The revenue, notwithstanding some £40,000,000 of taxation reduction during the past twelve months, and a certain amount of depression due to the economic crisis in other countries, continues to come in satisfactorily. The total yield from all sources during November was 4,079,700,200 francs (of which 4,022,175,300 francs was from "normal and permanent" sources), or less than one-quarter per cent. lower than in November, 1929, before the recent tax reductions came into force. This drop of 91,723,000 francs was entirely due to a slight decline in yield from indirect taxes. Direct taxation produced 10,570,000 francs more than a year ago. The yield from normal taxes and monopolies (exclusive of that from tobacco and the taxes now applied to debt extinction) was 4,022,175,300 francs, against 4,113,898,700 francs in November, 1929, and 3,835,227,000 francs in 1928. The yield from monopolies and indirect imposts was in all cases lower, with the exception of that from Customs, which produced 71,395,000 francs more than in November, 1929, and from colonial foodstuffs, where an increase of 2,270,000 francs was registered. The largest drop was in the recoveries from the turnover tax, which totalled 881 millions (or about 10 per cent.) less than in November last year. How far this represents the general falling off in trade is difficult to determine, in view of the two conflicting factors—the recent reductions in the tax, and the rise in retail prices since a year ago. The falling off of 38,000,000 francs in the sugar tax is to be accounted for by the lowering of the impost. The yield from taxes collected during November under the General Budget, exclusive of direct taxation, was 42,256,000 francs in excess

of Budget Estimates for the month. The total realised in excess of the estimates for the eight months was 1,047,000,000 francs, with four months of the financial year still to come. The total revenue for the eight months was 2,191,000,000 francs less than that for the corresponding period of last year, owing to the taxation relief already mentioned.

The foreign trade returns for November indicate total "visible" exports of 3,440,504,000 francs and imports of 4,249,795,000 francs. Entries were 270,000,000 francs less than in October, and 769,960,000 francs less than in November, 1929. Exports were only 62,000,000 francs lower than in the previous month, but 955,980,000 below those of November last year. The November exchanges left a total adverse balance on the eleven months of the year of 8,411,000,000 francs, as compared with 7,550,000,000 francs in the corresponding period of 1929. The net decline in exports as compared with the first eleven months of last year has been 6,057,500,000 francs, and in imports 5,196,500,000 francs. Imports of raw materials have fallen off by 4,976,000,000 francs, and exports of the same category by 2,312,000,000 francs. The drop in exports has been mostly in manufactured goods, which have fallen off 3,674,000,000 francs during the eleven months, or about 12½ per cent. Imports of manufactures, on the other hand, have increased by 1,350,580,000 francs, or 15 per cent. Coal imports during the eleven months have been 28,173,480 tons (4,097,378,000 francs) against 27,654,207 tons (3,878,540,000 francs) in the corresponding period of 1929, and 20,682,000 tons (528,455,000 francs, pre-war) in 1913.

GERMANY.

Public Finance — Financial Position of Communes — Reich Supervision of Communal Borrowing.

(FROM OUR CORRESPONDENT.)

BERLIN, December 22.

THE financial state of the German communes was, up to a few weeks ago, a source of grave anxiety. The finances of the Reich are to some extent provided for by the last emergency decree, though the fact must be reckoned with that the budget estimates do not completely cover the payment of emergency benefit and that another subsidy to the unemployment fund may be needed, as its separation from the budget is at present only formal. The unemployment burden may, however, not be quite as heavy as some economists have anticipated, since, owing to the fact that almost half the building trades operatives were already unemployed during the summer, the seasonal increase in unemployment this winter has not been as marked as usual. One last reserve of taxation, economically of a questionable character, remains at the disposal of the Reich to meet the cost of such subsidy, namely, an increase in the turnover tax. The greatest danger of such an increase lies in the effect it would have in rendering nugatory the efforts of the Government to reduce prices, but in the last resort even this consideration will go by the board, as a deficit must be avoided at any cost.

The state of the communes is even worse than that of the Reich for three reasons: in the first place they are only just beginning to feel the full effects of unemployment in the demand for poor relief. Under German law the unemployed receive benefit for the first half-year, then emergency benefit for a further 39 weeks, after which they become chargeable on the communes for poor relief. Already the number of unemployed to be supported by the communes has risen by nearly half a million, and in the course of the winter it will rise to 700,000 or 800,000.

The second cause of the peculiar financial difficulties of the communes is to be found in the German system of taxation. Apart from their grants from the Reich out of income tax receipts, which are of course declining heavily owing to the depression, and to a smaller extent out of

the relatively stable turnover tax, the communes' principal source of funds has hitherto been the taxes on property and industry. As these are levied in part without reference to the income from the property, they provide the communes with a financial reserve even in times of depression, but on the other hand the severity of their pressure in bad times strictly limits the extent to which it is possible to raise them.

The first emergency decree provided very little in the way of new sources of income for the communes; only the unsatisfactory "citizens tax," which was very costly to collect, and to a limited extent also the duty on beer and on the consumption of beverages in restaurants. Not until the issue of the second decree were the conditions under which these taxes might be raised so modified as to give rise to some hope of improvement in the financial position of many of the communes.

A third reason why the financial position of the communes is worse than that of the Reich lies in the fact that they are particularly hard hit by the collapse of the capital market. Many of them have undertaken construction works which they cannot leave unfinished without incurring heavy losses. Berlin, in particular, embarked while the capital market was liquid on a far too ambitious extension of her underground railway system. In 1929 and 1930 she suspended operations, but ultimately it became impossible to leave tunnels half built, bringing in no revenue, and to go on running services on short stretches of line which were not yet sufficiently linked up with the rest of the system to secure the necessary volume of traffic. Work therefore had to be resumed and financed out of floating loans on short-term credits. Part of the work has just been finished, and some of the lines are about to be opened.

Nevertheless, the communes have surmounted the most immediate financial dangers. They have adequate funds at their disposal for the end of the year, not only for the discharge of their credit obligations, which was never in question, but for the full payment of official salaries and of relief. This has been achieved, thanks largely to the communes' own credit organisation. The communes run savings banks which act as a reservoir for the deposits of small savers, and also, through their association with the communal banks, attract more substantial holdings. These savings banks have regional clearing offices ("Girozentralen"), and these again have a central clearing office, "Deutsche Girozentrale." As a large part of the savings deposits serve to meet the financial needs of the communes, these clearing houses make possible an equalisation of the relative abundance of funds in some towns and scarcity in others. In so far as such an equalisation is possible for long-term credit, it was very successfully carried out last year by the Council of German Towns in co-operation with the Girozentralen.

The requirements of short-term credit must have been admirably met by direct equalisation through the "Deutsche Girozentrale" during the last few months. This presupposes an effective determination in all the communes to pursue a sound financial policy, as otherwise the equalisation would have imposed an intolerable risk on those towns which were in a relatively strong position and were called upon to help the others. Now the influence of the National Socialists and the Communists, who do not feel themselves responsible for the soundness of financial policy, has in many cases prevented this determination from becoming effective in local representative assemblies, but where the local administration failed, the Government has stepped in and nominated State commissioners to supervise finance. In addition the State has given help to individual communes in exceptional distress, especially in Silesia.

The most difficult case was that of Berlin, which, owing to its constructional activities, has had to undertake very heavy short-term borrowing at home and abroad on unfavourable terms. It is, however, to be hoped that the new taxes which the Commissioner for Berlin has introduced, and the income which the new underground lines will soon bring in, may enable the city soon to pay off these loans.

The method of control of communal borrowing has been a subject of dispute in Germany since 1926. In most States it is subject to the State Government, but this supervision was so ineffective and so lacking in uniformity that in 1925 a permanent board was set up for the whole Reich to supervise at least the foreign borrowings of the communes. The activity of this "Advisory Council" was, under the influence of the Reichsbank, with Dr. Schacht at its head, extremely restrictive, and the communes strongly opposed its "guardianship." Its control was highly necessary, as the communes were very much inclined to borrow for purposes which were not urgent, but it was not always wisely exercised. At present it is especially badly needed in order to prevent the communes from bidding against each other as soon as the international market becomes more liquid.

After many unsuccessful attempts, agreement has been reached on important changes in the organisation in the duties of the Advisory Council. The new arrangement constitutes an improvement and meets the wishes of the communes. Control is extended to internal borrowing, and as far as foreign borrowing is concerned it is to cover also short- and medium-term credits. The credit committees of the communes, which have been responsible for the equalisation of long-period savings bank credits as between the communes, and have subjected the credit demands of individual communes to searching examination, are incorporated into the control system of the Reich. The gas, electricity and similar undertakings of the communes are exempt from control in order to be on the same footing as corresponding private enterprises. The Council is expressly required to examine very strictly the security for the service of the loans in order that its authorisation may be a more reliable guarantee than ever of the trustworthiness of the borrower.

HOLLAND.

Money and Stock Markets — Capital Issues — Foreign Trade.

(FROM OUR CORRESPONDENT.)

AMSTERDAM, December 8.

THE tendency on the stock market and on the foreign exchange market shows little change. In November the average rate for prolongations was 1.304 per cent., as compared with 4.1917 per cent. in November, 1929. The highest rate last month was 1½ per cent. and the lowest was 1 per cent.

An extraordinarily high total of issues was recorded in November. An aggregate of nearly 100 million guilders new capital issues in a single month is certainly exceptional in the Netherlands. At first sight this would appear to be a peculiar state of affairs to encounter in a period of acute trade depression, but the fact is that the high figure is almost entirely due to two very large issues. No less than 95.4 million guilders were accounted for by two flotations, viz., 4½ per cent. Dutch East Indies bonds to a nominal amount of 77.2 million guilders, and the 5 per cent. bond issue of the Philips Works, nominal value 20 million guilders. Hardly 4½ million guilders were therefore accounted for by other issues. If, in addition, it is remembered that none of these issues was a success, the total of last month's flotations becomes still less impressive. In reality, therefore, the situation of our capital issue market is still almost as inanimate as it has been in recent months.

There was not a single issue of shares last month. Throughout the entire year share issues have been very limited, and in the last few months they have totalled less than a million guilders a month, but the fact that an entire month passed without one flotation of shares is a remarkable feature in the annals of the Dutch capital issues market. The flotations marketed last month were all domestic, apart from one Belgian issue, the 5 per cent. Charbonnerie de Mariemont.

During the first eleven months of this year, shares to a total of 28.1 million guilders (last year 295.8 million)

NATIONAL BANK OF GREECE Established 1841

Head Office: Athens.
Branches throughout Greece.
New York Agency, 51 Maiden Lane.

**THE BANK OFFERS EXCEPTIONAL
FACILITIES FOR BUSINESS WITH GREECE**

Capital paid up and Reserves Drs. 1,205,000,000.

have been issued here. During the same period the issues of bonds totalled 525.8 millions (last year 164.1 millions).

The economic depression is also clearly reflected in the foreign trade returns of the Netherlands. According to the official statistics, the value of imports was 198 million guilders in October, 1930, against 258 millions in October, 1929, and 196 millions in September, 1930. A decline as compared with last year was also recorded in exports, which in October amounted to 151 million guilders, against 185 millions in October, 1929. Compared with September, 1930, however, the October exports are about 4 millions higher. The position is summarised in the following table:—

	IMPORTS.			
	Weight. (Metric Tons.)	Value. (In Million Guilders.)	1929.	1930.
January-September	22,820,000	23,928,000	2,043	1,874
October	2,894,000	2,704,000	258	198
January-October ...	25,714,000	26,632,000	2,301	2,072

	EXPORTS.			
	Weight. (Metric Tons.)	Value. (In Million Guilders.)	1929.	1930.
January-September	12,028,000	12,286,000	1,495	1,324
October	1,502,000	1,566,000	185	151
January-October ...	13,530,000	13,852,000	1,680	1,475

Notwithstanding that the excess of imports over exports during the first ten months of the year is lower than during the corresponding period last year (597 millions in 1930, against 621 millions in 1929), the relation became less favourable in October, as the value of imports dropped to the extent of 9.9 millions, whilst exports dropped by 12.2 millions. The decline in the weight of imports which has been recorded since the first quarter still continues, but the weight of exports was somewhat greater in October.

GREECE.

The Budget — Foreign Loans — Commercial Agreements — Foreign Trade.

(FROM OUR CORRESPONDENT.)

ATHENS, December 11.

AN optimistic tone pervaded the speech in which the Finance Minister presented his budget estimates for the forthcoming financial year 1931-1932. Greece, he said, possesses all the elements necessary for her to rank among those States which will show the greatest power of resistance against the universal economic crisis, will suffer the least, and will be the first to recover from its effects. He expects the current financial year to close with a surplus of over 300,000,000 drachmas. The estimated

revenue for next year is put at Drs. 10,179 millions, while expenditure is calculated to reach Drs. 10,172 millions, leaving thus a surplus of 7 millions. Nearly 35 per cent. of the revenue is absorbed by the service, ordinary and extraordinary, of the national debt, while 16.54 per cent. is required for the army, navy and aviation, and 6.62 per cent. for pensions. A sum of 470 millions is included among expenditure as a reserve for contingencies. At the same time, in order to provide further for an unforeseen fall in revenue, the Government asked for the authorisation of Parliament to cut down, in case of need, the salaries of public servants—the reduction to be up to 6 per cent. of their present figure. Receipts from the revenues assigned for the service of the public debt show for the first 10 months of 1930 a decrease of Drs. 238 millions compared with last year.

The Governor of the Bank of Greece has returned from London with a very satisfactory impression of the position of Greek credit, and the disposition of foreign markets towards Greece. He expects that the second part of the Public Works Loan will be floated in February in London, New York and Paris. Meanwhile the Government has obtained from the National Bank of Greece an advance of £600,000 repayable from the proceeds of the forthcoming issue. That American interest in Greek financing is increasing is shown from the fact that a representative of the National City Company (investment affiliate of the National City Bank of New York) is at present in Athens making a thorough investigation of the economic and financial conditions and prospects of the country. A loan of £1,000,000 has been concluded by the National Mortgage Bank of Greece. Of this amount £500,000 have been undertaken by Hambros Bank and Erlangers, Limited, and placed privately in London, and the remaining £500,000 by the National Bank of Greece, heading a syndicate of Greek banks. According to an official statement the amount embezzled by one of the cashiers of the National Bank will be partly recovered, and is, in any case, of small importance for the Bank, whose dividend for the closing year will not be affected by this malversation.

The commercial agreement with Poland has been put in force, while negotiations for a similar agreement with Roumania are making satisfactory progress. Negotiations have also begun again with Bulgaria, and it is hoped that all outstanding differences between the two countries will be settled in the near future. Imports from January to end October, 1930, amounted to Drs. 9,049 millions, and exports to Drs. 4,202 millions, against Drs. 10,952 millions and Drs. 5,448 millions respectively for the corresponding period of last year.

NEW ZEALAND.

Foreign Trade — Exchanges — Public Finance — Business Activity.

(FROM OUR CORRESPONDENT.)

CHRISTCHURCH, October 29.

IN common with many other countries, New Zealand is at present suffering some decline in business activity, owing largely to the fall in export prices. For the 1929-30 export season prices received for exports averaged about 20 per cent. less than for the preceding season. Production, however, increased, and despite some withholding of produce, particularly of wool, the volume of exports was greater, and the reduction in export values, amounting to £8 millions, was less than was generally anticipated. The large favourable balance of trade for 1928-29 was reduced until, for a month or two, the balance was slightly unfavourable, but imports declined, and, for the year ended August, 1930, there is a slight excess of exports over imports. The decline in imports was probably induced by the anticipation of reduced spending power in the country consequent upon the decline in export prices, by higher customs duties, less favourable exchange rates and increased bank rates on overdrafts.

The exchange situation is peculiar. Banks will sell telegraphic transfers on London at 5 per cent. premium. The Australian rate on London is much higher, about 9 per cent. premium. Yet the Australian-New Zealand rate published is approximately at par. Such anomalies appear to depend on the close control and rationing of the Australian exchanges. In fact, apart from the influence of Australia's position, there is nothing to explain the apparent depreciation in the New Zealand-London exchange, for the present rates are certainly not justified by New Zealand's balance of overseas payments. It is anticipated, however, that steps are likely to be taken to separate effectively the Australian and New Zealand exchanges on London. In this connection Sir Otto Niemeyer visited New Zealand at the request of the Government, and he is to report on the whole matter of currency and exchange regulation.

Some evidences of apprehension regarding the position in New Zealand have been shown during the 1930 session of Parliament, now nearing its end. The Budget for the 1929-30 financial year showed a slight surplus, but it was estimated that for the ensuing year the yield from Customs would be £1 million less, that of land tax £300,000 less, a railway loss of £1½ million would have to be met, and unavoidable increases in debt charges, pensions, etc., would absorb half a million more. Consequently a deficit of about £3 millions was anticipated unless adjustments were made. About half of this was covered by reductions in expenditure, which involved the suspension of compulsory military training, reduction of votes to highways and education, and suspension of certain subsidies, while the remaining half was covered by increased taxation. The existing primage duties were abolished, but surtaxes were placed on present dutiable items, and petrol was taxed a further 2d., making the tax 6d. a gallon, while many smaller taxes were increased. Later in the session an Unemployment Act was passed, providing for the collection of a tax of £1 10s. per head annually from all adult male workers. This is expected to yield £½ million per year, and an approximately equal amount is to be paid from the Consolidated Fund. The total fund is to be administered by an Employment Board, who are to supervise employment exchanges, explore and encourage the development of new fields for employment, and, where necessary, make subsistence payments to the unemployed. The plan follows closely the recommendations of a committee which inquired into unemployment last year, and it is probably better than the present practice of engaging as many unemployed as is possible, mainly on unproductive public works and at Arbitration Court award rates of pay, but it does not touch the real cause of unemployment, the fact that internal costs have for some years been higher than are warranted by prices received for exports.

The Government has, however, made significant gestures in the direction of economy. A Commission was appointed to inquire into and report upon the general administration of the State railways, and a Committee to report on new railway construction. The Commission's report detailed long lists of points where, owing to political rather than business administration, railway revenue is curtailed and railway expenditure increased, and recommended strongly and unanimously that the railways be removed from political control and administered by a selected group similar to a company directorate. The Government has not yet decided to apply this recommendation, but it states its intention of increasing certain charges, and there is little doubt that political control, which has involved the railways in much of their present losses, cannot last much longer. No report was forthcoming from the full Committee on railway construction, on account of lack of time, it was said; but a minority report of three members recommended that work should be stopped on three lines at present under construction, which appear likely to become the source of further railway losses. There is no doubt that railway construction for some years past has been very expensive and on too ambitious a scale, but under political control the matter has been complicated by the policy of providing work for the unemployed and by lavish plans for encouraging land settlement.

A statement of the public accounts for the first half-year made by the Acting Prime Minister discloses a considerable fall in revenue. A deficit of approximately £750,000 in the railway accounts was allowed for in the Budget, but the shortage for the first and less favourable half of the financial year exceeded £1 million. In addition, imports have declined more than was anticipated, and it appears that a shortage of perhaps £250,000 is to be expected in Customs revenue. The decline in revenue is itself some evidence of relative depression in business, but it points to the need for public economies more drastic than any yet attempted.

There is no doubt that some depression exists in business, and the level of confidence is not high. But depression is a relative term. The balance of overseas trade, which is the chief factor determining cyclical movements in New Zealand, is favourable, and despite low export prices, is likely to improve. The banking position is sound, and unlikely to become less favourable, partly because holders of funds have learned caution. The monthly average of total bank debits, a very good indicator of business conditions, is running at a level similar to that for the same period of 1928, and about 10 per cent. below that of 1929. There is much talk of unemployment, but the most pessimistic estimates of the number of unemployed fail to total as much as 5 per cent. of the normally employed population. Hence New Zealand, though suffering some decline in business now, and likely perhaps to experience further declines if export prices remain at their present low levels, is probably much less depressed than many other countries.

Letters to the Editor.

GOLD: PRICES: WAGES.

TO THE EDITOR OF THE ECONOMIST.

SIR,—Mr Turner cannot score by demolishing cockshies put up by himself. My first letter said that "the passing of the world slump will not find us abreast of our competitors unless meanwhile we have cured those faults in our system which are not world-wide but national"; and opined that "of these" (faults persisting and peculiar to our system) "the gravest is the pegging of money wages (and salaries)." To complain that I "ignore" and "dismiss" a whole catalogue of past causes, of which those that are peculiar do not persist and those that persist are not peculiar, is simply beside the point. He renews the assertion of his faith in the reality of monetary causes. I have always acknowledged it. In fact, the only point of substance still in dispute is his question, "Why select wages for sole treatment, when other costs are . . . just as much pegged as wages?" But I did not select wages, or even wages and salaries, for sole treatment, but for first treatment; and that because in a sinking ship lives may depend on plugging the biggest hole first.

In business to-day there is no hole comparable with the rise in real wages. My first letter showed clearly enough that I was not dealing with wages in this or that threatened industry, but with the general wage level in its aggregate effect at all stages of manufacture and distribution. For example, coal goes down in engineering costs as "materials"; but of last quarter's pithead price of Welsh coal, 65 per cent. was mining wages, and the other costs (34 per cent.), representing plant, stores, etc., if the analysis is carried back another stage, are again largely wages. Railway rates from pithead are largely the wages of railway men, and so on. Ultimately, cost has only two elements: (a) remuneration of persons (wages and salaries), and (b) remuneration of capital; and (a) is always so much the larger that the transfer to it from (b) involved in a small percentage rise in real wages may well wipe out (b) altogether, as has indeed happened in coal-mining. The fixed-interest *rentier*, it is true, is now gaining, like the wage-earner, at the expense of the *entrepreneur*; but the performance of contracts without repudiation is not properly described as "pegging." Money-wages are a short-term contract, and under my proposal would rise with prices as promptly as they would fall with them. You cannot get capital for industry without long-term contracts; but on the other hand, if capital is accumulated instead of being dissipated, real conversion of

debt (not issuing £100 of £4½ stock to replace £90 of £5 stock) brings down the *rentier's* income; and from that fall, as holders of Consols in Goschen's days well know, there is no recovery. As my first letter indicated, the pegging of wages, by dissipating capital, is itself blocking this road to prosperity. Perhaps, after this explanation, Mr Turner will recognise that to represent me as merely "reviving the hoary idea of having another cut at wages" is inappropriate to a serious discussion.

Turning to the welcome intervention of "E. M. D.," who has sought impartially to find truth on both sides, I agree with so much of his letter that I need only make a few reservations. My thesis is not that "wages should be continually adjusted to secure that their real value bears a constant ratio to productivity," meaning by that term "maximum potential productivity"; but, quite simply, that the wages system should be based broadly on the steadiness of real (rather than money) wages, so that no party in industry should take a larger slice unless the cake itself was actually (not potentially) larger. Perhaps I should have made this clearer by speaking of "product of industry" rather than "productivity."

I cannot plead guilty to having written anything implying that no money wages are too low, holding strongly (as I do) that the present relation between the wages of (say) a skilled fitter and a road-sweeper is absurd; but I agree with E. M. D. in thinking that all that is a separate, and to my mind a later, question. The urgent need is to get industry on its feet again; and the fact that both fitter and sweeper have this year had a rise of 6 per cent. in real wages, while industry is dying of inability to reduce its costs, is the feature on which I concentrate. But I would put to E. M. D. one point of large size. In two places he speaks of "the burden of sacrifice" involved in pegging real wages till times are better. If he so describes the lot of labour, with its real wages fully maintained, practically no taxation unless voluntarily incurred, and increasing subventions of public assistance in all its forms, what strength of language is he reserving for those—many of them quite small people—whose businesses are being closed down, whose capital instead of producing income is being written off by scores of millions, and who are taxed higher and higher to provide the aforesaid subventions for others?

