JOURNAL
OF THE
INDIAN INSTITUTE OF SCIENCE

Volume I included 21 issues during 1914-18. Thereafter one volume was published annually until 1925, when Volumes VIII (A) and (B), followed by IX (A) and (B) (1926) and X (A) and (B) (1927) appeared.

VOLUME XI (A)—1928.

Parts I—XIX.

VOLUME XII (A)—1929.

Part I.—Phototropic Compounds of Mercury. By Bh. S. V. Raghava Rao and H. E. Watson. Price, Re. 1.

Part II.—Photoelectric Emission from Phototropic Mercury Compounds. By Bh. S. V. Raghava Rao and H. E. Watson. Price, As. 12.

Part III.—Attempts to Synthesise *Ortho*-Thiolphenylhydrazine. By Praphulla Chandra Guha and Tejendra Nath Ghosh. Price, As. 6.

Part IV.—I. Characterisation of very small quantities of Proteins by Van Slyke's Method. By Nuggihalli Narayana and Mothnahalli Sreenivasaya. II. The Determination of Pyruvic Acid. By Basettihalli Hanumantha Rao Krishna and Mothnahalli Sreenivasaya. Price, As. 12.

Part V.—I. Studies on Soil *Actinomyces*. Part I. Introduction. By V. Subrahmanyam and Roland V. Norris. II. Studies on Soil *Actinomyces*. Part II. Their Mode of Occurrence in the Soil. By V. Subrahmanyam. Price, Re. 1.

Part VI.—I. A Study of the Symbiotic Fungus from the Mysore Lac Insect. By M. Sreenivasaya and S. Mahdihassan. II. The Golgi Apparatus of Free-Living Protozoa. By H. S. Madhava Rao. Price, As. 12.

Part VII.—I. Formation of Heterocyclic Compounds from Diethylxanthic Formic Ester. By Praphulla Chandra Guha and Devendra Nath Datta. II. Ring Closure of Hydrazo-Monothiodicarbonylamides with Acetic Anhydride: Formation of Iminothiazolones and Iminothiotriazoles. By Praphulla Chandra Guha and Tarani Kanta Chakraborty. Price, Rs. 1-4.

Part VIII.—I. Studies in Enzyme Action. Part III. Amylase from Cumbu (*Pennisetum typhoides*). By D. Narayanamurti, C. V. Ramaswami Ayyar and Roland V. Norris. II. Studies in Enzyme Action. Part IV. Tyrosinase I. By D. Narayanamurti and C. V. Ramaswami Ayyar. Price, Rs. 1-8.

Part IX.—The Activated Sludge Process of Sewage Treatment. Report on the Working of the Plant at the Indian Institute of Science, Bangalore. By N. Swaminathan. Price, Rs. 1-4.

Part X.—Contributions to the Study of Spike-Disease of Sandal (*Santalum Album*, Linn.). Part VI. Nitrogen Metabolism in Healthy and Spiked Sandal Leaves. By N. Narasimhamurthy and M. Sreenivasaya. Price, As. 12.

DILATOMETRIC STUDIES IN ENZYME ACTION.*

By M. Sreenivasaya and B. N. Sastri.

The changes in volume accompanying enzyme actions are measurable and can therefore be studied with the aid of a dilatometer. Koelichen (*Z. physikal. Chem.*, 1901, **33**, 154) utilised the volume change to determine the velocity of decomposition of acetyl alcohol in presence of sodium hydroxide. Benrath (*Z. physikal. Chem.*, 1909, **67**, 501) has made a study of the density changes of reacting liquid systems such as the inversion of sucrose and formation and hydrolysis of esters. Van't Hoff (*Sitzungsber. preuss. Akad. Wiss.*, 1910, **34**, 963) extended its application to a study of the enzymic synthesis of glucosides. Galeotti (*Z. physikal. Chem.*, 1911, **76**, 105) investigated dilatometrically the inversion of sucrose, the saponification of ethyl acetate, and the hydrolysis of starch, peptone and proteins by acids and in some cases by enzymes. Later (*Z. physikal. Chem.*, 1912, **80**, 241) he studied the conditions of synthesis of esters and fats brought about by pancreatic extract, employing the dilatometer. In spite of the lead given by the above authors, the dilatometer does not appear to have been extensively employed in the investigation of enzymes, in spite of its simplicity and manipulative elegance and the accuracy of the results that can be attained.

