1927, £4,748,000; 1928, £5,211,000; service of this issue of sterling, dollar and franc bonds requires annually about £1,660,000. The creation of the Institute and the issue of the loan form part of a comprehensive programme for stabilising the currency and furthering the economic development of the country.

English and International Trust, Limited.—Issue at par of 100,000 £10 shares, to be converted after July 1st into £5 of 5½ per cent. cumulative preferred stock and £5 of ordinary stock. The company will carry on the usual business of an investment trust, and in particular will become one of a chain of affiliated companies in different countries.

Bankside Investment Trust, Limited.—Issue at 97½ of £700,000 (out of £1,000,000) 5 per cent. first mortgage debenture stock, redeemable at 105 in 1982 by a sinking fund; interest is guaranteed by City of London Electric Lighting Company till 1971. The company was formed in 1920 as a private company to acquire and develop lands and buildings, and is now converted into a public company. The stock is secured as a specific charge on properties valued at £1,310,000, and a floating charge on all other assets.

Monks Investment Trust, Limited.—Issue at par of 600,000 £1 shares. The company will carry on the usual business of an investment trust company.

Automatic Confections, Limited.—Issue at par of 2,000,000 (out of 2,800,000) 1s. shares. The company acquires rights to use an automatic machine and to sell certain confectionery therefrom, together with the benefit of existing agreements. The purchase consideration is £40,000 in shares. Working capital is estimated at £19,000.

Harwood Self-Winding Watch Company, Limited.—Issue at par of 260,000 (out of 1,400,000) 5s. ordinary shares. The company acquires licences to manufacture and sell in the United Kingdom, and to manufacture in Switzerland for sale in the United Kingdom, a patent watch. The purchase price is £65,000, payable as to £15,000 in cash and £50,000 in shares, with a royalty, and the company gets an option for one year to acquire Dominion and Colonial rights for £100,000 in shares. Working capital is estimated at £30,000.

Fourwheel Jacks, Limited.—Issue of 880,000 (out of 2,000,000) 1s. shares. The company acquires patent rights within the British Empire, excluding Canada, in inventions for four-wheel jacks, together with the lease of a fitting station. The purchase consideration is £38,005, payable as to £9,505 in cash and £28,500 in shares. A further 350,000 shares are under option at par. Working capital is estimated at £21,000.

Colne Valley Water Company.—Sale by tender of £100,000 5 per cent. perpetual debenture stock, at a minimum price of par; a full trustee investment. Issued stock capital is £790,000, and issued loan capital £680,809. Net revenue for 1928 was £71,884; interest on debenture stock, including present issue, requires £20,701. The company supplies an area of about 90 square miles, with a population of over 200,000. Present issue is made to meet expenditure on new works, extensions, etc.

Particulars of the following have been issued for public information only in connection with Stock Exchange "introductions":—**Equitable Office Building Corporation:** issued capital 891,984 shares of no par value (common stock) and 502 $100 shares (7 per cent. convertible preferred stock), together with $19,440,612 first mortgage, 1974, $8,737,000 5 per cent. sinking fund debentures, 1952, and $35,000 6 per cent. gold second mortgage $1,000 bonds, 1943; organised under the laws of the State of New York in 1913; owners of a 40-storey office building in Manhattan; net profits have been: 1925-26, $1,237,223; 1926-27, $1,632,465; 1927-28, $1,838,191. **English and Scottish Investors, Ltd.**; issued capital £750,000 n. £10 shares, to be converted into £6 5 per cent. preference and £4 ordinary stock; an investment and trust company. **De Havilland Aircraft Co., Limited**; issued capital 300,000 £1 shares; incorporated in 1920 as a private company; designers and manufacturers of aircraft, etc.; profits are given over 5 years, and 10 per cent. dividends have been paid throughout. **Zimbo Products (1929), Limited**; issued capital £32,000 in 1s. shares; formed to acquire a business of patent curtain-rod manufacturers; purchase consideration is £2,500 in cash and £17,000 in shares; a further 360,000 shares are under option at par; working capital is estimated at £9,500. **Preanger (Java) Rubber Co., Limited**; issued capital £50,000 in 2s. shares; incorporated in 1910 to acquire share capital of an existing company; area of estate is 1,281 acres, and capitalisation per planted acre £45 14s.; recent dividends have been: 1923-24, 12½ per cent.; 1924-25, 50; 1925-60; 1926-27, 52; 1927-28, 21 per cent. **D. Smith and Sons (1924), Limited;** issued capital £30,000 in 1s. shares; incorporated in 1924 to acquire a business of cardboard-box makers and paper merchants; net assets are £55,298.

COMPANY MEETINGS, &c.

THE GAS LIGHT AND COKE COMPANY.

SATISFACTORY PROGRESS—SOUND FINANCIAL POSITION.

The general meeting of the Gas Light and Coke Company was held at the Chief Office on the 8th instant. Sir David Milne-Watson, LL.D. D.L. (the Governor), presided. The report and accounts were taken as read. The chairman said :

You will notice that we have raised a further £2,000,000 of 5 per cent. redeemable debenture stock. We received the excellent price of £99 for each £100 of stock—a great testimony to the company's reputation in the world of finance.

EXPENDITURE ON EXPANSION OF BUSINESS.

The expenditure of capital amounted to £618,000, of which £523,000 was on new mains, meters and stoves, rendered necessary owing to our desire to get new business and to furnish an ample supply in districts where building developments are taking place. A credit of £96,000 from the amount written off plant and from depreciation of stoves leaves a net capital expenditure of £522,000.

SAVINGS ON REVENUE ACCOUNT.

The company has saved large sums of money on coal and oil. The reduction in coal is due to the fact that in 1927 we were still hampered with high prices as an aftermath of the coal stoppage. The reduction in oil is due to the lower prices that have ruled during the past year. There has been a saving under these two headings of over £1,400,000. There has also been a large decrease under the heading of repairs and renewals of meters. This is not due to any slackening off in the company's policy of repairing and renewing meters, but to the fact that a large part of the expenditure in 1927 is not recurrent.

BENEFIT TO CONSUMER AND SHAREHOLDER.

Owing to the reduced price of gas the amount charged our customers has fallen by over £1,300,000. This will be regarded with great satisfaction by consumers and shareholders alike, as with the reduction in the price of gas we were enabled to give a very substantial benefit to the consumers and at the same time declare a higher dividend.

RESIDUALS.

With regard to residuals, there has been a fall in prices all round—only to be expected in view of the reductions in the price of coal. A revenue of over £2,000,000 from residuals must in the circumstances be considered very satisfactory.

As I have said, the reduction in the price of gas has enabled us to declare a higher dividend. A dividend for June was paid at the rate of £5 10s. per cent. per annum, and now we are in a position to recommend a dividend at the rate of £5 12s. per cent. per annum, the full amount permissible with the price of gas at 8.6d. per therm.

To sum up the result of the trading for the year :

AN INCREASED CARRY-FORWARD.

A credit balance of £1,853,000 has been transferred from revenue to profit and loss, as against £1,737,000 last year. This, after the interest on borrowed money and the dividends for the June half-year have been debited, together with a contribution of £50,000 to special purposes, leaves £830,000 from which to pay the charges for the December half-year. This enables us to declare the usual dividends on the preference maximum stocks and a dividend at the rate of £5 12s. per cent. per annum on the ordinary stock. These dividends, together with £20,000 to redemption fund, will absorb £671,000 and leave £159,000 to be carried forward—an increase of £37,000 on the amount brought forward.

A SOUND FINANCIAL POSITION.

Looking at the company's position generally, we have made very satisfactory progress during the past year, and there never was a time in its history when its financial position was in a sounder condition.

So far as increase in business is concerned, one per cent. may not seem very large so far as percentages go, but, when you take into consideration the size and age of the company, and the intense competition from our younger rivals—electricity and oil—I think it may be regarded as very satisfactory. When it is realised that an increase of one per cent. in the company's total business means roughly 500 million cubic feet of gas, involving the use of 40,000 tons of coal, and is equal to the supply for a whole year of a moderate-sized town, there is no reason to be dissatisfied.

EFFECT OF WEATHER ON GAS OUTPUT—RECENT RECORDS.

A critic, on referring to the capital account, may say that we have spent a large amount to get an increase of this kind. I should like to remind you that in the nature of our business we are particularly dependent on the weather, and in 1928 we had a remarkably fine summer and an extremely mild autumn and early winter, conditions distinctly against the sale of gas. It is well to remember that our object is first to secure consumers and then to see that their premises are fitted up with suitable apparatus, so that when weather conditions are suitable the apparatus is there to enable us to reap the benefit. Our recent experience has shown that we have been amply rewarded for this policy, for in the severe weather during last month we have had a record output, which would not have been obtained had we not pushed the sale and hire of apparatus. The board also consider that their policy with regard to new showrooms has been amply justified. The showrooms in this building and our new showrooms at Church Street, Kensington; Seven Sisters Road; Kilburn; Finchley Road, etc., have fully justified the large expenditure on them. They have had the effect of making the public realise that modern gas appliances, which are eminently efficient and at the same time artistic, can be employed in houses however beautiful the decorations may be, thereby securing a good class of business.

MODERNISING THE WORKS.

The company has pursued its policy of putting in modern plant at all its works whenever an opportunity has arisen. Within the last few years several of the works have been undergoing a process of renewal in order that the latest methods of carbonisation might be brought into use, and the reduction in the cost of manufacture has been noteworthy.

As I have told you before, we have found it very advantageous to own our own ships, and recently we have ordered three more to run to our up-river stations, where the economy effected by avoiding the unloading of coal lower down the river and barging it up has been very material.

LOW-TEMPERATURE CARBONISATION—A NEW SMOKELESS FUEL.

On the last occasion I told you that the company, at the request of the Government, was putting up a low temperature carbonisation plant at Richmond. This is now approaching completion, and within a few days we hope to be in a position to supply a smokeless fuel named "Gloco." Very many interesting questions arise out of low temperature carbonisation, especially with regard to residuals. The company is carrying out investigation and research with a view to finding a new use for the tar and its constituents produced from this method of carbonisation.

IMPORTANT RESEARCH WORK.

In the summer we opened a new central laboratory at our Fulham works. Sir Richard Threlfall, Chairman of the Fuel Research Board, was kind enough to come and open this laboratory, when he made a very interesting speech on the value of research. We were never more convinced than at the present time of the necessity for research, and we have now working for us a highly efficient staff of chemists, who are studying the numerous problems connected with our work. Our central laboratory, working in conjunction with a full-scale experimental plant, has as its especial object fundamental research into the problems of our industry as apart from routine laboratory work. There are many problems connected with the nature and carbonisation of coal, and it is only right that a company such as ours should take its part in this research work on coal, gas and residuals, which has such an important bearing at the present time on the welfare of the country.

GAS-MAKING BY COKE OVENS.

We are also considering the question of the installation of coke ovens at Beckton. We have received tenders for this work, and are now considering them. This shows that we have no prejudice against coke ovens forming part of a gas works.

It has been assumed by a great number of people that there is antagonism between the gas industry and the coke oven industry. Nothing is really further from the case, because we regard ourselves as having shown the way to the by-product coke oven industry. When the coke oven industry was merely supplying coke for foundry purposes there was perhaps little connection between the two; but since the recovery of by-products there has naturally been greater community of interest. Both industries are part and parcel of one great industry, namely, that of the carbonisation of coal. They should try to work together, bearing in mind the special object of each industry, and so help to solve some of the great difficulties of the country, namely, the iron, steel and coal problems. If both industries approached this question in a friendly manner, trying to understand one another's difficulties and not trying to "down" each other, a great deal of good would come to both industries and also to the country generally.

THE NATIONAL ASPECT OF THE GAS INDUSTRY—OBSOLETE LEGISLATION.

There never was a time, probably, when greater prominence was given to the national aspect of the gas industry than at the present moment. As you know, the Government appointed a National Fuel and Power Committee, of which I had the honour to be a member, and that Committee has made a series of recommendations which are of great importance to the industry.

The general legislative provisions under which we work date back as far as 1847, and in many respects are quite out of date. We are hampered as an industry by inadequate and old-fashioned methods of raising capital, which do not apply to our younger rivals; we are handicapped with limitations in the handling of our residuals; and we are limited with regard to working with allied industries. There are many other minor disadvantages under which we labour. The industry feels that it has a real grievance, and this has been fully recognised in the Committee's main report, where it is recommended that we should be allowed to adopt more up-to-date methods and to bring ourselves into line with modern practice. I am glad to say that the Government has promised to introduce a Bill giving effect to some of those recommendations. The industry would have preferred to have a completely new Charter; but we realise that in the last session of a Parliament we could not possibly expect to get a Bill dealing with all our grievances. We therefore welcome, as a first step, the Bill which the Government propose to introduce, hoping and believing that it will not be long before we obtain, whatever Government may happen to be in power, a further relief from the trammels which hinder us. It is not dividends we are after. What we want is freedom to get new business and to compete on modern lines with our rivals who are not subject to so many restrictions as we are.

GOOD RELATIONS WITH WORKERS.

With regard to labour matters, I am glad to say that we have had no difficulties during the past year. I cannot imagine any company having a more loyal and faithful body of workers than this company has. There is a definite feeling of enthusiasm for the company among those who work for it, and this is due to a great extent to the co-partnership or family spirit which permeates the whole company. I cannot pass from this subject without saying how deeply touched I was when the many thousands of co-partners of the company decided last year to subscribe and present me with my portrait and my wife with a very beautiful tea service. We were deeply touched by this expression of their goodwill, and it was one of the proudest moments of my life when the portrait by Sir William Orpen, R.A., was presented to me.

THE HOLBORN EXPLOSION.

The last days of 1928 were clouded over by the explosion in the Post Office tube in Holborn. As the matter is now being enquired into by a Commission, it would be out of place for me to make any remarks on this occurrence. The staff of the company, both officers and men, worked splendidly night and day during the anxious time that followed the explosion, and everything was done to mitigate the inconvenience and trouble caused in the district.

With regard to the staff, I have nothing but praise for both officers and workmen for the way they have carried out their duties, and to them is due the directors' thanks for their efforts.

It would be invidious to mention any particular persons by name, but, when referring to the staff, I would like to say that we have appointed Mr. R. W. Foot general manager of the company. Mr. Foot has been acting as assistant general manager for some years, and has fully earned the title of general manager.

THE INDUSTRIAL SITUATION.

At our meeting last year I referred to the question of co-operation between capital and labour, and no doubt you have seen in the papers a good deal with regard to this matter. It is premature to say what will be the outcome of the meetings that have taken place, but I can confidently say that, so far, nothing but good has resulted; and I sincerely hope that when matters have been further discussed we shall enter on a period of better understanding between the two parties chiefly responsible for the success of industry.

There never was a time when it was more necessary that the two sides should understand one another, and anything which brings employers and employed in closer touch with one another is good. Frank discussion and friendly meetings will do a great deal to help solve the difficult questions which lie before the British industry before it can once more take its old place in the world's economic position.

British industry has gone through a very trying time, and, though we are not out of the wood, I think there is no use in despairing or in constantly belittling what has been done by this country from an industrial point of view. There are few countries which have suffered more severely by the war or whose industry has been more disorganised. We have been able to weather the storm and have recovered a great deal of lost ground. We have put ourselves, at any rate, in the position of earning the respect of the world in that we have shouldered our burdens, financial and otherwise, in a determined way; and, though complete success has not been achieved industrially, yet we are, I believe, on the high road to do so.

The report and accounts were adopted.

EXTRAORDINARY MEETING.

Notice was then read convening an extraordinary meeting for the purpose of considering the Bill now before Parliament.

The Chairman said : The main object of the Bill is the acquisition of two more undertakings. Amalgamation has been the policy of this company for many years, and it is a policy that has been in every way justified. As a result we are able not only to supply gas more cheaply in the new areas, but, by the advantage we possess in having at our command greater facilities for the provisions of new capital, it is possible to develop business more rapidly in these outlying areas than would have otherwise been the case. In return, the older districts belonging to the company reap such advantage as must follow from an extension of the company's business with regard to the sale of gas.

The results of the provisions in the Bill as to price will be very satisfactory to the new districts. The graduated concession in price, amounting in all to no less than 3d. per therm, means that the consumers in these areas may look forward for some time to come to a steady reduction in the price of gas as a result of the amalgamation. After this reduction has been made there will remain a small differential price in both of the new areas, which their geographical position fully justifies.

A resolution approving the Bill was adopted.

STANDARD TRUST, LIMITED.

SUCCESSFUL RESULTS OF THE YEAR.

The twenty-sixth ordinary annual meeting of the Standard Trust, Limited, was held, on the 11th instant, at 25-31 Moorgate, London.

Mr. Alfred Shepherd, W.S. (the chairman), in the course of his speech, said the figures in the balance sheet differ considerably from those for the previous year. This, however, is due almost entirely to the increase in the company's capital from £500,000 to £675,000, and to the increase of the debenture stock from £430,000 to £560,000. These increases are also reflected in the figures given in the revenue account.

The net profits of the year amount to £44,037 1s. 10d., which compares with £35,696 3s. 2d. in the previous year, or, adding the balances brought forward, the amount available for disposal this year is £54,368 13s., as against £41,869 17s. 1d. The directors have transferred to the superannuation fund £3,579 10s. 10d., and have also transferred to the reserve fund £5,118 4s., as against £290 2s. 11d. last year, thus leaving a sum of £45,670 18s. 2d., as against £40,444 1s. 2d. last year.

Your directors recommend that the final dividend on £375,000 preference stock should now be paid and that a final dividend of 6 per cent. should be paid on £250,000 ordinary stock, making, with the interim dividend of 4 per cent., a dividend of 10 per cent. on the ordinary stock entitled to participate, being at the same rate as last year. There will remain to be carried forward £11,788 1s. 11d., as against £10,331 11s. 2d. in the previous year. These results appear to your board, and they trust they will be considered by you, as satisfactory. The general reserve fund, which last year amounted to £75,000, has been increased as mentioned in the report, and now stands at £140,000.

It will be observed that a very large proportion of the securities are publicly quoted or dealt in in various Stock Exchanges, so that quotations are available for these. The valuation shows a very satisfactory surplus over the figure at which the investments appear in the balance sheet. With reference to the proposed increase of capital, it is right that I should state that it will only be issued if and when the board consider that conditions indicate that the proceeds could be profitably invested.

The report and accounts were unanimously adopted.

A resolution was unanimously adopted increasing the capital of the company to £1,000,000 by the creation of 150,000 5½ per cent. preference shares of £1 each and 100,000 ordinary shares of £1 each.

SOUTH METROPOLITAN GAS COMPANY.

DEVELOPMENTS IN CARBONISATION PROCESSES.

CRITICISMS OF GOVERNMENT'S ELECTRICAL POLICY.

The ordinary general meeting of the South Metropolitan Gas Company was held on the 13th instant, at the Cannon Street Hotel, Cannon Street, London. Mr. Charles Carpenter, D.Sc., M.I.C.E. (President and Joint Managing Director), in the chair.

The secretary and accountant (Mr. Frank Day) having read the notice convening the meeting.

The President, in moving the adoption of the report and accounts, said: You will have observed that while there has been an increase in the number of our consumers, this has been accompanied by a slight reduction in the consumption of gas. This is easily understandable when one looks back at the mild weather which prevailed during the latter part of the year, and which was bound to affect that portion of our supply which is used for heating purposes. The past month of January has, on the other hand, been colder than usual, so you will not be surprised to learn that during that period our sales increased by over 10 per cent. The two chief loads in our business are those for lighting and for heating. The former changes with the seasons, and the latter with the climate, and it is this portion of our output which adds to or reduces the prosperity of our business.

Now it is because of this climatic variability that the bulk of complaints of gas cost arises.

Now, in order to overcome trouble of that kind we instituted nearly a year ago a system of monthly meter inspecting and account rendering. The new system has proved a great success, and, although in a few isolated cases there are still some objections to the abolition of the Quarter Day accounts, the great majority of our consumers have welcomed the change.

COST OF COAL.

Coal, as the report tells you, has been purchased at reduced prices. Unfortunately the saving in fall of coal costs has been largely discounted by the lower revenue from by-products, so that the net result shows a lesser saving. It is, of course, as you are aware, the net cost of coal which really matters, that is, its price after deducting returns from by-products. The prices obtained for these, particularly coke and, to some extent, tar, are found over a period of years to bear a definite relationship to the price paid for coal. There is a certain lag in the time taken for their adjustment, and this may result in either one of these products being temporarily maintained at a non-economic value. But when coal remains stable over a long period the revenue from products settles down to a pretty definite ratio. Coke, I may say, reflects more quickly than tar or ammonia the effect of reduced coal costs, as is shown by the lower revenue obtained. The future of tar for road purposes is a very promising one. It is essential not only to maintain a high quality product, but it becomes increasingly necessary to see that the methods adopted for the application of tar to road surfaces are suitable ones.

I am glad to be able to say that our efforts to obtain cleaner coal continue to meet with success, and though progress is small, we have increased our knowledge of the characteristics of the various kinds we purchase, and are thereby gradually extending a system of buying by quality rather than by description. There is, however, a great deal yet to be done at our collieries before they can put on the market coal as free from ash as that imported from America during the Coal Stoppage of three years ago. While this matter of clean coal is closely bound up with the economics of gas manufacture, its greatest influence is an indirect one. Our carbonising process extracts whatever gas or products are contained in the raw material, and if coal were merely bought upon a gas content basis, its varying qualities would not seriously matter whichever we use. But the quality of the coke by-product produced thereby is a very important thing indeed, as this resultant product contains a large proportion of the original coal ash. We are also continuing our work upon the sizing and preparation of coke for the market, and there is no doubt whatever that it is increasing in popularity for domestic use.

LOW TEMPERATURE FUEL.

I must now shortly deal with our arrangements for the production of what is called low temperature coke. There is no doubt that to-day the public are in a more sympathetic mood to listen to suggestions for rendering life healthier in the Metropolis, and there is no doubt again that this will affect its attitude towards the movement for the total abolition of raw coal as fuel. There are two methods of putting this proposal into practice, both of which involve applying to the raw coal a preliminary, either partial or complete, distillation of the volatile, and when discharged into the air harmful products. In the one case the existing grates would, generally speaking, require to be adapted to the fuel, whilst the other process produces a fuel adapted to the grates.

The carbonising processes to which coal for these purposes is subjected are called respectively the high and low temperature systems. They produce not only a different solid residual, such as coke in the one case, and such as "coalite" in the other, but the resultant gaseous and liquid products differ widely in character. The technology of the low temperature processes differs radically from the older one, and many problems of great interest are involved with their adoption. The two systems which we are about to work on the large scale differ completely in their respective designs, and may be roughly said to represent the two extremes between which various modifications have been proposed. In a general way the two we shall be using may be classified by saying that the one uses small coal, and the other utilises fines. We shall be able to test the public requirements with two different products, having the smokeless attribute in common, both being combustible in ordinary grates.

ASSOCIATION WITH SOUTH SUBURBAN GAS.

You will remember that in February, 1927, you authorised our association with our neighbour, the South Suburban Gas Company, and I am pleased to say the first fruits of this association are beginning to be gathered by both parties. As the report tells you, the connecting main between the chief works of both undertakings has now been laid, and gas made from coal delivered by ship to our wharves in the River Thames is now available for distribution throughout a total area of something like 200 square miles. The gas thus sold in bulk has not been included in the figures of gas sold with which I dealt at the commencement of my remarks.

The report further informs you that the Capital Powers Bill authorised at the meeting a year ago received Royal Assent in due course, and by it our capital authorisation has been brought well up to our requirements. We shall probably make an issue in the first half of the year, for, as you will have noticed, our capital account is now overdrawn.

The rate of dividend proposed is as last year, and the allocation to the Co-partnership Fund of its share of surplus profits is identical with the previous one.

LABOUR-SAVING MACHINERY.

The Co-partnership has throughout a difficult period played its part in maintaining harmonious relations between the management and the staff. This is, and will be, all the more valuable since under pressure being put upon us by the action of the Government and its Ministers, our attitude towards labour is "nolens volens" being changed. If you would allow me I will quote from the report of my remarks at the meeting held in August, 1911, when I stated that so happy were our relations with labour that our settled policy was only to adopt labour-saving machinery when the work to be done could not be so efficiently performed by hand. We are now completely reversing that policy by putting in plant the object of which is to reduce labour charges to the lowest possible limit.

GOVERNMENT AND ELECTRICITY—A PROTEST.

The reason for this is that each day that passes finds us up against a state-encouraged competition of electric energy supply. In so far as this was only directed to cheapening the cost of current we should have no fear or cause for complaint. But an endeavour is being made to build up a monopoly in the supply of heat and light, and force the state-aided product on all and sundry whether or no they desire it. A few months ago the Minister of Transport took the opportunity, when opening a new bridge, to express his regret that so many new houses were "not being wired for the use of vacuum cleaners, cooking, irons and other apparatus which ought to be used."

I strongly protest against the head of a very important Government department, a Cabinet Minister, in fact, going out of his way to support proposals which are not only unfair but uneconomic. And it is not surprising that buildings are being erected by local authorities in which, while as much raw coal as possible may be burnt in the kitchen, and lamps of all kinds, safe or unsafe, burning foreign and imported oil may be used without restrictions, the use by their tenants of gas whereby to light and at the same time warm their rooms is absolutely prohibited upon pain of their tenancies being terminated and themselves turned out of house and home. It is very surprising that after something like 50 years of electrical progress so unfair an interference with the liberties of municipal tenants should be deemed necessary.

The report and accounts were unanimously adopted.

WANDSWORTH, WIMBLEDON AND EPSOM DISTRICT GAS COMPANY.

RECORD GAS SALES.

The ordinary general meeting of the Wandsworth, Wimbledon and Epsom District Gas Company was held on the 12th instant at the Cannon Street Hotel, London, Mr. Frank H. Jones (the chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said that they had sold more gas in the year 1928 than ever before in the company's history, while in January of this year they had sold more than in any previous January. As prices of gas were, they were still lower than most of their neighbours—that was taking the average of the gas sold and not their very low Wandsworth price. After 95 years those were facts which the Board and the employees were very proud of, and he thought the shareholders would be also. They had spent £110,699 of capital during the year. It was a large sum of money, but it represented nearly 20 miles of new mains and a gas-producing plant at their Wandsworth (Riverside) Works of about 7,000,000 cubic feet of gas per day. This plant was not only up to the most modern standards, but was also more economical than anything they had ever had before. It was not shown on the balance sheet, but it was a fact that they were making more gas at Wandsworth than ever previously, as it stood to reason that to take coal direct from a ship into the carbonising plant was much more economical than sending it on in solid form by barge, train or motor to works away from the water that provided such cheap carriage. They had a saving of nearly £61,000 in their coal bill, which was partly wiped out by a lower return from residuals of £35,000.

The cost of upkeep of the works was slightly lower. There were three items totalling more than £44,000 under the headings of "Profit sharing," "National insurance," and "Pension fund." This was a very large expenditure, and it was spent, one might say, on their employees. Up to a point this was so, but he wished them to understand that it was expenditure of the wisest kind. It ensured that while a man was at work he had no need to worry, because he knew that if he was ill or had an accident he was being provided for. In fact, an employee in this company had not very much to worry about in regard to the future, because they had a pension fund and a co-partnership fund. They had 1,843 employees, 1,213 profit-sharers (holding £100,000 of the company's shares) and 1,504 on the pension fund. This £44,000 was no capricious gift on the part of the company. The Board's endeavour was, and had been, to make service to the company something to be sought after and, when obtained, held.

The company's own ships had carried over a quarter of a million tons during the year—more than ever before. They had been producing gas on a large scale in what was a somewhat new way at Wandsworth during the year—namely, in chamber ovens. These had been at work for eight months and were fulfilling expectations. They were making much greater use of low-grade fuel and waste heat on their works. This had proved a success and would be extended. Some of their residuals had been falling in value for some time, but they were making every endeavour to make up for this in other ways, and he thought they would succeed. They had had a large increase in the number of gas appliances in the district. During the past few years they had altered and, he thought, made their five showrooms more attractive. Anyhow, he knew by results that they were more efficient.

Referring to the question of recent trouble with broken mains, he said he saw no reason to be unduly apprehensive of the future. As they would see from the report, the dividends would be increased over those declared for 1927, owing to the reduction in the selling price of gas. During the year the Board had made the Company's engineer, Mr. Croft, general manager. This was after 18 years' experience of him and following a general reorganisation of the staff, which was necessary to meet modern conditions. The company's secretary, Mr. Charles Braine, was retiring from his position at the end of March after having served the company for 33¼ years.

Mr. R. Garraway Rice (deputy-chairman) seconded the motion, which was carried unanimously.

Dividends were declared for the half-year to December 31st as follows:—

On the Five per Cent. Preference stock, £5; Wandsworth "A," £9; Wandsworth "B," £7 10s.; Wandsworth "C," £6 6s.; Wimbledon stock, £7 2s. 6d.; Epsom stock, £7 12s. 6d., and the new Ordinary Stock £6 6s., all at per cent. per annum.

A special general meeting was then held for the purposes of considering the Bill now being promoted in Parliament. The Chairman, having explained the clauses of the Bill in detail, the resolution was put to the meeting and carried unanimously.

SUN LIFE ASSURANCE SOCIETY.

STEADY PROGRESS MAINTAINED.

A general meeting of the Sun Life Assurance Society was held, on the 12th instant, at 63, Threadneedle Street, London, the Hon. Sir William H. Goschen, K.B.E. (the chairman), presiding.

The Chairman, in the course of his speech, said: The report contains history—history of steady progress and, I think, success. I have no wonderful happenings to recount or stirring events to chronicle—such is not the policy of the society. Our aim rather is to maintain steady progress and to get on with our own business.

Our business has for many years past been confined to Great Britain, so that our policyholders are not concerned with the laws framed in the interests of policyholders in other countries. Obtaining business is a matter of organisation, but inasmuch as organisation involves education and expense its speed of expansion is limited. If this society's business expands, it is not at the expense of other offices; there is certainly competition, but such competition as a life assurance company meets with in this country is not harmful to the structure of life assurance, at any rate, at present.

NEW BUSINESS.

In the year under review our efforts resulted in 19,419 new assurances for a sum assured of £15,274,880. This is about £2,000,000 more than in the previous year. The new business figures of an office are, however, rather liable to mislead if used in judging the success of its work. The new business figure contains many different classes of assurance at many different rates of premium, from the single premium endowment at £85 per cent. to the short-term temporary assurance at a few shillings per cent. You may take it from me, however, that the quality of the new business is good, and that the part of our business made up of policies effected for purposes of saving and family provision has again very materially increased.

A noteworthy feature of the year has been the number of staff schemes of superannuation by endowment assurance or deferred annuities which have been completed both in London and the provinces. The society has also taken a share in the effort to cultivate group assurance, but so far the results are small. In the early part of the year a prospectus was issued offering monthly premiums payable by banker's order, and the scheme has proved very popular. The special schemes for Civil Servants, Local Government officials, teachers, bank officials and employees in certain other specialised occupations are achieving success, and, above all, a factor which speaks well for the success of the office is the increasing amount of business that we obtain from those who already hold policies with us.

It has been a custom for many years to refer to the society's practice and experience of accepting proposals without medical examination of the person upon whose life the risk is to depend. The results of our 28 years' experience have quite confirmed our earlier conviction of the soundness of the practice, and as years go by there is still no indication that the rate of mortality is higher than it would have been had the society not transacted this business.

ENDOWMENT ASSURANCE.

It must never be overlooked, however, that life assurance is much more than an investment. It is a protection as well, and the more this can be brought home to people the more popular it will become. In the old days life assurance was regarded entirely as protection for dependents, but for some time past the appeal has been more and more that of investment; we are convinced, however, that the true appeal is between these extremes and that for the great mass of people, the endowment assurance maturing about the age of retirement is the best form of contract. Trimmings may be added to suit individual taste—bonuses, cessation of premiums on ill-health, options for annuities, or any other of the many refinements—but such a policy as I have described will have provided cover during the years of greatest family responsibility and funds at a time when earned income will be reduced. I am glad to be able to say that a considerable proportion of the society's business is made up of these long-term endowment assurances, and that although our efforts to persuade policyholders to take still longer term policies have not had much effect, the average term is just about twenty years and the age at maturity sixty.

The question of security offered by a life assurance is paramount. The investment of such large sums as those with which we are entrusted is no light task, and we are continuously engaged in the endeavour to combine undoubted security with high interest. If you will look through the list of investments and bear in mind that the rate of interest earned on the society's life assurance fund after deduction of income-tax is £4 15s. 10d., I think that you will agree that we have made quite a reasonable success of our endeavour.

The report and accounts were unanimously adopted.

AMPAT (SUMATRA) RUBBER ESTATE, LIMITED.

STRONG FINANCIAL POSITION.

The fifteenth annual general meeting of the Ampat (Sumatra) Rubber Estate, Ltd., was held, on the 8th instant, at the registered office of the company, 5 Whittington Avenue, London, E.C. 3.

Mr. A. G. Angier presided, in the absence of Mr. D. W. Lovell (the chairman) who was indisposed.

Mr. Hester, representing the secretaries and agents (Messrs. Guthrie and Co.) read the notice convening the meeting and the auditors' report.

The Chairman said: It is a satisfaction to the board that in spite of the crisis in the rubber industry which followed the abolition of restriction in February last, they are able to recommend payment of a dividend of 5 per cent. for the year under review, and that, in addition, it has been possible to strengthen the balance sheet by additions to reserve. Our general reserve stands at £20,000; we still have over £8,000 in taxation reserve and possess British Government and other gilt-edged securities to a total of over £58,000. I emphasise our strong financial position now because the rubber industry has entered upon a new phase, and the figures are of special interest at this juncture.

CONDITION OF THE ESTATES.

We possess, as you know, two properties—at Ramboeng we have a planted area of 1,976 acres, of which approximately 1,726 acres are mature and producing, whilst approximately 250 acres are still immature. Both from a general and an individual point of view, the events of the next few years will be particularly interesting, as they will gradually show the results of the more modern scientific planting methods adopted and the effect of unrestricted production on price.

In regard to the mature area of 1,726 acres, which are now referred to as "old rubber," since it was raised in less scientific days, special steps are being taken in an endeavour to prolong the "life" and improve productivity of the trees. The yield from this area has always been good, but all cultivations, whether it be rubber or anything else, must in time reach their peak of productivity and subsequently decline.

We have taken advantage of the presence in the East of Mr. W. J. Gallagher, one of the foremost authorities on rubber and tropical agriculture, to inspect our properties. Mr. Gallagher considers that if the productivity of the old rubber is to be maintained or improved, manuring is advisable in order to re-nourish the soil. On Mr. Gallagher's advice we are, therefore, adopting a system of manuring which we are confident should produce beneficial effects.

On our new property at Aek Boeroe, 777 acres are now planted, and last year's new clearing will be budded during the current year. Progress at Aek Boeroe continued to be much slower than we anticipated when commencing operations owing to scarcity of labour.

Since the effect of the recent low prices has been felt in the Dutch Indies, the labour position has slightly improved and we are hopeful of recruiting during the current year the balance of the labour we require.

MARKET SITUATION.

So far, I have dealt with those matters which can be gone into on the facts as they are known—finance and estate condition: it is far more difficult for a chairman to refer to the market situation, as that is the factor outside our control and upon which it is almost impossible to speak with confidence. The position as regards stocks and shipments during the middle and latter part of last year was very obscure until quite recently, and the prospects of a rise in price seemed extremely remote. Consequently the directors felt it prudent to fortify the company's position, so far as they could, by certain forward sales. To that end we sold forward for delivery during the current financial year 285,600 lbs., at approximately 9.04d. per lb. landed London.

During the last few weeks the market position has somewhat clarified and the price of rubber has risen a few pence per lb., as a result of the fact that the accumulation of stocks expected in London has not materialised. The heavy shipments from the East, which were anticipated, instead of coming to London, have been shipped to America, but whether this heavy bulk of rubber will go into early consumption or whether American dealers and manufacturers have taken advantage of the low price to build up stocks for the purpose of stabilising the market it is not yet possible to say. Consumption during 1928 was very satisfactory, and American consumers are optimistic in regard to 1929. Usually, however, years which show a large increase in rubber consumption in America are followed by a period of comparative quiescence, and although we hope that American manufacturers' expectations of a still better year in 1929 will materialise, it is advisable for us to take a more cautious view. We can, however, I think, conclude that so far as the price of rubber is concerned, we are past the worst.

The report and accounts were unanimously adopted.

STERLING TRUST, LIMITED.

INCREASED DIVIDEND—CAPITAL ISSUE IN PROSPECT.

The twelfth ordinary general meeting of The Sterling Trust, Limited, was held, on the 12th instant, at Winchester House, Old Broad Street, London, Baron Emile B. d'Erlanger (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, dealing with the balance-sheet, said that the issued capital was now £1,750,000, having been increased by £500,000 during the past year. The premium account now stood at £235,978, and the reserve account, with this year's appropriation, stood at £190,000. The first two items on the assets side, together £4,939,915, showed an increase of £774,744, principally due to the investment of the funds made available by the issue during the year of 250,000 shares. For several years past the market value of their investments had been on the up grade, and it now amounted to a sum much in excess of their book value. It might well be that at some time in the future, and from one cause or another, the trend would be in the opposite direction, but, even so, it would have to be definite and drastic in a downward direction for the market value of their investments to approximate to their book value. He purposely refrained, however, from stating the amount of the appreciation in this respect, because of its variable character, and, moreover, it was not so important from the stockholders' point of view as was the income from the investments, which did not necessarily vary with the market value of the securities.

INCREASED DISTRIBUTION.

The revenue account showed an income of £252,524, an increase of £23,525, and he would remind stockholders that this income was stated net, after deduction of income tax. It might have been expected that the income would have been much greater than that of the previous year, in view of the new capital provided, but it must be remembered that the company only had the fresh capital by instalments. Put in another way, they only had the benefit for 5½ months of the total amount subscribed. There would, therefore, be a considerable increase in the current year's income through the issue of the 250,000 shares last March. He would later say something about more capital, for stockholders would understand that trust companies in these days were greedy of it, which, of course, was natural and justifiable, always provided that the money could be put to profitable use. After placing £20,000 to reserve account, the directors recommended a final dividend of 2½ per cent. on the preference stock and 9 per cent. on the ordinary stock, the latter making, with the interim dividend, 14 per cent. for the year, or an increase of 1 per cent. over the previous year taking the stock in its split form. There would remain to be carried forward £79,834, as against £76,313 brought in from last year's accounts.

Referring to the geographical distribution of the company's investments, the Chairman said that they had 39½ per cent. in Great Britain, 8 per cent. in the British Empire, 28 per cent. in Europe, 4½ per cent. in Asia, ½ per cent. in Africa and 19½ per cent. in America. As to the nature of the investments, they had 68 per cent. in bonds, debentures and the like, 14½ per cent. in Preference stocks and shares and 17½ per cent. in ordinary and deferred stocks and shares.

POLITICAL AND FINANCIAL OUTLOOK.

The clouds that gathered over the political and financial world during the Great War had hung for many years heavily upon the air. Little by little, however, they were being dissipated, and the weather forecast was getting brighter. In all countries of the world the currencies were being stabilised, and economic and political order was being established. Roumania was the latest addition to the countries that had taken steps to re-establish their finances. It was one of the richest countries in the whole of Europe, and, if well and honestly administered, should afford a lucrative field for investment.

The greatest political and economical problem awaiting solution was the question of reparations and war debts—in one sense, separate questions, but in practice interdependent. The question of reparations was *sub judice*, and it would be indiscreet on his part to discuss it. He thought, however, he would meet with unanimous approval in saying that the representatives chosen by the various countries interested were of such outstanding character and ability that we could look with confidence to a practical and equitable solution.

With the gradual settlement of political and economic affairs in Europe, the return which trust companies could look forward to on sound investment securities must tend to decrease, and that was why the directors thought that no time should be lost in placing the company's reserve capital and investing it to the best advantage.

Sir George A. Touche, Bart., seconded the motion, which was carried unanimously.

TILLING AND BRITISH AUTOMOBILE TRACTION, LIMITED.

SATISFACTORY PROGRESS CONTINUES.

The twenty-fifth ordinary general meeting of Tilling and British Automobile Traction, Ltd., was held on Thursday, February 14, 1929, at Electrical Federation Offices, 88, Kingsway, London, W.C. 2.

The Chairman (Mr. Sidney E. Garcke, M.I.Mech.E.) said:—The balance sheet now before you discloses the altered situation in consequence of the enlargement of the activities of the company under the scheme set out in our previous report, and dealt with in detail by myself at the last general meeting. Although the size of the business is enlarged, and there are, therefore, substantial alterations in the figures now laid before you, I do not think there is anything that requires special elucidation by myself, but I should like to point out that, in regard to the profit disclosed, it has to be borne in mind that the new capital is not yet fully productive, and, in respect of many of the additional investments taken over in the spring, a full year's dividend has not yet been received.

The issued share and debenture capital of the company now exceeds £2,000,000, all of which is invested in transport undertakings spread throughout the country. We have a substantial holding in many of the larger provincial omnibus concerns, and either directly or through companies in which we have a holding we are now interested in no less that 36 undertakings. The total capital of the undertakings in which we have a direct investment is close on £5,000,000, and they control between them approximately 4,300 omnibuses.

CONVERSATIONS WITH THE RAILWAYS.

Last spring the railway companies promoted Bills in Parliament to secure powers to run road transport, including omnibuses. Their efforts met with considerable success, and a new situation was thus created. From the first, both road and rail transport experts have realised the many disadvantages which would result from increasing the already considerable competition on the roads by introducing yet another set of road passenger vehicles owned and operated by the railway companies. There are many practical difficulties associated with the problem of securing satisfactory permanent relations between the railway companies and the large group of omnibus concerns in which we are interested, but I do not consider it by any means impossible to bring about a full measure of co-operation which will remove the danger of competition on the road, and at the same time considerably benefit the railway companies by the joint development of traffic. Conversations intended to bring about these desirable results are now taking place.

LICENSING DIFFICULTIES.

For many years past the public control of omnibus services, by no less than 1,331 different licensing authorities, has been unsatisfactory. The Government have set up a Royal Commission on transport, and it is hoped that it will recommend some scheme which, while securing for the public a reasonable degree of control over the operations of the omnibus proprietors, will at the same time remove from the latter the menace of frequent incursions by irresponsible operators whose actions are more often than not dictated by the desire to be immediately bought out, and whose operations are, therefore, designed to create the maximum amount of interference with the regularity of the public services.

BURDEN OF TAXATION.

Many of our companies are now beginning to complain of the serious burden of taxation. I am not referring to general taxation so much as to that which has fallen specially upon our industry. A great deal of propaganda has taken place in the Press designed to show that the motor movement as a whole does not pay its proper share towards the cost of the roads, but we who have to do our best to carry the public efficiently and at low cost are beginning to feel that the public service section, at any rate, is bearing its full share, and the fact must not be overlooked that the roads are not merely traffic-ways for vehicles, but are utilised for a variety of other purposes. Since transport is the agency of all industry, every increase in the burden of taxation on transport is a burden upon industry itself. Every increase in taxation on our section of the transport industry has to be passed on to the travelling public, if not in actual increase in fare, then certainly in some form of reduction of facility.

In connection with the scheme set out in the last report whereby we acquired from Thomas Tilling, Ltd., and from the British Electric Traction Co., Ltd., and others further substantial holdings in omnibus undertakings, it was arranged to invite those companies to nominate additional directors to represent them on this Board.

The reports and accounts were unanimously adopted.

S.T.D. MOTORS, LIMITED.

SUBSTANTIALLY INCREASED PROFITS.

REORGANISATION SCHEME OUTLINED.

The meeting of S.T.D. Motors, Limited, was held, on the 12th instant, at Winchester House, Old Broad Street, London, Mr. James Todd, F.C.A., the chairman, presiding.

Mr. A. White (the joint secretary) having read the notice convening the meeting and the auditors' report,

The Chairman, in moving the adoption of the report and accounts, said that the profit for the year amounted to £163,482, as against £145,052. A further £25,000 had been put to reserve, making it £789,867; £37,500 had been paid in redemption of the notes, a full year's dividend had been paid on the preferred ordinary shares, and £168,258 was carried forward.

RESULTS OF VARIOUS SUBSIDIARIES.

Dealing with the various subsidiary companies and their results, the chairman said that the results of the trading of Automobiles Talbot, France, had been better than in any year since the war; substantial profits, estimated at frs. 7,000,000, had been earned, and the whole of the output of the French works found a ready market. The trading of Clement Talbot, Limited, showed an increase for the year, and the 14-45 h.p. six-cylinder car of that company maintained its popularity; special efforts were being made further to develop the overseas markets; home sales for the current year showed an increase to date. The works of the Darracq Motor Engineering Co., Limited, were now solely used in the manufacture of motor-car bodies, the whole output being taken by Clement Talbot. W. and G. du Cros, Limited, which operated the yellow taxi-cab, was developing the W. and G. du Cros safety 'buses and charabancs now seen on the road; indications pointed to an improvement in the position of that company.

The improvement in the business of Heenan and Froude, Limited, continued, and a dividend of 13 per cent., as compared with 6½ per cent., had been paid. The Sunbeam Motor Car Co., Limited, had again had a satisfactory year, with a record output of cars, paying 15 per cent., free of tax, as compared with 14½ per cent. A number of new records had been made on Sunbeam cars. Mr. Louis Coatalen had designed for that company a large six-wheel chassis for commercial and passenger-carrying work, and would shortly have on the road another chassis of slightly less carrying capacity, and for that class of vehicle it was believed there would be a good demand. The prestige of the Sunbeam had been well maintained throughout the world. Good results had again been shown by Jonas Woodhead and Sons, Limited.

He thought shareholders would agree that, in view of the keen competition in the motor-car industry, trading results had been satisfactory. Present indications gave hope of that progress continuing during the current year.

The building up of their reserves for some years past had been a method of preparation for what the board felt must ultimately arise, namely, the necessity for dealing with the depreciation in the value of the franc. Although the policy adopted by them had relieved the stringency of that reduced value to some extent, it would be apparent that, with their extensive financial interests in France, the depreciated value of the franc materially affected their position. The directors had under consideration a scheme for dealing drastically with the position, and were considering a revaluation of the French assets upon the stabilised franc basis.

FIRST STEP TOWARDS REORGANISATION.

The first step had been taken that morning when the 8 per cent guaranteed note-holders had agreed to a proposal to extend the term of redemption and thereby reduce the annual repayment from £50,000 increasing to £75,000 per annum to £18,750 per annum. The directors were considering asking the preferred ordinary shareholders to fund their arrears of dividend by accepting funding certificates representing the total arrears due to them such certificates to carry interest at an agreed rate, allocating an amount each year out of profits for the redemption of those certificates. He had put before the shareholders quite frankly what the board were considering, and until the scheme was laid before them in its entirety and they had had an opportunity of considering it from all angles, he would ask them kindly to refrain from criticising or asking questions as to details which could not be answered with any certainty at this stage and might even hamper the board in their endeavours to put forward suggestions with a view to benefiting every ordinary and preferred ordinary shareholder in the company.

The report and accounts were unanimously adopted.

At a meeting of the holders of the 8 per cent. guaranteed notes of the company, held earlier, the proposal to extend the time of repayment was approved by an overwhelming majority, one noteholder only voting in the negative.

THE V.O.C. HOLDING COMPANY, LIMITED.

DIVIDEND TWENTY PER CENT. PRESENT POSITION AND PROSPECTS.

The adjourned seventh ordinary annual general meeting of the V.O.C. Holding Company, Limited, was held on the 14th instant, at Winchester House, Old Broad Street, London, E.C., The Rt. Hon. the Viscount Bearsted, M.C. (chairman of the company), presiding.

The secretary (Mr. W. A. Turner, F.C.I.S.) having read the notice convening the meeting and the report of the auditors,

The chairman, in moving the adoption of the report and accounts, said: Ladies and gentlemen, in the profit and loss account of the Concessions Company there is credited an amount of £4,107,789, representing the proceeds from the sale of oil. The increase of £1,497,972 over the corresponding amount for 1926 is attributable to the increase in production to 2,978,219 tons in 1927, as against 1,802,943 tons in 1926. Up to 30th June, 1927, the production was disposed of in accordance with our sales contracts, but the price received for oil delivered on and after 1st July, 1927, was in accordance with the terms laid down by the Arbitration Award.

Turning to the accounts of the Holding company, the main item at the credit of revenue account is the dividend due by the Concessions company amounting to a net sum of £851,619. The net balance on revenue account for the year to be carried to the balance sheet is £863,212. The directors recommend payment of a dividend of twenty per cent. less tax, on both classes of shares. (Applause.) This will absorb £863,713, leaving a balance of £3,348 to be carried forward to 1928, and I shall in due course propose a formal resolution to this effect.

THE AWARD.

Regarding the arbitration in respect of the price for the first 20,000 barrels per annum, the award has been accepted by both parties, and your board are of the opinion that the results may be looked upon as satisfactory. Your board are definitely of the opinion that it is not in the interests of the company that the details of the award should be made public. A disclosure of details would mean the giving of invaluable information to the owners of oil being sold in competition with your production, which can only be harmful to this company.

Results have fully justified the board's sales policy. Production has risen from the rate of 2,000,000 barrels of crude oil per annum in the Midsummer of 1924 to nearly 50,000,000 barrels of crude oil per annum at the date of this meeting. Contracts at the end of 1924 were in respect of 4,000,000 barrels of crude oil per annum. Contracts at the present moment are at the rate of nearly 44,000,000 barrels of crude oil per annum.

THE YEAR 1928.

Owing to the date at which this meeting is being held it is possible for me to give you a brief review of the operations for the whole of the year 1928. The production of crude oil for 1928 was approximately 5,084,500 tons, or about 34,500,000 barrels. The company's sale contracts now consist of 20,000,000 barrels of crude oil per annum sold on the terms of the 1924 agreement as revised, 5,000,000 barrels of crude oil per annum sold to the Mexican Eagle based on world market prices for oil products and 6,000,000 barrels of crude oil per annum sold to the Asiatic Petroleum Co., Limited, on the Eagle terms. In addition to these contracts your board were able to make an arrangement with the Asiatic Petroleum Co., Limited, for the off-take of flush production. I am glad to be able to inform you that an economic working scheme has been arrived at, which should to some considerable extent result in reduced working charges in the future.

DRILLING OPERATIONS.

Until late in the year 1928 a small drilling programme was maintained at La Rosa, while the Lagunillas drilling programme was steadily increased. As regards the actual drilling work undertaken in the La Rosa and Lagunillas fields, the year 1927 witnessed considerable development. At La Rosa the coastal territory to the North of Punta Icotea has been proved productive, and there is now little doubt that the oil-bearing territory is continuous from Southern La Rosa through Cabimas to Ambrosio, a distance of about 11 kms. In the Lagunillas field a large amount of development was undertaken during 1928, and the number of productive wells was increased from 21 at the end of 1927 to 96 at the end of 1928. The length of the field along the coast line is now about 12 kms., and there are no signs of the end of the productive territory being reached in either direction; in fact, the northern and southern extremities of the field are at the present time the best producing areas. One of the most outstanding improvements achieved during the year is that the time taken to drill wells has been approximately halved. As regards field installations and constructional work, our work has been satisfactorily continued.

THE ATTITUDE OF THE MINORITY GROUP.

I believe that the time has come when I should be very frank in dealing with a pernicious and persistent attempt at interference in the conduct of this company's affairs during the past four years—an interference taking the form of an attack on the board of directors and the management. You will remember that at a meeting of the V.O.C. shareholders in 1924 a committee was appointed consisting of Mr. Beatty, Mr. Cull and General Aranguren, and I do not believe I am incorrect in suggesting that the committee might properly be said to represent the Gulbenkian Group, or as they prefer to call themselves "The Minority Group." With the object of providing for harmonious conduct of the operations, two members of the committee—Mr. Beatty and Mr. Cull—were invited to join the board.

In December, 1925, the question of the sale of your company's increasing production of oil had to be considered by the board. There was no question as to the steps which the company was obliged to take, as it was a term of the then existing sale contract that the Shell Group had the refusal of all oil which might be produced by this company until 1936. The only question which the board had to study was the terms upon which the production in excess of the existing firmly contracted quantities should be offered.

Mr. Gulbenkian and his friends on the board were opposed to the offer being made on the terms on which they had firmly contracted for 4,000,000 barrels per annum in 1924. The matter, which was one of policy, was treated as such and was put to a vote, when they were defeated. As an expression of protest they tendered their resignations and somewhat to their surprise, I think, their resignations were accepted.

In my opinion the question at dispute at that time was purely one of policy, and that the policy recommended by the management, and adopted by the majority of the board and later endorsed by the majority of the shareholders, was sound, is best proved by the balance sheet and the profit and loss account, which I have to-day had the pleasure of expounding to you. (Applause.) I am prepared to stand by that rather than by the problematical discussions as to what might or might not have been the result if an alternative policy had been adopted.

In my opinion this whole agitation has been fathered by Mr. Gulbenkian, as a prelude to a financial operation. This company's affairs should, in my opinion, be conducted by the board of directors with a sole regard to the prosperity of the company as a going concern and without any regard to fantastic financial schemes. In this attitude I have the unanimous support of the present board, and I fully believe of the great majority of shareholders.

After considerable discussion, the report and accounts were carried unanimously.

WHITTAKER AUTOMATIC LOOMS, LIMITED.

LARGE DEMAND—GOOD PROSPECTS.

The statutory meeting of Whittaker Automatic Looms, Ltd., was held on the 11th instant, at Winchester House, London, E.C.

Mr. Condie Sandeman, K.C., the chairman, who presided, said that the company had been formed to take over a going concern which had approximately 3,000 automatic loom attachments in almost every country where weaving was a serious industry. Up to the date of the report the company had received orders for over 2,000 attachments, approximately 1,700 for England, and many repeat orders had been received, showing that satisfaction was being given. The attachments were working equally as well for linen and woollen goods as in the cotton trade, and he did not think it possible to exaggerate the importance of the Whittaker Automatic Loom attachment and the enormous potential market which it enjoyed. Taking the three industries he had mentioned, any one of them could give the company sufficient business to more than justify the original profit estimate of the prospectus.

There was no question in the opinion of the textile industries—the textile machine manufacturers and the leaders of the great related trade unions—that automatic weaving was essential. The United States of America was almost completely equipped with automatic looms, the high cost of labour in America rendering them inevitable. The fitting of automatic looms throughout our own great cotton industry must result in Lancashire regaining her relative position, and substantially the same applied to the woollen, linen, and artificial silk industries.

The Whittaker loom attachment was a device of national importance; it could be applied to existing looms of any make. It put in the hands of manufacturers effective means of overcoming the increasing shortage of skilled weavers and enabled them to reduce their costs of weaving to a greater extent than any other weaving invention for the last fifty years. One of its chief advantages was the simplicity of the mechanism and the small alterations required. The reduction in weaving costs was so considerable that the device had already received the serious consideration of the whole of the textile manufacturing industry of the world. As to price, there was no effective competitor, because the attachment fitted to an existing loom resulted in an automatic loom doing everything achieved by the latest American automatic looms at a cost within the reach of any manufacturer in this country.

A vote of thanks to the Chairman, moved by Mr. John Whittaker, J.P., terminated the proceedings.

Established 1889.

SAN FRANCISCO MINES OF MEXICO, LIMITED.

SATISFACTORY RESULTS OF A DIFFICULT YEAR.

The 16th ordinary general meeting of this company was held on February 14 at Winchester House, Old Broad Street, London.

Sir Henry Strakosch, G.B.E., presided, and in the course of his speech said: While our profit for the past year was not as great as that for previous periods, nevertheless, taking all the circumstances into consideration, we are justified in congratulating ourselves upon the results. For the third year we have been subjected to falling metal prices. On the average of the three metals, lead, zinc and silver, prices were 13 per cent. lower, while we had less favourable selling terms for our zinc product. The result was that, although the ore milled rose 7½ per cent. to 300,000 tons, our operating profit, which was exceptionally high in the previous year, fell to £366,316, and our net profit to £283,130, a reduction of 11½ per cent. In view of the generally satisfactory position of the Company and the lower capital expenditure experienced, the directors felt justified in reducing the carry forward by some £4,000, making the dividend for the year 3s. 9d. per share, or only 3d. lower than for 1926–27.

Comparing like with like—that is, taking sulphide ore only—the grade of the ore milled during the past three years has shown extremely little variation, and this has also been reflected in the values given to the ore reserves which allow for the inevitable dilution with waste which takes place and give as nearly as possible the estimated value of the mill heads. The blocked-out ore reserves advanced 335,000 tons, or by nearly one-third, to a total of 1,395,000 tons. If we include partly blocked-out ore, the reserves are now 1,877,000 tons, as compared with 1,460,000 tons, and represent over six years' supply for the present size of the mill as compared with barely five years' supply at September, 1927. Thus we have considerably strengthened our position. These reserve figures, of course, apply only to the ore brought into sight by our work, and cannot be taken as a measure of the probable life of the mine. But the farther we go the more we can see ahead of us, and I can to-day repeat and accentuate Lord Denbigh's remark of last year that never before have we been able to look forward to a longer life than at the present time.

SUBSIDIARY VEINS.

The manager refers to the discovery of a new vein in our property—the Hill Vein. Though we have hopes with regard to this newcomer, it does not yet figure in our reserves, of which 13 per cent. apply to the Bronces and East and West Madronos Veins and 87 per cent. to the various reefs on the San Francisco system. The discovery and development of these subsidiary veins show that we are no longer solely dependent upon our main vein and its branches, and we have little doubt that, as further work is taken in hand from time to time, appreciable subsidiary supplies of ore will be found in this way.

I believe I am right in saying that the time is not far distant when we shall be justified in considering a programme involving further expansion. Before such a programme can be initiated the study of numerous details and collateral problems has to be made. These will all receive the careful attention of the board and management.

We are having some anxiety as to our electric power, which is purchased from a hydro-electric company, and is generated by means of dams from a neighbouring river. The last two rainy seasons have been comparatively unproductive of rain, and the position is further complicated by the fact that the power company has contracted to the full extent of its present plant and that the plant is being reconditioned unit by unit in order to increase its efficiency. We are informed that additional plant is to be installed, which should be ready by the autumn, but if this is delayed, and if, in addition, the next rainy season also fails, the situation will become more critical. We are therefore considering whether we shall purchase and erect a second-hand steam plant which is available, and which should enable us to continue operations at the full rate, although perhaps at somewhat heavier power cost.

During the year 52 acres of additional mining ground have been purchased through our holding company, the Compania Minera Plomosa. This consists of a group carrying the Madronos veins, and thus we have further increased our limits. It is rarely that these purchases do not prove in time to strengthen our position.

THE CURRENT YEAR.

During the first four months of the current financial year the operating profit has been $635,000. The results would have been better had not operating difficulties of a temporary character reduced the surplus. Notwithstanding these difficulties, the profit was 13 per cent. better than the average for last year. The outlook for metal prices is better by reason of the fact that Lead and Zinc Conventions have been formed, with a view to steadying output, increasing consumption and maintaining prices, and this, coupled with the benefit we are receiving from the better terms of our new lead contract, encourages us to anticipate a higher profit for the current year.

The report and accounts were unanimously adopted.

RAILWAY SHARE TRUST AND AGENCY COMPANY, LIMITED.

INCREASED NET REVENUE.

The fortieth ordinary general meeting of the Railway Trust and Agency Co., Limited, was held on the 14th instant, at Winchester House, Old Broad Street, London.

Mr. Richard S. Guinness (the Chairman) said: This year the company has had the full benefit from the recent re-organisation of capital and the new issue of preference stock that was made in February, 1927.

The income from investments shows an increase of some £10,000 at £149,709, which is slightly in excess of 7 per cent. upon the book values of investments. You will understand that this high interest yield is shown because of the prudent policy we have adopted for many years past of strengthening our reserves out of income and applying capital profits to provide for depreciation, thus increasing the general earning capacity to the ultimate advantage of our shareholders as evidenced by the increased dividend we are able to recommend you to-day.

Owing to the larger provision for income tax, the charges including debenture interest are slightly higher than last year, nevertheless the net revenue available for reserves and dividends shows an increase over last year of £7,600, enabling us to make the same allocation as last year, viz., £12,500 to reserve and distribute an additional £6,000 by way of ordinary dividend, strengthening at the same time the carry forward by nearly £5,000.

The usual valuation of the investments has been made. This valuation shows a considerable improvement over that of last year, so that the surplus over capital and reserve remains a substantial figure.

Your board and management continue to watch closely the careful distribution of investment between fixed interest bearing securities and preferred and ordinary stocks and shares.

Geographical distribution is also closely watched and our statistics show that we derive some 42 per cent. of our revenue from investments in the United Kingdom, 14 per cent. from Continental securities and the balance well distributed through the world, the largest other proportion being 8 per cent. from the Argentine Republic. In a word the progress made by this company in recent years has been continuous. In 1919 the earnings on the ordinary stock were 6 per cent. and a dividend of 4 per cent. was paid, while in the past year the amount available for ordinary stock is 12 per cent., and we recommend a dividend of 9 per cent.

The report and accounts were adopted.

RAILWAY DEBENTURE AND GENERAL TRUST COMPANY, LIMITED.

SUCCESSFUL RESULTS. INCREASED REVENUE.

The fifty-sixth ordinary general meeting of the Railway Debenture and General Trust Co., Limited, was held, on the 14th instant, at Winchester House, Old Broad Street, London.

Mr Richard S. Guinness (the chairman) said: This is the first complete year that we have been operating under the wider powers of investment obtained in July, 1927. Owing to the change in the debenture debt in the middle of 1927 occasioned by the paying off of the balance of the 4 per cent. debenture stock and the subsequent increase of capital, a detailed comparison with the previous year's figures is not practicable, but I will now review shortly the accounts before you.

The gross revenue amounts to £169,105, an increase of about £21,000, but as interest charges are higher by about £2,800 the amount available for reserves and dividends does not show quite such a large increase. We have been able to reduce our expenses by about £500, and the balance, after interest and expenses, consequently shows an increase of £18,700. Of this amount, £6,700 is absorbed by the increased amount required to meet the preference dividend and the balance of £12,000 is required for the dividend of 8 per cent. upon the additional ordinary stock issued last year. After placing to reserve the same amount as in previous years we are able to pay the same dividend as in 1927 on the increased ordinary stock.

The investments have been valued in the usual way, and the valuation shows an improvement upon last year. Your company still holds a very large amount of fixed interest bearing securities and consequently the scope for increase in values is not as large as in those companies who have larger holdings in junior securities.

The present percentage of our holdings in debentures and loans is 81 per cent.; last year it was 90 per cent. The holdings of preference and ordinary stocks are 8½ per cent. and 10½ per cent. respectively. We shall gradually increase these proportions where we see favourable opportunities for investment in stocks and shares which give a reasonable income return, and, at the same time, opportunity for capital appreciation. The usual list of holdings is attached, but as few of you have the time to analyse them I might say that 41 per cent. of our revenue comes from holdings in the United Kingdom, 15 per cent. from investments on the Continent, and the balance is represented by securities in Canada, South America and other countries.

The report and accounts were unanimously adopted

AEONIC RADIO, LIMITED.

GRATIFYING PROGRESS.

The statutory meeting of Aeonic Radio, Limited, was held, on the 14th instant, at 90 Regent Street, London.

Alderman Sir William Kay, Kt., J.P. (the chairman), said that the net profit up to the 7th February amounted to over £35,000. That profit dated from the 1st November last, but it was not until the middle of December that they had the benefit of the new capital and for practically six weeks, therefore, the profits had been made on the old and very small capital of J. L. Gottlieb and Co., Limited. The extraordinary progress the company had made with the very limited factory space at its disposal was due to the product and to the fact that they had had most loyal and energetic support from their staff. They had been compelled to refuse very large orders from some of the leading wholesalers in the country for the reason that it had been absolutely impossible to execute them. Contracts had therefore been placed for doubling the factory and that increased factory space would be available in a few days' time, and they expected to have it in full working order by March 1st next.

Although that arrangement had been made, the expansion of their business had been so insistent that the directors had decided again to double the factory space available, and on completion by May 1st next they would be in possession of 70,000 square feet of factory space all on one floor. Their financial position was highly satisfactory, and when the above work was completed they would be able to employ from 1,500 to 2,000 hands at the Cromer Street service depot and the works at Horley. The directors were proud of the fact that the company's very successful product was entirely of British manufacture and that up to now it had no components or accessories which were of other than British manufacture. Because of the superlative value the Aeonic receivers gave to the public, they had sufficient orders in hand to keep them working to the full limit of their capacity, and the directors were confident that that would continue for an indefinite period. Aeonic was now a household word, and the popularity of its products was increasing in a most remarkable manner. The company had acquired an option on certain important patents, the commercial value of which they were now investigating. They had every reason to believe that those were of considerable value, and negotiations for large contracts were proceeding which, if secured, would be a further source of considerable revenue to the company. Should that take place, it would be necessary to issue further capital, which would carry considerable profitable "rights" to the shareholders.

The position and prospects of the company were more than encouraging. The prospectus estimates had already been exceeded and the directors were satisfied that that result would continue.

A vote of thanks to the chairman concluded the proceedings.

Hungarian General Creditbank,

BUDAPEST

The Board of Directors of the Hungarian General Creditbank, Budapest, at their meeting held on February 7th, 1929, issued the balance sheet of the Bank for 1928. Net profits amount to 7,446,928·64 pengös as against 6,984,093·33 pengös in 1927. The Board of Directors will propose to the annual General Meeting, to be held on February 16th, that a dividend of 5·50 pengös per share should be paid as in the previous year, totalling 4,554,000 pengös. Further, it will be proposed to allocate 1,000,000 pengös to the Reserve Fund, 600,000 pengös to the Pension Fund, 824,000 to the remuneration of the staff, and finally 127,741 to the Welfare Fund of the staff.

Saving deposits and current accounts deposits amount to 343 million pengös in the balance sheet for 1928, as against 296 millions in the previous year, debtors total 192 million pengö as against 185 millions, and the bill portfolio amounts to 101 millions as against 89 millions. The surplus profit is due to the increased yield of the current business, to the goods departments and to the branches of the Bank.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS.

The following table shows the national income and expenditure during the week ended February 9, 1929:—

(000's omitted.)

EXPENDITURE.	£	RECEIPTS.	£
Supply Services	6,646	From Revenue	31,048
Interest, &c., on Debt	3,321		
Sinking Fund	620		
Sundries	681		
Decrease in Debt	19,648		
Increases in Balances	132		
	31,048		31,048

The revenue for the week amounted to £31,047,600, as compared with £29,793,500 in the corresponding week last year. Property and income-tax amounted to £18,469,000, against £19,694,000, and super-tax to £4,160,000, against £3,700,000. Customs brought in £2,293,000, against £1,987,000, and excise £1,179,000, against £1,223,000. Ordinary receipts were lower at £42,600, as compared with £91,326, whilst special receipts at £1,959,000 showed an increase of £1,944,700 over last year's figure.

The National Debt was reduced by £19,653,000, as shown below:—

(000's omitted.)

	£		£
National War Bonds	− 3,948	Treasury Bonds	+ 109
Bank of England Advances	− 18,170	Treasury Bills	+ 10,250

MOSCOW QUOTATIONS FOR TCHERVONETZ.

According to advices received in London, the following are the Moscow quotations for tchervonetz :—

£1,000 sterling equals 942·93–944·81 tchervontzi.
1 tchervonetz = 10 gold roubles. £1 sterling = 9·46 gold roubles.

INDIA COUNCIL REMITTANCES.

The total remittances from the Government of India to the Secretary of State for India in Council from April 1, 1928, to February 9, 1929, amounted to £24,225,000 by means of purchases of sterling in India. Of this amount, £750,000 was remitted on account of the Paper Currency Reserve.

BULLION.

The following statistics of imports and exports of gold for week ended February 14, 1929, are issued by the Statistical Department of H.M. Customs and Excise :—

Imported into Great Britain and Northern Ireland.	£	Exported from Great Britain and Northern Ireland.	£
From—		To—	
France	11,523	Poland, inc. Danzig	1,700
Australia	7,676	Germany	5,090
British South Africa	3,725	Netherlands	3,280
Other countries	2,606	France	11,557
		Switzerland	58,100
		Egypt	76,815
		Italy	2,590
		U.S. of America	1,752,600
		Gibraltar	5,000
		British India	133,971
		Straits Settlements	45,937
		Other countries	765
Total declared value of imports	25,530	Total declared value of exports	2,097,405

GOLD.

The Bank of England gold reserve against notes amounted to £149,626,177 on the 6th instant (as compared with £152,714,393 on the previous Wednesday), and represents a decrease of £4,280,138 since the 29th April, 1925—when an effective gold standard was resumed. No gold was available in the open market this week, and the usual requirements of India and the trade were met by withdrawals from the Bank of England.

There was a net influx of gold of £133,139 during the week under review.

Following the heavy withdrawals of gold from the Bank of England last week for shipment to New York, the Bank raised its official rate of discount from 4½ per cent. to 5½ per cent. on the 7th instant. The subsequent appreciation of the pound sterling in terms of the dollar being unfavourable to the export of gold, further shipments, for the time being, are unlikely.

The Roumanian Loan, the prospectus of which has just been issued, provides for a part to be applied for the stabilisation of the currency. The gold contents of the leu have been fixed at 10 milligrammes of gold 9/10ths fine, thus making the gold parity Lei 813·6 to the pound sterling.

SILVER.

The week has been quiet in the silver market. Owing to the New Year holidays in China, which commenced on the 11th instant, business from this quarter has been restricted and the Bombay market remained closed for two days in consequence of the disturbances in that city. Buyers being reluctant, prices continued to sag and to-day touched 25⅜d. and 25⅜d. for cash and two months' delivery respectively. Without being active, America has made some offers of silver, but transactions have been rather limited. Some enquiry was received from the Indian bazaars after their re-opening, but demands have been easily met by moderate sales on Continental account.

The following were the United Kingdom imports and exports of silver registered from mid-day on the 4th instant, to mid-day on the 11th instant :—

Imports.	£	Exports.	£
Norway	13,500	Persia	19,240
Germany	11,375	Irish Free State	12,058
Mexico	101,369	British India	451,465
Other countries	11,913	Other countries	2,875
	138,157		485,638

NOTICES.