Of course, any action in the sphere of wages and salaries bristles with practical difficulties; but are the consequences of the inaction of the last four years free from them? As Bacon wrote ["of Boldness"]: "In counsel it is good to see dangers, and in execution not to see them, except they be very great." The time has come for execution; and Germany under a democratic government, to say nothing of Italy under her Duce, has already moved.—Yours faithfully,

Cookham.

DR. BARNARDO.

EVERYBODY with a smattering of knowledge of the social history of the last century knows of the remarkable work done by Lord Shaftesbury in improving the lot of the children of the poor, and everybody with the faintest interest in the poor children of to-day knows that Dr. Barnardo's Homes stand in a class apart from the general run of orphanages and institutions for the care of destitute children. It is far less generally known how much the public work on behalf of children carried through by Lord Shaftesbury and his successors owed to the example of the inspired organising genius who gave his name to the Homes. The biography of Dr. Barnardo* recently published by Dr. Bready tells, with a most contagious enthusiasm, the story of Dr. Barnardo's early work in the slums, of his conversion to Christianity, of his dramatic discovery of the full horrors and extent of child destitution, and of his extraordinary achievement in building up his extensive provision for the physical, mental and moral equipment of destitute children without ever abandoning his principle "no destitute child ever refused admission" and, for many years, without either borrowing or begging.

The chapter which tells of Dr. Barnardo's persecution by detractors and of his ultimate emergence with enhanced reputation, and that which deals with the problem of financing the Homes are most striking reading. But the reader's most vivid impression is of the tremendous force

* "Dr. Barnardo." By J. Wesley Bready. George Allen and Unwin, Ltd.

of imagination, will, and sheer practical genius which made possible the planning, organisation and for many years also the administration of this gigantic work by a single man. Small wonder that the administration of the Poor Law was largely transformed by his example, and that at least one vitally important law, the Custody of Children Act, owed its origin directly to him. It says much for Dr. Bready's power of characterisation that he "puts across" such a vivid picture of his hero's personality as to convince us that here was a man of whom so remarkable a feat does not appear incredible.

BOOKS RECEIVED.

[Brief mention of a book in this column does not necessarily mean that it will not receive fuller notice in a subsequent issue.]

(It would be a convenience to our readers if publishers would make a point of notifying us of the prices of books sent for inclusion in this column.)

A Picture of World Economic Conditions in the Early Fall of 1930. (New York) National Industrial Conference Board, 247, Park Avenue. \$2.50.

Contains a brief survey of the state of affairs in each of twenty-two countries, and special reports received up to October, 1930, by the foreign correspondents of the Board.

Menace of Over-Production. Edited by Scoville Hamlin. (London) Chapman and Hall, Ltd., 11, Henrietta Street. 13s. 6d. net.

A collection of short essays, by American experts, on different aspects of the subject. Industries separately discussed include coal-mining, oil, the respective textile industries, radio and agriculture.

British Policy and Canada, 1774-1791. By Gerald S. Graham. (London) Longmans, Green and Co., 39, Paternoster Row. 10s. 6d. net.

A study of the development of trade policy in the British Empire after the loss of the American colonies.

Japan's Economic Position. By John E. Orchard. With the collaboration of Dorothy Johnson Orchard. (London) McGraw-Hill Publishing Company, Ltd., 6 and 8, Bouverie Street. 25s. net.

A very detailed account of the economic resources and industrial activities of Japan.

Bulgaria's Economic Position. By Leo Pasvolksky. (Washington, D.C.) Institute of Economics, 26, Jackson Place. \$3.00.

An interesting and reliable study.

Brazil of To-Day. (Rio de Janeiro) Ministry of Agriculture, Industry and Commerce.

A useful collection of statistics with a number of very effective diagrams.

The Economic Crisis. By Viscount D'Abernon. (London) Hodder and Stoughton, Warwick Square. 1s. net.

Reprint of Lord D'Abernon's address to the Liverpool Chamber of Commerce.

The Old Trade Unions. By William Kiddier. (London) George Allen and Unwin, Ltd., 40, Museum Street. 7s. 6d. net.

An account of the London Society of Brushmakers based on their records and illustrated with facsimiles. It contains fascinating material, but the author obtrudes a somewhat tiresome style.

The Economic Crisis in Germany. By Werner Kehl. (Berlin) by the Author, 35, Mauerstrasse.

Translation of a paper recently read by a prominent German banker.

The London Money Market. By William F. Spalding. Fourth Edition. (London) Sir Isaac Pitman and Sons, Ltd., Parker Street, Kingsway. 10s. 6d. net.

This new edition of an exceedingly useful book has been partly re-written in consequence of recent currency legislation.

The Work of a Bank. By H. T. Easton. Fifth Edition. Revised and re-written by Herbert G. Hodder. (London) Effingham Wilson, 16, Copthall Avenue. 7s. 6d.

A useful account of the practical side of banking. There is a chapter on the qualifications required for entry into and promotion within the profession.

Sozialökonomische Theorie des Geldes. By Junichi Ohno. (Leipzig) A. Deichertschen Verlagsbuchhandlung, Königstrasse, 17. 6 mk.

A treatise on monetary theory by a Japanese professor.

Grundlinien der Geldtheorie. By Gustavo Del Vecchio. (Tübingen) Verlag von J. C. B. Mohr (Paul Siebeck). 11 m.

A German translation of an Italian treatise on monetary theory.

Die Finanzpolitik der Reichsbahn. By Dr. phil. Bruno Moil. (Leipzig) Akademische Verlagsgesellschaft, Schlossgasse, 9. 4.50 Rm.

A valuable and well-documented discussion of the financial policy of the German State railways.

Krieg und Kriminalität in Deutschland. By Prof. Dr. Moritz Liepmann. (London) Oxford University Press, Warwick Square. 11s. 6d. net.

This new volume in the German Carnegie series embodies the results of an analysis of war-time criminal statistics in Germany.

The French Default! By Horace B. Samuel. (London) Effingham Wilson, 16, Copthall Avenue.

An *ex parte* statement, in somewhat undiplomatic language, of the case for the British holders of French loans.

Social Studies of a Manchester City Ward. (Manchester) Sherratt and Hughes.

An investigation by a social study group of the housing needs of Ancoats in relation to the Greenwood Act.

A Summary of Commerce and Business Economics. By Grace P. Rumming and John Blakeman. (London) Simpkin, Marshall, Ltd., Stationers' Hall Court. 3s.

A small textbook on the descriptive and practical side, arranged almost in note form.

Particulars and Statistics Concerning Foreign Securities. (London) Kitchin, Baker, Mason and Co., Pinners Hall.

A ready reference dossier of foreign government securities, which gives such relevant statistics as imports and exports, budget, etc.

Income Tax. By Harry C. King. (London) Gee and Co. (Publishers), Ltd., 8, Kirby Street. 1s. net.

A brief reference pamphlet on personal allowances.

Postal Reform. By Edwin Wells. (London) The C. W. Daniel Company, 46, Bernard Street, W.C. 1. 1s. net.

A scheme for bringing about, by means of differential postage rates, a more even distribution through the day of the volume of correspondence handled by the Post Office.

What Money Scarcity Means to You. By E. E. Canney. (Manchester) Published by the Author at 30, St. Ann Street, Manchester. 1s.

An inflationist pamphlet.

Records of the Geological Survey of India. Vol. LXIV. (Calcutta) Government of India, Central Publication Branch. 15s. 6d.

Contains a most valuable collection of statistics of mineral production, covering the years 1924-28.

Institute of International Education. Eleventh Annual Report of the Director. (New York) Institute of International Education, 2, West 45th Street.

Report of the Superintendent of Insurance. Dominion of Canada. Vol. I. Fire and Miscellaneous. (Ottawa) F. A. Acland.

The Stock Exchange.

THE UNILEVER GALAXY.

Of the outstanding business combinations of recent years, the building up of the Unilever combine has been one of the most noteworthy. The fusion of the Margarine Union group and Lever Brothers in December, 1929, the securing of control of United Africa, and the subsequent acquisition of a majority interest in a group of provision stores in Great Britain, constituted one of the biggest industrial amalgamations in European history. There was brought under single dictation, as far as trading policy and finance were concerned, a group of companies of world-wide ramifications and multitudinous functions, extending from the production of vegetable oils in the tropics to the catching of whales in the Antarctic, from the manufacture and marketing of margarine, soap, perfumeries, and cattle foods to the retailing of groceries and the keeping of fish shops and restaurants.

This colossal combination began with the amalgamation in 1927 of two old-established margarine manufacturing

companies—Anton Jurgens and Van den Berghs—which had subsidiaries operating in most European countries. Margarine Unie was formed to take over the Continental companies of both groups, and Margarine Union, Limited, to acquire the English companies. The reason for this dual organisation was the avoidance of double taxation. In 1929 Margarine Unie extended its interests widely in German, Danish and other European companies engaged in the margarine trade. It came to an agreement with the Schicht and Hartog concerns, both manufacturers of margarine and soap, which was of great importance to its control of the European trade. Finally, in September, 1929, it amalgamated with Lever Brothers. This involved the fusion of the numerous Lever subsidiaries with those of the Margarine Union group, and the changing of the name Margarine Union to Unilever. One of the subsidiaries of the Lever group was the Niger Company, which had already merged (in April) with the African and Eastern,

Nestle Concern.

Limited, under the style of United Africa. To this company were transferred the West African interests of Margarine Union. A controlling interest had also been obtained in Meadow Dairy, Limited, which subsequently acquired virtual control of Home and Colonial Stores, Maypole Dairy and Liptons. An attempt to bring International Tea Stores into this grocery combine failed at the eleventh hour, for the directors of International Tea reversed their decision to merge their company's identity in the Unilever colossus, their declared reason being the fear that the Unilever directors might dictate their manufacturing and buying policy.

The financial control of this trust was arranged in an ingenious, if complex, manner. It was designed to give the Van den Berghs, Jurgens, Schicht, Hartog and Lever families an indubitably powerful position in the world trade in margarine and soap. The ordinary shares of Margarine Unie (Unilever N.V.) and the 6 per cent. deferred shares of Margarine Union (Unilever, Limited), which carried special voting rights, were divided equally between two private companies, one established in Holland and the other in England. To-day, all the capital of the Dutch company is held by the Van den Bergh, Jurgens, Schicht and Hartog group, with the exception of one share, which is held by the Lever group, while, conversely, the Lever group holds all the capital of the English company, with the exception of one share held by the Dutch group. The £2,400,000 ordinary capital of Lever Brothers was acquired by Margarine Union (Unilever, Limited) in exchange for £6,000,000 Unilever ordinary shares. £1,100,000 7 per cent. preferred shares of Unilevers were also issued to Lever Brothers in surrender of their co-partnership certificates. The board of the two Unilever companies is composed as to one-half of representatives of the Lever group, and as to the other half of representatives of the Dutch group. As regards United Africa, the Niger Company, a subsidiary of Lever Brothers, was already in possession of 6,500,000 shares of that company, and control of the £15,731,000 capital of United Africa was secured by the allotment to Unilever of 1,584,000 ordinary shares in exchange for the West African interests of the Margarine Union.

How the Meadow Dairy came into the hands of the Unilever combine has never been clearly stated. The Meadow Dairy Company, however, acquired over 50 per cent. of the voting power of Home and Colonial, and also assumed the management of Lipton's, while Home and Colonial in turn took control of Maypole Dairy. The ramifications of the Unilever-United Africa-Meadow Dairy combine are, in fact, so complicated that we have thought fit to show them in graphical form on the previous page, in order that the investor may study them at leisure.

The combined capitalisation of the Unilever twin-companies at December 31, 1929, was £19,723,666. The acquisition of Levers and other interests raised it to £27,539,083, made up of £4,935,083 7 per cent. preferred shares, £22,504,000 ordinary shares, and £100,000 deferred shares. In May last a bonus distribution was made of one new ordinary share for every sixteen held (involving £1,003,375), and 2,000,000 ordinary shares of Unilever, Ltd., were offered for cash at £3 per share. These emissions brought the combined capitalisation to £30,542,458. The allocation out of the 1929 profits of £1,500,000 to reserve and the addition to reserve of £4,000,000 premiums on the new issue increased the total reserve fund (less the bonus issue of ordinary shares) to over £12,000,000. Thus the total amount of shareholders' money employed in the two Unilever companies amounts to £42,542,458. Earnings on £6,000,000 of this total capital can only accrue after payment of interest on £7,188,062 debentures and £54,227,546 preferred and preferred ordinary shares of Lever Brothers.

What is this enormous amount of capital likely to earn in 1930? In 1929 the profits of the Unilever twin-concerns represented over 20 per cent. of the then issued ordinary share capital. The world trade depression only began to have its deadly effect upon company earnings in the second and third quarters of this year. It is possible that the profits of the grocery stores may be fairly well maintained, but the competition of

cheap butter may have recently had some effect on the results of the margarine manufacturing companies of the group.

Adverse features may, of course, have been offset to some extent by potential economies in management expenses as a result of the co-ordination of the various interests of the Margarine and Lever companies. It may be questioned, however, whether the other economies have been sufficient to offset the heavy inventory losses which must needs have resulted from the severe fall in the market values of vegetable and animal oils. Some idea of the extent of this decline can be obtained from the following table of representative market quotations:—

	Dec. 1929.			Dec. 1930.			
	£	s.	d.	£	s.	d.	Decline per cent.
Soya bean oil c.i.f. in bulk ...	28	15	0	19	5	0	33.04
Palm oil	31	15	0	20	0	0	37.01
Whale oil	25	0	0	16	0	0	36.00

In the Unilever report for 1929 it was stated that the natural growth of the business entailed the financing of larger stocks of raw materials on behalf of the subsidiary and associated companies. At December 31st last their stocks on hand amounted to approximately £16,000,000. A decline, say, of 33 per cent. in the values of these stocks would involve an inventory loss of over £5,000,000, subject, of course, to economies in other directions.

These considerations suggest the possibility of a conservative dividend policy on the part of the Unilever group. Unilever shares have fallen this year from 76s. 3d. to 35s. The latter price would appear to reflect the Stock Exchange view that losses on holdings of large raw material stocks this year are one of the greatest difficulties with which companies throughout the world are at present contending.

THE WEEK IN THE MARKETS.

THE LONDON STOCK EXCHANGE.

SETTLING DAYS.

TICKET.	ACCOUNT.
January 6.	January 8.
A SHORT holiday week brought little interest and less satisfaction to the London Stock Exchange. Dealings were of attenuated proportions, and though the undertone was fairly steady on Monday, the renewal of New York liquidation caused an easier tendency subsequently. Until the situation in that centre has been straightened out a sustained recovery in London can scarcely be looked for.	

Dealings in gilt-edged stocks were reduced to small dimensions. War Loan was steady, and long-dated stocks generally held their ground, with the exception of Funding Loan, which was again offered on external account. India loans were slightly harder, but Australians again lost ground. The new Auckland stock was dealt in at ½ discount.

Among Foreign Bonds, Brazilians staged a fair recovery, on information that the Federal Government had advanced 50,000 contos to the States to enable them to meet their overseas obligations. German bonds also obtained slight support.

Despite the good impression produced, as regards the general trade outlook, by the Lancashire coal miners' acceptance of the "spread-over," home rails continued to attract little or no attention. Southerns drooped on a number of small selling orders, but business in the other groups was scarcely sufficient to test prices. Argentine railways made a measureable recovery following satisfactory crop advices, and Leopoldinas and San Paulos were also firmer.

Industrial share prices remained fairly steady, though not a great deal of business was done. Internationals were affected by a renewal of Wall Street selling, H.M.V. and Columbias being among the sufferers. Cables and Wireless were sold on the November figures of the Communications Company, whose total was the lowest yet recorded. Hudsons Bays were again an uncertain market, on trepidation as to the contents of the forthcoming report of the investigation committee.

British Aluminium were marked up sharply, for special reasons, and Turner and Newall showed a modest improvement on bear closing. The effect of the Morris decision to produce a £100 car was, paradoxically, to strengthen the tone of the whole motor share market. Electrical shares moved within narrow limits, without any definite tendency. Rayons and textiles received a certain amount of support from the provinces. The Unilever companies were steady on a moderate turnover at the outset, but reacted when Amsterdam became a seller. Tobaccos were irregular, though Carreras showed a moderate gain after the meeting. Lautaro preference gave way, and the ordinary became a nominal market, on the postponement of dividends pending the outcome of the New York conference on "Cosach" finance. Bank shares were harder on a modest demand, but no interest was taken in insurance shares, apart from Prudentials.

Business was largely at a standstill in the rubber share market, the commodity being quoted at lower levels. Tea shares were as idle as ever, "heavy" shares remaining dull, though one or two Ceylon issues obtained slight support. Oil shares lost further ground, Royal Dutch being sold from Amsterdam and Eagle issues from Paris, while on Tuesday New York influences were also thrown on the bear side.

The mining markets were again extremely quiet. The Rand dividends created, on the whole, a good impression, but this was more than offset by the receipt of moderate selling orders from the Cape and Paris. Among Rhodesians, Chartered suffered a further decline, and the Northern copper propositions were largely neglected, pending the completion of the fusion arrangements between Congo Border, N'Changa and Bwana. On Monday, the price of tin advanced sharply on the Metal Exchange, as a result of bear closing and supporting orders, but the ensuing activity in tin shares was entirely professional, and died out when the rise in the metal was not held. Rio Tintos were in demand on the firmer tendency of copper.

FOREIGN STOCK EXCHANGES.

NEW YORK.

On Friday last week the New York stock market made a display of strength, after early irregularity, railways being particularly firm on widespread reports that the Eastern Roads had agreed on a consolidation scheme. Later, however, profit-taking left the list irregular, and the volume of trading was greatly reduced. The bond market, however, enjoyed a sharp rally, which was held in some quarters to indicate the end of the liquidation movement by the banks. Christmas week opened with an unsettled tendency, which became more pronounced in the later dealings. Though no violent liquidation was experienced, many stocks recorded sizeable losses, including Steel Corporation, American Telephone, Westinghouse and General Electric. In some quarters the setback to recovery was

ascribed to nervousness, following further country bank failures, while in other quarters tax-selling and other temporary features were given chief responsibility. Seasonal holiday trade throughout the country developed fairly well, but this was partly due to the stimulus of important price reductions made by the large stores and the mail order houses.

CANADA.

After a spell of heavy liquidation during the first half of November, Canadian stock markets remained fairly steady for some time, with little business, but early in December they resumed a downward course in sympathy with New York. Some issues have now receded to the levels of 1926. There is no tangible evidence as yet of a business revival, and the situation in the West of Canada has changed for the worse. Many factors have combined to bring about the present situation, including the continued decline in commodity prices, difficulty in marketing the Western grain crop and the resulting embarrassments of the wheat pools (in which the banks are heavily involved), the passing of dividends by companies like Massey-Harris and Noranda, the rumoured impending suspension of other dividends, the internal troubles of countries like Brazil and Cuba (in both of which a great deal of Canadian capital is invested) and the curtailment

TO AUGMENT CAPITAL

INVESTMENT

by L. L. B. Angas

(Author of "The Coming Collapse in Rubber," 1926.)

A book which shows how to detect the beginnings and endings of slumps and booms in single industries, and how to exploit the fluctuations which take place in shares on the Stock Exchange.

Rules are laid down for the timing of both buying and selling, and directions are given for taking profits and losses.

A valuable feature of the book is the list of faults which must be avoided.

The Economist: "To the Stockbroker, and even more to the individual investor, this book will be a *valde magnum*, the mastering of whose principles will repay in hard cash many hours of study."

Financial News: "The most remarkable book on the technique of speculative investment published in England since the War."

Publishers: Macmillan & Co., St. Martin's Street, LONDON, W.C.1. 187 pages. Numerous Charts. PRICE 20/-

of the public's purchasing power as the result of increasing unemployment. The liquidation of stocks, however, has been orderly and gradual, with nothing approaching a panic. Most speculative operators have been driven out of the market, selling now being done by genuine investors. Last month hopes were entertained that the consummation of another merger would improve the outlook for newsprint companies, but the negotiations have apparently come to nothing. Stocks of all companies which depend upon Western business are in particular disfavour, and issues like International Nickel and Brazilian Traction, which are also listed in New York, have had to face heavy selling pressure. The mining market is also depressed, apart from the stocks of well-established gold mines like Dome and McIntyre.

INVESTMENT NOTES.

American Banking Position.—The crisis in the American stock markets arising out of the failure of the misnamed Bank of United States has, so far, had less extensive repercussions than were at one time feared, but the general situation is not yet clear. The collateral loans of Federal Reserve member banks are nearly as high as they were a year ago. Actually, the total loans on securities (including other lenders as well as banks) have been reduced from nearly 17 billion dollars a year ago to approximately 10½ billion dollars at the present time, a reduction of nearly 40 per cent. The fact that collateral loans of the member banks have not appreciably declined is explained by the shifting over of loans made by non-banking customers to banks. Loans on account of "others," which played such an important part in the stock market gamble last year, have now been reduced by about 90 per cent. during the past year. The member banks of New York City have now little more than 1 billion dollars liability on account of "others," i.e., loans placed by banks for customers, whereas last year they had a liability of more than 5.2 billion dollars on this account, a considerable part of which they might at any time have been called upon to take over. The National City Bank, in its December Bulletin, has given some interesting figures, which enable the American failures of 1930 to be seen in their true perspective. Bank failures this year have been greater in numbers and in deposits involved than in previous years; but, under the present system of small independent institutions, country bank failures are a regrettable but not abnormal feature of American business life. The following table, given by the National City Bank, shows that in no year since 1921 has the number of suspensions been less than 354:—

Year.	Number of Suspensions.			Deposits in Millions.		
	Total.	Member Banks.	Non-Member Banks.	Total.	Member Banks.	Non-Member Banks.
1921	501	70	431	\$196	\$43	\$153
1922	354	57	297	111	24	86
1923	648	124	524	189	51	138
1924	776	159	617	213	74	139
1925	612	146	466	173	67	106

Total ...	6,382	1,094	5,288	\$2,033	\$566	\$1,467

* Ten months to October 31; subject to revision.

In the nine-year period 1921-1929, some 3,514 of the 5,642 "banks" which failed had a capital of \$25,000 or less, and 3,411 were located in towns of less than 1,000 population. The failure of the Bank of United States, which was a member of the Federal Reserve System, was a more serious affair, and it is to be hoped that failures of this order will be few and far between. The total number of failures for 1929, however, is expected to exceed one thousand.

Brewery Company Profits.—The ability of the brewing trade to make good profits in the face of increasingly heavy taxation, keen temperance propaganda, and industrial depression, has been exemplified by the majority of recent brewery company reports. In the following table, sixteen of the most important breweries have been selected from those companies which have published their accounts since August last and their results have been compared with those for 1929. Thirteen companies have increased their profits, while, in the aggregate, net revenue exceeds by £564,217, or 8.3 per cent., the corresponding total for last year. Four companies have increased and two decreased their dividends, but of the latter Benskin's Watford Brewery has paid 17½ per cent. against 25 per cent., on a trebled capital, part of which was issued on bonus terms:—

Company.	Net profit, 1929.	Ord. Div.	Net profit, 1930.	Ord. Div.	Present price.	Yield %
Allsopp	£ 128,240	8	£ 145,323	8½	23½	7 10

* Tax free.