THE DILATOMETER.

The instrument consists essentially of a bulb nearly 50 c.c. in capacity. To one end is fused a tap, whilst the other end is connected to a capillary. The whole is bent into a U-form [see Fig. 1(a)] the capillary-bearing bulb and the tap forming the two arms. Several such dilatometers can be used simultaneously by fixing them all by means of their capillaries to a suitable clamp [Fig. 1(b)]. A common scale, fixed behind the set of capillaries, allows the easy reading of the meniscus.

Agitation of the reaction mixture which is necessary in the case of insoluble enzymes like lipase, may be carried out by introducing a few glass beads into the bulb, before fusing on the tap, and mechanically shaking the dilatometer. A more elegant method is to introduce into the bulb a platinum-plated stirrer which can be worked electromagnetically.

* Reprinted from the *Biochemical Journal*, 1929, **23**, 975.

Fig. 1

EXPERIMENTAL.

The dilatometer is thoroughly washed successively with alcoholic potassium hydroxide, chromic acid, distilled water, alcohol and finally with ether, and then dried. The taps are carefully greased and a small reservoir of about 75 c.c. capacity is attached to the tap end of the instrument by means of pressure tubing. By opening the tap and applying gentle suction at the capillary end, filling can be smoothly effected without the introduction of air bubbles.

The operation is carried out with the dilatometer and the reaction mixture completely immersed in the thermostat. Filling takes less than 5 minutes and the first reading can easily be recorded within that period. The temperature variation of the thermostat employed was $\pm 0.001^\circ$ and a control dilatometer which was always used served as an effective indicator of the constancy of the temperature maintained throughout the experiment.

The capacity of each of the dilatometers employed was determined and the capillaries were carefully calibrated in the usual way. A dilatometric study of the following enzyme reactions was carried out: taka-diastase on starch, invertase on sucrose, emulsin on salicin, tannase on methyl gallate and amidase on asparagine. In the case of diastase, the method has been extended to a study of the influence of salts and also to a determination of the rate of liquefaction. Every one of the dilatometrically investigated reactions has been simultaneously followed by an entirely independent method to establish the accuracy of the method.

TABLE I.

Hydrolysis of starch by taka-diastase.

Materials: Lintner's soluble starch, 5 per cent. solution; taka-diastase (Parke Davis), 1 per cent. solution.

Mixture employed: 220 c.c. starch solution + 5 c.c. enzyme.

Temperature of thermostat: 30.0° .

Time	Dilatometer readings, mm.		Maltose value c.c. KMnO_4
	Control	Experimental

(See Fig. 7.)

DISCUSSION.

A study of the tables and graphs demonstrates the closeness of the results obtained by the dilatometer and the methods generally adopted. In many cases, the dilatometric method has proved more satisfactory and less tedious. The estimation of sugars resulting during enzyme hydrolysis or the electrometric titration of acidities produced during the hydrolysis of methyl gallate and other esters is certainly more cumbersome and tedious than taking readings of the dilatometer at intervals.

The influence of salts like potassium nitrate on diastase has been studied. The study is being extended to other ions and colloids such as agar-agar, silicic acid, etc.

Limitations of the method.—In cases where the volume change is not pronounced, the method offers no special advantage over other methods. Again, the instrument cannot be employed in a study of enzyme reactions which involve the liberation of gases. In the course of an investigation of a preparation of amidase from *Aspergillus niger* on asparagine, no volume change was noticeable. The ammonia liberated during the enzymic cleavage of amides dissolves in the reaction mixture producing an increase in volume which is opposed to the fall due to hydrolysis. In such cases, accompanied by opposing changes of volume, this method is inapplicable.

SUMMARY.

1. A convenient form of dilatometer for the study of enzyme action is described.
2. The hydrolytic action of diastase, invertase, emulsin, amidase and tannase on their respective substrates has been studied.
3. Limitations of the method are discussed.

Our thanks are due to Mr. V. N. Patwardhan, for supplying us with a preparation of cholam amylase, and to Mr. P. D. Dalvi for making a dilatometric study of tannase.