Messrs. Coutts and Company announce that the Marquess of Cambridge, K.C.V.O., has been appointed a director of the Bank.

The Banca Commerciale Italiana and Greca, recently formed by the Banca Commerciale Italiana of Milan, announce the opening of their offices at Athens and Piræus. Other branches will shortly be established at Salonica and Cavalla.

The Commercial Bank of Australia, Limited, notify that a branch of the Bank has been opened at Ararat, Victoria; also that Mr. J. L. Webb has been re-appointed chairman of directors for the year 1929.

A new office of the Equitable Trust Co. of New York has been opened at 368 East 149th Street, Bronx. In addition to general banking, trust, foreign, bond investment, and other services, this new office provides the most modern safe deposit facilities.

The directors of Westminster Bank, Limited, announce the appointment of Mr. J. Greenhill as manager of the Lothbury office and of Mr. W. W. Woodhams as treasurer and deputy-manager. Mr. Greenhill will be succeeded in the management of Lombard Street office by Mr. W. T. Ford, the present deputy-manager.

Zinc Corporation	5,073	Lead concentrates and 4,888 tons zinc concentrates.

SAN FRANCISCO MINES OF MEXICO, LIMITED.—Production for January: Ore treated, 27,220 tons; lead concentrates produced, 3,445 tons; zinc concentrates produced, 4,072 tons. Estimated net smelter returns, $331,444. Operating expenses, $137,274. Estimated operating profit, $194,170. Office note.—The return includes a plus adjustment of $44,616, being excess of realisations of products over valuations in respect of previous months.

BURMA CORPORATION, LIMITED (Incorporated in India).—During the month of January, 41,244 tons of ore were mined, including 4,185 tons of high grade ore. 30,000 tons of ore were milled in the treatment plant, producing 11,100 tons of leady concentrates. 14,518 tons of lead bearing material, including 3,764 tons of high grade ore, were smelted in the blast furnaces, producing 7,166 tons of hard lead for treatment in the refinery. Refinery products were 6,502 tons refined lead and 592,042 ozs. refined silver. Of silver production, 36,545 ozs. were recovered from the treatment of copper matte. Zinc plant produced 5,050 tons zinc concentrates, assaying 9·58 ozs. silver, 5·45 per cent. lead and 51·71 per cent. zinc. In addition to the above, 750 tons copper matte were produced from the treatment of accumulated smelter by-products and 5,721 tons copper ore. 100 tons of refined antimonial lead were also produced. Included in the tonnage of refined lead is 475 tons recovered from the smelting of copper ore.

NORTH BROKEN HILL.—During January the production was as follows: 30,616 tons of crude ore were treated, assaying 14 per cent. lead, 7·8 ozs. silver per ton, and 10·6 per cent. zinc, producing 6,130 tons lead concentrates, assaying 64·8 per cent. lead, 32·3 ozs. silver per ton, and 7·6 per cent. zinc; also 4,860 tons zinc concentrates, assaying 49·8 per cent. zinc, 3·1 per cent. lead, and 4·1 ozs. silver per ton; 6,374 tons dump slimes were treated, assaying 9·8 per cent. lead, 7·6 ozs. silver per ton, and 11·4 per cent. zinc, producing 880 tons lead concentrates, assaying 57·4 per cent. lead, 42 ozs. silver per ton, and 12·1 per cent. zinc; also 1,240 tons zinc concentrates, assaying 45·7 per cent. zinc, 5·3 per cent. lead, and 5·3 ozs. silver per ton.

MOSCOW.—During the four weeks ended on 26th January, 1929, 8,740 tons of Central Mine ore, together with 1,630 tons of slimes, were milled at the Central Mine, producing 1,649 tons of leady concentrates (including 73 tons from the de-leading plant), which assayed 54 ozs. silver, 65 per cent. lead, together with 2,463 tons of zinc concentrates assaying 8 ozs. silver, 4 per cent. lead, and 50 per cent. zinc per ton, and 193 tons special slimes, assaying 10 ozs. silver, 13 per cent. lead and 7 per cent. zinc per ton.

BROKEN HILL SOUTH, LIMITED.—For the six weeks ended February 9th, 1929, 29,540 tons of crude ore were treated, and produced 5,933 tons of leady concentrates, assaying 68 per cent. lead and 28 ozs. silver per ton; also 5,539 tons of zinc concentrates, assaying 49 per cent. zinc.

† Represents National War Bonds, 3½% War Loan, and Treasury Bonds at market value, £2,735,724, and British Government Guaranteed Stock, £19,425.

SWISS BANK CORPORATION.—The net profit for 1928 together with carry forward from 1927, amounts to £644,200, against £537,227 for 1927. At the annual general meeting, to take place on February 28th, the board will recommend the allocation of £20,000 to Pension Fund, and of £40,000 to Reserve Fund for the extension of head office premises in Basle; they further propose to pay a dividend of 8 per cent. as for the preceding year, to place £80,000 to Reserve Fund, which will reach a total of £1,760,000 and carry forward £28,610. Acting upon the authority given by the extraordinary general meeting of October 17, 1927, the board have decided to issue 40,000 shares of Frs.500 each, thus increasing the paid-up capital from Frs.140,000,000 to Frs.160,000,000. The new shares which will rank for full dividend for current year will be offered to shareholders at Frs.625 per share in proportion to their existing holding. (The Swiss Exchange has been taken at Frs.25 to the £). Acting upon authority given by the extraordinary general meeting of the 17th of October, 1929, the board of directors have decided to proceed to the immediate issue of 40,000 new shares of Frs.500 each, thereby increasing the issued capital from Frs.140,000,000 to Frs.160,000,000. The new shares, ranking for dividend as from the 1st of January, 1929, are offered to the existing shareholders in proportion one new share for each seven held, at Frs. 625 p.s.

ANGLO-FRENCH BANKING CORPORATION, LIMITED. — The directors of the Anglo-French Banking Corporation have issued their first report, covering the period of six months from the inception of operations to 31st December, 1928. This period has been mainly one of organisation, but, it is stated, there is already sufficient evidence, judging by the increasing volume of transactions carried through, to show that the objects for which the Corporation was founded will be achieved. Notwithstanding the fact that only about one-half of the capital was available during the last five months of the period covered, and that the expenses are of necessity disproportionately heavy in the initial stages of the development of the business, the directors are able to report that, after meeting all expenses, there remains a credit to profit and loss account. The profit, after payment of all charges and making provision for rebate of discount on current bills and commission, amounts to £2,133, which it is recommended should be carried forward.

RUBBER, &c.

THE ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED.—An extraordinary general meeting is convened for February 21st at 5, Fenchurch Street, London, at 2 p.m. to consider the resolution that the capital of the company should be increased to £600,000 by the creation of 50,000 new Ordinary shares of £1 each. The Board has recently entered into a contract to purchase the Holmwood Estate in Ceylon, a very fine tea property situated in the Agra Patna District, and arrangements have also been made to lease from the Ceylon Government a further 500 acres of forest land, which it is proposed to open in tea. The increase of capital is required to finance these additions to the company's properties, and also to provide for the further improvement of the existing estates and factories. It is proposed at an early date to offer the new shares to the shareholders.

BARU (JAVA) ESTATES, LIMITED.—The directors have resolved to offer for subscription to shareholders, *pro rata* to their existing holdings, 20,000 Ordinary shares out of the unissued capital at 25s. per share. Each shareholder will be entitled to apply for one new share for every five Ordinary shares held on February 8th, 1929. The proceeds of the issue are required to provide working capital, for buildings and machinery, and further extensions on the Estates, and also for a factory on Pleihari Estate, all of which would otherwise have to be provided out of revenue. The shares now to be issued will be entitled to participate in full in any dividend declared after they are fully paid up.

MISCELLANEOUS.

BRITISH COLUMBIA POWER CORPORATION, LIMITED.—There is a decrease of $61,747 or £12,731 in the working expenses for December, 1928, when the British Columbia Power Corporation were in control, as compared with December, 1927. The net income, compared with December, 1927, shows an increase of $36,190 or £7,462. The six months' working from July 1st to December 31, 1928, shows an increase in the aggregate net earnings of £50,676, as compared with the same period in the previous year.

The net earnings for the six months to end 1928 are £441,479.

BRITISH INDUSTRIES FAIR, BIRMINGHAM.—Barclays Bank (Dominion, Colonial and Overseas) announce that a representative will be in attendance at Barclays Bank, Limited, Stand 2, Block 19K, Castle Bromwich, Birmingham, during the above Fair. Copies of the bank's trade summary and review, and information regarding the trade conditions, etc., in South, West, East and Central Africa, Egypt, Palestine and Sudan, Malta, Gibraltar, West Indies and Mauritius can be obtained from him on application.

COMPANHIA DE MOCAMBIQUE.—The London Committee state that the Customs receipts for the Port of Beira during December last amounted to £22,580, as compared with £18,317 for the corresponding period of 1927.

GUY MOTORS, LIMITED.—The accounts for year to September 30, 1928, reveal a net profit of £60,263 after providing for directors' fees, depreciation and income tax. The net profit for the preceding year was £50,832. The ordinary dividend is 15 per cent., less tax, as against 10 per cent., less tax, for preceding year. Nothing goes to reserve, against £50,000 a year ago, but the carry-forward is increased from £47,835 to £63,491. The report states that the works continue to be well employed. Cash is at £119,287, against £1,272. Investments at cost stand at £138,844, the balance-sheet stating that the market value on September 30, 1928, is greater. Nothing appeared under investments in September 30, 1927, balance-sheet. General reserve at £50,000. Capital reserve, including premium on shares, stands at £196,762.

HEMPSPINNING COMPANY, LTD., OF SZEGED (HUNGARY)

Szegeder Hanfspinnerei A.G.

INCREASED DIVIDEND

The Board of Directors of the Company issued the balance sheet for 1928, which shows net profits amounting to 656,800 pengös, as against 618,700 for 1927. The Annual General Meeting will be held on February 27th, and the Board of Directors will propose to the Shareholders the payment of a dividend of 3.50 pengös, as against 3.20 pengös for the previous year, after the statutory charges have been duly met. The payment of dividend will be either at the counter of the Company at Szeged, or at the counter of the bankers, Adolf Kohner Söhne, in Budapest.

HOME AND COLONIAL STORES.—The report for year 1928 discloses a net profit of £454,092, against £452,835 for 1927. The ordinary dividend and bonus is again 25 per cent. The sum of £45,409 is added to reserve, making total reserve funds £1,306,320. The sum of £18,000 has been set aside to provide for income tax. The Staff Sick Fund receives £5,000 and Staff Benevolent Fund £3,000. The carry-forward is increased from £128,260 to £131,942. Resolutions are to be submitted at the meeting on February 21st to increase the capital by a further issue of £600,000 in ordinary shares of 4s. each and to subdivide existing ordinary shares to a like denomination. The object of the increase of capital is to enable the company to acquire a controlling interest in a competitive multiple shop undertaking on terms to be explained at the meeting. The balance-sheet is summarised on another page.

LEWIS'S LIMITED.—The profit for the year ended February 1st, 1929, was £707,323, an increase of £91,048 over the previous corresponding financial year, and the dividend on the cumulative participating preferred ordinary shares is 15 per cent., less tax, for the year, and 12½ per cent., less tax, on the deferred ordinary shares; £10,000 is placed to reserve for the staff pension fund; £125,000 to general reserve, being an increase of £50,000 over last year; and £57,259 is carried forward.

NIGER COMPANY, LIMITED.—The trading profit for year to June 30, 1928, was £601,572, against £642,075 for preceding year. Provision for interest on debenture stock absorbed £320,850, against £321,327. The sum of £15,000 is again written off discount and expenses of debenture-stock issues. The sum of £125,000 is set aside for depreciation, etc., against £100,000. The dividend on the preference shares absorbed £160,000. The carry-forward is reduced from £247,407 to £228,129. The balance-sheet is fully summarised on another page.

SINCLAIR IRON COMPANY, LIMITED.—We are officially informed that it is hoped to post a notice of importance to shareholders during this week end.

SINGER AND COMPANY, LIMITED.—The directors state that the amount of business done by the Company since July 31, 1928, is equal to expectations, their cars give every satisfaction and dealers' requirements of cars involve the factories working at full pressure. The Birmingham works has proved its great advantage in economical production, and the prospect of a satisfactory year's working is quite good. For the half-year ending January 31, 1929, the output of all cars has increased.

SIR W. G. ARMSTRONG WHITWORTH AND COMPANY.—Capital and other losses to be written off amount to £14,117,536 10s. 3d. The bankers have agreed to cancel £1,463,986 4 per cent. mortgage debenture stock, £1,000,000 5½ per cent. second mortgage debenture stock, and £2,408,000 6½ per cent. consolidated debenture stock, with all interest thereon, receiving in exchange 4,700,000 new "B" ordinary 10s. shares, entitled to 90 per cent. of the distributed surplus. It is proposed that security for remaining £1,036,014 first debentures be altered to a floating charge on the undertaking; that remaining £3,500,000 second debentures and notes shall be cancelled, in exchange for £80 5 per cent. income debenture stock and £20 shares (per £100 cancelled) of A.W. Second Stock Trust, Limited, to which assets of nominal value £3,500,000 will be transferred; that remaining £2,592,000 debentures be cancelled, in exchange for £67 10s. income debenture stock (per £100 cancelled) of A.W. Consolidated Trust, Limited, to which assets of nominal value £1,750,000 will be transferred; that £1,000,000 £1 6 per cent. first non-cumulative preference shares and £1,000,000 £1 4 per cent. second non-cumulative preference shares be created, to be held by the two trusts; that is, "A" ordinary shares be given in exchange for existing preference and ordinary shares, 15 for each £5 4s. per cent. first cumulative preference, 2 for each £1 5s. per cent. non-cumulative second preference, 1 for each £1 6½ per cent. non-cumulative third preference, and 1 for every 2 £1 ordinary shares now held : that on a poll every "B" ordinary share, every two preference shares and every 100 "A" ordinary shares carry one vote. Meetings are to be held at Central Hall, London,

* For Half Year. † Free of Income Tax.

(*Continued from page* 373.)

S.W. 1, *on Tuesday, February 19th, to consider the scheme of arrangement, and to pass, if thought fit,* resolutions embodying the above and other proposals.

S.T.D. MOTORS, LIMITED.—At a general meeting of the holders of 8 per cent. guaranteed notes of S.T.D. Motors, Limited, the resolution concerning the redemption of the notes was passed by an overwhelming majority.

THE MERCANTILE INVESTMENT AND GENERAL TRUST COMPANY, LIMITED.—The profits of the year ended *January 31, 1929,* amount to £311,910 (against £293,024 last year) out of which a dividend of 16 per cent. on the ordinary stock is recommended (*15 per cent. last year*), £50,000 has been transferred to reserve, and the carry-forward is increased from £36,318 to £45,229. The board propose to issue the balance of the authorised capital, namely, 250,000 5 per cent. cumulative preference shares and 250,000 ordinary shares of £1 each, and to offer the same *pro rata* to the ordinary stockholders in units of 1 preference share and 1 ordinary share at the price of £3 for the two shares.

TIN SELECTION TRUST, LIMITED.—The directors have decided to issue forthwith and to allot provisionally to shareholders whose names appear on the Trust's Register at January 29th, 500,000 of the 1,000,000 newly-created shares at the price of 25s. per share, and in the proportion of one new share in respect to every two shares now held, fractions being ignored. The new shares will be identical in all respects and will rank equally with the old shares in regard to all dividends hereafter declared. The shares are payable in full on acceptance, and the sum of 25s. per share to be paid on or before February 18, 1929. The whole of the issue of 500,000 shares has been underwritten at an underwriting commission of 9d. per share and an over-riding commission of 3d. per share.

WASTE FOOD PRODUCTS, LIMITED.—With a view to financing the erection of the second unit of plant and the other arrangements and contracts entered into by the board, which were not contemplated at the time of the issue of the company's prospectus, the board deem it advisable that the capital of the company should be increased. An extraordinary general meeting of the company is called for February 18th at Manchester House, London, at 3.15 p.m.

It is not proposed to issue the whole of these shares immediately, but the chairman hopes to be in a position at the extraordinary general meeting of the company to inform the shareholders of the directors' proposals with regard to an issue of part of these shares, for which the holders of Ordinary shares will, in the first instance, have priority of allotment.

Commercial Reports.

THE CORN TRADE.

Mark Lane, Thursday Evening.

A spell of severe cold and frosty weather over the United Kingdom during the past week rendered field work impossible, and caused some anxiety as to the effect on standing crops. Fair supplies of native wheat were available at the principal statute markets, but prices generally marked no improvement. Imported descriptions, however, ruled firmer in sympathy with advanced forward offers, and in the floating and forward cargo section, a better demand was dealt with, particularly for Argentine and Australian descriptions. Liberal sales are reported of the former variety on Continental account, and United Kingdom millers also purchased more freely, but the feature of the market was a renewal of activity on Indian account, and large bookings of Australian were made up to May-June shipment. Higher first-hand quotations, together with less favourable weather reports from North America and India, combined with large shipments to non-European countries, resulted in a very firm tone on this side. To the United Kingdom, steamers of Australian afloat sold 47s. 3d. bulk, 47s. 10½d. bags, ditto to Calcutta, March 45s., May 44s. 7½d., and Karachi, afloat 44s. 10½d. to 45s. 7½d., March 44s. 9d. to 45s. 9d., Rosafe to United Kingdom-Continent, 64½ lb. afloat 44s. 1½d., 64 lb. April 44s. 4½d., and Barusso, 64 lb. March 15th-April 15th **44s., all per 480 lb. c.i.f. terms.** Of feeding stuffs, maize tended to be dearer for new crop positions, and sellers were more reserved.

Wheat dearer. No. 2 Northern Manitoba 52s. 6d., No. 3 ditto 51s., No. 4 Manitoba 49s. 9d., No. 5 45s. 9d., No. 6 40s., No. 2 mixed Durum 45s., Rosafe 64 lb. 46s. 9d., Barusso 63½ lb. 46s. 9d. Australian 49s. 9d., all ex-ship, per 496 lb. English 9s. 7d.-9s. 10d. per 112 lb.

Flour firm. London standard grade 39s. 6d., town whites 40s. 6d., patents 41s. 6d.-42s. 6d. per sack delivered in the Home Counties, with 6d.-1s. per sack less for deliveries in the London districts. Of imported, Manitoba patents range from 35s. 6d.-38s. 6d., Minneapolis 35s. 6d.-38s., Australian 36s. 6d., ex-store, per 280 lb.

Maize easier spot and near, but distant positions firmer. Plate landed 44s., ex-ship to arrive 42s. 6d., February-March 43s. 9d., March-April 41s., new April-May 39s. 6d., May-June also June-July 39s., No. 2 mixed American ex-ship to arrive 41s. 3d., ditto yellow 41s. 3d., No. 2 white flat African 43s. 6d. landed, per 480 lb. Yellow maize meal £11 10s. ex-wharf, Hominy chop £9 per ton.

Barley firm for feeding kinds. Californian ex-ship 45s.-52s., Chilian Chevalier 48s.-58s., Australian 45s.-49s., Smyrna 44s. 47s., per 448 lbs. Algerian-Tunisian ex-ship 34s. 6d., Canadian feed 32s. 6d. ex-ship to arrive, 33s. landed, No. 3 Canadian Western 36s., No. 2 Federal American 30s. 6d. ex-ship to arrive, 400 lb. English malting 10s.-15s., feed 9s. 3d.-10s. per 112 lb.

Oats quiet. Plate ex-ship to arrive 23s. 9d., February 25s. 3d., March 25s. 6d., black Plate landed 25s. 3d., No. 3 white clipped American 36 lb. landed 27s. 3d., mixed Canadian feed 21s. 9d., Chilian white 33s., German landed 29s. ex-ship to arrive 28s., per 320 lb. English 9s.-10s. per 112 lb., Scotch landed 30s. per 336 lb., Irish black 26s. 6d. per 320 lb.

COMPARATIVE AVERAGES OF GRAIN.

The following table gives the estimated sales of *home-grown* wheat during the harvest years 1928–29, 1927–28, 1926–27, 1925–26:—

	1928-1929.	1927-1928.	1926-1927.	1925-1926.

AMERICAN WHEAT MARKETS.

The general position shows a steady improvement throughout the week. Cold weather conditions have prevailed in Europe and the American South-West, and receipts have been of small dimensions. Good export inquiries and an active cash demand assisted the rise in values, but there has been some *selling by commission houses.* Quotations:—

Nearest Future.	Jan. 4, 1928.	Feb. 15, 1928.	Jan. 2, 1929.	Feb. 6, 1929.	Feb. 13, 1929.
Winnipeg (No. 1 Manitoba)—Cents per 60 lbs.	137	134⅛	122	128⅛	132⅛
Chicago (No. 2 Winter)—Cents per 60 lbs.	130⅛	130⅛	116⅛	124⅛	127⅛

Visible supplies of wheat in Canada at 82,145,000 bushels show an increase of 928,000 bushels, as compared with the previous figures. Supplies a year ago stood at 72,178,000 bushels.

COAL.

Our Glasgow correspondent writes:—With outputs restricted in conformity with the stablisation scheme, supplies are very scarce, and as home demand is brisk the shipping position is largely nominal. Firmer prices have again been conceded for any odd lots becoming available. It is understood that a new scheme has been drawn up, to be instituted when the present agreement terminates, and that copies are about to be sent out for coalowners' consideration. Shipment prices (f.o.b. district ports) are largely nominal and as follow:—Lanarkshire: Ell best, 18s.; splint best, 18s. 6d.; splint second, 18s.; navigation, 17s. 6d.; navigation second, 15s.; steam, 15s.; hartley, 18s.; trebles, 15s. 6d.; doubles, 15s. 6d.; singles, 13s. 6d.-14s.; pearls, 12s. 6d.; dross, 10s. 6d. Fife: Screened navigation, 18s.; first-class steam, 17s.-17s. 6d.; third-class steam, 16s.-16s. 6d.; trebles, 17s.-17s. 6d.; doubles, 16s.-16s. 6d.; singles, 14s. 6d.; pearls, 13s. Lothians: Prime steam, 16s.; secondary steam, 15s.; trebles, 16s. 6d.; doubles, 16s.; singles, 14s. 3d.; pearls, 11s. 9d.

GET FIT & KEEP FIT

A doctor states that one-half of the work in his busy life is unnecessary and that all should take steps to attain good health through exercise. The Macdonald Smith Course of Health and Energy will teach you how to get fit and keep fit with a minimum of time spent, whatever your age or occupation.

Write to-day for booklet "Health and Energy" and full particulars of this excellent system to:

MACDONALD SMITH (Dept. E.)
94, GOWER STREET, LONDON, W.C.1

Our Sheffield correspondent writes :—The position of the coal industry continues to improve in all sections. There is a scarcity of coal for export. Many contracts for industrial coal have been arranged at 6d. per ton advance, and demand for house coal is brisker. Steams are firm at 16s. 6d. f.o.b. The market for blast-furnace coke has also hardened on the week, and prices of best brands are now 14s. and 14s. 6d. at ovens. The home demand for foundry coke is poor, but export inquiries are numerous, and producers can command the current quotations.

Our Cardiff correspondent writes :—The position on the Cardiff coal market has not undergone any material change during the present week. The demand continues active, collieries are regularly employed, and prices are very firm. Indeed, quotations for some of the Monmouthsire coals have further hardened to the extent of between 3d. and 6d. per ton, and there are now many grades of coal being marketed at prices which are from 1s. to 1s. 6d. per ton above the minimum schedule. This position is likely to be strengthened, for during the present week supplies have been reduced as a result of colliery stoppages caused by severe frost and heavy snowfall. The frozen condition, however, of many of the appliances at the South Wales docks has temporarily dislocated coal shipment conditions. The traffic returns of the Great Western Railway indicate an expanding volume of trade, and those for the week ended February 10th give total shipments amounting to practically 580,000 tons, compared with 557,000 tons the previous week, and only 453,000 tons in the corresponding week last year. Arrangements are in progress for the resumption of work at more of the pits that were closed down last year. The Egyptian State Railways are in the market for 180,000 tons. Current approximate quotations are as follows :—Best Admiralties, 19s. 4½d. to 19s. 6d.; seconds, 19s. to 19s. 3d.; best drys, 18s. 9d. to 19s.; Western Valleys, 18s. 9d. to 19s 3d.; Black Veins, 19s. to 19s. 6d.; Eastern Valleys, 18s. to 18s. 6d.; best small steams, 13s. 9d. to 14s.; cargo smalls, 12s. 6d. to 13s.; cooking smalls, 13s. 9d. to 14s.; anthracite best large, 33s. to 35s.; Red Vein large, 21s. to 25s. 6d.; machine-made cobbles, 40s. to 43s.; French nuts, 41s. to 43s. 6d.; stove nuts, 40s. to 42s. 6d.; rubbly culm, 9s. 3d. to 10s.; foundry coke, 25s. to 37s.; patent fuel, 20s. to 21s. 6d.; pitwood, ex ship, 26s. 6d. to 26s. 9d.

IRON AND STEEL.

We extract the following from the weekly report of the London Iron and Steel Exchange :—Active business conditions continue to characterise the iron and steel markets. The pig-iron market is probably the quietest department of the trade, but even here there has been a noticeable improvement in the demand, so much so that after a partially successful attempt to raise the prices of Midland foundry irons by 2s. 6d. per ton, the makers have agreed amongst themselves to maintain the advance, and this concerted action seems to have met with more success than the previous attempt, though the movement has to some extent temporarily checked buying. In semi-finished steel a good business has been transacted, the greater part of the orders having gone to British producers, with the result that in one or two districts quotations have been advanced. This was due to the stringent situation which has arisen on the Continent, where material has been quoted at rather higher prices than of late. The demand for finished steel has improved, and a good business has been transacted with several of the export markets, in which buyers appear to have relinquished the view that they can obtain lower prices by waiting. In particular, there has been a revival in the demand for sheets, which came along just as some of the works were getting rather slack.

Our Sheffield correspondent writes :—Improvement in the local steel trade is confined to basic material, and for this the position and outlook have never been brighter. Next week two open-hearth furnaces will be started at the Redbourne Hill Works, Lincolnshire, together with a mill capable of producing 4,000 tons of material per week. A large Talbot furnace may shortly be added to the working plant. The increased demand has sent up values of basic scrap, which is now worth 64s. The output of heavy finished steel and tool steel remains at previous levels, and the absence of considerable expansion is disappointing. Demand for acid steels shows some sign of improvement. Local manufacturers seem confident of better trade later in the year when the railways come into the market for normal supplies of rolling stock and spares. There are good inquiries for steel from the shipyards. The export trade is only moderate. The partial advance of 2s. 6d. per ton on the prices of local foundry pig iron has now become general, although consumption of such materials remains low. The foundry trade is as depressed as ever owing to its excessive output

capacity. Business in hand-tools is steady. The year has opened unfavourably in the cutlery and plate branches, most of the factories being short of orders.

Our Glasgow correspondent writes :—The position in the iron and steel trade in the West of Scotland is practically unchanged. Makers of heavy steel are now fairly well employed, particularly in the manufacture of shipbuilding material, orders for which are being placed more freely. Semis from the Continent are for the moment unobtainable, and home producers are in consequence finding a better demand, although buyers are not disposed to pay the increased prices being asked. Galvanised and black sheet makers continue fully employed, and within the last few days there have been more inquiries on the market. No settlement has been reached in the iron trade dispute. The pig-iron market remains quiet and little business passing.

Our Cardiff correspondent writes :—On the Swansea Metal Exchange on Tuesday there were purchases for shipment to the Far East, South America and the Continent, but there was no great pressure of business, and prices were steady at from 18s. to 18s. 3d. Shipments last week totalled 115,074 boxes, compared with 155,345 boxes the previous week, and stocks have increased to 250,253 boxes. Prices of galvanised sheets are unaltered at from £13 12s. 6d. to £13 15s., and those for tinplate bars, Welsh and foreign, are unaltered at £6 and £5 12s. 6d. respectively.

Our Middlesbrough correspondent writes :—Pig iron : The market is gradually recovering, and there is a tendency for prices to harden. The price of Cleveland iron has been raised 1s., and is now at the following level : No. 1, 69s. 6d.; No. 3 G.M.B., 67s.; No. 4 foundry, 66s.; No. 4 forge, 65s. 6d. The rise is to some extent due to scarcity, and also due to increased costs of raw material. Continental orders are rather more in evidence, and some transactions have been made. It is more than likely that the make of the iron will be increased by the rekindling of further furnaces. The hematite market is slowly recovering, and supplies are very limited. The price of East Coast mixed numbers is given as 72s., with prompt supplies very difficult to obtain.

The improvement is still being continued in the steel trade, and although the works can deal with very much larger orders, they are certainly better off now for forward business than for a very long time. Iron rivets have been advanced 5s. per ton, otherwise prices remain unchanged on the following basis : Steel ship plates, £8 7s. 6d.; steel ship angles, £7 17s. 6d.; iron bars, £10 5s.; steel rails, £8 10s. The coke market is distinctly firmer, and blast-furnace coke delivered furnaces commands 18s. per ton minimum. The foreign ore trade is also very firm, with supplies scarce, and best rubio at a minimum of 22s. 6d. per ton.

OTHER METALS.

TIN.—Eastern markets were closed on several days owing to the Chinese New Year holidays, and here the tone was somewhat irregular, demand being generally quiet, and opening advances were not maintained. Stocks in London and Liverpool warehouses for week ending 9th February totalled 7,779 tons compared with 2,542 tons at same period last year. Standard cash changed hands at £225–£223 15s. and £224 7s. 6d., with three months fluctuating between £227 and £225. In the East, sales were on the basis of £228 10s. and £228 2s. 6d. per ton c.i.f. terms.

COPPER met with fair support, but with realisations in progress, values moved in buyers' favour. Standard cash sold £77 12s. 6d. £77 15s., and £77 10s., three months £78 2s. 6d., £76 12s. 6d. and £77 1s. 3d.

LEAD was again well supported, and a firm tone governed the market but closed below the best. Good soft foreign pig February sold £23 6s. 3d. to £22 18s. 9d.; March, £23 5s., £23 6s. 3d. and £22 17s. 6d.; April, £23 5s., £23 6s. 3d. and £23 5s. to £22 16s. 3d. ton.

SPELTER quiet, and occasionally the turn easier. February sold £26 5s. to £26 2s. 6d.; March, £26 3s. 9d.; April, £26 6s. 3d. to £26 3s. 9d.; May, £26 7s. 6d. to £26 3s. 9d.; June, £26 7s. 6d.; July, £26 8s. 9d. ton.

ALUMINIUM steady. Ingots and bars for home delivery £25 ton.

ANTIMONY dull. English quoted £54 to £55. Chinese regulus spot, £38 5s.; February–March, £34 5s. ton c.i.f.

WOLFRAM quiet. Chinese and Straits qualities 18s. to 18s. 6d. per unit c.i.f.

QUICKSILVER steady. Spot, £22 5s. to £22 10s. per bottle.

TIN PLATES quiet. I.C. coke prompt and forward quoted 18s. to 18s. 3d. per box f.o.b. Swansea.

THE COTTON TRADE.

LIVERPOOL, February 13th.

Spot sales for the week 7th to 13th (inclusive) are 27,000 bales, of which 19,350 bales are American, 500 Brazil, 950 Argentine, 2,250 Peru, 1,500 Egyptian, 800 African, 1,500 East Indian, and 150 sundries.

Imports for the same period are 78,981 bales, of which 58,546 bales are American, 356 Argentine, 574 Peru, 8,648 Egyptian, 958 African, 9,751 East Indian, 148 sundries.

Quotations to-day are : American Middling, 10.48; Egyptian F.G.F. Sakel, 17.95; Uppers, 12.25; Brazil Fair, 10.78; Peru G.F. Mod-Rough, 12.75; Smooth, 11.43; West African Middling, 10.53; and East African G.F., 12.20.

MANCHESTER, February 13th.

The tone of the market has been rather firmer in sympathy with the advance in raw material rates, but very few buyers have been stimulated to act with more freedom, and the sales in yarn and cloth have again been unimportant. Cable and mail advices from India remain poor, and owing to the disturbances in Bombay and the embargo upon exports to Calcutta the turnover in piece goods has been unimportant. The holidays in China are now drawing to a close, and there is some expectation of an increased demand in the near future. Restricted operations have taken place for most of the smaller markets East and West. The better news from the home trade has been maintained, and owing to improved clearances in the wholesale establishments rather more orders have been placed with manufacturers. A slow feeling has prevailed in American and Egyptian yarns, prices being somewhat irregular when tested. It is difficult for most firms to prevent loss of ground.

Comparative Statement of the Cotton Trade.

THE WOOL TRADE.

Our Bradford correspondent writes :—There is no doubt that confidence in wool values has been shaken, and until the raw material settles on a stable basis once more no real expansion can be expected in the demand for tops and yarns. At the moment this much-needed stability is not in sight, for the reports from the primary markets this week indicate that irregularity is still in evidence, and, notwithstanding a fair amount of buying on foreign account, prices generally are in buyers' favour. Quotations are largely nominal in the absence of bulk buying, but it is indicative of the general weakness that merinos have lost from 2d. to 3d. per lb. during the last two or three weeks. Crossbred tops are irregular, and demand is very limited. Spinners seem to be unable to do much with tops at to-day's prices, and this is also noticeable in the demand for yarns for export to the Continent. As things are, quotations for yarns are below replacement values, but the keen competition for the small amount of business available, and the desire of spinners to keep machinery running, result in price-cutting in all departments. The uncertainty regarding wool values and the rise in the Bank rate have had a depressing effect on business in piece goods for the home market, and wholesale fabric buyers are again operating with the utmost caution.

COLONIAL WOOLS.

(FROM A CORRESPONDENT.)

The wool market presents some rather disappointing features. Conditions among home trade spinners and manufacturers are admittedly not very good. The close of the London sales on an all-round lower level has unfortunately not been followed by any important development in manufacturing circles—certainly not such as is really desirable. The presentation of the case for safeguarding at the inquiry which is being held in London is probably unduly emphasising the keenness of foreign competition, the difficulty of offering cloths at competitive prices, and the increase in unemployment. It is true that tops have been sold at prices distinctly below cost out of the last London sales, and similar disparities are shown by a consideration of all the authentic information received about the movement of wool values in Australia, New Zealand and South Africa. Prices for tops of any quality below 46's are kept firm by the scarcity of corresponding qualities of the raw material, and yet with Bradford as an extensive buyer at Wellington prices are indicated as having been on the easy side.

In merinos, an all-round ease of 1d. per lb. in the clean scoured cost at Sydney still leaves average 64's at 39d., which is equivalent to 46d. in the top. This price cannot be made to-day, and yet it is impossible to see how fine wool can depreciate much, if any, more from the present point. Home trade users will probably still have to face strong Continental competition, and the only real hope for the former seems to lie in an expansion of manufacturing requirements. There is certainly nothing at the present time to justify sellers of the raw material expecting any upward movement. Manufacturing conditions are against it, for besides the lack of confidence at home there are disturbing influences on the Continent, and users in this country are not alone in thinking at its present price wool is dear enough.

HIDE, LEATHER, AND ALLIED TRADES.

The outlook continues rather depressing in the allied industries, and little improvement is looked for until prices of hides and skins become more stabilised. Hides continue to fall in value in all markets, leather being in slow demand in all producing countries. At most of the provincial auctions this week, prices of hides have shown further declines of ½d. to ¼d., and best ox hides are now selling at about 7d. to 7½d. per lb., the general opinion being that values will yet be weaker. Calfskins also share the decline, and are easier at most markets. All classes of overseas hides are lower without exception, and South American frigorific ox are now selling at 9¾d., a few seconds at 8⅞d. finding English buyers. Russia has bought a parcel of saladero Bovril ox at 8¾d. Cape hides continue to show weakness, and dry salted have sold at 12½d.-11½d. for first and second grades. Australian hides are offered at less money, Queensland meatworks hides being quoted at 10½d., and New South Wales at 11d. Cables from the United States report a weak market, with best heavy packers selling at 16¼ cents.

The turnover in leather is poor, and both tanners and merchants appear anxious to get rid of bends and offal at less money. Dry hide bends are still difficult to sell, but there is a day-to-day demand for wet salted bends which prevents any severe drop in values. Still, as quite good quality bends are now being offered at 2s. to 2s. 4d., it is obvious tanners are not making any money just now, and there is some anxiety as to the financial position of certain firms. Offal is selling slowly in the better grades, and merchants appear able to "pick up" bargains in this direction.

COMMERCIAL SERVICE.
The Bank has over 350 Branches in Africa, and Agents and Correspondents throughout the World. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade between South and East Africa, the United States of America and the Continent of Europe.
THE STANDARD BANK MONTHLY REVIEW is sent post free on application. It gives the latest information on all South and East African matters of Trade and Commercial interest.

Upper leathers remain quiet, and curriers of kips are working short time. Calf box and willow are selling in small lots, and the position of producers has not improved owing to the reduction of 1d.-2d. per foot by a leading German tanner, who does a large business with this country. The value of imports of dressed leather for January last were valued at £554,643, as compared with £801,377 for the first month of last year.

VEGETABLE OILS AND OILSEEDS.

The feature of the markets has been the steady rise in linseed oil, current value of which is now around £29 5s. per ton naked ex Hull mill, an advance of 15s. and more on the week. Imported oil is now largely ruled out owing to the ice conditions in Holland preventing the mills obtaining seed, while here supplies are light, as crushers have kept down production on account of the high price of seed and the poor market for oil. Of late consumers have bought rather more freely. A better demand for cotton oil at the lower level of values has sprung up, and crude is firmer. Current value of crude Egyptian is £28, and common edible £31 10s. for prompt and February-April delivery. Rape and castor oils are dearer.

In the oilseed section, linseed is steady, and with a little better demand. Spot values have hardened somewhat. For Plate on passage to Hull £15 17s. 6d. has been paid, and this about represents current value for "afloat" and "shipment," but very small interest is manifested in these positions. The quantity now afloat for Europe continues to expand, and is now 264,700 tons, or 6,300 tons higher on the week. A fair trade in black Egyptian cotton-seed has been done around £10 for shipment to Hull, but shippers now want more money. Oilcakes are in good demand, and prices are firmly held.

THE JUTE TRADE.

DUNDEE, February 13th.

According to advices from Calcutta the remaining supply of raw jute available for sale this season is not large, and in consequence a firm tone pervades the market. Sellers are very reserved, and appear to be waiting for higher prices, which may accrue whenever consumers are prepared to show interest in purchasing the fibre. Meanwhile, business in the raw material is mostly confined to speculative operations, and spinners at all centres are holding off, though they have considerable quantities to buy yet to satisfy their requirements for the season, at least those in Dundee and on the Continent. The Calcutta mills have large stocks, which will in all probability be maintained in view of their recent decision to increase their production by six hours per week as from July 1st next. Fears are entertained that the present crop will not turn out a sufficient quantity to meet the world's requirements. Few offers are reaching this market from Calcutta, and the sellers here are mostly holders of secured parcels, offered at lower prices than those ruling in Calcutta. A few sales are taking place in spot and afloat parcels, which are cheap compared with the rates for shipment. White jute is scarcely mentioned, First Marks and Lightnings being difficult to secure in Calcutta. Values are nominal at £38 for First Marks and £35 10s. to £36 for Lightnings, February-March shipment. Grade Firsts have been sold on spot at £34 15s. Daisee assortment is offered at £33 afloat and at £33 10s. for February-March, while Tossa assortment rules at £35 10s., threes at from £34 10s. to £35, and fours at £32 15s., same shipment.

Fair quantities of jute yarns have been sold, and spinners are in a very healthy position to the end of June. Prices of hessian yarns are firm at 3s. 6½d. for common 8 lb. cops and at 3s. 7½d. for 8 lb. spools. Twist is from 5⅔d. to 5⅞d. for 3 ply 8 lb., and sacking yarns are being sold at from 3⅛⅝d. to 4d. for 24 lb. weft and 5⅝d. for 8 lb. spools. Rove is steady at £27 10s. for 18 lb. and £17 10s. for 200 lb. Fine yarns are well sold and firm in price. Carpet qualities have come in for more attention at 5¼d. to 5⅜d. for 14 lb. warp.

Jute cloth is slowly but steadily improving. The widths from 50 to 60 in. especially are comfortable for the next three months, and delivery would be difficult to obtain before June. Prices are firm at from 4⅜d. for 10½ oz. 40 in. hessians and from 3½d. for 8 oz. Manufacturers are finding it difficult to obtain more, but they have gradually worked themselves into a position that enables them to refuse less for packed goods. Linoleum hessians are quiet, but steady, while heavy goods continue dull.

OVERSEAS PRODUCE.

FOOD, BEVERAGES, &c.

SUGAR.—Steady conditions obtained in this market, and there is an increased off-take, both on grocery and manufacturing account, prices for all spot goods remaining without change. The British refined T.L. granulated is very much in the limelight just now, and in addition to the 25,000 tons disposed of to China, and reported 5,000 tons to India, 6,000 tons for near shipment have been sold to Scandinavian ports, also at 10s. 9d. f.o.b. terms. T.L. granulated spot London sold 22s. Czecho February-March, 11s. 6d.; April-August, 11s. 7½d.; November-December, 11s. 7½d., f.o.b. Hamburg. Dutch "J" prompt, 11s. 7½d.; November-December, 11s. 9d., f.o.b. Rotterdam. White Mauritius spot, 21s. to 21s. 9d.; January-February, 14s. 6d., c.i.f., U.K. Centrifugals basis 96 per cent., February-March, 9s. 6d.; March-April, 9s. 7½d., c.i.f., U.K. White Java, May-June, 11s. 4½d., c.i.f. Europe; July-September, 12s. 3d.; and October-December, 12s. 4½d., c.i.f., Calcutta. Terminals fully steady, with moderate sales. Of raws, March sellers, 8s. 9¾d.; May sold 9s. 0¾d.; August, 9s. 5½d.; December, 9s. 7½d. White March sellers, 12s. 1½d.; May buyers, 11s. 9¾d.; August, 12s. 1½d.; December sellers, 12s. 3d. per cwt. Cuban receipts last week, 266,347 tons, as against 180,641 last year; exports, 139,695, against 79,708; stocks, 601,155, against 419,232. Stocks of raw sugar in the three chief ports of the United Kingdom for week ending February 9th totalled 178,942 tons, against 92,249 last year. Imports into the U.K. during last month total 209,911 tons, against 187,498 same time last year; consumption, 152,533, against 115,332; and stocks, 291,400, against 278,250. Stocks of home-grown, 61,000 tons, against 48,050 last year.

TEA.—Indian auctions embraced some 53,026 packages, which came to a slow and hesitating market. A few parcels of fine quality possessing autumnal flavour were well competed for and brought steady prices, but otherwise a decline of ¾d. to 1d. per lb. was registered. Many lots were withdrawn owing to bids not reaching selling limits. Ceylon sales of 27,562 packages. Fine and finest lots, where quality proved equal, realised fully steady prices, but other grades disclosed irregularity and weakness. Good leaf teas suitable for export declined ½d. to ¾d. Java and Sumatra auctions met a quiet market and prices favoured buyers. New season's China quite neglected at the moment.

COFFEE.—Market generally steady, with a fair offtake from the spot. Kenya bold sold 127s. 6d. to 141s.; Costa Rica, 166s. 6d. to 167s.

COCOA.—Market firm. Cameroon spot sold 52s., fair fermented Accra, 49s. 6d. Terminal: February sold 48s. to 48s. 3d.; May, 48s. 3d. to 48s. 6d.; September, 50s. 3d.; December, 49s. 7½d. Accra F/F, March-May, sold 43s. 6d. to 43s. 9d. to 43s. 6d., f.o.b.

RICE.—Quietly steady. Burma: Two stars spot old crop 13s. 9d. to 14s. 3d., for shipment No. 2, February-March, quoted 13s. 1½d.; No. 3, 13s. 4½d.; and straits quality, March-April, 13s. 7½d. Beans firmly held and Madagascar butters sparingly offered. Afloat, per "Clan Macintosh," sold 37s. 9d., with 38s. sellers, 19s. to 20s.; December-January, 19s. 6d.; January-February, 18s. 4½d.; February-March, 18s. 3d. per cwt.

SPICE.—Pepper in quiet demand. Black Lampong January-March sellers, 1s. 4¼d.; March-May, 1s. 3½d.; May-July, 1s. 1⅞d.; August-October, 1s. 0¾d.; white Muntok, January-March, sold 2s. 3½d.; March-May, 2s. 3d.; May-July, 2s. 2d. London stocks reduced 12 tons on the week for black, but 50 tons higher for white. Tellicherry, January-March, 144s.; Aleppy, 142s. cwt. Cloves steady. Zanzibar spot, sellers, 1s. 5d.; March-May, 1s. 5¼d. per lb. Tapioca, also sago flour, quiet, unaltered. African ginger, spot, London, 53s. per cwt.

FRUIT (Dried).—Currants in limited request. Pyrgos quoted 45s. 9d. to 46s.; Patras, 47s. 6d.; choice, up to 51s.; Amalis, 46s. to 46s. 6d.; Gulf, 49s. to 52s.; Vostizza, 51s. to 58s. Sultanas in better demand and market steady. Medium to good Smyrna, spot, 41s. to 55s.; Cretan, 45s. to 70s.; Greek, 34s. to 65s. Australian sell readily at 32s. to 50s. Californian soda, bleached, 35s. to 38s.; unbleached, 29s.; Cape, unbleached, 33s. to 37s.; bleached, 45s. to 50s. Raisins dull. Valencia quarter boxes, 50s. to 55s.; Australian, 32s. to 36s. Figs quiet. Genuine new, spot, 28s. to 30s.; layers, 60s. to 65s.; pulled, 60s. to 70s. Dates in good demand for Siar and prices steady. Hallowie new, spot, 28s. to 30s.; Khadrowie, 23s.; Siar, 15s. to 17s. Evaporated fruits: Market continues firm, with supplies of most descriptions in moderate compass. Apricots were sparingly offered, while there is a better inquiry for plums, particularly large sizes, small counts being scarce. Californian plums, 20's-30's, 65s.; 30's-40's, 57s.; 60's-70's, 42s. 6d. to 43s. Australian pears range from 57s. 6d. to 70s. as to quality. Apricots, South African new crop, Royal, 60s. to 117s. 6d.; Cape, 72s. 6d. to 82s. 6d.; Californian new, 85s. to 117s. 6d. Peaches, Californian, choice, 50s.; extra choice, 53s.; fancy, 58s. Apples, Californian, spot, sliced, extra choice, 67s. 6d. Almonds quiet, and tendency in buyers' favour. Mazagan, 142s. 6d.; Mogador, 140s.; Majorcas, 145s.; bitter, Jordan, 185s. to 210s. cwt.

CANNED GOODS.

CANNED FRUITS.—The general position of Californian fruits remains unaltered, with only moderate interest shown by trade buyers. Spot stocks of loganberries are short, with firm prices asked for shipment parcels. Pears realise full rates, both spot and to arrive, but apricots and peaches move off rather quietly. Australian descriptions in limited supply, the trade being chiefly interested in new season's quotations. Italian tomatoes held for firm rates, with only small stocks now to come forward.

CANNED FISH.—Sardines met a quiet sale at steady prices. Portuguese clubs quoted 5s. per dozen tins. Lobsters steady, but trade restricted. Best halves, 140s. to 145s., and quarters, 77s. 6d. to 82s. 6d. Salmon: Spot trade fair, and forward quotations firm. Red tall, spot, 42s. 6d. to 45s. Pink, steady. Talls, spot, 26s. to 27s.; halves, 31s. 6d. to 33s. 6d. Japanese crab in fair request and brings full rates. Finest quality, 95s. to 97s. 6d.

CANNED MEATS.—Steady, with ox tongues firm on scarcity. Lunch tongues in good demand for forward delivery at reasonable rates, and cases 12 × 6 lb. quoted 92s. 6d. to 107s. 6d. per dozen tins. Danish cooked hams sell readily at about 1s. 7d. per lb. for cases of six tins.

CONDENSED MILK AND MILK POWDERS.—Market generally unaltered. There are some attractive lines offering from Belgium at the moment. Full-cream sweetened, English, spot, 45s.; Dutch ditto, 38s. 6d.; February-March, 38s. 6d. Machine-skimmed, sweetened, English, spot, 27s.; Dutch ditto, 24s.; February-March, 23s. 6d., all in 5-cwt. barrels. Powders: Spray, F.C., 26 per cent., 2 × 56 lb. tins, crated, prompt, 94s.; M.S. (1-cwt. cases), prompt, 41s.; roller process, F.C., 26 per cent., prompt, 78s.; M.S. ditto, 31s., all net, duty paid, ex-wharf, London. On the grocery side, F.C. S., 21s.; M.S.S., 10s. basis per case, usual packing. Cream in steady demand, and Danish in glass containers are attracting attention. Evaporated, unsweetened, 48 × 16 oz., 18s. 6d.; 96 × 6 oz., 19s. 6d.; sweetened condensed, 48 × 14 oz., 20s. per case.

HONEY.—Market firm for best qualities. Palish set Jamaica 54s.; amber set, 48s.; and manufacturing kinds, 42s. 6d. Haitian yellow palish set, 50s.; New Zealand, dark amber, 50s. to 55s.; medium, 55s. to 65s.; light, 65s. to 85s.; whites and water whites 65s. to 87s. 6d. cwt.

RUBBER.

Market firmer on better consumptive figures in America. Plantation standard sheet spot, also February, sold 11½d., March 11¾d., April-June 11⅞d. to 11¼d., July-September 11⅝d. to 11⅜d., October-December 11⅞d. to 1s., January-March (1929) 1s. 0⅛d., January-December (1930) 1s. 0⅜d. to 1s. 0½d. per lb. London stocks 24 tons higher on the week at 25,413 compared with 64,945 at corresponding period last year. Landings amounted to 1,692 tons and deliveries 1,668. Liverpool stocks 246 tons higher at 4,106, landings being 443 and deliveries 197.

THE MONEY MARKET.

This week money has been relatively easy with 4½ per cent. the ruling rate for short loans on Thursday. This lessening of the pressure came as a relief to the market, which had money due for repayment at the Bank, and it was believed that the Bank itself was taking steps to ease the position. Confirmation of this is found in this week's Bank return, which reveals in addition to the increase of

£1,609,424 in Discounts and Advances—representing the previous Thursday's borrowings at the Bank—an expansion of £2,001,246 in Other Securities, this last suggesting that the Bank has been buying commercial bills in the open market. Finally, and most welcome of all, the Bank on Tuesday managed to secure the bulk of the South African gold available, amounting to £696,553, even though it had to pay 84s. 10¾d. per oz., or 1¾d. above its minimum price. This, coupled with a return of an additional £878,942 of notes from circulation, has meant an increase of £1,575,505 in the Banking Department's reserve.

* * *

Maturities of Treasury Bills in the hands of the Bank helped to reduce the item Government Securities by £1,549,271, while Treasury bill repayments and other factors reduced Public Deposits by £4,559,461. The net result of all the above changes was an increase of £7,494,885 in Banker's Deposits, and this goes some way to explain this week's monetary ease. At the same time it must be emphasised that by Thursday market rate on three months' bills had dropped to $5\frac{3}{16}$-¼ per cent., or a full ¼ per cent. below Bank rate. As the New York exchange remains at about $4.85\frac{1}{4}$, or little above the lower gold point, it is not impossible that money may be stiffened up next week.

* * *

The American situation continues to be the main centre of interest. The absence of any substantial improvement in sterling is explained partly by a commercial demand for dollars and partly by the fact that immediately after the rise in Bank rate operators over-sold dollars and have since been engaged in repurchasing. Though little definite news is forthcoming, there are signs that American banks are placing difficulties in the way of further European money obtaining employment in New York, and it is even suggested that some banks are refusing to renew time deposits on foreign account. Such statements of course must be received with reserve, but it would seem that recent developments are succeeding in their object of checking the flow of money towards New York, though so far the flow has not been reversed.

	Feb. 21, 1929.	Feb. 14, 1929.	Feb. 7. 1929.	Jan. 31, 1929.	Previous Rate and Date Changed
	%	%	%	%	%
Bank Rate	5	5	5	4½	4½ (Feb. 7,'29)
Banks' Deposit Rate	3½	3½	3½	2½	2½ (Feb. 7,'29)
Discount { Call	3½	3½	3½	2½	2½ (Feb. 7,'29)
Houses { Notice	3¾	3¾	3¾	2¾	2¾ (Feb. 7,'29)
Market rate (3 months' bills)	$5\frac{7}{16}$-½	5½	$5\frac{1}{8}$-$\frac{3}{16}$	4⅛	...

The monthly statement of weekly balances of the nine English members of the London Clearing House for January reveals several interesting changes. Deposits are slightly higher than in December, while there is a further marked increase in acceptances:—

	Sept., 1928.	Oct., 1928.	Nov., 1928.	Dec., 1928.	Jan., 1929.
Capital and reserves	130·8	130·8	130·8	130·8	130·8
Acceptances	177·8	182·2	200·5	217·3	232·4
Deposits (incl. undiv. profits)	1,732·2	1,752·9	1,751·8	1,806·3	1,809·6
Total liabilities	2,040·8	2,065·9	2,083·1	2,154·4	2,172·8
Coin, notes, balance at bank, and cheques in course of collection	244·6	251·9	250·4	268·9	255·1
Money at call	140·7	142·7	141·8	159·9	145·[illegible]
Investments	268·3	267·4	265·4	[illegible]	274·[illegible]
Discounts	244·1	248·1	248·4	258·7	279·2
Loans and advances	929·8	937·9	940·8	944·5	956·1
Cover for Accept., premises, &c.	213·3	217·9	236·3	253·4	268·0
Total assets	2,040·8	2,[illegible]	2,083·1	2,154·5	2,172·8

On the assets side of the account there is a tendency for the banks to change over from the more liquid items of cash and call-money to those, such as discounts, investments and advances, which are of a less liquid character.

NEW YORK MARKETS.

Our New York correspondent cables:—The reserve statement shows a cessation of sales of Government securities but a continuance of the drop in bill holdings, which [illegible] on the same level as a year ago. The decrease has substantially reduced borrow[illegible] system ratio from 69·8 to 70·8. The Reserve Board will scarcely allow the bull market to hit up its old stride from this level without taking action by raising the discount rate, but there is strong opposition within and without the Reserve Board in favour of no change, lest business suffer from high money rates and the lack of confidence which a bad fall in stocks would engender. Industrial progress continues. Steel prices are firmer; railroad traffic is rising. But there is expectation that the peak activity for the year may come earlier than usual.

THE STOCK MARKETS.

After a hesitant opening, the stock markets became steadier in tone, though business was of more limited dimensions than of late. Gilt-edged stocks were firmer, but Home Rails lacked animation. Interest in the industrial markets chiefly centred on electricity and gas stocks. Rubber shares were in increased demand on the rise in the commodity to over 1s. a pound, but tea shares were easier, and oils irregular. Rhodesians were again prominent in the mining markets, but dealings in Kaffirs remained of relatively small dimensions.

THE COMMODITY MARKETS.

Reports from the principal markets this week are encouraging in a very quiet way. The weather has been favourable to the coal trade and prices are firm, though shippings from South Wales were temporarily hampered by the freezing of dock appliances. The slight improvement in pig iron continues and steel works in most districts are well supplied with orders. Manchester reports a slight recovery in foreign demand and a continuance of the recent improvement in the home market. Bradford is still waiting for wool prices to reach a workable level. The timber market is in a healthy condition. Hides and leather show a very slight improvement. Oilcakes and vegetable oils are a little firmer but seeds are quiet. Wheat has risen slightly.

FOREIGN EXCHANGES.

Sterling on New York was comparatively steady during the past week between $4.85\frac{3}{16}$ and $4.85\frac{7}{16}$, with $4.85\frac{11}{32}$ quoted at the close. Forwards were $\frac{5}{32}$ and $\frac{15}{32}$ cents discount for the one and three months' periods. A noteworthy movement took place in the Canadian exchange, which was strongly offered for both spot and forward dates. Dealings at 4.88 were recorded on Tuesday last, but a reaction to $4.87\frac{1}{8}$ occurred at the close. Such a movement must be attributed to special causes which augmented the normal heavy seasonal demands for sterling. Paris remained at 124.28, with 11 and 21 centimes premium quoted for the one and three months' forward dates. Brussels depreciated to $34.95\frac{1}{4}$, the reflection of the higher London money rates having been somewhat delayed in this case. Italy improved to 92.60, as against 92.80 a week ago, as did Holland to $12.11\frac{1}{2}$, compared with $12.11\frac{3}{4}$, and Switzerland to $25.23\frac{1}{4}$, against $25,23\frac{3}{4}$. Madrid fluctuated in erratic fashion according to the varying political news, and, after being offered up to 32.00, improved to 31.30 at the close. Forwards were 6 and 16 centavos premium. The Scandinavian exchanges continued to move in favour of sterling, while Berlin, after touching $20.46\frac{1}{4}$, improved to $20.44\frac{1}{2}$, as a result of the higher discount rates now prevailing in that centre. Among the South American and Eastern exchanges Buenos Aires depreciated to $47\frac{5}{16}$, against $47\frac{13}{32}$ a week ago, as also did Japan at Is. $10\frac{9}{32}$d., against 1s. $10\frac{15}{32}$d. Silver was irregular but closed $\frac{1}{16}$d. better on balance at $25\frac{13}{16}$ for both spot and forward. Hong Kong was 2s. and Shanghai 2s. 6¾d.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following companies: Underground Railways Group, Clerical Medical and General Life Assurance Society, Provident Mutual Life Assurance Association, Scottish Life Assurance, Anglo-Ceylon and General Estates, Atlas Light and Power, Borax Consolidated, South Suburban Gas, Imperial Tobacco (of Great Britain and Ireland), and Home and Colonial Stores. The important announcement as to dividend policy made [illegible] Imperial Tobacco [illegible]

LEGISLATURE AND EXECUTIVE.

Recent events in Parliament have brought into unusual prominence the question of the relations between the Executive and the Legislature. The events themselves have been trivial. There has been a mild and, on the whole, ineffective protest against according to the Minister of Health an over-riding authority to bring the Local Government Bill into operation and to make its application practical; and there has been a sustained and wholly effective protest against the scale of payments to the Irish Loyalists proposed by the Executive of the day. Nevertheless the importance given to them is entirely proper, because it is undoubtedly time that the nation should reflect how far the development of modern Society and the enormous extension of the activities of the State should affect the British theory of Parliamentary government. The basic principle of that theory is the absolute sovereignty of Parliament itself. But absolute sovereignty is at once the easiest attribute to confer and the most difficult to enforce, especially when, as in the present case, it rests upon no documentary sanction. Far from complaining of the fact that the British Constitution is unwritten, we regard the fact as its saving virtue. It attains thereby an elasticity, which enables a veil to be drawn over the failures of the House of Commons and a line to be drawn under its successes. By one of those paradoxes which disgust the logician and delight the cynic, the more safeguards men devise for a constitution the less stability they confer upon it; and the epidemic of dictatorships, which to-day, in a form more or less unconcealed, has permeated the Latin and Slav countries of Europe, is a warning that rigidity in democracy is the prelude to collapse. The case of the United States of America is no proof to the contrary, because the constitution of that country has never yet been subjected to any severe strain either by the open opponents of democracy or from a mere pressure of work. But any system whose principles are graven "not on tablets of stone but on the hearts of men" is exposed to encroachments, often unintentional in their authors, from many sides. By one form of attack the Executive and the Legislature, so far from holding opposite positions, are equally menaced. It is of the very essence of Parliamentary Government that no body outside Parliament should resist the decisions of Parliament, until Parliament itself asks for the verdict of the country, otherwise than through the Courts of Law. This means that should any statute be alleged to infringe the rights of the subject, the remedy of the persons affected lies in a suit against the Crown, and the sole duty of Parliament is to secure him the right to bring such an action if he wishes. It should be said, in passing, that this right is not yet effectually secured, and even where it is, it may be overridden by that more dangerous form of legislation—an Act of Amnesty. But this does not alter the fact that any attempt by an outside body to dictate to Parliament is directly unconstitutional, and it was this feature of the object and conduct of the General Strike which, more than anything else, brought about the collapse of that movement. Resistance to a movement of this kind is practically the same as resistance to dictation by a Sovereign, and the one principle upon which history has given the British people a right to insist is that, if they are to be misgoverned, they shall be misgoverned by Parliament and no one else.

Hence the public delight when, within Parliament itself, members justify this confidence by showing that they are the representatives of the nation and not merely delegates of particular interests. It is quite clear that when an interest recognises the supreme authority of Parliament, its first instinct is to secure special representation, amounting, if possible, to control, in Parliament itself. The symptoms of this instinct did not disappear with the passing of the epoch of George III. They exist to-day; no party is free from them; and they [illegible] carefully watched.

[illegible] whole seem to us at least equally as important question, known as the struggle between the Executive and the Legislature, of the method whereby Parliament should arrive at its decisions and enforce its will. It must nevertheless be part of the doctrine of the Sovereignty of Parliament that the Executive alone should not be able to dictate either to the Legislature or to the subject. No such power has ever been claimed in theory nor—although the fact is often disguised—is it really exercised in practice. The reluctance of a party majority to put Ministers in a minority and condemn themselves to seek re-election has led to the belief that the House of Commons is elected merely to elect an Executive. This is not so. The Committee stage of measures rarely witnesses important amendments other than those moved by Ministers, not because the Executive is omnipotent but because it is wise. Amendments are not the fruit of the unprompted sagacity of Ministers, but of consultation with their supporters, and often with their opponents outside the Chamber. It is only when this consultation is imperfect, as in the case of the compensation to Irish Loyalists, that the influence of the Legislature is apparent—but it is always exercised; and anyone who has worked in a Government Department will confirm the statement that the phrase "Parliament will not have it" is a final and often the only argument whereby a Minister persuades his permanent officials. The control of the Legislature over finance is, perhaps, rather less effective. The Estimates Committee and the Public Accounts Committee can, in the nature of things, only conduct post mortems, and the preparation and introduction of financial proposals must remain the sole responsibility of the Executive. Yet even here Ministers must respond to pressure, and only last year the dropping of the kerosene duty was a case in point. The fact is that both the Executive and the Legislature have an equal urge towards compromise, and if the one is apprehensive of dissolution the other is apprehensive of humiliation.

There remains only the point raised by the tendency to insert in statutes a power to make Departmental Orders having the force of statutes. The complexity, the novelty, and the extensiveness of modern legislation undoubtedly render some administrative elasticity essential. If the Legislature attempted to control its every detail it would be choked by the pressure of work into complete impotence. The trouble has arisen because legislation deals no longer with the broad system under which we live, but with the details of their lives. The device whereby administrative orders are laid upon the table of the House of Commons is, for the most part, dilatory without being effective. Such orders are rarely noticed at all, and, if they are, the moving of a prayer for their cancellation is a cumbersome process. It is both easier and better to challenge administrative action upon the estimates, and there have been cases, even in the present Parliament, where such a method has been effective. The House of Commons is therefore quite right to insist that the actual statute should cover all forseeable categories of administrative action, so that they are susceptible to the ordinary forms of challenge. The delegation of a pragmatic power to Departments will, no doubt, in certain cases be necessary, although it is worth noting that in the case of the most important precedent—the National Health Insurance Act—it has not been necessary to use it. The best check upon its abuse appears to us, as already indicated above, to be an indisputable right of appeal to the Courts, with some suitable provision as to the costs of the parties to the action. Another desirable suggestion, contained in a recent letter to the "Times," is that an *ad hoc* Select Committee of the House of Commons should be appointed to which such orders should automatically be sent for examination and report. Such a procedure would mean more work and more delay, but it would be justifiable. For although we have endeavoured to point out that the authority of the Legislature is, to a remarkable degree, unshaken by the enlargement of its activities and the multiplication of its problems, we are equally convinced that [illegible]

THE POSITION OF THE INDIAN PRINCES.

At this time, when the political future of the Indian Empire is under consideration in all its aspects, and when the Legislative Assembly at Delhi has just abandoned its boycott of the Simon Commission, it is patently impossible that the scope of the inquiry should be limited to those portions of India which, owing to the chances and changes of war and diplomacy a century ago, happen to be "British territory" now. Those same chances and changes put on the map of the Indian Empire, side by side with (or, rather, in and out of) British India, some score of States in treaty relations with the British Crown; and these States to-day cover more than a third of the territory of India and contain more than a fifth of its population.

Between these States and British India political divorce is inconceivable. It could only be accomplished by reducing India to the chaos out of which the Indian Empire was formed by the Moguls in the sixteenth century after Christ and was re-formed by the British in the nineteenth century; and the chaos would be far more disastrous to-day than it was even under those disastrous conditions of anarchy, in which India found herself a hundred and fifty and three hundred and fifty years ago, before Akbar's British successors, and before Akbar himself, had done their work. For to-day the Indian Empire is a country knit together internally by all the modern means of communication, a country whose parts are economically interdependent, and which, thanks to this interdependence of its parts, is able to play a great *rôle* in the economic life of the world at large as a single unit.

This interdependence of British India and the States, which is the essence of the problem, leaps to the eye at the first glance at the map. It is true that there are some regions of India in which British territory predominates, and others in which State territories predominate, but there are no clean cuts anywhere; and no sections of India which are large enough and compact enough to aspire to complete self-sufficiency consist exclusively of one or other kind of territory. It is true, again that some of the Indian States are larger, more populous and more progressive than some countries in other parts of the world which enjoy sovereign independence. Such are Hyderabad and the principalities of Rajputana (assuming that the Rajput Princes were to form a local confederation). These larger States, however, lack one important element of self-sufficiency. They are landlocked, with strips of British Indian territory intervening between them and the Indian seaboard. The comparatively few States which possess coastlines, such as Kathiawar or Travancore, are of much smaller size; but even Kathiawar and Travancore are large and compact entities compared with the majority of the States, which are mere enclaves in the territory of British India or of other States. The majority of the Indian States could no more stand by themselves in Asia than Andalusia or Brunswick or the other tiny German States that form the enclaves in Prussia could stand by themselves in Europe. It must not be forgotten, however, that the dependence is reciprocal; for if the States cannot live without British India, it is equally true that British India cannot live without the States. Lift British India out of the framework of the Indian Empire as constituted and British India and the States in unison, and it becomes a vast irregular honeycomb, with many of its main lines of internal communication cut by foreign territory, and with foreign bodies, great and small, so permeating its structure as to make it almost incapable of holding together.

Thus British India and the States are mutually indispensable; and fortunately, owing to their geographical interlacement, they have many things in common to hold them together. Indeed, they have in common all the major elements which give the Indian Empire as a whole its distinctive individuality. If one analyses the economy of India into its constituent regions and races and languages and religions, one finds that [illegible] Dravidian, [illegible] represented in British India and in the States alike. British India and the States are both woven out of the warp and woof of which India herself is made.

This is only another way of saying that the boundaries between British India and the States are arbitrary—so arbitrary that they could never have outlasted (as they have done by a century or more) the historical accidents which originally drew them where they now run, if those accidents had not been incidental to a historical process which was building both British India and the States, as fast as it was creating each of them, into the common framework of a single empire. For if we go back to the origins, we can find parallels in British India to the genesis of almost every Indian State on the map. Hyderabad, the premier State in the Indian Empire under the British Raj, had the same status under the Mogul State as Bengal, which is now the premier province of British India. The State of Kashmir and the British province of the Punjab are both fragments of the Sikh "successor-States" of the Mogul Raj; the States of Gwalior and Indore and the British Central Provinces are all fragments of the Maratha "successor-States" of the Mogul Raj. The Rajput principalities are in substantially the same relation to the British Raj to-day as that in which they stood to the Mogul Raj in the seventeenth century. It was historical accident that differentiated the status of those other territories, though always within the larger unity of the Indian Empire, when the British rebuilt the Mogul building out of the old material but on firmer foundations and on a better plan.

Now the Indian Empire, as rebuilt by the British seems likely to endure as a political structure long after the British builders have handed over the responsibility for the upkeep to the Indian inmates of the house; and this prospect of long life which the Indian Empire happily has before it bears directly upon our problem; for it is evident that, the longer the Indian Empire lasts, the more closely will British India and the States become assimilated to one another. Look at an historical analogy of the Roman Empire. In the age of Augustus it presents as variegated a picture as the map of the Indian Empire to-day, with the Roman provinces interwoven with Oriental client principalities, Greek free cities and Gallic self-governing cantons—some of them enjoying their autonomy in virtue of treaties with Rome and others at the Roman Government's pleasure. That might be the picture of the Indian Empire now; but open a Roman atlas two centuries later and you will find that the variety has been levelled down to uniformity and to a single status and a single form of administration has come to prevail through all the territories contained within the Imperial frontiers. Or observe the evolution of the modern German Reich since its foundation in 18[illegible]. During this short period of little more than half a century the tendency towards centralisation and uniformity has grown and is growing with a steady acceleration. With every year that is added to the life of the Reich as a whole, the distinction between Prussia and the other Prussian States within the framework of the Reich grows fainter. This tendency towards internal uniformity is evidently inherent in all territorially compact empires which are solidly built on firm foundations; and we imagine that in the Indian Empire to-day this is realised by all statesmen of ability and vision, whether they happen to be autonomous princes or British Indian politicians.

The practical problem is: In what fashion is this natural and perhaps inevitable process of internal assimilation to work itself out? Is it to happen through revolution and violence or through evolution and mutual consent? The choice between the alternative methods is vital; for though both might produce the same ultimate picture on the map, they would produce utterly different effects upon the political development of the Indian people.