Some of the smaller companies, which are not dealt with in the above table, present a less uniformly satisfactory record, but it is impossible to say how far diminished profits can be correlated with industrial depression. Many of the small local breweries, while still in a strong position, would be among the first to suffer were restrictive legislation, in the future, to be locally applied. Though the Licensing Commission is not expected to report until the early spring, an unofficial forecast has been made, that the majority will recommend significant alterations in the *status quo*, particularly in relation to the condemnation of "special removals," the curtailment of occasional licences and drinking facilities on new estates and in clubs, and the enforcement of Sunday closing. How soon and to what extent such proposals would be likely to be translated into law, it is impossible to forecast, but shareholders should keep their possibilities in mind.

Australian Company Profits.—The success of the recent £28,000,000 Internal Conversion Loan—which was fully subscribed by the middle of last week, some £16,000,000 being received in cash and £12,000,000 in conversions—has been welcomed in this country, though other developments, such as the bonus on increased gold production and the bill to advance 3s. a bushel f.o.b. to wheat growers, are less favourably viewed. Meanwhile, it is of interest to examine the recent profit statements of well-known Australian companies to ascertain how far their earnings position has been affected by the continuing

economic depression. The following are the recent figures for eight companies with a substantial British interest:—

Company.	Net Profit.		Ordinary Dividend.		To Reserves, 1930.	Increase or decrease in carry-forward, 1930.
	1929.	1930.	1929.	1930.

Total	2,053,858	1,191,843	...	...	207,200	- 32,600

† Free of British income tax.

Although placed in London in the same category as Dalgely's and Elder, Smith, the Australian Mercantile Land and Finance really comes under a slightly different heading. A greater amount of its interests are in stations in Queensland and New South Wales which it itself owns. The Queensland drought has been heavy, and the fact that the company actually earned a profit is probably due to profits which it made in conducting wool sales. With a better wool-clip from clients and the recent beneficial rains in all parts of Australia, its future should show a marked improvement. In order to meet its dividends it was necessary to draw £50,000 from its reserves, which are, however, substantial. The £25 shares, £5 paid, are quoted at £2, yielding £8 15s. per cent. as compared with £6½ a year ago, yielding £8 per cent. Dalgely's and Elder, Smith both have their interests widely spread over all agricultural activities. Their profits dropped last year by 44.16 per cent. and 43.32 per cent. respectively. Both concerns own their own stations, finance "the man on the land," conduct wool and wheat sales, and have interests in the shipping and motor-car business. Both are sound concerns, but Dalgely's generally pay away a smaller percentage of their profits in the form of dividends. The price of Dalgely shares of £25, £5 paid, has fallen from £12½ to £7½, the yield being practically unchanged at £6 17s. 11d. Elder, Smith's are not quoted in London, but their latest Melbourne quotation is £6 7s. 9d. lower than a year ago at £4 6s. 3d., the yield being £6 19s. 1d. The Sulphide Corporation is dealt with on another page. Kandos Cement, an Australian company, has been obliged temporarily to close down its works, its store houses being full. The falling off in the earnings of the two banks was, naturally, less than in the case of the industrial concerns, the declines being 17.3 per cent. in the profits of the A.B.C. Bank and 9.7 per cent. by the E.S. and A. Bank. The latter bank was able to maintain its dividend rate, since it has always made heavy allocations to reserves. The present price of the A.B.C. shares is 17s. 6d. per share, as compared with 28s. a year ago, the yield being £8 per cent. The E.S.A. £5 shares, £3 paid, are priced at £4½, as compared with £6½, the yield having risen from £5 10s. 1d. to £8 16s. 5d. Murray's and Paterson's are wholesale warehousemen. The policy of the large retail stores of Australia is adversely affecting this trade, since the stores now conduct their own importing; they also supply the country storekeeper and conduct a mail-order business on a large scale. Murray's have withdrawn £60,000 from reserves to meet their preference dividend of £70,000 and passed their ordinary dividend. Paterson's showed a decline of 53.2 per cent. in profits and paid a dividend of 3 per cent. The profits for the eight companies, in the aggregate, show a fall of £862,015, or 41.97 per cent., the greater part of which reflects the severity of the setback which Australia's progress has lately suffered.

Amalgamated Cotton Mills Trust.—The continued unsatisfactory experience of this Lancashire textile holding company is a further indication of the deplorable present condition of the industry. For the year to October 31st

last, gross receipts on an issued capital of £7½ millions amounted to £60,119, compared with £84,457 in 1929. Expenses, including directors' fees, accounted for £12,731, interest required £42,142, and the balance of £5,246, together with £3,683 brought in, was carried forward to the next account. The dividend on the £2,600,000 cumulative preference shares is in arrear from May, 1925, and amounts to about £875,000. The ordinary shares have received no payment since 1919.

	Year to October 31,		
	1928.	1929.	1930.
Gross receipts	£ 71,107	£ 84,457	£ 60,119
Expenses	15,500	10,010	12,731
Interest	45,630	51,420	42,142
Net revenue	9,977	23,027	5,246
Brought forward	Dr. 29,321	Dr. 19,344	3,683
Carried forward	Dr. 19,344	3,683	8,929

The operating subsidiaries record a trading loss of £76,055, against a profit last year of £142,217. Some £479,893, of which £132,191 was taken from reserves, is written off in respect of depreciation of stocks, while depreciation of plant is shown at £113,009, and debenture interest and preference dividends to outside shareholders account for £194,297, leaving a total debit of £731,063. The directors refrain from prophesying any widespread improvement in the immediate future. The trust's balance sheet reveals a somewhat weak position. Investments totalling £7,956,188 are shown at their original cost, while loans and creditors amount to £979,291, against £226,535 for debtors. The board has apparently reversed its decision against the disclosure of subsidiary figures since last year's general meeting and has now appended a summary of the assets and liabilities of subsidiary and associated cotton mill companies. This shows an excess of assets over liabilities, apart from share capital, of £4,622,613. Closer examination reveals, however, that fixed capital, which includes an unstated amount of goodwill, totals £7,582,325, as at the date of acquisition by the company, less depreciation of £1,613,881 written off over a period of some ten years, and before adding recent acquisitions. Stocks totalling £2,218,715 are presumably taken at market price. Investments, which account for £80,826, are shown without comment. At the annual meeting the chairman stressed the necessity of reducing costs to enable the Lancashire mills to compete successfully with cheaper foreign goods, especially those coming from Japan. The heavy fall in commodity prices, he declared, had severely affected purchasing power in the East, and since 75 per cent. of Lancashire's output is exported, the mills are now working a little more than one-half of their full capacity. The fall of 4d. a pound in the price of cotton had resulted in a loss of £479,893 by the company and its subsidiaries.

HARRIS, FORBES & COMPANY LTD

77 CORNHILL, LONDON, E.C. 3

GOVERNMENT, MUNICIPAL,
RAILWAY, PUBLIC UTILITY,
INVESTMENT TRUST AND
INDUSTRIAL FINANCING

African and Eastern Meeting.—Sir Robert Waley Cohen, chairman of the African and Eastern Trade Corporation, revealed numerous significant facts, at last week's general meeting, regarding the relations between the United Africa Company and the Unilever group. The general scope of the latter company's interests is discussed in a leading article on page 1227 of this issue. Sir Robert pointed out that although the holding of African and Eastern in United Africa represented only about 45 per cent. of the total capital, legal precautions had been taken to secure that the former company had the right to an equal voice in affairs with Unilever. If any dispute were to arise, Sir Robert added, the powers of African and Eastern were equal to those of Unilever, and no decision could be taken except as the result of independent arbitration. No dispute with Unilever as regards trading or financial policy had, in fact, arisen; the only difference of opinion had been about the nature of the management. The African and Eastern had been in favour of the appointment of two managing directors, one for each party, but the Unilever group had insisted on three managing directors under the control of an executive committee, consisting of four members chosen from the board. The African and Eastern directors had given way and the affairs of United Africa were now in effect managed by a committee. Sir Robert added that he was chairman of the committee, but that he could not accept the same responsibility for the conduct of affairs as he undertook on the formation of United Africa. As regards actual trading operations, Sir Robert declared that the company was in the unfortunate position of having to exchange with the native producers of primary commodities, which had fallen heavily in price, a range of manufactured goods the prices of which had fallen to no proportionate extent. The company found it necessary to carry large quantities of produce and merchandise, and had taken heavy inventory losses on these stocks at present market values. In these circumstances, it had concentrated upon economies in operating expenditures and had been able to reduce its overhead charges by about £435,000 per annum. In spite of the elimination of wasteful competition it had worked with almost no final profit. Sir Robert admitted that there was still reason to be anxious about the cocoa trade, in which the company had made heavy losses in the past year. Consumption had declined and the price of cocoa this season had touched a figure nearly 50 per cent. below the average price of last season's crop. The main cause of the excessive fall in price, which was greater than the relation between supply and demand warranted, was the severe competition which still existed in the cocoa trade. The organisation of the cocoa business he described as "a very unscientific piece of commercial machinery." The evils which had been brought about by excessive speculation in cocoa futures could only be mitigated by closer co-operation among all concerned. The United Africa Company had made almost superhuman efforts to secure co-operation among its principal competitors, but so far had not met with great success. Sir Robert added that considerable economies might be effected if the Government also showed a greater willingness to co-operate. The Government was holding very large stocks of materials of all kinds, duplicating the stocks held by private organisation. The suggestion he threw out that the Government should transfer to private enterprise some of the activities which, in the primitive stage, it had been obliged to undertake, merits sympathetic attention.

Chosen Corporation Developments.—In last week's *Economist* (page 1182), we summarised the statements made by three directors of the Chosen Corporation in a circular addressed to shareholders before the annual meeting. The latter took place last Friday, December 19th. After the chairman, Mr M. C. Harman, had addressed the shareholders, Mr Bourke-Borrowes, one of the three dissenting directors, declared that profits remitted from Korea had been left on deposit with the British Bank for Foreign Trade (of which Mr Harman is chairman), and

that difficulty had been experienced in withdrawing them in other than small sums. Answering numerous questions, Mr Harman admitted that no security had been given for these amounts by the bank, but declared that it was not customary for depositors to demand security from their bankers. He contended that the bank's deposits were "covered" on the average, by advances of about 35s. for every pound of deposits, and that the bank's affairs were under the supervision of a committee representing the chief creditors, and had retained the services of two leading firms of chartered accountants. Mr Harman disclosed that in the last eighteen months the current and deposit account liabilities of the bank had fallen from £1,400,000 to £320,000, and described the fact of the bank's continued existence, despite this strain, as "good evidence of its ultimate solidity." In answer to criticism of alleged "group finance," Mr Harman rejoined that all mining companies worked in a group finance system. In short, Mr Harman apologised for nothing and withdrew nothing. After the vote, a poll was demanded, and Mr Bourke-Borrowes announced the retirement from the board of himself and two colleagues—Mr Rondon and Mr Casenave—who had been associated with him in the issue of the dissenting circular. The meeting thus confirmed the company's connection with the Harman interests. The £1 shares have been dealt in this week at 4s. 9d.

Hector Whaling Limited.—Shareholders of the Hector Whaling Limited find themselves in an unfortunate position, which was frankly disclosed to them by the chairman, Sir Karl Knudsen, at the general meeting on December 16th. The company's financial year ended in July, and the profits amounted to £94,543, or 28.5 per cent., on the ordinary share capital, as compared with £138,624 in the previous year, the reduction being due to the fall in the price of whale oil. The company's fleet usually proceeds to the whaling waters in the autumn, and it has been the practice of the company to sell part or all of its catch forward. This year, however, the company has not sold its oil forward, and, unfortunately, the price of whale oil has fallen further to £16 per ton. Discussions were being held in the spring with other whaling companies with regard to the restriction of output, and the formation of a selling pool, but before these discussions were ended some of the companies sold their oil forward at £25 per ton. The Hector Whaling Company, in other words, lost the market, and the chairman stated at the meeting that the company is prepared to put part or all of its catch into storage until the price of whale oil recovers, or the big consumers decide to re-enter the market. As a result, the directors wisely decided to conserve the company's financial resources by withholding the final dividend, the interim dividend of 12½ per cent. having been paid. The results for the past two years compare as follows:—

	Year to July, 1929.	Year to July, 1930.
Total income	181,109	144,809
Earned for dividend	138,624	94,543
Per cent. earned	60.8	28.5
Do., paid	25%	12½%
Carry forward	31,624*	84,754

* Less reserve appropriation, £50,000.

As regards the whaling operations, the chairman was able to report the addition of three new whale boats and considerable improvement in gun efficiency. The 1929-30 season's catch amounted to approximately 200,000 barrels and the results reported to date for the 1930-31 season showed a considerable increase on those of the previous year. The company's £1 shares, which were as high as 36s. 5d. this year, are now quoted at 14s.

Two Film Companies.—Two British film concerns formed during the boom of 1928—British and Dominions Film Corporation, Ltd., and British and Foreign Films, Ltd.—have just published their accounts for the past year. Like other new concerns in the

industry, both were caught napping by the coming of the "talkies." The loss made by the British and Foreign company during the first sixteen months of its existence was shown at £37,457. It is now stated that this figure must be raised to £54,185, owing to certain over-valuations. The total loss suffered during the past seventeen months was £90,509. The total loss to date is £144,754. The directors attribute to the previous management the company's unfortunate financial position. All cash receipts have been used to redeem loans or to pay creditors. The loss made by the British and Dominions Film Corporation was £48,741 for the seventeen months to November 30th last, making the total debit of the profit and loss account £181,349, including a loss of £127,220 made chiefly on silent films. It is understood that the company is negotiating with Paramount Famous-Lasky Corp. for the use of one of the new sound studios for ten years at an annual rental of £300,000. Negotiations are also said to be taking place with Regal Films, Ltd., for exhibition of the company's films throughout Canada. This is expected to involve at least £100,000. Both companies came into existence, in short, at what is now seen to have been an unfortunate moment, and both are carrying heavy accumulated losses in consequence. It is, however, satisfactory to hear that British and Dominions have been markedly successful with some of their recent "talkie" productions.

Tea Restriction in Dutch East Indies.—It has been reported from Amsterdam this week that a meeting of the Association of Dutch East Indian Tea Growers has decided in favour of the principle of restricting the tea crop in 1930 on the same basis as in 1929. Negotiations for restriction, writes our Amsterdam correspondent, were first undertaken at the beginning of this year between the British and the Dutch East Indian tea producers, with a view to arriving at a 10 per cent. "cut" in production. The negotiations were successful, and the resultant restriction is deemed by those concerned to have exercised a beneficial effect on the market. The Dutch growers were by no means unanimous when the scheme was first mooted at the beginning of this year. The original proposal was that they should reduce their production by 12 million metric pounds, but this was considered too great a sacrifice. It was pointed out that there had been a regular expansion in Dutch East Indian production in previous years, the total having risen from 131 million metric pounds in 1927 to 139 millions in 1928 and 147 millions in 1929. The potential production for 1930 would thus have been about 155 millions, against not more than 135 millions proposed under the original restriction scheme; the effective reduction proposed thus being as much as 13 per cent. The Dutch planters suggested a reduction of not more than 7½ million pounds, but the British planters declared this unacceptable, and eventually a restrictive figure of 8½ million pounds was agreed upon. Apparently, this week's Dutch decision involves agreement on the temporary continuance of restriction as a broad policy, but the exact figures have still to be worked out.

Sulphide Corporation.—Our mining correspondent writes: Last year's results were adversely affected, not only by the fall in metal prices but by the restriction of the company's industrial activities—although these influences were in some degree counter-balanced by improved recoveries and enhanced efficiency. As regards the first-named point, it may be mentioned that the average price received for lead was nearly £3 9s., and for zinc approximately £5 below the 1928-29 level. At £72,600 the net profit shows a decrease of £140,600. In view of the uncertainties in Australia, and of the further decline in metal prices, the directors are following a conservative policy in the distribution of earnings. Only 5 per cent., absorbing £30,000, is to be paid upon the preference shares, £7,200 being placed to reserve for contingencies, and £25,000 to taxation reserve. Actually, £21,000 was placed to reserve for contingencies twelve months ago; hence there seems little point in the directors' remark as to the "conservation of cash resources." With all

these Broken Hill companies, labour is a very important item. Hence it is to be hoped that there will be a satisfactory outcome to the conference now in progress with the unions regarding a revision of the terms of employment.

The Rand December Dividends.—Our mining correspondent writes: The proverbial ill wind has this year been exemplified in the case of the gold mining industry of the Witwatersrand. Owing to the depression in other branches of business, an ample supply of native labour has been available; indeed, we have heard of workers being turned away from mines. Largely as a result of the position in this respect, gold production has expanded to a record level, and the profits have been higher than for years past. Indeed, it is a long time since so many increases were shown in the half-yearly dividend declarations compared with those of the preceding period. Our usual table is given:—

Company.	Dec., 1929.	Total, 1929.	June, 1930.	Dec., 1930.	Total, 1930.
Brakpan	25	48½	21½	22½	43½
Consol. Main Reef	5	10	3½	6½	10

* Tax free. † Less tax.

This table does not include declarations made at dates other than June and December.

Of the score of mining companies included in the above tabulation, practically one-half are paying more for the second than for the first half of 1930, the most notable example being the jump from 20 per cent. to 30 per cent. in the case of the Sub Nigel. Moreover, two shares—Simmer & Jack and Robinson Deep B—reappear after an absence of several years. On the adverse side, there is a small further decrease on the part of the New Modder, the total for the year being 132½ per cent., as against 140 per cent. for both 1929 and 1928. (The Village Deep, of course, ceased to be a mining enterprise in June.) In regard to the finance concerns, a very different story has to be told. The final distribution for 1929-30 of the Johannesburg Consolidated Investment Co. was paid less tax instead of tax free. In view of the falling off in the company's revenue from its diamond interests, the failure of the Potgietersrust Platinum undertaking, and of the at present unremunerative commit-

Castbury
Maker
of Fine Chocolates.

ments in Northern Rhodesia, fears of a cut in the rate had been entertained. But the decision of the directors to "defer" payment of the interim dividend altogether came as a shock, and resulted in a sharp fall in the price of the shares—since partially recovered. With the Rand Mines, also, some nervousness had been felt, this company being to some extent interested in the foreign undertakings whose position necessitated the passing of the Central Mining distribution. Fortunately, the cut is no more than 10 per cent.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following companies:—Orient Steam Navigation, Venezuela Telephone and Electrical Appliances, Harrods (Buenos Aires), W. Abbott and Sons, Carreras, and Samuel Allsopp and Sons. Presiding at the annual meeting of Carreras, Ltd., the chairman said that the Indian boycott had had an adverse effect on the company's sales in that country, and the general world depression had also affected the company's sales. Sir Alan Anderson told the Orient Company shareholders that the Australian situation had, naturally, greatly affected the company's earnings. The chairman of Harrods (Buenos Aires), Ltd., informed shareholders that the company's earnings had been seriously affected by the recent upheavals in the Argentine. A further hindrance to progress was the severe drought which that country had recently experienced.

AUSTRALIAN ESTATES AND MORTGAGE.—Figures so far available make it very improbable that the results for 1930 will permit the final dividend to be paid on the preference shares of the Australian Estates and Mortgage Company. In view of the general position in Australia it is considered essential that liquid resources should be conserved, and that the reserve should not be further drawn upon for dividend payment. The matter will be considered when the accounts are available. The interim preference dividend was duly paid last July. For 1929 the full preference dividend was paid with the assistance of £100,000 taken from reserve, but the ordinary shares received nothing, as against 5 per cent. for 1928.

CORDOBA CENTRAL RAILWAY.—The directors announce that they have decided to postpone payment of the half-year's interest due on January 1 on the 5 per cent. second debenture stock.

MILLARS' TIMBER AND TRADING.—The directors announce that having regard to the heavy falling off in sales consequent upon industrial depression in Australia and elsewhere, they do not feel justified in paying the interim half-yearly dividend on the preference shares, due January 1, 1931.

STEEL INDUSTRIES OF GREAT BRITAIN, LIMITED.—In view of the decision of the directors of The United Steel Companies, Limited, not to declare an interim dividend, no interim dividend on the 6 per cent. cumulative convertible preference shares of £1 each, fully paid, of Steel Industries of Great Britain, Limited, will be paid on January 1, 1931.

UNITED STEEL COMPANIES, LIMITED.—In view of the continued depression in the coal, iron and steel trades, and the necessity of conserving the resources of the company, the directors of The United Steel Companies, Limited, have decided not to declare an interim dividend.

COMPANY MEETINGS, &c.

VENEZUELA TELEPHONE AND ELECTRICAL APPLIANCES COMPANY, LIMITED.

CONTINUED DEVELOPMENT OF THE UNDERTAKING.

"A TRULY NATIONAL AND EFFICIENT SYSTEM."

SIR ALEXANDER ROGER'S SPEECH.

The fortieth ordinary general meeting of Venezuela Telephone and Electrical Appliances Company, Ltd., was held, on the 19th instant, at Winchester House, Old Broad Street, London, E.C.

Sir Alexander Roger (chairman of the company) presided.

The Secretary (Mr F. Hollyer) having read the notice convening the meeting and the auditors' report,

The Chairman said:—Gentlemen, As you will have seen from the directors' report, the company has suffered a great loss through the lamentable death of Mr Cecil Langham Reed, one of its directors, and, on behalf of his colleagues, I wish to place on record our appreciation of the good work accomplished by Mr Reed during the short time he served on the board of your company. (Hear, hear.)

As the report and accounts have been in your hands for some days, I presume you will take them as read.

BALANCE-SHEET ITEMS.

The assets in the balance sheet under cost of property account show that the substantial sum of £93,964 has been expended on capital additions. This represents expansion at a high rate, being over 14 per cent. addition on the capital account. Stores and materials at £55,959 may perhaps at first glance appear to be rather large, but, as explained before, Venezuela being some distance away from the sources of supply, it is necessary to have material available to avoid delay in connecting subscribers.

Sundry debtors at £28,094 is approximately £10,000 larger, but, as usual, the principal item of this sum is made up of subscribers' unpaid balances for June and part of May. The proportion of bad debts arising, I am glad to say, is generally negligible. A new item appears of subsidiary companies at £99,448. To the extent of over £84,000 this represents the purchase of the Maracaibo Telephone Company, to which I will refer later, and the bulk of the remainder represents telephone equipment in transit for Maracaibo.

Reserve for renewals and depreciation account at £123,388, to which a further £10,000 will be added, making £133,388, is equivalent to 18 per cent. of the cost of property account.

A valuation of the company's plant and properties has been made by a leading firm of qualified telephone property valuers, and it shows that the physical assets are of greater worth than the figures in the balance sheet.

It had been thought that when the conversion of the Caracas exchange to automatic operation had been completed, which it now is, some additional writing down of obsolete plant might be necessary. The valuation shows, however, that the existing reserves are real and on the generous side.

RESULT OF THE YEAR'S OPERATIONS.

As regards revenue, the item of subscriptions, at £149,271, represents a gratifying increase of 13.6 per cent. You will notice also the profit of £3,700 resulting from operating the Maracaibo Company for the 10-months period ended June 30, 1930. Operating and other local expenses, at £78,501, have increased by less than 5 per cent., which is a matter of congratulation to our staff. London expenses are higher on account of continued development. Interest on loans is heavier, due to temporary borrowings being on a larger scale.

The result of the year's operations is a net profit of £51,780, as compared with the £38,387 profit figure of last year.

After deducting the final dividend of 4 per cent. on the preference shares, the amount of the dividends recommended now—that is, the dividends of 8 per cent. on the ordinary and "A" ordinary shares—and transferring £10,000 to the reserve for renewals and depreciation, we carry forward £47,294 on profit and loss account, compared with £31,128 brought in. This, I think, you will regard with satisfaction.

ACQUISITION OF MARACAIBO UNDERTAKING.

As already stated, we have purchased, in August, 1929, the telephone undertaking of Maracaibo. Maracaibo has a population of approximately 80,000 persons, being the second largest town in the Republic. We think the purchase will prove advantageous both from the public point of view and our own, but, as is not unusual with small telephone properties, it was necessary for the

whole system to be technically overhauled. This has been done, and we are putting the Maracaibo undertaking on a sound basis for future expansion. At present there is an industrial slump due to the restricted output of the petroleum companies in Maracaibo and district, but we believe that to be temporary. The Maracaibo Company has now been merged with the Nacional Company.

The Caracas exchange has been wholly converted to automatic working, and additional automatic equipment is already on order. The exchange at Maracay has also been converted from manual to automatic, and work is well advanced on similar conversions at Puerto Cabello and Valencia. Automatics will be installed in the near future at La Guayra, Sabana Grande, and Dos Caminos. At June 30th last the company's subscribers numbered 10,505, an increase during the year of 1,040, or approximately 11 per cent.

The balance sheet shows that the sums owing by way of loans to the company's associated interests amounted to £165,836 at June 30th last. Since that date the bulk of the outstanding 6 per cent. and 7 per cent. debentures have been redeemed and public notice has been given of the company's intention to pay off the remainder. Cash has been deposited with the trustees to satisfy the debentures covered by the notice, and the trustees have executed documents releasing the debenture mortgages.

FURTHER EXPANSION IN PROSPECT.

As also mentioned in the directors' report, the shareholders gave their consent at the extraordinary general meeting of the company held on September 10th last, to transfer the company's property to a local company in exchange for shares. These arrangements have proceeded satisfactorily, and the operating is now being conducted under the auspices of the Nacional Company, to whom the local staff has been transferred.

In consequence of these important transactions and expansion which have been carried out during the past eighteen months, the directors are giving detailed consideration to the constitution of the company, the capital and loan account, which latter at the present time is in the neighbourhood of £400,000, and the local organisation. It is hoped that very shortly plans will be put before you which we think will be of interest to you, and will put the company in a position to undertake further development of its national telephone business in Venezuela with advantage both to the public which it serves and to the company.

We were very glad to be able to take part in the commemoration of the centenary of Simon Bolivar, the liberator of the five great countries—Venezuela, Colombia, Ecuador, Peru, and Bolivia—and we appreciate the remarks made by the Venezuelan Minister at the Latin American Society's dinner which was held last night, when he stated that the first European Power to recognise their countries as Sovereign States was Great Britain, who continued to be the same friend she had always proved to be.

Representing as we do a conspicuous example of British enterprise in the Republic of Venezuela, we also welcome heartily his remarks to the effect that Britain contributed from the first, and contributes to-day, with her capital and enterprise, to the economic development of Venezuela. We can echo his wish with all sincerity that this old and mutual friendship will gain nothing but strength in the future.

VENEZUELA'S SOUND FINANCIAL POSITION.

It may not perhaps be generally realised that Venezuela has developed into one of the most prosperous, relatively, of the South American Republics. Since the discovery of petroleum in the Maracaibo Lake basin, for example, the country has become second only to the United States among the oil-producing countries, and it is conceivable that there are still large areas rich in petroleum yet to be discovered. The finances of the country are satisfactory, and the surplus of revenue over expenditure each year continues. The Government has recently announced that it intends to liquidate its External Debt on January 1st next, which will reduce the Public Debt to considerably less than a million and a quarter pounds, and this is being annually amortised. Very few, if any, countries of the world can produce such a healthy financial statement of affairs as this.

The telephone service of the company has been brought up to date by the introduction of the most modern automatic plant, and development in every possible direction has been made. The company may fairly claim to have given the public of Venezuela a truly national and efficient system, with every capacity for expansion, all of which is a matter of prime importance to the business and social community of the Republic.

TRIBUTE TO STAFF.

Relations with the various authorities continue to be on the most friendly footing, and we record our gratitude for the assistance the Government have been ever ready to give to us. We are grateful, too, to the company's manager, Mr Vegas, and to all the *personnel* of the excellent technical and commercial organisation which has been built up around him. Mr Wallis, the company's late manager, continues to do most valuable work and maintains that personal contact with the board which is so helpful to the company's welfare. The company has a most hardworking and loyal staff in Venezuela, and the directors have the utmost confidence in the whole administration there. I am sure you will wish to associate yourselves with this expression of appreciation.

I now move:—"That the report and accounts be received and adopted, and that the dividends recommended therein be paid."

Mr Claude Bishop seconded the resolution, which was carried unanimously.

A resolution increasing the aggregate remuneration of the directors for a temporary period was carried unanimously. In connection with this the chairman explained that it did not mean an increase in the remuneration of the individual directors, but the resolution was necessary in order to provide for the fees of a sixth director for a short period. Since November 26th last the number of directors constituting the board had been reduced again to five.

Mr H. S. Bennett was re-elected a director of the company, and the auditors, Messrs Price, Waterhouse and Company, having been reappointed, the proceedings terminated with a unanimous vote of thanks to the chairman, directors, management and staff for the extremely satisfactory conduct and progress of the company's affairs.

W. ABBOTT AND SONS, LIMITED.

EMINENTLY SATISFACTORY RESULTS.

The twenty-first annual general meeting was held at the Registered Offices of the Company, "Farleigh House," 97-99 Cheapside, in the City of London, on Monday, December 22, 1930, Mr O. H. Abbott, the chairman and managing director, presiding.

The Chairman said, among other things: That with the shareholders' permission, he would adopt the usual procedure and take the report and accounts as read. The company had now reached the twenty-first year of its existence and was growing in size and importance every year. The year had been a very trying one for most businesses. He would touch on this later.

Turning to the profit and loss account, it would be seen that the year ended August 31, 1930, after debiting salaries, wages, rent, taxes, repairs, &c., and crediting transfer fees, resulted in a profit of £35,421 5s. 10d., to which must be added the amount brought forward from last year of £11,265 2s. 8d., making a total of £46,686 8s. 6d. A sum of £2,500 had been added to reserve in accordance with the articles of association. The reserve now stood at £55,600.

In view of the unprecedented trade depression, which was world-wide, and was being felt by all, the directors felt that the result of the year's trading was eminently satisfactory. It was never pleasant to receive a lower dividend on one's investments, but a conservative policy was necessary in such times and prudence should reap its reward later. There was a very widespread feeling that, as shoes were a necessity, our class of business was the last to suffer from a trade slump. That idea was erroneous. There were two sides to our business—the utility side, when shoes are bought as a necessity, and the luxury side, which embraces that extra pair or pairs that go to enrich one's shoe wardrobe. It was in such times of depression that the luxury side of our business suffered and profits were affected accordingly.

The directors' policy is progressive, and we are always on the look out for positions which appear promising for our business. As already mentioned, seven new branches had been opened during the period under review. A further branch had just been opened in Rye Lane, Peckham, and new premises at Ilford were now in the hands of our shopfitters. Each new branch strengthening and giving fuller emphasis to our trade slogan: "Quality—Service—Progress."

He had much pleasure in moving:—

"That the report and statement of accounts as submitted be received, approved and adopted," which was duly seconded and carried unanimously.

HARRODS (BUENOS AIRES), LIMITED.

SATISFACTORY RESULTS OF A DIFFICULT YEAR.

The annual general meeting of Harrods (Buenos Aires), Ltd., was held, on the 22nd instant, at Harrods, Ltd., Brompton Road, London, Sir Woodman Burbridge, Bt., C.B.E. (chairman and managing director), presiding.

The Chairman, in the course of moving the adoption of the report and accounts, said: When we met you last year I told you that we had every hope of maintaining our profits, unless unforeseen circumstances should arise. Since that time Argentina has passed through one of the most difficult periods of its history. Within a week after our last general meeting, the "Caja de Conversion" suspended the free delivery of gold in exchange for notes, in view of the large withdrawals, which reduced the monetary circulation. The exchange which was then already below par, immediately dropped still further, and, as you will have observed from the accounts, this has caused serious losses.

When the harvests were all gathered, it was found that the damage caused by the drought was much more serious than expected, the yield realised was very low, and unfortunately the reduced quantity of grain could only be marketed at unremunerative prices. As the greater part of Argentina's production is intended for export, there is no need for me to enlarge upon the severe drop in the national income, and the restrictive effect on the spending power of the general public when crops fail and prices are low. These circumstances might very well have produced a much more serious crisis, and we are indeed in a fortunate position, when we are able to report a net profit of £470,000 for the past year.

FIGURES COMPARED.

The setback of the past year unhappily causes a break in the steady and consistent progress shown in the profits of the previous five years, which, I may remind you, include the dividends received from the South American Stores, and are as follows:—

In 1925	£ 224,000
„ 1926	294,000
„ 1927	396,000
„ 1928	511,000
„ 1929	558,000
and „ 1930 they were.....	470,000

a decreased profit of £86,000, which is entirely attributable to loss on exchange upon remittances.

Excluding exchange losses, Harrod's (Buenos Aires) has shown increased net profit, while the South American Stores just failed to maintain their profits.

Last year I mentioned that the combined trade of our companies showed an increase of £800,000 for that year. During the twelve months under review we have suffered a decrease to the extent of £400,000. I think we must regard the figures as not unsatisfactory in the difficult circumstances through which we have been passing.

Though the trading has shown a decrease, the maintenance of our financial strength has been carefully guarded, with the result that the total liquid resources in cash and gilt-edged securities of our combined companies this year amount to £650,000, or an increase of £250,000 over the previous year.

The gross profit on trading amounts to £559,027, a reduction of £17,666, but I am very pleased to be able to say that the expenses, which total to £391,167, show a greater reduction, namely, £20,420, so that, in spite of the smaller sales and gross profit, we have made a larger trading profit. If you compare the figures in this year's profit and loss account with last year's, you will find that every controllable expense has been cut down.

The profit of the South American Stores (Gath and Chaves), Ltd., for the thirteen months to August 31, 1930, amounted to £470,725, and compares with £453,303 for the previous twelve months. As regards the Chilean Stores (Gath and Chaves), they were able to show improved results, their profits having been £30,374, an increase of £3,338.

Our current financial year commenced on September 1, 1930, and I am sorry to say that we have made a bad start. Our business has been considerably upset by the political disturbances; therefore, as you can quite understand, our trade and profits are showing a decrease, and the exchange is still low, so that a good first half-year cannot possibly be expected. Assuming we have a good, or at least a reasonably fair, harvest, exchanges may then improve, and we hope Argentina will be free from the elements of unrest which were present last year, and on those grounds we are hopeful of improved conditions in the second half-year, which commences on March 1, 1931.

The report and accounts were unanimously agreed to, and special resolutions were passed approving alterations in the articles of association.

CARRERAS LIMITED.

POPULARITY OF COMPANY'S BRANDS. TRIBUTE TO QUALITY AND PURITY.

The annual general meeting of Carreras, Ltd., was held, on the 19th instant, at Arcadia Works, Hampstead Road, London, N.W. Sir Louis B. Baken (chairman and managing director), who presided, said: Ladies and gentlemen, you will have noticed that the net profit for the year amounts to £988,204, and after writing off all expenses, including a contribution to the staff superannuation fund, and making full provision for depreciations, the amount available for disposal, including the net amount brought forward, is £2,027,369. This sum your directors propose to appropriate as set out in the report, leaving a balance of £1,057,160 to carry forward to next year.

The past year has, as you know, been a particularly difficult one in all industries.

Several of our best export markets have passed through specially troublous times in the period under review. In India the general boycott of British goods was an adverse factor, and resulted in a decline in our sales, but I am glad to tell you that there are already indications that our trade in India is getting back to its normal basis, and during the past month or more has shown a decided tendency to improve.

In Australia our progress has also been hampered, but for a different reason. Most of you are doubtless aware of the economic conditions which prevail in the Commonwealth, and that in the attempt to remedy their own financial position the Australian Government has considerably increased its tariffs and also placed severe restrictions on the quantities of cigarettes to be imported into the country. At the time the new regulations came into force, now some months ago, your directors took steps which they thought were most likely to conserve the valuable trade which we have built up in Australia. We realised that the action we took would involve trading on a very small margin of profit for a time, but we felt sure that it was wiser to do this than have our brands shut out of that market.

We also immediately set ourselves to devise further plans to meet the new position which had arisen, and which involved the manufacture of our products in Australia. I am glad to tell you we have obtained control of an established manufacturing business in Melbourne—a business with a very high reputation and a good solid trade. We are now pressing forward our plans to extend the factory accommodation there so that Carreras brands will be manufactured and sold under conditions which will enable us to compete both economically and successfully in that market.

In regard to the home trade, the whole of the tobacco industry has never, in my opinion, experienced such fierce competition than in the past year. Notwithstanding this, it is pleasant and satisfactory to record a most important point, namely, amongst the most popular brands ours are holding their own. The costs of advertising and selling our products have been considerably higher, but a gratifying feature is the fact that we have been able to stand up against heavy odds, to retain the good will of the public and the trade, and at the same time to employ our entire staff of contented workpeople at full wages throughout the whole year.

We have introduced several new lines, and you will be interested to know that our Black Cat Red Band cigarette, which was put on the market in October, is proving very successful, while Piccadilly No. 1—a very high-class production—is making most satisfactory progress. Our latest introduction is the Craven Navy Cut cigarette—a brother to Craven "A" but without the cork tip—which we feel sure will make a special appeal to smokers who prefer a non-tipped cigarette.

I should like to stress emphatically one all-important point of which we never have lost and never will lose sight and which has made our business what it is—that is the purity and quality of all goods which are produced in the Carreras factories.

During the past year we have entered into very close business relationship with the old-established and well-known business of John Sinclair, Ltd., of Newcastle-on-Tyne.

One of the greatest advantages which has accrued in connection with the John Sinclair business is that we have secured the services of Mr John Alexander Sinclair as one of the directors of Carreras. He is well known and well liked throughout the trade, and his knowledge, experience, and personal qualities will be a great asset in our business.

I have already referred to the intensive competition with which we have had to contend in the past year, and to have retained in spite of this, the volume of our home business under the conditions which have prevailed, indicates the strength of the public appreciation of our products. You have a business which has been built up on a solid and very sound basis, and that basis we are determined to retain.

The report and accounts were unanimously adopted.

CAPITAL and INTEREST

are both lost if your investments fail.

This loss may be avoided by investing in "Globe" Life Assurance, a gilt-edged security not liable to depreciation.

A copy of our new comprehensive prospectus, featuring many attractive schemes, will be sent post free on your request.

ORIENT STEAM NAVIGATION COMPANY, LIMITED.

BOARD'S PRUDENT DIVIDEND POLICY.

The thirty-first ordinary general meeting of Orient Steam Navigation Company, Ltd., was held, on the 19th instant, at 3 and 5 Fenchurch Avenue, London.

Sir Alan Garrett Anderson, K.B.E., who presided, in the course of his speech said: You will remember that last year we prepared ourselves for the bad weather ahead. Soon after our meeting the economic storm broke over Australia. It took a form that I certainly had not expected: the Australian banks suddenly told their clients who were contemplating a journey to Europe that it would be difficult for them to transfer their Australian balances into the world currency they required to use abroad.

The breakdown of the exchange stops Australia from buying British goods, so our cargo from London in the last six months is only half what it was a year ago. One needs cash to travel, so the ordinary travellers in first and third class are much reduced. As Australia cannot at present employ her own people, she cannot welcome new settlers. So the ships provided for migrants are not required.

In short, the only part of the trade between the United Kingdom and Australia which has not been rudely amputated is the export of cargo from Australia. For this wool, wheat, butter, fruit, &c., which he sells abroad the Australian receives world currency to-day 10 per cent. more than par in the Australian pounds with which he pays his local costs and wages.

No doubt, also, this crisis of bad trade and unemployment seriously as they damage business, unpleasant as they are to everyone, say to Australia in language which not even the deafest citizen can fail to hear: "Costs must come down without delay." Already, indeed, the Labour Governments of Victoria and South Australia are taking a firm stand over economy: already the shearers have agreed to a 20 per cent. cut in wages. Already the index figure of food and groceries in Australia, on which wages are partly based, has fallen from 165 per cent. in October, 1929, to 137 per cent. in October, 1930. The adverse balance of trade has not yet been corrected, but in three months, July-September, it has been reduced from £17,716,000 last year to £3,279,000 this year. Recovery is a slow process, but this is a good beginning.

Pastoral and agricultural production promise this season to beat all records. Last, but not least, of the favourable signs, Mr Latham, speaking for the Opposition in the House of Representatives at Canberra, offered recently to share with the Government the responsibility and odium of enacting such measures as the safety and credit of the Commonwealth State require, and we are now told that the Commonwealth have successfully negotiated the first financial obstacle that lay before them.

The profit for the year is £237,644. We ask you to approve an allocation of £25,000 of this to the pensions reserve and £50,000 to the general reserve account. This brings pensions reserve to £100,000 and the general reserve to £1,025,000, not far short of the par value of the ordinary shares. We also recommend a dividend of 7½ per cent., free of tax, on the ordinary shares, leaving a balance of £101,000 to carry forward. This compares with the dividend of 12½ per cent. which we have paid in each of the last nine years. The reasons for prudence in conserving our resources are obvious, and we feel sure you will support us in the dividend policy which we recommend.

While we do our best to supplement our earnings by cruises and trade between intermediate ports, the trade with Australia and New Zealand supplies 80 per cent. of our revenue. We need

Australia to prosper and progress. In the two great exports of wheat and wool her people have set the pace for the world, and now science promises to bring down the cost of producing wheat, wool and butter, so that even at to-day's prices Australia should do well. The road of progress is open. It is only the barrier of high costs which blocks their path.

The report was unanimously adopted.

SAMUEL ALLSOPP AND SONS, LIMITED.

INCREASED PROFITS AND DIVIDEND.

The ordinary general meeting of Samuel Allsopp and Sons, Ltd., was held, on the 19th instant, at the Cannon Street Hotel, London. Sir William Barclay Peat (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, said that the profits for the year, after deduction of interest, sinking fund, repairs, depreciation, &c., amounted to £145,323, compared with £128,240 in the preceding year, and £114,077 in 1928. They were proposing to carry to reserve £25,000, practically the same sum as that transferred to reserve last year, thereby increasing the published reserve to £260,000. They were paying 8½ per cent. dividend on the ordinary shares, as against 8 per cent. in the previous year and 7 per cent. in 1928, and were carrying forward £59,769, which was an increase in the carry-forward of £27,919.

ANOTHER INCREASE IN BARRELAGE.

Their trade had somewhat improved, as compared with the previous year. Their ales had been of the usual first-class quality, and the management of the brewery excellent. It was satisfactory to report that Allsopps had increased their barrelage each year during the last four years—that was to say, an increase upon an increase had occurred each year. In that respect their experience was better than that of brewers in general. That was a cause of satisfaction to the directors, and, he thought, to their customers, because they might deduce from the facts given that Allsopps beer might be said to be in popular demand. He was informed that the whole of their undertaking had been well maintained and kept in repair. Shareholders would no doubt agree that the results were satisfactory.

The brewing trade as a whole had not escaped a reduced consumption, but this company had not as yet suffered. They had maintained their barrelage. Industrial conditions all over the world had shown a marked deterioration during the past year, but he was not pessimistic as to the future of the country. They were passing through very trying times, but the country had a long record of successful enterprise and did not lack men of courage and ability to deal with difficulties.

Mr John H. Calder seconded the resolution, which was carried unanimously.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8, Bouverie Street, Fleet Street, London, E.C.4.

Government Returns, &c.

NATIONAL ACCOUNTS.

As is shown from the Treasury Return printed below, the total ordinary revenue for the week ended December 20, 1930, amounted to £4,125,000, against ordinary expenditure of £23,165,100. After allocating £7,620,400 to the Sinking Fund, and having allowed for a decrease in Exchequer Balances of £3,487,400, the week's operations, as shown below, increased the National Debt by £15,739,000 to £7,756,736,000:—

(000's omitted.)

Public Department Advances	+ 16,000	Bank of England Advances	— 9,500
Treasury Bills	+ 6,739	Road Fund	— 500
National Savings Certificates	+ 150		
4% Treasury Bonds	+ 2,850		
	+ 25,739		— 10,000

A complete analysis of the National Debt at the end of last quarter was printed in the *Economist* of October 4.

Martins Bank Ltd. have opened new branches at 27-29 Tothill Street, London, S.W.1, and at 213 Baker Street, London, N.W.1.

Lloyds Bank Limited announce that a branch of the bank is now open at 197 High Street, Penge, S.E.20.

The National Provincial Bank Limited announce that a branch of the bank is now open at 1 Cottenham Park Parade, Raynes Park, S.W.20.

Company News.

REPORTS AND NOTICES.

MISCELLANEOUS.

W. ABBOTT AND SONS, LIMITED.—The profit for year ended August 31, 1930, amounted to £35,421, which compares with £39,909 for year ended August 31, 1929. The dividend on the ordinary shares is 10 per cent. for the year, as compared with 15 per cent. for preceding year. The sum of £2,500 is put to reserve, against £3,100, and the carry forward is reduced from £11,265 to £9,047. The reserve account now stands at £55,600. The whole of the company's shops have been maintained in a good and efficient state of repair. Since the close of the company's last financial year seven new branches have been opened, and to other properties considerable alterations, additions and improvements have been made. Total assets amount to £506,925. Goodwill at cost is at £30,000. Cash is lower at £9,814, compared with £17,129. Stock at cost is at £294,356, against £292,503. Bank loan is at £54,945, against £29,750.

ILFORD LIMITED.—After making allowance for depreciation and provision for doubtful debts, &c., the net profit for year, October 31, 1930, is £133,218, against £121,512, and, with £14,220 brought in, there is available £147,438. The directors have transferred £22,000, compared with £15,000, to reserve fund, and from that fund have written off the expenses of the preference share issue, amounting to £32,000. Last year, in addition to the reserve allocation, £5,000 was written off goodwill. The directors recommend a final dividend of 10 per cent., making 15 per cent., on the ordinary shares, as last year, leaving £15,977 to be carried forward.

LOW TEMPERATURE CARBONISATION.—The report for the year to October 31, 1930, of Low Temperature Carbonisation, Ltd., states that sales and trading revenue amounted to £76,549, against £115,089 in the previous period of fifteen months. After deducting costs of coal and carbonising and salaries, &c., and including interest and dividends received, there is £30,475, from which is deducted running expenses, research and experimental work, costs leaving £2,683, against £11,578. Interest absorbed a further £12,000, leaving a debit balance of £9,317, which has been transferred to the balance-sheet, making a total debit at profit and loss account of £13,811. Meeting, Cannon Street Hotel, E.C.4, December 30th, at 12 noon.