This practical problem is raised by the fact that [illegible] to-day democracy is in the ascendant. If autocracy [illegible] in the ascendant there, no practical problem [illegible]

[illegible] the little autocrats, his client princes, would take it as the most natural thing in the world, as they did when the Cæsars of Rome ate up their client princes of Mauritania and Cappadocia and Judea. For subject peoples, a big autocrat is apt to be an improvement upon a small one; and no problem arises over the change because no question of political principle is involved. It is quite otherwise when, as in India to-day, democracy is in the ascendant and autocracy on the wane, and when the movement towards democracy, while discernible in the States as well as in British India, has not moved at an even pace in both parts of the Indian Empire. If the political life of India were stationary or retrograde, the internal assimilation might go forward automatically without any political decisions having to be taken. Culturally, as we have noted, the States and British India have been created out of the same fundamentally Indian elements; economically, the modern means of communication and production and exchange are drawing them ever closer together. It is the movement towards self-government that is now altering the original conditions under which some territories in India were annexed by the British Crown and others brought into treaty-relations with the British Crown in the past. The pre-supposition of all these arrangements was that the sovereign Power in British India was identical with the Power which was the other party to the treaties with the Indian Princes; and so long as the ultimate sovereignty of British India remains vested in the Government of the United Kingdom, that pre-supposition holds good. If, however, British India acquires Dominion status, the sovereign in British India will then be, not His Majesty's Government at Westminster, responsible to the Parliament of the United Kingdom, but His Majesty's Government at Delhi, responsible to the British Indian legislature. The question will then arise: In these new circumstances, will the Crown, as party to the treaties with the Princes, have to act on the advice of the Government at Delhi or on that of the Government at Westminster? In the former alternative, the Princes lose the security of their direct relations with the Government of the United Kingdom; in the latter alternative, the existence at Delhi becomes the ultimate political authority for one part of the Indian Empire, while the Government at Westminster remains the ultimate political authority for the other. Thus, if British India attains Dominion government in the form of Dominion status, the constitutional problem presented by the treaties between the Crown and the Princes will be difficult; and, *à fortiori*, it is obvious that, if British India became a sovereign independent state, the problem would be almost insoluble. For then the Princes would remain in treaty relations with the United Kingdom and would find themselves in no political relation at all with the rest of India.

This explains the very important resolution which, on Wednesday, February 13th, was moved in the Chamber of Princes at Delhi by the Maharajah of Patiala the Chancellor, was seconded by the Maharajah of Kashmir, and was voted unanimously:—

"While adhering to their policy of non-interference in the affairs of British India and repeating their assurance of sympathy with its continued political progress, the Princes and chiefs composing this Chamber, in view of recent pronouncements of a section of British Indian politicians indicative of a movement towards complete independence, desire to place on record that, in the light of their mutual obligations arising from their treaties and engagements with the British Crown, they cannot assent to any proposals having for their object the adjustment of equitable relations between the Indian States and British India unless such proposals proceed upon the initial basis of the British connexion."

The "equitable relations" which we envisage are that the larger Indian States should evolve internally into democratic constitutional monarchies and, as such, should eventually enter into a federation with the present provinces of British India as States members of an all-India Commonwealth enjoying democratic self-government both as a whole and in its several parts. If this is the right solution, it is obvious that the key to it is to be found in maintaining the connexion between British India and the British Crown, since the Crown [illegible] States. [illegible] the Indian Empire might possibly be [illegible] trous results for the Indian people; but it is hardly conceivable that they could come closer together, as they must do in the end if the ideal of an All-India Commonwealth is to be realised by mutual agreement.

A PROTECTIONIST MARE'S NEST.

We had occasion a month ago to draw attention to a new line of thought along which the minds of certain Protectionists were moving—namely, that since capital has become internationally mobile while labour retains its comparative immobility, and since certain of the old classic economists included in their Free Trade arguments the circumstance that capital was unwilling (in those days) to migrate, therefore the bottom has dropped out of the case for Free Trade. We had hoped that this idea, which has apparently taken a century to mature in the Protectionist mind, had been nipped in the bud. But the correspondence columns to-day show that the argument is still claiming attention among thinkers in the fiscal camps, and a further sign of its survival is to be found in a letter which Mr. Carlyon Bellairs addressed to the "Times" last week. In that letter he revived two "favourite contentions of the Free Importers which have been dropped. The first is:—

> Free imports enabled our capital to be most remuneratively employed within our country. That contention has long ago been discarded in face of the fact that it is more or less remunerative spent abroad and interest comes back to us in imports that help to employ British labour.

In a way this new little controversy is refreshing. As a rule our complaint is that the Protectionist is unwilling to look at particular industries one by one in water-tight compartments, and then argues from the particular to the general. But in the new argument regarding the mobility of capital we find the process reversed and the Protectionist arguing from the general to the particular. Mobility of capital means that British subjects go abroad to employ foreign labour, Protection will help to concentrate this capital at home employing British labour—so runs the argument; and the fallacy unless we misjudge the intentions of the gentlemen who use these arguments, Mr. Baldwin must have supported his attempts to extend the existing Protection to certain industries piecemeal. Or do we mistake them? Are they, on the other hand, out for a full measure of general Protection such as Mr. Baldwin disavows?

We cannot be sure of the answer to these questions. Nor does it greatly matter. What matters at the moment is that at a General Election, which is rapidly approaching, the British people are to be asked by the Government to sanction the erection of machinery for the piecemeal and unlimited extension of Protection to industries not protected at present; and into the argument on the Protectionist side has been imported this idea that the mobility of capital demolishes the case of those who oppose this extension. We have been at pains to discuss the basic points on which protagonists of this idea rested, and even now we can only distinguish two amid the welter of irrelevancies served up by Mr. Graham and his friends. The first is that because the early economists adduced the immobility of capital among their arguments for Free Trade, therefore, since capital is not wholly immobile, the Free Trade case is dead; and, secondly, that capital invested abroad does not employ British labour. The first contention is too patently ridiculous to require serious refutation. Has the bottom fallen out of the Christian doctrine because circumstances of life have changed since the days when the Gospels were written? Have Conservatism or Liberalism no longer any meaning because arguments used by Disraeli and Gladstone are no longer applicable? Does the earth cease to revolve round the sun because of Einstein's theories? The second contention requires, on the other hand, the most [illegible]

(2,500 millions), net shipping freights (666·66), St. Peter's penny, viz., gifts to the Holy See and miscellaneous, 400 millions, (and some doubts are reasonable about freights, owing to the merchant marine world crisis), it seems that an estimate between 3,500 and 5,000 million lire may be reached on the credit side of the balance. There remains a gap of from 3,500 to 5,000 to be filled. As Italian loans issued in foreign countries in 1928 were negligible the gap must have been filled by several sources: sales of Italian joint-stock companies' shares, short credits obtained by Italian banks and firms, sales of bills and assets held by Italian firms in foreign countries and sales of bills and assets by the Bank of Italy. Only this last item can be ascertained exactly: the total gold and gold assets of the Bank of Italy decreased by 1,035·1 million lire, from 12,105.9 at January 10, 1928, to 11,070.8 at December 31, 1928.

As to the causes of the exceptional state of the balance of payments, Professor Mortara, in a thoughtful essay in the *Giornale degli Economisti*, is of opinion that an exceptional increase in imports, not a decrease of exports, is the main cause of it; that the imports increased mainly owing to bad agricultural yields and to replacement of industrial stocks which fell excessively during the 1927 revaluation crisis; that the growing imports of raw materials are an index of increasing industrial activity. His forecast is that in 1929 food imports will again be heavy, that raw material imports will increase further, and that the improvement in industrial activity may lead to increased exports of manufactures. Italy appears to be passing through a temporary crisis of adjustment, when imports are increasing toward capital equipment of a growing industrial and agricultural activity, but the consequent flow of export goods is as yet not abundant enough. An analogous process went on in Germany in the past two years; and it will perhaps prove in the end to have been for the good of both nations. The technical difference between Germany and Italy is probably that Germany relies on long-term indebtedness, whereas Italy, more optimistically, is content with short credits. Perhaps there are abroad hidden resources, the property of Italian firms and individuals, accumulated in war and post-war years, on which Italy can draw. If and in so far as this is so, the indebtedness is only apparent and amounts to nothing more than the repatriation of national assets, temporarily located in foreign countries. The speech of Signor Stringher at the general meeting of the Bank of Italy, due at the end of February, is this year awaited with unusual interest, as it is widely hoped that it will throw light on this problem of international payments, which is at the moment the most momentous problem with which Italy is confronted.

SMALL SAVINGS.

THE new schemes evolved by the National Savings Committee for the encouragement of thrift among industrial workers have drawn fresh attention to the valuable work being performed throughout the country by Savings Associations. An essential feature of both schemes, reference to which was made in the *Economist's* issue of December 22, 1928, is that the existence of a voluntary Savings Association, managed by a joint committee of employers and employed, is presupposed. Under "Scheme 9"—the first of the two new plans—the employee undertakes to save an agreed amount weekly towards the acquisition, through a Savings Association, of an agreed total number of Certificates. The employer, who can cover his risk under an insurance policy at a very moderate cost, undertakes to make up the employee's savings to the pre-arranged total should he die before accumulating that sum through his own efforts. Under "Scheme 10," the employer is simply invited to agree to add a Certificate, by way of *ex gratia* bonus, when the employee has subscribed through the Savings Association for a pre-arranged number of Certificates. As testimony to the vitality of the Savings Association movement, on which these new plans for industrial thrift have been grafted, it may be mentioned that at the end of last year in England and Wales there were over 27,000 Associations at work, including 16,000 in the elementary schools. Up to December 29, 1928, over 590 million certificates had been purchased, representing a cash value of some £698 millions. Deducting realisations, the amount of principal remaining invested at that date was about £362 millions, a figure which is brought up to approximately £485·5 millions by the interest accrued. In addition, Saving Certificates to the value of £10·5 millions had been converted into the 4½ per cent. Conversion Loan or National Savings Bonds.

These are impressive figures; and though the bulk of the net investment (subscriptions less realisations) in Savings Certificates took place between 1916 and 1922, it is satisfactory that after eight years of persistent depression in many fields of industry there should still be this solid monument to thrift, to which—if we may accept as still valid the estimate made in 1923 by the Montagu Committee—"at least half" has been contributed by the efforts of the "small saver." When we proceed, however, to look beyond this one medium of investment, and to explore the general question of the recent rate of "small saving" in this country, we are faced at once with difficulties as great as those involved in attempts to estimate the aggregate value of the accumulated total. But, though no precise conclusions can be reached, it may be of interest to examine the nature of the available evidence.

As an indication of the rate of saving, there is first the return published annually by the Post Office Savings Banks. For the five years 1923-27, withdrawals exceeded receipts by £17 millions, while the amount of Government securities standing to holders' credit fell by £18 millions, a total loss of £35 millions (excluding interest accrued on deposits), against a gain of £12 millions in the five years 1909–13. Turning to the Trustee Savings Banks, we find in the same post-war quinquennium a decrease on balance of £11·9 millions in deposits (before crediting interest accrued), offset in part by an increase of £5·7 millions in the amount of Government stock held for depositors. On the debit side of the account we may also place a fall of about one million pounds in the deposits of the Yorkshire Penny Bank. On the credit side there is an increase (apart from interest credited) of £1·3 millions between 1922 and 1926 in the deposits of the Railway Savings Banks, and a surplus of over £14 millions recorded by cash purchases, less sales, of National Savings Certificates, of which £7 millions may be regarded as "small savings."

So far, taking the obvious avenues for the investment of savings by individuals of small means, and making due allowance for discrepancies between the dates of the various published returns, we find no evidence at all of "new" savings having been effected on balance during these five years. Instead, an average decline of some £8 millions a year is disclosed,—a decline converted, it is true, into a substantial rise by the crediting of accrued interest, which may be regarded perhaps for our purpose as "savings once removed." There are, however, other media for thrift commonly utilised by those of small means. At this point we enter a field of saving in which it seems necessary to make certain rough and ready distinctions. We must differentiate between "purposive" saving for eventual consumption, "purposive" saving whose accumulation becomes "capital," and what may be termed "corporative" saving, as opposed to saving by individuals. Under the first head we may group the bulk of the increase in the total funds of Societies registered under the Friendly Societies Act, an increase which amounted to £17 millions between 1922 and 1927. The greater part of subscriptions to these funds represents spending "deferred" in order to ensure the provision of medical attention, burial expenses, and similar benefits in case of need. To a lesser extent, but in the same manner, the premium income of Industrial Assurance and Collecting Societies (£222 millions between 1922 and 1927) represents in the main abstention from immediate spending in order that dependents may have subsequently the power to "consume." Under "purposive" saving for "capital" purposes we may class the increase in the share capital and deposits of building societies, which amounted in the five years 1923-27 to the remarkably large total of £110 millions—a striking reflection of the

housing shortage. Finally, in the category of "corporative" saving, we may place the increase in the accumulated funds of Trade Unions and of Industrial and Provident Societies (the bulk belonging to the Distributive Trading Societies)—an increase amounting between 1922 and 1926 to roughly £38 millions.

There remain two insoluble questions,—how far "small savers" are investing the fruits of their thrift directly in such securities as Government stocks (other than those held through the Post Office and Trustee Savings Banks), Corporation Stocks, Investment Trusts (two media certainly popular with the "middling" and "petty" bourgeoisie), and in Joint Stock enterprise in general; and, secondly, the extent to which "small savers" still accumulate cash in the sterile form of private "stockings." We are here in the realm of pure conjecture, but the opinion may be hazarded that private "hoarding" is now an almost negligible factor, and that the bulk of the investments in Government, municipal, and joint stock securities held by individuals not liable to income tax represents in the main inheritance rather than "new savings."

Various estimates have been made in recent times of the aggregate capital in the hands of the "small" man, but none can be considered as even approximately precise. If we add together the figures, estimates in part, for 1927–28, of Saving Certificates in "small" hands (£248 millions), deposits and Government stocks in Post Office and Trustee Savings Banks (£591 millions), Yorkshire Penny Savings Bank Deposits (£28 millions), and the aggregate funds (a total involving some duplication) of all "registered societies,"—including Railway Savings Banks, industrial assurance companies, building societies, and co-operative societies,—some £750 millions, we arrive at a figure of £1,617 millions, to which must be added an unascertainable amount of joint stock and Government security holdings, and a proportion of life and annuity funds in companies other than industrial assurance companies. On the whole, it appears not unreasonable to conclude from this survey of the available data that the total wealth belonging to the "small saving" class lies between the limits of £1,700 and £2,000 millions, or, say, between 10 and 12 per cent. of the estimated aggregate national wealth; that this sum includes a substantial proportion of (*a*) "purposive" savings, by way of insurance, destined to be spent by the savers or their dependents before death, and (*b*) "corporative" savings, *e.g.*, in co-operative societies,—over whose direction the individual has no control; and that even when accrued interest is included, the aggregate annual savings (apart from savings for the foregoing purposes and for the building of houses) of all those whose incomes are below the income tax exemption limit are a relatively unimportant factor in the national economy when compared with the total annual savings of the country, estimated by the Colwyn Committee to amount to £450–500 millions a year, and to be barely adequate, at that level, for the maintenance of national well-being.

In brief, the value of thrift on the part of those whose means are not greatly in excess of the level which affords a tolerable standard of life, from the individual point of view, is predominantly moral rather than economic. To regulate expenditure so as to attain what Mr. Micawber considered to be the basis of contentment, and to order the appetites, so that at the year's end a surplus, however small, of earnings over spendings may be available for investment, is a policy which represents at least the half-way house to good citizenship. At the same time, while appreciating to the full the estimable work performed by the National Savings Committee and all other bodies concerned with the encouragement of "popular" thrift, let us face the fact, unpalatable though it be to proponents of the equalisation of incomes, that it is to the surplus over expenditure of the larger and not readily "consumable" incomes that we have to look for the savings necessary for the maintenance of our industrial economic structure.

Notes of the Week.

Local Government Bill, Third Reading.—A third reading debate on a measure of this sort, which has had a full-dress second reading, and has then been discussed clause by clause in Committee of the whole House, and again on Report, tends to be rather tedious. New arguments rarely make an appearance, and no speaker really hopes that his views will be incorporated in the Bill before it becomes law. Mr. Chamberlain, in a very able and lucid speech, sought to prove that the amendments made in Committee had greatly improved the Bill without altering its principles. But can he have had his tongue in his cheek when he said of one of his amendments: "It is a concession which has given very great satisfaction throughout the country. . . . It is a slight further postponement of that time when the Bill will come completely into operation"? He estimates the cost of the new financial concessions at about £700,000 a year, excluding the enlargement of Road Fund grants. The various qualifications, however, so hedge about the distributive provisions of the Bill that little evidence of their operation can appear for some years. Opposition criticism was chiefly concentrated on this part of the Bill. Mr. Pethick-Lawrence in particular sought to show how meaningless the guarantee of a shilling per head gain may be if the obligations and undertakings of local authorities are increased, and have to be borne by greatly reduced total rateable values. Mr. Greenwood and Mr. Ernest Brown (both of whom have heightened their parliamentary reputations in the debates on the Bill) exhibited once more the failure of the "formula" substantially to improve the present distribution of grants, and several opposition speakers complained that rating relief was badly distributed or insufficient. There seems to be a lamentable lack of knowledge in all parts of the House, including the Government front benches, as to whether the relief is meant to stay with the recipients or to increase their competitive ability by causing them to reduce their prices. The Government have certainly preserved the main structure of their Bill, but they have not altogether convinced some of their supporters that health services are not being harmed or that the wide powers given to the Minister are absolutely necessary. From an electoral point of view, the Liberal and Labour parties have no cause to fear the presentation to the electorate of a measure whose good provisions—and they are not few—are far less obvious and more difficult to explain than its errors and omissions.

Irish Loyalists and the Government.—It is not often that the modern back-bench supporter of the Government is aroused sufficiently to give his leaders a bad time, but experience even in the present Parliament has shown that Ministers can impose too great a strain upon the docility of their followers. The cause of Tuesday's trouble was a very simple one, which should easily have been foreseen by the Government. The Minister for the Dominions asked the House for a supplementary vote, to cover the cost of paying compensation to Irish "Loyalists" for damage inflicted upon them during the troubles attending the birth of the Free State. Mr. Amery, in introducing the vote, reviewed briefly the reasons for which it was required, but made it clear that even with the additional sum at their disposal the Government did not intend to meet all claims in full. Then the storm broke from the Conservative back-benches. The Government were informed none too politely that they were attempting to shirk a debt of honour, and that the only ground justifying such an action was virtually that of an empty Exchequer. In reply, Mr. Churchill attempted to defend the Government's action, not indeed by the plea that in point of fact the Exchequer was empty, but by an argument of a kindred nature, namely that of the need for economy. This halting attempt by the Chancellor to argue in favour of economy before a House seized with the spirit of doing justice at all costs was very roughly handled by Lord Hugh Cecil, and it was clear to the Whips that the issue must not be allowed to go to a division. So, in the end, Mr. Baldwin was called in hurriedly to move to report progress, or in other words, to withdraw the vote for

reconsideration by the Government. Several facts emerge from this incident. The first and probably the most important is that despite developments referred to in a leading article in this issue of the *Economist*, the House of Commons has a will of its own which at times it is prepared to exercise even against the Executive. The second and minor fact is that Mr. Amery and Mr. Churchill have between them succeeded in causing their colleagues in the Cabinet a temporary embarrassment at the hands of their own party. While welcoming this ebullition of independence on the part of private members, we condole with the Chancellor on the rude rebuff administered to one of his too rare—and probably justifiable—efforts to tighten the purse strings of the Exchequer.

A Fresh Attempt at Naval Limitation.—In the vitally important matter of securing a limitation of navies and an agreement between the naval Powers regarding the conditions under which navies are to be used, the distinction between strategy and tactics has to be observed. Strategically, all parties ought to be perpetually active, for the future of mankind depends on a solution of this problem, and, on a long and statesmanlike view, we have no time to lose. Tactically, on the other hand, it is obviously wise to pick and choose between times and seasons, and to take the most favourable moments for making overtures or gestures which, if they miscarried once, could not be repeated with the same prospect of success. Thus, the British Ambassador at Washington showed himself a good diplomat in waiting until the 15th of this month, when the Cruiser Bill had passed the Senate at Washington, before expressing the personal opinion that a fresh effort would soon be made on the British side to bring about an agreement between the principal naval Powers. Sir Esmé Howard appears to have expressed this view in answer to inquiries from the American Press regarding certain reports which it had received from Great Britain. Sir Esmé Howard's expression of opinion has since been followed by a statement from the Foreign Office, which uses more precise and cautious language without contradicting what the Ambassador said. On the 6th of this month Sir Austen Chamberlain informed the House of Commons at Westminster that the Government were engaged in examining "all questions concerning our relations with America and the naval conditions of the two countries." We are now informed that when this examination is concluded the first step will be to communicate the results to the Dominions; and this statement implies that a definite plan of action is in contemplation. It may well be that His Majesty's Government will not be in a position to approach the United States Government until after Mr. Hoover has replaced Mr. Coolidge at the White House, and until after a new Government has come into office as a result of the General Election in this country. This is no ground for despondency, for conditions may well be more favourable after these two domestic changes than they are now.

The I.L.P. New Model.—The main item in the report which the National Council of the I.L.P. will present to the party conference at Easter is a striking example of leadership stimulated from the back. At last year's conference at Norwich, the Council's comparatively "gradualist" plans for the attainment of a universal Living Wage were torpedoed by a resolution roundly declaring for "the establishment by law of a living wage for all workers, irrespective of occupation." Thus "gingered" by their followers on the Left, the National Council has evolved a new scheme. It is now proposed that the first act of a Labour Government should be to determine a Living Income standard, which should be applied immediately to all public and semi-public utilities and services. The next step should be to make the Living Income standard the basis for unemployment, Poor Law and pensions allowances. Finally, *pari passu* with the progressive nationalisation of industry, all concerns remaining under private control should be required to raise their wage rates up to the standard within two years, a special Excess Profits Duty being levied in the interim on all firms paying less than the statutory minimum. Whether this accelerated time-table for the transit to Utopia will satisfy the more impetuous standard-bearers of "Socialism in our Time," remains to be seen. It may be safely concluded, however, that the great majority of the electorate is unlikely to be impressed with a plan which begins by saddling those engaged in our productive and exporting industries with an aggravated burden of "sheltered" wage-costs, and a fantastic load of taxation for the benefit of the non-productive, and which ends with a proposal whose effects (given what the I.L.P. defines as a "politically defensible minimum") could only be unemployment on an unthinkable scale.

Marketing British Goods.—At the Mansion House banquet, given to the leading exhibitors and buyers attending the British Industries Fair, the Prince of Wales propounded a cogent question, which he has put on similar occasions in the past: "Is the salesmanship of this country up to the standard of the workmanship of the men?" In undue concentration on "the science of selling," to the neglect of the technique of production, there may, indeed, be dangers; but there is ground for fearing that in a number of industries our manufacturers have not yet given sufficient attention to studying the special needs of foreign markets, or to the important question of securing efficient representation "on the spot." The forthcoming report of the Advisory Committee on Education for Salesmanship, to which the Prince referred in his speech, should provide industrialists with valuable food for thought. The steady growth of the Fair itself, whose two sections at London and Birmingham have attained the dimensions of a great annual exhibition, is an encouraging sign of the vigorous development of many of our "newer" industries, and of the efforts which our older trades are making to adapt themselves to altered conditions and changed requirements. If the possibilities of overseas markets are to be utilised to the full, these efforts must be supplemented by the determination of manufacturers to see that the goods which they produce are such as to suit the home tastes and temperaments of our customers abroad, and that their merits are brought to the notice of potential foreign buyers by salesmen who have studied the requirements and psychology of the markets with which they are concerned. The Prince of Wales is one of the most widely-travelled of British subjects, and he has given frequent proof of his powers of observation. The emphasis which he laid on the need for greater study of "scientific selling" deserves the fullest attention of all those in this country who produce for export.

The Trend of Production.—The Board of Trade have just issued their production index numbers for the last quarter of 1928, and also for the year as a whole. The figures for the last quarter, when compared with those for the third quarter are distinctly encouraging. The general index for all groups has arisen from 100·1 to 107·6, and for manufacturing industries—that is, excluding mines and quarries—from 104·4 to 111·7. Among the subsidiary index numbers, iron and steel has risen from 97·4 to 105·2, non-ferrous metals from 109·9 to 119·8, and textiles from 91·9 to 101·2. The year's figures are naturally less encouraging, as they include the summer set-back as well as the autumn revival. Comparing 1928 with 1927, the index for all groups has fallen from 106·8 to 105·2, and that for manufacturing industries from 109·9 to 109·2. The biggest declines are in mines and quarries, iron and steel, and leather and boots and shoes. Considering the results, as a whole, it is clear that definite progress has been made since 1924, the base year, which in these calculations is equated to 100. At the same time though the present trend of production is in the right direction, the improvement has not been sufficient to carry the 1928 average above the 1927 level. There is ground for hope, however, that if the present trend is maintained, the 1929 average may turn out to be easily the best of the three years.

Cost of Living.—The cost of living at the end of January, showed a fall of 2 points as compared with the end of December. At February 1st the index number of the Ministry of Labour stood at 65 per cent. above the level of July, 1914. This compares with 67 per cent. on January 1st, and 66 per cent. a year ago. For food alone, the percentage at February 1st was 56, as compared with 59 per cent. a month ago and a year ago. The following table shows the monthly movements of the index figure over a number of years:—

AVERAGE PERCENTAGE INCREASE over JULY, 1914.—All Items. (Food, Rent, Clothing, Fuel, and Light, &c.)

1st Day of	1918.	1921.	1924.	1925.	1926.	1927.	1928.	1929.
	%	%	%	%	%	%	%	%
January ...	85–90	165	77	80	75	75	68	67
February ...	90	151	79	79	73	72	66	65
March.....	90	141	78	79	72	71	64	...
April	90–95	133	73	75	68	65	64	...
May	85–100	128	71	73	67	64	64	...
June	100	119	69	72	68	63	65	...
July	100–105	119	70	73	70	66	65	...
August	110	122	71	73	70	64	65	...
September..	110	120	72	74	72	65	65	...
October.....	115–120	110	76	76	74	67	66	...
November ..	120-125	103	80	76	79	69	67	...
December ..	120	99	81	77	79	69	68	...

The reduction in the cost of living during January was chiefly due to reductions in the prices of eggs, bacon, fish, butter and cheese.

Employment in January.—The decline in employment which took place during the last week of December was followed by an improvement during January. At the end of the month, however, the position was worse than in the third week of December, and was about the same as at the end of November. According to the *Ministry of Labour Gazette*, among the 11·9 million workpeople insured under the Unemployment Insurance Acts of Great Britain and Northern Ireland, the percentage unemployed (wholly and partially) at January 21st was 12·3. This compares with 11·2 per cent. at December 17th, and 10·7 per cent. at January 23, 1928. The total number of registered unemployed at January 28th was approximately 1,434,000, as compared with 1,565,000 at December 31, 1928, and 1,199,000 at January 30, 1928. The following table gives the monthly movements in the unemployment percentage for some years past:—

PERCENTAGE UNEMPLOYED AMONG INSURED WORKPEOPLE in GREAT BRITAIN and NORTHERN IRELAND.

End of—	1922.	1923.	1924.	1925.	1926.	1927.	1928.	1929.

* Excluding workpeople in the coal-mining industry who were disqualified for unemployment benefit owing to the dispute.

Employment was reduced in the building trade, public works contracting, and the brick and tile, artificial stone and cement industries. Unemployment also increased in the pottery, glass bottle, tinplate, general and constructional engineering, and the miscellaneous metal trades. Other industries experiencing a decline in employment included the woollen and worsted, silk and artificial silk, hosiery, lace and carpet industries, textile bleaching, dyeing and finishing, the leather trades, tailoring and dressmaking, the food, drink and tobacco industries, other than grain milling, the furniture and woodworking, printing and paper industries, and the distributive trades. There was, however, some improvement in shipbuilding and ship-repairing, marine engineering, the linen textile industry and hat and cap manufacture. The position in the coal mines showed very little change.

Electricity Supply, 1927-1928.—The eighth annual Report of the Electricity Commissioners covering the period 1st April, 1927–31st March, 1928, supplies the usual statistical information regarding the development of electricity supply in Great Britain. On the 31st March, 1928, there were 642 authorised undertakers in Great Britain—an increase of 19 over the previous year. Of this total, local authorities numbered 376, power companies and persons, 261, and joint electricity boards and authorities, 6. The total output of electricity for authorised undertakers amounted to 8,551,000,000 units, with an addition of 1,377,000,000 units for railway companies, tramway authorities and non-statutory undertakings, the grand total being, therefore, 9,928,000,000 units. If we examine the statistics of individual stations, we find that 20 stations, out of a total of 570 recorded, were responsible for 40·9 per cent. of the total output, while 170 stations, with an average output each of more than 10,000,000 units per annum, accounted for 93·6 per cent., the remaining 400 being responsible for 6·4 per cent. These statistics serve to show that the work of concentration of output in the large stations is already far advanced. The new generating stations authorised during the year had an aggregate capacity of 246,642 kilowatts, compared with 236,100 kilowatts in 1926–27, while extensions to existing stations required 421,715 kilowatts, compared with 539,504 kilowatts. The final total, 668,357 kilowatts, is more than 107,000 kilowatts less than that recorded in 1926–27. One reason for such a decline may be found perhaps in developments under the national reorganisation of electricity supply which is now being carried out by the Central Electricity Board. The Report of the Electricity Commissioners devotes some attention to the prospects of wider territorial development of electricity as a part of the work of the Central Board, and shows that areas in which electricity supply is already available or is authorised now amount to 89 per cent. of urban territories, containing more than 97 per cent. of the urban population, and nearly 42 per cent. of rural districts, containing 67 per cent. of the rural population. This would point to very widespread use of electricity, but the Electricity Commission makes no distinction between areas which are adequately supplied with electricity as apart from areas where supply is merely authorised. This distinction is essential to an understanding of the position. The actual expenditure by local authorities, which the Electricity Commission approved during 1927–28, totalled £18,020,000, which is the highest recorded since 1921. During eight years, expenditure on electricity supply by local authorities has been given as £102,587,000. To this, of course, should be added expenditure by the power companies, which is not given. A final section of the report surveys the position of power equipment in industry in 1924 as given in the Census of Production. The latter shows that the estimates made by the B.E.A.M.A. have been close to the mark. The B.E.A.M.A. estimated the total capacity of electric motors in the industry at 7,900,000 h.p., which is 42,000 h.p. less than the official total, and the total capacity of all plant installed, including the electricity supply industry, as 16,500,000 h.p., 81,000 h.p. more than the official total; while it gave the capacity of electric generators as 6,630,000 kilowatts, 123,000 kilowatts in excess of the Census total. It is curious, in this connection, that the Electricity Commission should have misunderstood the estimate of 34 per cent. given by the B.E.A.M.A. as the capacity of electric motors driven by prime movers in industry, compared with the total capacity of all prime movers. The Census figures show that, in 1924, such a percentage was only 31 per cent., but that the capacity of all electric motors, including those driven by purchased energy, was about 52 per cent. These statistics serve to show that Britain, electrically, has still very considerable leeway to make good.

Iron and Steel Production in January.—The iron and steel production figures for January are the most encouraging of any in recent months. The number of blast furnaces in operation increased by seven during the month to 139, and production of pig iron rose by 23,500 tons to 563,900 tons, an increase of 4 per cent. Steel production rose from 683,100 tons in December to 764,600 tons in January, compared with 626,200 tons in January, 1928. The production would have been higher but for the holidays taken at the New Year in Scotland and the North-East coast. The January steel production is thus

higher than in any month since March last. After having fallen to 183,600 tons in December, the lowest point since May, 1926, imports rose in January to 244,300 tons. Imports of pig iron; billets, blooms and slabs; sheet and tinplate bars; iron and steel bars and shapes; and girders, joists and beams, all registered increases. Exports also increased, and at 421,200 tons have only been surpassed on two occasions since the end of the war, namely, in May, 1927 (422,400 tons), and May 1923 (424,500 tons). The biggest increases took place in galvanised sheets (53,600 tons to 82,500 tons), tinplates and sheets (34,300 tons to 48,200 tons), and railway rails (21,800 tons to 34,000 tons). While production is encouraging it is doubtful if present prices are very remunerative, but the tendency is in the right direction—the Board of Trade price index shows that iron and steel prices have been gradually hardening since August last, when they were 11·7 above 1913 till January, when they were 12·5 per cent. above. At the meeting of the Exchange at Middlesbrough on February 12th the price of Cleveland No. 3 pig iron was increased for the first time since March 13th last; the increase amounted only to 1s. per ton, but it is symptomatic of the more favourable outlook.

Lancashire Cotton Corporation.—Our Manchester correspondent writes:—The work and developments in connection with the Lancashire Cotton Corporation, Ltd., continue to excite great interest in all sections of the Lancashire industry. In addition to the financial proposals there is much curiosity with regard to the personnel of the officials about to be appointed. Applications are now being received for a secretary, an accountant, a head buyer for mill stores and a mill surveyor and architect. It is understood that applications for membership have been received from about 70 companies, and these mills are now being valued, and the terms on which they can be absorbed will be forwarded in due course. At the end of last week Sir Kenneth Stewart, the chairman, addressed a special meeting of the members of the Cotton Yarn Association on the aims of the recently registered Lancashire Cotton Corporation. Great Britain, he said, still had an enormous export trade in cotton goods and in a great many ways showed efficiency in conducting it. At the same time, they were not satisfied with the loss of 2,000,000,000 yards per annum sustained in the last 15 years. They believed that they could get back some of this, but to do so would require careful work along lines which were rather new to the cotton trade. They must be prepared to standardise certain lines of goods and try and put them into the hands of their customers at lower prices than their foreign competitors. They must take the initiative and try to organise mass selling of such types of goods as they had lost. It is now recognised in Lancashire that twelve months ago, when the scheme of the Cotton Yarn Association for the amalgamation of spinning mills was formulated, the idea was to bring about a combination of mills and nothing more. During the intervening months, however, the promoters have become convinced that the situation requires a bigger and more ambitious project. It is now agreed that the directors of the Lancashire Cotton Corporation, Ltd., have in their vision the establishment of what is generally known as a vertical combine, and an attempt is now being made to set up an organisation which will buy raw cotton, spin it into yarn, manufacture cloth, arrange for bleaching, printing and dyeing, and, if necessary, have their own works, and ultimately market the finished article. The Corporation has this week issued a statement of the conditions upon which it will receive offers to absorb individual cotton mills. It is pointed out that the Corporation is open to all spinning and weaving concerns whatever their position, and the merger will be carried out by purchasing the assets of the companies and discharging their liabilities with the debentures and shares of the Corporation. Mill buildings, machinery, etc., will be purchased according to valuation from 10s. to 35s. per spindle, and stocks taken over on a basis of market values. When the assets have all been valued the total purchase consideration will be certified by the auditors. A conditional agreement will then be entered into for the sale and purchase of the assets, excluding one-half of the uncalled capital, which is not purchased, but goes to the creditors. A scheme of arrangement will then be drawn up for submission to the court, and the necessary creditors' and shareholders' meetings will be held. The scheme being sanctioned, the agreements become binding, and the mill company will be wound up. With regard to finance, the Corporation will create and issue first mortgage convertible debenture stock; 5½ per cent. non-cumulative convertible income debenture stock in multiples of £1, ranking after the first stock; 6 per cent. non-cumulative preference shares of £1 each; deferred shares of 1s. each, and at some future date some form of profit-sharing for employees is suggested. It will be recognised that a considerable amount of work will have to be done by the officials of the Corporation during the next few months, and it is doubtful whether the mill amalgamation will be effective until the autumn.

Short Time for Egyptian Cotton Spinners.—Our Manchester correspondent writes:—As anticipated, the members of the Bolton Master Cotton Spinners' Association have supported the recommendation that production of yarn should be reduced by 33 per cent. for two months. A ballot on this proposal has been taken, and the result announced at the end of last week showed that 85·2 per cent. were in favour and 14·8 per cent. against. This organised short time has begun this week and will continue until April 13th. Probably before the expiration of this period another meeting of the Association will be held to consider further action if necessary. There has not been any organised short time in the Egyptian spinning section of the Lancashire cotton industry since 1921, but during the last few months demand has been slack, and leading employers are convinced that restriction of output is necessary in order to check the accumulation of stock and stabilise prices. Out of the 19 million spindles in Lancashire engaged on Egyptian cotton, the Bolton Masters' Association represents the owners of about 12 million spindles. An attempt is being made to get these outside firms to fall into line. This short time will affect about 60,000 operatives, chiefly in the Bolton district.

British War Pensions Expenditure.—The latest analysis of the accounts of the Ministry of Pensions, covering practically all classes of war pensions, disablement, and other allowances, and the cost of medical treatment, reveal the remarkable manner in which outlay in this sphere is contracting. In the financial year to 1921 the aggregate call on the taxpayers was £106 million; in the financial year which closed in March, 1928, the outlay was £59 million. Having regard to the manner in which the great majority of the pensions and other allowances have been stabilised, further contraction may not be so rapid; and interest may turn rather on the cost of administration. Eight years ago that was rather more than 1s. 3d. per £ of benefit or pension paid, a figure which has now been reduced to a little more than sixpence. The British Government has an arrangement with the Canadian Government for the administration of certain pensions to migrants to the Dominion, and in that case, notwithstanding several items of exceptional expenditure in the last financial year, the cost of administration was approximately 8d. per £ of pension or benefit paid,—comparing favourably with the British figure. The large staff of the Ministry of Pensions has also been much reduced, in the last complete year by no less than 18·6 per cent. The efficiency of the administration may be tested in some ways by the losses incurred in compensation, amounts irrecoverable, erroneous awards and payments and similar items. That annual sum is steadily decreasing; last year it was ·054 per cent. of the pensions in payment, indicating that in every 10,000 cases there were only five which were irregular. Six years ago there were in every 10,000 cases thirty-three which were irregular. The statistics are an interesting illustration of broad tendencies in what was necessarily one of the largest of the war-time public departments.

Life Office Bonus Announcements.—Two more Life Offices, whose actuarial valuations were due to be made as at December 31, 1928, have made preliminary announcements as to the results. The *Alliance*, whose valuation was in respect of the quinquennium 1924–1928 inclusive, has decided to declare a compound reversionary bonus at the rate of 42s. per cent. per annum, this rate representing an increase of 8s. per cent. per annum as compared with the bonus declared five years ago. The rate of interim bonus for the current quinquennium is to be also at the increased rate of 42s. per cent. per annum compound. The *Wesleyan and General*, the only Mutual Society conducting both ordinary and industrial life assurance, announces a reversionary bonus for the year 1928 in respect of its ordinary life business at the rate of 42s. per cent. for endowment assurances, and 48s. per cent. for whole life assurances. These rates are the same as those declared for the two preceding years 1926 and 1927.

Scottish Life Assurance Co., Ltd.—From the point of view both of the policyholders and of the outside public, the disadvantage of the system of making valuations and distributions of profit once every five years is that only on such occasions can any real insight be gained into the working of the company. For life assurance is peculiar in this respect—as in others—that the annual accounts afford very little indication of profits earned, which can be determined, not, as is sometimes attempted by ignorant persons, by a comparison between income and outgo, but only by means of a valuation of assets and of liabilities. In the case of the Scottish Life the next valuation is due to be made as at 31st December, 1930, so that 1928 was the third year of the current quinquennium. It is not without interest, therefore, to compare the progress made in the last three years with the corresponding figures of the first three years of the preceding quinquennium.

Years.	Average New Business.	Average Premium Income.	Average Net Rate of Interest.	Average Adjusted Expense Ratio.
	£	£	£	
1921–22–23	789,780	365,410	4 13 -%	15·3%
1926–27–28	1,092,031	539,547	4 15 2%	15·4%

Despite the fortuitous assistance of single premium policies for large amounts during the past three years, the figures indicate a marked expansion in the company's business. More important still, it is apparent that the profit-earning capacity has been more than maintained, and the prospects for the with-profit policyholders are very favourable. An indication of this is furnished by a statement in the report that the interim bonus for the years 1929 and 1930 is to be raised from 43s. per cent. to 47s. per cent.

Indemnity Mutual Marine Assurance Company.—The 1928 accounts of this company—the first of the marine companies to issue its report—have now been published. In presenting its figures the company adopts the marine form of accounting—that is to say, each year's underwriting account is kept open for two years, being thereafter closed by a transfer to the suspense account, which looks after any subsequent claims. The results may be most easily summarised by a comparison with those of the previous few years, as follows:—

Year.	Premium Income.	1st and 2nd Year Claims.	Expenses.	Transfers to Suspense to Close Account.	Surplus (+) or Deficit (−)
	£	£	£	£	£
1923	845,289	661,833	35,119	147,461	+ 876
1924	750,229	650,048	33,995	68,076	− 1,889
1925	613,170	550,256	32,106	61,366	− 30,558
1926	611,516	548,762	31,587	166,167	− 135,000
1927	630,100	562,737	32,116	35,246	...

Turning now to the current underwriting account for 1928, the first year's experience has not been very satisfactory compared with that of the preceding year's account. The chief feature of the current account is the very substantial reduction in premium income from £630,100 to £458,016. The first year claims amounted to £161,757, and expenses to a further £33,505, leaving a balance carried forward to the second year of the account equivalent to 55 per cent. of the premium income as compared with 56½ per cent. at the end of 1927. The interest income is lower at £75,741, and, in order to maintain the relation between this and the dividend, the latter has been further reduced from 32s. per share to 28s. per share and costs £75,040. The company is a subsidiary of the Northern.

Scottish Temperance & General Assurance Co., Ltd.—Like the Provident Mutual this Company has just completed the first year of a new quinquennium, and the results so far as they may be judged from the accounts appear to be very satisfactory. The new business has slightly increased from £1,188,369 to £1,210,194, and the total premium income has advanced from £570,065 to £572,237. The net rate of interest was £4 17s. 5d. per cent. compared with £4 16s. 10d. per cent., and although the expense ratio has risen from 12·4 per cent. to 13·7 per cent. the difference can be largely ascribed to the special expenses incidental to a quinquennial actuarial valuation. The balance sheet discloses some changes during the year mostly of the same nature as those that have been commented on recently in connection with the accounts of other companies, namely a distinct tendency towards a reduction in holdings of British Government and Municipal securities and an increase in debentures and preference stocks yielding a higher return.

UNITED STATES. — SHARE MARKET — MONEY — INDUSTRY.

(FROM OUR CORRESPONDENT.)

NEW YORK, February 8.

INCREASE in your Bank rate, coupled with another of the Federal Reserve Board's "warnings" against speculative use of credit, caught the share market in a vulnerable position this week and provoked the sharpest reaction since early in last December. In two days active stocks lost from 5 to 15 points, and the Dow Jones average for industrial shares declined about 15 points. At the close of to-day's business this average stands at 301, which compares with a recent top of 322 and with a low of 257 made on the early December reaction. Meanwhile the turnover on the decline has not been very large. The opening on yesterday, with the news "out," was big, and over 1,300,000 shares were turned over in the first half-hour. The total for the day, however, only slightly exceeded 5,000,000 shares, the pace slackening as the day wore on. To-day the total failed to reach the 5,000,000 share mark, but the decline was only about one-third as large as that of the previous day. Altogether the liquidation was not as severe as that which attended the December break; and the market might have done better to-day had it not been for the fact that the next four days will embrace only one trading day. This is because of the Lincoln Day holiday on next Tuesday, and because of a special holiday declared by the Stock Exchange authorities for to-morrow (Saturday) because of clerical difficulties experienced by some of the larger houses on account of the recent influenza epidemic. With regard to the future of the share market the feeling in informed quarters has been that a good reaction is likely before spring. Whether this will be precipitated by the events of the past week or will be delayed until the spring demand for money begins to be felt remains to be seen.

In this connection much is likely to depend on the actions of the Federal Reserve authorities; and they are rather difficult to forecast on logical grounds. For the action of the Bank of England in advancing its rate a full 1 per cent. Wall Street has full approval. The measure is considered to be justified by conditions and to have been

courageously taken. The "warning" of the Federal Reserve Board, on the other hand, has been received with mixed feelings. The "warning" is of a piece with others issued during the past year, and the Street remembers that these previous pronouncements have been rather inconsistent and strikingly lacking in utility. This one, like that of last May, is an extract from an essay on credit conditions contained in the Board's monthly bulletin, which was sent out as a press release with a previous day's publicity devoted to the fact that the Board would issue "an important statement." The release dealt with the growth of brokers' loans during the past year, and indicated that if necessary the Board would take steps (which were not described) to restrict the volume of Federal Reserve credit used by banks making speculative loans. As to the seriousness of the absorption of credit by the share market there is, perhaps, some difference of opinion. But as to the efficacy of the publicity method of controlling credit conditions there is, in the light of the experience of the past year, little ground for confidence. In the best quarters the feeling is strong that in controlling credit talk is a poor substitute for action. The policy of the Bank of England, which says nothing and takes appropriate action, is greatly preferred. The issuing of statements has the additional disadvantage of furnishing politicians with opportunities for descanting on the inadequacies of Federal Reserve policies and performances. Already this particular "warning" has stirred up talk on the floors of both Houses of Congress.

Undoubtedly the most disconcerting aspect of the Board's statement is the apprehensions it arouses that the weak and vacillating policy of last year may be followed again. It will be recalled that the overdone easy money policy of the autumn of 1927 was not reversed with sufficient firmness during the early part of 1928. Three ½ per cent. advances in discount rates were spread over the first half-year, interspersed with "warnings." Speculation was never really checked. Then with the arrival of August money was pumped into the bill market by the Reserve Banks with much liberality. An official of the New York Reserve Bank, speaking after the event, admitted that in the effort to support the bill market $100,000,000 more credit was extended by the Reserve Banks than was called for by seasonal commercial demands. By the end of the year, however, it became apparent that the authorities had decided to end the ten years' subsidy of the bill market and make the latter stand on its own feet. This decision represented a great advance, and encouraged the belief that matters would be taken more firmly in hand. That is why the apparent relapse to the warning technique is discouraging. However, the Reserve Banks may continue their policy of reducing their holdings of bills, and otherwise use the orthodox methods by which central banks control credit. But at present there is danger that they will rely on the advance in your Bank rate and temporise with the situation here.

As far as the condition of the system is concerned, the latest statements show that following the first of the month demands the local Reserve Bank strengthened its position, its reserves gaining, its discounts falling, and its reserve ratio rising 1.8 per cent. to 78.8 per cent. For the system as a whole the total volume of credit changed only slightly, a moderate reduction of bills bought in the open market offsetting a moderate increase in discounts. From this it may be seen that discounts increased at the other banks while those at New York fell. The ratio for the system was practically unchanged. On the face of things, it would appear that an advance of discount rates would come more appropriately at some of the interior banks than at New York. Here the ratio of reserve is the highest for the system, compared with only about 55 per cent. for some of the banks. It is also worth noting that four of the banks—those at St. Louis, Dallas, Minneapolis and San Francisco—still have 4½ per cent. discount rates. Further, it may be noted that the additional money that has come into the call money market has not come from the New York banks but from those in the interior.

There is no change in the tenor of business news. The steel industry is very active, and the automobile industry, with Ford producing about 7,000 cars a day and with Chevrolet gathering speed in the production of its new small six-cylinder car, is running well ahead of this time last year.

FRANCE.—POLITICS—DEBT CONVERSION—CAPITAL MARKET—REVENUE—RAILWAYS.

(FROM OUR CORRESPONDENT.)

PARIS, February 20.

THE Government's narrow escape from defeat—by a majority of six only, in a full House—need not be taken too seriously, in view of the whole circumstances, but the incident, from the international point of view, is significant. In the division on the question of restoring at least a large proportion of the provincial law courts which were abolished (by *decret-loi*) in 1926, for reasons of economy, the crucial factor was the personal situation of many local deputies. "Any deputy," it was announced as a truism, "who votes against the restoration of the local tribunals in his constituency will be defeated at the next elections." The Government made the question a matter of confidence, but this did not prevent 15 members of the Gauche Radicale (M. Loucheur's group of 53, who actually hold the balance of power in the Chamber) from voting against the Government of which their leader is a member.

The incident illustrates the precarious position of the existing Cabinet, which the great Radical-Socialist group is anxious to overthrow in order to regain the influential situation it lost by its unfortunate blunder arising from the Angers Congress of the party. M. Poincaré, it is known, is anxious to retire as soon as the reparations and inter-allied debt questions are settled, and it is practically certain that, in the event of any "snap defeat" on party grounds, before that climax, he would be called upon once more to succeed himself. The circumstances of yesterday's incident were exceptional, however, and there is no indication that any similar situation is likely to arise in the near future.

Meanwhile, in connection with the work of financial restoration, the Government has secured an outstanding victory in the success of the Caisse d'Amortissement's new conversion and consolidation loan. The subscription lists for this 4½ per cent. issue at 93½ opened on Monday, the new stock being obtainable in exchange for either Defence or 6 per cent. "Tobacco" Bonds (the latter being the first issue made by the Caisse). The applications by holders of Defence Bonds were so numerous that, on Monday evening, it was officially announced that the limit the Caisse desired to attain for this category of subscriptions had been reached, and that henceforward only offers to exchange "Tobacco" Bonds would be accepted. It is unofficially stated that the amount of Defence Bonds thus consolidated was 4,000,000,000f. The new scrip, at the issue price of 93½, yields 5·05 per cent. nett (free of all taxation), so that the new loan has set up a new low rate for long-term money which cannot but have a widespread beneficial effect on the whole economic situation. The lists are to remain open, if necessary, until March 30, for the exchange of "Tobacco" Bonds, and as there are now only 2,400,000,000f. of these in existence, of which 1,200,000,000f. are held by the banks, there is little doubt of the complete success of the issue.

The French banks, according to an American financial expert who is quoted here, have now the opportunity to secure a first-class position in international affairs. With the American financial leaders steadily raising the price of money, in their efforts to check reckless speculation, and the Bank of England rate at 5½ per cent., there would apparently be every reason why Paris, with a rate of 3½ per cent., should obtain increased influence in the international market. Unfortunately for French interests, Paris is not yet organised to handle any large increase of business. The banks are in several cases increasing their capital. Paris, however, has so far by no means recovered its pre-war volume of business. The last Bank of France statement indicated the amount of bills under discount as only 4,955 millions, whereas the average total at the corresponding date in 1913 was 1,778 millions, which would correspond in present-day francs to something like 8,900 millions. Advances on securities, again, which stood at 742,000,000f. (say 3,710 millions in new francs) at the end of 1913, were returned last week at 2,314 millions. While there is a feeling here that the Bank of England will bring its rate back to 5½ within the next ten or twelve weeks, there is no sign of any modification in the French rate being probable.

The revenue returns for January indicate a continuance of the same satisfactory situation that prevailed throughout the past year. The total yield from all Budget sources (that is, exclusive of that from the tobacco monopoly and the taxes diverted to the Caisse d'Amortissement and of the revenue from Posts, Telegraphs and Telephones) amounted during the month to 3,903,701,000f., or about 500,000,000f. more than in January, 1928. The yield from indirect taxation and monopolies (exclusive of tobacco) was 3,409,036,000f., or 436,364,800f. more than in the corresponding month last year. The yield for the month from the latter sources was 498,065,000f. more than Budget Estimates for the month. The turnover tax reached the record figure of 917,021,000f., which suggests that trade is much better than common report would lead one to think. It must be remembered, however, that the yield from this tax in January represented transactions in December and included the Christmas turnover, which latter is shown to have been appreciably better than in the previous year, as the yield from the tax in question was nearly 100 millions more. Customs were 141 millions up, and taxes on securities 112¾ millions more than in January, 1928. With the exception of the taxes on petrol, heavy mineral oils, sugar and saccharine and the luxury tax, every category of indirect taxation yielded appreciably more than a year ago. Income tax and other direct taxes yielded 479,305,000f. for the month, or 53¾ millions more than in January, 1928. It is significant of the closer methods of collection that now prevail that the amount of overdue income tax recovered was only 1,317,000f., or 2,279,500f. less than in January, 1928. The Treasury remains abundantly furnished, its balance at the Bank of France on February 8 being 6,411,513,000f. (which includes, of course, the 3,000,000,000 "loan without interest" advanced by the Bank on stabilisation.

Provisional figures showing the results of the working of the French railways in 1928 indicate total receipts of 15,036,000,000f. and total working costs and charges of 14,391,000,000f., leaving a surplus of 645,000,000f. (say £4,960,000). With the exception of the State system (which had a deficit of 237 millions), and the Midi Company (26 millions), all seven lines show surpluses. The Est had a favourable balance of 325,000,000f., the P.L.M. one of 256 millions and the Nord Company one of 180,000,000f. The loss on the two lines mentioned (under the Convention of 1921, relative to the financial working of the new régime, which instituted a kind of national pooling arrangement) will be met out of the common fund to which all the prosperous lines contribute.

GERMANY.—MONEY MARKET—UNEMPLOYMENT—INDUSTRY.

(FROM OUR CORRESPONDENT.)

BERLIN, February 20th.

THE credit situation has undergone a sudden and unexpected change. On the one hand, money rates have hardened and of a return to the extreme fluidity of the earlier part of the month there is no sign. On the other hand, the exchange position has radically altered. Only a few weeks after gold was being imported the question whether gold will not have to be exported is being discussed, and the Reichsbank, in order to keep the foreign exchanges from rising, is parting rapidly with its exchange reserve. Relief is expected from the new large foreign loans of the Harpener and the Berlin Electricity Works companies, but as against this there is apparently a continuing demand for foreign

currencies for Reparation transfers and the next instalment of industrial bonds interest at the beginning of April will probably be speedily converted into exchange.

Day money rates, which were around 3½ to 5½ per cent. at the beginning of last week, rose to 6 to 8 per cent. at the end, and began this week at 6½ to 8 per cent. Yesterday the rate declined to 5¾ to 7¾ per cent. The banks seem not to have made adequate preparations for the mid-month demand, which was increased by property-tax liabilities. The month loans rate rose to 7 to 8 per cent. The private discount rate, which had long been at 5⅝, was three times advanced and at 6 per cent. a considerable quantity of Treasury bills were sold.

There has been a steady outflow of foreign funds, and a great part of the three-months foreign credits contracted late last year have had to be repaid. Money has gone abroad for investment. The exchange market has also been affected by the prospect of a new advance in the New York Federal Reserve Bank rate; the fear of an advance in the dollar exchange from this cause led to the forward purchase of exchange. The Reichsbank's return for February 15th shows only in part the result of this change in conditions. The Reichsbank is in a position to export gold if necessary. The gold cover of its circulation on the 15th was 66·9 per cent., as against the 30 per cent. required by law; the combined gold and exchange cover 69·4 per cent. as against the 40 per cent. required. For the moment the Reichsbank's intervention has resulted in a decline in the dollar and sterling rates.

The wholesale-price index number for February 13th advanced to 139·5 as against 138·9 a week earlier. Agricultural products prices have gone up sharply; and manufactured goods for consumption, which rose very much in 1927 and 1928, have been cheapening. The index groups are: Agricultural products, 134·0; colonial goods, 125·6; industrial raw and half-manufactured materials, 133·8; manufactures, 158·2 (whereof means of production 137·4, and goods for consumption 173·9). At the end of January 19·4 per cent. of about 4 million Trade Union members were fully employed, as against 11·4 per cent at the end of January, 1928; and 8·2 per cent. were partly unemployed, as against 3·5 per cent. In the seasonal industries 58·4 per cent. were fully unemployed, and 3·4 per cent. partly unemployed; in the non-seasonal industries (in which employment depends upon the general state of trade) 10·3 per cent. were fully unemployed and 9·3 per cent. partly unemployed. In this group the lowest employment is in the clothing, footwear, wood-working and tobacco branches. In textiles there are 8·6 per cent. of fully unemployed, metal industries 9·5 per cent., mining 3·1 per cent. The rate of increase in the number of fully unemployed declined very much in January. The present winter puts the new Unemployment Insurance system to its first severe test, and the prospect is not favourable. The accounts of November showed a deficit. The emergency fund then in hand was equal to only about two months of expenditure at the November rate; and unemployment has since then about trebled. It is very likely that the Unemployment Insurance premiums, which are fixed by the law of 1927 at a maximum of 3 per cent. of wages, will have to be increased. "Crisis" unemployment relief, which is financed by the Reich and the municipalities, also requires increasing sums. In January the number of occupations entitled to its benefits was increased by ordinance, and last week the Reichstag social affairs

committee decided for an extension of the system to all occupations and for a prolongation of the maximum period of payment. At best the Republic, which pays no contribution to Unemployment Insurance, will probably be called upon to lend it a large sum.

Ruhr coal production in the last four report weeks declined. Pig-iron production in January was 1,097,980 metric tons, as against 1,180,576 tons in January, 1928. Activity in the iron and steel branches has been affected by the prolonged frost. Building, which usually begins to recover at this stage of the winter, is entirely stagnant, and the transport of materials on internal waterways has suffered. The steel rails, steel sleepers, and foundry branches report bad business. The iron and steel syndicates have announced unchanged prices and delivery conditions for March.

Foreign trade in aluminium finished wares has developed well, export in 1928 being 6,700 metric tons against 5,500 tons in 1927 and 2,500 tons in 1913. Exports of aluminium semi-products were: 1928, 4,200 tons; 1927, 3,600 tons; 1913, 2,500 tons. Import of raw aluminium in 1928 was 14,800 tons, against 12,709 tons in 1927, and 15,300 tons in 1913. Owing to the big import of raw aluminium and bauxite, the value export surplus in the whole aluminium-industries branch in 1928 was only 19 million marks. The export of metal-thread lamps in 1928 was 68,986,000 pieces, against 55,439,000 in 1927, and 48,814,000 in 1926. Export to Great Britain in the three years has been about stable. Import is declining. The trade balance in porcelain goods is becoming less favourable.

The Hamburg-American Company's dividend for 1928 will be only 7 per cent., as against 8 per cent. for 1927. The cause of the reduction may be that 30 million marks new shares, which carried only a half-year's dividend in 1927, will this year carry the full dividend, so that the amount to be distributed in dividends will be only 400,000 marks less. The North-German Lloyd announces that it will maintain its 8 per cent. dividend. Both companies have signed agreements with Russia for regulation of passenger traffic.

BULGARIA. — RAILWAY AUTONOMY — BANKING PROGRESS — CROPS — TRADE BALANCE — REFUGEE SETTLEMENT.

(FROM OUR CORRESPONDENT.)

SOFIA, January 27.

POLITICS have given the Government sufficient respite to carry through the new legislation on financial and economic measures connected with the stabilisation loan. There still remains much work to be done in this direction. One of the important impending reforms is the administrative and financial autonomy of the railways system. A Bill to this effect is being prepared. The railways budget, which showed, in 1928-29, 1,167.7 million leva receipts and 853 millions expenditure, is to be separated from the general State accountancy, and the railways will have to repay to the Treasury, up to the year 1979, 3.990 million leva, the estimated lump sum representing expenditures effected on railways account and still incorporated in the whole of the public debt. The credit balance remaining after covering all exploitation expenditure, and, after due provision for repayment of the debt to the State and for special reserve funds, will be dealt with by the Minister of Railways according to a plan established every year and approved by the Council of Ministers. The utilisation of reserve funds will be determined by the Minister of Railways. In the case of a deficit on the yearly railways budget, the reserve funds will be employed to cover the debit balance, and, if they do not suffice, the difference is to be taken out of the general budget of the State in the form of re-imbursable advances to the railways administration.

The coming in of the proceeds of the loan is allowing the repayment of 900 million leva floating indebtedness of the Treasury, resulting chiefly from past budgetary deficiencies. A further 300 million leva and 100 millions respectively are paid over to the Agricultural and to the Central Co-operative Banks. Substantial progress towards consolidation has been made by the National Bank. Gold exchange reserves have been strengthened, long-term assets are being liquidated as rapidly as local financial and economic conditions allow. Among other innovations, the new rediscount facilities for bills of agricultural landowners are much commented upon. They are generally believed to prepare the way towards a proper organisation of agricultural credits—one of the most urgent needs of the country's economy.

As a result of the new impulse given by the National Bank, the recent slow improvement in monetary and credit conditions has been accelerated. The official discount rate has been reduced to 9 per cent. Interest rates on commercial advances in the open market are rapidly dropping from 15 to 12 and even 11 per cent. As no corresponding reduction of rates on deposits with private banks appears to take place for the present, a serious shrinkage of banking profit margins is to be expected. Although these profits seem to have been fairly good in 1928, the state of overbanking begins to make itself felt all over the market, and amalgamations of private banks appear more and more advisable. Two of the leading banks, the Banque Franco Belge de Bulgarie (a creation of the Société Générale de Belgique, Banque Belge pour l'Etranger and Wiener Bankverein) and the Banque Balkanique (owned by the Banque de l'Union Parisienne, the Credit Anstalt für Handel und Gewerbe, the Wiener Bankverein and the Ungarische Allgemeine Kreditbank) are amalgamating into a new joint stock bank with a paid-up capital of 150 million leva.

In contrast to pessimistic forecasts, the general results of agricultural activity in 1928 proved satisfactory, with the exception of the maize crop. The wheat yield was 13,796,000 quintals, against 11,463,000 quintals in 1927. As a consequence, however, of the general weakness of grain prices abroad, a substantial part of Bulgarian crops remained unsold. Reduced exports of maize, eggs, flour, hides, skins and wine, although partly compensated by higher tobacco prices, have greatly influenced the general trade balance, which shows a deficiency of 813 million leva. The full significance of the situation becomes apparent from a comparison with balances of the previous years:—

	1926.	1927.	1928.
	In million leva.		
Imports	5·547	6·173	7·192
Exports	5·566	6·684	6·379
	+ 19	+ 511	− 813

The steady increase of imports, in spite of high Customs duties and of the unfavourable monetary conditions which prevailed up to the second half of 1928, is generally explained by the constantly developing needs of the rural population, by heavy imports of machinery for agriculture and industry, and by a general rise in the purchasing power of the country. An effective and rapid increase in local production and, still more important, an extended market for Bulgarian products abroad, is becoming a major necessity to the country. Much effort is being spent in this direction on the part of both the Government and private enterprise, but these endeavours remain for the most part unco-ordinated. Roads and communications badly need serious repairs and considerable extension. Irrigation of land, storage and grading accommodation for its products, and careful re-grouping of scattered landed property, are further necessities which require expert handling, thorough study, heavy capital outlay and, above all, a prolonged period of political stability and lasting peace in the Balkans.

The settlement of refugees made very valuable headway in 1928. Up to the end of December 1,800 houses have been built and handed over to refugees. 1,750 houses are in construction. 80,000 hectares of land have been measured, cleared and prepared for cultivation, 7,000 people have been definitely housed. There remain to be settled 30,000 refugees. Important reclamation works are in course of execution and extensive sanitary work has been carried out with apparently considerable success.

GREECE. — THE PAST YEAR — NATIONAL BANK — AGRARIAN BANK—NEW LOAN.

(FROM OUR CORRESPONDENT.)

ATHENS, January 30.

RECONSTRUCTION has continued to make good progress in Greece during the past year. Two important features of the economic history of the country in 1928 are the issue, early in January, of the Refugee and Stabilisation Loan of £9,000,000 under the auspices of the League of Nations, and the establishment, in the month of May, of the Bank of Greece (the new bank of issue provided for in the Protocol of Geneva), followed by the legal stabilisation of the currency at 375 drachmas to the pound sterling, as against a pre-war parity of 25.225 drachmas. The Budget of the State has closed with a surplus, while estimates for the current financial year anticipate an equilibrium of revenue and expenditure. So far the stabilisation of the currency has been successful, the drachma showing only insignificant fluctuations. The Bank of Greece published its first balance-sheet on December 31, 1928, showing a reserve in gold and gold exchange of 54.24 per cent., against its note circulation and sight liabilities combined. Since May, 1928, when the Bank of Greece began business, this reserve has increased by 0.57 per cent., the note circulation has risen from Drs. 4,863,353,000 to Drs. 5,689,550,330, gold in the vaults of the Bank has declined from Drs. 876,306,000 to Drs. 553,559,985, but foreign gold exchange has grown from Drs. 3,191,081,000 to Drs. 4,590,493,000. Unlike other central banks, the Bank of Greece is not following a policy of accumulating gold.

National economy has shown prosperity in some branches of industry and trade, and the increase in the number of bankruptcies is unimportant and unemployment comparatively small. Stock Exchange prices are on the whole steady, and bank deposits have increased. The index number of the cost of living was 1,939 in December, as compared with 1,881 one year ago, and 100 in 1914—the base year. Agricultural production shows a noteworthy development. Foreign trade is active, but the big surplus of imports has not diminished. The reduction of the Bank rate is nominal, for interest rates on the open market continue at higher levels. Thanks to the various foreign loans recently concluded, the settlement of the refugees and the construction of public works for the organisation and development of the economic resources of the country are being gradually accomplished.

After long negotiations the question concerning the ownership of the difference between the old par value and the stabilisation price of the cover in gold and gold bonds of the note circulation transferred to the new bank of issue by the National Bank of Greece has been amicably settled between the latter and the Government. The Bank will pay to the Treasury a sum of Drs. 110 million. In addition, it has been decided to establish an Agrarian Bank to take over the agrarian credit branch of the National Bank. The capital of this new bank will amount to 450 million drachmas, and will be supplied half by the State and half by the National Bank, which will transfer to the Agrarian Bank credits of 650 million drachmas, while the Government will lend to it, out of the proceeds of the loan floated in London last December, a sum of 500 millions. Thus the Agrarian Bank will start business with total resources of 1,600 million drachmas. In all probability the new institution will be an autonomous corporate body controlled by the National Bank, whose organisation and branches will be used by the former. It will be governed by a board of directors, the members of which will be appointed half by the State and half by the National Bank. Till now agrarian credit has constituted practically a monopoly of the National Bank.

A contract has just been concluded between the Government and the New York banking house of J. and W. Seligman Company concerning the issue of the American part of the Public Works Loan of £22,000,000. This part has been fixed at $54,000,000. Of this sum $20,000,000 to $30,000,000 will be issued within 18 months from the date of the ratification of the respective contract by the Greek Parliament. The balance will be issued within five years. The loan will be guaranteed by the revenues assigned for the public debt, and its service (and consequently that of the sterling bonds issued by Hambros) will be effected by the International Financial Commission. It will be redeemed in 40 years. The bonds will bear interest at 6 per cent., and will be purchased firm by the bankers at a price six points lower than that of the Stabilisation Loan on the New York Stock Exchange. If the bankers realise a public issue price of more than five points above the price at which they will purchase the bonds from the Greek Government, such surplus shall be shared as to half with the Government. Should the price offered by the bankers not be considered advantageous by the Greek Government, it can apply to other markets outside of America, where, for a period of two years, it cannot contract with other bankers. As an advance against this loan the issuing bankers will open a credit to the Government of $7,500,000 available in 16 months, as a whole or by instalments, at a rate of interest 1 per cent. above the discount rate of the Federal Reserve Bank of New York (plus ⅛ per cent. monthly in the second year), and 1 per cent. commission per annum. This credit will be repayable in two years' time out of the proceeds of the loan, and if the loan be not issued, by the sale to the bankers of the unissued bonds of the 5 per cent. 1914 loan, at a price 3 points below that quoted, at the time of sale, on the London Stock Exchange. In some circles there is a tendency to regard these conditions as somewhat onerous.

CANADA.—POLITICS—TRADE TREATY WITH NEWFOUNDLAND—WEATHER AND GENERAL CONDITIONS — TRADE RETURNS — THE TARIFF BOARD.

(FROM OUR CORRESPONDENT.)

OTTAWA, January 29, 1929.

THE Federal Parliament is due to reassemble on February 7th, and the Cabinet has been meeting almost daily to review estimates and discuss the sessional programme. Since the last session ended the standing of parties has undergone no alteration, and the King Government, although its regular supporters are rather less than half the House of Commons, can confidently rely upon the faithful support of the eleven Liberal-Progressives to provide it with a comfortable majority on all occasions. The agrarian and labour groups will, as usual, adopt an attitude of critical independence, but they will only at intervals co-operate with the Conservatives in attacking the Government, and Ministers can usually rely upon Conservative support in resisting the demands of the western Radicals. No legislation of major importance is foreshadowed, but there will be the usual crop of amending measures, of which the most important probably will be a bill calculated to meet the dual complaints of the Liverpool corn trade and the western farmers about the flaws and inadequacies of the present grain-grading system. Power and immigration issues will provide material for discussion and controversy, but since the Supreme Court of Canada has not yet given its verdict on the constitutional aspects of the water power question, the Government has still available a good excuse for avoiding the formulation of any definite policy. There will be legislation providing compensation for Canadians who suffered losses in the war, and it is predicted that the Government will pay half of the amounts awarded by a special Commission which examined the numerous claims. But the chief battle of the session will probably take place

in the railway committee, which will be called upon to decide between the rival claims of the Canadian National and Canadian Pacific Railway systems for charters to construct branch lines through the same territories. Mr. Dunning, the Minister of Railways, has been striving hard to secure a compromise, but has so far failed, and the Canadian Pacific Railway are evidently determined to exert all their influence to secure authority for the invasion of northern Saskatchewan, which Sir H. Thornton claims is a Canadian National preserve.

The trade treaty, which was concluded a few years ago between Canada and Newfoundland, has not been working smoothly, and Sir Richard Squires, the Premier of Newfoundland, recently visited Ottawa to inform the Government that unless its terms became more effective, it might be cancelled. Under this treaty Newfoundland agreed to give Canada most favoured-nation terms, and thereby remove an advantage which American exporters had previously enjoyed over their Canadian competitors. Canada, on her part, agreed to give Newfoundland British preferential rates, and to subsidise a steamship service between Sydney, Nova Scotia and St. John's, Newfoundland. Sir Richard Squires alleges that the Canadian Government has not begun to pay the subsidy, but the retort of the latter is that Newfoundland has not implemented her pledges in regard to tariff adjustments, and that only when this is done will the subsidy be paid. A series of conferences took place at Ottawa, but it is not yet known whether an amicable arrangement was reached. In the field of external affairs another interesting development is the appointment of the first Canadian Minister to Japan in the person of Mr. Herbert Marler, a corporation lawyer of Montreal, who served for a few months as Minister without portfolio in the King Cabinet.

So far, Canada has enjoyed a very variable winter. The prairie provinces in all their history have rarely known a colder December, but there has also been in these regions an almost complete absence of snow until within the last fortnight and, unless there are heavy falls in February and March, the crop season will start with scanty reserves of moisture. Eastern Canada, on the other hand, has only had one spell of seriously cold weather, and about the middle of January there was an abnormal thaw which resulted in serious floods through southern Ontario and certain parts of Quebec. Extensive areas were inundated, and although the loss of life was slight, considerable damage was done to property, and transportation services were impeded for some days. General business is still being maintained at a satisfactory level, but the movement of merchandise is not quite so large as it was a year ago; the carloading figure for the week ending January 19th, placed at 58,156 cars, a gain of 1,069 cars over the total for the previous week, shows a recession of some 5,000 cars from the figure for the corresponding week of 1927. Plans for expansion and development, however, are taking shape in many directions, and there is every sign that the coming of spring will see a fresh burst of new construction, which will stimulate a variety of industries, and provide a great deal of fresh employment. The full trade returns for the calendar year 1928 have now been published by the Dominion Bureau of Statistics, and they show that the total value was $2,596,448,113, which is a gain of $270,548,179 over the total for 1927; exports were valued at $1,374,130,197, and imports at $1,222,317,916, and the favourable trade balance was roughly 152 million dollars, which is a decrease of about ten million dollars as compared with last year. Of the exports, agricultural and vegetable products valued at 651 million dollars, constituted almost half the total, and showed a gain of more than 100 million dollars. On the import side, the largest contribution was made by "iron and its products," which were valued at $322,959,144, an increase of nearly 75 million dollars. Britain bought from Canada 440 million dollars worth of goods and sold in return about 191 millions. The United States still remains Canada's best customer, having purchased 492½ million dollars worth of goods, an increase of 18 million dollars, and also increased her exports by 115 million dollars, their total value being 826 millions.

The Tariff Advisory Board resumed its sittings at Ottawa on January 23rd, and has already heard a series of applications. The manufacturers of copper rods, which now enter free, are asking for a duty as an offset to a discrimination which they allege is practised by the American Copper Export Association, and by which they are forced to pay higher prices for copper bars than are charged to their American competitors. Mr. Moore, the Chairman of the Board, after hearing the evidence, expressed the view that the situation warranted drastic action by the Federal Government. Applications in connection with jewellery, seamless copper tubing and safety glass were also dealt with by the Board. The fight of the steel and coal interests for increased protection has again been resumed with the same resistance from such users of steel as the Ford Motor Co.

Letters to the Editor.

BANK RATE POLICY.

TO THE EDITOR OF THE ECONOMIST.

SIR,—The general consternation of business men in Great Britain and of stock exchange Bulls in America at the recent action of the Directors of the Bank of England in raising the Bank rate from 4½ to 5½ per cent. is intelligible enough; but there is something paradoxical in the circumstance that, while Wall Street leaders and their representatives in Congress denounce the Federal Reserve Board as the tool of Governor Norman, his critics here in much more moderate language regret that the Bank of England has become insensibly, and under the pressure of adverse monetary circumstances, a too complaisant instrument of the Federal Reserve Board or of the American Treasury. Why, asks the average City man—and the querulous question is heard on all sides—should we be the catspaw that removes American chestnuts from the fire, merely because the controllers of credit at Washington are afraid of unpopularity and do not want to burn their fingers? The complaint is reasonable enough, and the problem deserves discussion. There is no reason why a mystery should be made of high finance, or why outsiders not in the sacred circle, who have applied their minds to the riddles of monetary policy, should not imitate the candour, though they cannot pretend to the penetrating insight, of a Bagehot.

Let us acknowledge to start with that, if it is right and necessary to maintain at all costs a gold stock of a hundred and fifty millions sterling under the new Order, the Bank of England were justified in putting up the rate. That is the correct and traditional method of checking the outflow of gold and turning the exchanges in favour of London. To quote a classical passage from *Lombard Street*:—

"If the interest of money be raised, it is proved by experience that money *does* come to Lombard Street, and theory shows that it *ought* to come . . . Loanable capital, like every other commodity, comes where there is most to be made of it. Continental bankers and others instantly send great sums here, as soon as the rate of interest shows that it can be done profitably. While English credit is good, a rise of the value of money in Lombard Street immediately by a banking operation brings money to Lombard Street. And there is also a slower mercantile operation. The rise in the rate of discount acts immediately on the trade of this country. Prices fall here; in consequence imports are diminished, exports are increased, and therefore there is more likelihood of a balance in bullion coming to this country after the rise in the rate than there was before."

But even if the rule of thumb propounded by the Cunliffe Committee be accepted, we may remind ourselves that there are exceptions to all rules of this kind. Ought this one to have been applied to the very exceptional conditions which brought about the recent gold drain to the United States? They are exceptional in several ways. In the first place, in consequence of the exorbitant gold debt treaty, which Mr. Baldwin for some undiscoverable reason persuaded Mr. Bonar Law's cabinet to accept, the United States is in possession of far more than its share of the world stock of gold. Out of about two thousand millions sterling supposed to be available for monetary purposes the U.S.A. has absorbed nearly half. This is far more than is required for legitimate purposes of money and banking, and consequently the immense surplus has been applied to stimulating a long continued speculative movement on the American stock exchanges. The rise has become dangerous; the Federal Reserve Bank has issued warnings, but has failed to take effective action. The high call rates in Wall Street have made money more profitable there than in London; gold has consequently been flowing in, and this inflow is so inconvenient to the Federal Reserve Board, and so alarming to sober bankers, that they have asked the Bank of England to help them at our expense by raising the price of money (which was already quite dear enough) in Great Britain and Europe.

What was the alternative? The alternative would, I think, have been to tell the Federal Reserve Board that we could not afford this kind of co-operation, and to have allowed, if necessary, at least twenty or thirty millions of gold to be exported to the United States. If the United States persists in its policy of demanding gold and refusing goods in exchange for the food, raw materials, and munitions, which it lent to Great Britain and its other European Allies in the last two years of the War, we had better economise in gold and revise our rather extravagant notions about the correct proportion of Reserve to Liabilities. So long as Europe consents to monetary dependence on the United States, and allows its rates of interest to be regulated by call money in Wall Street, we cannot expect Washington—or the public opinion on which it acts—to be much disturbed by commercial distress in Europe or by the embarrassments in which we are placed by the double action of American monetary and fiscal policy.—Yours, etc.

London, February 20th. FRANCIS W. HIRST.

[Our own views on this matter were expressed in a leading article in our issue of February 9th. Incidentally, was it more than a coincidence that the Bank rate was raised in the same week in which gold stocks fell below £150 million?—Ed. *Econ.*]

FREE TRADE AND THE MOBILITY OF CAPITAL.

TO THE EDITOR OF THE ECONOMIST.

SIR,—In your foot-note to my letter of January 26th, you say that I meet no single point in your article. I think this is hardly fair, in that my letter was mainly based on a quotation from your article. I also gather the impression—perhaps wrongly—that to be a classic economist is to be a discarded economist; which, if it is the case, leaves little, if any, of the theory of Free Trade. As for "culling quotations from their context," every quotation, I suppose, is more or less "culled from its context"; the whole question is, is the sense of the quotation contradicted by the context? I have yet to be shown that in the quotations I gave the context does contradict their very evident and straightforward meaning: I do not think it does, or I would not have given the quotations.

In your article (January 19th) you say that you will ask "one or two pertinent questions." Actually, you ask no less than seven, and then blame me for not covering your whole article in one letter: give me two or three pages of the *Economist*, and I shall be happy to do so! Your questions are: (1) Is it assumed by our critics that Free Trade encourages capital exports? I reply that Free Trade obviously *discourages* investment in many home industries which suffer from foreign competition. (2) Do I consider that capital exported is wasted because it is used to employ the foreigner and not the Briton? It is not wasted from the point of view of its owners, and it may be highly beneficial—or it may not—to the whole country: but it *does* employ the foreigner and not the Briton. (3) Is it the idea that Protection should go hand in hand with the greater concentration of capital at home in producing goods which we now buy from abroad? Certainly I anticipate that result, and, if I may "cull a quotation," it seems to me a logical application of Mill's dictum, "Industry is limited by capital." (4) Is the aim to make Britain as self-sufficing as possible? Self-sufficiency is hardly the point to me: it is a question above all of employing labour. But I deplore the decay of agriculture, whose revival I would support on other than purely economic grounds. (5) Do our Protectionists wish Great Britain to have a favourable balance of international payments? Your Protectionists are not, I hope, Mercantilists, and only favour a so-called "favourable balance" on the lines and in the circumstances indicated by Lord Goschen in his "Theory of the Foreign Exchanges." (6) Do they conjure up a picture of "The City" battening on a system which profits no one but them? Foreign transactions on the whole, I take it, most decidedly are more profitable to the City than home dealings; as, for example, exchange business, insurance, commissions and so on: regard our "Invisible Exports"! But I say no more than that. Yet why are almost all bankers Free Traders? (7) Do they deny that our capital exports have, by financing the development of new countries, increased our supplies of food and raw materials, and enabled these countries to buy increased quantities of our manufactures? Not at all—*pas si bête*; and the present writer has never said otherwise than that a great deal of overseas investment has been of inestimable benefit to this country; though he is very doubtful of the national benefit of investing our capital with our chief commercial rivals. The point is not this at all, however. It is that the mere fact of foreign investment removes the only real economic argument against Protection, while at the same time it totally destroys the orthodox economic defence of Free Trade as a national system.

Lastly, I do not regard it as any "concession" to say that the theory of Free Trade is unaffected by the mobility of capital "if the entire world is to be considered as one economic unit." On the contrary, I have always—nor am I alone in this—affirmed the essential cosmopolitanism of Free Trade. If, in fact, you have one World-state, and national barriers and distinctions gradually cease to exist, why on earth worry as to where in the world either capital or labour is employed? All the "orthodox" arguments hold good for such a World-state; but, thank God, we have not got one. We have still got Great Britain, and for a nation, mobile capital with (largely) immobile labour, is not a happy combination—for labour.—Faithfully yours,

(Signed) DOUGLAS GRAHAM.

16, Girdlers Road,
London, W. 14. (dated) February 5, 1929.

TO THE EDITOR OF THE ECONOMIST.

SIR,—If the conflict between high mobility of capital and the immobility of labour is the sole ground of this particular Protectionist argument, then interference with trade must be justified along any geographical line over which capital moves easily but labour only with much urging. Protection for the countryside against the towns might find its supporters, or for the depressed North of England against the wealthy South. But three reasons point out international boundaries as the basis of discussion; immobility of labour often, though not always, reaches a maximum at those points, different currency systems complicate the issue, and our minds are accustomed to work in terms of international trade.

A purchaser of raw material, let us say, buys abroad rather than at home because *at the ruling rate of exchange* the foreign product is the cheaper; for a like reason foreign buyers take our own products. Hence the rate of exchange is the crucial factor in determining the course of a nation's international trade. Those who buy products abroad must buy foreign currency or bills to pay for them, while foreigners making purchases here must sell their currency for sterling, and the interaction of these forces determines the exchange. Now, if the ruling prices create an excess of demand for foreign currency over the supply thereof, at the given exchange rate, then that rate moves against sterling until equilibrium is again reached. As the exchange rate moves, different commodities come within the range of those which it is profitable to buy (or to sell) abroad; one of them, incidentally, may be gold, which, as we have recently seen, has peculiar reactions on the capital market.

In this way, neglecting for the moment capital and interest payments and losses on the exchanges, exports must always be equal in value to imports. If, now, monetary payments have to be made from abroad without a corresponding return of goods—interest or reparations—then the demand for sterling increases, the exchange rate moves "in favour of" this country, and hence exporters find it more difficult to market their goods while at the same time a greater range of foreign goods comes into competition with home products. In the end imports exceed exports by the amount which is transferred in this way.

The export of capital has naturally the reverse effect. While it stimulates exports it acts as a "protection" to industries competing with imported goods. But a new factor now enters in. The price of foreign capital rights, being expressed as a percentage per annum, is independent of the actual state of the exchanges, and in this respect differs from the price of material goods. The reaction on the exchanges produced by the purchase of foreign bonds or shares has no tendency to check that export of capital, for the only thing which can check it is an alteration of the comparative ruling rates of return on investment. That can happen in three ways: the satiation of the foreign market may cause a fall in its current rate of interest, or the neglect of the home capital market may cause a rise there, or the resultant movement of the exchanges against sterling, making British goods cheaper to the foreigner, may produce an export of gold which forces the Bank to raise the market rate of interest.

But so long as the export of capital continues, the excess over our imports of our export of goods, plus interest due to us, must equal the net capital export. Thus a movement of capital abroad has several results: it transfers to foreigners a certain potential demand on *our* industrial effort, it stimulates exports and hinders imports, it produces later on a return of interest which has the opposite effect, and it builds up markets abroad for further exports of British goods. The test, whether those markets are going to be more valuable than the home markets which might otherwise have received the stimulus, is based on, but not confined to, the rate of interest paid.

Thus in determining our practical policy with regard to capital movements we must consider the distribution of unemployment between the various industries. If unemployment were heaviest in those industries which would receive the stimulus of capital investment in this country, or in industries dependent for raw materials on foreign produce, yet not dependent on foreign markets for the disposal of the finished article, and if unemployment were low in industries producing for export, then there would be a *prima facie* case for regarding the ease with which capital moves abroad as unfortunate.

But an examination of our list of home capital issues, which shows a sadly disproportionate amount invested in speculative semi-luxury ventures, does not incline us to believe that the liberation of more funds for home investment would help our depressed industries very much. Their most urgent need is an enlarged market, and it is for help in competing with the foreigner in overseas markets that their leaders are appealing. The exporting coalfields, the exporting iron and steel and engineering trades, and the shipbuilding industry account for by far the worst part of our unemployment. For these industries, and for those which have to face the competition of foreign imports, the mobility of capital is a blessing and not a curse.

To this statement the doctrines of Protection provide no qualification. The effect of a protective tariff, by diminishing imports, is to set the exchanges moving in our favour till exports are reduced to meet imports again. Since its result is to make sterling more valuable in terms of foreign commodities, protecting one industry harms not only the export industries but also all other trades, not the least of which is agriculture, which have to fight foreign imports. Meanwhile the net effect on capital movements, which depend on rates per cent. and therefore not on the exchange rates, is virtually nil; in so far as capitalists (British and foreign) are tempted to invest in the trades sheltered by the tariff (the motor car and tyre industries, for instance), the inducement is lessened to invest in the unprotected and unprotectable industries, which need new capital most.

Protection cannot, and must not, be viewed in relation only to the particular industry which demands it; that has justly been your complaint against the procedure of "safeguarding." Protecting an individual industry may—indeed, will—help that industry and its "feeders," but its reaction on the whole course of our national trade is even more certain to be evil.—Yours. etc.,

SOCIUS.

Oxford, February 16th.

THE MINORITY DILEMMA.

TO THE EDITOR OF THE ECONOMIST.

SIR,—Has it ever occurred to you that the present position of the Liberal Party may be due to its adherence to Free Trade?

The Conservative Party in the past thought opposition to Home Rule a great asset, quite ignorant of the change of opinion that had taken place.

Just the same now, I believe, the Liberal Party is hopelessly wrong in thinking Free Trade is an asset.

Without presuming to argue with the *Economist*, I suggest that the younger generation is not convinced that we are wise to continue free imports while the rest of the world becomes persistently more protectionist.

Let the Liberal Party relegate Free Trade to a non-political issue and a great change may take place.—Yours faithfully,

ALFRED HICKS.

6, Austin Friars, E.C.2, February 19, 1929.

[We imagine that even a political party does not shed one of its fundamental convictions as easily as Mr. Hicks seems to think; nor should we expect his theory to find much favour at Liberal Headquarters.—Ed. *Econ.*]

Books and Publications.

THE FUTURE OF SOCIALISM.*

IT is the privilege of contributors to the "To-day and To-morrow" series to indulge in a certain amount of prophetic licence; and an examination of existing tendencies in the Socialist movement might have led to interesting, if tentative, conclusions concerning the limitations placed by psychological or political factors upon the future development of this or that type of public enterprise. Reference to the dynamic reactions of "rationalisation" and industrial combination on a competitive system and an individualist economic philosophy might have given an element of realism to the author's speculations on the future of Socialism; and at the same time provided serious-minded citizens with a thought-provoking corrective to antitheses now largely obsolete and misleading. But such a book remains to be written; for Dr. Shadwell has not really attempted to write it. Into his last two paragraphs he throws the suggestion that "The course of evolution tends always to multiplicity and diversity. There will be new arrangements added to the old, much of which will remain. . . . Among them will be an extension of public ownership, especially of natural sources of power; but I think the main change in this direction will be in placing monopolies or businesses which threaten to become monopolies under public control, and in joint enterprises in which public and private capital are mixed."

So far so good. But it is only here that Dr. Shadwell concerns himself with the future of Socialism. His main preoccupation is with its past; and his whole treatment of that past is designed to emphasise the opposition between a narrowly defined Socialist ideal of direct state trading and a static economic individualism, continuously uniform in its reactions on human ability and human consciousness. There is always a widespread demand, however, for simple interpretations of complex phenomena, and this demand Dr. Shadwell's little book is well calculated to satisfy.

* "Typhoeus or the Future of Socialism." By A. Shadwell. "To-day and To-morrow" series. Kegan Paul. 2s. 6d. pp. 116.

THE ROMANCE OF TRADE.*

WITHIN the short compass of 250 pages of large clear type Professor Kirkaldy succeeds admirably in presenting a fairly generous allowance of economic history, and in giving a lucid account of the main features of modern industrial organisation. The first part of the book deals with early economic problems, money and the right to interest, new trade routes, population, and the minimum wage. The second half treats of the three agents of production—land, labour and capital—and is much better written than the first half; for, firstly, the simplicity of the style seems less forced and exaggerated, and, secondly, the matter itself is much more interesting and important. The writer here warms more vigorously to his subject, and brings in much shrewd common sense and practical sagacity. At the same time, a slight feeling of uneasiness arises that all is not as it should be with the intellectual equipment of the nation when obvious truths have to be so elaborately demonstrated and obvious errors have to be so carefully refuted. Possibly neither the truths nor the errors are so obvious as some of us suppose, though they have a quite Euclidean look.

One or two small mistakes may be noted. The date of publication of "The Wealth of Nations," page 3, should be 1776; "after the Civil War," line 4, page 183, does not seem quite clear. But such very minor defects do not weigh in the balance against the general interest of the work, which should make a useful text-book for schools.

* "The Romance of Trade; A Survey, Commercial and Economic." By A. W. Kirkaldy, M.A., &c., Dean of the Faculty of Economics and Commerce, University College, Nottingham. (London) Kegan Paul. 6s. net. 246 pp.

BOOKS RECEIVED.

[Brief mention of a book in this column does not necessarily mean that it will not receive fuller notice in a subsequent issue.]

The Economics of Welfare. By A. C. Pigou. Third Edition. (London) Macmillan and Co., Ltd., St. Martin's Street. 30s. net.

This new edition contains a number of new chapters, among which is one on subsidies to wages. References to facts are brought up to date, and there are some minor changes in arrangement and exposition.

A Study of Interest Rates. By Karin Kock. (London) P. S. King and Son, Ltd., Orchard House, Great Smith Street. 12s. 6d. net.

This is a very thorough treatment of an important problem. The author's qualifications on the theoretical side are reinforced by practical experience in both Swedish and English banks.

Economic Effects of Public Debts. By Shutaro Matsushita. (New York) Columbia University Press. (London) P. S. King and Son, Orchard House, Westminster. 12s. net.

This discussion of the economic effects of the nature, purpose and redemption of public debts has two introductory chapters on the theory of public debts and its history.

The Unemployed. By Ronald C. Davison. (London) Longmans, Green and Co., Ltd., 39 Paternoster Row, E.C. 4. 10s. 6d. net.

This book makes no pretence of handling the question of prevention, but is concerned purely with the problem of dealing with the unemployed. Its treatment is in consequence largely historical.

Capitalism and Morality. By Lewis Watt. (London) Cassell and Co., Ltd., La Belle Sauvage. 3s. 6d. net.

A commonsense discussion, by a teacher of moral philosophy, of the ethical implications of our present social system.

The Price of Petrol. By E. H. Davenport. (London) London General Press, 8 Bouverie Street. 1s.

A very readable pamphlet which discusses briefly and clearly the influences governing the supply of and demand for petrol.

Public Schools and the Worker in New York. (New York) National Industrial Conference Board, Inc., 247 Park Avenue. $1.50.

A description, without pretence of criticism, of the public educational opportunities for industrial workers in New York State.

Winkler's Manual of Foreign Corporations, 1928. (New York) Overseas Statistics, Inc., 56 Pine Street. $15.00 net.

Contains full information for the investor about the more important foreign (non-American) corporations.

The Stock Exchange Year Book, 1929. Compiled and published by Thomas Skinner and Co., Gresham House, Old Broad Street. 50s. net.

The Mining Year Book, 1929. (London) Walter E. Skinner, 15 Dowgate Hill, Cannon Street, E.C.4. 20s. net.

Contains full particulars of 1,642 mining companies, exploration and mining investment companies. There are also statistical tables of gold output, prices of base metals, and annual yields of the principal mining companies.

The Agricultural Economics Society. Proceedings of a conference, July 6-9, 1928.

Contains the constitution and list of members of the society together with reprints of six papers read at the conference.

The National Farmers' Union Year Book for 1929. (London) National Farmers' Union, 45 Bedford Square. 5s.

A most useful book of reference on all questions of direct or indirect interest to farmers. In addition to a generous provision of statistical tables, there are also sections on railway rates, legislation, milk prosecutions, etc.

City of Birmingham Official Handbook, 1928-1929. Compiled and edited by W. S. Body. (Birmingham) Council House.

An illustrated record of the extremely many-sided activities of the City of Birmingham.

Twelfth Annual Report of the United States Tariff Commission. 1928. (Washington) United States Tariff Commission, 8th and E. Streets, N.W.

The bulk of this document is devoted to accounts of investigations carried by the Commission. These are extremely detailed and result in such recondite statistics as a table of "comparative costs of production of domestic and Italian cherries (sulphured or in brine, stemmed and pitted)."

Jentgen's Artificial Silk Review, January, 1929. (Manchester). 1 Booth Street.

This number contains a variety of interesting articles, very well illustrated, on the technical processes and the economics of the rayon industry.

Rubber Quarterly, February 15, 1929. (London). London General Press, 8 Bouverie Street. 1s.

Articles in this issue are: "The outlook for 1929"; "Rubber Markets"; "The World's Roads"; and "Rubber in Ceylon and the Dutch East Indies."

Motor Transport Fundamentals—International Series. (New York) National Automobile Chamber of Commerce, 366 Madison Avenue.

American suggestions for the relief of traffic congestion are here published in four parallel columns, in French, German, Spanish and English.

Prospettive Economiche, 1929—*VII "Energia Idroelettrica."* (Milan) Opera Edita Sotto Gli Auspici della Università Bocconi.

A survey, in Italian, of the position and prospects of hydro-electric power production.

Handbuch der Internationalen Petroleum Industrie, 1929. Edited by Dr. Oskar Tokayer. (Berlin) Finanz-Veilag. G.M.B.H., Neue Friedrichstrasse 47. Rmk. 40.

A very exhaustive handbook in German. The usual information is given about every important company directly or indirectly connected with petroleum products. The companies are grouped under their respective countries.

Deportation et Travail Forcé des Ouvriers et de la Population Civile de la Belgique Occupée. Par Fernand Passelecq. (London) Oxford University Press, Warwick Square. 10s. 6d. net.

Published by the Carnegie Endowment for International Peace, this is a very well-documented account of forced labour in occupied Belgium.

L'enseignement du droit en France et aux Etats-Unis. By Robert Valens.

and

L'enseignement du droit comme science sociale et comme science internationale. By Edouard Lambert. (Paris) Marcel Giaid, 16, Rue Soufflot. 65 fr.

A comparative study in French of the systems of law teaching of France and the United States respectively.

Danmark under Den Store Krig. By Einar Cohn. (London) Oxford University Press, Warwick Square. 14s. net.

This is an economic history of Denmark during the war, published in Danish.

Island under og efter Verdenskrigen. By Thorstein Thorsteinsson. (London) Oxford University Press, Warwick Square. 3s. 6d. net.

A study, in Danish, of Iceland during and after the war. This volume belongs to the Carnegie Endowment for International Peace series.

The Stock Exchange.

BRAZIL'S BORROWING STATUS.

GUESTS of every nationality are made welcome in the London capital market, provided they settle their bills promptly and have either a comfortable personal estate or the promise of one in due course. Cosmopolitanism in this branch of the "catering" industry is shown by experience to be a paying proposition, but while the management may be desirous of maintaining that policy as far as possible, they are bound to ask themselves from time to time whether Country X is not drawing rather generously on the market's hospitality, whether the Colonial gentlemen in the Trustee suite or the South Americans on the upper floors are fully aware of the proportions their accounts are reaching, and, possibly, whether the increased demand for accommodation for home clients may not make necessary some restriction of the floor-space available for foreign boarders generally. Whether "restriction" on these lines is a practicable economic policy for other than short periods is an open question, but the perennial and quite legitimate concern of the higher financial authorities with such questions both emphasises the desirability of examining the borrowing record of individual countries, and robs the process of any suggestion of invidiousness. The conclusions of the British Economic Mission to Australia were recently reviewed in these columns. We now propose to transfer the methods there employed to a fresh continent, by setting out some of the leading features in the situation of another borrower of considerable importance to British investors—the United States of Brazil.

The extent to which Brazil has availed herself of outside help in developing her vast patrimony may be inferred from a few leading figures. Approximately £270,000,000 of Brazilian securities of all kinds are quoted on the London Stock Exchange. The total external debt of the Central Government, reduced to terms of pounds sterling, may be expressed at about £145,000,000. Particulars of the debts of the different States are difficult to obtain, but on the basis of an investigation recently carried out by the Bank of London and South America, we are inclined to put the total at a minimum of £65,000,000. Various "funding" schemes have been found necessary from time to time, but the rehabilitation of the credit of the Republic was completed with the resumption of sinking fund payments on the external debt in 1927, though the record of some of the States and Cities is more doubtful, a number continuing to figure in the defaulters' list. That Brazilian credit has recently improved, but is still viewed with a certain conservatism among British investors, may be seen from the following table of quotations and yields on a number of representative stocks :—

	Price. End of February. 1926.	1927.	1928.	Feb., 21, 1929.	Yield at last price.† £ s. d.

*Ex dividend. ‡ Issue Price. † Including profit on Redemption. § Flat yield. No allowance for redemption.

The attitude of many investors towards the question of Brazilian borrowing may be summed up by saying that while they recognise the almost boundless possibilities of wealth with which nature has endowed the country, and the evident desire of the Brazilian authorities to honour their present engagements in the spirit and the letter, they are not completely satisfied with the progress made in the exploitation of the natural resources, the fruits of which must, in every relatively undeveloped country, provide both the justification for the incurring of capital obligations and the wherewithal for meeting them. On an area covering nearly half the South American Continent, with a seaboard of over 4,000 miles, Brazil supports a population which has increased by 50 per cent. since 1912, but is still only a third of that of the U.S.A. As only a thirteenth part of the whole area enjoys a temperate climate, the greater part falling within the Torrid Zone, it would be unfair to insist on comparisons based on relative areas : but as over 60 per cent. of the country even now consists of virgin forest, civilisation has evidently a considerable way still to go. Brazil's exports average £2,880 per thousand of her inhabitants, as compared with £8,200 in the case of the United States, £14,920 in Argentina, and £11,950 in Chile. She has 0·82 kilometres of railway per thousand people, against 3·40 in the United States, 3·55 in Argentina, and 2·16 in Chile. Her highways (excluding the streets of towns and cities) extend to 2·05 kilometres per thousand of her population, as compared with 40·65, 2·88, and 9·98 kilometres respectively in the three countries mentioned. These comparisons are significant, since transport facilities are generally recognised as the key to extensive colonisation in a "new" country. Of similar importance is the fact that in Brazil there are approximately four motor vehicles per thousand people, against 197 in the United States, 25 in Argentina, and 5 in Chile.

So far as these figures are indicative of underlying economic conditions, it would seem that not only will Brazilian development not bear comparison with that of the leading "new" country of the world, but that she is actually less advanced than her South American neighbours in the so-called A.B.C. group. This, of course, is no argument against the provision of fresh capital for her requirements; it may, indeed, measure both the necessity and the potential productiveness of such a policy. On a very different footing, however, is the contention that Brazil's whole economic structure is precariously based on a single commodity, maintained at a high price level by artificial means. In 1913, exports of coffee accounted for 62 per cent. of Brazil's total exports; over the last five years the proportion has averaged 73 per cent. The policy of holding back coffee to "steady" the market, with the aid of foreign capital, was incepted by the State of San Paulo as far back as 1906. The original loans have been paid off, but further borrowings have subsequently been effected, so that a very large sum representing payment of interest on foreign money must be added to the cost of production of each year's crop. Whereas the total coffee stocks in the interior of San Paulo had been reduced a couple of years ago to 5,990,000 bags (of 60 kg.), the total was estimated to have risen, at the end of last year, to 12,600,000 bags—an amount equal to about half an average world crop. "Valorisation" may be defensible as a means of obviating violent price changes due to the not uncommon sequence of heavy and light coffee crops, but so far as it aims at the continued exploitation of a monopoly it is a decidedly insecure foundation on which to build the permanent welfare of a great nation. In a normal year Brazil still contributes two-thirds of the world's coffee crop, but the production of her competitors, including the Dutch East Indies, Colombia and Venezuela—who obtain all the benefits of the scheme *gratis*—has risen from 8,726,000 bags in 1925-26, and 8,140,000 bags in 1926-27, to 9,911,000 in 1927-28, and an estimated total of 10,041,000 in the current crop year.

British observers readily admit that, judged by short-term standards, Brazil's position has recently shown a marked improvement. Budgetary surpluses have replaced the deficits of earlier years and the floating debt has been reduced. Last year was a good coffee year, and the national exports of all kinds reached a higher total than for many years past. The country has at last more or less adjusted itself to a milreis stabilised in 1927 at 5 29/32d.—a rate first enacted when the exchange stood at 7½d., apparently for no better reason than that 5 29/32d. was the arithmetic mean of the rates prevailing during the years 1922–26. The political situation, moreover, appears to be more stable than a few years ago, when internal strife and attempted revolution had impaired Brazilian credit abroad.

Without detracting, however, from the value of the work accomplished under the existing President, Dr. Washington Luis, the potential investor is called upon to take a longer view, and to ask whether Brazil has yet succeeded in living up to her great opportunities and basing her prosperity on an enduring foundation. He will inquire, for instance, as to the steps taken to give effect to the recommendations of the influential British commission which visited Brazil in 1925, particularly as regards the administration of the railways, the necessity for continuity of policy as between an existing Government and its successor, and the desirability of encouraging the cultivation of cotton and other products so as to reduce the dangers of over-dependence on a single artificially controlled commodity. He will ask whether a country in Brazil's position can afford the luxury of an import tariff among the highest in the world, designed to foster industries which—with the possible exception of cotton textile manufacture—are non-indigenous to her soil.

Sooner or later, the London capital market and Brazil herself will be called upon to consider the all-important question, which has not as yet been squarely faced, as to how far the institutions typical of a "Western" civilisation are applicable to a country lying mainly in the tropics. Her geographical position is, at bottom, the main factor distinguishing Brazil's problems and opportunities from those of the United States of America, of her sister republics Chile and Argentina, and, say, of Australia. Of the 691,700 immigrants which swelled her population in the ten years ended 1926, nearly two-thirds were of Southern European origin, and only approximately 10 per cent. of "Nordic" type. Which system is the more appropriate to a country in Brazil's situation: that of Western Europe, the United States and other countries in the "temperate" zone, or that of, say, the Dutch East Indies? The question is fundamental, and all concerned would do well to consider its implications.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

TICKET. March 5.	ACCOUNT. March 7.

AT last there is evidence that securities of an investment character are beginning to recover from the shock of dearer money. Business for a new Account remained very light throughout the week, and probably the gilt-edged market benefited by the lack of attraction elsewhere. Purchase by the Bank of gold in the open market was also duly noted. An unusually quiet week on Wall Street was the reason why the Anglo-American leaders absorbed less than their ordinary share of attention. Home Railway stocks for once did not prove an exception to the general rule, but with the rest remained quietly firm after the effect of last week's dividend announcements had worn off, as it soon did. A good rise in the price of the commodity made rubbers as strong and interesting a section as any.

A more hopeful view being taken of the monetary outlook, gilt-edged securities showed some recovery, the market being none too plentifully supplied with stock. After some irregularity the New York exchange was firmer, and conditions in Lombard Street were less stringent than had been anticipated. A quiet but steady business was done in the Three and a-Half and Four and a-Half Conversion Loans, War Loan and Four Per Cent. Consols. Victory Bonds, exceptionally, were on offer throughout the week. India loans were quiet, without definite trend, apart from the new Four and a-Half per Cents., which declined to 2¼ discount. Commonwealth stocks were similarly uninteresting, though Australia Five per Cent. scrip again touched par.

Despite its full subscription, the new Rumanian Loan opened at 1 discount, subsequently improving to ⅜ discount. Business in the Foreign market generally was inactive to the point of dullness, particularly as regards Chinese and a number of European issues. The liquidation of Peru Corporations, however, came to an end, a modest recovery being recorded in mid-week.

Home Rails opened inauspiciously, Monday's quotations in some cases falling below pre-dividend levels. The publication of the Great Western and Southern reports encouraged a small amount of inquiry, and the steadier tendency was not upset by the current traffic figures, showing a decline in revenue on all four group lines—a by-product, in part, of the abnormal meteorological conditions of last week. Business, however, remained of decidedly meagre dimensions. The request for more frequent information regarding net, as distinct from gross, traffic receipts deserves every support—in the interests of the railway managements as well as of shareholders—the benefits of early intimation of important "economies" being obvious. Apart from scattered realisations, the Foreign Railway market was featureless. The week's Argentine traffic figures made an indifferent showing, and dullness was common to most of the group. San Paulo again lost ground, and International of Central America suffered a sharp relapse.

Industrial stocks gave the new Account an uninspiring send-off, after the week-end reaction in Wall Street, but bear covering and a cautious recrudescence of speculations gave the market a better appearance as the week progressed. Interest chiefly centred in public utility stocks, including those of electric light and power companies at home and abroad, and of a number of foreign gas companies. Courtaulds had a slightly better tone, and the satisfactory report of the Bradford Dyers (described in a later "Investment Note") was reflected in a rise of 1s. on Tuesday. Margarine shares shook off their recent dullness, and match shares were in demand. Newspapers attracted little attention, shipping issues were quiet, and breweries irregular. The plain speaking of the chairman at the Imperial Tobacco meeting (described on a later page) was not without effect on values, though hope continued to spring eternal in some breasts. Marconis reacted after a tentative rise. Apart from an improvement in Leyland, on the report and the dropping of the capital reduction scheme, the motor group was quiet, and no clear trend was discernible among iron and steel shares. Despite the consistency shown by store profits in the reports now appearing, only a moderate business was done in that section. The firmness of insurance shares was a noteworthy feature throughout the week.

The recovery in rubber shares, which had been hanging fire for a week or two, again assumed prominence on the rise of the commodity to over 1s. a pound. The movement receives special treatment in a subsequent "Note." Dealings in the commodity tended to be erratic, a gain of ¼d. on Tuesday being lost on the following day. Orders came in steadily for rubber shares, but symptoms of enhanced "selectivity" were evident on the part of numerous buyers. "Mixed" tea and rubber companies hardened in sympathy with rubber's rise, but business in the tea market proper was limited, quotations showing a tendency to fall away. Oil shares were heavy and unsettled at the opening, but revived on news of a decrease in American crude production and the more hopeful sentiment of Wall Street. Eagles were bought in Paris, and Anglo-Persian recovered after initial weakness.

Mining markets shared in the general condition of early dullness and moderate subsequent interest, though Kaffirs were possibly the least affected by the latter tendency, neither Paris nor Johannesburg sending over much business. Rumours of consolidations imparted a show of activity to the diamond section. Rhodesians recovered a shadow of their recent animation, partly on optimistic

rumours and partly on the "Chartered" report (discussed on a later page), which induced American buying. Tin shares were irregular, following the course of commodity prices, but copper shares gained ground, on balance, with the conspicuous exception of Rio Tinto.

FOREIGN STOCK EXCHANGES.

NEW YORK.

There was a more cheerful sentiment in the share market on anticipation of the discount rate remaining unchanged and on the further drop in brokers' loans, which is hoped in speculative quarters to satisfy the Reserve Board and ward off a rise in the rate. Easier money will probably vanish next week on the month-end settlements. The Reserve statement shows a cessation of sales of Government securities, but a continuance of the drop in bill holdings which are now on the level of a year ago. The decline in brokers' loans has substantially reduced borrowing at the Reserve, which is all taking place here against some increase elsewhere. The Reserve Board is scarcely likely to allow the bull market to hit up its old stride now without taking action by raising the discount rate, but there is strong opposition within as well as without the Reserve Board in favour of no change.

PARIS.

The recent irregularity of the Bourse must be explained by the contrary factors by which it seems to have been influenced. The lowering of the contango rate to 3¾ per cent. at the mid-month settlement and the success of the Caisse d'Amortissement conversion and consolidation loan disclosed a sound monetary position. On the other side, prolonged uncertainty concerning the London and New York markets, abnormal fluctuations in one of the most outstandingly speculative groups, and even the subscription to the loan, which ought temporarily to have diverted available funds, all combined to depress the general tone of securities. Firmness was noticeable, however, in Suez, Forges et Aciéries du Nord et de l'Est, Mines de Lens, Compagnie Parisienne de Distribution d'Electricité, and the whole of the rubber section.

BERLIN.

Although money rates advanced a week ago, the Bourse was firm and somewhat more active. Short sellers bought in, and there was a revival of foreign buying. Monday began with a decline, and artificial silk stocks and Polyphon were sold. Owing to another advance in the private discount rate, the third within a week, Tuesday, after a firm opening, ended undecided and inactive. On Wednesday and Thursday the market was weak and dull, with selling of potash stocks in evidence.

AMSTERDAM.

Business during the past week was on a larger scale than for some time past. Interest was chiefly centred on rubber and artificial silk shares, the latter on the international agreement for price regulation made at the Paris conference. Sugar shares were firm on the lower taxation of the Cuban crop, though business was limited. Oils were weak, and tobaccos irregular. On Thursday the Bourse was firm generally. The money market was easier.

INVESTMENT NOTES.

The Position in Wall Street.—The monetary outlook is becoming more rather than less confused, cables our New York correspondent. The prevailing uncertainty is having its effect on the stock market, all but professional speculative business being restricted. While there is as yet no pressure of liquidation on the part of the public, prices are generally lower. The major investment interests, as well as the large stock market operators, are either keeping out altogether or standing by until the situation becomes clearer, and the volume of trading has fallen in consequence below 3,000,000 shares daily as compared with 4,000,000 to 5,000,000 during the period of rising markets. It is not believed that the New York Federal Reserve bank rate will be raised, unless the stock market makes a new advance with heavy public participation, or the trend of brokers' loans again turns upward. It is possible, however, that the reserve banks in the interior of the country will increase their rates, Minneapolis, Kansas City, Dallas and San Francisco still having rates of 4½ per cent. In the meantime, there are definite indications that the Federal Reserve authorities are determined to reduce the volume and increase the price of credit by stringent action in the bill market and by sales of Government securities. The policy of allowing bill holdings to run off has resulted in a rise in rates above the official discount level. There is some expectation of a further rise, the occurrence of which would increase the probability of a higher discount rate. Call money has been plentiful this week, but the effect will shortly be felt of month-end requirements and preparations for the March 1st settlement and mid-March income tax payments, and a fresh "run-up" of rates is looked for. The further outlook depends on the extent to which brokers' loans continue the decline initiated last week with a drop of over $100,000,000, and the probability of general business maintaining its rapid pace.

Rubber's New Rise.—At the end of last week "spot" rubber in London touched one shilling a pound for the first time since the beginning of last April, when the decision to abandon restriction was first announced. The present price is 1s. 0½d. The rubber share market has simultaneously been roused out of its prolonged lethargy, and become one of the most active parts of the "House." Some idea of the recent vicissitudes of typical share values may be obtained from the following table, which shows prices (*a*) on the eve of the announcement that the future of the restriction scheme was being examined by the Committee of Civil Research; (*b*) before the decision to abolish the scheme; (*c*) before the present upward movement in commodity prices was initiated, and (*d*) at the present time :—

Shares of £1.	Stock Exchange Quotations. Beginning Feb., 1928.	Beginning April, 1928.	Jan. 10, 1929.	Feb. 21, 1929.	Yield at last price.

		3⅛	3⅛	4⅛	4 14 0

The consistency with which rubber confounds the prophets suggests that the market's intelligence system relies rather less on ascertained fact and rather more on prevailing sentiment than is desirable, but on the present occasion the wisest of observers might well have been led astray. Broadly, when the repeal of restriction became effective, four months ago, the plantation industry was faced with two crucial problems, the first of temporary, the second of more permanent significance. How could the market dispose of the large stocks which, it was believed, were waiting to be shipped from British estates on November 1, without depressing prices? The stocks in question were believed to represent an addition of from 40 to 50 per cent. to normal visible supplies, or from two to three months' world rubber consumption. Providing this problem were satisfactorily disposed of, how could the industry bridge the gap between an "unrestricted" annual rubber output of about 700,000 tons and a world consumption of approximately 625,000 tons? In effect, America's increased demand has gone far to suggest a solution of both problems, the British Government, in removing restriction at the moment it did, having acted much more wisely than its best advisers were aware. American rubber consumption rose from 370,000 tons in 1927 to 441,000 tons in 1928, a result due in part to the stimulus of lower prices, in part to the activity of business generally, especially in the latter half of the year, and in part to the re-entry of Mr. Ford as a large-scale motor-car producer, after a prolonged suspension. The tendency on the part of some rubber publicists, however, to budget for a further large increase in American consumption during 1929 is, to say the least, premature. Past experience suggests that demand in that country seldom shows a steady upward curve, but is more or less stationary for a year or two after every marked rise, while the ground won is being "consolidated." The reclaimed rubber industry, moreover, has apparently come to stay, the last Census of Manufactures showing that the proportion of reclaimed to crude used in American factories was as high as 49 per cent. Finally, the rise in crude rubber consumption last year must be regarded as a *gross* rather than a *net* quantity, since the number of motor tyres in stock in the United States increased during 1928 by an amount sufficient to equip two months' production of the whole automobile industry of the country. The investor should also bear in mind the fact that numerous British companies have made forward contracts over 1929 at lower prices than those now prevailing, so that considerable discrimination is called for in the purchase of rubber shares at the moment.

American Acquisition of British Utilities.—We have recently noted the absorption by American interests of various public utility companies in Central and South America formerly owned by British interests—in particular, the Electric Bond and Share Company's acquisition of Pernambuco Tramways, the Mexican and Chilean holdings of the Whitehall Electric Investments and the Argentine holdings of Atlas Light and Power. We have now to record the expansion of American interests in the public utility field in Great Britain. Utilities Power and Light Corporation, which is one of the leading American systems, has acquired the entire ordinary share capital of seven British power companies—Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Company, Cambridgeshire and District Electric Corporation, East Anglian Electric Supply Company, Edmundsons' Electricity Corporation, Oxford Electric Company, Wessex Electricity Company and Western Electricity Supply Company, together with subsidiary interests in other power companies

including the North Metropolitan Electric. These holdings have been acquired through the Greater London and Counties Trust, the entire ordinary share capital of which (£300,000) is owned by Utilities Power and Light. An official of the American company has stated that extensions and developments which were necessary in the areas served by its English subsidiaries would require within five years an expenditure of £10,000,000, affecting 95 cities and towns in England and Scotland. Lord Birkenhead has apparently accepted (on the telephone) the chairmanship of the Greater London and Counties Trust, and has stated (if the telephone again is to be relied on) that he believed the use of American funds in the field of public utilities in England to be greatly in the national interest. Lord Birkenhead is said to have emphasised the fact that British industries would remain under British control, but presumably he referred to British management and the control laid down by British Acts of Parliament. Control of policy of these British companies would, of course, remain with the American board of directors of the Utilities Light and Power sitting in Chicago.

Imperial Finance and Canada.—In the *Economist* of January 19th last we discussed a review of Imperial finance issued by a well-known Stock Exchange house. A second review has now been issued, in which an analysis is made of the loans raised by the various British Dominions and Colonies between 1900 and 1928. The analysis shows that, while "business" (*i.e.*, industrial, commercial and utility) loans within the Empire have been on a much smaller scale than before the war, Government loans have increased—the latter fact being attributed to the very heavy borrowing of the Australian Commonwealth and State Governments, and the former to the "Americanisation" of Canadian finance. The amounts raised in the London capital market by Canada for business purposes during the last ten years have averaged £2,164,000 a year against £19,859,000 in the decade which ended in 1914. There have recently been signs, however, that London is likely again to play a part in this connection. This week, for example, a new Canadian finance company, the Consolidated Investment Corporation of Canada, which has been formed under the auspices of Messrs. Wood, Gundy and Co., has placed 80,000 5 per cent. cumulative preferred shares of $100 each (carrying warrants for common shares) in London among the important finance houses. This Corporation has been formed to finance industrial developments in Canada and will start with cash resources of $32,000,000. There should be good opportunities for the investment of British funds in Canada in view of the "record" trade and economic activity which has recently prevailed in the Dominion, and further developments along similar lines will be awaited with interest.

American Share Values—A New Service.—With every week that passes in the security markets, the implications of the interaction of London and New York become increasingly evident. To make any calculation as to the probable course of a single active British security without allowing for the effect of American intervention is admittedly to court disaster. Of even greater concern to the market are the wider forces which govern the Wall Street situation at a given moment—a fact exemplified by the tense interest with which observers on this side have followed every movement of the Federal Reserve authorities in New York during the past fortnight. To measure the fluctuations of every stock quoted in New York is obviously impracticable, but many observers are accustoming themselves to the use of index numbers, which show the average movement in a number of representative stocks, expressed as a percentage of a "base" figure. For the convenience of those of our readers who desire to follow contemporary movements in the American markets, we have made arrangements for the cabling of a series of index numbers of recognised authority in the United States, prepared and copyright by the Standard Statistics Company, Inc., of New York and 13, Copthall Avenue, London. The figures will show the price fluctuations of 392 common stocks, arranged in three main groups—industrial, railroad and public utility stocks—and will be computed as at the close of business on the Thursday of the week previous to that in which they appear. The recent course of these figures is shown below:

AMERICAN SECURITY VALUES.
(1926 = 100.)

	1927.		1928.		1929.		
	Lowest.	Highest.	Lowest.	Highest.	Beginning of Jan.	Feb.	Middle of Feb.
324 Industrials....	104·7	137·1	132·5	186·4	182·8	197·1	191·9
33 Rails	106·1	128·0	120·5	139·7	140·9	145·3	141·2
35 Utilities	103·3	128·3	128·3	180·6	184·6	210·0	220·2
Total, 392 Stocks	104·7	134·1	130·3	178·9	182·8	191·6	186·3

In spite of the setback during February, American security values are, on the average, still nearly 80 per cent. above the lowest point touched in 1927. By contrast, the *Banker's Magazine* index shows an average rise in 278 British "variable dividend" securities of only 18 per cent. since January, 1927. Comparisons cannot be pressed too closely, but it would, nevertheless, appear that the increase in American values has considerably outstripped that of British securities. The Standard Statistics Company's indices will appear in future issues of *The Economist* in the section devoted to Foreign Stock Exchanges, under the heading "New York."

"Chartered" Company.—The financial results published by the "Chartered" Company for the year ended September 30 last contain few surprises. An increase of £26,379 in revenue from dividends and interest, and a welcome profit on the estates, after several lean seasons, of £34,450, against £9,472 last year and a loss of £43,046 the year before, explain a good rise in total net profits. On the other hand, the balance of profit on realisation of investments—a naturally variable item—is down from £122,591 to £86,858. Expenses are considerably reduced. Earnings and distribution for the last three years are shown below in tabular form:—

Years ended September 30.	1926.	1927.	1928.
Net profit	£ 539,128	£ 526,915	£ 569,920
Dividend { earned	10·1%	10%	10·3%
Dividend { paid, less tax	10%	10%	10%
Dividend { amount	529,737	525,630	550,269
Increase in carry-forward	+ 9,391	+ 1,285	+ 19,651

Few variations appear in the balance sheet, a summary of which will be found on a later page. The value of shares and debentures held is now entered at £6,332,272, comprising more than half the gross assets, and explanations annually given in a note make it clear that this is an undervaluation. The corresponding figure last year was £6,028,903. Net liquid assets are reduced from £623,043 to £383,449, but that leaves out of account an undisclosed sum invested in first-class securities. By far the most notable aspect of the current report is naturally the development that has taken place in the Northern Rhodesian copper fields. As a result of the year's prospecting, the series of sedimentary rocks, carrying a high percentage of copper for that type of deposit, have been traced over large areas. The report refers to a strike distance of 35,000 feet of these beds, with an average thickness of 30 feet, as having been proved by boreholes and underground development to contain a high-grade ore. Many more miles of outcrop have been traced but not yet proved. At the Roan Antelope and N'Kana mines actual ore reserves have been computed totalling together 50,000,000 tons, with an average grade of 3·65 per cent. copper, while other development work indicates a further 100,000,000 tons of ore of similar or better grade. The total recoverable copper contained in this tonnage might be supposed to amount to 4,500,000 tons, which, at the low valuation of £60 a ton, would be worth more than £250,000,000. This is, in fact, equal to more than one-quarter of the total value of gold won from the Rand up to date. The "Chartered" Company, besides receiving royalties on the copper and being interested through its shareholdings in the profits made in mining it, clearly hopes to benefit by the industrial development of the country which would be likely to follow the opening-up of the mines. It should, of course, be remembered that, though the existence of rich copper deposits is known, unexpected difficulties in exploitation must always be allowed for. The report stimulated "Chartered" shares, which have risen to 40s., and at that price give an apparent yield of £3 15s. per cent.

Imperial Tobacco Company.—The views of those who expect the Imperial Tobacco Company to maintain last year's rate of dividend on its increased capital received correction at the hands of the Chairman at the general meeting of the Company on February 19th. Last year the Company increased its cash dividends from 25 per cent. to 26 per cent. tax free and by a capital bonus distribution increased the number of its ordinary shares by one fourth. The views of the Chairman were expressed as follows:

> "During the year under review our trade largely increased and I am glad to say that we are still progressing. But to forecast a sudden leap in our prosperity such as would enable the company to increase the amount distributed in dividends on the ordinary shares by one fourth would be a flight of optimism in which I am not prepared to indulge."

What then, is a reasonable estimate to take of next year's dividends? In the last four years the net profits of the Imperial Tobacco Company have shown an average increase of £307,659 per annum. If the same average increase is shown in the year ending October next, the net profits should amount to £9,907,365, or £9,055,156 after allowing for preference dividends, which would be equivalent to 24·19 per cent. on the increased ordinary capital of £37,439,621. Last year the directors distributed in dividends 89 per cent. of the net profits remaining after payment of preference dividends. If they distributed this year again 89 per cent. of the surplus profits, estimated at £9,055,156, they would be able to pay a dividend of approximately 21½ per cent. tax free on the increased capital. The chairman refused to tell sharcholders the value of the investments in associated companies, or the percentage of profits derived from them, but he stated that these investments stood in their books at considerably less than their actual value. In the last balance-sheet, this item stood at £8,811,033, a very large part of this amount representing the holding in the British American Tobacco Company which measures the Imperial Tobacco Company's share of the export trade. It will be recalled that last year the British American Tobacco distributed to its shareholders free shares in the Tobacco Securities Trust. The Chairman of Imperial Tobacco stated that it was against the Company's interest to divulge the number of shares it held in British American Tobacco, but if Imperial Tobacco retains approximately the one-third interest which it took up when the British American Tobacco was formed in 1902, it would have been entitled to receive 979,150 ordinary shares of £1 and 979,150 deferred shares of 5s. in the Tobacco Securities Trust, which at the present market valuation would be worth well over £5,000,000. The next balance-sheet of the Imperial Tobacco Company will therefore contain probably as large hidden reserves as the balance-sheet of October 31st last. It remains to be seen whether the market, in valuing Imperial Tobacco shares, will pay due regard to the possibilities of a future share bonus, or whether it will consider only the possibility of a reduced rate of dividend of say, 21½ per cent. tax free. The Ordinary £1 shares have recently reacted from 133s. 6d. to 131s.

Bradford Dyers.—A substantial and welcome recovery in earnings was reported a year ago by the Bradford Dyers' Association, and the accounts for 1928 show that the movement has steadily continued. It will be seen from the table that more than three times as much was actually earned on the ordinary capital in 1928 as in 1926, and the dividend is now increased from 2s. to 2s. 3d. on the £1 shares. Considerable allocation to reserves is recommended for the first time since the bonus share issue in 1925, and though that necessitates drawing on the carry-forward, the latter still amounts to as much as £378,851.

For benefit of employees	...	...	10,000
Increase or decrease in carry-forward	– 74,386	+ 86,393	– 184,171

In the balance sheet, which is summarised on a later page, few changes occur. Land, buildings, goodwill, etc,. are written down from £4,860,784 to £4,746,681. Investments and loans are up from £2,230,969 to £2,288,434, and cash from £251,578 to £323,185. Creditors are reduced from £809,335 to £609,107. Reserves now aggregate £967,036. At their present price of 2¼ the £1 ordinary shares yield exactly 5 per cent., less tax.

John Barker.—The report and full accounts are not yet available, but Barker's preliminary profit statement goes to confirm the view that the great London stores have enjoyed a not unsatisfactory year. The figures, which are subject to final audit, show that the position has been more than maintained, so that after paying a 20 per cent. dividend for the tenth year in succession the company finds it possible to write £41,267 off fixtures and fittings (in view of the rebuilding programme) and £20,000 off goodwill—an item which is likely to disappear altogether in a year or two—and to place another £100,000 to the rebuilding and modernisation reserve, which stood in the last balance-sheet at £200,000. The usual £10,000 is allocated to the pension and benevolent fund. The increased aggregate appropriation to reserves is noteworthy.

Year ended January 31st.	1926–7.	1927–8.	1928–9.
	£	£	£
Net profit, after paying debenture int.	429,434	431,170	444,901
5½% preference dividend	10,175	10,175	10,175
6% preference dividend	36,000	36,000	36,000
Ordinary { Earned	34·6%	34·7%	36·0%
Ordinary { Paid	20%	20%	20%
Ordinary { Amount	221,266	221,266	221,266
To reserves, etc.	150,590	162,220	176,267
Increase in carry-forward	+11,403	+1,509	+1,193

In the last balance-sheet the reserve for general purposes stood at £827,000, and is not presumably being increased; the carry-forward now amounts to £291,010. Out of the rebuilding reserve £150,000 is to be applied forthwith to write down the book value of such premises as are involved in the rebuilding scheme. Doubtless further information about the progress of rebuilding arrangements will be given when the report appears, and it will be possible to view the extent of the available reserves in relation to the heavy demands likely to be made on them by the reconstruction of Kensington High Street. At their present price of 3 11/16 the £1 ordinary shares yield £5 8s. 9d., less tax.

Bovril.—The Bovril report for 1928 shows few outstanding changes. Sales have again been very satisfactory, say the directors; in 1927, it will be remembered, they exceeded all previous records. Attention is drawn in the report to the increase in net profits in spite of a further rise in the cost of "raw material," and it is true that a gradual fall which had been going on for the previous two years has now been checked. But it must be taken into account that £400,000 more capital, raised by 5½ per cent. eight-year notes which were heavily over-subscribed, was available for part of the last financial year. Gross trading profit has increased from £580,143 to £582,508. Virol, Limited, in which the company holds a controlling interest, continued to pay a 22½ per cent. dividend, as it has done regularly since 1925; but for the second year in succession the total income from subsidiaries has diminished, this time from £61,875 to

£54,190. The difference is more than set off by a reduction in working and other expenses.

Years ending December 31.	1926.	1927.	1928.
	£	£	£
Net profit	380,661	360,524	366,898

To reserve	75,000	64,507	60,000
Increase or decrease in carry-forward	+ 1,661	− 7,975	− 7,475

The balance-sheet, a summary of which is given on a later page, shows a considerable increase in the valuation of "stock of cattle, raw materials, and manufactured products," the figure being £1,950,613, against £1,614,599. The holding of cash has been strengthened from £131,881 to £182,024, and bills payable are reduced from £110,000 to £30,000. The reserve now stands at £1,160,000, more than one-quarter of the total share and loan capital. We presume that the recent weather has been a bull point for Bovril, Limited, but for forecasting the future of the company that is a more ephemeral consideration than the price of materials. At their present price of 2 1/16 the £1 deferred shares yield £6 6s. per cent.

The Reaction in Northern Rhodesians.—Our Mining correspondent writes: This group of shares has recently enjoyed two spells of strength and activity under the influence of the schemes for the financing of the Bwana M'Kubwa Copper Co., and, secondly, of N'Changa. That a partial reaction should lately have been in progress should afford no ground for surprise. Quotations had in most cases been pushed ahead to a level discounting the results which may be secured in two or three years' time. The following table shows how the current prices of various shares compare with the highest levels touched this year and with the extremes of 1928:—

	Highest 1928.	*Lowest 1928.*	*Highest 1929.*	*Current price.*
	s. d.	s. d.	s. d.	s. d.
Bwana M'Kubwa (5s.)	14 3	3 10½	25 0	21 1½
Chartered (15s.)	35 3	25 7½	43 0	40 0
Loangwa (5s.)	5 6	3 6	8 0	6 7½
N'Changa (£1 with 17s. 6d. paid)	33 3	9 3	92 6	81 3
Rhodesian Anglo-Amer. (10s.)	28 1½	24 4½	36 3	31 3
Rhodesian Congo Border (£1)	61 6	16 3	103 9	95 0
Roan Antelope (5s.)	40 7½	23 9	53 1½	46 3
S. Rhodesia Base Metals (£1)	28 9	4 7½	15 0	8 9
Wankie Colliery (10s.)	26 9	23 6	30 9	28 6

The Wankie Colliery is included in the list since it possesses a virtual monopoly of the supply of fuel for Northern Rhodesian requirements.

It will be seen that in the majority of cases present prices contrast somewhat startlingly with the best of 1928, while as against the worst they appear inflated. Conditions have, of course, undergone a drastic alteration, but it is more than probable that the market will experience many more vicissitudes before some of the companies reach the stage of actual production.

CAPITAL ISSUES.

CAPITAL issues by public prospectus or offer for sale represented this week a sum of £4,934,500, against £4,442,500 in the corresponding week last year, bringing the total for the year 1929 to date up to £65,393,428, excluding conversions. Issues by existing companies to their shareholders amounting to £1,482,500 were also announced, and new securities coming on to the market by way of notices "for public information only" accounted for a further £1,791,416 on the basis of the opening price in each case. There were no Government or municipal issues, but two companies asked for seven-figure subscriptions. *Foreign Railways Investment Trust* has Lord St. Davids as chairman and a board of three well-qualified directors, but as the underwriters were left with 84 per cent. of the public issue investors were presumably inclined to doubt whether foreign railways—a relatively compact group, with the Argentine lines inevitably forming a large part of the whole—offer that opportunity of risk-spreading which is the chief merit of a trust company. The *Decca Record Company* would seem to have obtained nearly 96 per cent. of the share capital of the old Decca Gramophone Company. The profit estimate adds the conjectural figure of £160,000 "estimated profit from records" to the actual past profits, £61,134. A further 192,000 £1 shares are under option. *Alexander Drew and Sons*, which has taken over a prosperous private business of calico printers and merchants, is a fair industrial preference issue; the prospectus gives lucid information in a refreshingly conservative tone. A share is offered to the public in another successful private enterprise, *Smith's Potato Crisps* (1929). The process of disentangling the various transactions leading up to the issue is by no means facilitated by the wording of the offer for sale. *H. Yager* (*London*) is a timber and manufacturing concern requiring additional capital for industrial development. *Pye Radio* similarly issues participating preferred as well as ordinary shares, but as participation is limited to a maximum 10 per cent. dividend the public obtains, in effect, about 15 per cent. of the equity after subscribing more than half the total capital. The company is the outcome of the splitting of an existing firm, which has done well in the past. *Direct Produce* (*London*) is buying up 48 greengrocery and other leasehold shops, mostly in outlying districts of London, which are stated to have made an aggregate profit of £42,781 last year. In view of this, a purchase price averaging £1,636 per establishment seems strangely modest. *Vendomatic*, capitalised in shilling shares, will "carry on business as universal providers" by means of automatic machines. There has been some discussion in the daily Press as to the exact position of the gentleman described in the prospectus as the company's technical adviser. *Clifford Motor Components* amalgamates two private companies manufacturing valves and piston rings and celluloid coverings. Separate figures are not given, but combined profits have been on a rising scale.

ISSUES OF THE WEEK.

By Prospectus or Offer for Sale.

Foreign Railways Investment Trust, Limited.—Issue of 200,000 £10 shares at 10s. premium, to be converted when fully paid into £5 of 5 per cent. preference and £5 of ordinary stock. New stocks will then rank *pari passu* with £500,000 5 per cent. cumulative preference stock and £500,000 ordinary stock already issued. The company was incorporated last December to carry on investment trust business in all its branches and particularly, but not exclusively, to invest in the securities of foreign railways.

Decca Record Company, Limited.—Issue at par of 1,000,000 (out of 1,250,000) £1 ordinary shares; 221,763 (out of 231,250) £1 7 per cent. cumulative preference shares are issued to vendors. The company links up a gramophone record factory with a gramophone selling organisation. The purchase price for the factory (valued at £152,699) and 354,822 out of 370,000 shares in the Decca Gramophone Company is £847,852, payable as to £626,089 in cash and £221,763 in shares as above. A further £3,208 is payable for interest and compensation. Profits of Decca company have been: (years ended April 30th) 1925, £40,540; 1926, £69,398; (11 months to March 31st) 1927, £55,535; (year ended March 31st) 1928, £61,002. Proceeds of present issue (subject to preliminary expenses) available as working capital are estimated at £359,420. A further 192,000 shares are under option, 92,000 at 22s. 6d. and 100,000 at 27s. 6d.

Alexander Drew and Sons, Limited.—Issue at par of 200,000 £1 7 per cent. cumulative preference shares. The company acquires the goodwill and trading assets of a private company of calico printers and merchants, with net assets valued at £390,374 (excluding goodwill). The purchase price is £390,000, payable as to £180,000 in cash and £210,000 in £1 ordinary shares. A further 10,000 ordinary shares are reserved for issue to employees. Profits have been (to March 31): 1925, £83,901; 1926, £50,315; 1927, £57,544; 1928, £94,099. The present issue will provide £20,000 for working capital, in addition to net liquid assets acquired amounting to over £155,000.

Smith's Potato Crisps (1929) Limited.—Offer for sale of 780,000 (out of 1,300,000) 5s. shares at par. The company acquired, as from September 30th last, an existing business whose net assets were valued at £159,105 (excluding goodwill), for the sum of £290,000 in shares, which shares were then sold to the promoters of the new company, who also subscribed for the remaining 140,000 shares at par.

H. Yager (London), Limited.—Authorised capital consists of 325,000 £1 8 per cent. cumulative participating (*pari passu* with ordinary to 10 per cent.) preference shares (150,000 issued), and 3,500,000 1s. ordinary shares (3,000,000 issued). Issue at par of a further 150,000 £1 preference and 300,000 1s. ordinary shares. The company was incorporated in 1927 to acquire a timber importing and merchanting and cabinet manufacturing business. Net assets, excluding goodwill, are valued at £415,560. Profits for 14 months ended November 30, 1928, were £60,189.

Pye Radio, Limited.—Issue at par of 150,000 £1 8 per cent. cumulative participating preferred ordinary shares and 150,000 (out of 600,000) 1s. deferred ordinary shares, the former to participate *pari passu* with the latter to a maximum of 10 per cent. The company acquires, as from April 1, 1928, the radio branch of a business of scientific instrument and radio apparatus manufacturers. Net assets acquired are valued at £63,863. The purchase consideration is £100,600 (£12,458 for goodwill), payable as to £82,100 in cash and £18,500 in deferred shares. Profits have been (to March 31st): 1926, £4,972; 1927, £6,730; 1928, £16,166; 9 months to December 31, 1928, £24,279. Working capital, subject to preliminary and issuing expenses, is estimated at £79,400.

Direct Produce (London) Limited.—Issue at par of 1,050,000 (out of 1,750,000) 2s. shares. The company acquires 48 fruiterer, greengrocer, and florist shops, valued at £102,246 (including goodwill), and intends to supply garden produce and to acquire and establish further businesses in the London area. The purchase price is £78,500, payable as to £53,500 in cash and £25,000 in shares. Net profit of the 48 shops for the year ended January 12, 1929, was £42,781. Working capital is estimated at £27,000.

Vendomatic, Limited.—Issue at par of 1,900,000 (out of 2,200,000) 1s. ordinary shares. The company acquires an existing business, and will deal in automatic machines and sell articles therefrom. The purchase price is £7,500 (of which £6,000 is attributable to goodwill), payable in shares. Working capital is estimated at £87,750.

Clifford Motor Components, Limited.—Issue at par of 620,000 (out of 850,000) 2s. shares. The company acquires the total share capital of two businesses, manufacturing valves and piston rings and patent celluloid coverings respectively. Net assets, excluding goodwill, are valued at £44,637. The purchase price is £45,000, payable as to £22,000 in cash and £23,000 in shares. Profits have been: 1925–26, £4,905; 1926–7, £7,162; 1927–8, £10,241. Working capital is estimated at £23,850.

Particulars of the following have been issued for public information only in connection with Stock Exchange "introductions":—**London and Strathclyde Trust, Limited**; issued capital £300,000 5 per cent. cumulative preference and £200,000 ordinary stock; £500,000 5 per cent. debenture stock, 1953-8, has been created, of which £220,450 has been issued at 95. **Savings and Economic Bank of Bihar, Limited**; issued capital 52,500,000 lei, in 420,000 shares of lei 125 each; holders have the option to re-sell their shares at 5s. 9d., as to series "A" in 1938 and as to series "B" in 1948; from 1924 to 1927 dividends at 19½ per cent. were paid, and 20 per cent. is guaranteed for the years 1928, 1929, and 1930. **Alliance Trust Company, Limited**; issued capital £700,000 4½ per cent. cumulative preference stock, £650,000 4 per cent. cumulative preference stock, £565,000 5 per cent. cumulative preference stock (including £250,000 new, sold at 92½), and £907,500 ordinary stock, together with £1,780,400 4½ per cent. debenture stock, £500,000 redeemable in 1965, £780,400 in 1956, and £500,000 in 1952, and £3,346,905 terminable debentures and interim loans; registered in 1888 as a mortgage and investment trust company; ordinary dividends have been: 1924-5, 23 per cent.; 1925-6, 24; 1926-7, 25; 1927-8, 25 per cent. and a 20 per cent. capital bonus in preference shares. **Société Sucrière Anonyme de Marie**; issued capital frs. 12,750,000 in 100-franc shares; incorporated in France in 1890 to acquire an old-established business of beet-sugar manufacturers; dividends have been: 1926 and 1927, 21 per cent. tax free; 1928, 33 per cent. less tax.

COMPANY MEETINGS, &c.

IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED.

SUCCESSFUL RESULTS OF THE YEAR.
INCREASED TURNOVER AND PROFIT.

The Annual Meeting of the Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held at Bristol, on the 19th instant, Mr. Henry Wills Gunn presiding in the absence of the chairman, Sir Gilbert Wills, Bt., who is suffering from influenza.

Mr. Gunn, in moving the adoption of the report and accounts, referred to the great loss the company had sustained by the death of Sir George Wills, and proceeded :

Taking the balance sheet, the first item, land, buildings, plant, and machinery at cost, less amounts written off, £4,922,663, represents a net increase of £93,223 over the previous year. With the expansion of our business this item must increase. Ample depreciation has been provided for, and in the opinion of the board the figure at which it stands to-day is well within its actual value. Goodwill and patent rights remain, as in previous years, at £9,422,581, which, having regard to the extent of our business, profits earned, and the great commercial value of our brands and trade marks, is a very conservative figure. The investments in associated companies show an increase of £430,926, and now amount to £8,811,033, and, as stated in the balance sheet, the aggregate market value of these investments is largely in excess of book value.

SHAREHOLDING IN BRITISH-AMERICAN TOBACCO COMPANY.

It is perhaps unnecessary for me to remind you that a very large part of this amount represents our shareholding in the British-American Tobacco Company, Limited. Since the date of this balance sheet the British-American Tobacco Company has distributed to its shareholders shares in a subsidiary company, and of these shares our company receives its due proportion. I would, however, ask you to realise that our holding in the British-American Tobacco Company represents our interest in overseas trade in our brands, and the value of that interest as a revenue-producing item is included in our profit and loss account. Loans to and current accounts with associated companies amount to £1,052,744, an increase over 1927 of £28,582. Stock-in-trade, including leaf in transit at approximate cost and advances to branches abroad for purchases of leaf, etc., amounts to £30,495,433, a decrease in the year of £390,099. It will be noted that stock-in-trade and payments on account of leaf in transit have been shown in one amount this year.

Debtors, after making ample provision for discounts to be allowed and doubtful debts, amount to £6,606,770, an increase of £57,960. Government and other securities, at cost or market value, whichever is lower, stand at £12,939,952, an increase of £960,082 over 1927. Cash at bankers and in hand amounts to £4,766,561, showing an increase of £344,134.

Turning to the liabilities side of the balance sheet, capital issued remains at the same figure as last year. Creditors (including current accounts with associated companies), provisions for taxation and bonus to customers, estimated capital liability under dividend guarantees, amounts set aside for contingencies and to meet fluctuations in value of leaf tobacco stocks, employers' liability, marine and other funds, amount to £14,628,828, a decrease of £3,697,876. This decrease is more than accounted for by the transfer of £4,000,000 to general reserve, as shown on the balance sheet.

TRANSFERS TO GENERAL RESERVE.