STEEL INDUSTRIES OF GREAT BRITAIN, LIMITED.—The initial accounts, covering the period from June 25, 1929, to September 30 last, of Steel Industries of Great Britain, Ltd., show income of £105,764, consisting mainly of interest received in respect of "B" and "C" debentures of the United Steel Companies, Ltd., against which has been charged expenses and interest, leaving £92,383. Of this, preference dividends to June 30, 1930, absorbed £86,982, leaving a surplus of £5,401. The balance sheet shows the investment in the United Steel Companies at £6,627,631, while preliminary expenses appear at £110,854, and cash at £20,374. Liabilities include loans from bankers at £176,336, creditors £9,656, and amount due to the United Steel Companies £1,363. Meeting, 16 Great George Street, S.W., December 29th, at 2.30 p.m.

Commercial Reports.

THE CORN TRADE.

Mark Lane, Tuesday evening.

The seeding of winter cereals in this country has practically been completed. Although prices have not encouraged production, many reports indicate a larger area under cultivation, growers apparently being hopeful of some measure of Governmental assistance before next harvest. With holiday conditions in force, business on the import market naturally proved of small dimensions, and price variations have been unimportant. The proposal to allocate further funds in order to assist the Farm Board operations in stabilising prices in the United States, produced a steady effect on North American markets, but operations on this side were not influenced thereby in view of the heavy statistical position. Hopes are entertained in some quarters that bottom prices have been reached, and even that an improvement may be seen in the New Year. While optimistic sentiment is to be applauded during the present world-wide wave of depression, prospects in the grain trade appear far from rosy regarding any material advance in values. The world's total surplus of wheat is far in excess of consumers' requirements for the present cereal year, and financial conditions in most of the great exporting countries render it imperative to market supplies. Both British and Continental ports hold large stocks of Russian wheat that offers at low rates, consequently millers refrain from entering into future contracts. Although new crop estimates in Australia and Argentina have suffered some reduction owing to wet harvesting weather, larger quantities will be available for export than last season, and pressure to stimulate the export movement is steadily increasing.

WHEAT.—Quiet and easier. English new malting, 6s. 3d.-12s.; feed, 4s. 6d.-5s. 9d. per 112 lbs.

OATS.—Easier. Plate, landed, 12s. 9d.; ex ship, 10s. 6d.-10s. 9d.; Chilian tawny, landed, 13s. 6d.; best whites, ex ship, 19s. 6d.; landed, 20s.-20s. 6d.; mixed Canadian feed, landed, 11s.; North Russian, landed, 14s. 9d.; South Russian, ex ship to arrive, 13s.; ditto, landed, 13s. 3d.-13s. 9d. as to sample, per 320 lbs.; English new, 5s.-6s. per 112 lbs.

AMERICAN WHEAT MARKETS.

The following table shows wheat quotations in recent weeks with comparative figures for 1929:—

NEAREST FUTURE.	Jan. 2, 1929.	Dec. 15, 1929.	Jan. 2, 1930.	Dec. 10, 1930.	Dec. 17, 1930.	Dec. 22, 1930.
Winnipeg (No. 1 Manitoba) —Cents per 60 lb.	122	136½	148½	58½	54	50½
Chicago (No. 2 Winter) —Cents per 60 lb.	116½	121½	130½	77½	76½	76½

The visible supply of wheat in Canada at 60,694,000 bushels shows an increase on the week of 1,276,000 bushels. Supplies a year ago stood at 74,563,000 bushels.

THE COAL TRADE.

Our Sheffield correspondent writes:—Export demand for best steams and prices are both being maintained, but there is little forward contracting. House-coal demand is quiet again after the Christmas spurt. Industrial requirements continue poor, with a shrinking tendency. Consumption of blast-furnace coke is being reduced by a damping down of three further furnaces. Prices of best steams are 16s. and 16s. 3d. f.o.b., and coke 10s. 6d. to 11s. 6d. per ton at ovens.

Our Glasgow correspondent writes:—The coal trade is busy working off orders due to be completed before the end of the year. These are on a fairly heavy scale and there is not a great deal of any quality coming on offer in the market. In fact, so far as large coal is concerned, it is now practically impossible to secure any local tonnages. This position is likely to last until the end of the year, and meantime the collieries are quoting relatively high prices for whatever small parcels they have available. The ranges of prices for the shipping trade are round the following (f.o.b. district ports):—LANARKSHIRE.—Ell best, 15s.; splint best, 16s. 6d.; splint second, 15s. 6d.; navigation, 17s.; navigation second, 15s.; steam, 13s. 6d.; Hartley, 16s.; trebles, 14s.-14s. 6d.; doubles, 13s. 3d.-13s. 6d.; singles, 13s.-13s. 6d.; pearls, 12s. 9d.-13s.; dross, 10s. 3d. FIFE.—Screened navigation, 16s. 6d.-17s. 6d.; first-class steam, 13s. 6d.; third-class steam, 12s.; trebles, 14s. 6d.-16s. 6d.; doubles, 13s.; singles, 12s. 6d.-13s.; pearls, 12s. 6d.-12s. 9d. LOTHIAN.—Prime steam, 12s. 6d.; secondary steam, 12s.; trebles, 13s. 6d.-14s. 6d.; doubles, 12s. 6d.-12s. 9d.; singles, 12s. 6d.-13s.; pearls, 12s. 6d.-12s. 9d. Ayrshire.—Un-screened navigation, 16s.; jewel, 18s.; steam, 13s.; trebles, 14s.; doubles, 13s. 6d.; singles, 13s.; pearls, 12s. 6d.; dross, 11s.

Our Cardiff correspondent writes:—Prompt supplies have continued comparatively scarce on the Cardiff coal market, and, with colliery stems full, pre-holiday shipments are likely to be heavy. Prices are nominally unchanged. Under a decision of the Marketing Association, special measures have been taken to facilitate the

Address

shipment of pit-head stocks of dumped duff steam coals. The National Industrial Board has found it impossible to comply with last week's request of the executive committee of the South Wales Miners' Federation that it should expedite the hearing of the wages and hours dispute, and make its report in time for the joint board meeting fixed for Tuesday (December 23rd). The temporary terms on which the collieries are working expire at the end of the present year; still, it is thought likely that provisional arrangements will be made to continue work from day to day on these terms pending the consideration of the matters in dispute. The following are the current approximate quotations:—Best Admiralties, 20s.; seconds, 18s. 9d. to 19s. 9d.; best duffs, 18s. 6d. to 19s. 3d.; Black Veins, 18s. 3d. to 18s. 6d.; Western Valleys, 18s. to 18s. 3d.; Eastern Valleys, 17s. 7½d. to 18s. 3d.; best small steams, 13s. to 13s. 6d.; cargo smalls, 12s. to 12s. 6d.; coking smalls, 14s. to 15s.; anthracite, best large, 36s. to 37s. 6d.; Red Vein, large, 22s. 6d. to 27s. 6d.; machine-made cobbles, 40s. to 45s.; French nuts, 43s. to 46s.; stove nuts, 39s. 6d. to 43s. 6d.; rubbly culm, 9s. to 9s. 3d.; foundry coke, 29s. to 35s.; patent fuel, 20s. to 21s.; pitwood, ex ship, 27s. to 27s. 6d.

IRON AND STEEL.

Our Middlesbrough correspondent writes:—Deliveries of Cleveland iron to local consumers will be suspended after Wednesday, and most of the foundries will not re-commence operations until the first week in January. This will cause accumulations of stocks at the furnaces which will be inconvenient to producers, as they are not too well placed as regards orders with which to commence the new year. It is expected, however, that after the holidays are over they will decide upon a reduction in prices in order to induce consumers who have been holding back forward orders to come on the market for fresh supplies and thus check the importation of Continental iron and also the competition from the Midlands. In the meantime official prices are unchanged, viz.: No. 1, 66s.; No. 3, 63s. 6d.; No. 4 foundry, 62s. 6d.; and No. 4 forge, 62s. f.o.b. or f.o.t. Hematite is rather weaker and sales have been made for prompt delivery at 70s. for ordinary mixed numbers. For forward, however, makers look upon the prospects as satisfactory and are not inclined to accept less than 70s. 6d., while some ask 71s. Stocks will increase over the holidays to some extent, but a furnace on the Tees is shortly to be put out for relining. Shipments of pig iron continue on a small scale, the total cleared to 20th instant being 7,776 tons, against 7,787 tons to the same date last month. In the finished departments there is very little fresh business coming forward and most mills close down on Wednesday until the first week in January. Prices to home consumers under the rebate scheme are unchanged, viz.: Plates, £8 15s.; joists, £8 10s.; angles, &c., £8 7s. 6d. Among other quotations, heavy steel rails are £8 10s.; crown iron bars, £10 15s.; 24-gauge black sheets, £8 12s. 6d.; 24-gauge galvanised corrugated sheets, £11 5s., also for home use. There is nothing doing in ore. Best Bilbao rubio is nominally 16s. 6d. c.i.f. for early delivery and 16s. 9d. to 17s. for delivery over the first three and six months of next year. The rate of freight Bilbao/Middlesbrough for early tonnage remains about 5s. Coke is offered at 17s. delivered furnaces for early delivery, and slightly less has been accepted in some cases. The number of furnaces in blast in the district remains at 25.

Our Sheffield correspondent writes:—The open-hearth steel plants in the district have closed for two weeks, but in some cases melting is being continued throughout the stoppage. There is little work on hand or contracted for, and the inquiries relate to small quantities. The Lincolnshire works have also closed for two weeks or probably longer. The rolling mills in Sheffield have had a very unsatisfactory year. Some improvement in the iron and steel trade is hoped for next month, but it is felt that there can be no general revival until a decided change for the better in the international situation takes place. The overseas markets still constitute the weakest spot in the situation here. A moderate amount of business is still being done in high grade tool and special steels, including stainless materials. A large electric furnace has lately been installed at a Sheffield works which is to be employed entirely on melting stainless steel. The file trade has never been so bad. There is a fair inquiry for many kinds of hand and engineers' small tools.

Our Glasgow correspondent writes:—Business in the pig iron market is very quiet, and at the present time there are only six furnaces in blast. In almost every branch things are very dull, partly owing to the continued poor demand for export and partly on account of the impending holidays and, in some cases, stocktaking operations, which are causing buyers for home consumption to restrict their purchases to immediate requirements only. In the sheet trade bookings for early delivery are keeping up to recent levels, but are not sufficient to keep all the mills employed. Tube makers are having a lean time and here also plant is not fully employed. There are indications that the New Year holidays will be somewhat prolonged, and in very few cases will the stoppage be for less than a week.

Our Cardiff correspondent writes:—The position in the various departments of the South Wales iron and steel industry is unchanged. Production will be considerably restricted this week by the Christmas holidays, and the market is hopeful of an improved demand for timplates and galvanised sheets with the turn of the year. Prices are unaltered.

OTHER METALS.

TIN.—In the standard market the tone was strong, values advancing sharply on improved inquiries and lighter offerings, Eastern advices being firmer. Standard cash changed hands at £105 5s. to £114 7s. 6d.; three months, £106 5s. to £115 15s. In the East, sales were reported at £110 5s. to £113 7s. 6d. per ton c.i.f. terms.

COPPER.—Market firmer in face of a better demand, sellers showing more reserve. Standard, cash, sold at £45 12s. 6d. to £47 5s.; three months, £44 17s. 6d. to £47 per ton.

LEAD.—Market quiet, but tone steadier on lighter offerings. Good soft foreign pig, January, sold £14 17s. 6d. to £15; February, £14 17s. 6d.; March, £14 16s. 3d. to £15 per ton.

SPELTER.—Firm, with improved inquiries. December sold at £13 11s. 3d.; January, £13 13s. 9d.; February, £13 16s. 3d. to £14; and March, £14 to £14 5s. and £14 3s. 9d. per ton.

ALUMINIUM.—Steady. Home trade and export, £85 per ton.

TIN PLATES.—Quiet. I.C. coke, prompt and forward, 15s. 9d. per box f.o.b. Swansea.

QUICKSILVER.—Maintained. Spot, £21 15s. to £22 per bottle.

ANTIMONY.—Steadier. English regulus, £38 to £45; Chinese ditto, spot, £26; afloat, buyers, £24 10s.; Chinese, January-February, quoted £22 15s.; crude, January-February, buyers, £14 per ton c.i.f.

ANTIMONY OXIDE.—January-February, £24 10s. per ton c.i.f.

ANTIMONY ORE.—60 per cent., January-February, 3s.; 50 per cent., ditto, 2s. 6d. per unit c.i.f.

WOLFRAM.—Quietly steady. Chinese, January-February, sellers, 14s. 3d. per unit c.i.f.

THE COTTON TRADE.

MANCHESTER, December 22nd.

Business in the market during the past week has been disturbed by the wider fluctuations in raw material rates and the approaching holidays. Owing to the slackness which has existed for some time now, it is not reasonable to anticipate a revival of demand this Christmas week. Only a miscellaneous trade has been put through in piece goods for India. On the whole, less satisfactory advices have been received with regard to the political situation. Shippers to China have continued to look on, and there is no hope of an increased demand until there is an improvement in the price of silver. Buying for the several minor outlets East and West has been confined to sorting up lots. Some manufacturers are being compelled to extend the usual holidays. Here and there a little more inquiry has been experienced in American and Egyptian yarns. Although sales of any weight have been exceptional, the turnover shows a slight improvement, but the prices secured have given no satisfaction to spinners.

THE WOOL TRADE.

Our Bradford correspondent writes:—Overseas cables reporting the results of the last auctions in Australia, New Zealand and South Africa clearly indicate that values ruling at the end of the year are exceedingly low, and consequently very disappointing to growers everywhere. The average price of a bale of wool in Sydney is now between £10 and £11, or just over 8d. per lb. This is far too little, for if wool were selling at 33 per cent. more, it would barely cover the cost of production. It is doubtful whether the average for wool in New Zealand is 6d. per lb. in the grease, whereas growers need 10d. to get out without loss. The outstanding feature of this year has been the expanding demand for the raw material, especially merino wool, coupled with a sharp decline in prices which proved disastrous to wool growers. The consumption of merino wool is proceeding rapidly, and it is safe to assume that the bottom has been touched in both merinos and crossbreds. It is absolutely unreasonable to talk about lower prices, stabilisation being urgently needed. Steps have been taken in this direction in South Africa, where definite limits have been fixed for future sales. This is a sound policy which is entirely justified under present circumstances. The following are the reserve prices put on wool offered in Port

Elizabeth and other coastal ports. The clean coat delivered Bradford is also given:—

THE JUTE TRADE.

DUNDEE, December 22nd.

Conditions in the jute trade are now very quiet, and there is little or no hope of improvement until the Christmas and New Year holidays are over. The workers this year will receive a more lengthy holiday than usual at New Year, many of the works closing down for a fortnight. Both raw jute and Calcutta goods have been declining in value, but the tone of the markets is again steadier. There is still much uncertainty prevailing, and, though prices may at times look like being lower, there is always the periodical recovery. Sellers of the fibre are very reluctant to allow prices to decline further, and the fact that the Calcutta market is being sparingly fed from up-country, where there must be ample supplies, is helping to maintain a steady undertone. Good First Marks are still seldom offered, but red circle ram is quoted at £20 10s., while lightnings are offered at £18 5s. for green circle ram, £17 10s. for red H quality, £17 5s. for triangle Jajoida down to £16 10s. for Asahi lightning, December-January shipment. Daisie assortment has been sold down to £14 10s., but the return to steadier conditions resulted in £14 15s. becoming lowest, with Daisie 3 at £14 10s. and fours at £13 10s. Jute yarns are very quiet, but quite steady in value all round. Common 8-lb. cops are offered at 2s. and 8-lb. spools at 2s. 1d., but there are also higher prices. Twist is available at 3½d. for 3 ply 8 lb., and sacking yarns are unchanged at 2½d. for 24 lb. web and 3½d. for 8 lb. chains. Rove is from £23 10s. for 48 lb. and £17 for 200 lb. Fine yarns are receiving steady support at from 3s. for second quality 8 lb. Rio warp, 2s. 7d. for third, and 2s. 4d. for fourth. Carpet yarns are quiet. Business in jute cloth is even quieter now, but manufacturers are making no change in their quoted limits, which rule from 2½d. to 3d. for 10½ oz. 40 in. hessians and from 2d. for 8 oz. Linoleum hessians are slow and nominal, while trade in heavy goods is of very little importance meantime. The Calcutta goods market is receiving little support from actual consumers, but speculators continue to operate at each decline in prices.

THE CHATWOOD SECURITY

The policy of a firm controls its destiny. This subtle yet vital element throughout a firm defines its aims and governs its achievements.

The Chatwood policy has always been to confine its efforts to the production of work of quality. Craftsmanship is placed before material gain.

There is throughout the firm a definite atmosphere of continuous mental stocktaking. The reputation of yesterday does not carry anyone over to-morrow. Each success is only regarded as an inspiration to greater efforts.

The Chatwood tradition is maintained—

"Achievement is but another milestone along the highway of progress—the end of the journey lies ever beyond."

The furrow that leads to achievement is ploughed by imagination. Judgment helps courage to walk this furrow, but it is the love of hard work that takes one to the ultimate end of the journey.

HIDE, LEATHER AND ALLIED TRADES.

Hides were lower in price at most of the sales held during the week-end, and with no auctions taking place this week on account of the Christmas holidays the present standard of values will be operative until the end of the year. Surprise was evident at the fractional advances recorded at the sales held in Bermondsey last Thursday, and it is thought that orders for export were largely responsible for these. It is safe to assume that the position of the home tanning industry does not warrant higher values for raw material, and in all probability prices will level down again at the sales of the New Year. Trade in imported hides has been very small, partly on account of the holiday season, and also on account of the uncertainty of values. The only goods in which anything like a semblance of reasonable trade has transpired are Frigorifics, which have been taken up by Home and United States tanners on the basis of 6½d. for Argentine ox, with 5½d. paid for seconds and 6½d. for Montevideo ox. A sale of 10,000 Liebig colon hides found buyers at 7½d. to 7¾d. for heavies, while the lights changed hands at 6½d. Sales of dry River Plates have been small with B.A. Americanos still on offer at 7d. and M.V. Americanos at 7½d. Cape hides have not featured much in the business done, but a few sales have taken place in dries at 7½d. and 6½d. for first and seconds, with dry-salted 20-30 lbs. selling at 6½d. and 5½d. for the same grades. Australian hides are difficult to move. With most of the shoe factories either closed down or engaged on stocktaking, the turnover in all classes of leather has been small.

THE TIMBER TRADE.

The spot market for European building woods has been depressed during the past four or five weeks owing to the falling off in the demand from building-trade sources and increasing distress in the heavy trades. A decline in timber demand is not unusual at this time of the year, but on this occasion it is more

pronounced. Against that, however, is the much lower importations in November, and immediate preceding months, and it is expected that December shipments will be on a small scale. Thus, the total receipts this year are likely to be well below those of 1929, which must have a strengthening influence on values during the next four or five months. The decrease in supplies is largely due to the smaller shipments from Russia, according to latest plans, and also to British importers keeping their buying commitments from Finland, Sweden and other timber-producing countries well within limits during a period of price depression and uncertainty of the future. Stocks of sawn deals, battens and boards in the Metropolitan area are a little larger compared with a year ago; on the other hand, the floorings and the small stuff—slatings and plasterers' laths—are in much more moderate supply. The arrangement between the Soviet Government timber authorities and the British syndicate for the latter to handle the Russian shipments for the United Kingdom next year has led to meetings in London between the Swedish and Finnish shippers' representatives and British importers on a question of United Kingdom 1931 supplies and demand. Russia is planning to send 600,000 standards, against 500,000 this year, therefore on this year's supply and demand basis either an increase of demand for the 100,000 standards difference will be necessary in 1931 or less buying to that amount from countries other than Russia. The hardwood market shows little, if any, upward movement. As regards mahogany logs, the tendency of shippers is to put too high a limit on auction reserve prices, especially whilst demand is so poor. Teak and other Indian, as well as Canadian, logs are in quiet demand. In sawn hardwoods c.i.f. values of American lumber are weak, and shippers' anxiety to clear does not imbue one with the feeling of a sufficiency of stocks, and therefore forward business is restricted. States lumber shipments to the United Kingdom declined considerable last month, and the trade hopes for a still further decrease as a help to keeping the spot market more steady. Stocks of plywood are larger than usual in face of a heavy deficit in supplies last month, thus showing a lack of strength in consumption.

The Economist
MONTHLY SUPPLEMENT.

New Series.

SATURDAY, AUGUST 23, 1930.

No. 87.

In the following pages we have aimed at compiling tables which will show summary figures for as many nations of the world as possible, and have endeavoured to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations, supplemented from our statistical records. We propose in these columns to give our own appreciation of the trade position, fortified by informed opinion, and to leave the figures to be interpreted by our readers each in his own way.*

* "League of Nations Monthly Bulletin of Statistics." 1s. 6d.

THE STATE OF TRADE AT HOME AND ABROAD.

THE most ominous event of recent weeks has been the increase in unemployment to over 2,000,000, the latest weekly figures being 2,050,737. Recent declines in the amount of employment available include all the heavy industries, all the textile industries with the exception of the hemp and rope trade, the clothing trade, building and public works contracting, and shipping, while the only cases where improvements have occurred are tinplate manufacture, paper-making, and hotel and boarding-house service. The July percentage of unemployment in the insured industries was 17.1 per cent.

There is no escaping the fact that the rise in unemployment to over 2,000,000 has had an unfortunate psychological effect, and the gravity of the situation represented by this figure requires little emphasis. It should, however, be remembered that August is the holiday month, and that trade is now normally at its lowest point for the year. Reference to the home industrial reports on a subsequent page will show that in several cases manufacturers are anticipating an improvement in business in the autumn, and while the revival will at the best only be a slight one, it may be sufficient to bring about a small and temporary mitigation of the position.

Any chance, however, of a real improvement depends upon world trade and the course of world commodity prices. Until a few days ago there seemed to be signs that world prices were steadier, and the recent damage to grain crops in both France and America had been the partial cause of a slight increase in cereal prices. Unfortunately, in England, at least, these hopes have lately been discounted by such events as last week's reduction of 4s. per ton in pig iron, the fall of rubber to a record low level, and the renewed weakness of non-ferrous metal and cotton prices. Thus while the catastrophic fall of commodity prices is now probably near its end, it is premature to say that the corner has yet been turned. Regarding the situation from a "short-run" standpoint, the key probably lies in the two countries already mentioned, namely, France and the United States. In France, the continued influx of gold is having its effect upon domestic prices and the cost of living, both of which have recently risen appreciably. The damage suffered by French crops means that this year France will revert to

her normal rôle of an importer of wheat, and this, in conjunction with the American drought, may reduce existing stocks and so help wheat-growing countries and improve their purchasing power all round. In view of the importance of our own export trade to Australia and the Argentine, this is a development that is not without its hopeful aspects.

The strikes in the French textile areas are also of importance. Their immediate cause was a dispute as to whether or not the employers should bear the workers' share of the new insurance contributions as well as their own, but, fundamentally, they probably arise from the present upward trend of the French cost of living. Their outcome is still uncertain, but it seems possible that, in the end, French working costs will approximate more closely to the British level. This will put an end to one of the disabilities under which British manufacturers have lately been labouring.

The effect of the drought in the "middle-west" of the United States is not so easy to gauge. For one thing, it is by no means clear whether the damage will prove sufficiently severe to off-set the dead-weight of the heavy wheat stocks carried over in many countries from last year, and it is significant that, so far, wheat prices in the London markets, which set the pace for the whole of Europe, have only responded in a limited degree.