In view of the fact that our stock-in-trade is taken into our accounts at approximate cost, your directors have for many years considered that provision to meet fluctuation in the value of leaf tobacco stocks is essential. You will appreciate that our leaf is not used as soon as it is bought, but is matured until the most favourable condition for manufacture is attained. Now the extent of provision to meet fluctuations must depend upon the limits within which fluctuations are likely to occur. We had in the past a considerable period of fluctuating markets. In recent years, however, prices have tended to become stabilised.

In part, therefore, the provision that has been made is no longer necessary, and to that extent the directors have made the transfer to general reserve.

Further, as a result of recent changes in the basis of assessment to income tax, a portion of the provision for taxation is, in the opinion of the directors, no longer required. In these matters it is our invariable practice to act with caution and prudence. That practice has resulted in great financial strength.

The transfer of £4,000,000 already mentioned and the £500,000 transferred from profit and loss account increase the general reserve to £11,500,000, and after the increase in the issued Ordinary share capital, which later this afternoon you will be asked to authorise, the general reserve will stand at £4,012,075. The provision for pensions, etc., amounts to £3,141,015, showing an increase of £265,112. This increase is made up of £250,000 transferred from profit and loss account and the difference between interest credited to the fund and the pensions paid during the year. The last item on the balance sheet is the balance of profit and loss account, particulars of which will be found in the report and accounts.

PROFIT AND LOSS ACCOUNT.

The net trading profit for the year and interest and dividends on investments (including a very substantial sum derived from dividends on capital employed outside the United Kingdom), and after fully providing for all charges, depreciation of property and plant, bonus to customers, and taxation, amounted, with the item of transfer fees, etc., to £9,599,705, as compared with £9,227,796 in the previous year, an increase in 1928 of £371,909. I am confident you will agree that this result is gratifying. It is, in fact, even more satisfactory than at first sight appears, because it has been made possible by a largely increased turnover on a smaller rate of profit. On the debit side of the profit and loss account we have made allocations, as before, of £250,000 to pensions and £500,000 to general reserve, leaving a balance of profit for the year of £8,849,705, which is carried to the appropriation account.

DIVIDENDS.

Adding to this balance of £8,849,705 the undivided profit brought forward from last year of £959,042, there remains an amount to be dealt with of £9,808,747. Out of this the total dividends upon three classes of preference shares have been provided. Upon the Ordinary shares an interim dividend of 7½ per cent., free of tax, was paid on 1st September last, and it is now proposed, with your consent, to declare a final dividend of 11 per cent. and a bonus of 1s. 6d. per share, both free of income tax, being a total for the year of 26 per cent., which is an increase of 10s. over the dividend for 1927. After these allocations there will remain to be carried forward to the current year, as undivided profit, the sum of £1,169,097.

By the increase in issued capital which you are being asked to approve, the existing number of Ordinary shares is increased by one-fourth. I have noticed that it is assumed in some quarters that the company will be able to maintain the present rate of dividend on the increased capital. I would like to state quite definitely that I see no justification for that assumption.

During the year under review our trade largely increased. But to forecast a sudden leap in our prosperity, such as would enable the company to increase the amount distributed in dividends on the Ordinary shares by one-quarter, would be a flight of optimism in which I am not prepared to indulge.

CONTRIBUTORY PENSION SCHEME.

During the last year the directors have given prolonged consideration to the question of the establishment of a contributory pension scheme for the company's employees. With the limited time at my disposal I cannot give you in detail particulars of the scheme we have decided upon after consultation with one of the leading actuaries of the day, but I think you would like, and, indeed, are entitled, to have an outline of the proposal. We propose to establish on May 1st next a contributory pension scheme, which all employees of the company in the United Kingdom and the Irish Free State who are over the age of 18 and on the regular employment list will be eligible to join, and which all other such employees will join as they attain the age of 18 or when they enter the company's service, if that is after 18 years of age. Directors and higher salaried officials will be excluded.

The Finance Act of 1921 contains provisions whereby income tax relief can be obtained on superannuation funds which are approved by the Commissioners of Inland Revenue. A voluntary scheme such as we have had hitherto cannot obtain that relief. A contributory scheme such as we propose to set up can and does obtain it. In the scheme proposed we have provided benefits which is no respect are less generous, and which in some respects are more generous, than those which have been given under our present scheme. Further, these benefits will be certain and definite.

To do this means alienating a large sum—exactly how much depends upon the number of employees who join the scheme. I think I can safely say that, including the interest on the capital required, no greater charge will be made on revenue than has been made in the past. The capital required is available, and the accrued liability is funded once and for all.

Mr. William Rennie seconded the resolution, which was carried unanimously.

At an extraordinary meeting held subsequently, resolutions were passed authorising that the capital of the company should be increased to £55,000,000, by the creation of 5,000,000 shares of £1 each, ranking with the existing Ordinary shares, and that the new shares be issued in the proportion of one for every four existing Ordinary shares.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED.

STEADY EXPANSION.
RECORD FIGURES.

The Annual Meeting of the Scottish Life Assurance Co., Limited, was held on the 19th inst., in Edinburgh, His Grace the Duke of Atholl, president of the company, presiding.

The Chairman, in moving the adoption of the report for 1928, said :—

It has always been a satisfaction to me to preside at the annual meeting, and it is an additional pleasure to do so on the present occasion, when it falls to us to report record figures. The year 1928 appears to have been a good one for life assurance, and I should like to think there is some justification on that account for drawing the inference that, slowly but surely, the trade of the country is on the upward grade. There are many parts of the country and there are many industries which are still in a distressed condition, but I am not without hope that, even in these districts and these industries, methods will be found for gradually surmounting the great difficulties of the position.

It seems to me that one reason why we and other insurance companies can produce a heartening report is that during 1928 there was a pleasing absence of industrial disputes, and a consequent period of peace in the labour world. If the spirit of conciliation between master and man continues, it will go far to remedy matters. It has been the absence of that spirit in the past which has led to such woeful results.

RECORD NEW BUSINESS.

The new assurances granted amounted to £1,402,000, of which £161,000 was reassured with other companies, leaving a net new business of £1,241,000, which is a considerably larger amount than had hitherto been transacted in any one year in the history of the company. The total life premium income was £593,000 net. The interest on the funds, after deducting income tax, reached £248,000. This represents a gross rate of interest of £5 10s. 4d. per cent., and a net rate of £4 15s. per cent. The fact that throughout the current quinquennium the company had been able to earn on the average distinctly more than 4¾ per cent. was an important factor in its success. The claims by death amounted to £147,000. Measured by the "Death strain" method, which is the most correct method actuarially, the ratio of actual claims to expected claims represented 59 per cent. It is a matter for congratulation that the mortality experienced has once more worked out so well, and this is a tribute to the care in selection of its lives, which has always been a characteristic of this company. The endowment assurances paid on survivance amounted, with bonus additions, to £153,000. The ratio of expenses of management (including commission) to the premium income was 12.7 per cent. The increase in the life funds was the very substantial one of £426,000, being a greater addition than had been made in any previous year, and this brought the funds up to £5,575,000. For the first time in the history of the company the gross income from all sources exceeded £1,000,000. The exact figure was £1,026,530, and the total outgo amounted to £605,504.

INTERMEDIATE BONUS INCREASED.

Owing to the successful working of the company during the current quinquennium, the directors saw their way to grant an additional benefit to policyholders. This took the form of increasing the intermediate bonus in respect of the two concluding years of the current quinquennium, 1929 and 1930. For the first three years the intermediate bonus was at the rate of 43s. per cent. This rate has now been increased for the two final years to 47s. per cent., and applies to full-profit policies which become claims by death during the years 1929 and 1930. This higher rate of bonus has, indeed, applied throughout to endowment assurances maturing during the quinquennium. We feel sure that this increased benefit will cause much gratification to our policyholders as giving evidence that the directors desire to do the very best that they can for them.

INCREASING FIELD FOR LIFE ASSURANCE.

The figures speak for themselves. I would only say what has been said so frequently from this chair, that I do think that there is an increasing field for life assurance in this country. The ordinary citizen is, speaking generally, content with a woefully inadequate provision for his wife and family, and I consider that the officials of this and other companies are doing a great national service in bringing home to their fellow-citizens the necessity for a more adequate provision being made as a safeguard against the poverty and destitution which would otherwise confront their families.

Sir John Lorne MacLeod, G.B.E., LL.D., chairman of the board, seconded, and the report was adopted with the declaration of a dividend of 18 per cent. less tax.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY.

RECORD NEW BUSINESS.

The annual general meeting of this Society was held on the 21st instant, at 15, St. James's Square, London, S.W.

Mr. Francis E. J. Smith (the chairman) first referred with regret to the death of Colonel Sir Edward Ward, chairman of the Employers' Liability Assurance Corporation, remarking that the directorate of this Society had lost a true friend, distinguished in many and very diverse fields. He added that the harmonious co-operation between the two companies, which reigned to-day to their mutual profit, had been fostered largely by Sir Edward's geniality.

Another change was patent in the building in which they met that day. Without any sacrifice of its distinctive beauty and dignity the house, which was built in 1770 by James Stuart, had been converted into an up-to-date office where the staff could work in healthy and comfortable surroundings. The Society had spent on alterations and new office equipment the large sum of £33,500, of which some £15,000 had been taken out of the past year's profits. Even that left the house standing in the books at only £40,000, which was far below its market price.

OVER TWO MILLION NET NEW LIFE BUSINESS.

As befitted the inauguration of their remodelled home, they had to report a record year's business. For the first time in their history of 104 years the Society had passed the two million mark with their net new life business. It had taken many years to reach the one million mark, but only 14 years to double that record. The single premiums showed an increase as compared with the previous year, but this was a class of business they had not specially sought.

They had paid in claims under Endowment Policies £186,000, or more than twice the amount of similar claims paid in any previous year. The figures, however, were not strictly comparable, as a large number of War Bond policies granted in the closing years of the war had matured for payment. Apart from the maturity of Endowment Assurance policies they had paid some £21,000 less in death claims than in the previous year; but this fall must be regarded as fortuitous seeing that it was inevitable, with the larger business they were doing, that claims would increase.

They had opened up successfully two other classes of business. They had recently started to lend to those purchasing houses for their own occupation two-thirds of the company's valuation if they took out an endowment policy as part of the security. They had also issued policies with monthly premiums to suit all those whose salaries were paid to them on a monthly basis. The past year had seen a great expansion of this class of business, which had proved extremely popular and had clearly met a real need. Over £200,000 of their new business had been effected under this system. As time went on and as the convenience of the system became more widely known, they had every reason to believe that its advantages would be more widely appreciated.

He now came to the crucial question in the conduct of any life assurance company, viz., its earned, as compared with its assumed, rate of interest. They were one of the few offices that assumed they would only make 2½ per cent. interest, and this was the governing factor in the whole of their valuation. Their net earnings did not represent quite twice that rate, but they made £4 17s. 5d., so that they were within 2s. 7d. of earning net twice their valuation rate. It was on this fact that the conviction rested that their bonuses were bound to be good. The rise of 2s. now shown in their net rate, translated into money, meant £10,000 into their coffers in one year.

EXPENSE RATIO.

Their expense ratio also was satisfactory, being £14 13s. 5d. per cent. of the premium income as compared with £15 0s. 8d. per cent. in the previous year, but to some extent this was a fallacious test, as single premiums had artificially swollen their premium income.

The balance sheet showed that the Life Assurance Fund had risen from £9,316,048 to £9, 791,105, which was very satisfactory when they remembered that matured endowment assurances had cost them £100,000 more than in 1927.

They were still taking only Stock Exchange and other securities with a fixed due date for redemption, and he was glad to say that, thanks largely to this policy, the excess of the value of their Stock Exchange securities over book values was nearly £200,000—a figure about £65,000 higher than a year ago.

All sources of profit remained unimpaired—surplus interest, mortality profit and economy in expense ratio. It was therefore only reasonable to expect that the Society's old record of continuously expanding profit would be repeated in 1931, when their bonus fell to be declared.

The report and accounts were unanimously adopted.

PROVIDENT MUTUAL LIFE ASSURANCE ASSOCIATION.

ANOTHER YEAR OF EXPANSION AND PROSPERITY.

The annual general meeting of the Provident Mutual Life Assurance Association was held on the 20th instant, at the offices of the association, 25–31, Moorgate, London. Mr. Owen Hugh Smith (chairman of the association) presiding.

The Manager and Actuary (Mr. C. V. R. Coutts, F.I.A.) having read the notice convening the meeting and the report of the auditors,

The Chairman, after a sympathetic reference to the loss sustained by the association in the deaths of the late Chairman, Mr. George Acton Davis, and a director, Mr. James Nicholson Stuart, said: I now turn to the report and accounts for the year. We have again to place before you a record of expansion and prosperity. The premium income has increased by £68,000 to £840,000, as compared with an increase in 1927 of £39,000. Five years ago the premium income was £581,000. There has therefore been an increase in the volume of the business of the association of nearly 50 per cent. in five years. The new business is almost identical with that placed on the books in the previous year. If measured by the new premiums it is slightly higher than that for 1927. If measured by the new sums assured it is slightly lower.

The expense ratio shows a fractional increase from 13·9 to 14·5. The increase is partly due to the increased volume of new business and partly to the fact that certain items of expenditure—as, for example, salaries of the staff, etc.—come up for revision after a quinquennial valuation.

Claims by death continue remarkably low, and, in fact, only represent 45 per cent. of the amount expected by the tables of mortality which we employ, as compared with 51 per cent. in the previous year.

THE FUNDS.

You will see from the revenue account that we have paid out £325,000 in cash bonuses during the year as the result of 54,000 of our members electing to take their quinquennial profits in this form. This item is, of course, of a non-recurring character, and, therefore, to some extent distorts the comparison with the previous year. But notwithstanding this large cash payment the funds have increased by £197,000.

The net rate of interest earned on the funds, as calculated by the usual methods, was £4 12s. 5d., which shows an apparent fall of 2s. 11d. as compared with the previous year. This is of no real significance. The formula assumes that our income and outgo is evenly distributed throughout the year, which is more or less true in a normal year, but the payment of over £300,000 in cash bonuses in the early months of the year has upset the equilibrium.

The investment of the association's funds continues to occupy the care and attention of the board and management. And I need hardly say that we are adhering to the general principles laid down so often on these occasions by our late chairman. You will see from the balance sheet that we have continued the policy, to which reference was made last year, of investing a limited proportion of our funds in ordinary stocks of the highest character. We have also taken advantage of the opportunity of increasing our holding of mortgages on properties in this country. In accordance with our practice in the past we have not brought into revenue any profits on securities either realised or appreciated in market value. It may interest you, therefore, to know that at the 31st December last the estimated market value of our Stock Exchange securities exceeded the aggregate value at which they stand in the balance sheet by approximately £320,000, without taking into account the investment reserve fund of £160,000. We are therefore in the happy position of holding a reserve against any future fluctuations in values of nearly half a million.

The quinquennial distribution of profits, in which over 110,000 policyholders participated, took place early in the year. And it is no small tribute to the efficiency of our staff that the whole of this work was carried through without outside assistance and without the discovery of a single mistake in the many hundreds of thousands of calculations which were required.

SATISFACTORY ACTUARIAL INVESTIGATION.

The usual actuarial investigation into our position at the end of the year has been made, and I am glad to be able to report that at the end of this, the first year of the current quinquennial period, the high profit-earning power which we experienced during the previous quinquennium has been fully maintained. The board, therefore, have no hesitation in deciding to maintain the interim bonuses at the full rates declared for the last quinquennium, which, as you all know, are by far the highest ever recorded in the history of this association, now extending over nearly 90 years. Now, gentlemen, I move the adoption of the report and accounts.

Mr. Herman B. Sim seconded the motion, which was carried unanimously.

The retiring directors having been re-elected and the auditors re-appointed, votes of thanks were passed to the manager and staff and also to the chairman and directors, and the proceedings then terminated.

THE UNDERGROUND GROUP.

RECORD TRAFFIC.

LORD ASHFIELD'S VIEWS.

The annual meetings of the Metropolitan District Railway Company, the London Electric Railway Company, the City and South London Railway Company, the Central London Railway Company, and the London General Omnibus Company, Limited, were held jointly on the 21st instant, at 55, Broadway, Westminster, S.W.

At the request of the chairmen of the respective companies, Mr. H. A. Vernet read the speech which had been prepared by Lord Ashfield (the chairman), who was absent through indisposition. The speech contained the following statements:—Almost for the first time in the 10 years of my chairmanship, it is with pleasure that I meet you to give an account of the affairs of your companies and of your Board's stewardship, for this is the first year since I have been associated with this group of companies that the results have been truly satisfactory. We have deserved, I hope, this success, and our measure of satisfaction is the greater when we see that the basis upon which it is founded has been widened, for the success of this last year, as of the year before it, has attended not only your omnibus undertaking, but also your railway undertakings. All have partaken in the progress that has been made. This makes us more hopeful of the future, for we cannot but think that the tide of misfortune that for so long overwhelmed us has surely and safely turned at last and that we may now look forward to a cheerful prospect in the future.

134 MILLION MORE PASSENGERS.

The total number of passengers carried during the year 1928 was 1,803 millions, an increase of 134 millions over the passengers carried in the preceding year. It is the highest number ever carried by your companies in one year; and I would ask you to note the succession of records which they have made and broken during recent years. If we omit the year 1926, which was prejudicially affected by the General Strike, there has been since 1922 an increase in the passengers carried of some 100 millions or more each year, a record of progress which cannot be paralleled at any other time in their career. This enlargement in the volume of traffic carried cannot be counted a normal growth. It has naturally been stimulated by the expansion of our activities. It may indeed be looked upon as a reward for our enterprise. The extensions of the Underground Railways to Edgware and Morden has led to the development of new populations north and south dependent mainly on these railways for their means of transport. The passengers carried on the Edgware extension have increased at the rate of almost 40 per cent. per annum; the passengers carried on the Morden extension at the rate of almost 20 per cent. per annum. Together they have contributed 8 millions of passengers to the increase of the year. Small it may be in relation to the total increase, but none the less encouraging, as indicating that a liberal policy in meeting the demands for fresh transport facilities is not without its compensations.

One important qualification must be made. In the year 1928, 196 omnibuses which had been acquired from independent companies were absorbed into the fleet of the London General Omnibus Company and the small companies previously owning them wound up. As a consequence some 75 millions of passengers in the increase that we have enjoyed are in the nature of a transfer, though there are secondary advantages in the step that we have taken in the economy resulting from consolidating our omnibus interests as far as possible in one hand.

TRAFFIC RECEIPTS.

The gross traffic receipts for the year 1928 amounted to almost £15,000,000, the expenditure to £12,000,000, so that the net receipts were almost £3,000,000, or, to be more exact, £2,895,000, an increase of £266,000 over the preceding year. The comparison is somewhat confused this year. For the first time we have been required to include in expenditure sums which previously had been treated as reserves and deducted at a later stage. The sums so dealt with amounted to £160,000 in round figures and therefore if we were to adjust the accounts for the year 1928 to agree with those for the year 1927, the increase in our net receipts would have been £426,000 instead of the £266,000 shown in the statistical supplement. Our miscellaneous receipts amounted to just over £1,050,000, or £27,000 more than they were a year ago, so that altogether the amount of money at our disposal at this stage was increased by £453,000, or, allowing for an increase of £108,000 in the amount carried forward from 1927, £561,000. This additional money has been applied in the following way: £183,000, or 33 per cent., was required to meet the increased fixed interest charges in respect of prior securities issued during the year and to provide £75,000 towards the writing down in the balance sheet of the unsatisfactory motor omnibuses taken over from the small companies wound up. If you will look at the capital table in the statistical supplement, you will see that the increase in our capital is £1,526,000, attributable to the issue of debenture stocks on behalf of the London General Omnibus Company and to a loan to the Metropolitan District Railway Company in connection with the construction of the new office building. Then a further £127,000, or 23 per cent. was applied to meet directly the cost of renewals or carried to the reserve for contingencies and renewals. Then £205,000, or 36 per cent., was applied to the payment of additional dividends on the ordinary stocks and shares.

Finally, £46,000 more, or 8 per cent., is carried forward to next year's accounts. I think you will agree that we have made a prudent distribution of the additional moneys at our disposal and that we have had regard in their disposal to the conflicting claims which can be made upon us, strengthening our companies' position on the one hand and satisfying the natural wishes of the shareholders for increased dividends on the other hand. The dividend paid on the stocks and shares of the four railway companies is to be, if you agree, at the rate of 5 per cent., and on the ordinary shares of the London General Omnibus Company at the rate of 8 per cent., free of tax. I give you the figures for the whole year. The average return upon the ordinary stocks and shares of the group of companies is now at the rate of 5·69 per cent., an increase of just over 1 per cent. over the rate for 1927 and the highest average rate so far paid in the history of this group of companies. Since 1915, when the common fund was instituted, the average rate of return per annum has only been a little over 3½ per cent. We may claim to have already suffered twice the term of lean years in Pharaoh's dream. May we now enjoy twice the term of fat years. The law of average should apply here.

Certain elements of cost are beyond our control and in the past year we have had one grave disappointment. I refer to the petrol tax of 4d. per gallon which was placed on the fuel used by our omnibuses. The tax only operated for a part of the year, but in the eight months it amounted to a sum of £249,000. For a full year it will amount to nearly £375,000. In addition to the petrol tax we have paid in licensed vehicle duty £400,000, so that the total amount paid in respect of the omnibuses was, in 1928, £649,000, and in a full year would amount to almost £800,000, which represents 5·35 per cent. of the gross traffic receipts of the group of companies taken together, and much more if the omnibus receipts were taken separately.

The report and accounts were unanimously adopted.

BORAX CONSOLIDATED.

NEW BORATE MINERAL DEVELOPMENTS.

The thirty-first ordinary general meeting of Borax Consolidated, Ltd., was held, on the 20th instant, at the Cannon Street Hotel, London.

The Right Hon. the Earl of Leven and Melville (the chairman) said that the net profit for the past year had amounted to £307,187, as compared with £320,738 for the previous year.

In the balance sheet the increase in the expenditure on buildings and plant referred largely to the works at Wilmington, California, the equipment of which they were contemplating, and to which they had transferred the manufacture hitherto carried on at New York. A large saving in cost had been effected by the operation of this new plant in conjunction with the new mineral.

At the last meeting he had reported that the company was developing on one of its properties in Southern California a new borate mineral which would be more economical for the purpose of borax production than the minerals they had hitherto worked. During the year a large amount of development work had been done, and they had proved the existence of a very large body of this ore on the property. The use of it at the company's refineries in the United States and in Europe had enabled them to show a profit for the year which they would probably not otherwise have made in face of the competition which they had had to meet from various sources in the U.S.A.

COMPETITION FROM U.S.A.

The competition arose from several sources, the largest and most important being that of an American company operating in California, producing potash from lake brines and also borax in the proportion of about one ton of borax to two tons of potash. The borax, being produced as part of the operations, had to be forced on to the market. This, with the competition from other U.S.A. sources, had led to a disastrous reduction in the price of both borax and boric acid, the market being flooded with more than it could at present absorb. So far as potash was concerned, the European producers had so far not met the competition by a reduction in price, as the production of potash at present in the United States supplied only about 20 per cent. of the consumption there. How long these conditions would last would presumably depend upon the development of potash production in the States and the necessity for the European producers to lower their price to meet the changed conditions. It appeared probable that a large increase of potash production in the States might take place in the near future.

So far as Searles Lake, where the potash he referred to was being produced, was concerned, the company had a large patented or freehold property on the lake, and had the right to work the brine free of royalty for the production of potash and by-products. During the war they had done a large amount of experimental work for the production of potash, but at that time processes were not sufficiently developed to enable this to be done at a profit, especially as they then did not aim at producing any by-products. Except for this work they had so far not thought it advisable to develop the property at Searles Lake for the production of potash and borax. The matter, however, was receiving most careful attention.

POSSIBILITIES OF THE NEW MINERAL.

The company's new mineral, to which he had referred, was not only the most economical ore as yet developed for the manufacture of borax, but it also had great possibilities in other directions for use in various industries, especially in a concentrated form. Difficulties in treating it had been overcome after lengthy experiments, and they had been engaged in erecting a plant at the mines, which was just being completed, for the concentration of this mineral. The processes were covered by patents either already granted or applied for.

The demand for borax had shown expansion. The low price had led to enlarged use in certain industries. The unsatisfactory feature was the unstable price, owing to the struggle to sell a product which was at present largely overproduced. Competition had become intensified during the current year, and it was difficult, therefore, to make a forecast, but shareholders might rest assured that the Board were leaving nothing undone to protect their interests.

The report and accounts were unanimously adopted.

SOUTH SUBURBAN GAS COMPANY.

INCREASED CONSUMPTION—LOWER PRICE OF GAS.

The annual ordinary meeting of the proprietors of the South Suburban Gas Company was held, on the 15th instant, at Cannon Street Hotel, London, Dr. Charles Carpenter, Chairman of the company, presiding.

The Chairman, in moving the adoption of the report and accounts, said: Despite the unfavourable weather (I mean from the gas-maker's point of view) prevalent during the latter part of the year, we have had a—shall I say?—comforting increase of business and a satisfying addition to the number of our consumers. Now, the all-important means of achieving this result is through the medium of a low price for gas, and that is why, in my opinion, the first matter for congratulation in reviewing our figures for 1928 is that we have brought our price down to 9d. per therm. The price of coal is an important factor in this, but a greater one is the cost of labour. We need and employ more than our competitors, primarily because the foundation of our business is to use the raw material which this country itself provides, and instead of wasting its by-products or causing nuisance by blowing them into the atmosphere, utilises them for the general good.

The increase in our gas consumption—namely, 3¼ per cent.—is, under the circumstances, a satisfactory one; we could not expect it to be fully proportionate to that of the increase in the number of our consumers—namely, 4¼ per cent. bringing their total to 110,343. Apart from this, and as some indication of the popularity of gas-using apparatus, I may mention that we continue to have a considerable demand for these articles, which it is our practice to sell outright or to let on hire or hire-purchase, as the case may be.

The year under review sees the last of the sliding scale which broke down so hopelessly and operated so unfairly during the war. You are not likely to forget that, under it, our dividend authorised by the Act which put it into operation fell to 1s. 8d. per £100 of stock, and how we were by a special Act of Parliament allowed to add to this the totally inadequate figure of £3 13s. 4d. Our new arrangement provides, as you are aware, for a basic rate of 5 per cent., plus such additions as we may earn as the result of good working.

In accordance with the agreement made with our neighbours, we are now taking gas regularly from them. This will avoid any capital outlay upon carbonising plant, and this will prove in more ways than one a particular advantage to this company.

Mr. B. R. Green seconded the motion, which was carried unanimously.

ATLAS LIGHT AND POWER COMPANY, LIMITED.
SALE OF CERTAIN HOLDINGS

An extraordinary general meeting of this company was held on the 21st instant, at River Plate House, London, E.C., for the purpose of submitting an agreement with the American and Foreign Power Company, Incorporated, of New York, providing for the sale of all the Atlas Company's holdings in Electric Supply and Traction Companies operating in the Argentine Republic. Mr. W. Sandford Poole (the Chairman) presided, and first explained that although Sir George Touche had resigned the chairmanship he had agreed to remain on the board for some time longer.

After reviewing the early history of the Company, the Chairman referred to the negotiations resulting in the agreement for the sale of the holdings in Argentine subsidiary companies, which was before the meeting for approval, and explained its principal terms. He said the total amount to be received from the sale was £8,878,000, made up of a capital account figure of £8,500,000 and a revenue account figure of £378,000 for adjustment of earnings and interest. The sum of £855,500 had been received as deposit, and the further sums of £3,640,000 and £4,382,500 respectively would be received on March 11th and July 10th. The expenses of carrying through the transaction are to be divided equally.

The company had an option until April 1st, to take up to 100,000 shares of the South American Power Company at $100 per share, but full particulars of that company had not yet been supplied. The agreement provided for arbitration by Sir William Plender in the event of any statements made to the purchasers proving substantially incorrect. No part of the compensation fund of £37,500 would be appropriated to the board as a whole without the sanction of the shareholders at a subsequent general meeting.

The board recommended the sale because the amount offered for the properties was such as to make it wise to let a buyer have them. The chairman instanced the case of Consols going up to 112 in 1897. Competition, financed by cheap American money, was also being increasingly felt. The properties to be sold for £8,500,000 probably stand at about £5,000,000 in the Company's accounts.

If the agreement was approved the debenture holders would be offered repayment at 105 per cent. or the option of taking up a certain amount of new 5 per cent. debenture stock in lieu of cash. The balance of the purchase price would be available for the purchase of general investments and possibly the acquisition of some other electrical holdings if opportunities occurred of going into fresh and promising fields.

The provisional agreement submitted was approved after considerable discussion, and a further resolution was passed altering the provisions of the memorandum of association with a view to widening the objects and scope of the company.

ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED.
INCREASE OF CAPITAL APPROVED.

An extraordinary general meeting of the Anglo-Ceylon and General Estates Co., Ltd., was held at 5, Fenchurch Street, E.C., on the 21st instant, to consider a proposal to increase the capital of the company to £600,000 by the creation of 50,000 new ordinary shares of £1 each.

Sir Edward Rosling presided, and said that the main reason for the need for more capital was the purchase of Holmwood Estate, which consisted of 370 acres of tea in one of the best tea-growing districts in Ceylon; but in addition to that they required further capital for the development of some of their unopened land, as well as the necessary work to bring their line accommodation up to the standard required by the Government—a work which they hoped to see practically completed in about two years' time.

In addition to the purchase of Holmwood, the Government had agreed to lease them 500 acres of forest land, which it was proposed to add to their existing estate of Niriella, bringing its total area up to nearly 2,000 acres. Of this, 520 acres were already under tea, and 147 acres in rubber and they had just completed building an up-to-date factory. This estate, when fully developed should prove to be a very valuable property.

Early last year they were approached by the Ceylon Tea Research Committee to sell St. Coombs Estate for the purpose of research work, and, after somewhat lengthy negotiations, the transfer was completed last November. It was largely owing to this sale that the directors decided on the purchase of Holmwood.

In Mauritius, they had purchased Colmar estate, consisting of 290 acres of cane land. The directors did not want to increase their sugar interests, but this property cut right into Britannia estate, so that they could not afford to allow competing interests to obtain possession of it.

In addition to their purchases, the net capital expenditure this year would amount approximately to £45,000, and as there was still a good deal of development work necessary, the directors had decided, in addition to the issue of shares, also to issue the balance of debentures, viz., £100,000. Both issues would be made towards the end of next month, and would first be issued to the shareholders and debentureholders. The shares would be offered at 40s., viz., £1 premium.

The increase of capital was unanimously approved.

THE BAH LIAS RUBBER ESTATES, LIMITED
SOUND FINANCIAL POSITION.

Mr. H. Eric Miller, presiding at the 18th Ordinary General Meeting of the Bah Lias Rubber Estates, Limited, held on February 21, said that the costs of their rubber showed a decrease of 2.35d. per lb. as compared with the previous year. A dividend of 6 per cent. was recommended, leaving the balance of £52,280 to carry forward. The financial position was thoroughly sound. They had some five hundred thousand lbs. of surplus stock carried forward at bare cost of collection and preparation at under 3d. per lb., so that the current year's account would have the benefit of that. No low-priced forward sales had been entered into. Although they were bound to see fluctuations in the day-to-day quotations for rubber, he thought the rise was based on a solid foundation. (Hear, hear.) He had dealt with the general situation of their industry at some length in his speech to the United Serdang shareholders, when he indicated that the absorption of crude rubber by manufacturers during the current year was likely to exceed new production, and that a further contraction in the already none too ample world's stocks would ensue. During the first half of the calender year manufacturing activity in the rubber industry was naturally greater than during the second half, and the fact that the U.S.A. manufacturers absorbed no less than 43,000 tons of rubber during January only emphasised that point. Some manufacturers had realised that rubber was too low in price last year, and took advantage of their opportunity to purchase freely. Others banked on prices being still lower, and had had to pay heavily and urgently regardless of price. Accumulations in the East had been eagerly absorbed, and the market had reached a more rational price level. Everything pointed to a further contraction of supplies in consuming countries, and speculators might carry the price very much higher than would be in the best interests of the industry. The removal of restriction was hailed by many Americans as opening up the prospects of attaining stability in the market at their own price, but in reality they were as far from stability as ever. In conclusion, he said the Board would continue to do their utmost to safeguard the interests of the shareholders, and he looked forward to meeting them a year hence with a good account of their stewardship.

The report and accounts were unanimously adopted, and the other routine business having been transacted, a cordial vote of thanks was passed to the directors, agents and staff in the East.

THE HOME AND COLONIAL STORES, LIMITED.
IMPORTANT COMBINATION OF INTERESTS.

The thirty-fourth Ordinary General Meeting of the Home and Colonial Stores, Limited, was held on the 21st inst. at 2 and 4 Paul Street, London.

Mr. W. May (the chairman) said that the year under review had proved a difficult and anxious one for those engaged in the management of the company. Industrial conditions had been, speaking generally, very unsatisfactory, and this had had a reflex action on their turnover; and, though there appeared to be some slight improvement in some directions, there was nothing to justify their thinking that anything like normal conditions were yet restored. To meet the situation, as also the keen competition they had experienced—and parenthetically he would remark that they did not fear fair competition, as they made no claim to be monopolists, their policy being big trade, small profits and quick returns—they had opened a number of new branches and availed themselves of every opportunity of serving new districts. They had, where possible, enlarged the floor space and frontages of many of their old branches and introduced several new lines of goods into most of them, and to-day they had, including those of their subsidiary companies, a total of 1,050 branches. He thought it would be agreed that, on the whole, the company had not done so badly during the last year, as they were able to maintain the same dividend on the ordinary shares which was paid for 1927.

The balance-sheet showed that, with the £45,409 now added, the total reserves amounted to the highly respectable figure of £1,306,319, and the balance on profit and loss account was £332,942. Their financial position was still strong and absolutely sound, their liquid assets totalling £1,247,967, against £307,232 liabilities, or nearly £950,000 net.

The directors recommended a final dividend on the ordinary shares of 1s. 6d. per share, making 15 per cent. for the year, and a special bonus, as before, of 2s. per share. This, with the interim dividend, made a total of 5s. per share, less tax, and after allocating £5,000 to the company's sick fund and £3,000 to the staff benevolent fund, they carried forward £131,942, or about £3,700 more than last year.

The report and accounts were unanimously adopted. The Chairman then explained the directors' proposals for a combination of interests of the Meadow Dairy Co. with those of this company, and the proposed increase of capital to enable this to be carried out was agreed to.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS.

The following table shows the national income and expenditure during the week ended February 16, 1929:—

(000's omitted.)

Expenditure	£	Receipts	£
Supply Services	4,300	From Revenue	24,977
Interest, &c., on Debt	848	Decrease in Balances	363
Sinking Fund	505		
Sundries	409		
Decrease in Debt	19,278		
	25,340		25,340

The revenue for the week amounted to £24,977,332, as compared with £26,863,766 in the corresponding week last year. Property and Income-tax amounted to £14,809,000 as against £13,586,000, and super-tax to £2,960,000 as against £3,120,000. Customs brought in £1,529,000, against £1,290,000, and Excise £2,335,000, against £6,772,000. Ordinary receipts showed £28,373, against £608,766 a year ago.

The National Debt was reduced by £19,278,000, as shown below:—

(000's omitted.)

	£		£
National War Bonds	− 800	National Savings Certificates	+ 250
Public Department Advances	− 1,000		
Treasury Bills	− 17,322

Govs	5,000
Total	£29,133

Net arrivals, £683,167.

Messrs. Samuel Montagu and Company write as follows on February 20, concerning the bullion market :—

GOLD.

The Bank of England gold reserve against notes amounted to £149,837,878 on the 13th instant (as compared with £149,626,177 on the previous Wednesday), and represents a decrease of £4,068,437 since April 29, 1925—when an effective gold standard was resumed. The bulk—about £710,000—of the £923,000 bar gold from South Africa available in the open market this week was secured by the Bank of England, the balance being disposed of as follows :—India, £80,000; Straits Settlements, £50,000; Home Trade, £40,000, and Continental Trade, £36,000. There was a net influx of gold of £651,702 during the week.

SILVER.

Silver prices continued their downward trend until the 16th instant, when the cash quotation was fixed at 25⅜d., and that for two months' delivery 25⅛d. The sagging prices were due more to reluctance on the part of buyers than any eagerness to sell, and the market was therefore in a condition easily responsive to pressure. On the resumption of business in Shanghai following the China New Year holidays, little activity was evident until yesterday, when some substantial buying orders from the Far East rather took the market by surprise, causing a sharp recovery to 25⅞d. for both positions —a rise of ⅛d. for cash and 3/16d. for two months' delivery. The enquiry was not resumed to-day, and quotations reacted ⅛d. in consequence. America has been a more willing seller during the week, but the Indian Bazaars were inclined to buy, especially at the lower level of prices. The following were the United Kingdom imports and exports of silver registered from mid-day on the 11th instant to mid-day on the 18th instant :—

IMPORTS.	£
Netherlands	11,150
Canada	34,979
Other countries	7,354
	£53,483

EXPORTS.	£
Netherlands	79,030

Reports and Notices.

The 1929 edition of the "Stock Exchange Official Intelligence," the only work of its kind that is issued by the Stock Exchange—will be published on March 25th. The 1927 and 1928 editions (the latter of which was considerably larger than any previous issue) were exhausted soon after publication.

Waring and Gillow, Limited, announce that the address of their offices is now 61 and 62, Conduit Street, London, E.C.3.

The directors of the Phœnix Assurance Company, Limited, have appointed Mr. Arthur Melmoth Walters (of Messrs. Walters & Company) to be a deputy chairman jointly with Mr. E. G. Buxton, the present deputy chairman.

The directors of the Alliance Trust Company have appointed Mr. William Dunbar Macdougall, manager of the company, to be a director of the company in room of the late Mr. Thomas Maitland. Mr. Macdougall will still retain office as manager.

The head offices of the Universal Automobile Insurance Company, Limited, are now at 162, Buckingham Palace Road (corner of Elizabeth Street), London, S.W.1. Telephone numbers: Sloane 8276, 8277, 8278.

Mr. A. d'A. Willis, a partner in the firm of Messrs. Ogilvy, Gillanders & Co., has joined the board of Sika (India), Limited. Messrs. Ogilvy, Gillanders & Co. have arranged with their Indian houses, Messrs. Gillanders, Arbuthnot & Co., to act as managers of the Indian Sika business.

BANKS.

BANK OF NOVA SCOTIA (INCORPORATED 1832).—The statement for the year 1928 shows:—Profit and loss—balance December 31, 1927, $479,207; net profits for year 1928, losses by bad debts estimated and provided for, $2,535,518, against $2,965,310 for preceding year. The ordinary dividend is again 16 per cent. for the year, absorbing $1,600,000. War tax on circulation to December 31, 1928, $100,000; contribution to officers' pension fund, $100,000; written off bank premises account, $300,000; balance carried forward December 31, 1928, $914,725; reserve fund now amounts to $20,000,000. Deposits amounted to $212,487,129, against $203,498,571 at end of 1927.

MISCELLANEOUS.

SIR W. G. ARMSTRONG, WHITWORTH AND COMPANY.—At an extraordinary general meeting of the company held on February 19th resolutions were passed by the requisite majority for the subdivision and reorganisation of the capital, the alteration of the articles of association and other matters consequential on the scheme being sanctioned by the Court. The scheme was fully dealt with in the *Economist* of February 16th, pages 347 and 373.

Commercial Reports.

THE CORN TRADE.

Mark Lane, Thursday Evening.

Severe wintry weather has continued over the United Kingdom during the past week, and field work naturally remained in abeyance. Preparations, however, are well forward, and the land should be in excellent condition for spring sowings, when ploughing is resumed. Larger supplies of native wheat at the principal country markets experienced a better sale at rather firmer rates, while imported descriptions also moved off with more freedom. In the floating and forward cargo section, European buyers were busy operators following recent liberal bookings, but India continued to purchase freely in the Australian market. Prices fluctuated slightly. North American sellers being somewhat reserved owing to indifferent crop prospects, but the tone was largly influenced by some pressure to sell Southern Hemisphere supplies, and shipments from this quarter are increasing. To India, West Australian c.i.f. terms sold 46s. 6d., ditto 15th May–15th June 45s. 9d., East Australian 15th March shipment 45s. 3d., all basis Bombay, per qr. 480 lbs. c.i.f. Indian terms. Feeding stuffs generally quiet and maize easier on favourable Argentine crop reports. Flour steady.

Wheat steadier. No. 2 Northern Manitoba, 53s. 3d.; ditto, 51s. 9d.; No. 4 Manitoba, 50s. 6d.; No. 5, 46s.; No. 6, 45s. 6d.; No. 2 mixed Durum, 45s.; Rosafe, 64 lbs., 47s.; Barusso, 63½ lbs., 47s.; Australian, 50s. 6d., all ex-ship, per 496 lbs. Plate, 9s. 7d.–9s. 10d. per 112 lbs.

Flour maintained. London standard grade, 40s. 6d.; town whites, 41s. 6d.; patents, 42s. 6d.–43s. 6d. per sack delivered in the Home Counties, with 6d.–1s. per sack less for deliveries in the London districts. Of imported, Manitoba patents range from 36s.–39s.; Minneapolis, 36s. 6d.–38s. 6d.; Australian, 36s. 6d. ex store. On c.i.f. terms Manitoba top patents February–March quoted 35s. 6d.–36s. 6d.; export ditto, 33s. 6d.–34s. 6d.; Australian, [illegible] 41s. 3d.; new

April-May, 39s. 9d.; May-June, also June-July, 39s. 3d.; No. 2 mixed American ex-ship to arrive, 41s.; ditto yellow, 41s.; No. 2 white flat African, 43s., landed, per 480 lbs. Yellow maize meal, £11 10s. ex-wharf; Hominy chop, £9 per ton.

Barley steady. Californian ex-ship, 45s.–52s.; Chilian Chevalier, 48s.–58s.; Australian, 45s.–49s.; Smyrna, 44s.–47s. per 448 lbs.; Algerian/Tunisian ex-ship, 34s. 6d.; Canadian feed, 32s. 6d.; ex-ship to arrive, 33s. 3d. landed; No. 3 Canadian Western, 36s.; No. 2 Federal American, 30s. 9d. ex-ship to arrive, per 400 lbs. English malting, 10s.–12s. 6d.; feed, 9s. 3d.–10s. per 112 lbs.

Oats firmer. Plate ex-ship to arrive, 25s.; February, 25s. 6d.; March, 25s. 9d.; black Plate landed, 25s.; No. 3 white clipped American 36 lbs. landed, 27s. 3d.; mixed Canadian feed ex-ship, 21s. 3d.; landed, 22s. 3d.; Chilian white, 32s. landed; German landed, 29s.; ex-ship to arrive, 28s. per 320 lbs. English, 9s. 4d.–10s. per 112 lbs. Scotch landed, 30s. per 336 lbs. Irish black, 26s. 6d. per 320 lbs.

COMPARATIVE AVERAGES OF GRAIN.

The following table gives the estimated sales of home-grown wheat during the harvest years 1928–29, 1927–28, 1926–27, 1925–26:—

	1928-1929.	1927-1928.	1926-1927.	1925-1926.

THE

MINING YEAR BOOK

formerly known as

MINING MANUAL & MINING YEAR BOOK. 1929

By WALTER E. SKINNER.

The Standard Reference Work on Mines.

Price **20/-** net.

Post free (Inland), 20/9; Post free (Abroad), 21/6.

1,000 pages. In Demy 8vo, bound in RED Cloth.

A Recognised Indispensable Work of Reference

For MINING INVESTORS, MINING ENGINEERS, MINE MANAGERS, BANKERS, STOCKBROKERS, DIRECTORS, and others interested in the MINING INDUSTRY.

COMPLETE and UP-TO-DATE PARTICULARS concerning 1,642 Mining Companies operating in all parts of the world. Gold, Diamond, Copper, Tin, Platinum, Silver, Iron, and other Mines, Collieries, Exploration and Mining Finance Companies, arranged in alphabetical order.

Particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property with the purchase consideration; plant erected or in course of erection; latest working results; ore reserves, details of capital; calls; dividends paid; and the financial position as disclosed by the latest accounts. Highest and lowest prices of the shares for the last three years; also latest prices.

Directories of Oil, Gold and Mining and Consulting ENGINEERS and MINE MANAGERS, with their addresses, and names of the Companies with which they are connected.

Stock Exchanges INDEX of private, dormant, or Companies which have ceased to be of public or market interest. One of the most useful and important features of the book. It is the only List of its kind published.

Statistical TABLES are given at the commencement of the volume, showing the annual yields of the principal mining companies, Gold Outputs of the World's Mining Fields, and the highest and lowest prices of base metals for the past eight years.

Glossary of MINING TERMS.—An up-to-date glossary covering 440 Mining terms, by means of which Mining developments can easily be followed, and the difficulties of understanding technical phraseology quickly mastered.

Full particulars of the book will be sent free on application to the Publishers,

WALTER E. SKINNER, 15, Dowgate Hill, London, E.C.4.

THE MOUNT LYELL MINING AND RAILWAY COMPANY, LIMITED.—During the four weekly periods ended January 30 the mill treated 10,976 tons of ore, producing 1,869 tons of concentrates.

THE COTTON TRADE.

LIVERPOOL, February 20th.

The market continues to be dull and featureless. Spot sales for the week 14th to 20th (inclusive) are 28,000 bales, of which 18,900 are American, 850 Brazil, 600 Argentine, 3,850 Peru, 1,400 Egyptian, 1,100 African, 1,200 East Indian, and 100 sundries. Imports for the same period are 50,111 bales, of which 39,885 American, 1,283 Brazil, 1,022 Argentine, 1,822 Peru, 4,109 Egyptian, 168 African, 1,267 East Indian, 555 sundries. Quotations to-day are American Middling, 10·43; Egyptian Sakel, 17·90; Egyptian Uppers, 12·15; Brazil Fair, 10·73; Peru G.F. Mod-Rough, 12·75; Peru G.F. Smooth, 11·38; West African Mid., 10·48; East African G.F., 12·15.

MANCHESTER, February 20.

The market throughout the week has been steady. Both spinners and manufacturers have experienced an increased inquiry, and in some quarters rather more business has been done. All along the line, however, it has been most difficult to arrange sales, as most of the offers have been on a very low basis. Only minor fluctuations have occurred in raw material prices. Cloth merchants have reported more bids for India, and a rather better turnover has taken place for Calcutta and Bombay in light bleaching descriptions. Very little has been done in grey staples. Rather more encouraging news has come through from China, and owing to improved clearances some moderate contracts have been arranged in greys and whites. A little more activity has shown itself for Egypt. Only restricted operations have occurred for the Continent. The healthier offtake in home trade fabrics recently experienced has been maintained. American yarn quotations have been irregular when tested, but here and there the sales have been rather larger. Egyptian spinners have now begun organised short time, and rates have been firmer with a slight improvement in demand.

AMERICAN WHEAT MARKETS.

Early in the week there was some weakness owing to heavy Argentine offers, and some realising by bulls. Later there was a steady recovery owing to fears of damage to crops by sharp frosts; better export demand; and rumours of famine in Russia. The close was higher in the week. Quotations:—

Nearest Future.	Jan. 4, 1928.	Feb. 22, 1928.	Jan. 2, 1929.	Feb. 13, 1929.	Feb. 20, 1929.
Winnipeg No. 1 Manitoba—cents per bu.	137	135½	123	132½	134½
Chicago (No. 2 Winter)—Cents per bu.	130½	133½	116½	127½	128

Visible supplies of wheat in Canada at 82,874,000 bushels show an increase of 729,000 bushels, as compared with the previous figures. Supplies a year ago stood at 74,892,000 bushels.

COAL.

Our Cardiff correspondent writes:—Work at the South Wales docks has been severely dislocated by the snow and frost. Last week coal exports totalled only 281,375 tons, compared with 579,738 tons the previous week, and on Wednesday this week over 100 vessels were waiting loading turns. Temporarily a large number of the hydraulic shipping appliances have been disabled, and in some cases it will probably take a few weeks to repair the damage done by the frost. Fortunately, the position has been alleviated by an agreement between the employers and the workmen for the working of a third shift as an emergency measure, and after Tuesday the rate of shipment gradually improved. The collieries also have been better supplied with wagons, and pits which had stopped working owing to a scarcity of empties have resumed operations. Notwithstanding the disturbing effect of these adverse dock conditions, the market firmly maintains its recent improvement, and quotations are ruling at last week's figures. The following are the current approximate market prices:—Best Admiralties, 19s. 6d. to 19s. 9d.; seconds, 19s. to 19s. 6d.; best drys, 19s. to 19s. 3d.; Black Veins, 19s. 3d. to 19s. 6d.; Western Valleys, 19s. to 19s. 3d.; Eastern Valleys, 18s. 3d. to 18s. 9d.; best small steams, 14s. to 14s. 3d.; cargo smalls, 12s. 6d. to 13s.; cooking smalls, 14s. to 14s. 3d.; anthracite, best large, 33s. to 35s.; Red Vein, large, 21s. to 25s. 6d.; machine-made cobbles, 40s. to 42s. 6d.; French nuts, 41s. to 42s. 6d.; stove nuts, 40s. to 42s. 6d.; rubbly culm, 10s. to 10s. 3d.; foundry coke, 25s. to 37s.; patent fuel, 20s. to 21s. 6d.; pitwood, ex ship, 25s. 6d. to 26s.

Our Sheffield correspondent writes:—The cold spell has benefited both the house and export trade in coal. The call for house coal continues on a large scale and deliveries are in some cases in arrears. A slight improvement is also recorded in the demand for industrial fuel. South Yorkshire steams for export are firm at 16s. 6d. f.o.b. The market for blast furnace continues to harden and prices of best brands command 14s. and 14s. 6d. at ovens. The home demand for foundry coke continues light but shipments abroad are on a considerable scale.

Our Glasgow correspondent writes:—The demand from the Continent has fallen off to some extent, as importers realise that only small lots will be available for some weeks yet. The market all over is firm. There are various rumours current regarding a new scheme of co-operation among the coal owners. It is also rumoured that the coalowners' committee will recommend that the production quota fixed for each colliery should make provision for coal for shipment to Ireland and that quotas and prices should be reviewed once a month.

LANARKSHIRE.—Ell best, 18s. 6d.; splint best, 19s.; splint second, 18s. to 18s. 6d.; navigation, 17s. 6d.; navigation second 16s.; steam, 15s. 6d.; Hartley, 18s.; trebles, 16s. 6d.; doubles, 16s.; singles, 14s. 6d.; pearls, 12s. 6d.; dross, 10s. 6d. FIFE.—Screened navigation, 19s. 6d.; first-class steam, 17s. to 17s. 6d.; third-class steam, 17s.; trebles, 17s. 6d. to 18s. 6d.; doubles, 16s. 6d. to 17s.; singles, 14s. 6d. to 15s.; pearls, 13s. LOTHIANS.—Prime steam, 16s. 6d.; secondary steam, 16s.; trebles, 17s. 6d.; doubles, 16s. 6d.; singles, 13s.; pearls, 14s. 9d. AYRSHIRE.—Unscreened navigation, 16s. 6d.; jewel, 18s. 6d.; steam, 17s. 6d.; trebles, 17s. 6d.; doubles, 16s. 6d.; singles, 14s. 6d.; pearls, 12s. 9d.; dross, 11s.

IRON AND STEEL.

We extract the following from the weekly report of the London Iron & Steel Exchange:—

A slightly quieter tone characterised the iron and steel markets during the past week. The recent advance in pig-iron prices has been maintained, and consumers are showing rather more inclination to cover their requirements, although most of the business transacted has been of a hand-to-mouth character. Notwithstanding the advance in prices, there is still a certain quantity of pig iron going from this country to Belgium and other parts of the Continent. There has been a fair amount of activity in the semi-finished steel market, some good inquiries having been in circulation. The bulk of this business has been taken by British producers, who are inclined to quote stiffer prices in some districts owing to the higher cost of raw material. The continental quotations for semi-finished materials also continue firm, but there is comparatively little offering, as the continental works appear to require most of their production of this class of steel for their own finishing works. The demand for finished steel products has been rather quieter than of late, but, nevertheless, the market has remained steady. Most of the British works have a good tonnage of orders on their books.

Our Cardiff correspondent writes:—The principal event in the South Wales steel and tinplate market this week has been the raising of the minimum price of Welsh tinplate bars from £6 to £6 2s. 6d. per ton, which is the highest official figure since July, 1925, when it was reduced from £6 5s. to £6 [illegible]. The quotations for foreign bars remain unaltered at £5 12s. 6d. There is important branches of the industry in the district, and it is anticipated that the minimum price for tinplates will be raised above the present minimum of 18s. per basis box. Galvanised sheets are unchanged at from £13 12s. 6d. to £13 15s. per ton. The shipments of tinplates last week totalled only 93,605 boxes compared with 115,074 boxes the previous week, and stocks have, consequently, further increased to 257,312 boxes.

Our Workington correspondent writes as follows:—

There is a real improvement in the North-West Coast hematite pig-iron trade this week, the demand having increased to such an extent that stocks are virtually extinguished in the southern part of the district and are falling rapidly in West Cumberland, and the price of iron has been advanced by 2s. per ton. Consumers, fearing that they may be caught, are ordering freely for prompt and forward delivery. The make of the eleven furnaces in blast between Workington and Ulverston is not adequate to meet requirements; an additional furnace was lighted at Millom a few weeks ago, and it is not improbable that production may shortly be increased in West Cumberland. Midland, Scottish and South Wales users all have substantial needs to satisfy. The Continent is buying iron to analysis, and there is also a good deal of inquiry from America. The situation is, in fact, stronger than for several years past, and if the improvement continues it cannot be long before values reach a level at which makers will command a reasonable margin of profit. Bessemer mixed numbers are quoted at £4 0s. 6d. per ton delivered at Glasgow: £4 4s. 6d. per ton delivered at Manchester; £4 6s. 6d. per ton delivered at Sheffield; £4 8s. per ton, delivered at Birmingham. Low-phosphorus iron is in firm request at 2s. 6d. to 5s. per ton higher than the afore-mentioned figures, and malleable iron is a better market at 98s. per ton. There is not yet much doing in manganese alloys, of which there are large stocks, the furnaces at Workington on ferro having been put out of commission. Ferro-manganese is quoted at £13 10s. per ton. The outlook in the steel trade is healthier, useful orders for railway material, mostly for South America and the Colonies, having been booked, and there is sufficient work to keep the mills at Workington going for three weeks in four during March and April. Steel sheets are being produced at Workington for the first time for many years. The native ore production is just sufficient to meet local, East Coast, and Scottish smelters' requirements. The ore is costed at 17s. to 18s. per ton, according to grade. Heavy importations of African ore are due at Workington.

The coal trade is very busy and a much bigger output could be marketed. Prices are firm. Best round coal for shipment is 20s. to 20s. 6d. per ton; washed doubles, 18s. 6d. to 19s. per ton; washed singles, 18s. to 18s. 6d. per ton; washed smalls, 18s. per ton, all f.o.b. Best house, 30s. per ton; house nuts, 28s. 6d. per ton; gas coal, 28s.; West Coast coke, 20s. per ton.

Our Glasgow correspondent writes:—Business in the Glasgow pig-iron market remains quiet and transactions are on a small scale. There is, however, greater activity in the steel trade generally, steelmakers now having better-filled order books than they have had for some considerable time. It is still almost impossible to place orders on the Continent for semis for forward delivery, and owing to weather conditions, delay in delivery of existing contracts is very general. The demand for black and galvanised sheets is fair and, of course, works have sufficient orders on hand to keep plants fully occupied meantime. Tube makers are also busy with plenty of new work coming forward. There is no settlement in the iron trade dispute. Prices remain at recent levels.

Our Middlesbrough correspondent writes:—*Pig Iron.*—The slight improvement reported over the last few weeks is maintained. The supplies of the various grades of pig iron are scarce, and the tendency is for prices to increase further. Notwithstanding the competition of Midland iron with Cleveland, there is a scarcity of the latter, and should the demand in any way increase, it is not unlikely that prices may be further advanced. In the meantime they are as follows: No. 1, 69s. 6d.; No. 3 G.M.B., 67s.; No. 4 foundry, 66s.; No. 4 forge, 65s. 6d. In the hematite market East Coast mixed numbers are still 72s. Iron is not too plentiful, and buyers are now showing more willingness to contract ahead in

For Life Assurance.

AMP

The Australian Mutual Provident Society is unique. That is to say, all divisible Surplus, viz. about £1,000,000 belongs to the Policy-holders themselves and is distributed yearly. Moreover, the Society, established 1849, has been for many years the largest and most successful British Mutual Life Office. Why is this? Because it offers to Assurers the Acme of Security and Profit, and because its satisfied members are its best advertisement. Why are policies with the A.M.P. Society unique? Because while its premium rates are below the average, it possesses in a unique degree the combination of low expense rate, a high interest return and favourable mortality experience. The A.M.P. Society should be covering you. You will be sent full particulars on application.

EVERY YEAR A BONUS YEAR.

Assets: £70,000,000. Annual Income: £10,000,000.
New Business for 1927: £15,397,624.
Cash Surplus for One Year (1927): £2,[illegible]454.

ROBERT THODEY, F.I.A., Manager for the United Kingdom.

AUSTRALIAN MUTUAL PROVIDENT SOCIETY

Established in Australia, 1849.

LONDON OFFICE: 73/79, King William St., E.C.4.

rder to make sure of deliveries. The recent improvement in manufactured iron and steel has been maintained and, generally speaking, the works are well off for orders. The only change to note in prices is that of soft steel billets, which has been advanced about 5s. per ton during the week. Otherwise quotations are unaltered on the following basis: Steel ship plates, £8 7s. 6d.; steel ship angles, £7 17s. 6d.; iron bars, £10 5s.; steel rails, £8 10s., and, of course, are subject to the usual rebate. The ore position is still very firm and although best rubio is quoted at 22s. 6d., it is doubtful whether it could be secured at this price. The coke market is also firm, and 1ss. for blast furnace coke delivered furnaces is a minimum price.

Our Sheffield correspondent writes:—The recent advance of 2s. 6d. on Derbyshire foundry pig iron is stabilised, and there has been a similar rise in other Midland brands. It is the outcome of concerted action on the part of producers to secure prices which ensure a margin of profit. Owing to competition, there has been a good deal of unremunerative trading in such irons. Demand is poor, especially from the light castings foundries, and expansion of activity at the engineering foundries is slow. Business is far from good in bar iron. The local steel trade continues to improve if sections, but the absence of waggon-building and the paucity on railway work is responsible for the quietude of a good many plants. Demand for soft basic steel in crude forms is still expanding, and a shortage of scrap to feed the furnaces is reported. Heavy basic scrap is fetching 10s. per ton more than a year ago. Business for tool steels keeps steady, and best brands do not sell so readily as the medium qualities. The position of acid steel is reported to be slightly better than of late, but remains unsatisfactory. Business in hand tools has been sluggish this month, although exports are well maintained. The cutlery and plate branches are generally slack, although large contracts from the public caterers continue to arrive.

OTHER METALS.

Tin.—The market this week exhibited a good deal of irregularity, and prices declined rather sharply in view of lower Eastern cables and selling pressure, while influenced by an increase in warehouse stocks. Later sellers showed more reserve in face of improved buying orders, and values partially recovered. Stocks in London and Liverpool warehouses for week ending 16th February amounted to 8,296 tons, compared with 2,563 tons at corresponding period last year. Standard cash changed hand at £221 10s., £220 15s., £222 7s., and £221 12s. 6d.; three months £223 15s., £222, £223 17s. 6d., £222 15s. In the East sales were reported at £223 17s. 6d., £222 15s. per ton c.i.f. terms. Straits shipments for the first half of February totalled 4,235 tons.

Copper continued in good demand, and despite slight fluctuations at times the general tone proved firmer. Standard cash sold at £76 2s. 6d. to £76 15s., with three months £76 17s. 6d. to £77 1s. 3d.

Lead continued a firm market, and with a good trade demand liberal offerings were readily absorbed. Good soft foreign pig, February sold at £23 1s. 3d. to £23 6s. 3d., March £23 2s. 6d. to £23 5s., April £23 2s. 6d. to £23 3s. 9d., May £23 2s. 6d. to £23 6s. 3d. ton.

Spelter quiet and slightly irregular. February sold at £26 2s. 6d., £26 1s. 3d. and £26 1s. 3d., March £26 3s. 9d., £26 2s. 6d. and £26 1s. 3d., April £26 5s. to £26 3s. 9d., May £26 5s. to £26 3s. 6d., June £26 5s. per ton.

Aluminium steady. Ingots and bars for home delivery £95 per ton.

Antimony maintained. English regulus £54 to £55, and foreign ditto spot £38 10s. per ton.

Wolfram quiet. Chinese, also Straits quality, quoted 18s. to 18s. 3d. per unit, c.i.f. terms.

Quicksilver steady. Spot £22 5s. to £22 10s. per bottle.

Tin Plates quiet. Coke prompt and forward quoted 18s. to 18s. 3d. per box, f.o.b. Swansea.

HIDE, LEATHER, AND ALLIED TRADES.

Although there is a slightly improved demand for leather, prices of hides remain very unstable, and tenners refuse to operate on a large scale. Prices of provincial hides, however, have been rather steadier of late, and best ox are now selling from 7d. to 7½d. per lb. At last week's Bermondsey auctions the bulk of the offering was withdrawn in the absence of suitable bids. Caliskins are again weaker and declines of ½d. per lb. have been common at auctions. Woolskins share the prevailing weakness, and may be quoted at 1s. to 1s. 6d. each decline. In overseas hides there is little improvement, and Argentine frigorifics are now selling at about 9½d. for light ox. In saladeros a few Bovril ox have been sold at 7½d., whilst there is a rumour current that 10,000 Rio Grande ox have been sold in Antwerp at 7¾d. re-weights. Dry hides continue in buyers' favour, and B.A. Americanos are selling at nominally 12¾d. Australians are a shade steadier, Queensland meatworks dry salted ranking 10½d. The Chicago market is calmer in steady, with prices at "bottom"; still, best heavy native steers are now quoted at 14½ cents, a fall of ½ cent on the week.

The recent spell of wintry weather has brought in orders to manufacturers for stouter boots, and this in turn has led to more enquiries for heavier grades of bends. Consumers, however, are only buying for immediate wants, as tanners' quotations show a wide variation. Collections are frequent, as to repudiation of contracts, and demands for "allowances" from merchants even when the goods have been well up to sample. Dry hide bellies are still weak in price, but wet salted are rather steadier in view of a better demand. There is a slight improvement in upper leathers, although the recent reduction in prices of box and willow calf has rather upset the market. Glacé kid in black and brown is selling fairly well, but no definite decision seems to have been reached in regard to spring shades for women's shoes. Curriers are still rather slack, but some of them have received orders for suitable leather for the stouter grades of footwear.

OIL OUTPUTS.

United British Oilfields of Trinidad, Limited.—Production for the week ending Wednesday, February 13, 1929, amounted to 1,691 tons.

British Controlled Oilfields, Limited.—Production for the week ended February 13th: Venezuela, 33,599 barrels; Trinidad, 22,416 barrels; total, 50,015 barrels.

The Mexican Eagle Oil Co.—The production for the week ended February 9, 1929, was 137,000 barrels.

Venezuelan Consolidated Oilfields, Ltd.—Production for week ended 16th inst., 2 835 barrels (405 tons).

The Venezuelan Oil Concessions, Limited.—Production for the week ended February 16th was 128,400 metric tons (previous week ended February 9th, 134,172 metric tons).

COLONIAL WOOLS.

(FROM A CORRESPONDENT.)

The decline which has taken place in all markets during the past *three* weeks has been expected by many in the home trade since last December. Until the third week in January prices for all classes of wool had the appearance of being fairly sound, and keen buying on the part of all sections of the trade continued. There was, however, even at that time evidence that all Continental countries were beginning to feel the effect of lack of demand for *piece goods*. Reports now being received from the textile manufacturing centres shows that business is no better in Germany or France than in the West Riding of Yorkshire. During the two past months, the piece-goods business has fallen off everywhere, and there is no doubt that the attitude necessarily taken up by wholesale piece-goods merchants is exercising a greater influence upon the raw material than during 1923 and 1924, when marked advances were seen. Australian and New Zealand selling brokers are doing the right thing to meet the market, for there seems to be nothing to indicate any return to higher values during the next few months.

The probability of the Safeguarding inquiry becoming a protracted affair has been commented upon, and there is no doubt that the exposure of the unsatisfactory aspects of the industry has helped to intensify the atmosphere of uncertainty and weaken confidence in the future. Among the evidence brought forward in favour of the imposition of duties on imported fabrics, is the data provided last Tuesday by the secretary of the Woollen and Worsted Trades Federation, relative to the employment of machinery. This showed that the activity in the middle of January was less than in November last year, only just over 70 per cent. of the machinery being running. Many manufacturers who profess to be neutral on the question of Safeguarding are afraid that if duties are levied against imported goods, foreign competition in outside markets which have hitherto been largely supplied with British goods will be keener.

THE TIMBER TRADE.

[FROM OUR OWN CORRESPONDENT.]

Notwithstanding the severe weather, the deliveries into consumption this year are still well above those of the opening weeks of 1928, and with smaller supplies on hand (except floorings) the market looks promising for sellers. The building trade is not nearly so active as was expected, but the official returns of costs of buildings for which plans were passed last month indicate that with the coming of milder weather, construction work will be much more brisk.

Imports of both sawn and planed wood descriptions, i.e., deals, battens, boards and floorings, were large last month, the result of *late purchasing at attractive rates on a buying market moderately supplied.*

Activity in the f.o.b. and c.i.f. markets is confined principally *to the distribution among importers* of the f.o.w. and early summer shipments of Russian wood. As previously mentioned, a syndicate of British importers has purchased the whole of the Russian wood cut for the United Kingdom this year, and proposes to apportion supplies required without favour to importers, whether in the syndicate or not. This new method of purchase and wood distribution has not yet received the general approval of the importing section of the trade owing to *certain conditions regarding re-selling.* The members of the syndicate, it seems, will have to exercise some patience with their colleagues in the trade who up to the present would have preferred to do their 1929 Russian business unfettered.

Other important wood-shipping countries seem to be more than ever. Finland (for many years until last year the

wood-shipping country of the United Kingdom) [illegible] maintaining her f.o.b. values in face of the severe competition of Russian wood, and proposes to reduce output by some 10 per cent! The shippers of that country know that Russia cannot supply all the goods required for the United Kingdom, and believe that with decreased cut and the expectations of a larger consumption and import in the United Kingdom this year, and normal Continental demand, at the least, they will be able to clear their million standards' production this year. As official sales to end January comprised 40 per cent. of the output for export (it is likely to be over 50 per cent. by this time), and they have a good nine months to sell the balance, their position cannot be described as bad. Shippers in Sweden also are adopting a firm attitude.

Canadian pine and spruce are moving slowly in the United Kingdom. While over half a million European deals, battens and boards were delivered from docks in London last month, Canadian pine and spruce so dispatched numbered only some 15,500 pieces.

The hardwood market is becoming more active. Stocks of mahogany in first hands are light, imports being on the small side. American hardwood imports also are decreasing, and with stocks here not so heavy, and better demand in the States, higher United Kingdom spot prices should not be so hard to obtain as during the closing months of 1928. The plywood market is very firm, and although imports seem to be ever on the increase consumption moves up to keep stocks in healthy volume.

THE WOOL TRADE.

Our Bradford correspondent writes:—There is very little change in any section of the industry as compared with conditions ruling during the last three or four weeks, and the present inactivity is in marked contrast to the good business which was done in the early part of last year. Lack of confidence following the decline in wool values appears to be as much in evidence in the United States and on the Continent as it is here, and until users feel satisfied that the bottom has been touched, they will not depart from their present policy of extreme caution. The only consolation is that no really large stocks are being carried in any section, so that when once the wheels begin to turn there should be a fair volume of orders for both tops and yarns. Meanwhile quotations are largely nominal, although the indications are that merinos are fast approaching a workable basis. Crossbreds, on the other hand, appear to be too high in comparison with merinos, and users are looking for a general revision of quotations for tops to bring them more into harmony with the finer qualities. Unfortunately, in the present disturbed state of affairs, it is almost impossible to arrive at a true market price.

VEGETABLE OILS AND OILSEEDS.

Trade in most sections is on quiet lines. Linseed oil continues firm in the absence of foreign competition and has advanced somewhat following speculative interest. After rising to £29 5s. per ton naked ex Hull for spot and February-April values have eased on profit taking. Cotton oil has been in better demand and prices are firmer, current value of crude Egyptians being £28 5s. and common edible £31 15s. spot and February-April ex Hull. Other seed oils are quiet. Castor oil (first pressure) has been advanced to £47 10s. (barrels free) and rape oil is also dearer.

In the oilseed section, linseed is very quiet, and prices have an easier tendency. Neither English nor continental crushers are showing much interest. Present value of Plate in spot is about £16 and on passage and for shipment £15 17s. 6d. The quantity of linseed on passage to Europe has undergone a substantial reduction and is now 220,900 tons or 43,800 tons less than last week and compares with 272,400 tons a year ago. Generally shipments to Europe so far this season are much in excess of last year. Cotton seed is neglected as crushers decline to concede the figures now asked for black Egyptian, the economical value of which is £10 2s. 6d. for February and March loading. A little business has been done in Sakellaridis, but Bombay is nominal. Oilcakes are in fair demand and late prices are maintained.

OVERSEAS PRODUCE.

FOOD, BEVERAGES, &c.

Sugar.—The market furnishes very little matter for comment just now, and there is only moderate absorption in force, both on refinery and manufacturing account at previous rates. British refined and home-grown quite monopolise United Kingdom markets. An estimate by certain Cuban interests of 4½ millions of tons, expecting that crop, failed to influence the general position, as it was indicated quite a week ago, and taken, *cum grano salis*, by the London sugar circle, despite the knowledge of one or two centrals closing down owing to *unremunerative* prices ruling. There is no change in the Java position, but sellers adhere to full asking prices. An interesting fixture recorded to-day was the steamer "Comino," of 7,000 tons, London to Hong Kong, late February loading, at 25s., with sugar, this doubtless being part of the sale of 25,000 tons recently negotiated of the now predominant British refined T.L. granulated, to China. T.L. granulated spot London sold 22s., with business doing in Dutch J. to manufacturing exporters at 24s. 1½d. White Mauritius 21s.-21s. 4½d. as to quality. Parcels for shipment quite idle and Dutch [illegible] sellers 11s. 7½d. f.o.b. Rotterdam.

March-April quoted 9s. 1½d. c.i.f. United Kingdom. Terminal sections quiet and easier, while influenced by heavy liquidations of the March position in the New York centre. Of raws, March sold 8s. 5½d., May 8s. 8¼d., August 9s. 2½d. to 9s. 3½d., October 9s. 3¾d., December 9s. 4½d. White, March quoted 12s., May 11s. 8½d., August 12s., December sold 12s. 2½d. cwt. Cuban receipts last week 235,532 tons, against 321,656 last year; exports 123,157, against 81,077; stocks 712,245, against 567,332. Stocks of raw sugar in the three chief ports of the United Kingdom for week ending February 16th amounted to 165,547 tons, against 94,079 last year.

Coffee.—The market during the week disclosed some irregularity, but fair absorption took place, and on balance there is no material change to note. Costa Rica fair to fine bold sold 139s. 6d. to 159s. 6d.; peas to 167s.; Kenya bold up to 153s. Uganda, Robusta 89s. 6d. to 99s.

Cocoa.—Market after showing very active movement forward assumed a quieter tone, and the general position still hinges upon manipulations in the New York centre. Accra F/F March-May sold up to 45s. 6d., 44s. 6d. and 43s. 3d. f.o.b. Terminal: March sold 49s. 6d., 49s. and 49s. 3d.; May 49s. 10½d., 49s. 9d., 49s. 3d.; July, 51s. to 50s. 10½d., 51s. 3d.; September, 52s. to 52s. 6d., and December, 52s., 51s. 6d. and 52s.

Tea.—Indian auctions during the week totalled 55,400 packages. A generally quiet market was experienced, but there was fair support accorded the *finer qualities, and which ruled steady.* Good medium down to clean common varieties declined ½d. to ¾d., and really inferior 1s. per lb. lower. Ceylon auctions of 22,400 packages received fair competition, and some irregularity characterised the market, plain and medium kinds being frequently ½d. to ¼d. lower. There is nothing fresh to add with regard to new season's China, business being *reduced to a minimum.* Java and Sumatra sales quiet and mostly in favour of buyers.

Rice.—Market unaltered, with small sales in oil crop, two Stars Burma at 13s. 9d. to 14s. New crop expected to reach the London market next week. Bran firm, quiet.

Beans.—Market very firm for Rangoon haricots, and Mandalay shipment sold 21s. cwt. c.i.f. London. Butters firm, unaltered.

Peas.—Quite steady, but demand only moderate.

Spice.—Pepper market generally dull, and forward prices trended against sellers. Lampong, January-March sellers 1s. 4½d., March-May 1s. 4d., May-July 1s. 2¼d., August-October 1s. 1d.; Alleppi white, January-March sold 2s. 2¾d., March-May 2s. 3d., May-July 2s. 2¼d., August-October 1s. 10¾d. sellers per lb. London stocks 34 tons lower on the week. Tellicherry, January-March 153s., February-April 141s., March-May 142s.; Aleppy, January-May 142s. 6d. cwt. c.i.f.; Pimento, spot, 1s. 0¼d., lb. and unaltered forward. Cloves rather irregular. Zanzibar, spot, 1s. 1¼d. to 1s. 4¾d. as to quality, due steamer 1s. 4d., March-May 1s. 4¼d. lb. Tapioca, Singapore flake, February-April to Havre, 19s. 9d.; Pearl seed to London 17s. c.i.f. Sago flour January-February 13s. 7½d. c.i.f. United Kingdom. Dutch Farina, 12s. 1½d. f.o.b. Amsterdam. Ginger, spot, 52s. 6d. paid, forward 49s. cwt. c.i.f London or New York.

Fruit (Dried)—Currants quiet, and prices tend in buyers' favour. Pyrgos quoted 45s. 6d., Patras 47s. 6d., choice Vostizza Amalias 46s.-46s. 6d., Gulf 49s.-51s., Vostizza 50s.-57s. Sultanas steady. Medium to good Smyrna spot 41s.-55s., Cretan 42s.-70s., Greek 35s.-65s.; Australian in better request at 32s.-60s.; Californian soda, bleached 35s.-38s., unbleached 29s.; Cape, unbleached 33s.-37s.; bleached 45s.-50s. Raisins slow of sale. Valencia, 4-crown boxes 50s.-55s.; Australian, 32s.-36s. Figs quiet. Genuine new spot 28s.-32s. Dates steady, with a fair demand for Hallowie new spot 28s.-30s., Khadrowie 23s., Siar 15s.-17s.

Evaporated Fruits.—The general tone continued steady, and there is rather a better movement, with apricots and apples for full rates. Plums in good demand, and large counts firmer on scanty offerings. Californian plums, 20's-30's 40's 57s., 60's-70's 43s.-43s. 6d. Australian pears 57s. 6d.-70s. as to quality. Apricots, South African Royal 60s.-117s. 6d., Cape 72s. 6d.-82s. 6d., Californian 117s. 6d. Peaches, Californian choice 50s., extra choice 58s. Apples, Californian spot sliced extra choice 67s. 6d. tend easier both spot and forward, trading being Mazagan 142s. 6d., Mogador 140s., Majorcas 145s., bitter Jordan 135s.-210s. cwt.

CANNED GOODS.

Canned Fruits.—Californian descriptions in fair supply, demand chiefly for peaches and pears, which realised steady. Shipment parcels met with *moderate support at about* Australian varieties move off steadily. The spot Singapore pines continues restricted, and the forward position remained without material change. Italian tomatoes firmly held, forward quotations are above buyers' ideas.

Canned Fish.—Trade demand is slow to expand, operating to cover immediate requirements. Portuguese quoted 5s. per dozen tins. Lobsters, best halves 140s. and quarters 77s. 6s.-82s. 6d. Salmon: Spot trade was of moderate dimensions, and market steady. Red tall spot 42s. 6d., pink talls spot 26s.-27s., halves 31s. 6d.-33s. 6d. Japanese firm in sympathy with high forward rates. Finest quality 95s.-97s. 6d.

COMMERCIAL TIMES—WEEKLY PRICE CURRENT.

The prices in the following list are revised with the assistance of an eminent firm in each department.

12 by 6 lb., quoted 92s. 6d.-107s. 6d. per dozen tins. Danish cooked hams move off freely at about 1s. 7d. per lb. for cases of 6 tins.

CONDENSED MILK AND MILK POWDERS.—Market steady. Full-cream sweetened English spot 45s., Dutch ditto 38s. 6d., February-March 38s. 6d., machine-skimmed sweetened English spot 30s., Dutch ditto 24s. 6d., February-March 24s., all in 5 cwt barrels. Powders: Spray F.C. 26 per cent., 2 by 56 lb. tins crated, prompt, 94s.; M.S. (1 cwt. cases) prompt, 40s. Roller process, F.C., 26 per cent., prompt, 78s.; M.S. ditto 31s., all net, duty paid, ex-wharf London. On the grocery side, F.C.S. 21s.; M.S.S. 10s., basis per case, usual packing. Danish cream sells steadily. Evaporated, unsweetened, 48 by 16 oz., 18s. 6d.; 96 by 6 oz., sweetened, condensed, 48 by 14 oz., 20s. per case.

HONEY.—Market continues firm for the better grades, with a fair business passing. Palish set Jamaica 54s., amber set 48s., and manufacturing kinds 42s. 6d. Haitian yellow palish set 50s. New Zealand sells well, dark amber at 50s.-55s., medium 55s.-65s., light, 65s.-85s., whites and water whites 65s.-87s. 6d. cwt.

RUBBER.

Market still unsettled and business confined to moderate limits. Sheet spot and February sold 1s. 0⅛d. to 1s. 0⅜d. and 1s. 0½d.; March, 1s. 0⅝d. to 1s. 0¾d.; April-June, 1s. 0¾d. to 1s. 0⅞d. and 1s. 0⅝d.; July-September, 1s. 0⅞d. to 1s. 0⅜d. and 1s. 1d.; October-December, 1s. 0⅞d. to 1s. 1d., and 1s. 1⅛d. lb. London stocks reduced 656 tons on the week, landings being 1,085, deliveries 1,741, stocks, 24,747, against 63,769 at same time last year. Liverpool landings 200 tons, deliveries 220, stocks 20 tons down at 4,086. Singapore shipments first half February, 21,000 tons, estimate for whole month, 40,000.

GENERAL.

JUTE.—Market again dearer while supported by sustained buying both in London and Calcutta. Firsts, February-March, sold £37 6d.; March-April, £36 5s.; April-May, £36 12s. 6d.-£36 15s. Hessians, February-March, done £34 10s. per ton. Hessians firm, but arrivals of jute in Hamburg first half February 43,329 bales, Antwerp arrivals during January 35,600 bales. Stocks in Hamburg and Bremen on the 15th inst. total 126,735 bales, a decrease of 8,681 bales on the fortnight. Antwerp stocks, 11,3[illegible] bales.

HEMP.—Manila quite steady, but business reduced to a minimum, with K grade still monopolising what support arises just now. Something resembling a deadlock remains in force in the Philippines between dealers and shippers, as the former cannot become reconciled to the much lower rates now in force. K grade February-April, quoted £33 5s.; April-June, £33 10s. buyers. Other scarcely mentioned. Sisal slow on former terms. Manila receipts for the past week totalled 41,000 bales, compared with 27,000 last year, estimate for next week 50,000, and following week 37,000.

SHELLAC.—Market steady. T.N. spot 197s. 6d.; March 191s. May sold 193s.; August, 195s. cwt.

COPRA.—A dull and uninteresting market resulted. Straits S.D. March-April, Rotterdam, quoted £24 5s.; April-May, £24 15s. Others call for no comment. Palm kernels, February-March, Hamburg, £19 15s. ton.

MISCELLANEOUS.—Coconuts quoted 18s. to 21s. per 100. Coir yarn, Ceylon, £18 5s. to £39 10s.; Cochin, £23 to £40 10s.; Ceylon bristle, £19 to £25; cinnamon leaf oil, 5¼d.; citronella, Ceylon, 1s. 10d.; Java, 2s.

METROPOLITAN CATTLE.—February 20.

THE MONEY MARKET.

CONDITIONS this week have been relatively stringent, with rates for short loans ranging from 5 per cent. upwards. The market rate on three months' bank bills has been around 5¼ per cent., with a fair Continental demand for bills. Treasury bill repayments continue to be in excess of issues, but against this tax payments are continually

taking large sums off the market, and the cross-currents arising from these various factors are making the present situation unusually complex.

* * *

Over and above the internal difficulties of the London market comes the even greater obscurity attending the American outlook. On Wednesday the dollar exchange improved to $4·85\frac{7}{16}$, and this relieved London anxiety to some extent; but on Tuesday the Bank was only able to secure the balance of the South African gold by paying more than its minimum price, and it is possible that unless the Bank had bid for it, this gold would have gone to America. In bidding for this gold the Bank has not departed from its normal practice, but even so the American outlook and its possible reaction on London are viewed with some apprehension.

* * *

So long as the Reserve Banks refrain from raising their rates, there seems no reason to fear a further increase in Bank rate in London. At the moment the Reserve Banks are trying other methods to discourage the flow of money into Wall Street, and the fact that fresh foreign money is now being offered in London suggests that certain withdrawals from New York are taking place. It is, however, uncertain if the Reserve Banks' present policy will prove efficacious, and there are indeed signs that banking opinion in America is not unanimous. Definite action on the part of some of the Reserve Banks other than New York is a possibility that must not be lost sight of. But if the New York rate goes up, the probability is that the Bank of England would follow suit.

* * *

Meanwhile something can be done in London to relieve the present situation. The first need is to discountenance as strongly as possible any suggestion that British capital is being invested in the United States because of the possibility of a Labour victory at the election. Such a transfer of capital would merely mean the substitution of the greater for the smaller risk, and apart from this it is under present monetary conditions an unpatriotic action fraught with grave consequences to the country. Fortunately there is no real evidence that such a flight from the pound is taking place, but the mere unsupported suggestion, made in certain quarters, that such a movement is starting, is, to say the least of it, unhelpful.

	Feb. 28, 1929.	Feb. 21, 1929.	Feb. 14, 1929.	Feb. 7, 1929.	Previous Rate and Date Changed
	%	%	%	%	%
Bank Rate.....	5½	5½	5½	5½	4½ (Feb. 7,'29)
Banks' Deposit Rate..	3½	3½	3½	3½	2½ (Feb. 7,'29)
Discount { Call	3½	3½	3½	3½	2½ (Feb. 7,'29)
Houses { Notice.....	3¾	3¾	3¾	3¾	2½ (Feb. 7,'29)
Market rate (3 months' bills)	5½	$5\frac{5}{16}$–½	5½	$5\frac{1}{8}$–$\frac{3}{16}$	...

Finally, if a 5½ per cent. Bank rate is to succeed in its object of attracting money from New York back to London, it must be made effective, and this involves a stable discount rate of around 5¼ per cent. It is suggested that the market can do *something to help in this* by taking a longer view than at present. The market admittedly has its own difficulties to contend with, including the varying Continental demand for bills, but the regular lapse in discount rates at the week-end, followed by their stiffening in the middle of the week, is liable to create a false impression in foreign centres and to add to the difficulties of the authorities at home. There is no need to feel unduly alarmed as to the outlook, especially in view of this week's improvement in the New York exchange, but it must be recognised that the situation is one of some difficulty and obscurity, and that in consequence the active co-operation of all involved is necessary, if undesirable developments are to be forestalled.

NEW YORK MARKETS.

Our New York correspondent cables:—This week's statement of the Federal Reserve system shows a substantial rise in discounts, the natural accompaniment of end-of-the-month settlements. There has been a further fall in bill holdings, and little change in Government securities. The total volume of reserve credit is only six millions higher; this, together with the decrease in the brokers' loans held by member banks, indicates that the banks are co-operating in deflation of credit. The New York reserve ratio is down from 83.1 to 81.6, and that of the system is practically unchanged at 69.9.

THE STOCK MARKETS.

Monetary uncertainties exercised a markedly unfavourable influence on the stock markets, a disposition to reduce commitments being widespread. Gilt-edged quotations were lower, and home rails remained in a dull condition. Apart from some little activity in motor shares and margarine issues, industrials tended to lose ground, investment as well as speculative securities coming within the orbit of the movement. Rubber shares were rather less active than of late, shares irregular, and oil shares quiet. In the mining markets, Kaffirs were largely unchanged, while Rhodesians marked time, but copper shares reflected the continued strength of the metal.

THE COMMODITY MARKETS.

The general tone of markets this week is promising. Collieries are more active than they have been for a very long time; as the result of an extension of working hours congestion at the South Wales ports is being steadily reduced. Iron and steel manufacturers are optimistic: pig iron continues to improve, and prices of semi-finished steel in most districts are now able easily to compete with those on the Continent. It has been decided not to raise the price of tin plates for the present. Liverpool cotton is at last showing signs of increased activity, and the hardening of raw material prices is reflected by some improvement in Manchester. Oversea outlets for piece-goods are improving, but spinners are still hampered by heavy stocks. Merino wools seem to be nearing stabilisation, but the future of crossbreds is still uncertain. Jute yarns and cloth are firm. Hides and leather have improved slightly. Little business has been done in vegetable oils and oilseeds. Wheat has declined.

FOREIGN EXCHANGES.

The market was quiet during this week. Sterling on New York was steady between $4·85\frac{1}{4}$ and $4·85\frac{3}{8}$, closing at $4·85\frac{5}{16}$, forwards being $\frac{5}{32}$ cents and $\frac{13}{32}$ cents discount for one and three months. Canada was erratic, moving between 4·87 and $4·87\frac{3}{4}$, with $4·87\frac{5}{8}$ quoted at the close. Paris improved to 124·18 on Tuesday, owing to the demand for funds over the month end, but was higher at 124·27 on Thursday. Forwards were 6 centimes and 18 centimes premium. Brussels improved to $34·93\frac{1}{2}$, as against $34·95\frac{1}{2}$ a week ago, and Holland depreciated to $12·11\frac{3}{4}$. Spain was very erratic, fluctuating between 31·20 and 32·05, with 31·85 quoted at the close. Forward Spain was in better demand at $7\frac{1}{2}$ and $18\frac{1}{2}$ centavos premium for the one and three months periods respectively. German marks were again on offer, and closed at 20·45. Forwards were $\frac{1}{2}$ and $1\frac{1}{2}$ pfennigs discount for one and three months. As a result of the stabilisation of the Czecho-Slovakian crown at 33·75 crowns per dollar, Prague was quoted $163\frac{7}{8}$. Japan was again lower at 1s. 10¼d., but Buenos Aires remained unchanged at $47\frac{5}{16}$d. Silver was in demand from China and closed ⅛d. higher at $25\frac{15}{16}$d. for spot and 26d. for forward delivery. Hong Kong was 2s. 0⅛d. and Shanghai 2s. 6⅞d.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following companies:—British and German Trust, Great Western Railway, Pearl Assurance, Manchester Ship Canal, National Provident Institution, E. N. V. Engineering, R. M. C. Textiles (1928), General Investors and Trustees, City Offices, Rolls-Royce, Selfridge and Co., Maple and Co., Leyland Motors, Bovril, Jeremiah Rotherham, and Pearl Automatic Machines. The chairman of the Great Western Railway discussed various aspects of the railway transport situation, and announced that the proposal to permit dealings in £1 units of the company's stock had not been favourably viewed. An informative review of international monetary questions was given by Mr. Alfred Wagg at the British and German Trust meeting.

PLAIN QUESTIONS FOR THE PREMIER.

Six years ago Mr. Baldwin did a very rash, but also a very straightforward thing. He came to the country and said in effect, "I cannot be responsible for the Government of the country unless you give me the power to institute a general tariff on imported manufactured goods." He put to the electorate a perfectly plain question and the electorate returned a perfectly plain negative. This year Mr. Baldwin is repeating his rashness. He is about to ask the country once more for authority to extend the protectionist experiments in which the present Government have already indulged. But we are still waiting for him to couple rashness with candour, for with the election only a few months distant it is by no means clear to the closest student of politics, and therefore entirely obscure to the general public, what the exact fiscal policy is to which Mr. Baldwin is about to ask the country's consent. Time is running short, and the country has a right to demand from the Prime Minister a clear statement of the intentions of himself and his colleagues in the matter of Protection, if they are returned to power at the coming election, the more so because the one thing that is abundantly clear in the present welter of fiscal perplexities is that the tariff question will transcend all other election issues in its vital importance to the future of industrial Britain.

The need for a clear and unequivocal statement of ministerial policy is gravely heightened by the publication of the letter addressed by the Prime Minister to the Secretary of the Iron and Steel Trades Confederation. The Confederation requested the Government to appoint a Royal Commission to investigate the troubles of the iron and steel industry. This request Mr. Baldwin refuses on the grounds that it would be an unnecessary and dilatory proceeding and that the Balfour Committee has already examined the relevant data. Instead he promises, if he is returned to power at the election, to allow the iron and steel industry immediately to bring its case to the "safeguarding" committee. We are not ourselves overenamoured of Royal Commissions as a step to rapid and effective action, but in fairness to the Steel Confederation, it must be pointed out that their request was for something analogous to the Samuel Inquiry on the coal industry—an investigation calculated to supplement the by no means exhaustive findings of the Balfour Committee—and that they were far from wishing for an inquiry which would confine itself solely to the question of an import duty. But that is by the way. The significance of the Prime Minister's letter lies in the lurid light which it throws on the apparent fiscal intentions of the Conservative Government if they are returned to office.

Given a new lease of power, we now know, they will immediately appoint a safeguarding inquiry before which the iron and steel trade may plead its case for protection. Of what nature will this inquiry be? For an answer to that question we have to turn back to a speech delivered in the House of Commons on November 14th by Sir L. Worthington Evans, in which he expounded on behalf of the Government the changes in the present safeguarding procedure, which the Government proposes to introduce if their policy is sanctioned at the polls. The principal change in procedure is that there should be one permanent tribunal in place of the present *ad hoc* committees—a tribunal to which every industry, except agriculture, would have the right to apply. The modifications in the regulations governing the applications and the work of the committee are comparatively slight, but as we pointed out at the time, they are changed in two particulars, and in each case the change has the effect of making it easier for any applicant industry to obtain the protection which it claims. The new regulations as propounded by Sir L. Worthington Evans, still include no provision to ensure either that the case of the trader and consumer is properly considered, or that any broad view is taken by the tribunal of the national interests as a whole.

We seem therefore to have reached this perplexing position. Three years ago the Prime Minister refused to allow the case of iron and steel to go to a "safeguarding" committee because a tariff "on a basic industry of this magnitude would have repercussions," which would have constituted a breach of his pledge not to introduce any general measure of protection during the present Parliament; and if Mr. Baldwin's speech to his own party conference at Yarmouth still holds good, he still regards himself as pledged not to introduce any general measure of protection after the next general election. Yet he now tells us quite clearly that if he is returned to power one of his first acts will be to see that the iron and steel industry's case for a tariff is heard by the "safeguarding" tribunal. Nor does this exhaust the significance of Mr. Baldwin's letter. The very emphasis which he lays on the slow and cumbersome method of a Royal Commission underlines the fact that the quicker procedure of the Safeguarding Tribunal will shut out all possibility of investigating the problem of a tariff for steel in the light of the needs of British industry as a whole.

It is hardly necessary to point out to readers of the *Economist* that, as Mr. Baldwin has admitted, the ramifications of effect that will be produced by an import duty on steel will be wide enough to touch the national life at a thousand-and-one points. The plain truth, which we defy any Minister to deny, is that as soon as you come to the question of a tariff for iron and steel you are immediately face to face with the whole question of a general tariff. That, and nothing short of that, is what the country has to face, if we may rely on the scattered dicta of the Prime Minister and his colleagues. We suggest to Mr. Baldwin that it is not fair to allow the country any longer to rely upon such dicta. He owes it to his political reputation to make clear without further delay precisely what the meaning is of the protectionist policy which in a few months is to be voted upon by the people. So long as we lack such a statement we are bound to conclude, on the only evidence, that behind all the professions of gradual extension of "safeguarding" experiment lies the full threat of a complete revolution of our fiscal system, and that if Mr. Baldwin wins the election, he will immediately claim a mandate from the country to carry this revolution into effect.

If then Mr. Baldwin has really been driven by the extremists in his own party to plunge once more into the deep waters of full-blown protection, it is pertinent to ask what is the position of the Chancellor of the Exchequer? On July 24th in the House of Commons, Mr. Churchill said:—"In the fiscal sphere it seems to me that we ought not to contemplate any fundamental reversal of the fiscal system upon which the whole industrial and economic structure of this country is erected, and with which it is profoundly interwoven." Even the unlimited ingenuity of the Chancellor could hardly reconcile the holding of this belief, and the clear view of Britain's dependence on export with which he justified it, with support of the policy into which his own Prime Minister appears to have been irrevocably forced. What is the Government's policy and what does it mean? We appeal to Mr. Baldwin to shake himself clear of equivocalities and nebulosities and to tell the country what he means in terms as clearly understandable as those which he employed in 1923.

BLACK AFRICA.

THE great question of Black Africa is in the air. We are all aware of its presence and alive to the momentous consequences which its settlement will have, for good or evil, in the history of the world. A few weeks ago the complexity and importance of the problems involved were brought out by the publication of the report of a British Commission on Closer Union of the Dependencies in Eastern and Central Africa (the Hilton Young Commission); and, in a letter published in *The Times* last week, seven distinguished public men, headed by Lord Lugard and Lord Davidson, pointed out how wide the ramifications of these East African territories were, and pleaded for a procedure that should be no less authoritative and exhaustive than that which followed the publication of the Montagu-Chelmsford Report on India. We trust that this wise counsel will be followed; and, meanwhile, we venture to underline a point on which the writers of this

letter and the members of the Hilton Young Commission alike have insisted: namely, that East Africa cannot be seen in true perspective except as part of the continent to which it belongs. That continent is not, indeed, quite co-extensive with the Africa whose boundaries every child learns at school. Black Africa reaches, not to the southern coasts of the Mediterranean, but only to the southern rim of the Sahara; and North-West Africa and Egypt have far more in common with Southern Europe and Western Asia than they have with the Dark Continent, from which they are isolated by a desert less easily passable than any sea. Still, the true Africa, extending from the Cape to the Sahara, is vast enough; and some general knowledge of this immense region and its constituent elements—human and material—is the essential background for dealing effectively with the local problems as these crowd upon us, to-day in the East and to-morrow in the South or the West.

As everywhere, the most important element is the human element—and first and foremost the race which held the ground at the moment when the first Europeans arrived, and which still holds most of the ground notwithstanding the terrific impact of Western civilisation. This is the Black Race of Africa, which has given its name to the whole continent south of the Sahara; and the most curious and baffling feature of the African problem is that this race, which is probably the determining factor, is still almost an unknown quantity. There is really only one thing that we know about the African race for certain, and that is its physical vitality. Where Caribs, Red Indians and South Sea Islanders have wilted away, even on their own ground, at the touch of the Western intruder, the African has survived—and survived under the most adverse conditions conceivable, as a transported slave. It is not likely that, if he has come through this ordeal in the New World, he will die out in his native African domain, especially in an age in which Western society has learnt, in dealing with "native races," to be ashamed of its old methods of barbarism. In the world as it is, the continued existence of the Black Race of Africa seems assured; but this sole solid fact gives the measure of our ignorance; for while we may be reasonably sure of the African's ability to survive, we have little means of estimating his capacity for civilisation. It is true that we are equally in the dark about the capacity of other races that have likewise remained hitherto at the level of Primitive Mankind; but these races are mostly small in numbers and dwindling rapidly, so that in their case the unknown quantity is a question of philosophic speculation rather than of practical importance for the future of the world. Again, there are other races which show no less ability than the African race to survive physically in a Westernised world; for instance, the Hindus or the Chinese or the Javanese; but in their case the future is at least illuminated by the past, for they have a long record of native civilisation in which their racial and social idiosyncrasies have been brought to light. The African race alone is both alive and an enigma.

Of course, it has been stoutly denied, especially by white men interested to deny it, that the Black Race is an enigma at all. If it is still near the primitive level to-day, when certain other races have gone through the cycle of civilisation two or three times, does not that show that the Black Race is spiritually sterile—that its members are incapable of progress or that, in the older theological language, "niggers have no souls"? The older formula, with its implication of a creation in 4004 B.C., is really more tenable than its modern counterpart, for the whole argument depends upon being ignorant of, or ignoring, the immensity of time. In the geological and astronomical perspectives of to-day the 6,000 years' start of the Egyptians, or the 1,300 years' start of the English over the Black Africans in making the experiment of civilisation, shrink to an infinitesimal quantity compared to the hundreds of thousands of years during which Egyptians and English and Black Africans have all vegetated on the primitive level, together with the rest of mankind. Because our neighbour remains standing a few seconds after we have started to run, shall we venture to argue that his limbs are not made for motion? A few seconds later he may be hard at our heels, and who can say, before the race is over, whether he may not end in the van?

Even while we have been asserting that he cannot move, we have ourselves been shaking him out of the lethargy in which we likewise lay a few dozen generations ago. The impact of Europe on Africa is now a commonplace, and it needs a certain effort of the imagination to realise how tremendous this impact is. Compare it with the impact of Europe on India and China, of which we are now beginning to see the dynamic effects. When these latter collisions occurred, the two colliding bodies were not so far apart nor so different in structure. India and China were already civilised, Europe was not yet industrialised. It is only in Africa that an industrialised Europe has collided with an alien race still on the primitive level and at the same time physically sturdy enough to take the shock and survive it. The dynamic effects may be expected to be proportionately greater than those which are declaring themselves in India and China now.

For Africa is no longer on the periphery of the Western world. On the economic plane, at any rate, it is being drawn rapidly nearer to the central eddy of our Western life. Tropical products play a larger and larger part in our industry, and Black African populations are now consciously reckoned into the Balance of Power—for instance, when French statesmen speak of France as "a nation of a hundred millions," with an eye to the black troops which the French General Staff can mobilise on European battle-fields. African "man-power" has played three successive rôles in the economy of the European world, and each rôle has been more important than the last. When African slaves were "black ivory" they were rare and exotic articles of luxury. In the next stage, when they hoed and picked the cotton of the New World, they were already one of the pillars of the Western Economic system. In the third stage, when African "man-power" is being applied at home to the wholesale economic development of Africa itself, it is not inconceivable that Africa may become, in its turn, "the workshop of the world."

In an Africa so transformed, would the African himself be slave or free? That is perhaps the greatest of the questions raised by the "opening-up" of Africa at the stage which it has reached to-day—for slavery cannot be exorcised merely by outlawing the name. It is a status which has many guises, and those which disguise it under the most specious names may be the most difficult to guard against. This is only another way of saying that the key-problem of Africa at the present time is the problem of labour. It was bound to arise in an acute form; for a population which had barely scratched the surface of a continent could not suffice to till the soil when it had been carved and turned over by the Western motor-plough. There would have been a shortage of African man-power, even if the impact of the West had left the native African population intact. And of course, it has not done so. The slave trade and forced labour have each taken their toll; and though the African race is going to survive under conditions in which Caribs and Polynesians have gone under, it naturally is not surviving without heavy losses. The question now is: What view of African "man-power" are Western "Empire-builders," as a whole, going to take? Are they going to regard it as a precious capital, the indispensable plant by which alone the potential riches of the continent can be transformed into tangible wealth? Or are they going to pursue a policy of human "Raubwirtschaft" until it is too late? There are welcome indications—for example, in the Belgian Congo—that the "scientific" policy of conserving native African "man-power" is in the ascendant. It is fortunate that, in this issue, science seems to agree with humanity: for though the question may be settled on the economic plane, it is on the moral plane that it will come up for judgment.

THE BALANCE OF TRADE.

In a recent article on Overseas Trade in 1928 we were able to point to a definite, if slight, improvement in the visible trade balance of the United Kingdom, and an estimate of the invisible items led to the provisional conclusion that the total balance would show a larger movement to our credit. The publication by the Board of

The New York Trust Company

Capital, Surplus & Undivided Profits - $35,000,000

COMPLETE INTERNATIONAL
BANKING FACILITIES

100 Broadway New York City

Trade of its customary estimate of the total balance of payments shows our conclusion to have been substantially accurate and to have erred slightly on the side of conservatism. The Board of Trade figures include all transactions of a revenue character between the United Kingdom and other countries, whether these originate with governments or individuals. They are, as usual, subject to later revision if fuller data become available. The subjoined table gives the figures for the past three years:—

BALANCES OF INCOME AND EXPENDITURE IN THE TRANSACTIONS (OTHER THAN LENDING AND REPAYMENT OF CAPITAL) BETWEEN THE UNITED KINGDOM AND ALL OTHER COUNTRIES.

(In million £'s.)

Particulars.	1926.	1927.	1928.
Excess of imports of merchandise and bullion	475	390	359
Estimated excess of Government receipts from overseas*	4	1	13
Estimated net national shipping income†	120	140	130
Estimated net income from overseas investments	285	285	285
Estimated net receipts from short interest and commission	60	63	65
Estimated net receipts from other services	15	15	15
Total	484	504	508
Estimated total credit balance on items specified above	9	114	149

* These include some items on loan account.
† Including disbursements by foreign ships in British ports.

The excess of imports of bullion and merchandise for 1927 is now given as £390 million, as against an original figure of £392 million. The reduction of this item by £31 million in 1928 must be slightly discounted, as imports in the first few months of 1927 were still abnormal as a result of the coal stoppage, but as the last eight months of 1928, taken alone, still compare favourably in this respect with the corresponding period of 1928, the improvement in the visible balance of trade may safely be regarded as genuine.

The item "Government receipts" is composed of receipts and payments in respect of loans between governments; reparation receipts; receipts on account of Indian home charges; and receipts and payments on account of the overseas activities of the various public departments. As only estimates are available for part of the year under review, these figures usually require revision, and the Board of Trade has now added one million to the estimated net revenue under this head for each of the years 1926 and 1927, making a credit balance of £4 million and £1 million respectively. For 1928 the estimate rises to £13 million; £6½ million of the increase seems to arise from alterations in our favour of net war debt and reparation payments, and it is fair to assume, since no special explanation is offered, that the rest is spread evenly over the other component items. In spite of the fact that shipping was more active in 1928 than in 1927, "whole-cargo" freight and "time charter" rates were lower, as the result of a substantial increase in the world's carrying space during the year 1927–28. Assuming that ships were loaded to the same proportion of their full capacity—a large assumption, to which reference is made in another article in this issue—and that the trade to and from home ports occupied the same proportion of British shipping activity, the Board of Trade estimates the net national income from shipping services at £130 million, with a margin of error of 5 per cent. each way. The inadequacy, however, of the data on which this estimate is based makes it impossible to reach a figure for which even this degree of accuracy can be safely claimed, since no method of measuring the earnings of cargo-liners, whose importance far outweighs that of "tramp" vessels, exists at all.

It has been frequently complained that the Board of Trade tends to underestimate the credit balance on the invisible foreign trade of the United Kingdom. This year the Board has taken an important step towards the removal of this reproach by availing itself of the results of the investigations carried out last year by Sir Robert Kindersley into the magnitude of income and sinking fund payments from investment overseas. Since, after consideration of all the factors involved, the estimates of £270 million for each of the years 1926 and 1927 are raised to £285 million, it is rather surprising that the 1928 figure is no higher; we suggest that if it were raised to £300 million the relation between the revenues from this item in the respective years would be more accurately reflected. This figure does not include the income derived from private investments or from short loans, since no data exist from which even a reasonable guess at these items could be made, so that it is unlikely to be an over-statement. As it is not practicable to revise the figures for the years before 1926, they are no longer accurately comparable with those of the last three years.

Under the heading "Receipts from short interest and commissions" satisfactory facts emerge regarding the position of this country as a financial centre. The diminution of the money value of our imports, together with the stabilisation of currencies, led to a reduction in the profits on exchange transactions, but this was more than offset by the progress made by London in recovering its position as an international financial centre. Imports of grain and cotton, which in 1927 were financed from the United States, were last year financed here, and the lower money rates in London as compared with those ruling in New York brought much business, especially in acceptances, to the London market. In order to register the fact of this increase, an addition of 5 per cent. is made to the estimated revenue under this heading, bringing the total to £65 million. This does not make any pretence of being a measurement of the increase, and the public will no doubt concur in the opinion expressed by the President of the Board of Trade, that if the members of the money market, who alone are in a position to get the facts, would co-operate in an investigation analogous to that of Sir Robert Kindersley', the results would be of great value.

With miscellaneous receipts left at their former level of £15 million, a credit balance of £149 million is thus established. For 1927 the balance was £114 million as against an original estimate of £96 million, and for 1927 the debit balance of £7 million has now been revised to a credit

balance of £9 million. Even after these two favourable revisions, which are mainly due to the increased valuation of the income from oversea investments, the estimated credit balance for 1928 is £35 million greater than the balance for the preceding year. When all allowance is made for abnormalities in the early months of 1927, this increase in the credit balance must still be regarded as evidence of progress. New overseas issues in the London market in 1928, which were not all taken up by British investors, amounted to some £143 million, and the international payments may in many cases have been postponed for some months after the actual issue. Apparently, therefore, the credit balance on revenue transactions is resuming its traditional part as the chief source of capital for new investment abroad. While the profit and loss account of the country can show such a healthy balance, available for foreign investment, it is difficult to see what ground there can be for arguing that our national accounts would look better if the import item were reduced. The corresponding reduction on the other side, which equilibrium would require, would be just so much good business lost to the country. The invisible items, which usually are conveniently left out of account by protectionists, represent services which, alike by tradition and by our geographical position, we are well fitted to perform, and in which we are once more making progress relatively to our competitors.

ROUMANIA:—STABILISATION AND AFTER.

(BY OUR BUCHAREST CORRESPONDENT.)

PUBLIC opinion in Roumania acclaims the introduction of the legal stabilisation and the foreign loan as a turning point in the economic history of this country after the war. The general relief is all the greater as the impatience felt by the population for a whole year, caused by the perpetual adjournments of the negotiations, had become very acute, and the delays, combined with the poor harvest of last year and the general trade depression, had at last given rise to serious apprehensions concerning the economic situation. Whether the sanguine hopes now entertained by many for a speedy return to normal conditions will be realised would appear to be more than doubtful. The recovery of the country can only be slow and depends to a large extent on the Roumanian people themselves, who should understand that the introduction of the present reforms represents only the foundation of the edifice of economic reconstruction, the building of which will call for sustained effort on the part of all sections of the community. It will be the task of the authorities, as well as of the business community, to rehabilitate Roumanian credit which has suffered so severely since the war in consequence of their shortsighted attitude so often taken up in debt settlements. That this view is shared by the foreign financiers with whose assistance the present reforms are made possible is evident by the guarantees on which they have insisted as a condition of their help. Indeed, the foreign loan has not been secured without heavy sacrifice, as it has been found necessary to pledge the State monopolies. A significant light, moreover, is thrown on the standing of Roumanian credit by the very elaborate precautions taken for the service of the loan as regards the transfer of the necessary funds and the payment in gold of the coupons and drawn bonds to the holders, whether they be Roumanian or foreign, ally, neutral or enemy. Another bitter pill which the Roumanian negotiators had to swallow was the appointment for the period of three years of a technical adviser to the National Bank, which, to judge by the powers attached to this office, is practically tantamount to a control of the finances of the country. But it cannot be denied that as a result of these precautions and sacrifices the measures now introduced inspire confidence, and by this fact alone bear within themselves the seeds of success.

For the moment the phenomenon which is disconcerting many of the uninitiated sections of the community is the almost general fall in the prices of shares on the Bucharest Stock Exchange, led by the shares of the National Bank. While this is due partly to realisations by subscribers to the stabilisation loan, the chief reason for the setback is the over-speculation which preceded the conclusion of the negotiations. Speculative interests dispose of too few funds to be able to sustain a general marking up of prices for any length of time, and the entry of money to relieve the strained condition of the money market can only be expected to be very slow as confidence in the success of the stabilisation gains ground. The foreign trade balance is unfavourable. The deficit will be counterbalanced for a time by the transfer of funds resulting from the loan. But the attempt should now be made to attract foreign capital by definite measures such as the revision of the Mining Law and the commercialisation of the sale of agricultural products. A definite turn for the better cannot, however, be expected before a really abundant harvest is secured. Here is the crux of the situation, and nothing should be left undone to encourage and develop the agriculture of the country.

The reforms now enacted are the stabilisation of the currency and the reorganisation of the National Bank, the regulations for the Budget of the State and the administration of the Treasury, and the reorganisation of the railways. The funds necessary for all these measures are provided by the foreign loan which is issued by the Kingdom of Roumania Monopolies Institute created for this purpose, and amounts to about 101 million dollars. The sum of 30 million dollars, as part of the above-mentioned total, has been taken up by the Swedish match syndicate in consideration of the concession of the match monopoly, and it is worthy of note that the minimum annual royalty guaranteed to the Institute by the Swedish syndicate under the contract amounts to 3 million dollars. The principal appropriations from the proceeds are the following:—

	Million Dollars.
Stabilisation of Currency:	
National Bank	10
Credit Institutes (Banques Populaires, Co-operatives and Crédit Industriel)	15
Total	25
Fond de Roulement:	
Treasury	11
Railways	9
Total	20
Railways and other Productive Works:	
Railways	35
Other public works	10
Total	45

By the Law of Stabilisation the Leu is established as the Roumanian monetary unit weighing 10 milligrams and containing $\frac{9}{10}$ths fine gold, which brings the parity of the pound sterling to about Lei 813, and the gold points to about Lei 811 and 815. The bank notes of the National Bank continue to be legal tender and are convertible at sight. The position of the National Bank, which had become immobilised by long term bills and advances, is relieved by the receipt of 25 million dollars from the proceeds of the loan, i.e., 10 million from the State and 15 million from the refund of advances made to the Banques Populaires, the Co-operative Societies and the Industrial Credit Institute. This sum, together with a part of the 75 million Marks due from Germany under the recent agreement, and the credits arranged with the foreign issuing banks, is believed to put the Bank sufficiently in funds for the defence of the Leu. The note circulation and other sight liabilities are amply secured by the gold and foreign bill reserve of 35 per cent., arranged by the new statutes of the Bank. According to the latest Bank Return the note issue amounted to about 20,500 million Lei, the other sight liabilities to about 5,000 million, whereas the value of the metallic cover calculated at the stabilised rate of the Leu would amount to over 10,000 million. It is intended gradually to raise the note circulation in accordance with the needs of the situation. Special care has been taken to eliminate the political interests as much as possible from the conduct of the National Bank. The State is not allowed to hold more than 10 per cent. of the shares. As its holding amounted to 66,000 of a total of 200,000, it follows that 46,000 shares must be disposed of. This is to be effected in the period of three years. The State's share in the profits of the Bank is fixed on a sliding scale, and can amount to three quarters of the amount of the net profits remaining after the appropriation of certain reserves, distributions to the staff, and a 10 per cent. dividend to the shareholders, if the amount be sufficient for making up the dividend to the total of 25 per cent. These regulations are used by the speculators at the Stock Exchange, not quite without reason, to drive the price of the National Bank shares down. The share capital of the Bank is raised to 600 million Lei by writing up the assets of the Bank.

The most interesting part of the reforms affecting the Treasury is that which limits the treasury bonds in circulation to the maximum of 2,000 million Lei with a term of not more than 12 months and restricts the advances from the National Bank, which, moreover, must only be of a temporary nature, to the same figure.

The programme established for the Railways with the assistance of Monsieur Leverve, the French expert, provides very extensive reconstruction of lines, stations, bridges, rolling stock, etc. The expenses are estimated at 130 million dollars, arranged in two parts according to their urgency, the first part amounting to 45 million and the second to 85 million dollars. The duration of the programme is estimated at three years.

The industrial departments of the State and the exploitation of its domains, i.e., the river and maritime transports, the bridges, docks, warehouses, fisheries, forests, mines, will receive a commercial organisation under an independent administration. Special legislation for this purpose is under consideration. Naturally, it will take a long time to carry out this vast programme. But the energetic manner in which the Government have so far attacked their problems augurs well for the future.

THE SHIPPING SITUATION.

THE reports of the Chamber of Shipping and of the Liverpool Steamship Owners' Association, whose annual meetings took place last month, both indicate that 1928 was as difficult a year for the shipping industry as any since the end of the post-war "boom." As in the seven previous years, the brunt of the depression has been borne by owners of cargo-carrying tonnage, whose voyage-accounts in 1928 yielded in most instances a margin barely sufficient to cover depreciation. The year began inauspiciously with cargo freights at the lowest point, for the month of January, recorded since the war; a further fall occurred in February; and up to end of September rates on the average were consistently below the level of 1913. The autumn, however, witnessed a marked improvement in the position. Canada had a record wheat harvest, and chartered a large volume of tonnage; there was greater activity in the Chilean nitrate and Cuban sugar trades; good crop prospects in the Southern hemisphere stimulated demand for "future" space; and the entry of India into the market as grain-importer from Australia helped to keep tonnage well spread throughout the world. Between September and December the average level of whole-cargo freights, as measured by the *Economist* index number, rose by about 14 per cent.—an upward fluctuation which seems likely from the present trend of the market to be short-lived, but which inspired sufficient optimism on the part of shipowners to lead to the placing of contracts for a substantial number of new vessels.

This belated recovery, however, did not suffice to save 1928 from being ranked as one more "slump" year to be added to the unbroken succession of unprofitable years which extends back to 1921. Not only were freights for whole cargoes lower by 10 per cent. on the average than in 1927, and fractionally below the average of the last pre-war year—the average freight for the round voyage from the U.K. to the Plate and back being 34s. 3d. in 1928, against 38s. in 1927, and 31s. in 1909–13—but liner services (other than those mainly concerned with passenger traffic) suffered severely from the incidence of a "load-factor" in many cases ruinously low. The following table summarises the best available data of the British shipping industry's working during the past year:—

	1913.	1927.	1928.
Laden Entrances, U.K. (Million net tons)	49·1	57·3	57·0
Percentage British	*66*	*65*	*65*
Laden Clearances, U.K. (Million net tons)	67·8	59·3	60·3
Percentage British	*59*	*64*	*65*
"Load Index" (1913 = 100)...			
Entrances	100	91*	82
Clearances*	100	72	74
Economist Freight Index	100	110	99
Idle tonnage, U.K. ports (Thousand net tons)	†	326‡	401‡

* Excluding coal. † Figure not available. ‡ Quarterly average.

It will be seen that the combined total of "laden" entrances and clearances of shipping at United Kingdom ports was fractionally higher last year than in 1927, the British proportion of the total traffic being rather more than maintained. On the other hand, a slight improvement in the "load index" of clearances ("laden" with whole or part cargoes other than coal) was more than outweighed by a serious drop in the "load index" of vessels "entered." These indices of the proportion of filled to unfilled space (expressed as percentages of the 1913 proportion) are calculated from estimates given in the Report of the Liverpool Steamship Owners' Association, which contains the grave statement that "one of the most disquieting features of the year is the extent to which this carrying power (i.e. of regular liners) has been wasted. The amount of import cargo carried per 100 tons net of shipping in 1928 was less than in any year since the war. Compared with 1913, available space capable of carrying 12 million tons of cargo in the case of imports, and 5 million tons of cargo in the case of exports, was not used in 1928, a total of 17 million tons of wasted ship carrying power." This operation of uneconomically filled tonnage is, in fact, a feature at present of the shipping industry in all countries. The Chamber of Shipping Report points out that in 1928 the combined entrances and clearances of the ships of seven countries representing 70 per cent. of the world's ownership show an increase of 33 per cent. in comparison with 1913, whereas the total volume of sea-borne trade has probably risen by not more than 10 per cent. This evidence of a consistently low "load-factor" in the case of regular services accounts in part for the depression of "tramp" freights, since lines are driven by the intensity of competition in many routes to take consignments of grain and other "bulk-cargo" materials in default of adequate supplies of more remunerative goods. Undercut by the liners, "tramp" vessels were compelled, as will be seen from the foregoing table, to "lay up" last year to a considerably greater extent than in 1927, though in this respect also an improvement in the position was witnessed at the beginning of 1929.

In these circumstances it is not surprising that three salient tendencies should emerge from the history of the shipping industry during the past twelve months. The first is the hastening of the rate of liquidation of State shipping—an experiment whose cost has grown with the intensified competition between privately-owned lines. In the spring

Every description of Banking Business transacted.

of 1928 the Commonwealth Line, whose working had cost the Government of Australia from first to last over £16 millions, was sold to the Royal Mail group. In the United States the passage of the Jones-White Act inaugurated a further stage in the process of withdrawal by the Government from the management, at least—if not from the policy of subsidies in aid—of shipping. During the past six months a substantial proportion of the Shipping Board's effective fleet has been transferred to private ownership, and, notably, in February of this year, the fleets of the United States lines and the American Merchant lines—including the s.s. "Leviathan" and five other N. Atlantic passenger liners—with an aggregate tonnage of 188,000 tons gross, have been bought by Messrs. P. W. Chapman and Co. for $16 millions.

The second tendency is the effort being made by shipowners of all countries, and not least in Great Britain, to achieve more economical motive power as an offset to continued restriction of gross earnings. At no period since the birth of steam has the shipping industry been so keenly engaged as now in experiments with new forms of propulsion—improved Diesel engines, high-pressure boilers, electric drive—and in investigating possibilities of fuel economy offered by the use of pulverised coal.

The third feature of the situation, exemplified strongly by the Reports both of the Liverpool Steamship Owners' Association and of the Chamber of Shipping, is the growing conviction of shipowners—enforced by the failure of seaborne traffic to keep pace with the growth of population—that the maritime supremacy of this country and the general weal are alike menaced by the threat of "protective" barriers to trade. In his Presidential Address to the Chamber of Shipping, Sir William Currie emphasised the abiding truth of the principle embodied in the petition presented in 1820 to Parliament by the merchants of the City of London :—

> "That foreign commerce is eminently conducive to the wealth and prosperity of a country by enabling it to import the commodities, for the production of which the soil, climate, capital and industry of other countries are best calculated; and to export in payment these articles for which its own situation is better adapted. That freedom from restraint is calculated to give the utmost extension to foreign trade and the best direction to the capital and industry of the country."

The Report of the Liverpool Steamship Owners' Association summarises the industry's point of view by the statement that "Unlike some other countries, our ability to import and pay for food and raw materials on a large scale is essential to us, and, if it fail, we as a nation fail with it. Our ability so to buy from other countries is, however, bound up with our ability to sell to them in return our own products . . . and the purchasing power of our customers must in the end be dependent on their finding purchasers for what they have to offer in exchange. It is the extent to which we can sell to our customers abroad that ultimately controls the standard of living in this country." Coming, as they do, unanimously from an industry whose contribution to our "invisible" exports even last year is placed at £125 millions, and whose leaders see little hope of better days for the world's trade save in the general lowering of tariff barriers, these pronouncements should give food for thought even to the least reflective among the Protectionist faction in this country.

HOW RAILWAY ACCIDENTS HAPPEN.

THE publication of the official Ministry of Transport report on the Charfield railway disaster of last October affords a convenient opportunity for considering the lessons of the recent series of accidents. They include two accidents, namely, Darlington and Charfield, which were unfortunately attended by a heavy casualty list, the latter being rendered still more appalling by the outbreak of fire, and others, such as Queen Street, Glasgow, Dinwoodie, Ashchurch and Doe Hill, near Alfreton, where the loss of life was less serious. The last three of these accidents are still subject to inquiry, so that any detailed comment upon them would be improper. Still, it is permissble to say of them, as of the other three, that the first lesson is that, when once a collision occurs, it is a pure matter of chance whether or not the results are serious. That is why we are glad to find in the Charfield report the repeated insistence on the fact that the vital point to concentrate upon is the prevention of collisions rather than the mitigation of their results.

This does not mean that suitable precautions should not be taken by way of insurance against the effects of accidents, and, in particular, we heartily endorse Sir John Pringle's strong recommendation as to the abolition of gas as an illuminant on trains. Still, vital as it is that the substitution of electricity should be accelerated, and disquieting as it is to learn that as recently as last November only 40.6 per cent. of the country's passenger carriages were lit by electricity as opposed to oil and gas, no agitation against the use of gas or of wooden, as opposed to steel carriages, should be allowed to mask the main point at stake, which is the prevention of collisions from taking place at all. As Sir John well says in the Charfield report, "However well fitted stock may be with shock-absorbing devices, serious ill-effects, when the momentum of a heavy train at high speed is too suddenly checked, cannot be prevented." This may be an euphemistic way of describing a collision, but it contains the kernel of the whole matter.

How is it that collisions take place? The principle of railway operation is that, apart from service slacks, so long as a driver gets a clear signal he is entitled to proceed at full speed. The rules of signalling are too complex to explain briefly, but their essence is that no signalman may pull a signal "off" to safety unless either the line is clear to a point a quarter of a mile beyond the next signal, or unless under certain well-defined circumstances the train has been checked and brought under control, and unless the driver knows he must be on his guard and may only proceed so far as the road is clear. The first alternative applies mainly to trains travelling on a through run at their normal speed, and the second covers shunting and other movements in busy yards. Hence, for a collision to occur, either a driver must misread a signal or a signalman break either the general regulations or the special regulations laid down for his box. It may here be added that at Charfield, and apparently also at Ashchurch, the signalman was protected by electrical controls from erring in such a way as to cause a dangerous situation.

At Darlington a parcels train was shunting to and fro in the station, picking up vans. The first shunt the driver did caused him to foul the main line, and permission to do so was properly granted by the man at the South Junction box, who pulled off his signal to permit of the movement. A few minutes later the driver had to do a second shunt. Permission for the movement was this time refused by South Junction, as the main line had been cleared for a through fast excursion train, but the driver of the parcels train was allowed to proceed under caution down to the South Junction home signal, which was 120 yards short of the point where he would foul the main line. There he should have stopped, but for some inexplicable reason he went on through the signal and found himself on the main line in the path of the excursion train. This disaster was a case, therefore, of a driver running through his signals.

Queen Street, Glasgow, is a terminus lying in a confined space at the mouth of a tunnel through which the line rises on a very steep gradient. There is the ever-present danger of a train failing to grip the rails on this gradient and slipping back again into the station. For this reason, whenever a train starts without a second engine to assist it, it is laid down that, until it emerges from the tunnel, the line must be left clear behind it in case it slips back. In a natural anxiety to expedite traffic a signalman at Queen Street allowed a second train to shunt into the tunnel before the first train had cleared. The first train failed on the bank and slipped back until it hit the second train behind. This was a case where a signalman broke one of a complex list of rules designed to cope with a very difficult but unavoidable situation.

At Charfield there was a conflict of evidence. What happened was that a goods train was being shunted clear of the main line to make room for a following express. While the train was being shunted it was protected by three signals, these being Charfield distant, outer home and inner home. The levers operating these three signals were all "on" in the danger position; of that there is no question, as during the shunting movement they were held "on" by electrical and mechanical locks. On reaching the distant signal the driver of the express was not bound to stop, even though it was "on," for a distant signal is simply a warning that subsequent signals may be "on." But the driver should have checked his speed at the distant, and have stopped dead at the outer home, if that was also "on." As the outer home was over 440 yards from the point of collision, the standard margin of safety obtained. What happened was that the driver read the distant as "off" and carried on. He failed to see either home signal owing to ground mist, but he knew that, if the distant was "off," both home signals must (owing to the mechanical interlocking between the levers) also be "off," and so thought he was justified in proceeding. The disaster followed.

If the driver was right and the distant signal was "off," it follows that the position of this signal did not correspond with that of its lever. Sir John Pringle reviewed this possibility at some length, and finally rejected it. But the important point is that, even if the driver were right, it did not justify him carrying on at full speed when both home signals were obscured by fog. We allude to this because on this point Sir John Pringle's report is not a little disquieting. It says: "It is not an infrequent, and indeed is sometimes an accepted, practice for drivers of trains, when they are assured that the distant signal is clear, to assume, when it is not possible to see them, that the signals in advance, the levers for which precede the distant signal, will also be in that position." Sir John makes no attempt to condone the conduct of the driver in not reducing speed when both home signals had been obscured by fog, but it is not reassuring to have to believe that drivers are accustomed to depend upon the distant signal alone. The distant signal is intended to give the driver a warning of the position of the subsequent stop signals, so that if necessary he can pull up deliberately and comfortably. If it is true that drivers treat it as suggested above, so far from being a warning this signal becomes a very dangerous trap. To mention one possibility, an emergency might well arise to cause all signals to be thrown to danger after the train had passed the distant. We find it difficult to believe that drivers commonly act as this passage suggests, and on many grounds we think it a pity that this view appeared in such terms in an official and judicial report.

It is clear that both the Darlington and Charfield disasters, as well as that at Ashchurch, would have been prevented if some device were in existence whereby the brakes were automatically applied on a train's reaching a signal at danger. Such a device is already in use on the London Underground, where the uniform traffic conditions and speed of trains makes its adoption a relatively easy matter. On the main lines, which have to carry all sorts and kinds of traffic, its institution is far less simple, as is shown by the fact that a Departmental Committee of experts has now been considering the matter for some years. The recent series of accidents has emphasised the urgency of the Committee's task, and a statement as to the progress so far made and the difficulties still to be overcome would help to allay public anxiety.

In any case, there is no need to lose a sense of proportion, and in this connection it is only fair to add that in his report for the year 1927 Sir John Pringle says that the number of cases where automatic train control would have proved beneficial is not such as would justify immediate action in the direction of its adoption. This is a matter of opinion, which will legitimately be guided inter alia by the 1928 accidents cited above. Meanwhile it may be recalled, with some degree of assurance, that over the period 1916-1927 the average number of passengers killed in train accidents each year was no more than ten. Compared with the total number carried each year, amounting to over 1,000,000,000, this figure is infinitesimal. It may be added that in 1927 no less than 4,701 people were killed as the result of road accidents. Railways still remain the safest form of travel in this country.

Notes of the Week.

The Campaign Develops.—With rumour whispering insistently that the General Election will be held in the second week of May, the three political parties are marshalling their forces for a contest which seems likely to be notable for the obscurity of policies no less than for the multiplicity of candidates. Mr. MacDonald's speech at Bolton last Saturday was vigorous in criticism of the Government's "inaction and reaction"; but, apart from an indication that, if returned to power, the Labour Party would institute inquiries on Samuel Commission lines into the cotton and iron and steel industries, the speech contained little in the way of a positive programme. Answering the leader of the Labour Opposition, Mr. Baldwin treated his followers assembled on Wednesday in the Free Trade Hall at Manchester to a Conservative antistrophe in which denunciation of "Socialism" as an economic "dance of death" had to eke out a none too convincing defence of a Government whose record contains too many sins of omission for its return to office to be assured on the strength of a de-rating measure which the electorate does not understand or of a complacent optimism which it does not share. We have still to hear Mr. Lloyd George's final shaping of the Liberal Party's appeal, and it is premature, as yet, to attempt to crystallise the questions on which the country will have to vote. The obvious danger of this election is that "hatred and coarse thinking" on the ill-defined and largely exploded issue of "Capitalism *versus* Socialism" may obscure the more important con-

structive policies of all parties, and, worst of all, prevent the electorate from expressing its opinions directly on the vital question of our future fiscal policy.

The Employers and the T.U.C.—If evidence were needed of the growth of statesmanship in the Trade Union movement, that evidence would be forthcoming in the restrained official announcement that the General Council of the T.U.C. has decided to accept the joint invitation to a conference with the National Confederation of Employers' Organisations and the Federation of British Industries. The employers' organisations have offered to explain at this meeting their reasons for rejecting the proposal of the Melchett–Turner Conference to establish a National Industrial Council. These reasons may have been of the best—the public has yet to learn what they were—but coupled with the lock, stock and barrel rejection of the interim report of the Conference, and following closely upon the highly provocative memorandum of the British Engineers' Association, the attitude of the two Employers' Associations was not calculated to create a welcoming atmosphere in the T.U.C. for the reception of their invitation. The General Council was wise not to put itself in the wrong by refusing the employers' offer. As things now stand, both sides have an unique opportunity of making history. The representatives of the two great national organisations of employers have never before met the representatives of the national organisation of the trade unions in consultation. In spite of their rejection of the interim report of the Melchett–Turner Conference, the employers suggest by their offer to examine the question of "usefully consulting together upon matters of common interest to British industry" that there may, in fact, be much in the spirit, if not the letter, of the report which they might eventually come to accept. Again, though there is no hint at present of permanent machinery for discussion, personal contacts are generally the best solvent for traditional and baseless hostilities. If the Trade Union representatives can convince the employers of their sincerity in pursuing a policy of industrial co-operation, more common ground may yet be found than is at present apparent. Moreover, the discussions will take place in an atmosphere which, thanks to the Melchett–Turner Conference, is conducive to good results.

Reparations Committee at Work.—Having at the outset cleared the field of certain initial obstacles, the Experts Committee has formed itself into groups, and the full committee is unlikely to meet again until the various groups have hammered out something which presents at least a basis of discussion. While the groups are at work on their very difficult task, rumour is equally busy and propagandists are not inactive. We would counsel our readers not to attach too much weight to either. When the Dawes Committee was sitting in 1924 we were treated to an almost daily crop of stories of "unbridgeable gaps," "intransigeant attitudes," and impracticable figures. Yet accommodation was reached. It is essential that the intricate group negotiations should proceed behind closed doors and the stage has not yet been reached at which a good purpose can be secured by discussing the various *ballons d'essai* which are being sent up on behalf of various interests. The Committee is an exceedingly strong one, and should be given every chance, without the intrusion of premature outside controversy, to carry its work to fruition. Some light on the German attitude to the problems under discussion is given in a letter from our Berlin correspondent which will be found on a later page

---

The Evacuations from Kabul.—The congratulations which the King sent to the Royal Air Force on Monday were indeed well deserved. Under the most difficult conditions in the air and on the ground the Air Force have now completed the evacuation of all foreign residents in Kabul who have desired to leave. The work began some weeks ago with the evacuation of women and children, and it was completed on Sunday and Monday last by the evacuation of the staffs of foreign legations. On Sunday the entire staffs of the French and Italian Legations and part of the staff of the British Legation were conveyed to Peshawar; on Monday the rest of the British Legation staff followed, including the Minister, Sir Francis Humphrys. From first to last the Air Force are estimated to have evacuated more than 500 people of many different nationalities—an unprecedented feat, considering that Afghanistan is in the grip of winter and civil war. The last batch of evacuations would have been effected a day earlier if the first aeroplane which arrived at Kabul on Saturday the 23rd had not found the aerodrome under snow—which had to be cleared before the operation could be performed. As for the civil war, it has naturally added an element of danger and uncertainty to the enterprise; but it is satisfactory that no one of the several contending factions in Afghanistan appears to have shown any inclination towards xenophobia. Even the tribesmen and the doctors of the Islamic law who have dislodged King Amanullah from his capital on account of his "Westernising" policy have not vented their dislike of Western civilisation upon those Westerners and Westernised Turks whom King Amanullah's policy has introduced as strangers into their midst. The political case for evacuation is not so much that there is a fear of foreigners being exposed to deliberate ill-usage, but that they might suffer injuries to life and property incidentally to the vicissitudes of the Afghan civil war, which will certainly light up when the snows melt in the spring. With Kabul as the bone of contention between several Afghan armies, the continued presence of foreigners there might easily give rise, without any malice prepense, to "incidents" which would force the British Government's hand and compel intervention under even more difficult political and internal conditions than those under which the present retirement has been carried out. Moreover, there is a strong diplomatic argument in favour of evacuation; for it would be difficult for foreign legations remaining in the capital of a country in the throes of civil war not to enter into *de facto* relations of a closer kind with the momentary Government on the spot than with its rivals in the provinces, and it would thus be virtually impossible to avoid the appearance of taking sides in a quarrel in which we are actually a disinterested neutral. Our one diplomatic interest in Afghanistan is that a strong and orderly government, exercising effective authority throughout the country, and especially in the zone adjoining the Indian frontiers, should emerge at the earliest possible date. Now a strong and orderly government means, in Afghanistan as elsewhere, a government resting on at least the tacit consent of a sufficient percentage of the governed; and it is only the Afghans themselves who can bring such a government into being. Therefore, the wise policy for the British Government is a policy of benevolent and impartial neutrality; and the fewer hostages we leave in the hands of fortune the easier it is to carry that policy through. For this reason we hold that the fine performance of the Royal Air Force is happily matched by the good sense of the political decision which the evacuations subserve.

A Dictatorship in Liquidation.—Something has happened to the Dictatorship in Spain. To judge by the sudden demoniac activity of the Dictator, we should guess that the ice is melting and that he is making for the shore before his footing gives way. This is interesting, for if once a political thaw sets in at one point in Southern or Eastern Europe, who knows how far it may go? Thaw, like dry-rot, is contagious. Meanwhile, we sincerely hope that the Marqués de Estella will get safely to land and that we shall indeed soon see him in the comfortable, if humdrum, rôle of a member of parliament which he foreshadows for himself. When Xerxes was retreating, baffled, from Greece, some of the Greek leaders were eager to cut off his retreat by breaking down in his rear the bridge of boats which he had built across the Dardanelles—until Themistocles explained to them that, so far from destroying the existing bridge, they would have been well advised to build their adversary a brand-new bridge in order to assist him to remove himself to a safe distance. A golden bridge for dictators in retreat is just what we want to-day—and especially in the first instance, for the Marqués's experiences in the immediate future will probably be taken as a test case by the Duce and the Ghazi and the Marshal at Warsaw and the Professor at Kovno. The awkward thing about dictatorships is just this difficulty of winding them up; and there are hardly any limits to the amount of damage which a dictator driven to desperation may do. For your dictator is nothing if not a romantic; and if he is really trapped in the middle of the pond he may elect to end in a grand holocaust—blowing the ice sky-high and involving in his own destruction a crowd of harmless people near the edge who might otherwise have slipped off safely just in time. However, on the whole, the Marqués's latest announcements are reassuring, for they seem to show that he is under no delusions about his ability to keep himself in power by a continual exercise of force. The disbandment of the Artillery Corps—which seems to have gone "according to plan"—is the kind of manœuvre which may cover a retreat, but that is all. For the dictator who finds himself compelled to repeated resort to sensational coups is virtually confessing that his glory has departed from him. Again we recall an aphorism which we have quoted before in this connection: "One can do anything with bayonets except sit on them." The Marqués de Estella seems to appreciate the force of this maxim, and that is so much to the good.

Civil Service Estimates.—Estimates for the Civil and Revenue services were issued on Monday. Unfortunately, they are compared, not with the corresponding figures for the previous year, but with the total net estimates including supplementary votes, which ought to be shown separately, and no explanatory memoranda have so far been issued. Compared with last year's Budget estimates, the civil and revenue figures, which total £308,563,759, show an increase of £15,668,896. This is almost entirely covered by estimates in connection with the De-rating scheme, which are as follows:—

	£
Grants to Rating Authorities (England and Wales)	12,000,000
Ditto (Scotland)	1,200,000
Railway Freight Rebates	2,333,333
Private Mineral Railways Rates Grants	27,000
	15,560,333

It must be remembered that the first two items cover only the last six months of the financial year. Comparing the sum of £13,200,000 with figures previously given by the Government, it appears that these estimates do not include anything on account of the new money (£5,000,000 a year) promised to the local authorities. Is de-rating to cost less than was thought, or is a larger raid on the Road Fund foreshadowed? Other large changes are:—

	Increase.	Decrease.
	£	£
Ministry of Labour	541,491	...
Health (Great Britain)	686,642	...
Education (Great Britain)	503,940	...
Police (Great Britain)	125,043	...
Pensions Group	...	3,544,769
Old Age Pensions	1,856,000	...
Agriculture (Great Britain)	760,232	...
Development Fund	...	100,000
Beet Sugar Subsidy	...	1,250,000
Dominion Services	...	229,179
Colonial and Mid-Eastern Services	...	159,828
Imperial War Graves Commission	...	135,366
Empire Marketing	50,000	...
Department of Overseas Trade	47,810	...
Oversea Settlement	50,000	...
Unemployment Schemes Grants	265,000	...
Australian Zinc Concentrates	195,850	...
Law Charges (Great Britain)	...	42,048
Board of Control	83,833	...
Electoral Charges	40,000	...
Mint (including coinage)	...	100,000
Post Office	796,000	...
Inland Revenue	...	245,225
Net increase of above	195,426	

It will be observed that the greater part of the saving is accounted for by the automatic reductions in war pensions and upkeep of war graves; and it is agreeable to see the beet sugar subsidy cut down by a million and a quarter; but genuine items of economy are few, and those who look for less taxation when there is de-rating to be paid for are likely to be disappointed. Not many will complain of the increasing cost of health and education services, but increases which need explanation are those for the Ministries of Labour and Agriculture.

The Army Estimates.—The Army Estimates for 1929 amount to £40,545,000, a decrease of £505,000 on last year's Budget. Of this decrease £280,650 is accounted for by a change-over from payments to receipts under the leading "War Terminal Charges." Effective charges are down by £348,350, non-effective charges up by £124,000; thus the ratio of organisation costs to the whole is raised by about 0·5 per cent. The Estimates are accompanied by an explanatory memorandum and by a supplementary estimate for £115,000 to meet the excess cost involved in the employment of extra troops in China; it should be added that supplementary estimates for the China forces will have to be presented during the coming year. The actual extra cost covered by the new supplementary estimate is £565,000, but this is offset by £450,000 savings on other services. The fall in the general estimate for effectives is chiefly accounted for by a decrease of 1,500 in the personnel, thanks to the withdrawal of some troops from China, the disbandment of the West African Regiment and the reduction of the Sierra Leone garrison, the mechanisation of another Field Brigade, R.A., the abolition of horse transport companies, R.A.S.C., and "economies resulting from the systematic examination of all establishments." The Memorandum goes on to state that "the policy of mechanisation will continue to be applied in the light of experience gained and as money becomes available," and that "special attention will be devoted to the mechanical training of all ranks."

The State of Agriculture.—In two recent articles which survey the present condition of agriculture in England and Wales, *The Times* gives some figures which, though they do not purport to be more than rough estimates, are a decided aid to the formation of a clearer and more definite picture of the extent of the present depression. The sources are the statistics published from time to time by the Ministry of Agriculture, supplemented and corrected by published farm accounts. It is estimated that on a sheep and corn farm on light land, the income of which is derived as to 30 or 40 per cent. from barley and as to 15 to 20 per cent. from sheep, the money value of a given output exceeded the pre-war value by 44·4 per cent. in 1927 and by 42·7 per cent. in 1928, whereas the cost exceeded the pre-war level by 55·2 and 55·3 per cent. in the same years. Where the pre-war average net return on farm capital was 10 per cent., it had fallen in 1927 and 1928 to 3·5 and 2·1 per cent. respectively, though on better land, where it used to average 15 per cent. before the war, there is still a respectable profit. On heavy clay land devoted to wheat, pigs and cattle, receipts in 1927 and 1928 respectively amounted to about 47 and 33·2 per cent. more than before the war, whereas outgoings in each year were 156 per cent. of the pre-war level. A pre-war profit of 8 per cent. had turned into one of 3·6 in 1927 and into a loss of 3·7 per cent. in 1928. In comparing these with industrial profits it must be borne in mind that on arable farms expenditure is incurred some fourteen months before receipts are forthcoming. On West-country grass dairy land the situation is less bad; receipts in 1928 were 52·3 per cent. above the pre-war level and costs 53·8, but this slightly diminished net income represents a smaller percentage on the capital, which is now larger. Limiting his application of the term "depressed" to farms which are near or below the margin of profit, *The Times* correspondent finds that the depressed areas amount to about 1,600,000 acres out of the 26,000,000 acres under crops and grass in England and Wales, or one out of a total of ten million arable acres. The depression is to some extent localised on the heavy clay, gault, oolite and chalk lands of East Anglia, the Cotswolds, and the Southern counties. The worst hit district is undoubtedly East Anglia, where one million acres out of a total of five million are estimated to be at or below the margin of profit. This situation is more serious than is generally realised, since

conditions of soil and climate make it difficult to adapt these lands to other uses than arable farming. The National Conference on Agriculture, just completed, made one of its principal objects the direction of public attention to the importance of wheat-growing as the pivot of British agriculture.