Again, the drought has had a bad effect upon American business and upon Wall Street, and so long as trade remains depressed in the United States, it is difficult to see how a real general improvement can take place. Possibly, any benefit accruing to this country from the American drought will come indirectly by way of South America. There are reports that the United States will have to import maize from the Argentine, and prices have lately become firmer. If these are correct, the purchasing power of one of our most important customers will be improved.

Meanwhile, there is little sign of any revival in British business. The Stock Exchange, with the exception of the gilt-edged market, is very depressed, and it is clear that investors are showing no enterprise and are making security the key to their limited operations. Money remains cheap, but that is largely due to the absence of

any demand for it either from industrialists or the Stock Exchange. The further increase in the bill-holdings of the clearing banks simply means that under the present depressed conditions there is no other outlet for their funds. On the other hand, sterling has recently improved against both the French franc and the dollar, and the immediate effect of this has been to divert the French gold demands from London to New York. This has had a useful psychological effect in business and financial circles, while the present strength of sterling against the dollar suggests that this year the autumn strain upon the pound will not reach a serious intensity. In short, the monetary situation is such as to support the hopes of a slight improvement in trade during the autumn.

HOME INDUSTRIES.

Coal.—Apart from a temporary increase in shipments immediately after the holidays, export business remains dull, and in some cases orders are being held back until the nature of the changes arising out of the new Mines Act are known. Demand for house coal is slightly better, but there is no improvement in inland sales of industrial fuel.

Iron and Steel.—Business remains very restricted, and in many cases holidays have been extended. Further evidence of the depressed state of the industry is found in the recent reduction of 4s. per ton in Cleveland pig iron prices. It is hoped that this will stimulate demand, but so far it has had little effect. One or two railway orders for steel have lately come to hand, but trade otherwise is very disappointing.

Engineering.—No improvement has taken place, and a fair amount of short time is being worked in the general engineering trades. Shipyards on the North-East Coast are coming to the end of the contracts for tankers received some time ago, and with no fresh orders coming in to take their place the outlook is most depressing. The construction of transmission towers for the national electricity grid scheme has provided structural engineers with some business, but the industry generally is under the influence of the holidays and the trade depression.

Electrical Industry.—The following index of production in the electrical industry is copyright by the Economical and Statistical Department of the British Electrical and Allied Manufacturers' Associations. An explanation of the manner in which it has been computed was given on page 888 of the *Economist* of November 28, 1925.

INDEX OF ACTIVITY IN THE ELECTRICAL INDUSTRY.

Home trade remained depressed during July, but since the end of the month several large orders have been received. The improvement in the export index is due to the execution of old orders from Canada, New Zealand, Russia and South America. Few fresh inquiries are being received.

Motor Industry.—The period of seasonal slackness in the private car trade is approaching, and recent business has fallen below expectations. The commercial vehicle section is less affected, but here exports have fallen away. The cycle and motor cycle section is quiet, with only a fair volume of overseas business.

Cotton.—The current official estimate for the new American cotton crop is 14,362,000 bales, and allowing for the carry-over from last season, supplies for the next twelve months should be about 20,500,000 bales. As world consumption is rather less than 11,000,000 bales a year, there is no prospect of any scarcity and prices consequently have fallen. The growth in Egypt is doing well, and a record area is under cultivation. The yarn position is very unsatisfactory. Only a limited business has been done and despite the big curtailment of

output, spinners cannot improve prices. The piece-goods trade also remains disappointing. Some buying has taken place for Karachi and Madras, but operations for Bombay and Calcutta have been at a standstill. China trade remains bad, apart from a little activity in fancies for Hong Kong. Business with other markets has been restricted.

Wool.—Business has been quiet as the result of the holidays, but the undertone is a little more hopeful, and top prices, especially of merinos, rather steadier. The official announcement that this season's Australian wool clip is estimated at 180,000 bales below last year came at an opportune moment in view of the previous uncertainty, and has helped to clear the air. Makers of heavy woollen goods are a little more active, and yarn prices are steady, pending the opening of the London wool sales next month. There is no indication as yet as to how the British industry will be affected by the French strikes and their outcome, but if they result in raising French production costs, Bradford should benefit.

Linen.—Business is quiet, and market conditions easier. Inquiry, however, both for yarns and dress linens, is expanding, and this is a hopeful feature for the autumn. The Irish flax crop is now being pulled, and promises to be of good quality. The acreage is three-quarters of that of last year.

Rayon.—Home demand for yarn and fabrics has been fairly well maintained, and though export business is still below normal there have been slight improvements in several markets. There has been a fairly large turnover in multi-filament viscose yarns, but a certain amount of price-cutting has been in evidence. Special crepe yarns remain in active request, and there has been a fair volume of business in fine denier acetate warp.

Boots and Shoes.—Northampton boot and shoe manufacturers are hoping for a moderate revival in the autumn, and some firms are at present supplied with orders for some weeks ahead. This, however, is by no means the general experience.

Pottery.—Trade remains very bad, and manufacturers are faced with severe competition in all markets. It is hoped that the visit of the President of the North Staffordshire Chamber of Commerce to South Africa will bring new orders.

Chemical Industries.—Business remains quiet, partly owing to the holidays, and current orders are of limited dimensions. There is a steady market for pharmaceutical products, but demand for coal-tar derivatives is still restricted. Trade in certain heavy chemicals is slightly better.

Building Trades.—Although there was a slight increase in unemployment in July as compared with the preceding month a fair amount of work was available for skilled workers. Some time was lost owing to bad weather conditions. Employment in the brick industry remained fairly good.

Agriculture.—The promising outlook for the corn harvest was modified by unfavourable weather conditions during the latter part of July. Early potatoes were a satisfactory crop, while the main crop seems up to average. The yield of roots, with the exception of mangolds, is likely to be below average. Sugar-beet on an increased area is on the whole satisfactory, and hops are up to average, though the area under cultivation has been reduced. The bulk of the seed hay was secured in good condition, but many meadows remain uncut. Still yields are expected to be above average. Milk yields were normal with a tendency to fall.

Shipping.—The approach of the time when grain importers normally contract for space to move the Northern Hemisphere crops has led to a moderate expansion of demand on most homeward routes, and whole-cargo rates for cereal cargoes are distinctly better than a month ago. Other sections of the market, however, remain quiet, and little has been done to reduce the volume of laid-up tonnage.

Retail Trade.—A leading London store reports that trade has been very satisfactory, in spite of adverse weather in July and early August. The outlook, too, is encouraging.

BRITISH EMPIRE.

In Australia, further beneficial rains over the wheat belts have improved the outlook. The New South Wales Government is taking a ballot of growers in September on the question of the establishment of a compulsory pool. The Victorian Government has introduced a marketing bill, and will take a ballot of wheat growers if the bill is passed. Wool prices at the July sales showed an advance, and a more confident tone was noticeable. Imports for the first half of 1930 amounted to £131,134,000, or £12,514,000 below those of the first half of 1929. Exports came to £124,849,000, or a decrease of £20,002,000 below those of the preceding year.

Mail advices from India show that little improvement has taken place. Demand for cotton piece-goods, whether of British or Indian origin, remains at a standstill, and the course of business in the raw-cotton market shows clearly that confidence is lacking. In Burma, rice prices remain very low, and purchasing power is consequently restricted.

Little change has occurred in South Africa. Cereal prices are easier, as had been anticipated. Good rains have fallen in the Cape, Midland and North Coast districts, and farmers have made good progress with ploughing and sowing. Reaping and threshing of maize is nearly complete, and it appears that the earliest estimates of the crop will be realised. The latest estimate of the new sugar crop is 350,000 tons.

UNITED STATES OF AMERICA.

At the end of July there were several signs of an impending improvement. Operations in the steel mills had remained steady for four consecutive weeks at 57 per cent. of capacity, and automobile manufacturers were resuming work after stock-taking. Freight movements also underwent a certain seasonal expansion, but construction contracts declined, and output remained restricted in the textile industries. Finally credit was abundant, and there were signs of increasing resistance to the fall in commodity prices. Subsequently the position was changed by the severity of the drought in the middle-west. Rain has now fallen, and it is possible that the damage to the harvests may be less serious than at one time was feared. Still, heavy losses have been inflicted upon farmers in many states, and this seems likely to react unfavourably upon general business.

The following indices of American economic conditions have been forwarded to us by Moody's Investors' Service, of New York and London.

AMERICAN TRADE STATISTICS—JULY, 1930.

EUROPE.

In France, there is a fair demand for industrial coal, and it is hoped that the operation of the British Coal Mines Act will lead to reduced competition from Great Britain. The iron and steel trades are difficult and hesitant. The textiles industries are dislocated by the strikes in the Lille area, and while according to some reports they will not be of long duration, it remains to be seen what effect they will have on production costs and on French ability to compete with foreign manufacturers.

The Belgian coal industry fails to improve, and is suffering from foreign competition. Stocks remain heavy. The iron and steel trades are in a weak position, and certain prices have been reduced. The glass industry remains depressed.

The German coal industry fails to improve, and it is feared that the effect of the new British Act will be to intensify competition at Germany's expense. Conflicting reports are being received of the steel trades, some of which mention a revival in inquiry. Still it is difficult to detect any real improvement. Unemployment remains severe, and though the Government are initiating new remedial measures, doubts are expressed as to their ultimate effect.

SOUTH AMERICA.

In Argentina the general commercial situation remains quiet. Prospects for the new wheat, linseed, and oats crops are good, and reports of the new seeding of wheat in the northern districts and in Entre Rios are satisfactory. In the livestock markets, values of fat cattle are firm, while there is a good demand for best quality breeding cattle and steers for fattening. In Brazil the commercial situation continues difficult, and conditions in the import markets are dull. Trade in Chile is, on the whole, slack at present, but the arrangements for the consolidation of the nitrate industry in conjunction with the synthetic nitrogen interests, which have recently been successfully concluded, should help to restore confidence. Quiet conditions continue in Uruguay. There has been no expansion in business activity in Peru, and conditions generally are somewhat dull. In Mexico, the absence of any pronounced improvement in the mining situation continues to exercise an adverse effect on business, and commerce in general continues quiet. Trade in Ecuador is more active, as a result of increased exports of rice and coffee. Reports from Colombia state that there is some improvement apparent in the general demand for merchandise. In Salvador, exports of coffee have continued in completion of contracts, but the general trading situation has remained quiet.

FAR EAST.

Business with China remains very limited, and at Shanghai few, if any, inquiries are being received from the interior. The most hopeful sign is the recent recovery in the price of silver.

Japanese stock markets have displayed a steadier tone in sympathy with the recent slight upward movement in prices, and industrial reorganisation has also shown some signs of progress. The spun silk industry has reduced working by a further 15 per cent., and the smaller raw-silk factories have practically ceased operations. Cotton yarn and textile exports show a slight increase.

ELECTRICAL PRODUCTION.

In the *Economist* of July 10, 1926 (pages 57-8), we published a new index of electrical production in the chief industrial areas of Great Britain. We show below a résumé of the results achieved during recent periods:—

INDEX OF PRODUCTION OF ELECTRICITY.* (Monthly Average 1923-24 = 100.)

Date.	Britain, excluding London and Wales.	Coal Mining, Iron and Steel, Ship-building, Heavy Engineering.	General Engineering and Automobile Construction.	Chemicals.	Marine Transport, Docks, etc.	Textiles, Cotton, and Wool.

* Prepared by the economic and statistical department of the British Electrical and Allied Manufacturers' Association.

Mainly as a result of the continuance of depressed conditions and of holidays in the west of Scotland, the index number for the heavy industries is considerably below its 1929 level. Some recovery has taken place in the general engineering and textiles index numbers.

INDICES OF BUSINESS ACTIVITY.

THERE are few favourable features to be discerned in the latest figures of our series of indices of business activity; and, notwithstanding the fact that July contained more working days than June, which included the Whitsuntide holidays, the index numbers with few exceptions point to a grave deterioration in the general situation of British industry and commerce.

To select, in the first instance, the figures from which some crumbs of consolation are to be derived, it will be seen that the index of exports of British manufactures recorded a slight upward movement, though it must be added that the latest figure is 20 per cent. lower than that for July, 1929. The other two indices to show a rise were those of shipping movements and London bank clearings. In the first case, the upward fluctuation was of a purely seasonal nature, while the movements of the latter index during the past year suggest that it is of little value as an indicator of commercial turnover, whose volume is undoubtedly reflected much more accurately by the index of provincial bank clearings. This now stands at a level 8 per cent. lower than a year ago. Perhaps the least discouraging index of the series is that of net imports of raw materials, whose decline appears last month to have been checked. Moreover, the current figure compares not unfavourably with the average for the corresponding month in the past six years.

On the other hand, the remainder of the index numbers leave a uniformly gloomy impression. There was a sharp reaction last month in retained imports of non-ferrous metals, and the apparent internal consumption by this country of iron and steel, which has so far held up remarkably well against the trade depression, had a significantly

heavy fall. There was a further ominous decline in the apparent consumption of raw cotton, the index figure for which now represents a volume of in-take less than two-thirds of that recorded last July and lower even than in the coal stoppage of 1926. Consumption of rubber also contracted, and there is reason to suppose that this index is to some extent artificially held up by our inability to take into account the growth of invisible supplies in the hands of manufacturers.

Reflecting more generally the activity of industry, the two indices of consumption of power both declined sharply in July. It is notable that the apparent activity of concerns employing electricity is slightly lower, as compared with a year ago, than that of those relying upon coal. Certain difficulties, however, in the exact computation of the coal power index suggest a need for caution in drawing positive inference from this feature. Finally, the indices of the volume of employment, with the significant exception of the (largely unproductive) miscellaneous services, all registered a further decline, particularly severe in the case of "heavy industry." Employment in "general industry," it will be seen, is now 7½ per cent. below the level of July, 1929, and the total volume of employment in all spheres has fallen, notwithstanding the growth in population, to approximately the level of six years ago.

It is clear that the trade depression is developing to a point which may fairly be regarded as critical, and though, as pointed out in a previous column, there are certain factors in the world situation which may produce a minor alleviation of the position during the autumn, the outlook for the winter in this country is one which must occasion concern and anxiety.

The Economist

MONTHLY SUPPLEMENT.

New Series.

SATURDAY, SEPTEMBER 27, 1930.

No. 88.

In the following pages we have aimed at compiling tables which will show summary figures for as many nations of the world as possible, and have endeavoured to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations,* supplemented from our statistical records. We propose in these columns to give our own appreciation of the trade position, fortified by informed opinion, and to leave the figures to be interpreted by our readers each in his own way.

* "League of Nations Monthly Bulletin of Statistics." 1s. 6d.

THE STATE OF TRADE AT HOME AND ABROAD.

UNEMPLOYMENT again became worse during August, but the rate of increase was not so great as in the previous month. Even so, the August percentage is 17.5, while official records show that the increase in unemployment embraced most of the staple industries of the country, including the iron and steel and engineering trades, motor and other vehicle manufacture, shipbuilding, all textile industries except jute manufacture, building and contracting, and water transport services. There was a substantial

improvement in the jute industry, though even so unemployment there remains very bad, while in the coal trade an increase in the numbers wholly unemployed was more than offset by a great reduction in the numbers temporarily stopped.

As regards the month's production statistics, the output of coal has been maintained, but the iron and steel output figures were appreciably lower than in July. The overseas trade returns to some extent reflect the holidays, but even after making allowance for this cannot be called satisfactory. The improvement in railway receipts again reflects holiday traffic and not an improvement in trade, while the rise in shipping freights is accounted for by a slight seasonal revival of whole-cargo chartering. Commodity and security prices are again lower, while the financial statistics mainly point to the fact that money is cheap and in need of employment.

though many primary foodstuffs and materials are well below their pre-war prices. Abroad, the situation has been unsettled by the German elections and their repercussions throughout the Continent, while at home the general tone in industrial circles is one of gloom and despondency. Since midsummer nearly thirty blast-furnaces have been closed down; unemployment in the engineering, metal and textile trades has become intensified; forward business in the export coal trade has been arrested by uncertainty arising out of the application of the new Coal Mines Act, while in the steel trade the recent breakdown of the International Steel Cartel's system of price control has disturbed the whole basis of trading.

The business world thus is in a nervous condition and stands badly in need of greater confidence. Nor is it easy at the moment to see how confidence can be restored. Fortunately, the investigation of the League of Nations Financial Committee into the all-important question of the purchasing power of gold is now approaching its end. The interim report of the Committee has just been issued, and if the Committee's recommendations point to any practicable way in which the fall in world prices can be arrested, it will do something to restore confidence. In Great Britain alone, probably the quickest and most certain way of bringing back confidence would be if industry could be given the assurance that any further in-

crease in taxation would be avoided. In the present condition of the national finances, such a suggestion may not be practical politics, but the question of national economy will have to be faced sooner or later, and it is impossible to ignore the fact that the heavy burden of taxation is one of the principal causes of the present despondency in business circles.

Meanwhile there are one or two isolated signs of a hopeful character. The Indian boycott of British cotton goods seems to be breaking down, and despite the further fall in raw cotton prices, the tone on 'change in Manchester is a little brighter. The electrical industry remains relatively active and prosperous, and the recent success of a debenture issue, on terms which seemed none too favourable, by one of the chief undertakings engaged in the industry shows that even to-day there is plenty of capital about whose owners are ready to respond to offers possessing a

reasonable degree of security. Certain industries, such as rayon and boots and shoes, have registered small improvements. Again, despite the continued flow of Cape gold to France and the wider implications of the gold problem, there is at the moment no shortage of money in England. The Bank of England occupies a very strong position—so strong in fact that it should have no difficulty in withstanding the coming seasonal pressure upon its reserves, which this year will be less than usual owing to lower commodity prices and depressed trade. The low level of discount rates shows that the London market can easily absorb more bills, while the fact that Bank advances last August were £46,000,000 below the level of twelve months before, shows that the joint-stock banks have a margin in hand out of which they can meet new demands from industry. Finally, the low level of raw material prices is in itself an opportunity and incentive to manufacturers to replenish their stocks and to undertake new commitments upon favourable terms.

News from abroad shows that the trade depression remains widespread. It is still acute in Belgium and Germany, the Scandinavian timber and paper trades are affected, and even France is no longer escaping scot-free. In the United States the general tone is a little better, though no real basis for this improvement is apparent. Depression remains intense in Australia, while in Canada the low price of wheat means that purchasing power in the Prairie Provinces remains restricted. A slight improvement is noted in South Africa. The Argentine revolution has had no adverse effect upon trade in the Republic, and in some respects, indeed, has cleared the outlook. Japanese business remains very quiet, and unemployment severe, but a more hopeful feeling is apparent in certain markets.

HOME INDUSTRIES.

Coal.—In Yorkshire prompt demand for shipment is a little more active, but export business elsewhere is very restricted, and forward business everywhere is being held up pending better knowledge of schemes now being prepared under the Coal Mines Act. Home demand for industrial fuel is stagnant, but there is a slight seasonal revival in the house-coal trade.

Iron and Steel.—Following the closing down of 28 furnaces during July, stocks of pig iron have been reduced, but no revival in demand has resulted from the reduction of 4s. per ton in prices made in the middle of last month. Orders for structural steel are a little better, but demand from the shipbuilding industry is naturally very limited, and the breakdown during the summer of the price controls imposed by the International Steel Cartel has destroyed confidence in steel prices everywhere.

Engineering.—Confidence is still lacking, and the usual autumn revival has this year hardly taken place at all. The marine engineering branch is stagnant, and with the exception of locomotive builders and makers of boilers and engines, and other power-house equipment, all sections of the industry have lost ground.

Electrical Industry.—The following index of production in the electrical industry is copyright by the Economical and Statistical Department of the British Electrical and Allied Manufacturers' Associations. An explanation of the manner in which it has been computed was given on page 888 of the *Economist* of November 28, 1925.

Home activity consisted mainly of a number of isolated orders for generating plant, but inquiries were received in respect of contemplated large additions in the London area. The increase in the export index is due to the receipt of orders from India, Burma, Rhodesia and Finland, mainly from public supply undertakings.

Motor Industry.—Manufacturers of private cars are busy in preparation for the forthcoming exhibition, but sales have been limited, as is usual at this time of year. Makers of commercial vehicles have also lost ground, but cycle and motor cycle factories are moderately active for the time of year.

Cotton.—American cotton prices have lately fallen to the lowest point touched for the past fifteen years. Nevertheless, the tone of the Manchester market has improved, partly owing to better news from India, where, owing to the weakening of picketing, bazaar goods are being moved more freely. More promising advices have also come from China, and a little better support from Java, Egypt and the Continent. The home trade is still displaying caution. Sales of yarns have improved slightly.

Wool.—At the opening of the London sales wool sold more freely than had been expected, but prices of merinos and fine cross-breeds were 5 per cent. lower than in July, while medium cross-breeds fell by 7½ to 10 per cent. So far the sales have had little effect in Bradford, but some merino topmakers are adopting a firmer attitude. Demand, however, both for tops and yarns is very slow, and a certain number of "weak sellers" are depressing the market.

Linen.—Business has been checked by the low prices quoted by certain firms for Soviet flax due to arrive in December and January. Reports of the new Irish crop are not encouraging. Yarn and cloth sales are on a day-to-day basis, and stocks and production are being rigorously curtailed.

Rayon.—The yarn market has improved and prices have become more favourable to producers. There is a strong demand for speciality crepe yarns. Overseas demand for piece-goods is poor, with the exception of the Dominions, but home business, though uneven, is normal.

Boots and Shoes.—Business is a little better, and some factories have lately become busier. It is, however, still very difficult to secure large bulk orders.

Pottery.—There has been a slight seasonal expansion in trade, and some factories are a little better employed.

Chemical Industries.—Trade remains depressed. Exports of heavy chemicals compare unfavourably with those of August last year, but home demand is a little better, and prospects are slightly more encouraging. Consumption of alkali products has fallen away in most trades except the glass and soap industries, and makers of hydrochloric and sulphuric acid have felt the slump in the galvanising, tinplate, textile and iron and steel trades.

Building Trades.—Employment on the whole was unchanged in comparison with July, but was fairly good in certain districts, including Bristol, Hull and Coventry. Employment in the brick industry was fairly good.

Agriculture.—Except where crops were badly laid, corn was stacked in fair condition by the end of August. Grain was of moderate quality. Potato and other root crops were below average in size, but hay yields were above average and quality was good. Grass, too, was plentiful and milk yields well maintained.

Shipping.—The seasonal quickening of activity in the shipment of the Northern Hemisphere grain crops has produced a moderate recovery in "tramp" freights. Chartering to load South Russian grain has assumed large proportions, but, in consequence, the Argentine freight market has been unsettled and weak. Outward coal rates are dull.

Retail Trade.—Business was very slow during August and early September.

BRITISH EMPIRE.

In Australia the trade depression has intensified and unemployment remains severe. Prospects in the agricultural and pastoral areas are excellent, and, subject to later weather conditions, a large wheat yield seems probable. Prices, however, remain disappointing.

South African August trade showed an improvement over previous months, and in some centres the turnover was not far short of that for August of last year. Maize prices advanced on news of the American drought damage, but have since relaxed. The revised sugar crop estimate gives a total figure of 370,000 tons.

Mail reports from India state that there was a steady demand for raw cotton in the Bombay market. Sales of piece-goods remained very limited. According to later cable messages, rainfall has been fairly general except in the western Punjab. The condition of standing crops is, on the whole, good.