Lace and Safeguarding.—Sir Arthur Steel-Maitland, Minister of Labour, in a speech at Birmingham last week, made special reference to the effect of the lace duties. He accused Free Trade speakers of mis-stating the facts, notably in regard to the re-export trade. Lord Beauchamp had recently quoted in the House of Lords the figures which appeared in the Board of Trade Returns, from which it seemed that the re-exports of lace fell from £1,756,774 in 1924 to £128,639 in 1927. Sir Arthur Steel-Maitland rebuked Lord Beauchamp for failing to take into account the foreign lace "transhipped under bond" from British ports, which in 1927 amounted to £758,000, thus making the total 1927 figure of re-export not £128,000 but £873,000. The Minister, however, himself omitted to point out that, after taking all the factors into account, it is now established that, as compared with 1924 (which was the last complete free trade year), the year 1927 showed a decline in our lace re-export trade of nearly 50 per cent., or in value £870,000, which represents nearly twice the volume of lace accounted for by our retained imports. The figures of the bond transhipments were first disclosed for the Government by the Earl of Plymouth in the course of a debate in the House of Lords last November. He argued that the bulk of this lace in transit was "French lace on its way to the United States," and that the decline could be amply accounted for by the falling off in American demand. Unfortunately for his own argument, Lord Plymouth stated that the total of 1927 imports of lace into the U.S.A. from France and the United Kingdom in 1927 was only £712,000. We know from our own export Trade Returns that the British-made lace sent to the United States that year amounted to well over £400,000, so that the whole volume of French lace imported into the United States that year did not exceed £300,000, and this would include lace sent direct from France as well as that which came via British ports. Obviously, therefore, it is quite untrue to say that the "great bulk of the lace which is now transhipped under bond is French lace on its way to the United States." We fear that the safeguarders' explanation will not do; and the persistent testimony of our merchants to the effect that the safeguarding duty has seriously damaged our entrepot trade must be accepted as the true version.

British—American Coal Competition.—A correspondent writes: British coal exporters are regaining the trade lost to their American competitors. Between 1919 and 1926 the Americans secured a big overseas business in consequence of our industrial stoppages, restricted production and high costs. In a period of eighteen months in 1920 and 1921 the United States shipped 20,000,000 tons to this side of the Atlantic. In 1926, the year of our big strike, they sent 8,000,000 tons to Europe alone, besides doing great business in South America, Africa, and at various Pacific and Indian Ocean coaling stations. To-day, British exporters have displaced their American competitors in all neutral markets but Canada. In the first three quarters of 1928 United States exports to Europe reached only 200,000 tons—little more than "ballast" cargoes—compared with 650,000 tons in the corresponding period of 1927 and 6,700,000 tons in 1926. To the Argentine, Brazil and other overseas markets the American exports have diminished by about 90 per cent. as compared with 1926. The Americans built great hopes on the coal export trade when Great Britain was hampered by high costs and low output. The United States Government, as shipowner, was specially interested, as coal is an important cargo material, and it took elaborate steps to promote United States exports. However, since British coal cheapened, after reversion to the Eight Hours Day, the Americans have lost ground month by month, and costs are now against them. Owing to easy mining conditions, ordinary soft coal costs only about 8s. a ton at the pithead in the United States; but the pits are hundreds of miles from the ports, and the coal cannot be shipped at less than about £1 a ton, f.o.b., whereas British coal, including high-grade anthracite, averages less than 16s. per ton, f.o.b. Besides nearly beating American coal out of Europe, Africa and South America, our exporters are shipping anthracite "duff" to Boston in the United States; they have obtained some business in Canada against American competition; and in future shipping seasons they may, with suitable discharging plants and storage accommodation, beat American coal in the Canadian market. Canada imports from 14,000,000 to 18,000,000 tons of coal annually, and is, with the possible exception of France, the biggest coal importer in the world. The Dominion trade should, therefore, be highly attractive to British shippers. Cost of transport is the main factor in this case. Though American coal is mined some 4s. a ton cheaper than British, our coal can be shipped more cheaply, so that it can be quoted in Canada some shillings under the price of the American coal. Whether the American coal goes via the Atlantic Coast ports, or by rail, river, lake and canal to the Canadian cities such as Quebec, Montreal and Halifax, the transport charges range from 15s. to 25s. per ton—practically 100 per cent. more than the inclusive cost of taking our coal from mines here to the chief cities in Canada.

Wool in Cold Weather.—A Bradford correspondent writes: In warehouses in which no artificial heating is used it has been found very difficult during the cold spell to handle wool which has been stored in railway sidings. The only bales that can be opened and dealt with almost as well in extremely cold weather as in ordinary temperatures are those containing wool which will give 90 per cent. clean yield and upwards. Scoured merino containing a certain amount of fat might yield 90 per cent. and still be almost unusable at the present time without first being thawed. Ten per cent. of natural grease left in the wool during scouring will result in the fibres being frozen together, particularly if the bales have also been dumped in Australia and spent six to eight weeks in transit to Bradford. The bigger, less serrated staple of the crossbreds does not seem to melt into one mass like merinos. Yet in ordinary times, during the July sales in London for example, the coldest wool to handle in all warehouses is probably 36's to 44's quality. It is rather strange that, in ordinary temperatures or during the hottest months of the year, these qualities should absorb less heat from the atmosphere, and yet during the coldest periods they are least liable to freeze together. As the natural wool grease in both merinos and crossbreds has pretty much the same composition, whatever type of animal it comes from, this fact confirms another, which is that the crossbreds are carrying less grease. There is nothing new in this, but until the cold weather came many people had not been struck with the idea that, the harder wool freezes, the lower its yield. Even sliped wools are more difficult to handle during cold weather such as we have had. Any amount of 58's down to 48's slipes will only yield 80 to 86 per cent. Even when a fair part of this impurity is lime or earth, the remainder, which is chiefly grease, is sufficient to freeze the staples. The difficulty is not nearly so pronounced in low qualities, which respond to changes in temperature very much as the same qualities of greasy wool. It has been freely remarked that the cold wave has come too late to do much good to trade. We are too near spring for many people to start buying heavier clothing, though thousands in this country could do with it. It is possible that the hosiery trade might feel some benefit, because at a time like this, when a little extra warmth is needed, the purchase of better underwear is not such a serious outlay as the purchase of a new heavy-weight suit and overcoat. It is quite possible that the advantage to the trade of the present cold spell will not be felt until next July and August, when orders for winter-weight cloths and underwear will be larger from the retail distributors to the wholesalers on account of the clearance of their shelves which the present cold snap has helped them to make.

The Coffee Position.—A correspondent writes:—The pessimistic views expressed in some quarters regarding a glut in the world's coffee production have occasioned only a passing qualm in Brazil. Nevertheless, there is little evidence that the world's demands in 1929 for the coffee bean will be above the average, that is to say 24,000,000 bags; of this total the non-producing countries have consumed an average of 21,000,000 to 22,000,000 bags during the last five years. While some other producing countries appear likely to reap exceptionally abundant crops in 1929, it is not thought probable that the new Brazilian yield will exceed 9,000,000 bags against the 26,000,000 bags of the last crop; late advices from Santos suggest also that exports through that port will be anything from 20 to 30 per cent. below the quantity formerly estimated. It has been necessary, therefore, to modify the estimate of stocks in Brazilian warehouses at the end of June next. Reckoned a few months back as likely to reach 6,000,000 bags, these figures are now gauged at something under 3,000,000 bags. With this marked falling-off in quantities, there is not likely to be any notable fall in prices, although the value of all coffees entering the United States (Brazil's chief market) during 1928 averaged $0·213 per lb., or, 1 cent below the record values of 1925. So long as the finer grades of coffee are withheld from shipment in the warehouses of Brazil, coffee consumers are forced to use larger quantities of very fine Colombian, Venezuelan and Central American coffees. Colombia—in the absence of any untoward disaster—may gather a bumper crop. Already ranking as the second largest producer among the South American countries, this State derives 60 per cent. of its revenues from its coffee shipments. In Costa Rica coffee is also the leading export, representing 50 per cent. of that Republic's total foreign trade. The neighbouring State of Guatemala is anticipating a late but abundant crop, and exports may possibly exceed those of 1927, which ranked as a record season. Haiti, whose coffee sales represent 80 per cent. of its total export trade, has recovered almost completely from the last destructive hurricane, and Santo Domingo will contribute liberally; but Porto Rico will need more time before its former productive prosperity can be restored. Nicaraguan coffee, among the best that is grown in Central America, may again find its way abroad if sustained political peace will permit the release of some thousands of men to work on the neglected plantations. In El Salvador the crop may be somewhat late and also smaller than usual; but it is likely to be of an exceptionally high quality.

Government Trading Accounts.—The accounts of trading and commercial services conducted by the Government for the year ending March 31, 1928,* offer but little ammunition for interested persons anxious to prove a case for or against Government enterprise. The chief fact that emerges from a review of the few and unimportant commercial undertakings (other than the Post Office) in which the British Government at present engages, is the very great distance by which this country is removed from anything approaching State Socialism. The most active department, with the possible exception of the Admiralty, is the Ministry of Agriculture and Fisheries. This Ministry cuts its finances so fine that, according to a foreword (somewhat lacking in humour) to its Conway mussel-cleansing account, it was only the death of a superintendent which prevented a loss of £30 from being turned into a profit of £90. On estates held by the Ministry for the purpose of meeting the demand for small holdings there were losses varying from under £200 to over £8,000, and none showed a profit. The National Stud had a loss of £6,816; in every other year except 1923, since its acquisition in 1916, it has yielded a profit. Other accounts which record a net loss to the National Exchequer are those of Ramsgate Harbour; the sale of zinc concentrates; the Government wool-disinfecting station, and the sale of plaster casts by the Board of Education. The Mint, on the other hand, together with the Stationery Office and Richmond Park golf course, shows a respectable profit.

Chilean Budget, 1929.—A correspondent writes:—The ordinary 1929 budget of Chile, approved by Congress, is of particular interest in view of the larger amounts of both receipts and expenditures as compared with the previous year. The ordinary budget estimates receipts and expenditures at 1,123,291,500 pesos and 1,017,603,975 pesos, compared with 959,100,000 and 942,600,000 pesos respectively for 1928. Again, a surplus is anticipated, amounting to 51,687,525 pesos, compared with 16,500,000 pesos for the previous financial period. Of this latter surplus for the whole year, no less than 14,000,000 pesos were realised within the first seven months. The all-round advance in revenues is quite in keeping with the improved prospects of the country. Only one-third of the public revenue comes now from the Customs-house, whereas some fifteen years ago fully three-quarters of the national receipts was provided by import and export duties. The budget is divided into three parts: the first contains a summary of the budget of revenues and expenditures; the second, details of the revenues; and the third, details of the expenditures. It is provided that expenditures, based upon revenues and not in excess of such, are to be considered as the estimate of the amounts required to carry on the government services concerned. In the ordinary budget, the 1929 expenditures are 128,915,000 pesos greater than the total authorised in the 1928 ordinary budget; while, of the ordinary expenditures, 620,429,271 pesos are to be devoted to administrative purposes and 235,650,844 pesos for the service of the public debt. Other important expenditures are 119,114,200 pesos for social protection and 73,195,000 pesos for fiscal quotas to special funds and services. In regard to the extraordinary budget, as approved by Congress, it may be noted that the expenditures, totalling slightly over 225,000,000 pesos authorised, compare with 242,700,000 pesos for certain stated objects, and 59,800,000 pesos for such other items found to be necessary or advisable during the course of the previous year. For the second consecutive period in its recent history of financing, a careful demarcation of revenues and expenditures has been admitted in an ordinary and extraordinary budget. Before 1928, in addition to the ordinary appropriations, extraordinary expenditures had been provided for by separate legislation, each law being intended to create its own revenue for the sums to be expended. Exigencies, however, often rendered it necessary or advisable to set aside monies thus raised for purposes different from the original intention. Chile has commenced the new year well in many respects.

The China Indemnity Fund.—Events in China have revived interest in the position of the China Indemnity Fund, especially in view of the recent proposals of the advisory committee. The aggregate amount is approximately £11 millions, payable at the rate of £447,000 per annum until 1945. But in terms of the Act of 1925, and the recommendations of the committee, everything from 1922 will be placed at the disposal of educational and philanthropic schemes in China. Secured as they are on Customs receipts, the annual payments have been regularly made; and the latest return shows a balance in deposit and current account, under arrangement with banking authorities at Shanghai, of more than £2,353,000. The Chinese Government has earned certain concessions of interest on payments made before their due date. In the last financial year the expenditure has been negligible, since no legislative action has yet been taken in connection with the proposals of the advisory committee; and the funds are therefore accumulating for the philanthropic use which has been decided. It is understood, however, that the subject is now in active negotiation; and the British Government hopes that at an early date various schemes will be definitely started. Meanwhile minor but useful provision has been made for a number of Chinese students in London.

German Artificial Silk Prices.—Our Berlin correspondent writes:—The quotations of German artificial silk stocks in Berlin have of late sharply fluctuated, and in general fallen. In January, ostensibly in order to combat cheap

imports, the German manufacturers abandoned the principle of joint price-fixing, but gave to understand that this measure did not mean competition against one another. The weekly *Der Deutsche Volkswirt* affirms that nevertheless unprofitable competition has set in, and makes the following statements which, owing to the reticence of the concerns involved, cannot be tested: "At present a competition struggle is under way between Glanzstoff, I. G. Farbenindustrie, Küttner and the small producers, who have very materially reduced prices, on an average from 10 marks (price of 1928 before the *Treurabatten*) to at most 8 marks per kilogram. Therewith for the most popular middle qualities the selling price must have sunk to production cost or even under it, and a substantial margin of profit remains only on the dearer, finer yarns. It is possible that the present sharp struggle is due to the following considerations: The loose price-convention was bound sooner or later either to collapse or to take a closer form. Only a binding agreement, and also the fixing of production quotas, could be the basis of an understanding. To-day the aim is to increase sales as much as possible in order to come off well in negotiations as to quotas. The negotiations will certainly not be simple, especially because the I. G. Farbenindustrie has large pretensions in this . . . domain. Up to now conditions have developed rather to the disadvantage of Glanzstoff; the relative share of this company in the German market has in the last years declined. It may be assumed that Germany's total artificial silk production in 1928 was 20 million kilos (18 million in 1927). At present the daily production is about 70,000 kilos. To cupramonium silk, that is mainly to the Bemberg Co., falls 10,000 kilos, the remainder being viscose silk. Of this about 35,000 kilos falls to Glanzstoff, 9,000 kilos to Farbenindustrie, 7,000 kilos to Küttner, 6,000 to Zehlendorf, and 5,000 kilos to smaller companies. The expansion of Germany's production in the past year did not keep pace with world-production (rise from 121 to 157 million kilos). England, the United States and probably Italy increased their sales in 1928 more than Germany. That is probably partly due to the very low German import duty (60pf. per kilo)."

The French Deal in American War Stocks.—Our Paris Correspondent writes: The full facts, now made known, of the results of the French Government's agreement, in 1919, to purchase the American war stocks in France for $400,000,000, reveal that the transaction was one of the most disastrous on record. In view of the circumstance that payment of this sum falls due on August 1 next, and of the importance this factor will have in the pending debt settlement negotiations, the publication of the details of the deal will be found interesting. The Americans at first asked $840,000,000 (then 6,000,000,000f.) for the stocks, whereas the French initial bid was 1,500,000,000f., or $200,000,000. Eventually the Washington Government agreed to accept $400,000,000, payable in 5 per cent. bonds, reimbursable in ten years. This, with the dollar then at 7f. 25c., was equivalent to 2,900,000,000f., plus the interest. Towards the end of 1924, M. Clementel, the then Finance Minister, announced in his historic *Inventaire* that sales of stocks had been effected to a total of 3,317,237,604f., and that the liquidation might be regarded as completed. Of this total 2,739,070,721f. had actually been recovered down to August 31, 1924. A further 159,000,000f. was recovered during the following four years, leaving 419,500,000f. (say, £3,383,000) still outstanding at the end of 1928. Now, had the franc remained at 7f. 25c. to the dollar, the amount actually recovered from sales would have more or less equalled the purchase price to be paid to the American Government. Unfortunately, owing to the steady drop in the franc, the total amount recovered from the sales reported in 1924 by M. Clementel was equivalent, down to the end of 1928, to only $230,000,000, if calculated—as it obviously should be—at the exchange rates prevailing when the respective payments were actually received. The deficit to be borne by the French taxpayer, therefore, will be something like $170,000,000, quite apart from the interest charges during the ten years, or a total of approximately 6,250,000,000f.—always supposing that full payment in cash will be exacted on August 1 next. Worst of all, the condition of the French Treasury was such, during the period when the proceeds from the sales of stocks were mostly received, that not a centime of the 2,900,000,000f. recovered could be set aside with a view to ultimate use in payment for the stocks. The whole receipts had to be used, as and when received, to meet pressing needs; so that to-day, after having received nearly 3,000,000,000f. from the purchasers and having paid out nearly $8,000,000 in interest, the French Government is still faced with the obligation of having to pay the whole purchase price of the stocks, now equivalent to over 10,000,000,000f.

Latin American Loans.—A correspondent writes:—A feature of the past financial year has been, again, the large number of loans raised—apparently in no case with any difficulty—by Latin American countries. Formerly—and not so very long ago—it was necessary for the smaller and less responsible of the Republics to apply first to one and then to another of the European capitals for funds to carry on their national affairs, consisting not seldom of internecine warfare. To-day, however, happier conditions prevail, and the growing necessities of these countries, manifest in the form of extension of transport facilities, creation of monetary institutions, improvement of harbours and ports and construction of irrigation works, have been provided willingly by foreign—mainly American—financiers. During 1928 the Latin American Republics were enabled to raise in the form of loans—extending over long or short periods—something like £65,000,000. Of this total the United States provided in eleven months $303,355,000 (£60,671,000), which, however, was independent of $23,240,000 (£4,648,000) borrowed by corporations and municipalities. Large as this amount appears, it showed actually a decline from the total of similar borrowings in the previous year, when $335,360,300 (say, £67,072,060) and $90,000,000 (£18,000,000), representing respectively government and municipal issues, had been obtained. A considerable amount of private financing has also to be recorded, many electrical power, hydraulic, irrigation, mining, oil and other industrial enterprises having found financial support from both European and American syndicates. It is believed that from the latter source alone more than $500,000,000 (£100,000,000) has been received for the extension of existing or commencement of new Latin American industrial undertakings. Brazil and Bolivia were the largest borrowers among the Governments, and Cuba, Colombia, Guatemala and Argentina among the corporations. It is no less interesting to note that the greater part of the loans have been granted free of any kind of restrictions in regard to the manner or the locality in which the proceeds should be expended.

Insurance Against Illness.—Some four years ago there was inaugurated a novel form of insurance against doctors' bills. The scheme was really devised to meet the need of that large section of the middle classes outside the purview of the National Health Insurance Act, but with incomes incapable of meeting, without financial embarrassment, the heavy cost of unexpected doctors' bills and operations. Evidently at the outset the scheme was experimental, and to some extent tentative, but we are now advised that as the result of the experience gained, the whole of the benefits have been recast and the premiums revised. For instance, the joint annual premium for a man and wife not exceeding age 45 is now £4 2s. 6d. This premium secures indemnification for doctors' bills in excess of £3 10s. per annum, where the fee per visit is 5s., up to a maximum of 100 visits per annum per person. In addition, insurance against surgeons' fees is provided up to 25 guineas per annum per person; surgical applicances up to 10 guineas per annum per person; hospital and nursing home charges up to 6 weeks' treatment at 4 guineas per week per person, and other subsidiary benefits. The scheme still seems to suffer from the disadvantage of being somewhat complicated, but it is at any rate, an interesting experiment offering possibilities of great public utility. The new prospectus is issued by the Family Medical Services Limited, but the policies are apparently Lloyds' policies, and it is impossible therefore to obtain any information as to past underwriting experience of the scheme or of the extent to which it has been taken up by the general public.

Pearl Assurance Company.—The year 1928 has proved to be another highly successful one for this company—the first among the Ordinary-cum-Industrial Offices to issue its accounts. New life business amounted to £12,080,366, an increase of 18½ per cent., but there was a decline of 13½ per cent. in the Industrial branch, although the total, namely, £20,434,324, is still materially higher than the 1926 figure. Expenses are lower, the ratio to premium income being 10·5 per cent. in the Ordinary branch and 34·1 per cent. in the Industrial branch, compared with 11·1 per cent. and 35·5 per cent., respectively, in 1927. The interest earnings continue to show an upward tendency, being at the rate of £4 15s. 11d. per cent. on the combined Life branch funds as compared with £4 15s. 7d. per cent.

By far the most important feature of the year appears in the results of the annual valuation which in the Industrial branch has been made on the basis of the English Life Table No. 9 (based on the 1921 census), with interest at 2½ per cent. Hitherto the English Life Table No. 6 (based on the 1891 and 1901 census), with interest at 3 per cent., has been employed, and the change must have necessitated the addition of a large sum to the reserves. Unfortunately, the exact amount is not stated, so that comparison of the published results with those of preceding years is vitiated. This should be borne in mind when considering the following tables:—

	1926.	1927.	1928.
Ordinary Branch:—	£	£	£
Surplus earned during year	605,088	662,638	837,363
Brought forward from previous year	55,671	67,934	73,798
	660,759	730,572	911,161
Allocations:—			
To Policyholders' Bonus	454,300	504,572	617,375
„ Shareholders A/c	113,575	126,143	154,344
„ Staff Pension Fund	24,950	26,059	25,000
„ Carry forward to next year	67,934	73,798	114,442
	660,759	730,572	911,161
Industrial Branch:—			
Surplus earned during year	220,795	252,552	359,334
Brought forward from previous year	86,940	82,685	86,296
	307,735	335,237	445,630
Allocations:—			
To Policyholders' Bonus	150,000	175,000	275,000
„ Shareholders A/c	75,050	73,941	75,000
„ Staff Pension Fund	82,685	86,296	95,630
„ Carry forward to next year	307,735	335,237	445,630

The surplus in the Ordinary branch shows considerably more than the normal increase, and this explains the advance in the reversionary bonus from 42s. per cent. to 46s. per cent. But in the Industrial branch, notwithstanding the notable strengthening of reserves, the surplus is 50 per cent. greater than a year ago. This is really a very remarkable result. So extraordinary a rise in the profits cannot be due to an increase in the ordinary sources of profit, and it is to be hoped that further information on the point will be forthcoming at the annual meeting. The Industrial branch is now apparently capable of providing for the shareholders an immensely greater annual sum than ever before, and this year's allocation of £275,000 is nearly sufficient to meet the entire dividend—itself greatly increased. The Fire and Accident branch has made further progress, and the premium income has yielded a net profit of £54,807 and interest earnings of £15,486 after meeting the Preference dividend. Only one-half of the profit has been transferred to Profit and Loss Account, and the underwriting accounts are now supported by reserves amounting to 107 per cent. of the premium income. From the shareholders' point of view, the accounts may be epitomised in the statement that the total sum earned on the ordinary capital was £496,637, compared with which the dividend declared cost £297,778.

United Kingdom Provident Institution.—After a disappointing year in 1927—the United Kingdom Provident was one of the very few offices which failed to report an increase—the 1928 new business of £3,109,870 shows a small advance of some £68,000 over that of the preceding year. The total premium income is now £1,376,000 and the funds amount to £17,229,000. With so large a premium income the Institution has the advantage of a relatively big area over which to spread its overhead charges, and the expense ratio works out, therefore, at a low figure, being only 12·5 per cent. of the premiums, this figure being practically the same as that for 1927. The most notable feature of the 1928 report is the substantial rise in the net rate of interest, namely, £4 6s. 6d. per cent. in 1927 to £4 10s. 4d. per cent. in 1928. The Institution follows an admittedly ultra-conservative investment policy, and one result of this in recent years has been the very low rate of interest earned on its funds. Actually, in 1927 the rate of interest earned was the lowest of any of the offices whose accounts were reviewed in our Insurance Supplement of the 16th July, 1928. Even now, in spite of the advance of nearly 4s. in the rate earned, it is still a good deal less than the average rate earned by other offices, which is in the neighbourhood of 4¾ per cent. The advance in interest earnings is no doubt accounted for partly by the tendency to reduce the Institution's holding of British Government Securities, a movement which has evidently made further progress during 1928.

Clerical, Medical and General Life Assurance Society.—Last year's new business constituted a record, the amount—namely, £2,027,955—having exceeded the two-million mark for the first time. The expenses of management worked out at 14·7 per cent., compared with 15 per cent. in 1927, and the rate of interest earned has advanced appreciably from £4 15s. 4d. per cent. to £4 17s. 5d. per cent. In addition to interest earnings the Society realised invested profits of £15,492 and secured appreciation in values of £66,645. The accounts show that practically the whole of the realised profit has been devoted to meeting the cost of extensive alterations recently carried out at the Society's fine old Georgian offices in St. James's Square. The balance sheet of this Society is always of great interest, since it is one of the few offices which sets out its Stock Exchange securities in detail. There have been some notable changes during the past year in the investments. Mortgages on property within the United Kingdom have been increased by over £200,000, these being granted mostly in connection with private houses in respect of which the Society obtains by way of collateral security endowment assurance policies on the lives of the mortgagors. Mortgages outside the United Kingdom have risen by £230,000, and are stated to be secured wholly on city property in Toronto. These Canadian mortgages are being dealt with by a separate company with the title of C.M. and G. Investments, Ltd., having a capital of £5,000, the whole of which is held by the Society. Consequently, the Society secures the immense advantage of expert local knowledge, while retaining in its own hands the necessary measure of control. The rate of interest yielded by these mortgages is believed to be 6½ per cent., and the increase in their amount during last year must have contributed materially to the advance in total interest earnings. The only change of importance in the Stock Exchange securities is a further reduction in British Government securities brought about by the sale of £190,000 5 per cent. War Loan, and the redemption of £60,000 1928 National War Bonds. This reduction has been partly offset by an increase of £125,000 in Trade Facilities Acts securities. Thus in the main the changes appear to be consistent with the Society's traditional and declared policy of investing largely in mortgages, and in more recent times the development of mortgages in Canada. In this respect the Society's investment policy differs

widely from that of most other offices, and the following table is therefore of interest in this connection:—

	38 Principal Life Offices extracted from our Insurance Supplement, 16th July, 1928.	Clerical, Medical and General. 1927.	1928.
	Per cent.	Per cent.	Per cent.
Mortgages, including loans on policies	28·1	45·4	48·4
British Government Securities	23·4	12·6	10·9
Stock Exchange Securities other than British Government Securities	38·1	20·6	19·8
Employers Liability Assurance Co., 5,000 £1 shares		1·9	1·9
General Reversionary and Investment Co., 5,000 £100 shares		7·4	7·1
C.M. & G. Canadian Investments, Ltd., 500 £10 shares		—	—
Reversionary Interests, Properties, and other assets	10·4	12·1	11·9
	100·0	100·0	100·0

Lastly, it may be mentioned that the Society has a hidden reserve of £200,000 in the book value of the assets, and, in addition, it is stated that its subsidiary company, the General Reversionary and Investment Company, is worth fully £130,000 more than the book value.

Provident Mutual Life Assurance Association.—Realising the inadequacy of a comparison based merely on the amount of new sums assured effected as a criterion of growth, this Association prefers to concentrate on the figure of premium income. Although it is widely used as a test of progress, the amount of new business transacted takes no account either of natural wastage due to claims or of the element of surrenders and lapses. The premium income received each year includes both of these important factors and is therefore a more scientific measure. Thus last year's premium income amounted to £839,713 compared with £771,266 in 1927 and £396,668 in 1920—a highly creditable rate of increase. Last year's increase was achieved notwithstanding a small set-back in new sums assured from £2,301,061 to £2.273,014, but this reduction is easily explained by the fact that 1927 was the closing year of a quinquennium and produced no less than 70 per cent. more business than in 1926. The 1928 accounts show that the expense ratio is slightly higher at 14·5 per cent. compared with 13·9 per cent. in 1927, and the net rate of interest lower at £4 12s. 2d. per cent. compared with £4 14s. 11d. per cent., but the board have shown their confidence in the future by retaining for 1929 the same rates of interim bonus as were declared last year. The total balance-sheet assets now amount to £6,828,000 and the classification of the various types of security indicates that there have been during the year some important changes. Mortgages in in the United Kingdom have increased from £64,000 to £224,000. Holdings in British Government and Municipal securities have been realised to the amount of £212,000 and appear to have been re-invested mainly in ordinary shares which have risen from £416,458 to £716,849, and at the latter figure account for 10 per cent. of the total. It would seem that the Provident Mutual has become a convert to the principle of investment in Ordinary shares. Finally it is of interest to record that the Association's new chairman, Mr. Owen Hugh Smith, is a brother of Mr. Vivian Hugh Smith, who is himself the Governor of the Royal Exchange—a unique position for two members of the same family.

A Free Trade Conference—Under the auspices of the North Western Free Trade Union, a national conference on Free Trade will be held in the Free Trade Hall, Manchester, on Tuesday and Wednesday, March 19th and 20th. Among the addresses to be delivered the following may be mentioned: "Safeguarding and its General Application," by Sir George Paish; "Safeguarding and its Effect on Employment," by the Rt. Hon. J. M. Robertson; "Safeguarding Iron and Steel and its Counterblast," by David Macmullan; "Economic and Ethical Urgency for the Restoration of Free Trade," by Lord Parmoor; "Safeguarding and Agriculture," by Sir Robert Newman; "Safeguarding and Imperial Preference," by Harold Cox. Other addresses will deal with the cotton and woollen industries in relation to tariffs. We congratulate the Union on its enterprise in organising so timely and so comprehensive a conference, which should serve to stimulate the activities of Free Traders throughout the country.

Oversea Correspondence.

UNITED STATES.—WALL STREET—BANK STATEMENTS—MONEY PROSPECTS.

(FROM OUR CORRESPONDENT.)

New York, February 15.

Attention in Wall Street has continued to be divided between the share market and Federal Reserve policy and operations. The market has shown increased vulnerability since the advance of your Bank rate and the issue of the Federal Reserve "warning"; but at the same time it must be noted that the turnover on the Stock Exchange has not reached proportions of the first magnitude, and that the decline so far has been orderly. The greatest interest developed in this week's meetings of the directors of the Federal Reserve Bank of New York. In the first place it was announced last week that a special meeting of the board would be held on Monday. This announcement brought rumours that the discount rate would be advanced or that another "warning" statement would be issued. However, the meeting came and went without any public development whatever, leaving in its train the natural variety of conjectures as to the situation within the directorate of the bank and as between the bank and the Federal Reserve Board in Washington. A rally, meanwhile, had developed in the share market, and this continued for a brief space, until attention began to be centred on the regular meeting of the Bank board on Thursday. This meeting provided an abundance of excitement for Wall Street. Whereas the directors of the New York bank ordinarily complete their deliberations and announce any action by 3.30 in the afternoon, this particular meeting ran on until 6.50 p.m., when it was announced that there was no announcement to be made. Fresh rumours appeared on Friday, one of which was that the directors were seriously divided among themselves over policy. Another was that a controversy was in progress with the Board at Washington, the latter being unwilling to permit an advance in the discount rate. All that can be said with any positiveness is that there clearly are considerable differences of opinion within the system and that the indecisions of the past year have not been obliterated.

Meanwhile the weekly bank statements revealed a decrease of approximately $100,000,000 in brokers' loans at New York and a continuance of the system's policy of reducing its portfolio of paper purchased in the open market. With all the uncertainty and doubt concerning discount rates, this is the one bright spot of consistency and vigour in the system's attitude. It is steadily reducing the volume of bankers' bills held—with occasional reductions of its holdings of Government securities—and is thus pressing for a reduction in the total volume of credit extended. The member banks can, of course, offset this loss of central bank credit by increasing their discounts at the Reserve Bank; but any such action naturally increases official control of the money market, while it is a fact that, under existing circumstances, the member banks wish to reduce rather than to increase their discounts at the central institutions. If the authorities hold firm to this policy of selling bills—and the indications are that they will—a squeeze in the money market is likely to develop shortly, even without an advance in discount rates. Toward the end of February, in ordinary circumstances, a demand for funds develops in the interior of the country in anticipation of out-of-door work on the farms and of spring business. This demand usually results in a movement of funds from New York to the interior and in generally increased demands on the member banks for funds for commercial purposes. There results a tendency for the banks to withdraw money from the call money market in Wall Street, which action sometimes, and notably in March, 1926, has had a sharply deflating effect upon the share market. In good quarters there is a feeling that something of this kind is likely to develop this year, and that the share market has become, for the time being at least, a hazardous place for the bulls. Whether the history of 1926 will be repeated to the extent that general business will hold up well through the year despite a sharp share market reaction remains to be seen; but there is a considerable body of good opinion that favours that point of view. Certainly, industrial indices still point in a favourable direction.

GERMANY.—POLITICS—CREDIT—INDUSTRY—FOREIGN TRADE—BOURSE.

(FROM OUR CORRESPONDENT).

Berlin, February 26.

Within the next few days will probably be decided the question whether the long-promised Coalition Cabinet can be formed. The Foreign Minister, Dr. Stresemann, holds that his party, the Volkspartei, should not insist upon the condition laid down after the General Election of last year, that it should be taken into the Prussian Cabinet, which is at present on a "Weimar Coalition" basis, simultaneously with the reconstruction of the Federal Cabinet. The Volkspartei is not united, and some of its Press organs demand that, following the example of the Centre, it should withdraw from the Cabinet, although this would presumably mean the resignation of Dr. Stresemann. The public wish that a solid Coalition Cabinet should be formed before the meeting of the Paris Reparation Conference was not attained.

Developments in Paris, so far as they are known, have not caused much satisfaction here. The notion of "transfers protection" for part of the Reparation annuity is contrary to the desire of most Germans who have expressed themselves on the subject. But they hold that "transfers protection" should be abandoned only if the internally raised annuity is heavily reduced. If the transferability of the whole of the standard Dawes annuity is in doubt, then it would be in accordance with the Dawes Plan to reduce the annuity. The Dawes Plan, though it prescribed first a certain accumulation, assumed that in the end no more ought to be paid internally in marks than could certainly be transferred. The German view is that the annuity should be fixed at a sum which can certainly be transferred. This sum, however, is not determinable in advance. Even if the foreign-trade balance and foreign balance of payments should make it possible to transfer a given sum in one year, there is no guarantee that the same sum would be transferable in future years—the Dawes Committee itself declared that only "experience" could show what sum could be transferred. If the annuity were heavily reduced, German opinion would support the entire abandonment of "transfers protection," thus putting upon Germany the responsibility for the transfers. Partial "transfers protection" is here regarded as an Ally expedient for keeping the annuity at or about the present level, which Germans believe is too high.

The day-loan market has not recovered its fluidity, and at present it is under the influence of the month-end demand, with a rate to-day of $6\frac{1}{2}$-$8\frac{1}{2}$ per cent.; month loans are relatively easier at $6\frac{3}{4}$-$7\frac{3}{4}$ per cent. The private discount rate has again been advanced, to $6\frac{1}{2}$ per cent. The money market has been influenced by government sales of Treasury bills. The severe winter, by retarding activity in agriculture and in building, has somewhat reduced the demand for credit, but a heavier demand may be expected soon. The Reichsbank's return for the third week of February has not yet appeared, but it seems likely that sales of foreign exchange have continued. Sterling to-day again hardened to 20·45, the dollar to 4·214. Although the foreign exchanges are still somewhat below the German gold-export point, the financial Press consider a sale of German gold likely, on the ground that the complete depletion of the Reichsbank's exchange reserves should be avoided.

Revenue from taxation in January totalled 1,106,838,155 marks, the largest sum received in one month so far. Receipts in the first ten months of the financial year totalled 7,918,470,660 marks out of 8,862,000,000 marks estimated for the whole financial year.

Receipts for the ten months contain four instalments of those taxes which are payable quarterly, and no instalment of these falls to the remaining two months. The yield from Customs—971 million marks—is below the ten months' proportional share, the estimate for the whole financial year being 1,200 million marks.

The wholesale prices index number for February 20th is 140·0, against 139·5 a week earlier. Grain, livestock, dairy products, and fodder all show sharp rises. The trade position looks more favourable. Railway-car loadings in January were nearly 5 per cent. lower than in January, 1928, but the output of raw materials, in particular of iron and steel, is well maintained. Coal production continues to decline. Production of ingot steel in January was 1,469,653 metric tons, against 1,470,936 tons in January, 1928; of rolling-mill products, 1,001,824 tons, against 1,005,559 tons. The large steel production, taken together with the heavy imports of January, is regarded as an indication that no serious decline of trade is expected by manufacturers. A slight improvement is reported in the textiles branch. Shipbuilding orders in hand on January 1st were 402,261 gross tons, as against 524,991 tons on January 1, 1928; the volume of foreign orders has increased to 156,270 tons, as against 131,670 tons. The glass manufacturers are agitating for special protection against Czechoslovakia. German imports from which have about quadrupled in the last four years, whereas German exports to Czechoslovakia have increased very little. Simultaneously the Czechoslovak glass exporters are demanding reprisals against American tariff increases.

The foreign trade return for January, as compared with December, shows :—

	(000's omitted.) January Marks	December Marks
Imports—		
Livestock	12,080	13,162
Foodstuffs	404,240	332,146
Raw and half-manufactured materials	688,151	566,013
Manufactured goods	214,642	189,549
Commercial imports	1,319,113	1,100,870
Gold and silver	12,891	116,108
Totals	1,332,004	1,216,978
Exports—		
Livestock	1,297	900
Foodstuffs	65,414	65,939
Raw and Half-manufactured materials	247,352	224,178
Manufactured goods	790,935	737,922
Commercial exports	1,104,998	1,028,939
Thereof Reparations Deliveries	68,880	50,575
Gold and silver	3,070	4,568
Totals	1,108,068	1,033,507

The increase in imports as compared with December is in part due to the booking of goods released in earlier months from bond, but apart from that, imports increased by some 80 million marks. The export total, as shown, includes Reparation deliveries in kind. There was a considerable increase in exports of manufactured textiles and of heavy iron and steel goods, and a decline in exports of goods, such as toys and musical instruments, foreign purchases of which are dependent largely upon the Christmas demand.

The Bourse continues to be very nervous. It seems that uncertainty as to the English and American money-market outlook and fear of the effect of a possible failure of the Paris Reparations Conference are keeping the public out of the market. Automobile stocks have heavily fallen, and some other favourites, in particular Glanzstoffe and Bemberg (artificial silk) and Polyphone, have dropped. Potash stocks have also been weak; shipping stocks, in spite of the Hamburg-America's dividend reduction, relatively firm. Coal and steel stocks have been fairly well maintained. The "Frankfürter Zeitung's" stocks index (based on 100 as average of 1926) shows for February 22nd 128·48, as against 138·07 at the end of 1928, and a high point of 177·46 on May 2, 1927.

AUSTRIA.—INDUSTRIAL SET-BACK—SOCIAL SERVICES—TRADE AGREEMENTS—YEAR'S RESULTS—CAPITAL.

(FROM OUR CORRESPONDENT.)

Vienna, February 22.

In the last few weeks there has been a considerable decline in the business life of Austria. The unusually hard winter and the absence of foreign visitors have had an

unfavourable effect, which is strikingly illustrated by the fact that representatives of retail trade have approached the Minister of Finance and the Treasurer of the City of Vienna with a view to getting a grant of time in which to pay their taxes and local rates. This course of development has not yet expressed itself in an increase of bankruptcies and compositions; on the contrary, the weekly average for this January was 33 compositions and 9 bankruptcies compared with 46 compositions and 10 bankruptcies last January. On the other hand, less obvious liquidation is on the increase, and various firms are endeavouring to come to amicable settlements with their creditors without attracting public attention. Cafés and restaurants, which have sprung up like mushrooms during the last few years, are thinning out. Trade is feeling acutely the general reluctance to buy, and this carnival season is the worst Vienna has had for a number of years. Industry is less depressed than commerce, though the former is handicapped by shortage of coal, through frost and diminished electric power, whether this be drawn from the municipal generating stations or from private water-power plant. It is some consolation that the replenishment of depleted stocks of various kinds will call for the employment of more labour. The iron industry is fairly busy, and has orders both from abroad and from the domestic market. The State railways continue to be big consumers. Things are not going so well in the textile industry, which is cutting down output on account of slower sales to Germany and Hungary. Several cotton printing mills are to be closed down altogether, and the creation of a community of interest among the others is being planned.

An important obstacle in the way of the halting trade treaty negotiations between Germany and Austria is formed by the Austrian demand for a reduction of the German duty on cotton yarn. At the last moment a commercial war with Poland has been avoided. Conditions are excellent this year for the Austrian coal industry, and the Graz-Köflach Railway, which only last year was on the verge of bankruptcy, will be put on its feet much sooner than was expected by the Alpine Montangesellschaft for the sake of its coal mines. For some time now the Austrian soft coal industry has been trying to get greater tariff protection, but it is doubtful whether this demand will be granted after the serious coal shortage of the last few weeks, which has only been mitigated by heavy supplies from the Ruhr.

In consequence of the spell of very cold weather the number unemployed in Austria has risen from 250,750 in receipt of benefit and 31,000 not in receipt of benefit on February 1, to 300,000. This total will, however, be quickly reduced as soon as warmer weather sets in. Complaints about the burden of taxation and the expenditure on social schemes are becoming louder. While in the year 1923 34 million schillings had to be raised for national health insurance, no less than 100 million schillings were required last year. During the same period imposts for accident insurance rose from 6 to 26, pension insurance from 3 to 28, unemployment insurance from 50 to 160 million schillings. In addition to this, 60 millions have to be paid by industry for the health and unemployment insurance of employees. And yet it is vital to Austrian economy that the companies should be enabled to earn more, to make reserves and distribute higher dividends, for otherwise the urgently needed capital increases for the purpose of reducing bank debts cannot be effected. It appears that the banks will all distribute the same dividends as last year, although individual institutions considered the question of making a slight reduction in the dividend and adding to reserves. But as the Vienna banks act on an understanding the dividends of last year will most likely be maintained. The banks cannot look back to a very favourable year, as stock exchange business and capital issue were stagnant and old debts had still to be written off. In the current year the wide margin between the borrowing and lending rates will have effect. The reduction in the dividend of the Steyr Works, the largest automobile factory in Austria, from 10 per cent. to 5 per cent. has excited great interest. The reduction is a consequence of excessive indebtedness to the bank and of the difficulties in the way of issuing fresh shares. The National Bank is maintaining its rate of 6½ per cent., and hopes to continue without any change. This, however, will only be possible if the situation on the international money market does not further weaken. Interest rates on dollar credits have stiffened again, and up to 6¾ per cent. is now being paid. The hopes of issue of the investment loan in the near future have been dimmed by the present state of affairs in America. Efforts are still being continued to dispose of Austrian interests in petroleum concerns. The Vienna-Floridsdorf Mineral Oil Refinery has now passed into the possession of the Royal Dutch Group.

Savings deposits are increasing, and at the beginning of the month of February they had reached a level of 1,163 million schillings. This sum, however, also includes the proceeds of a number of sales of shares lately transacted by the public. The call on the National Bank is slight, and the bills receivable account, which at the end of January amounted to 165.2 million schillings, figured at only 123.7 million schillings at the middle of February.

DENMARK.—PRICES—FOREIGN TRADE—INDUSTRY.

(FROM OUR CORRESPONDENT.)

COPENHAGEN : February 16.

PRICES in Denmark are still stable. The retail price index for the beginning of January, showed that since October there has been a trifling rise, from 172 to 173. Some descriptions of food as well as fuel and light are dearer. Wholesale prices at 151 show no change at all for the last month, but the proportion between the prices of import goods and those of export goods showed a less favourable position than in December, import goods having risen from 146 to 148, while export goods had declined from 154 to 144.

In the general trade situation there is also little change. Several annual reports are favourable. The Landmandsbank, which had its capital affairs reorganised as from May 1st, 1928, shows a surplus for last year of just over Kr. 7,000,000. The bank has set aside Kr. 2,000,000 for a pension fund, and Kr. 1,000,000 for a price adjustment fund. Further, it is proposed—according to the Act providing for the reorganisation of the bank—that a dividend of 5 per cent. per annum for eight months be paid to the State, as the sole shareholder at present. As the share capital amounts to Kr. 50,000,000, this will be about Kr. 1,700,000. Finally, an amount of Kr. 1,700,000 is transferred to the reserve fund of the bank, by which the bond of Kr. 34,000,000 for reserves, given by the State at the reorganisation, is correspondingly reduced. This report is the first since the reorganisation, and it makes a very fair impression of the business of the bank. In considering the figures it should be borne in mind that until the reorganisation the bank was not only without proprietary capital, but actually worked with a considerable expenditure of interest owing to the deficit of the balance sheet. Not until this deficit had been covered and the new, considerable capital invested could the bank begin to work at a profit, and four months of the financial year had passed before this was the case.

The profits for 1928 of the Handelsbank were somewhat in excess of last year's figures, and the dividends are unchanged at 8 per cent. A few days ago the report of the East Asiatic Company was published, showing profits of Kr. 18,400,000, with the addition of Kr. 5,100,000 transferred from last year, making a total of Kr. 23,500,000. Last year the corresponding figures were: Profits, Kr. 16,600,000; transferred from the previous year, Kr. 4,300,000; total, Kr. 20,900,000. After deduction of administration expenses, writings-off for depreciation and setting aside for taxes, a dividend of 10 per cent. is proposed, corresponding to last year's dividend. An amount of Kr. 4,000,000 is placed to the disposition fund, and Kr. 2,000,000 are carried forward to next year's accounts. Further, it is reported that in compensation for Kr. 20,000,000 preference shares in the Landmandsbank, subscribed in 1922 and declared valueless by law, an amount of Kr. 10,000,000 is transferred from the disposition fund, whereby the said shares have been completely written off. After this the disposition fund amounts to Kr. 4,000,000, and the ordinary reserves are unchanged at Kr. 50,000,000, equal to the share capital. One of the big industrial concerns, De Forenede Papirfabriker (paper manufacturers), has declared a dividend of 10 per cent., against 8 per cent. last year. Naturally many companies have worked under difficulties in the past year, but the more important of the reports hitherto published may be said to confirm the impression of improving trade in 1928.

At the moment the hard frost and heavy snowfall are causing much difficulty to trade, especially to shipping, and in consequence unemployment shows a tendency to increase. Last week it increased by 2,500, but even after this the total number of 80,171 was slightly below the number last year at the same time. Every effort is made to maintain agricultural exports, and in agricultural quarters the courageous endeavours of the shipowners to keep up the exports of food to the United Kingdom have won much appreciation. For a country like Denmark, which does a very considerable foreign trade, a winter with ice troubles, like the present, is naturally a serious calamity. Last year the value of the imports into this country was Kr. 1,734,000,000, while the exports (re-exports included) have been computed to be of a value of Kr. 1,653,000,000. Should the hard weather continue for long, some setbacks to exports and imports alike can hardly be avoided, but up to the present the situation has been fairly well managed, more particularly as far as the supplies of agricultural produce for foreign markets are concerned.

ARGENTINA.—MONEY—MARKETS—RAILWAY PROJECTS—NEW INDICES.

(FROM OUR CORRESPONDENT.)

BUENOS AIRES, January 28th.

FINANCIAL conditions in Argentina continue to be marked by unusual supplies of loanable capital, upon which the growth of cereal exports has as yet made but little impression. General business is, however, brisker in many directions, with the prospect of various enterprises requiring financial accommodation during 1929. Therefore the tone of the local money market may reasonably be considered somewhat firmer, with rates for discounts and advances at 6 per cent. to 6½ per cent., with 7 per cent. for advances on current account; though these rates must be considered largely nominal, as business is very much a matter of individual arrangement at the present time. The effect of easy money has been particularly noticeable in the market for local securities; Argentine national, provincial, and municipal bonds have attained record quotations. Cédulas of the National Mortgage Bank, a 6 per cent. security, have touched 103·90 for certain series, while the Internal Credit bonds of 1925 are 102·30. This is principally due to the lack of issues by the Ministry of Finance, the National Mortgage Bank and the Municipality of Buenos Aires, while the funds in the hands of the investing public steadily increase. In 1908 the *per capita* sum on deposit with Argentine banks was $23 paper; in August, 1928, it had risen to $165. In other words, from deposits of $139,000,000 in 1908 the total had increased in 1928 to $1,780,000,000. This, of course, applies only to time and savings bank deposits, for the total of deposits in current account, time, and savings bank accounts on December 31, 1928, was, in round numbers, $4,020,000,000 paper. The cereal export movement has not been as heavy with respect to wheat as one would have expected to see in the month of January. Low prices for wheat and high prices for maize have to some extent checked shipment of the former grain, while the heavy yield, coupled with the system under which the Argentine crops are collected and shipped, has tended to keep prices low. Towards the end of January both wheat and linseed quotations improved a little, spot wheat being $9·60 paper per 100 kilos with $9·85 for March shipment. Linseed is $15·35 spot and $15·40 for March, while maize is $9·50 spot and $8·40 for May delivery. Conditions in the general produce markets have on the whole been satisfactory. Wool is moving with comparative freedom and prices are well maintained, though stocks on hand are somewhat higher than they were this time last year. Conditions in the hide market are not quite so satisfactory and prices tend to weaken all round. As a set-off to the unwelcome news of the sale of the Union Telephone Company to American interests may be cited the important extensions to be carried into effect by the Central Argentine and the Pacific railway systems. The latter concern is principally interested in the rearrangement of its Buenos Aires terminal facilities, and the bulk of its expenditure will be in connection with its station and goods yard at Retiro. The programme of the Central Argentine is much more exhaustive. Summarised as briefly as possible, it means the laying of close on a thousand kilometres of rail through what is practically virgin country in the north of the Republic, and the electrification of the second half of its suburban system in the vicinity of Buenos Aires, together with the abolition of level crossings within the municipal limits of that city. In all, the cost of this work is estimated to lie between £30 and £35 million sterling, and it is said, unofficially, that the necessary fresh capital will be sought at the rate of £4,000,000 a year. Relations between the railway companies and the Government are at the present time exceptionally cordial, and the general prospects for the second six months of the railway year, which ends on June 30th, 1929, are of the brightest. Exchange during January has slowly but surely moved in favour of Argentina, the cable rate for sterling being 47 1/32d. and that for United States dollars $104·40. Some small shipments of gold—barely £300,000 in all—have been made from Buenos Aires to Rio, but it is understood that this is for European account. The stock of gold in the Conversion Office has been increased by a deposit of some $15,000,000 gold previously held by the Banco de la Nación. It therefore now stands at $503,439,509 gold, the circulation in paper money being $1,437,198,932. As yet there are no indications of gold imports, but if exchange continues to move in favour of Argentina during February they may be expected to set in before the end of that month.

The Banco de la Nación has recently instituted a Bureau of Economic Research for the purpose of preparing and publishing monthly financial and economic statistics compiled in a more scientific and reliable manner than has hitherto been possible. It is intended to build up economic indices, and at the same time to investigate various local economic phenomena that have hitherto received little or no attention. As the review, which will be published in English as well as in Spanish, is purely scientific, and in no sense to be regarded as propaganda for the Bank in question, its value in estimating the trend of economic events in Argentina can scarcely be overrated, especially in view of the fact that the Bureau has been admirably staffed and placed under the direction of Señor Raúl Prebisch, well known as one of the leading modern Argentine economists and a Professor in the Faculty of Economic Sciences. Interested parties who care to apply to the Bank for copies of this publication will be placed free on the list of recipients.

AUSTRALIA.—PUBLIC FINANCE—EXPORTS.

(FROM OUR CORRESPONDENT.)

MELBOURNE, December 31, 1928.

THE public accounts of the Commonwealth and six States for 1927–28 show ordinary revenue and expenditure, loan expenditure, and public debts as at June 30, 1928, as follows :—

	Revenue.	Ordinary Expenditure.	Loan Expenditure.	Debt, June 30, 1928.
	£	£	£	£
New South Wales .	44,317,635	45,412,631	15,763,151	252,991,386

Net total, 1927–28	174,642,974	181,547,368	46,967,582	1,080,968,418
Net total, 1926–27	175,978,256	173,807,381	50,257,983	1,037,293,394

* Commonwealth revenue and expenditure are shown after allowing £13,747,356 for duplication with States.
† Net Commonwealth debt, after allowing £132,380,458 for duplication with States.

The relations between Commonwealth and States finance are becoming more and more intricate, and the allowance necessary for duplications is increasing. Apart from this the Commonwealth revenue and expenditure figures above are gross. Post Office, railway and certain other items are taken into account in full on each side, and these figures therefore correspond with those shown for the States. The official Commonwealth statement, however, is drawn up on a net basis, and shows merely balances of Post Office accounts, etc. in the general consolidated revenue statement.

The total revenue of the Commonwealth and States for 1927–28 includes taxation £83,999,322, against £86,061,103 for 1926–27, the decrease of two millions being due to smaller Customs and Excise receipts. Customs revenue for 1927–28 was only £29,848,379, against £31,832,600 for 1926–27, and Excise £11,598,351, against £11,719,878. The decline in Customs revenue has resulted from the reaction in Australian imports during 1927–28, and although the revenue from this source for 1928–29 is estimated at £31,450,000, this would require a larger increase in imports than is apparent at the moment. In any case, the value of imports depends partly upon regular borrowing abroad.

The total estimated taxation to be collected by the Commonwealth and States during 1928–29 according to the Budgets is approximately 86 millions, or an increase of two millions compared with 1927–28. During the last year or two there has been a tendency to accelerate collections of income tax before June 30, and the arrears which were allowed to stand over a few years ago as a reserve from one financial year to another have been largely used up. While reluctant to increase taxation rates, some of the Governments, including the Commonwealth and New South Wales, are endeavouring to increase the revenue by administrative methods and by stiffening the law in various matters of detail. The tendency of expenditure is to increase, and the estimates of the six States for 1928–29 show a gross total of £117,818,692, against £113,174,265 for 1927–28, and £110,724,802 for 1926–27. The increase is partly due to increased working expenses on railways and other departments, and partly to the increase in interest on public debts, which for the six States is estimated at approximately 33½ millions, against £31,058,282 for 1927–28 and £29,413,148 for 1926–27. Including the interest paid by the Commonwealth, the total for the Commonwealth and States together for 1927–28 (after making allowance for duplications) was £50,018,349, against £48,498,966 for 1926–27. In addition, sinking funds absorbed over 4½ millions. The interest is partly provided by the net earnings of railways and other public works, and partly falls upon the taxpayers. The latter part includes £17,240,189 interest on war debt for 1927–28, for which purpose £17,813,032 is estimated for 1928–29. The gross revenue from Government railways and tramways in Australia for 1927–28 was 53½ millions, while for 1928–29 it is estimated at 57 millions, an increase which is partly accounted for by the larger wheat harvest.

Australian exports have been active during the last few weeks. The National Council of Wool Selling Brokers of Australia has added 115,000 bales to the estimate made last June of 2,462,000 bales expected to be received into store for offering in Australia during the 1928–29 season. Butter exports have been larger than for the similar period of the 1927–28 season, but in some States there have lately been complaints of dry weather in the dairying districts. The wheat harvest is turning out well, and an exportable surplus of approximately 3,000,000 tons or 112,000,000 bushels is hoped for, against 72,694,121 bushels (inclusive of flour) exported during the twelve months ended November 30, 1928. Shipments of wheat on account of the new season have become active earlier than usual; India is at present the principal destination.

Letters to the Editor.

"BANK RATE POLICY."

TO THE EDITOR OF THE ECONOMIST.

SIR,—It is always a pleasure to read anything from the pen of Mr. Francis W. Hirst, and his letter in your issue of the 23rd inst. is no exception to this experience. But I am bound to state that I find it difficult to agree with many of the statements contained in his letter. He states that "the problem deserves discussion" and "there is no reason why a mystery should be made of high finance." Is there any mystery, and was there general consternation at the rise in the Bank rate from 4½ to 5½ per cent.? You very pertinently observe that the Bank rate was raised in the same week in which gold stocks fell below £150 million, and that probably was the principal cause of the action taken by the directors of the Bank of England. Many people anticipated it, and probably were prepared for it, but why we should be regarded as "the catspaw that removes American chestnuts from the fire" because it was followed by a slump in Wall Street I fail to see. It was rather a tribute to the importance of London as a monetary centre, and shows that we are capable of acting and judging for ourselves. Mr. Hirst supplies an admirable explanation of the phenomenon in his quotation from Bagehot. Mr. Hirst describes our debt to the United States as an "exorbitant gold debt treaty," and mentions this as one of the causes of the gold drain to that country. Why describe it as a gold debt treaty? So far as I am aware it is a dollar debt, and must be paid in dollars or the equivalent, and as a result of the restoration of the gold standard (which the Bank directors were endeavouring to maintain) will save this country, as estimated by the Treasury, about £336,000,000 during the payment of the debt. I should like to know Mr. Hirst's authority for stating that the Federal Reserve Board has asked the Bank of England to help them at our expense by raising our Bank rate. No doubt there is co-operation, as there ought to be between all central banks, but, first and foremost, the directors are, and will be, guided by what constitutes sound monetary policy as it affects this country.

There is one cause, and here I am confident Mr. Hirst will agree with me, that the present scarcity of loanable capital throughout the world has been accentuated by the Government's failure to proceed with disarmament. Mr. Churchill wrecked the Geneva Disarmament Conference, and now America proposes to spend £54,800,000, and the present Government are proceeding with their programme of cruiser building. This means a waste of loanable capital, and means dearer money in the future in America and this country. The remedy, then, is largely in our own hands, and that is to practise the strictest economy.—I am, Sir, your obedient servant,

London, February 23, 1929. D. M. MASON.

IMPERIAL FINANCE AND CANADA.

TO THE EDITOR OF THE ECONOMIST.

SIR,—May we refer to the investment note in your issue of February 23rd on the subject of Imperial Finance in Canada, and take the liberty of correcting the implication of the term "Americanisation" of Canadian finance. This would seem to suggest that the United States is obtaining a large share of the Canadian "business loans." Actually that is not the situation.

While War Loans were largely financed at home it is true that subsequent government and municipal borrowing was done to a considerable extent in the United States for the reason that money could be obtained there cheaper than elsewhere. This enabled savings in Canada to largely flow into industrial and trade channels with the result that since the War Canada has been financing its own industrial development to a much greater extent than before. The participation of the United States in Canadian industrial borrowing has not been large. Owing to the expanding nature of the industry in Canada, however, opportunities to participate in the development of Canada are becoming available to investors in Great Britain.

This explains why Canadian government borrowing and Canadian business loans in London have both been of smaller volume since 1919, as indicated by the stockbrokers' review of Imperial Finance from which you quoted.—Yours faithfully,

WOOD, GUNDY AND CO., LIMITED.

14, Cornhill, London, E.C. 3, February 26, 1929.

WAR-TIME ECONOMICS OF RUSSIA.*

AT the outbreak of the war Russia, with an area of 8,532,900 square miles and a population of 170 million, was largely dependent on imports of foreign manufactured goods, machinery and capital for her development. The isolation from the world market, allocation of rail transport for military purposes, fall in the supply of available labour, and general economic disturbance were severely felt early in 1915. These and other influences of the war on the national economy are discussed in one of the two latest volumes in the Russian series of the Social and Economic History of the World War by M. Zagovsky, who then traces the organisation of national resources after the retreat in Galicia in April, 1915. The forms and methods of Government war-time control are dealt with in a third section of the book, and a fourth section describes the attempt made to complete the work of control under the Provisional Government from March to October, 1917. It is clear that the initial mistake made by the Imperial Government lay in not making any real effort to regulate industry until a year after the outbreak of war. When the effort was made, there was no clear line of policy. On the other hand, as the author reminds us, to clothe, feed, and supply an army of 15 million men, concentrated at one point, was a problem to which Russian industry, agriculture, and transport were in no way adapted, and even had there been no war the drastic reduction in imports alone would have provoked a serious crisis in the country. The control policy in the period from March to October, 1927, does not appear to justify devoting such a considerable section of the book to it. M. Zagovsky has written a careful analysis which can be recommended to students of the Russian economic situation. The book has a special value as an introduction to, and an aid to, understanding conditions under the present Government.

Professor Michelson's survey of revenue and expenditure on the eve of and during the war, supported by useful statistics, makes available for the first time a complete estimate of Russia's war expenditure, and the resources from which the expenditure was met. Count Kokovzov, in his introduction, looks back with pride on Russia's past financial history, on the scrupulousness of the Imperial Government in meeting its obligations, and on the absence of recklessness in financial policy during 75 years prior to the war. M. Michelson reminds us that at the outbreak of war Russia was confronted not only with the problem common to all the belligerent countries of raising resources to conduct the war, but with the necessity of filling the gap created by the abolition of the monopoly of alcohol, which deprived the State budget of its most important source of revenue. As direct taxation —Imperial and local—per head in Russia before the war was only 3.11 roubles a year, or about one-ninth that of Great Britain, vital changes in taxation were called for.

Schemes and ideas were never lacking, but it was not until January 1, 1917, that the practical step was taken of putting income-tax into force. The annual budgets, however, played little part in meeting war expenditure, and did not even provide fully for payment of interest on short-term debt. M. Apostol's study of the Russian Government's credit operations will, therefore, probably be of greater interest to the British reader. M. Bernatzky, in his discussion of the monetary policy of the Russian Government, says that up to August 1, 1916, the Government had to provide 5,000 million roubles by the issue of notes. By October, 1917, the Russian currency consisted of a heterogeneous collection of notes of various designs, and the currency chaos was no small factor in the general dissolution of the economic system. M. Bernatzky shows how in the control of foreign exchange the Government's policy was marked by procrastination. He estimates that at the end of the war the value of gold in the State Bank was as high as £137,800,000. The Carnegie Endowment has made available a valuable study of Russia's financial policy and operations during the war.

THE FOREMAN'S VIEW.*

THE employer, the employee, and—from his armchair—the consumer, have all contributed their quota to the discussion of how industrial peace is to be secured. Hitherto, however, the foreman has been silent, though his peculiar function places him more nearly than anybody in a position simultaneously to understand the view point of both sides. The enterprise of the Glasgow and West of Scotland Association of Foremen Engineers and Draughtsmen has put an end to this silence, and we are indebted to it for five prize essays which contribute a variety of suggestions.

The winner of the first prize is remarkable for his breadth of view, and the essay stands alone in its comprehensiveness of scope and its far-sightedness. The writer is a staunch advocate of rationalisation in all its bearings, and holds generous views about education. But while the reader feels that if any fair proportion of the personnel of industry held these views there would never have been any labour problem, it is to the other four writers that he turns for immediate and detailed suggestions as to what, in present circumstances, is the first step to take. The most striking point that emerges is the strong faith which most of them place in machinery for bringing the employer and employee together in regular consultation. One competitor goes so far as to substitute this for trade unions, and almost all of them give it a prominent place in their scheme. Two of the five also advocate profit-sharing, while one strongly condemns it, and, surprisingly, advocates a bonus system instead. Stress is laid in most cases on the importance of greater accessibility of management to employees who have grievances or constructive suggestions. Indeed, by far the most conspicuous fact brought out by this competition is the waste and friction which have resulted from the decline of personal contact between employer and workman. There is profound wisdom in the observation of the first prize winner that "the distinction between skilled and unskilled seems to lie not in the job but in the man." Rightly, in our opinion, he implies that one of the first requisites for the maintenance of industrial peace is the acquisition by all workers of a "skilled" attitude of mind towards their jobs, and few things are more calculated to promote this than the extension to all employees, along the lines suggested by some of the other competitors, of closer contact with the management force, if not actually of a voice in the management.

AN IMPORTANT WORK OF REFERENCE.†

To readers of the *Economist* the "Stock Exchange Year Book" needs no introduction. It is worth its weight in gold, and that is no light compliment. In the 1929 issue we do not notice any novel features, but no less than 128 extra pages are required by new companies registered during the past year, the total of which, we are told, was 9,721, with an authorised capital of £237,890,043, figures which exceed those of any year since 1920. Though it would mean a break with tradition, the publishers would do well to consider carefully whether by enlarging the size of the pages, or otherwise, the book could not be made more comfortable to handle. If it were less unwieldy it would become an even greater asset in every office than it is at present.

† "The Stock Exchange Year-Book for 1929." Thomas Skinner and Co. 50s. net.

BOOKS RECEIVED.

[Brief mention of a book in this column does not necessarily mean that it will not receive fuller notice in a subsequent issue.]

Trade and Credit. By R. G. Hawtrey. (London) Longmans, Green and Co., Limited, 39 Paternoster Row. 10s. 6d. net.

Of the eight essays in this volume the first three deal with the machinery of credit in relation to trade. In the remaining five Mr. Hawtrey further expounds and defends his thesis that the trade cycle is a purely monetary phenomenon. The last two deal respectively with "Working Capital" and with Professor Pigou's "*Industrial Fluctuations*," and were specially written for this volume.

Railway Electrification and Traffic Problems. By Philip Burtt. With a foreword by Frank Pick. (London) Sir Isaac Pitman and Sons, Limited, Parker Street, Kingsway. 10s. 6d. net.

In support of the contention that British railways can only recover their prosperity by a bold programme of electrification, the author adduces the experience of other countries. His discussion is fully intelligible to the layman.

The Punjab Peasant in Prosperity and Debt. By Malcolm L. Darling. With a Foreword by Sir Edward Maclagan. Second edition. (London) Oxford University Press, Warwick Square. 11s. 6d. net.

An interesting study, generously illustrated, of a particular problem in Indian economics.

Limitations of a Balance Sheet. By Sir Gilbert Garnsey. (London) Gee and Co. (Publishers), Limited, 6 Kirby Street. 3s. net.

A reprint of a paper read before the Institute of Chartered Accountants.

Investment Counsel. Sixth edition, revised, 1929. (New York) Scudder, Stevens and Clark, 111 Broadway.

A short, readable booklet of pocket size, containing general advice for the investor.

How to Read the Balance Sheet of a Commercial Concern. By F. W. Pixley. Seventh edition. (London) Gee and Co. (Publishers), Limited, 6 Kirby Street. 5s. net.

This clear and concise little book should be of great value to the inexperienced investor.

An Analysis of the Companies Act, 1928. By Daniel S. Fripp. (London) Gee and Co. (Publishers), Limited, 6 Kirby Street. 1s. 6d. net.

An analysis, accompanied by explanatory notes, for the use of secretaries and auditors.

Auditors and the Companies Act, 1928. By A. C. Hooper. (London) Gee and Co., 6 Kirby Street. 1s. 6d. net.

A reprint of a paper read before the South Wales and Monmouthshire Society of Chartered Accountants.

Tin. Salient Facts and Opinions. By J. A. L. Gallard and Murray Stuart. (London) Mining Publications, Limited, 724 Salisbury House. 2s. 6d.

This very slim volume contains useful information for the investor, both about tin in general and about specified tin companies in particular.

The Fundamentals of Manufacturing Costs. By Lawrence R. Dicksee. Second edition. (London) Gee and Co. (Publishers), Limited, 6 Kirby Street. 2s. 6d. net.

A pamphlet which emphasises the importance of accurate costing and discusses the fundamental principles which must be observed in compiling a system.

The Handbook of the British West Indies, British Guiana and British Honduras. (London) The West India Committee, 14 Trinity Square. 5s. net.

In addition to statistical tables and general information of a political or economic character, there is a whole section devoted to cricket.

Sells' Directory of Registered Telegraphic Addresses, 1929. (London) Business Dictionaries, Limited, 8 and 9 Johnson's Court, Fleet Street.

An indispensable directory which includes a certain number of foreign firms, classified by countries. There is a useful stock exchange section.

Die Internationale Preisbildung. By Eugen Melchinger. (Tübingen) Verlag von J. B. B. Mohr (Paul Siebeck). 7.58 mks.

An historic discussion, in German, of the theory of international trade, with a conclusion on foreign trade policy.

Probleme der Monopolpolitik. By Theodor Vogelstein. (Berlin) Der Deutsche Volkswirt. Rm. 2.

A German monograph on some legal aspects of monopolies and trusts.

Superphosphat auf dem Weltmarkt. By Dr. P. Weicksel. (Berlin) Verlag Chemie, G.m.b.H. 6.50 mks.

A detailed statistical study by countries of the production of superphosphates.

Agrar Probleme. (Berlin) Verlagsbuchhandlung Paul Parey, Hedemannstrasse 28 u. 29.

This periodical is published by the International Agriculture Institute in Moscow, but the text is in German. It includes articles on general agricultural questions and articles on agriculture in particular countries. Of these latter two deal with Russia.

Probleme der Reparationspolitik. By Gustav Stolper. (Berlin) Der Deutsche Volkswirt. Rm. 2.

Another contribution to the already vast body of German pamphlets on reparations.

La Revue Marxiste. (Paris) "Les Revues," 47 Rue Monsieur-le-Prince. 8 fr.

This revolutionary French periodical contains articles on: "What We Want"; "Communism and Private Property"; "Spinoza as a Precursor"; and "The Marxist Method."

Journal of the Parliaments of the Empire. January, 1929. (London) Empire Parliamentary Association, Westminster Hall, Houses of Parliament. 10s. net.

A record of the proceedings of the various parliaments during their last session.

The Journal of Political Economy. February, 1929. (Chicago) The University of Chicago Press.

This number includes articles on: "Gold Economics and Stable Prices"; "McCulloch and Neo-Malthusian Propaganda"; and "The Population Problem since the World War."

The Bankers' Magazine. February, 1929. (Cambridge, Mass.) Bankers' Publishing Company, 465 Main Street. 50 cents.

Special articles in this issue are: "Aviation's Financial Future" and "The Trend Toward Long Term Investments."

OFFICIAL PUBLICATIONS RECEIVED.

The Stock Exchange.

CABLE MANUFACTURING COMPANIES.

In the industrial share market of the Stock Exchange there is a select group of three companies whose shares, judged on a dividend yield basis, seem dearly priced. But good things are never cheap, and the companies concerned occupy privileged and unassailable positions in the industrial world. We refer to the three cable manufacturers —Callenders Cable and Construction, British Insulated Cables, and W. T. Henley's Telegraph Works.

These three companies have avoided the pitfalls of a general electrical engineering and manufacturing business, and have confined themselves to the manufacture of cables and electrical wires. Callenders has large works at Erith, Kent, where it manufactures heavy electric cables for lighting, power and telephones; it also owns the whole of the share capital of the Anchor Co., which has extensive works at Leigh in Lancashire for the manufacture of rubber insulated cables, and is largely interested in the Okonite-Callender Cable Co., one of the leading manufacturers of cables in the United States. British Insulated also confines itself to cable manufacturing, having long ago disposed of its telephone manufacturing business to the Automatic Telephone Manufacturing Co., in which it holds an interest. W. T. Henley's Telegraph disposed of its tyre business in 1918 to Henley's Tyre and Rubber Co., which it still controls. Callenders and British Insulated have, however, made considerable investments outside their own business, notably in electric light and power companies, for whom they manufacture cables and wires. For instance, Callenders Cable hold shares in the Lancashire Electric Light and Power, Scottish Power, South Wales Power, Yorkshire Electric Power, and abroad in Sociedad Anon. de Fuezas Electricitas, while British Insulated has holdings in the Midland Electric Corporation (whose 5 per cent. debenture stock it guarantees) and the Electric Supply Co. of Victoria, which it controls. Unfortunately, neither Callenders nor British Insulated distinguishes in its profit and loss account between income derived from manufacturing and that derived from dividends on investments.

The manufacturing position of the three cable companies has been cemented by the close working agreement signed in June, 1927, providing for collaboration on the buying and marketing side of the business, as well as in research. A year ago the chairmen of the three companies were saying that considerable economies in cost had already been secured, and that many improvements in design and manufacture, through collaboration in research, had been made. The full benefits of this close working arrangement should begin to be realised in the accounts which are now shortly to be presented. It is not impossible that collaboration may eventually develop even more closely. In the meantime, each company is, no doubt, taking an agreed share of the orders received under the national scheme for electrical development.

The Stock Exchange has been somewhat hasty in anticipating a big increase in the profits of the cable manufacturers as a result of the Government's plans for the linking up of existing generating stations. There has been considerable delay in giving out the contracts for what is known as "the over-head grid" and it is only this year that the cable manufacturers' accounts will begin to show the benefit of this work. The earnings of the three companies in the last three years reported, which are given in the annexed table, do not therefore include any profits directly attributable to the national electrification scheme.

A study of these figures reveals the secret of the attractiveness of the cable manufacturers' shares. The capital in each case is small in relation to earnings and the dividend policy is conservative to a degree, although it is more liberal in the case of Henley's than of the other two.

	Callenders.	British Insulated.	Henley's.
	£	£	£
Loan capital	300,000	700,000	150,000

** Since increased—*see* later.
* Net profits after depreciation and income tax in all cases.
† Year ended 31st March, 1926, 1927 and 1928 respectively.

Callenders is earning twice as much on its ordinary share capital as it is paying out in dividends, British Insulated $2\frac{1}{2}$ times as much, and Henley's nearly $1\frac{3}{4}$ times as much. Callenders carried forward an amount equal to 59 per cent. on its ordinary capital, British Insulated, 23 per cent., and Henley's, 82 per cent. These impressive figures suggest that a distribution of bonus shares may be appropriate, sooner or later. Callenders declared a capital bonus of 100 per cent. in 1917 and $33\frac{1}{3}$ per cent. in 1925, British Insulated one of $33\frac{1}{3}$ per cent. in 1925, and Henley's one of 100 per cent. in 1918.

The last balance sheet figures may be examined with this possibility in mind:—

	Callenders.	British Insulated.	Henley's.
	£	£	£
Ord. capital	800,000	1,333,333	650,000
Net current assets	1,170,113	1,023,135	831,426
Net total assets	2,154,136	2,843,547	1,746,690
Book value of ord. shares ...	£2 13s. 11d.	£2 2s. 7d.	£2 13s. 7d.

The "net current assets" are arrived at after deducting from cash, debtors, bills receivable, work in hand and stocks, *i.e.*, current assets, all creditors and bills payable, *i.e.*, all current liabilities. The book values, that is, net assets belonging to the ordinary shares after paying off debenture and preference capital, represent a very conservative valuation of the companies' ordinary shares and do not, of course, take into account hidden reserves contained in the item of investments or property and plant. The next table suggests that the Stock Exchange is, quite rightly, valuing the ordinary shares, not on a dividend yield, but on an earnings yield basis:—

	Price.	Yield on Earnings.	Yield on Dividends.
Callenders	87/0 (old)	6·98%	3·45%
British Insulated ...	94/6	8·61%	3·17%
Henley's	120/-	6·95%	4·17%

From the point of view of yield on earnings, British Insulated is the cheapest share of the three. The ordinary share capital of Callenders has just been increased by the issue privately of 130,000 ordinary shares. This issue was made to provide for the Company's quota of payments in respect of the purchase by it and certain associates of substantially the whole of the share capital of an old-established company engaged in a similar business. These new shares are quoted at 83/- and, having regard to the fact that they rank for dividend from the beginning of 1929,

are relatively cheaper than the old ordinary shares at 87s. The highest and lowest prices for the shares in the last four years are shown in the next table :—

	1925.		1926.		1927.		1928.	
	High.	Low.	High.	Low.	High.	Low.	High.	Low.
Callenders	69/8	55/–	86/–	62/9	85/7	66/–	95/–	76/6
British Insulated	76/10	55/–	72/–	56/–	86/–	66/3	85/–	78/9
Henley's	70/–	56/–	89/9	69/4	5⅝	84/9	119/6	100/6

The accounts and balance sheets which we have been examining relate to the periods ended December 31st, 1927, except in the case of Henley's where the date is March 31st, 1928. In another month the 1928 reports for Callenders and British Insulated will be published, and will probably not show any appreciable increase in profits (in the case of Callenders, probably a decline) on account of the delay in proceeding with the national electricity development schemes. But the prospects for 1929 earnings are distinctly more promising.

The strength of the cable manufacturing companies' position in the long run, from the investor's point of view, is two-fold. On the financial side, having consistently followed a conservative policy for many years past, they have built up a position which, for real ultimate strength, is surpassed by few, if any, other companies whose shares are dealt in on the Stock Exchange. On the manufacturing side they are engaged in a compact branch of a trade ancillary to one of the most progressive of the "new" industries of Great Britain, and would seem already to have "rationalised" their production, with satisfactory results. The price of the shares naturally takes these facts into account, and the investor must inevitably be influenced by them in coming to a decision as to their attractions at the present level.

AMERICAN INTEREST IN BRITISH SECURITIES.—I.

The tendency of American investors and financial interests towards increased participation in British securities has recently been evidenced by such factors as the passing under American control of British public utility concerns in South America, and even in Great Britain ; the growth in the list of British company shares "traded in" in New York ; and the increasing readiness of the more speculative side of the British market to take its cue from the way New York "comes over." The interlocking of the two markets, once initiated, is obviously destined to go to considerable lengths, and to have far-reaching effects. In the following articles our New York correspondent examines the scope and importance of the movement, from the American point of view. Its evolution and present position are described below ; a later article will analyse the economic forces which have provided the main impetus, and are likely to ensure the permanence of the new development.

THE beginnings of the movement towards American participation in foreign finance go back to the period of the war, when, along with the homeward movement of American securities held in England and other European countries, the New York Stock Exchange listed as a temporary expedient the shares of De Beers Consolidated Mines, Rand Mines, the Royal Dutch Company, and Shell Transport and Trading. These listings were subject to renewal annually. With the exception of these shares, however, and of an Anglo-French loan of $500,000,000, American investors had little opportunity to buy British securities until October, 1927, when the New York Stock Exchange adopted listing regulations that standardised trading in foreign shares with all the convenience and elasticity of domestic bearer issues. The growth of the New York market in foreign securities dates from that time. The first shares to be listed under the new rules of the Exchange were Debenham's Securities, Limited, each American share representing the deposit of twelve ordinary shares.

At the end of 1928 there were listed on the New York Stock Exchange 6,030,985 shares of foreign companies, British shares accounting for roughly one-third of the total. The New York Curb market, however, has been by far the most active field for the exploitation of recognised foreign securities. At the end of last year 6,317,926 shares were listed on the Curb. During January of this year, a further 50,000 shares were added to the Stock Exchange list, and no less than 3,743,000 to the Curb. The above figures do not include Canadian and Latin-American securities. All listings are in the form of "American shares," *i.e.*, the receipts of a trust company issued in exchange for the original certificates deposited either in New York or at a foreign office.

The success of the importation of shares in the Ford Motor Company, Ltd., late last year, was the signal for many ventures by American capitalists, who bought up blocks of foreign shares, had trust company receipts issued, and created an international market by public offering of the "American shares." Special attention has now been turned to African shares. In the markets outside the two principal Exchanges activity has developed in such issues as Rhodesian Anglo-American Company, in which the Newmont Mining Company has an interest; in Rhodesian Selection Trust, N'Changa Copper Mines and Bwana M'Kubwa. Meanwhile, the flow of American capital into the oil, copper and public utility fields of South America is increasing. The recent acquisition of River Plate Telephone from its British owners by the American-owned International Telephone and Telegraph Company is an example of this tendency. The activities of United States interests are also marked among such companies as American and Foreign Power, controlled by the Electric Bond and Share Company, which has just acquired the Atlas Light and Power holdings. Another American public utility company to forge a link in the chain of American and British capital is Utilities Light and Power, which has announced the purchase of the common shares of the Greater London and Counties Trust, Ltd. (See the *Economist*, February 23, 1928, p. 405.) Another example is the passing of control of Columbia Graphophone from British to American hands. On the other side of the picture, British and Canadian interests have taken control of International Nickel.

The accompanying tables show the growth of listings and trading activity in British shares on the New York Stock Exchange and Curb market :—

British Shares Quoted on New York Stock Exchange.

Company (American Receipts).	Shares Traded. 1926.	1927.	1928.	Shares on List in 1928.
Columbia Graphophone, Ord. reg.	‡	‡	5,780,000	1,740,000

* Courtaulds and Marconi Wireless traded in 1926, but no figures for turnover available.
‡ No trading recorded.
† Information not available.
NOTE.—Figures for 1927 turnover apply to definitive shares.

Although public taste for investment is now running to stocks instead of bonds, the increase in listings of foreign bonds on the New York Stock Exchange is significant. The following table gives comparisons for recent years, the large addition in par value of bonds on the Exchange last year being mainly accounted for by the listing of approximately $12,000,000,000 of British Government bonds.

	Number of Listings.	Par Value $
January 1, 1925	163	3,881,058,000
January 1, 1926	184	4,410,811,000
January 1, 1927	225	4,848,507,000
October 1, 1927	271	5,350,903,000
August 1, 1928	313	18,138,803,000

The figures in all the above tables carry their own commentary, and certainly suggest that the movement has come to stay.

The incoming Hoover Administration is expected to stimulate the absorption of South American enterprises by United States companies, and the possibility of future supremacy of American capital in this field should be carefully considered by those it is likely to affect.

A MYSTERIOUS "STORES" DEAL.

If obscurantism were made a capital offence, the British company world would be deprived of some hundreds of its most conspicuously successful boards of directors. Whether the benefits of increased publicity might not be worth even so formidable a sacrifice is a question best left to the cynic, but recent events have certainly suggested the desirability of a more open-minded directorial policy towards shareholders when matters are afoot calculated permanently to affect the latters' interests.

A case in point is the acquisition of the Meadow Dairy by the Home and Colonial Stores. Both are old established and highly profitable concerns in the multiple food and provision trades, dating from 1901 and 1888 respectively. Both have been prominent in connection with recent developments in these trades, the Home and Colonial having, in 1924, obtained a substantial interest in the Maypole Dairy Company, while the Meadow Dairy has lately been associated with Liptons in a working agreement designed to retrieve the earning-power of that famous but unfortunate company. The Home and Colonial, at the beginning of last week, had an issued capital of £2,400,000, inclusive of £1,000,000 in £1 ordinary shares, which received 25 per cent. in dividends and bonus in respect of 1928. The Meadow Dairy's paid-up capital is £1,413,625, including £187,875 in 1s. preferred ordinary and £375,750 in 1s. ordinary shares, both of which for the last complete year (1927) received 30 per cent.

Early in February, for reasons not yet disclosed, the Meadow Dairy approached the Home and Colonial with "suggestions for an effective combination of interests," and so rapidly did the negotiations progress that in less than a fortnight the Home and Colonial Company's Secretary was able to issue a notice, with the annual report, of various resolutions designed to give practical effect to an agreement between the two companies. The meeting was held on February 21st, and, an independent motion for an adjournment being lost, it was resolved to split the existing £1 ordinary into five 4s. shares, and to increase the authorised capital by 3,000,000 new 4s. ordinary ranking *pari passu*, except that 775,000 of these shares were to carry ten times the voting power of the remaining ordinary shares. On the Meadow Dairy side it would appear that certain individual shareholders have contracted to sell 1,596,156 preferred and 4,873,051 ordinary shares—representing approximately 42½ per cent. and 65 per cent. of the outstanding total in each class respectively—to the Home and Colonial, on the basis of 5 Home and Colonial 4s. shares for every 21 preferred, and 5 for every 18 ordinary in the Meadow Dairy, the latter's shares being transferred *cum* a final dividend (which is apparently to be 20 per cent.) while the Home and Colonial shares given in exchange are to be *ex* the final dividend and bonus of 17½ per cent.

The first point which strikes the outside observer is the relatively unfavourable nature of the terms offered to the Meadow Dairy shareholders. On the basis of present dividends, every holder of 21 preferred shares who makes the exchange will, in addition to losing his final dividend for 1928, receive only 5s. in in dividends in succeeding years, as against 6s. 3·6d. at present, while the holder of 18 ordinary will receive 5s. against 5s. 4·8d. at present. If the calculation is workep on *earnings*, rather than dividends, per share, the result is as follows :—

	s.	d.
Earnings (1927) on 21 Meadow Dairy preferred	7	7·2
Earnings (1927) on 18 Meadow Dairy ordinary	6	6·2
Earnings (1928) on 5 Home and Colonial 4s. shares	6	1·7

On the basis of the Stock Exchange quotations prevailing in the middle of this week, 21 Meadow Dairy preferred are worth £4 14s. 6d., and 18 ordinary £4 12s. 3d., while five "split" 4s. Home and Colonial ordinary shares (*i.e.*, one existing £1 share) are worth, *ex* 3s. 6d. final dividend, £4 6s. 6d.

From the point of view of the outside Meadow Dairy shareholders, therefore, the terms are clearly not attractive. Why, then, did they prove sufficiently so to the insiders to induce them to enter the merger on such a footing? To return, for the moment, to the Home and Colonial side of the question, it will be found that if (*a*) the newly created "privileged" ordinary shares, with special voting rights, which have a nominal value of £155,000, are taken up by Home and Colonial rather than by Meadow Dairy interests, and (*b*) the whole of the Meadow Dairy shareholders, "insiders" and "outsiders," come in under the terms of the present offer, the issued capital of the Home and Colonial will be £3,151,428. But at last week's meeting the latter's maximum authorised capital was raised only to £3,000,000. Can it be that the Meadow Dairy interests who have contracted to come into the merger, are to receive, in fact, the new "privileged" shares as part of their holding? If the figures are recalculated on this hypothetical basis, it would appear that the interests in question will hold £155,000 out of a total issued capital of £2,996,428 in the Home and Colonial and will have 1,550,000 votes, or 50·1 per cent. of a total of 3,091,428. Does the merger, then, represent, *not* the acquisition of the Meadow Dairy by the Home and Colonial, but the control of the latter by certain interests which already control the Meadow Dairy? The Home and Colonial chairman stated at last week's meeting that the creation of the "privileged" shares "is simply to ensure that the control of the company remains in the same hands as for many years past, and incidentally it will secure the effective working of the joint management proposals," and also declared that the control would not be foreign.

There for the present, the matter rests. In this article we have merely attempted to seek from available evidence an explanation of a somewhat obscure transaction. A full official statement would seem to be desirable.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

TICKET.	ACCOUNT.
March 5.	March 7.

MARKETS opened in quiet though not uncheerful fashion, but on Tuesday took a definite downward turn. To describe the movement as reactionary would be inaccurate; rather, the word went round, and the markets stood fast. Monetary factors were the *fons et origo* of the development, particularly the fear lest an upward movement of the New York Federal Reserve rate should force the hand of the Bank of England. In their pursuance of a cautious policy operators had the double consolation of knowing that they were avoiding the dangers of fishing in troubled waters and were furthering the interests of higher authority.

The week's events naturally provided an unfavourable environment for gilt-edged stocks, and quotations were lower all round. Money was tight in Lombard Street, and though the Bank obtained £413,000 of bar gold in the market, the New York exchange tended to be easier, and a certain uneasiness as to the outlook became general. Most stocks were offered. Four per Cent.

Consols were weak, and Funding Loan lost ground, Five per Cent. War Loan offering, possibly, the most effective resistance to prevailing conditions. Indian loans were dull, and little business was done in Colonial issues.

The Foreign market was, as a whole, less markedly affected. Scattered selling was in evidence from time to time, but quotations showed few extensive changes. A few European issues were inquired for early in the week, but became easier in the absence of sustained interest. Turkish Unified was sold, while among South American stocks Brazilians lost their early support, and Peru Corporations were on offer. Chinese loans developed a dull tendency, but Japanese generally held their ground.

Though no considerable pressure to sell Home Railways was observable, the market remained in a dispirited condition, and was not at all assisted by the publication of traffic returns showing a fresh fall in gross revenue as compared with the corresponding week of 1928. Great Western lost ground, but all the group lines were easier in tendency, while little interest was shown in Underground stocks. The course of Foreign Railway values was uneventful. The Argentine lines failed to respond to fairly satisfactory traffic figures. Leopoldina, however, had a better tone, and San Paulo was higher on the week. Beira Railways were purchased at one time, on the dividend statement. Canadian Pacifics were quiet in the absence of confident buying over the water.

A general tendency towards reduced commitments was very markedly in evidence in the industrial markets. New York came over with an appearance of strength after the holiday, but the movement lacked stamina, and fears of unpleasant monetary possibilities produced a dull inertia. Foreign gas stocks came in for somewhat extensive profit-taking after last week's activity, and a recession took place in electric lighting issues. Match shares were sold, but the gramophone group made a partial rally after early weakness. International Nickel followed a broadly similar course. A few strong features stood out amidst the general unsettlement, motor shares being firm at one time, though Rolls-Royce could not hold the ground gained on the report. Napiers were prominent in view of the return of 15s. of capital to ordinary shareholders, and Tilling-Stevens on the preference arrears scheme. Courtaulds were better, and British Celanese slightly improved, but textiles as a whole were inactive. Margarine issues continued to attract a certain interest. Movements in brewery shares were adverse, and among shipping concerns P. & O. units came on offer. The insurance market was reactionary, and an easier tendency obtained in bank shares.

Rubber shares opened in brisk fashion, but were subsequently inclined to droop under the dual influence of a temporary halt in the rise of prices for the commodity and the omnipresent dullness of the House. The market remained, however, a centre of decided interest. A limited turnover was again reported in tea shares, with an easy tendency persisting for all but the rubber-cum-tea concerns. Oil shares were active on Monday, with rumours current of an agreement in the matter of the distribution of Russian petrol. The leading issues, however, quickly met with profit-taking, though the tone subsequently improved on a very moderate buying movement.

Kaffirs showed the same impassivity in the face of discouraging general conditions as during the Stock Exchange activity of earlier weeks, prices holding, for the most part, in the absence of any open speculative position, though business was reduced to meagre dimensions. Chartered lost ground on profit-taking before and after the meeting. Rhodesians marked time rather than halted, attempts to exploit current conditions meeting with no success. Tin shares had an unsettled appearance, reflecting the irregular course of prices for the metal, but the continued strength of copper was a bull point for Tinto and Tharsis. In the Western Australian section, the week's chief event was the announcement of the taking over of the Golden Horse Shoe by Lake View and Star.

LONDON ACTIVE SECURITIES.

The following tables show the movements of the week in the more active securities of the various markets :—

FOREIGN STOCK EXCHANGES.

NEW YORK.

Buoyancy in the share market continues, and prices in most sections have now fully recovered the loss which followed the break, early in the month, due to the Reserve Board's " warning." The outstanding feature is the sharp rise in copper shares, following the successive increases in the price of the metal, which is now 19½ cents per lb., and is expected to rise further. Steel shares are also good, stimulated by the capital readjustment programme of the United States Steel Corporation, and by higher prices. Motor shares are also reviving with a record output in hopes of heavy spring sales. Shares are encouraged by the growing belief that no change will be made in the New York discount rate, and by the fact that the market is becoming inured to high discount rates. End-of-the-month demands sent call money up to 10 per cent. at the close, but failed to halt speculative enthusiasm, and brokers' loans again took an upward course with a rise of $30 million. Bonds gradually sank, with the best railroad descriptions at the lowest level for several years, on the anticipation of a long period of comparatively high money rates.

PARIS.

A number of important companies have recently decided to increase their capital, and this will probably have the effect of withdrawing considerable funds off the markets for a time. These happenings were discounted months ago; once again, fact played false with theory, and the stocks hardly held their own, especially since the bear interest, on the eve of the declaration of options, tended to exploit the uncertainties of the political situation and the international monetary difficulties. The general tendency has been one of hesitation, and the majority of stocks (banks, coal, electricity, chemicals, etc.) have lost a certain amount of ground. Suez is well placed. Rubbers have advanced appreciably, and copper shares have been very firm, Boléo and Tharsis in particular.

BERLIN.

A week ago the Bourse closed with a slight recovery, due in part to foreign buying, but the new week began with a heavy and almost general decline, which was not checked by the intervention purchases of two leading " D " banks. Bemberg and Polyphon dropped sharply, and Farbenindustrie touched the low level of last March. Nervousness was caused by a fresh advance in the private discount rate. Tuesday opened with a moderate recovery, but in the absence of a buying public prices later declined. On Wednesday and Thursday a more substantial recovery took place, most marked in potash stocks, Polyphon, and others which had declined badly earlier in the week. Buying on Paris, Vienna and Prague orders was reported.

AMSTERDAM.

Business on the Bourse was restricted owing to the higher money rates, and the tendency was irregular, industrials weakening. Rubbers only, on the better prices for the commodity, were firm. Interest in oils centred chiefly on Royal Dutch, as a result of higher 1928 production. Sugar shares were steady, but shipping irregular, and tobaccos received little attention. Later in the week the market became more settled.

The money market was steady.

INVESTMENT NOTES.

Home Railway Stocks.—The London and North-Eastern Railway having announced its decision to pay the 2nd preference dividend for the year 1928 in full, and a nominal amount of ¼ per cent. on the preferred ordinary (as against ⅜ per cent. a year ago), the trustee character of the company's fixed charges is maintained. No draft is being made on reserves, " economies " of approximately £2,900,000 in working expenses having been effected —a creditable performance in a year of unusual difficulties. We hope next week to publish the first of our usual series of articles on the position of the great British railways, as evidenced by the detailed figures given in the reports for last year. Meanwhile, an examination of present Stock Exchange values, as compared with those prevailing after the dividend declarations of earlier years, reveals many points of interest. The following table shows the price and yield of the leading " senior " securities of the four group lines, at the end of February, in 1926, 1928, and 1929 respectively (the figures for February, 1927, are omitted, since they reflect the results of the abnormal coal-stoppage year, 1926) :—

Note.—The above prices include accrued interest, which has been deducted in calculating the respective yields. * Ex dividend.

Despite the difficulties of the recent months, very slight depreciation has occurred in the value of debenture and guaranteed stocks. In other words, the position of trustees who hold fixed charge securities is much happier than might have been expected, particularly as rates for money generally are somewhat higher to-day than three years

ago. In the case of preference stocks the fall in values is more noteworthy, except as regards the Great Western and the Southern. The position as regards ordinary stocks is as shown :—

ORDINARY STOCKS.

	End Feb., 1926.			End Feb., 1928.			Present Time.		
	Total Dividend.	Price.	Yield.	Total Dividend.	Price.	Yield.	Total Dividend.	Price.	Yield.

L.N.E.R. 5% Pref.	5	56½	8 17 0	⅜	38	1 0 0	½	23½	1 1 6
L.N.E.R. Deferred	1	18¼	5 6 9	Nil	15½	Nil	11¼	10⅞	Nil
G.W.R. Consol ...	7	90	7 15 6	7	102½	6 16 6	5	82	6 2 0
S.R. Prefd.	5	79	6 6 6	5	79	6 6 6	5	76	6 11 6
S.R. Defd.	3¼	45	7 15 6	2	35	5 14 3	2	325	6 5 0

The figures reveal the significant fact that, extensive as has been the fall in values (again with one or two exceptions) since 1926, the drop has not been fully proportionate to the decline in dividends, so that the yield obtained, in the majority of cases, is actually *lower* than it was three years ago. The dividends of that period were unrepresentative of true railway earning power, since they were paid to a significant extent by drafts on reserves—a policy which has, happily, been avoided during the last two years. It will be observed, finally, that, all through the list for the present year, Great Western stocks give a smaller yield (*i.e.*, stand at a higher average level) and North-Eastern a greater yield, than those of the other groups (apart from North-Eastern ordinary stocks, to which special conditions apply). Otherwise the average current yield on home railway debentures may be put at about 5–5¼ per cent.; on preference stocks at 5½–5¾ per cent.; and on ordinary stocks at 6–6½ per cent.

The Yield on American Common Stocks.—In the *Economist* of last week (page 406) we described various index numbers of American security values which we hope to publish regularly, week by week, in our columns, by the courtesy of the Standard Statistics Company, Inc., of New York and 13, Copthall Avenue, London. The figures for the current week will be found on page 455 of this issue, in the section devoted to Foreign Stock Exchanges. A further subject of interest to those desirous of keeping in touch with security market trends is that of variations in the dividend yield obtainable on a representative holding of stocks. It is generally understood that the average figure is appreciably lower in America than in Great Britain, and further, that the level in the former country has lately been declining—in other words, that the recent increase in stock values has outrun that in earning power. How far is this true? An approximate answer can be given by reference to a further index prepared by the Standard Statistics Company, which shows the dividend yield on 50 American common stocks during the last few years, based on the closing prices of Thursday in each week. The recent course of this index is shown :—

DIVIDEND YIELD ON 50 INDUSTRIAL COMMON STOCKS.

Date.	1927.		1928.		1929.	
	Lowest.	Highest.	Lowest.	Highest.	Jan. 24.	Feb. 21.
Average yield per cent.	4·21	5·12	3·32	4·42	3·33	3·90

The figures suggest that the fall in yields has been considerable, a "middle" figure of 4·66 per cent. in 1927, comparing with 3·87 per cent. in 1928. Exact comparison of American and British levels, in this respect, is not possible in the present state of knowledge, but a certain interest attaches, in a broad way, to the results shown below. The British index is our own, and is based on the yield obtainable at various dates, on an investment of £1,000 in each of 25 representative and "active" industrial ordinary shares :—

	American Common Stocks. End of				British Ordinary Shares. End of			
	Mar.	June.	Sept.	Dec.	Mar.	June.	Sept.	Dec.
	%	%	%	%	%	%	%	%
1926	5·00	5·17	4·76	4·88	6·28	6·36	6·18	6·14
1927	5·07	5·11	4·31	4·22	5·91	5·64	5·40	5·31
1928	4·03	4·11	3·72	3·44	5·31	5·31	5·28	5·16

No deduction for tax has been made in either case. Not only would the yield on a representative British holding appear higher than on an American, but the gap has recently tended to widen, the American index having fallen more rapidly than the British. We hope to indicate future changes in the American figures in the column to which reference has already been made.

Sir Basil Blackett on the War Loan.—The annual banking supplement of the *Financial News* was noteworthy for an article by Sir Basil Blackett, lately appointed a director of the Bank, on the problem of dealing with the Five per Cent. War Loan, which, he says, deserves more thorough examination and more general attention than it is receiving. We wholly concur, and it is well that men of such authority as Sir Basil Blackett should give prominence, as this article lucidly does, to the desiderata and the difficulties. Disclaiming the intention of suggesting or even discussing particular proposals, he presses for thorough recognition of two facts, that a reduction of ½ per cent. in the rate of interest on this loan is worth over £10 million a year to the Exchequer, and that the mere existence of this 5 per cent. loan is responsible for adding at least ½ per cent. to the cost of all new borrowing in the London market. The latter statement cannot be directly proved, but we would agree with him that it is not open to question, and that the cost of borrowing in London affects the cost in every other important market in the world; in fact, to convert this loan on to cheaper terms might help indirectly to stimulate industry all the world over. The obstacles in the way of conversion do not need to be reiterated here; Sir Basil suggests that the rest of the difficulties are small compared with those that arise purely from the magnitude of the loan and the proportionately tremendous risk which the Treasury would have to face whatever action were taken. But it concerns everyone that after June 1st next the Government will be paying a higher rate than is obligatory under the terms of the original contract upon more than £2,000,000,000 of the National Debt, besides losing a not inconsiderable sum yearly owing to interest on War Loan not being subject to tax deduction at the source. And, in Sir Basil Blackett's opinion, even holders of the loan would gain on balance as citizens and taxpayers, not to speak of the benefit to British industry, if the interest rate on this part of the debt could be reduced.

Bulgarian Finances.—The Information Section of the League of Nations has published official statistics of the Ministry of Finance of Bulgaria which shows that for the nine months period, December 31, 1928, there has been an appreciable increase in the budget receipts over the corresponding period of 1927. The actual receipts proved to be 6·1 per cent. higher, while the actual expenditure was 3·8 per cent. lower than the budget estimates in each case. As a surplus balance was allowed for in the estimates, it would appear that the Bulgarian budget was drawn up on conservative lines. It may be recalled that the special security assigned to the Bulgaria 7½ per cent. Stabilisation Loan of 1928, which was issued under the auspices of the League of Nations, was the receipts obtained from all import and export duties, which were estimated on the basis of last year's figures to cover the service of the loan over four times. If at any time the total yield of these revenues fell below 150 per cent. of the annual sum required to meet the service of the loan, the Inter-Allied Commission undertook to release, at the request of the League, such additional revenues as might be sufficient to bring the yield up to 150 per cent., but it would appear

that the improvement in Bulgarian finances might allow the 7½ per cent. Stabilisation Loan to stand, as it were, on its own legs. This would be another achievement of the League of Nations in the work of reconstructing the finances of belligerent Europe.

The Underground and the Petrol Tax.—At the general meeting of the Underground group of railways, Lord Ashfield, through his deputy, referred to the question of motor taxation, which in view of the coming Budget has become the subject of much discussion. The petrol tax of 4d. a gallon, according to Lord Ashfield, costs the Underground group nearly £375,000 in a full year, in addition to which the licensed vehicle duty costs £425,000, making a total of £800,000, which represented 5·35 per cent. of the gross traffic receipts of the Underground group, or a much greater percentage if the omnibuses were taken separately. The present taxation represented a charge for the Underground of 1·2d. per mile run. For every 14 passengers carried in an omnibus one is required to meet the burden of taxation. The latest figures available for the cost of maintaining roadways in the London area indicated an average cost of under £1,000 a mile, yet the contribution made through taxation by the London General Omnibus Company and its associates in 1929 would amount to over £900 per annum per mile of roadway run over. Lord Ashfield concluded that his group paid more than their fair share of the cost of the roadways which they used, and that the pedestrians, cyclists, horse vehicles and motor vehicles of all sorts other than motor omnibuses, not to mention gas pipes, water pipes, electric cables and telephones, all used the roadways practically for nothing if the money contributed by the Underground group was directly devoted to the maintenance and upkeep of those roads. Lord Ashfield remarked that the real burden of taxation must fall upon the ultimate consumer, so that if the price of petrol were to rise some adjustment in omnibus fares would be unavoidable. The question, is perhaps, more urgent than Lord Ashfield imagines. In a pamphlet on "The Price of Petrol," by Mr. E. H. Davenport, which has just been published by the London General Press, it is pointed out that the over-production of crude oil and a fall in crude oil prices do not always lead to a fall in petrol prices. Petrol is not the only product of the crude oil. If the market for other products is weak and their prices fall, petrol will have to be increased in price to cover the deficiency. This is happening to-day with regard to fuel oil, which has fallen considerably in price, and is now selling at a very low level. While coal remains cheap it cannot be expected that the price of fuel oil will recover. Petrol will therefore have to bear the burden of the deficiency on the sales of fuel oil, for the total receipts from all oil products must somehow cover the total cost of refining, producing and marketing the crude oil. Read in conjunction with Lord Ashfield's views on the subject of motor taxation and omnibus fares, this argument in "The Price of Petrol" does not make the outlook too promising for the travelling community.

The above was written before the increase in the price, which was actually announced as we went to press.

Courtaulds.—The 1928 report may most appropriately be read in the context of the chairman's recent letter to "The Times," on which we commented in our issue of February 16th (p. 351). The actual results for the last three years are tabulated below. Incidentally, the report shows that no allocation has been made this year to special reserve before striking profits, so that the real increase in earnings is £250,000 less than the apparent figure:—

Years ended December 31.	1926.	1927.	1928.
	£	£	£
Profits	3,840,791	4,585,921*	5,171,997
Preference dividend	400,000	400,000	400,000
Ordinary { Earned, after tax	28·6%	34·8%	(a)19·8%
Ordinary { paid, tax free	22½%	25%	(b)15%
Ordinary { amount	2,700,000	3,000,000	3,600,000
To general reserve	750,000	1,000,000	1,000,000
Increase or decrease in carry-forward	− 9,209	+ 185,921	+ 171,997

* Excluding £250,000 carried to special reserve.
(a) Equivalent to 39·7% on old capital. (b) Equivalent to 30% on old capital.

The balance-sheet figure for stock-in-trade has gone up from £2,058,671 to £2,283,903, in spite of a substantial price cut last December. "During the last quarter of the year," says the report, the home market "was disturbed by very low offers from new producers, coupled with a similar state of affairs on the Continent, and stocks increased" in consequence. The assets side of the balance-sheet shows the all-round increase in earning assets that one has come to expect of this company. Cash has fallen from £3,532,325 to £1,634,709. The cautious phraseology employed in Courtalds' reports is proverbial, and though favourable reference is made to the United States of America and Canada, the state of Continental markets is described as chaotic. In this country the recent price reduction, though "favourably received" (whatever the phrase may mean), has not yet resulted in increased business. The shares were up to 5 at the time of Mr. Courtauld's letter; just before the appearance of the report they were being dealt in around 4½, and are now down to 4⅜, at which they yield £3 11s. 6d. per cent. free of tax.

Selfridge.—The full accounts for 1928-9 are less favourable, in one respect, than might have been hoped for. Under Selfridge's guarantee of a 25 per cent. dividend on 450,000 ordinary £1 shares of William Whiteley, Limited (for fifteen years from February, 1927), some £46,105, approximately two-fifths of the maximum liability, actually fell to be paid. Consequently, though allocations against depreciation and for writing down of balance-sheet items were diminished, and nothing was put to reserve, a small draft had to be made on the £148,950 carried forward in order to maintain the dividend on the privately held Selfridge ordinary shares at 20 per cent. The cover on both classes of preferred shares was slightly reduced :—

Year ending January 31.	1926-7.	1927-8.	1928-9.
	£	£	£

A summary of the balance sheet, which shows no noteworthy changes except a reduction from £149,479 to £90,575 in the cash holding, will be found on a later page. As to the future, a good deal depends on the contingent liabilities of the company. The guarantee on the ordinary shares in Selfridge Provincial Stores comes to an end in November of this year. The latter closes its financial year on August 31st, so that from the time when its last report was issued the guarantee had another 14 months to run, but as the Provincial dividend was covered 1·3 times by earnings last year the parent may escape further liability. The case of Whiteley's, however, is not quite on the same footing. The 1928–9 report of Whiteleys shows that profits, less depreciation charges, have increased from £106,570 to £142,551, though the latter included an unstated sum transferred from reserves no longer required. The apparent earnings amount to 16⅜ per cent. on the ordinary shares, leaving £38,753 to be provided by Selfridge's during the current year. Though this is better than last year, and though, according to the directors, Whiteley's business has shown progress in all sections and the expenditure on improvements and maintenance of property has been deliberately on a larger scale than hitherto, it is possible that Selfridge's may still have to meet a certain charge for some time. It happens that Whiteley's ordinary shares and Selfridges,

preferred ordinary at their present prices of 3½ and 1 13/32 respectively give almost identical yields, viz., 7⅛ per cent., less tax. As regards the status of the two securities, however, the investor may find it of interest to consider whether payments by Selfridge's to Whiteley's under the guarantee would not take precedence, if necessary, over dividends on the former's preferred ordinary shares.

New Capital Issues in February.—In the table below we show the new capital raised in London by issue to the public or shareholders in February, 1929; comparative figures for the previous month and for the corresponding months of 1928 are given, together with the monthly averages for preceding years :—

(000's omitted).

February, 1929..	950	22,427	372	2,005	25,754

The £950,000 obtained by the British Government consists entirely of National Savings Certificates, new sales of which have exceeded encashments every week since the beginning of the year. Issues exceeding £2 million in each case were made by Debenhams, J. Sears & Co., and the London Power Company, but no less than £9,719,000 of the United Kingdom total must be credited to investment trust companies. No corporation borrowing took place. The Roumanian stabilisation and development loan supplied the bulk of the £2,005,000 raised for foreign countries.

CAPITAL ISSUES.

PROBABLY by reason of the general dullness of the City, the week was a light one for prospectus issues, which amounted to £3,152,470, bringing the total for the year to date up to £68,675,978, excluding conversions. The corresponding figures for last year were £7,248,250 and £144,167,729. Issues totalling £685,080 to shareholders only were also announced, and new securities that came on the market by way of advertisements "for information only" accounted for a further £1,259,617 on the basis of the opening price. Trust companies were represented as usual, this time by the *Clyde and Mersey Investment Trust*, on the board of which Glasgow names were prominent. £1 million of the total of £1¼ millions had already been privately placed. Three debenture issues of £150,000 each were made by the three *Scottish National Trust* companies following their latest issues of share capital. The first of the three issues, apparently, is not to be dealt in on the London Stock Exchange. Bovril, Limited, offered first preference shares in the *Argentine Estates of Bovril*, the dividend for six years being guaranteed by the parent company. No dividend was paid in the last financial year on the two classes of junior shares. *Petroleum Refineries* proposes to exploit a licence obtained from Detroit and to set up a factory to produce motor spirit on the Humber. The prospectus includes a profit estimate calculated on the assumption that the plant will work a 24-hour day for no less than 340 days in the year. The failure of some speculative issues to obtain full subscription contrasts sharply with the eagerness shown by subscribers a few weeks ago. *Saint Raphaël Casino and Hotels* involves a double gamble. *Ice-Rinks* would seem to have been designed to seize a climatic opportunity; its programme extends to "London and leading British and Continental resorts," and a start is being made by the purchase of land at Golders Green. The *Guinea Portable Gramophone* is to be "almost" dust-proof and rain-proof; 3,000,000 shilling shares were offered to the public, the issuing house obtaining an option on no less than another 1,200,000. Certain aspects of the issue aroused debate in the daily Press. *Malaysiam Tin* is entering an admittedly speculative field; one of two mines acquired is already in production, but the mining rights on another estate which is to be purchased have not yet been procured. *Sphinx Electric* draws a rosy picture of the future of its patent products, but gives only combined *gross* profits for the last five years of three businesses, two out of which are being acquired.

ISSUES OF THE WEEK.

By Prospectus or Offer of Sale.

Net total previously recorded, £64,538,428.

Clyde and Mersey Investment Trust, Limited.—Issue at par of 125,000 (out of 200,000) £10 shares, to be converted when fully paid into £6 of 5 per cent. preference and £4 of ordinary stock.

Scottish National Trust Company, Limited; Second Scottish National Trust Company, Limited; Third Scottish National Trust Company, Limited.—These three investment trust companies were incorporated in 1924, 1925 and 1926 respectively. Issued capital in each case consists of £360,000 5 per cent. cumulative preference stock, £240,000 ordinary stock, and 15,000 £10 shares convertible into £90,000 preference and £60,000 ordinary stock. Each is now issuing £150,000 5 per cent. debenture stock at 96, redeemable in 1950–5, 1951–6, and 1952–7 respectively, ranking with some £600,000 already issued.

Argentine Estates of Bovril Limited.—Offer for sale at par, with guarantee of dividend up to 1935 by Bovril, Limited, of 311,470 £1 6 per cent. cumulative preference shares. The Argentine company farms a group of estancias stocked with cattle, together with meat-preserving factories. Issued capital consists of 188,530 £1 6 per cent. cumulative preference, 460,000 £1 8 per cent. cumulative preferred ordinary, and 482,028 10s. ordinary shares, together with £198,700 5¼ per cent. first mortgage debentures and £200,000 6 per cent. redeemable debenture stock. Profits for 5 years ending September 30, 1927, averaged £69,743. Proceeds of present issue will be available for further working capital and redemption of debentures.

Petroleum Refineries, Limited.—Issue at par of 700,000 10s. 8 per cent. participating preferred ordinary and 700,000 (out of 2,400,000) 1s. ordinary shares, the former entitled to two-fifths of the surplus distributed profits after payment of 8 per cent. on the ordinary. The company acquires a licence to produce motor spirit from petroleum oils or other raw material under certain patents, options to acquire a freehold site and an existing sales organisation for £59,000 in all, and the benefit of a contract to construct plant at a cost of £150,000. The total purchase consideration is £72,000, payable as to £25,000 in cash and £47,000 in ordinary shares. Working capital, after payment for site and plant, is estimated at £70,000. A further 700,000 1s. shares are under option at par.

Saint Raphaël Casino and Hotels, Limited.—Issue of 700,000 (out of 1,000,000) 5s. 8 per cent. cumulative participating preference shares at par and 700,000 (out of 1,000,000) 1s. deferred shares at 2s., the former entitled, after payment of 20 per cent. on the deferred, to half the surplus distributed profit, subject to a maximum additional dividend of 10 per cent. The company acquires control of two French companies owning a casino and a hotel at St. Raphael. The 95 per cent. interest to be acquired represents a valuation of approximately £204,400. Purchase consideration is £182,435 in cash and £10,000 in deferred shares. Working capital is estimated at £35,000. The remaining 100,000 1s. shares are under option at par.

Ice-Rinks, Limited.—Issue at par of 850,000 (out of 1,320,000) 5s. shares. The company will erect, finance, and manage ice-skating rinks in London and British and Continental resorts. A freehold site at Golder's Green is acquired for the sum of £22,500 in cash, and 150,000 shares are issued as fully paid to the promoters. Working capital is estimated at over £20,000.

Guinea Portable Gramophone Company, Limited.—Issue at par of 3,000,000 (out of 5,000,000) 1s. ordinary shares. The company acquires an invention embodied in a British patent, with patent rights for nine foreign countries. The purchase consideration is £75,000, payable as to £35,000 in cash and £40,000 in shares. Working capital is estimated at £65,000. The remaining 1,200,000 shares are under option at par.

Grace National Bank
Hanover Square, New York, U. S. A.

Commercial Banking. Execution of orders in New York for European banking correspondents.

Special Representative

148 Leadenhall St. London, E. C. 3.

Malaysiam Tin, Limited.—Issue at par of 460,000 (out of 1,000,000) 5s. shares. The company acquires tin-bearing properties in the State of Perak. The purchase consideration is £85,763 in cash, £20,000 in shares, and an option on a further 20,000 shares at par. Working capital is estimated at £10,000. The company also has an option on another area.

Sphinx Electric, Limited.—Issue at par of 290,000 (out of 300,000) 5s. 10 per cent. participating preference and 580,000 (out of 1,500,000) 1s. ordinary shares, the former entitled to one-quarter of the surplus distributed profits after payment of 10 per cent. on the ordinary. The company acquires an established business of electrical apparatus manufacturers, together with the share capital of a similar business in the Irish Free State, valued in all at £88,700. The purchase price is £88,000 (including £34,000 for goodwill), payable as to £47,000 in cash, £2,500 in preference and £38,500 in ordinary shares. Gross profits are given over five years. Working capital is estimated at £42,000. The remaining 150,000 ordinary shares are under option at par.

Particulars of the following have been issued for public information only in connection with Stock Exchange "introductions" :—**English and New York Trust Company, Limited** issued capital £45,000 5 per cent. cumulative preference stock and £300,000 ordinary stock; incorporated in 1912, and objects now limited to those of an investment trust company; £250,000 5 per cent. debenture stock, 1979, has been placed at 96½. **Nevett, Limited**; issued capital 79,487 £1 shares; incorporated in 1918 as a private company of bookbinders, etc., and converted into a public company in 1920; recent dividends have been: 1925-26 and 1926-27, 6 per cent.; 1927-28, 7½ per cent. **Hungarian General Savings Bank, Limite** issued capital 400,000 shares of 50 pengö each; the bank was founded in 1881, and carries on all branches of banking business. **British Indestructo Glass, Limited**; issued capita £95,000 in 2s. shares; acquires the exclusive licence to manufacture a certain type of glass in England, Scotland, and Wales; purchase price is $20,000 in cash and £45,000 in shares; a further 540,000 shares are under option at 3s.

OIL OUTPUTS.

THE MEXICAN EAGLE OIL.—The production for the week ended February 16, 1929, was 130,000 barrels.

VENEZUELAN CONSOLIDATED OILFIELDS.—Production for week ended February 23, 2,779 barrels (397 tons).

BRITISH CONTROLLED OILFIELDS, LIMITED.—Production for the week ended February 20: Venezuela, 35,590 barrels; Trinidad, 19,834 barrels; total, 55,424 barrels.

THE VENEZUELAN OIL CONCESSIONS, LIMITED, announces that its production for the week ending February 23 was 124,210 metric tons (previous week ended February 16, 128,400 metric tons). In addition to this output the company has a substantial quantity of potential production in completed wells in non-competitive territory which is closed in.

COMPANY MEETINGS, &c.

PEARL ASSURANCE COMPANY, LIMITED.

A YEAR OF SOLID PROGRESS.
FURTHER FALL IN EXPENSE RATIO.
FAVOURABLE MORTALITY EXPERIENCE.
TOTAL FUNDS EXCEED £53½ MILLION.

The sixty-fifth annual general meeting of the Pearl Assurance Company, Limited, was held on Thursday, February 28th, at the registered offices, High Holborn, London, W.C.1.

Mr. George Tilley (the chairman of the company) presided.

The secretary (Mr. W. N. Proddow, F.C.I.S.) having read the auditors' certificate.

The Chairman said :—

LADIES AND GENTLEMEN,—

It is the custom of your chairman, at this our annual meeting, to comment on the salient features of the report, and on the principal events affecting the business of the company through the year under review.

The figures of the report now in your hands tell such a plain tale of solid progress that comment upon them seems almost superfluous, but you will doubtless like to hear something about the inner meaning of those figures, and I need hardly say that in reviewing such a report a chairman has quite a pleasant task.

ORDINARY BRANCH.

The new business of this branch (as you may have read when we published the figures) is again a record for the company. Indeed, we have broken so many records in 1928 that you would become tired of hearing the word, were not the records in question of such a pleasant nature.

The number of policies issued during the year in this branch was 42,133, assuring the sum of £12,080,366, and producing a new annual premium income of £670,334. The amount of single premiums was £512,105. Included in these totals there are no less than 11,902 policies which assure sums of £500 or more.

The composition of our new business is of interest as showing that although we are quite commonly known as an industrial office, yet we attract business from all classes of the community, and the only sense in which we could be termed a "class" office is perhaps in the term "first class."

PREMIUM INCOME.

The premium income of the year at £4,659,731, shows an increase of over half a million, an imposing figure, and the more remarkable in that so many of our policies are now terminating by maturity and thereby involving payment to policyholders of sums assured and bonus additions far in excess of anything in the past. Thus on claims by death or on survival to the end of the chosen endowment period we paid £3,048,605, as compared with totals of £2,122,396 in 1927, and £992,429 in 1926. These increases in payments of about £1,000,000 each year are foreseen and provided for; they are the justification of our business, the object of which is to accumulate savings and to pay claims, but a most interesting point to observe in this connection is that further business follows these huge payments in ever increasing proportions, which seems good evidence of the satisfaction we give our policyholders.

GROWING VOGUE AND POPULARITY OF INSURANCE.

In dealing with assurance matters comment is frequently made in the Press of its growing vogue and popularity. Comparisons are made of the amount of life assurance carried per head of the population in this country as compared with others, for instance America—comparisons which are usually unfavourable to us. There is now, however, without doubt, evidence of a decided move forward in this country in the matter of provision by insurance on a more adequate scale for the needs of the family, for the needs of old age, for meeting the great inroads made into capital by the death duties, and for many other things to which insurance adapts itself. The movement has not yet gone sufficiently fast or far, but that it is manifesting itself is a fact to be welcomed by all who prize the spirit of thrift, responsibility and forethought, which lies at the root of all proper insurance. In this movement the Pearl is pre-eminent among British life offices, and I am pleased to tell you that we can see no indications of any approaching limit to our rapid expansion.

I would add that although our claim payments naturally increase each year, the rate of mortality we experience is *very* favourable, and testifies to the care with which we write our business.

INDUSTRIAL BRANCH.

The outstanding feature of this branch, as with the ordinary branch, is the great increase shown in the premium income of the year. This income has increased by over half a million to a total of £6,490,894. The record set up is striking in its magnitude, and particularly so when regard is had to the disappointing lack of progress in the industrial situation of the country, and the continuance of disastrous and widespread unemployment. In the aggregate, the areas of marked unemployment contribute but little to our figures of increase, and our staff as a whole, and not least those in the badly affected districts, have worked magnificently to bring about such results as we are showing.

This is the third year in succession that I have had to tell you of our difficulties in regard to policyholders who found themselves in distress through unemployment or under-employment following on troubles in the coalfields in 1926. I am sure you will be pleased to know that we are continuing our efforts to ease the situation by offering every facility to enable policyholders gradually to reduce arrears of premiums which had accumulated, and so to avoid the lapsing of their policies. Our efforts have been very successful, and tens of thousands of policies, highly valued by their owners, are now either running normally or are within sight of normality.

The rate of mortality in this branch also is very favourable, and a considerable improvement on that of 1927. It may be noted, however, that our payments upon maturity of endowments rose by nearly £84,000 to a total of £484,022, and increases in these figures may be looked for as a regular feature of the future in this, as in the ordinary branch. It is our constant aim to ensure prompt payment of these endowments as well as claims on death, as there is no time at which promptitude is more appreciated by the public than when claims become payable.

FIRE BRANCH.

The premium income in the fire branch during the year amounted to £500,984. Losses incurred, including ample provision for all losses outstanding, and after deduction of amounts recoverable under reinsurance, absorb the sum of £255,963, being 51 per cent. of the premiums. Commission and expenses of management amounted to £215,318, or 43 per cent. of the premiums. After the adjustment of the premium reserve on our usual basis of 40 per cent. of the year's income, there is a surplus, including interest, of £61,608, of which £22,000 has been carried to the profit and loss account and the balance of £39,608 to additional reserve.

This is the first occasion on which we have transferred an amount from the fire account to the profit and loss account. It has always been the policy of your directors to build up the fire reserves, but the position has now become so strong that we may safely transfer some of the profit. Even now we are leaving the underwriting profit practically untouched, for the amount transferred to the profit and loss account is only a trifle larger than the net interest on the fire funds. The fire insurance fund at the end of the year was £535,168, representing considerably more than 100 per cent. of the year's premiums.

BUSINESS ABROAD.

With regard to our operations both at home and abroad, the past year has been a satisfactory one. At the last meeting I mentioned that we had commenced business in Canada, and I am now able to say that our results so far have come up to our expectations, both as regards the volume of business and underwriting profit. In the United States I am happy to say that fire business has shown a distinct improvement, and that we have ourselves participated in the benefits arising therefrom. In other areas we are pursuing a steady policy of expansion, and during the year operations have been commenced in Cuba and Germany. I may say, however, that the establishment of business abroad is becoming more complicated and difficult every year, owing to constantly increasing competition, and to the growth of national spirit, which finds its expression in Government legislation, involving protracted negotiations and difficulties before authority to commence operations can be obtained.

In past years we have relied to a considerable extent for our fire income on business received by reinsurance, which, owing largely to prevailing economic conditions, tends to decrease in volume year by year. While we hope that this tendency will soon be checked, the board decided, in order to replace the business which is being lost in this manner, to get their staff more interested in the fire business, so that a greater rate of progress might be achieved. This new movement was begun in March last, and during the last nine months of the year under review produced most gratifying results. I rely upon our outdoor staff to bring to bear on the fire business the same energy and determination as has made our ordinary and industrial life business such a signal success.

At one of our annual meetings, after we commenced to transact fire business, the hope was expressed from the chair that our shareholders would assist in the development of that branch of the company's work by transferring to us their own fire insurances and general business, and I am happy to say that a very good response was made to that appeal, which has been greatly appreciated by the directors; but we feel that there is a large number of new shareholders who have not so far placed their risks with this company, and I would ask them to give consideration to this subject, with a view to placing with us not only their own business but that of any of their connections which they can influence.

ACCIDENT BRANCH.

Premiums in the personal accident, employers' liability and general accident accounts amounted to £118,125. Claims paid and outstanding, less recoveries under reinsurances, were £46,466, or 39.3 per cent. of the premiums. Commission and expenses of management were £40,663, being 34.4 per cent. After the adjustment of the premium reserves there remains a surplus, with interest, of £29,872, of which £12,000 has been transferred to the profit and loss account, and the remainder, £17,872, to additional reserves. The accident funds now amount to £143,246, which again indicates a strong position.

CONTROL OF EXPENSES.

It is usual to find that a large expansion of business is accompanied with an increase in expenses, an increase not only absolute, but relative to the premium income. This, indeed, is natural, because in the first year of the existence of a policy there falls to be paid fees to agents for introduction, stamp duties, fees for medical examination, besides the clerical costs involved in setting up the records.

It is with the greatest satisfaction, therefore, that I am again able to direct your attention to a further fall in the rate of our expenses as measured by the premium income, in both the ordinary and the industrial branches. Our progress in this respect for five years, and a comparison with the figures for the year 1913, is as follows :—

Year.	Expense Ratios Per Cent. Ordinary Branch.	Industrial Branch.
1913	14.67	45.13
1924	11.79	38.10
1925	11.36	37.59
1926	10.20	36.63
1927	11.14	35.55
1928	10.53	34.11

Our premium income in the ordinary branch is over £4,600,000, and in the industrial branch over £6,400,000, and a simple calculation shows that a saving of only 1 per cent. in the expense rate represents a gain in one year of £46,000 in the ordinary and £64,000 in the industrial branch.

The importance, therefore, of any improvement in methods, or in organisation, which reduces expenses is very apparent, and it is largely due to our efforts in these directions that our results are so progressively good from year to year.

GENERAL RESULTS.

Looking at the results as a whole, our total income for the year was £14,222,066, showing an increase of £1,348,076, which is another record for the company. If it is realised that an income of £1,000,000 puts an office in the category known as the "Big Offices," the fact that in *one year we made an* increase of more than that amount gives some idea of the magnitude of our progress. It is peculiarly gratifying that such a phenomenal increase should be recorded in the first complete year for which Mr. McIntyre has been managing director, and proves that the directors have been justified in their choice. I have known Mr. McIntyre for over 40 years, and when we appointed him to his present position I know he possessed a vigorous personality and a very intimate knowledge of our business, and this, added to the esteem in which he is held by the staff, caused us confidently to anticipate the great success which has attended his management.

The splendid results of the year's working may, therefore, be attributed in a great measure to the guidance and untiring efforts of the managing director, assisted by a board whose members devote their whole time to our business and assist him with their great experience. As an example of such experience I would like to refer to Mr. Abel, seeing he has recently completed his fiftieth year in the service of the company. Entering our employ in 1879, he was elected to the board after 39 years' service on the outdoor staff, having travelled steadily through every grade of the outdoor organisation, filling in turn every office which it was within the power of the directors to entrust to him, and bringing to each those high qualities of mind and character, and that absolute devotion to the interests of the company, which have made his career at once an example and an encouragement to the generation which has followed him.

Whatever troubles may beset us in the future (and, judging by the past, they are bound to be many and serious) it is evident that under our managing director, so well backed and advised by his colleagues, we are well equipped for meeting them.

FUNDS AND INTEREST.

The total funds now stand at the imposing figure of £53,582,028, this being an increase in the year in excess of £5,000,000. There is scarcely a more important duty in the hands of your board of directors than that of securing the best possible results from the investment of these huge funds, and I can assure you that a very great amount of time and care is devoted to this subject. In this matter we rely not only on ourselves and our trained officials, but upon the most expert advice that we can obtain from brokers and financial houses. The large amount we have available for investment is by itself sufficient inducement to those experts to give us of their best, but independently of this, our association with them is of a happy and most friendly nature. That our diligence in these matters is justified in the results may be seen from the fact that once again the rates of interest on our funds show a satisfactory advance. The gross rates earned upon our two principal funds are £5 5s. 10d. per cent. in the ordinary and £5 4s per cent. in the industrial branch, these being increases of nearly 1s. per cent. in each case.

Surplus interest being one of the main sources of profit in life assurance business, is a very significant item. Thus each increase of 1s. per cent. in the rate earned represents on our present funds an increased annual income of approximately £27,000.

Although our funds are shown as exceeding £53,000,000, we possess, in addition, another great asset which is not mentioned in the balance-sheet. I refer to our staff, which, I claim, is one of the best in the country, and an asset the great worth of which is constantly impressed on our minds.

VALUATION.

The annual valuation has again been made by Mr. Austin, F.I.A., and the process of building up the strength of our reserves in the industrial branch has been carried a stage further, to what we are almost safe in denominating an ultimate or permanent basis. The mortality table is that which is known as the English Life No. 9 (Males), a more up-to-date table than that previously employed, while the rate of interest assumed in the calculation is 2½ per cent. This basis may be claimed as one of unchallengeable strength, and we believe we are the first industrial company to attain to such a position. I shall have more to say on this matter at a later stage, and in connection with another subject.

The surplus of the year from this branch is £445,630, including £86,296 brought forward from the previous account.

In the ordinary branch the surplus is £911,161, including £73,798 brought forward from the previous account. In accordance with the recommendation of our actuary we have declared a reversionary bonus to participating policyholders at the rate of 46s. per cent. for the year. This is an increase of 4s. per cent. upon the rate last declared, and is convincing evidence of the strength and soundness of the business. Bonuses on such a generous scale as this are most satisfactory to our policyholders; they are a great attraction to prospective policyholders, and of great help to our staff, whose path is smoothed and made comparatively easy by such an attractive rate.

The following is a record of our bonus in recent years, showing the rapid progress that has been made.

Year.	Rate of Bonus Per Cent.
1923	£1 16 0
1924-25	2 0 0
1926-27	2 2 0
1928	2 6 0

Notwithstanding the increase in the bonus, I would observe that the amount carried forward in this branch to the next account is greater than the amount brought in. We confidently anticipate a continuance of good bonus rates in the future.

PROFIT SHARING.

The board contemplate at an early date asking the shareholders to approve a scheme whereby policyholders in the industrial branch will be accorded a definite share in profits. This is so important a step that I must explain briefly the reasons which actuate us in the proposed course. The basis to which we have attained in the valuation of our industrial branch policies is the culmination of years of effort in this direction. Anyone, even though little versed in the technique of the actuary, can see by a perusal of our reports, that we have for years past steadily added to, and built up, the strength of our valuation reserves, and we consider that the present position calls for, and justifies, a change in this policy. Without abandoning our usual caution, therefore, it must be expected that surpluses will emerge in future in totals greatly exceeding those of past years, and a wise and proper disposal of these profits is a plain duty confronting us.

A few words on the origin of such surpluses is desirable, as such origins have a very pertinent bearing upon the application of the results. The premiums to be charged for the various benefits offered in the prospectus are calculated by the actuary on the best assumptions he can make. The rates of mortality that will probably be experienced in the future, the rates of interest that will be earned on the funds as they accumulate, and the expenses that will be incurred in securing and managing the business, are all the subject of careful estimate, and according as the estimates are in excess or defect of the actual experience, as it emerges, so will profit or loss on the transactions eventuate.

Of recent years profound changes have taken place practically in all three of these factors, and the changes are partly the result of forces over which we have no control, and partly from causes which do come under the general heading of enterprising and efficient management. Thus, in the case of rates of mortality, there has been a general betterment, partly due to improved social conditions, to the extension of health services, greater temperance, better education, and so on, but in the case of our own policyholders, also due in part to care in the selection of lives.

EFFICIENCY OF ADMINISTRATION.

In the case of interest earnings, the general rate has ruled higher during, and since, the war than before, and our accumulated funds consequently earn more than was the case years ago. But here, again, management is applied, and by a careful, well-considered investment policy, the returns are even more enhanced.

In the matter of expenses, good management is able to introduce improved methods in many directions. Some such improvements are rendered possible solely by the great growth of the business, and the general result shows that appreciable savings have been effected, and this without detriment to the remuneration of the staff.

From the foregoing remarks it may be seen that a part of the surpluses of the company may legitimately be claimed to result from efficiency of administration, while another part is independent of this factor. It is, therefore, just that our policyholders should participate in the beneficial results which flow from a general improvement, and especially so when the latter is brought about by a more or less conscious forward movement of the nation towards a saner and healthier conception of life and living.

A policy of distributing profits to industrial branch policyholders is, as you know, not new to this company, for on two previous occasions distributions have been made, although on a different system from that which is now in mind. Thus, in 1906, we increased the sums assured in the great bulk of the industrial business by amounts ranging from 5 to 7½ per cent. The estimated cost of this concession was £482,000, which was a very substantial figure in relation to the funds of those days. Again, in 1926, the sums then assured were increased by an average of 11 per cent., the total increases in the sums assured amounting to over £9,000,000. This latter distribution was accompanied by a general revision of the prospectus in favour of future entrants, giving them the same increased sums assured as had been granted to existing policyholders.

There was, and is, nothing in the policies issued by, or in the constitution of, the company which confers on these policyholders any right to claim benefits greater than those contracted for, and the allocations of profit referred to were entirely voluntary acts on the part of the company. We are convinced, however, that these acts were not merely generous, but were businesslike in the best sense of the word, and the results are reflected in the great increase in the assurances effected with us subsequent to the distribution.

STAFF PENSIONS AND GRANTS.

In the past, distribution of profits to policyholders such as I have just dealt with has been only one of the calls on what I may term our surplus funds. Of other calls I may instance the staff pension fund as one of the most important. Another is grants and allowances to members of the staff or their dependants, in cases of death or withdrawal from the service, and where there is no claim upon the pension fund. During the past year we paid £12,546 in such grants, and we are, as usual, carrying £100,000 to the pension fund, thus raising the total of that fund to £909,240. Total allocations for these objects are likely to increase in future years, and we feel that one of the first calls to be made on the increasing profits of the company must be to meet growing demands in these directions. I feel assured that the directors have the full and cordial agreement of the shareholders in the policy of thus helping and supporting the staff or their dependant survivors at a time when their needs are greatest. This is a most practical way in which to express appreciation of the staff, and of the great part they take in making the company the success it is. Appreciation in such a form is worth much more than the most sincere vote of thanks.

NATIONAL HEALTH INSURANCE.

I am pleased to say that our staff continues to administer National Health Insurance to the satisfaction both of the members and of the National Amalgamated Approved Society, in whose hands is placed the administration of this side of our activities. The "Pearl" membership of this society is increasing satisfactorily, the new entrants during the year numbering 55,000. Our representatives paid to insured members no less than 1,199,073 benefit payments in respect of sickness, disablement and maternity benefits, amounting in all to a total of £739,409. It may be noted that as from January 1, 1928, insured persons upon attainment of the age of 65, ceased to be entitled to cash benefits.

The National Amalgamated Approved Society is doing a splendid work in providing various treatment benefits for its members, benefits which in many cases they would not otherwise be able to afford. These benefits, by helping the members to retain health, and consequently employment, are of inestimable value to them, and also lessen claims on the benefit funds of the society.

I may say that, in additional (treatment) benefits, the disbursements of the society in respect of dental, optical, hospital and convalescent home treatment, medical and surgical appliances and nursing benefit for the year 1928 amounted to £441,601.

On the occasion of our last annual meeting I drew your attention to the fact that the society had taken steps to obtain the consent of the members to a separation of the funds of the male and female sections. As I anticipated, there was a large majority in favour of the change, which I am now able to inform you has received the approval and consent of the Ministry of Health.

SURPLUS.

The total surplus shown in the report as arising from the valuation of the life branches is £1,356,791, including £160,094 brought forward. This is disposed of as follows: £617,375 to participating policyholders; £429,344 to profit and loss account; £100,000 to the staff pension fund, leaving £210,072 to be carried forward. The balance of the profit and loss account at the end of the year was £105,457, which, when added to the amount now appropriated from the life branches, totals £534,801, and from this it is proposed to distribute £172,652 13s. 5d. as a final dividend to the ordinary shareholders.

The Chairman then moved that the report, balance-sheet and statement of accounts for the year ended December 31, 1928, be received, adopted and entered on the minutes. Mr. A. T. Abel seconded the resolution, which was agreed to.

Mr. J. Pierce proposed: "That the retiring directors, Mr. George Tilley and Sir Frederick J. Roll, be re-elected." This motion was seconded by Mr. E. Gay and carried.

A resolution of thanks to the directors was proposed by Mr. E. Taylor, seconded by Mr. L. Campbell, and duly carried.

Mr. J. McIntyre proposed a hearty vote of thanks to the staff, which was seconded by Mr. A. T. Abel.

The Secretary (Mr. W. N. Proddow) responded on behalf of the staff.

GREAT WESTERN RAILWAY COMPANY.
RESULTS OF A DIFFICULT YEAR.
CO-ORDINATION OF ROAD AND RAIL TRANSPORT.

The annual general meeting of the proprietors of the Great Western Railway Company was held, on the 27th ultimo, at Paddington Station, London. The Right Hon. Viscount Churchill, G.C.V.O., Chairman of the company, presiding.

The Secretary (Mr. F. R. E. Davis) read the notice convening the meeting and the report of the Audit Committee.

The Chairman (who was received with applause), in an exhaustive and comparative review of the more important figures in the accounts, said: The receipts from railway and ancillary businesses amounted to £35,527,544, as compared with £37,079,012 in 1927, a decrease of £1,551,468. We can identify most of this loss with our business in the South Wales area. It is some consolation to know that on the other parts of our system traffics were fairly well maintained, and if the outlook in South Wales, which I am glad to say is now brighter, continues to improve, I hope we shall have better results to place before you in twelve months' time. The gross expenditure on the railway and ancillary businesses was £29,408,172, as compared with £30,016,268, a reduction of £608,096, which, I am sure, you will view with satisfaction, having regard to the large economies which we had already effected, in the immediately preceding years. This reduction, I am pleased to say, does not in any way represent deferred expenditure, as their permanent way, rolling stock and buildings had been properly maintained. The interim dividend of 1½ per cent. paid for the June half-year absorbed £636,928, leaving a balance of £1,590,797, which enables us to pay a dividend of 3½ per cent. for the past half-year, making 5 per cent. for the year and leaving a balance of £104,631 to be carried forward. This compares with a dividend of 7 per cent. for the year 1927, when £58,220 was carried forward.

TRIBUTE TO EMPLOYEES.

Ladies and gentlemen, much as we regret the reduction in the dividend, which is entirely due to abnormal conditions, the financial results would have been even more unfavourable but for the praiseworthy efforts which all grades made to meet the position with which we were faced, and events have shown that our employees are keenly alive to the fact that their own welfare depends on the prosperity of the company. This is evidenced by the voluntary arrangement agreed to in August last under which 2½ per cent. of payments for directors' fees, salaries and wages was surrendered by all concerned so that there might be some set-off to the diminished revenue, and I feel sure that you, the proprietors, will appreciate this tangible effort on the part of the staff to share in the hardship which must necessarily follow in the train of such acute depression as prevailed last year.

It will be apparent to you that the year 1928 was a disappointing one for the company. The slight improvement in the trade outlook which took place in the early part of the year was not maintained, and as the year wore on, it became obvious that we should have to reconcile ourselves to the task of combating the consequences of severe depression in those branches of industry upon which we rely for so much of our traffic, namely, the coal, iron and steel industries.

TONNAGE OF EXPORTS AND IMPORTS.

You will appreciate the difficult position in which we found ourselves when I tell you that whereas the tonnage of exports at our six principal ports in South Wales was approximately thirty-one and a half millions in 1927, the figure for last year dropped to about twenty-nine million seven hundred thousand tons, being a decrease of one million eight hundred thousand tons. The tonnage of imports for the year 1927 was about six millions, whereas the figure for 1928 dropped to five millions, being a decrease of one million tons, and an aggregate decrease, taking both exports and imports, of very nearly three million tons, which meant a loss to us of nearly £300,000 in revenue at the docks alone, and in addition to this we also lost revenue on the railway through the traffic not passing.

IRON AND STEEL INDUSTRIES.

In the iron and steel industries the position was much the same. Here, again, the figures of production for these commodities in the United Kingdom did not compare favourably with those for Europe as a whole, and it is significant that whilst the production in the United Kingdom shows in the aggregate a decrease compared with the pre-war figures, there is a considerable increase in the production for the entire European Continent. Competition from Continental manufacturers is still very acute, but due probably to an increase in Continental labour costs and to a reduction in those of home manufacturers—the tonnage of iron and steel, especially iron ore, imported at our docks last year was much less than in previous years, and this no doubt has helped to alleviate unemployment in this country. The total output, however, did not show any marked increase for the year, and our revenue from the carriage of iron and steel goods showed a decrease compared with 1927.

ROAD BILLS.