A slight growth in confidence has lately become apparent in Canadian business circles, and stocks of goods in wholesalers' and retailers' hands have been reduced. The small initial payment made to farmers by the Wheat Pool will, however, reduce purchasing power in the West below normal dimensions and so retard the recovery.

UNITED STATES OF AMERICA.

The business outlook improved slightly during August. Industrial activity showed a small seasonal gain, and the distributive trades revived a little, notwithstanding the adverse effects of the drought. The steel industry, however, only operated at 54 per cent. of capacity, and the automobile industry did no more than recover the ground lost between June and July. Commodity prices generally were firmer.

The following indices of American economic conditions have been forwarded to us by Moody's Investors' Service, of New York and London.

AMERICAN TRADE STATISTICS—AUGUST, 1930.

* Preliminary estimates made by Messrs Moody, subject to revision. † Based on reports of U.S. Labour Bureau and of Bureau of the States of New York, Wisconsin, and Pennsylvania. ‡ Average of actual prices. § Partly estimated.

EUROPE.

In the French coal industry demand was affected by the labour trouble in the textile trades. The iron and steel trades are less active than earlier in the year, but are still fairly busy. The strike in the Roubaix woollen industries has at last been settled, but the market is awaiting the opening of the forthcoming Australian wool sales. The cotton trade is inactive and prices unremunerative. The outlook in the vineyards is discouraging.

Belgian industries remain depressed, steel prices continue to fall, and coal stocks have again increased. No improvement is apparent in the glass industry, and apart from some recovery in hides, Antwerp produce markets are lifeless.

In Germany some unsettlement was caused by the elections and the consequent transfer of funds from Berlin to other centres. There is no improvement in the steel trades, and further dismissals of workers have taken place. There was a slight increase in home coal movements in August immediately before the expiry of summer prices. The unemployment figure rose to 2,870,000 by the end of August.

Dutch home industries are not unduly depressed, nor is unemployment increasing to any alarming extent. The Dutch colonies, however, are feeling very acutely the effects of the collapse in rubber, sugar and other commodity prices, and this is having an unfavourable influence upon certain aspects of the home situation, notably upon the national revenues.

In Norway, the dispute in the paper industry has been settled amicably, thus removing all fear of a wide-spread stoppage of work, which might have spread to other trades. The timber market remains dull.

Swedish timber sales are very slow, this being partly due to prevailing uncertainty as to the Russian situation. The paper market is weak. The visit of the British Coal Commission seems to have been fairly successful, though no definite result has yet been announced.

Danish dairy produce prices show recoveries in one or two instances, and butter and bacon exports are greater in quantity than a year ago. Preliminary grain harvest results are encouraging.

In Switzerland, the depression is most weak in the textile industries. The chemical trades are relatively well placed.

SOUTH AMERICA.

The Argentine revolution, although sudden, was not entirely unexpected, and leaves the economic position of the country undisturbed. Indeed, recent reports indicate that there has been a minimum of interruption to business and that the commercial situation is normal. Agricultural conditions appear generally satisfactory, although the crop prospects are still dependent upon weather conditions during the next month or so. Trade generally continues to be affected by the world economic situation and by the depression in the primary commodity markets. This also applies to Chile, but that country should ultimately derive considerable benefit from the recent agreement between Chilean producers of nitrate of soda and the synthetic nitrogen interests for the sale and distribution of fertilisers in the world's markets. The Brazilian situation remains depressed, but the tone of the principal coffee markets has latterly shown improvement. Peruvian conditions have been affected by the overthrow of the Government in Lima and the setting up of a military Junta, which, owing to the already depressed trade situation in the Republic, has tended to increase the general unsettlement. In Colombia credit is tight and trade depressed, while business is dull in Venezuela, Nicaragua and Guatemala. Some improvement, however, is reported in Ecuador.

FAR EAST.

In Japan commodity and share markets have both been very quiet. Sales of raw silk were of normal volume, while rayon exports remain satisfactory. Mainly owing to anticipations of a further curtailment of production, a better tone has developed in the cotton yarn market, and prices are a little harder. The Government is proposing to issue loans up to an amount of Y. 170,000,000, at a low rate of interest, in order to assist agriculture. The gold efflux for the first eight months of 1930 amounted to Y. 240,000,000.

ELECTRICAL PRODUCTION.

In the *Economist* of July 10, 1926 (pages 57–8), we published a new index of electrical production in the chief industrial areas of Great Britain. We show below a *résumé* of the results achieved during recent periods:—

INDEX OF PRODUCTION OF ELECTRICITY.*

* Prepared by the economic and statistical department of the British Electrical and Allied Manufacturers' Association.

The August figures are additional evidence of the intensification of the trade depression. Returns from the North-East Coast, Sheffield and the textile districts are particularly disappointing.

INDICES OF BUSINESS ACTIVITY.

THE latest movements of our series of index numbers of business activity reveal, as was to be expected, no signs of any definite change in the general trend, which continues almost without exception to be in a downward direction. In fact, whether judged from the angle of external or internal trade or from that of the volume of employment, the picture presented by our indices is suggestive of a depression considerably more profound than was the case six months ago, even when full allowance is made for the normal tendency of many branches of commerce to "slow up" during the summer months.

Turning to certain of the more significant indices in detail, it will be seen that the index of exports of British manufactures has undergone a further significant decline and now stands at a level no less than 23 per cent. lower than a year ago or in the corresponding month of 1928. Retained imports of raw materials have also fallen; but in this case the recession is largely of a seasonal character, and the latest figure compares not unfavourably with that for the month of August in the past four years, though it is impossible, pending the next quarterly official "revaluation" of our foreign trade returns, to say whether, in the provisional figures given for July and August, we have made proper allowance for fluctuations in prices. With regard to the basic industries—iron and steel and cotton textiles—the calamitous level at which the index of apparent consumption of raw cotton stands speaks for itself, and the decline from 123 in May to 90 in August registered by the iron and steel consumption index is equally discouraging. In this connection it will also be noted that, after successfully resisting the depression for some time, imports of non-ferrous metal are now declining fairly rapidly. The evidence afforded by the indices

of consumption of power is somewhat mixed. As compared with a year ago, the electricity index has fallen by nearly 9 per cent., but there appears to have been no diminution in the amount of coal consumed. The reason for this discrepancy is obscure.

The activity of shipping continues to be moderately well maintained, though in this case it is necessary to make allowance for the normal seasonal activity of passenger liner traffic in the summer months, and it should also be appreciated that in default of any knowledge as to the proportion of unfilled space in shipping entering or clearing at British ports, this index is not a wholly reliable pointer with regard to the volume of cargo moving. Clearly, from the slow but steady decline in the volume of provincial bank clearings, there is proof that the rate of turnover in domestic commerce is still declining, and the newly-compiled indices of retail turnover, to which reference is made elsewhere in this issue of the *Economist*, point definitely to the same conclusion, which is also borne out by the trend of merchandise traffic on the railways and of postal traffic.

In the case of the four indices of the volume of employment, it will be seen that the decline in the total, which started last December, has continued unchecked in August. The figure for "miscellaneous services" shows no alteration, but in "heavy industry" and, to an extent only a little less marked, in "general" industry, a further substantial contraction in the numbers at work has taken place. In another column we discuss generally the factors governing the present situation and the outlook for the future. Here, the only appropriate comment is that indications of any improvement—however slight—are still to seek.

INDICES OF BUSINESS ACTIVITY.

The Economist

MONTHLY SUPPLEMENT.

New Series.

SATURDAY, OCTOBER 25, 1930.

No. 89.

In the following pages we have aimed at compiling tables which will show summary figures for as many nations of the world as possible, and have endeavoured to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations,* supplemented from our statistical records. We propose in these columns to give our own appreciation of the trade position, fortified by informed opinion, and to leave the figures to be interpreted by our readers each in his own way.

* "League of Nations Monthly Bulletin of Statistics." 1s. 6d.

THE STATE OF TRADE AT HOME AND ABROAD.

THE autumn is now well advanced and, unfortunately, the somewhat pessimistic forecasts made last summer, that the revival in trade which usually follows the holidays would this year fail to materialise, are proving only too well-grounded. As the table on this page shows, the unemployment percentage rose from 17.5 per cent. in August to 18.1 per cent. in September; the latest foreign trade returns are most disappointing; commodity prices are still falling; and there has been a sharp setback in railway traffic receipts. So far, the picture is indeed a gloomy one.

To some extent it is possible to argue that this bald summary of the facts overstates the gravity of the position. Thus an analysis of the September returns of unemployment shows that the increase in the total figure is to some extent due to seasonal increases in the building trades, among makers of building material, and in hotel and boarding-house services. Again, there have been very slight improvements in the coal, pig iron, cotton, motor vehicle and pottery trades; while the fall in railway receipts may partially reflect the cessation of the holiday traffic. September has witnessed an improvement over the previous month in the output of coal, pig iron and steel, while the number of furnaces in blast remained unchanged during the month. There has also been a marked increase in the consumption of electric power, especially in Lancashire and Yorkshire.

On the other hand, the unemployment increases that have occurred in the chemical, iron and steel (except pig iron), engineering and shipbuilding industries, in certain of the textile trades, and among transport and distributive workers cannot be lightly dismissed. The latest Lloyd's quarterly shipbuilding returns give a figure of only 1,116,746 tons under construction as on September 30th, as against 1,392,603 tons at the end of June, and 1,448,355 tons a year before. This figure is extremely disappointing, and shows the depth of the depression in which not only shipbuilding but marine engineering and—indirectly—the steel trades are labouring. Furthermore, while it is possible to argue that the low September export figures reflect to some extent the usual holiday recession, no such comfort can be derived in respect of the raw material import returns of £16.5

millions, which, whether compared with the August figure of £17.5 millions or with the September, 1929, figure of £24.2 millions, are equally disappointing.

More serious still, a general feeling of discouragement is still apparent, especially in the heavy industries. It is generally agreed that the country is approaching an extremely difficult winter, and no one is willing to forecast how long the depression will last or in what quarters purchasing power will first revive. The further fall in

wholesale prices, which is still continuing, has increased the margin between the prices of primary products and retail prices, wages and production costs generally. Nevertheless, taking a long view, it would be incorrect to say that all the signs to-day are of a discouraging nature. To mention one significant point, sentiment in the cotton industry has now slightly improved. Demand from India is in some respects better, and orders from the Continent and the home trade are growing in number. In fact, the suggestion is already heard that it may shortly be possible to restart some of the machinery now standing idle, while the increase in Lancashire's power consumption may have some significance. Wool prices also seem a little more stable, though business remains disappointing, and Belfast linen manufacturers have lately received some bulk orders, while certain sections of the chemical

trades are holding their ground.

Still, in the long run, the course of British trade will depend upon the world at large. In the Empire, good weather conditions are being experienced in India, Australia and South Africa, and there are already signs that this is stimulating business, or at least preventing it from losing further ground. The United States witnessed a seasonal improvement in trade during September, and if, as is generally believed, stocks have been allowed to run down, even a slight increase in buying should rapidly lead to fresh productive activity. South American trade has naturally been restricted by the low exchange rates and political disturbances. European news is perhaps the most discouraging. Unemployment has again increased in Germany; trade remains bad in Belgium; and even French reports are now less optimistic than they were a few months ago.

BRITAIN AND WORLD TRADE.

BY

A. LOVEDAY.

Head of the Economic and Intelligence Service of the League of Nations.

The following pages contain portions of an essay by Mr A. Loveday, on the extent and causes of the failure of the United Kingdom to retain its former proportion of world trade. This essay will shortly be published in book form under the title of "Quo Vadimus?, and Other Economic Essays." Some comments on Mr. Loveday's thesis will be found in a leading article in this issue.

ALL world depressions—are temporary—many are salutary—and on the measures adopted in each country during periods of adversity depend not only the rapidity, but the permanence and degree of subsequent recovery. With the immediate repercussions of the present depression this memorandum is but indirectly concerned. Its object is to consider the general status of British industry and trade in the world before the depression made itself felt; and attention will be directed mainly, if not wholly, to the period ending in December, 1928. But the gradual lowering of that status in recent years has been due to causes which, unless rigorous action is taken, are likely to be intensified by the present fall in prices, so that a study of the changes which took place before 1929 is not without pertinence to-day.

Until recent months writers have tended to attribute the difficulties of the United Kingdom largely to the alleged impoverishment of Europe or to the competitive advantages which certain countries have reaped from inflation. The chaos which existed in Europe during the first few years after the Armistice no doubt hampered the exports of this country and of all others for which Europe constituted an important market. But while others developed their trade outside Europe, we lost a large part of our trans-oceanic markets, and during the last two or three years European demand has probably been up to the pre-war standard.

The Lost Ground.

I propose to endeavour to show in the first place that our failure to secure trade has been greatest—outside the British Empire—in regions which have been least affected by the war; that our markets have not been mainly captured by countries enjoying the alleged benefits of inflation; that these favoured nations have not increased their trade by more than, or, indeed, by as much as, others which have pursued a monetary policy similar to our own. This last fact constitutes no proof that our monetary policy has not adversely affected our foreign trade and our industrial production. It implies merely that there must be some deeper-lying cause which has affected us and not our neighbours, and has magnified the ill-effects, or diminished the good effects, of deflation. That ultimate cause, as probably most students of the questions would agree, is lack of suppleness in the mechanism of production, and that ultimate cause has put a check, not only on our export trade, but on our whole production of wealth. We are to-day standing still or but slowly crawling forward, in a progressive world. We are standing or crawling with an awkward rigidity in a world in which suppleness is becoming a constantly more imperative quality, because demand is becoming constantly more mobile.

If the alleged reduced purchasing power of Europe were the true cause of our difficulties, then we might expect to find that, while our trade with other parts of the world was fairly maintained, our exports to Europe had suffered a substantial contraction. But this is the reverse of the truth. It is practically certain that the imports of Europe to-day are greater than they were in 1913. Europe is obtaining from the United Kingdom a slightly smaller proportion of her total purchases, and—after allowing for price changes—possibly a slightly

smaller quantum of goods. But during the last two or three years such reduction as there may have been in the aggregate of her purchases from us has been wholly due to our enfeebled competitive power and not to any general reduction of imports by Europe. Moreover, the falling off in our exports, if any, must have been relatively small. It can scarcely have amounted to 5 per cent. in 1927 or 1928. On the other hand, our share in the trade of the other continents of the world has been very greatly reduced, as may be seen at a glance from the following figures:—

PROPORTION OF TOTAL IMPORTS OBTAINED FROM UNITED KINGDOM.

By:—	1913.	1925.	1927.	1928.
	%	%	%	%
Europe	8.4	9.2	8.1	7.7
North America	16.8	11.2	10.3	10.1
South America	27.9	21.2	18.7	18.8
Africa	36.7	34.6	32.9	31.3
Asia	31.5	19.9	18.6	18.9
Oceania	53.4	46	43.2	44.4
World	14.5	13.3	12.1	11.7

Thus, our share in European purchases in 1928 was about 8 per cent. smaller than in 1913; our share in those of Asia and North America was 40 per cent. lower; and our share in those of South America had declined by 30 per cent., and that in Oceania and Africa by some 15 per cent. We have held our position better in Europe than elsewhere, and better in the British Empire than in other parts of the transoceanic continents. We contribute about one-fifth less than we did to the total world trade viewed in this way. To attribute this loss to the weakness of European demand is definitely misleading. The figures render it abundantly clear that our loss of status has been greatest in the American continent and Asia, where the effects of the war were least.

Britain's Diminished Share.

Percentages are, however, liable to be misleading and it is worth while, therefore, to endeavour to estimate the comparative loss in absolute values. For this purpose I will take the actual 1927 trade figures and compare them with the trade that we should have done in that year if we had retained in the various markets of the world the percentage which we enjoyed in 1913:—

SALES OF UNITED KINGDOM TO VARIOUS PARTS OF THE WORLD.

To:—	Actual in 1927.	Calculated Figure Assuming 1913 Proportions had been retained.	Deficit in 1927.
	£Mn.	£Mn.	£Mn.
Europe	314	326	— 12
North America	112	183	— 71
Caribbean	9	19	— 10
South America	68	102	— 34
Africa	100	111	— 11
Asia	176	298	— 122
Oceania	91	112	— 21
World	839	1,005	— 166

The figures are necessarily rough, and except in the case of the world total it is to their inter-relationship, not to their amounts, that attention should be paid. The percentages on which the calculations are based refer to only about 95 per cent. of total trade, and, owing to the manner in which trade statistics are compiled, the imports from the United Kingdom by other countries cover, in addition to our exports, a large proportion of our re-exports. But the results probably afford a sufficiently accurate picture of relative magnitudes. If the share of the United Kingdom in world imports to-day were the same as in 1913 it would be between £160 and £170 millions greater than it is.

The sum of the continental figures naturally differs from the results for total trade as the continental

distribution of trade has undergone a considerable change. In fact, if the United Kingdom had retained its share in the imports of each individual continent, its total trade would be roughly about £280 millions greater than it is.† It has, therefore, maintained its position best in those parts of the world which have been most unsuccessful in maintaining their position. It has shared in adversity, not in prosperity.

The individual figures for each continent are striking enough. If the 1913 proportions had been maintained, Europe, the Caribbean and Africa might each have purchased £10-12 millions more from the United Kingdom, and South America might have purchased about as much more as these three together. But the difference in North America amounts to over £70 millions and in Asia to over £120 millions. In 1927 the total imports from all sources of these two continents were twice or more than twice as great as in 1913, as were, too, those of Oceania, where the loss of possible purchases in the above system of reckoning amounted to £20 millions.

Our Competitors.

Such, very roughly, are the general proportions of the problem. To whom has this trade been lost and to what extent have other European countries on whose recovery we have so long been waiting to bring prosperity, suffered a similar loss of status? The answer to the second question will help to an understanding of the first, for the great difference between the position of the United Kingdom and that of other leading European countries is that the former has continued to lose status steadily from year to year, while the latter, gravely injured at first, have, for the most part, made a rapid recovery in recent years.

The course of events may be most clearly followed if we turn from the statistics of imports to those of exports. The shares of certain selected countries in the total exports of the world in recent years have been as follows:—

PERCENTAGE SHARE IN WORLD* EXPORTS (BY VALUE).

	1913.	1924.	1925.	1927.	1928.
United Kingdom	13.94	13.01	12.16	11.36	11.20
Germany	13.11	5.73	6.81	8.00	8.83
France	7.24	7.98	7.24	7.13	6.40
Italy	2.60	2.30	2.37	2.65	2.43
Sweden	1.19	1.23	1.19	1.43	1.34
Denmark	0.93	1.22	1.23	1.27	1.31
Belgium	(a)	2.37	2.24	2.43	2.67
Europe	55.20	45.20	44.10	46.10	46.00

* The Netherlands are omitted owing to the fact that their pre- and post-war statistics are not comparable. (a) Not available.

Neither France, Germany nor Italy has so large a share in the trade of the world as in 1913. But, since 1924, Germany and Italy, Sweden, Denmark and Belgium have improved their position—Germany very substantially—while the share of the United Kingdom has sunk from over 13 to 11.2 per cent. Germany, it is true, was making a partial recovery from the very low status to which inflation and political difficulties had reduced her. But the figures for the other countries show that it was not simply due to the automatic reactions of this recovery on the percentages of the remaining members of the group that the British decline is to be attributed. About half the decline in the French share in 1928 is due simply to a change in the manner of compiling the statistics. The figure for Europe includes Russia; but Europe in spite of this has suffered a smaller reduction in her share of world trade than has the United Kingdom.

The decrease in the contributions of certain of the leading European nations is due to a large extent to the very rapid growth of the exports of the United States. But it is not wholly due to this fact. If the United States are eliminated, the shares of France and Germany still show a contraction. On the other hand, France's contribution to European trade, even in 1928, was greater than in 1913, while that of the United Kingdom had dropped slightly from 25 to 24 per cent. In 1929, according to the provisional and partial statistics avail-

† This figure and the others here given mainly refer to c.i.f. values, country of import.

able, the share of the United Kingdom, both in European and in world trade, continued to decline, while that of Germany rose.

The manner in which other European countries have outstripped the United Kingdom in recent years may be further illustrated by the indices of the quantum of their exports—that is by indices showing the change in values after eliminating the price factor. Owing to the manner in which the calculations are made, the figures of different countries are not exactly comparable, but they reflect adequately the general course of events.

QUANTUM EXPORT INDICES.

	1913.	1924.	1925.	1927.	1928.
United Kingdom	100	80.6	80.0	82.7	84.4
Germany	100	50.8	65.3	75.5	85.7
France	100	119.0	124.0	146.0	148.0
Italy	100	119.0	129.2	130.0	132.2
Sweden	100	93.3	99.6	117.2	106.8

The quantum of British exports in 1928 was thus lower, compared with 1913, than that of any of the other countries given—even than Germany, although Germany has lost territory which is believed to have accounted for about 11 per cent. of her pre-war national income. Actually the quantum index of British exports is lower than in any other country in the world for which information is available, except Russia. But probably in no other highly organised country is prosperity so dependent on exports.

Who Has Gained?

These facts give some key to the second question—who has taken the trade which the United Kingdom has failed to secure? Obviously, if the general level of the prices of her exports is abnormally high, the probability is that the captured trade has been shared as booty by any and every competitor whose prices were less "exclusive." This is, in fact, exactly what has happened. It has been the habit of the British Press to attribute the loss of trade mainly to the irresistible competition of countries whose finances have been so lamentable that their currencies have become grossly debased. But, if this were the main cause, the share of British trade in the world in recent years when currencies elsewhere were being stabilised, and prices rising locally should have increased, while, in fact, it has decreased.

There can, indeed, be no doubt that the importance of exchange dumping has been unwittingly exaggerated. The United Kingdom has lost ground to the great and the small, to the financially pure and the financially reprobate, but primarily to the United States. Thus Germany, which is buying less from the United Kingdom, takes a larger share of her imports from Bulgaria, Denmark, Finland, Greece, Italy, Holland, Sweden, Switzerland—indeed most European States. France buys a smaller proportion from Germany, and from a number of other European countries, but more from India, from the United States, and above all from her own Colonies. Spain is taking more from France; Southern Europe—Bulgaria, Yugoslavia, Greece—more from Italy and the United States; Scandinavia more from the United States and miscellaneous countries of minor importance. Outside Europe by far the most serious competitors have been the United States and Japan. In South America the pre-war position has been reversed. Thus, in 1913 South America took 27.9 per cent. of her imports from the United Kingdom, and 16.2 per cent. from the United States. In 1928 she took 18.8 per cent. from the United Kingdom, and 28.8 per cent. from the United States. In 1913 China took 16.5 per cent. of her imports from the United Kingdom, and 26.4 per cent. from Japan and the United States. In 1927, during six months, of which there was a partial blockade of Japanese goods, she took 7.3 per cent. from the United Kingdom and 44.5 per cent. from the other two.

The Currency Factor.

It is useless to amass further examples. The successful competitors are many, but in Europe the other great trading nations, elsewhere the U.S.A. and Japan, have naturally taken the largest share. The greatest trading nations of Europe have, however, debased their currencies; and it might appear at first sight that the fact that their share in the imports of neighbour states has so largely increased

at the cost of British exports proves the contention that Britain has suffered particularly from a passing and abnormal competition. But if the unusual nature of this competition, and not some defect in British economy, were the true cause of existing difficulties, then other countries whose currency policy has been similar to ours, or even "saner," should have suffered in like manner. They have not done so. The exports of all the European countries except the United Kingdom which have deflated their currencies, and re-established the pre-war value of their currencies continued to expand after stabilisation had been effected in the face of the competition of neighbouring states with debased currencies.

INDICES OF GOLD VALUE OF EXPORTS.

	1913.	1924.	1925.	1926.	1927.	1928.	1929.
United Kingdom.....	100	138	146	124	135	138	139
Denmark	100	194	221	216	226	241	251
Norway	100	142	184	174	173	176	194
Sweden	100	153	167	174	198	193	221
Switzerland.....	100	146	148	133	146	154	151
Netherlands	...	100	114	110	120	126	126

The figure for the first year during the whole of which the exchanges of each country were at par is printed in italics. Both Switzerland and the Netherlands felt the immediate effects of deflation, but their recovery was prompt and decisive. Only the United Kingdom failed to recover. Even in 1929 the gold value of her trade was over 5 per cent. lower than in the year she returned to the gold standard. That this was not due to a wider price movement than elsewhere is proved by the indices of the quantum of her trade given above. In Denmark and Norway the fall in prices was, in fact, far more serious, and in Switzerland it was nearly as great. If deflation has had comparatively so little influence elsewhere, is it likely to have been the main cause of the troubles of one single country? It is not impossible; for the United Kingdom was the only belligerent country in Europe which has thought it expedient to restore the pre-war value of its currency, and its debt per head is higher than in any of the other members of this group of nations. But it is at least highly improbable that the redistribution of national income which domestic debt payments involve is even the major cause of the protracted depression. Deflation was more detrimental in England than elsewhere, because other countries made the necessary adjustments to their whole machinery of production—and we did not.

It remains to show that the trade of these countries, other than England, which have deflated their currencies, has developed more than that of the "inflaters," about whose machiavellian competition so much has been written. The position in 1927, the most favourable year for the latter group, was as follows:—

GOLD VALUE OF EXPORTS IN 1927 AS PER CENT. OF EXPORTS IN 1913.

France	163	Denmark	226
Germany	101	Norway	173
Italy	169	Sweden	198
		Switzerland	146

The only comment which these figures demand is that the trade of Switzerland in recent years has apparently been under-estimated owing to the manner in which the statistics are compiled.*

It may be hoped that the evidence produced has been sufficient to substantiate the three points it was intended to make—that British trade in the last few years has not been primarily affected by the unsettlement of Europe; that it has not been specially influenced by the competition of countries with debased currencies; and that, if domestic deflation has been unfavourable to it, the detriment suffered has been due to some inherent and peculiar defect in British economy.

Old and New Industries.

Another school of thought has attributed the depression in British trade largely to the coincidence of a number of fortuitous events which could neither have been foreseen nor prevented—to the stimulus the war

* It should be added, however, that in a number of cases the quantum indices of the deflationary countries were lower than those of the inflationary. But the higher prices obtained more than offset this relative drop in quantity.

gave to the cotton industry in the Far East and South America, to the influence of disarmament on the heavy metal industry, to the excess of subsidised tonnage, to the check which the progress in heat conservation gave to the demand for coal. There is no doubt much truth in this argument. Free trade necessarily involves industrial specialisation, and if the industries on which a free trade country specialises are adversely affected by external events, that country must suffer temporarily and readapt itself. It must readapt itself. Its mechanism must be sufficiently supple to permit that readaptation. It must face, recognise and cut its losses; it must turn its attention to other products. If it fails to do this it will suffer all the losses and reap none of the profits of free trade. And, to-day, what is really important and significant in England is not the depression of the depressed industries, but the relatively small progress made by the relatively prosperous. It is the growing, not the decaying, which require watching.

[Mr Loveday proceeds to illustrate this point by an analysis of Britain's share of production and trade in different industries.—Ed., Econ.]

In short, the trade of the world has increased; the share of the United Kingdom has decreased and is decreasing. It is decreasing in the world; it is decreasing in Europe; and as we examine one group of industries after another the same phenomenon presents itself. It is due neither to inflation here, nor to deflation there, nor to poverty nor to tariffs. If high tariffs were the cause of our difficulties they should have curtailed the trade of other nations more than ours; for the United Kingdom receives most-favoured-nation treatment wherever it is granted and, in addition, imperial preference. Relatively to other countries her position in this respect is more and not less favourable than it was in 1913.

In the report of the British Mission to the Argentine it is remarked that "in South America, while in some departments—particularly old-established businesses—we have retained our original position, in new departments of trade we have been completely outdistanced. In new forms of transport it is the same. We have excelled in railroad construction and shipbuilding, others have taken the place which might have been ours in aviation, road construction and motor transport."*

Likewise, others have taken the place which might have been ours in, for instance, the markets for wireless or photographic apparatus, scientific instruments, agricultural machinery, etc. It is on these new and growing industries that the prosperity of highly industrialised countries must ultimately depend. But between 1925 and 1928 the Netherlands increased her exports of wireless apparatus by over £1½ millions, while British exports declined; and Sweden, Switzerland and the Netherlands, whose total sales of scientific instruments aggregated less than one-half of the British in the earlier of these two years, raised that total by over £250,000, against approximately £100,000 in the case of Great Britain.

Why Britain Declines.

It is unnecessary further to multiply examples. The evidence is, it may be hoped, adequate at least to suggest that the difficulties are confined to no particular type of industry, major or minor, new or old; that they are due primarily neither to special conditions in the Far East (or West) nor to the chaos in Europe which is past, neither to inflation nor to deflation; and that our successful competitors are drawn from all quarters of the globe and have pursued currency policies wholly dissimilar. Disorder and prosperity, depreciating and appreciating exchanges, tariffs and dumping, subsidies and prohibitions may all, in fact, have proved damaging; but there must surely have been some special reason connected with our internal economy which rendered them more disastrous to the United Kingdom than to other countries. But this view is too rarely expressed.

"Lancashire," wrote Professor Siegfried in 1924, "is perfectly sanguine of success once normal conditions have been restored."† She "asks for no assistance from the

* "Report of British Economic Mission to Argentine," page 6.
† "Post War Britain," page 110.

State so long as she is buoyed up by the prosperity of the world"—by a prosperous world requiring in 1928, for instance, exactly the same products from exactly the same markets as fifteen years earlier. But in the process of being restored to prosperity the world changed its tastes. Lancashire waited, like Sir Richard Strachan, and the new markets were supplied by others. Similarly, Professor Pigou, writing in 1927, found "it improbable that the weakness of the post-war trend is due to circumstances peculiar to this country."* The analysis made by, at any rate, a very large proportion of the business men in the country was similar to the opinions recorded by these economists, and, like a famous recent Committee, they substituted for constructive proposals or constructive action, "earnest hope."

All mass movements are more easily perceptible from without, and it is, perhaps, not surprising, therefore, that it should have been a French economist who first drew attention to the striking parallelism which exists between the fluctuations in unemployment and in real wages. Professor Rueff has calculated† for the period 1919-1925 the relationship between the number of unemployed and the relationship of wholesale prices to average salaries and set out his results in diagrammatic form. If the year 1926 and part of 1927, when all other factors were subordinate to the coal dispute and its effects, be ignored, the consilience of the two curves he gives is very remarkable. "On est, par là, fondé à penser," says Professor Rueff, "que la cause immédiate du chômage généralisé—non la cause profonde—consiste dans le défaut d'adaptation des salaires au niveau général des prix." This view has frequently been attacked on the ground that the unemployment in 1920 was not caused by falling prices, but that the fall both in prices and in employment was due to a common cause, be it deflation or the natural bursting of a turgid boom. In fact, the causes which put men out of employment may well be different from those which prevent them finding new employment subsequently. It is the latter—even to-day when unemployment is increasing—which are ultimately important; for if Professor Rueff is correct in his analysis, and if wages remain as rigidly inflexible after the price fall of 1929-30 as they have remained in recent years, then, unless prices rise once more, the numbers permanently unemployed may increase from an average of some one million or more to an average of two.

Wages and Costs.

Professor Rueff's curve conceals no mystery and illustrates no new theory. If the price of apples is too high, some will remain unsold; of labour, some will remain unhired. Professor Pigou has expressed the view that there is "at least 5 per cent. of extra unemployment which it is reasonable to attribute to the maintenance of rates of real wages above the level that would establish equilibrium between the demand for and the supply of labour."‡ But, it is sometimes urged, wages are higher in the United States and the trade and exports of that country have expanded; in England wages are lowest in the most depressed industries. Between 1923 and 1928 the United States maintained relatively stable prices, while the national productivity rapidly increased; wages had to rise. Between 1923 and 1928 the United Kingdom allowed prices to fall, while national productivity per head has remained almost unchanged. Wages had to fall, but actually rose; and unemployment increased.

Wages are lowest where the pressure is greatest; but the total costs of any particular industry depend not only on the rates paid by it, but on those paid in all other industries whose products or services it requires. Hence the importance which is attached to the high rates ruling in sheltered industries—in transport and public services, in building, etc. But the contrast between the sheltered

* "The Economic Position of Great Britain," page 25.

† Actually Professor Rueff takes not the ratio of money wages to cost of living which gives what is normally considered as real wages, but of money wages to wholesale prices. Professor Pigou has shown that both ratios give roughly similar results—so that the point need not be elaborated. But there are sound theoretical reasons for Professor Rueff's choice. (See *Revue Politique et Parlementaire*—10/XI/25, and *Economic Journal*—IX/27.)

‡ The *Economic Journal*, Vol. XXXVII, No. 147, page 356.

and the depressed may be over-emphasised. The mal-adjustment which exists is damaging to the one and to the other, and it is equally damaging to those industries which are neither sheltered nor shrivelling. Unemployment is as great as it is to-day because the "prosperous" industries are not sufficiently prosperous, because the industries whose exports are increasing are not maintaining their share either in world production or in world trade. It is our successes, not simply our failures, which demand attention.

"Her whole history," says Professor Siegfried, writing of Lancashire some years ago, "has been a continual adaptation, from one decade to another, to meet the changing requirements of the world situation." Is this true of Lancashire or any other part of England during the last decade? Is not the essential defect lack of mobility and lack of adaptation? It is inevitable in a world that is growing richer year by year, and richer per head of population, that the basic industries supplying the primary needs of the people should constitute an ever-diminishing proportion of the national dividend; that the industries satisfying secondary needs, the smaller and the new industries—those which exist to-day and those which will come into being tomorrow—should constitute an ever-increasing proportion. The future lies with the countries whose whole economic organisation is the most mobile, with those which have the imagination to foresee future needs, the courage to scrap obsolete plant and the skill to adopt and adapt new inventions.

But in England "the recorded number of insured persons unemployed does not represent the number of persons unable to find any kind of remunerative work, but the number unable to find work more or less of a kind to which they have been accustomed, at rates of pay not substantially reduced." "We are convinced," says the Committee on Industry and Trade, "that no scheme of compulsory insurance . . . would be acceptable or workable if framed on any other basis."* The sociologist or the politician may further be convinced that this basis is desirable, and the economist that so long as it is adopted, as the rate of change in the world increases, and increase it must, unemployment may be expected to increase likewise.

The World Sweeps By.

For the lack of mobility and adaptability is not a characteristic of wages and labour alone. The height of wages is not absolute, but is relative to the productivity of labour, and the productivity of labour depends not on labour only but upon the whole organisation of production—and taxation. In all the industrial countries of Europe and America industry has been largely re-equipped and reorganised during the last ten years. In some cases this re-equipment was necessitated by war damage, in others stimulated by inflation, in others—as in Sweden or in Switzerland—the result of a simple recognition of the necessity for change. To one inflation, to another deflation, gave the required pressure. To such pressure all responded in varying degrees, and in England too, no doubt, much reorganisation is now being undertaken. But the view sometimes expressed on the Continent of Europe that the world swept by while the British industrialist sat in hope and the banker in contemplation of the overdrafts he had granted, is perhaps not simply picturesque. In the contest between hope and contemplation, contemplation won because, as prices fell, the value of the overdrafts increased.

The Balfour Committee "after looking at their six volumes as a whole" found "the outstanding feature on which there was good reason for satisfaction" lay in their unanimity, and then decided to draw no formal conclusions. But this same Committee thought "it abundantly clear that the first step towards putting British industry in a position to compete successfully in overseas markets is to subject their organisation and equipment to a thorough process of reconditioning." If this conclusion is not formal, it is at least forceful.

* "Committee on Industry and Trade." Summary Vol., page 131.

About the necessity for reorganisation, only those can judge who are in constant touch with the daily facts of business. The point is raised here because, in so far as the necessity exists, the question of the height of wages is not one which should be solved by changes in wage rates alone. But the need for reorganisation and readaptation is constant, and as the world grows richer per head of population, and secondary, shifting wants grow in importance, this need must become the more imperative. It is not simply to the success of the effort which is being made at the moment, therefore, that attention should be turned, but to the general adaptability of the whole machine. The demand for capital to-day for the opening up of new countries, for the laying of railway lines, for the cutting of canals or the irrigation of land may be relatively less than it was in the nineteenth century, but the life of capital is likely to be shorter. It will depend less on its physical durability and more on new inventions and changing demand. Not the old but the out-of-date must be scrapped. Obsolescence receives a new significance—almost a new meaning. All plant is obsolete which cannot compete successfully, and all labour is crippled whose power or willingness to work is limited to one job. The future lies with those who have the courage to scrap and the courage to move and change. But before plant can be scrapped it must be written off; and gross profits must be earned and allocated, not to dividends or the fisc, but to reserves. To the extent to which amortisation and re-equipment is prevented by the taxation of gross profits, it may be expected that unemployment and the demand for revenue, on account of unemployed benefits, will increase; but the source of revenue—the wealth produced—must decrease.

The Real Need.

Scrapping demands the courage to scrap, and reorganisation the courage possibly even to sacrifice overdrafts. England in the nineteenth century evolved an economy of maximum profits derived from maximum risks. She can scarcely feed four persons in ten of her population; she is dependent on foreign sources for a very large proportion of her raw material requirements. Her imports of foodstuffs in 1928 amounted to £531 millions and of raw materials to £335 millions, a total of £866 millions—while the value of her total exports was only £724 millions. She is dependent, not for her prosperity but for her existence, on the sales of her manufactures abroad. She is dependent, therefore, on a changing foreign demand, over which she can have no control, for which she can find no substitute.

Is it a paradox or a consequence that in this economy of national risk so much pains should have been taken during the last ten years to insure each individual, rich and poor, against all the manifold hazards of life. Against the national risk the only insurance possible is production. But more attention is paid to-day to the distribution of the national income than to its creation. Some urge on the country "safety first," but safety lies only in enterprise. Others commend inflation, to be taken, like cocktails, in small doses. But by such inflation the worker is relieved of part of his wages and the entrepreneur of the obligation to reorganise and re-equip. Inflation and cocktails may both stimulate for the moment—but the one leads to cirrhosis of the liver and the other prevents the cure of a gouty economic system. However serious the position at the moment may be, it is never the momentary situation which ultimately matters. The real problem is that of restoring elasticity to the whole organism. To-day is anything free excepting the importation of commodities and is a solution more likely to be found in the restoration of freedom or in placing a coping-stone to false logic?

Is it really impossible to restore the fluidity of labour and wages, to cut losses, to "subject the organisation and equipment of industry to a thorough process of re-conditioning"? Is it met by these methods and the courage they demand that the status of British industry and trade can best be restored? Is it not certain that, whatever may be achieved by the measures now being adopted, in the ultimate test of time the most adaptable will prove the most progressive?

THE STATE OF TRADE—(Continued.)

HOME INDUSTRIES.

Coal.—Export business is still restricted by the uncertainty regarding the marketing schemes to be prepared in accordance with the new Coal Mines Act. Demand for house coal and for fuel for gas and electricity works is improving seasonally, but sales of industrial coal remain disappointing.

Iron and Steel.—No change has occurred in the situation. The depression in the shipbuilding industry and the limited purchasing power of important overseas markets, such as Australia, India and the Argentine, is having a serious effect. There is no better demand for pig iron, and the most that can be said is that no further reduction in the total number of furnaces in blast occurred last month. At a meeting of British steel-makers held ten days ago it was decided not to countenance any further reduction in prices, but so far this has done little to restore confidence or stimulate demand.

Engineering.—Unemployment has again increased, and the most that can be said is that the decline in activity is no worse than that experienced last month by business generally. Makers of prime movers and power equipment remain relatively active, and builders of agricultural machinery have lately obtained a few sporadic orders. The machine tool and textile machinery branches of the industry are dull, and the marine engineering section is now at a very low ebb.

Electrical Industry.—The following index of production in the electrical industry is copyright by the Economical and Statistical Department of the British Electrical and Allied Manufacturers' Associations. An explanation of the manner in which it has been computed was given on page 888 of the *Economist* of November 28, 1925.

While actual business on home account remains unsatisfactory, a fairly large number of inquiries from industrial consumers are coming to hand. Export orders are now falling off, and it seems that the world depression is at last beginning to affect foreign consumption of electrical power.

Motor Industry.—Although favourable results are expected from the exhibition, so far there has been no material improvement in the private car section. Demand from abroad is quiet and below last year's level. The commercial section is also quiet, with a disappointing decline in exports. Cycle and motor cycle makers are active in anticipation of the forthcoming show, but here again export trade is disappointing.

Cotton.—Demand for yarn and cloth has broadened, and there is now greater confidence in current prices. Inquiry in piece-goods for India has been better, and there has been some activity in light bleaching goods for Madras and Karachi. Most of the trade with China has been in fancies and specialities, but a few more lines in white shirtings have lately been booked. Trade with Egypt has been restricted by financial difficulties, and South American business has been affected by the political troubles, but home and Continental demand has improved. Sales of American and Egyptian yarns have increased, but prices remain poor. Still if the present improvement continues, it should be possible to restart some idle machinery.

Wool.—The recent London sales ended with declines of 5 to 10 per cent. in wool as compared with the previous sales, but there is a general feeling, confirmed by cable advices from overseas, that bottom has been reached. Deliveries of merino tops against previous contracts have lately been fairly good, but new orders are only being placed sparingly, and business in crossbreds is disappointing.

Linen.—Only small quantities of new season Irish flax have been marketed. Quality is disappointing, with prices favouring buyers. There is a better inquiry for yarn and cloth,

and although prices remain unremunerative, several bulk contracts have been placed.

Rayon.—There has been a fair demand for high-class specialities, but there has been a considerable amount of price-cutting at the lower end of the trade, and stocks have tended to increase. Demand for acetate yarns has been slow.

Boots and Shoes.—Business remains quiet and production of moderate dimensions. There is a fair demand for the better qualities of ladies' goods.

Pottery.—Trade is quiet, and overseas demand has lately shown signs of decreasing in volume.

Chemical Industries.—The recent improvement in the rayon industry has helped certain trades, but makers of hydrochloric and sulphuric acids are adversely affected by the depression in the metal industries. Demand for fertilisers, though small, is normal for the time of year.

Building Trades.—Employment has undergone a slight seasonal decline, though it remains fairly good in some districts. Employment at Peterborough in the brick industry remained good.

Agriculture.—Corn harvesting was delayed by the bad weather and in many areas had not been completed by the end of September. Much of the corn, too, was gathered in a damp and soft condition. The lifting of potatoes has also been retarded by the wet, and quality is affected. Some progress has been made with ploughing, but cleaning of the stubbles has been largely impracticable. Livestock has done fairly well and milk yields were well maintained.

Shipping.—The seasonal recovery in freights which began in August and already showed signs of being arrested in September, underwent a definite reaction during the past month. The temporary activity of Black Sea chartering has died down, and all the homeward markets have relapsed into conditions of extreme dullness. Outward coal business continues quiet.

Retail Trade.—Business has not been too good, but the cold spell of weather experienced early in October stimulated demand in certain sections, and it is hoped that here activity will be maintained until the early Christmas business begins.

UNITED STATES OF AMERICA.

Some seasonal improvement in business is reported. Steel mills have lately operated at 61 per cent. of capacity, as against 54 per cent. reported the previous month. Construction contracts have expanded in volume, especially as regards residential building. Textile shipments and sales have been in excess of production, and stocks have been reduced. Automobile output, however, has fallen to the lowest point for the year, but stocks are relatively small. Freight movements have expanded slightly, and the distributive trades are improving. The recent fall in commodity prices reflects the break in the wheat markets.

The following indices of American economic conditions have been forwarded to us by Moody's Investors' Service, of New York and London.

BRITISH EMPIRE.

Australian weather conditions are reported to be generally favourable. The wheat export surplus may possibly amount to 4,000,000 tons. Voluntary pools are operating on the lines of last year, the suggestion of compulsory pools having been rejected.

Canadian trade continues to decline in volume under the influence of the world depression, and current statistics of production, employment and car loadings are disappointing. It is clear that purchasing power both in the agricultural areas and among industrial workers remains restricted. Money is cheap and easy.

In India, mail reports from Bombay state that Japanese spinners have been increasing their purchases of raw cotton. The trade outlook generally is better, and according to cable advices there have been good clearances of home-made goods. The latest weather reports state that satisfactory rains have fallen and that crop prospects are good in most areas.

South African trade has improved slightly, but competition remains keen and the outlook is still very uncertain. Good rains have fallen in the Cape Province, and winter crops have consequently improved. The cotton crop is one of the best yet produced, while the final estimate of the maize crop is given as 23,075,000 bags.

ELECTRICAL PRODUCTION.

In the *Economist* of July 10, 1926 (pages 57–8), we published a new index of electrical production in the chief industrial areas of Great Britain. We show below a résumé of the results achieved during recent periods:—

INDEX OF PRODUCTION OF ELECTRICITY.*
(Monthly Average 1923-24 = 100.)

Date.	Britain, excluding London and Wales.	Coal Mining, Iron and Steel, Shipbuilding, Heavy Engineering.	General Engineering and Automobile Construction.	Chemicals.	Marine Transport, Docks, etc.	Textiles, Cotton, and Wool.

September.....	156	137	223	282†	203	144

† Increase due to special causes.

* Prepared by the economic and statistical department of the British Electrical and Allied Manufacturers' Association.

Since August there has been a sharp recovery, which was most marked in Lancashire and Yorkshire. The shipbuilding, iron and steel and heavy engineering areas remain depressed.

EUROPE.

The French coalfields report a fair demand for both industrial and domestic fuel. Export trade in iron and steel is depressed, and home trade is less active. The textile trades are still in a most unsatisfactory condition.

The Belgian coal trade remains dull, and foreign competition is intense. There have been further reductions in iron and steel prices, but these have failed to stimulate demand. Steps are being taken to reorganise the glass industry, with the object of reducing costs and stimulating sales.

German trade news remains discouraging. Unemployment continues to increase, and the wage dispute in the metal trades is having an unsettling effect. The September export figures at 1,001,000,000 marks, however, show an improvement of 30,000,000 marks over the preceding month, and allowing for the fall in prices compare very favourably with those of 1,200,000,000 marks recorded in September of last year. The figures include reparations deliveries.

Dutch industrial activity is well maintained in the face of the world depression, but some anxiety is felt as to the difficulties planters in the Dutch East Indies are passing through as the result of the collapse of sugar and rubber prices.

In Scandinavia, the timber trade is dull, and Denmark reports prices of butter and bacon again to have weakened.

Industrial reports from Switzerland are not encouraging, with the single exception of the electrical trades, which appear to be fairly busy. Money is very plentiful and cheap, but security prices, including those of bonds, are lower.

Recent Austrian reports show that the situation was no worse in September than in the preceding month. In certain trades a moderate seasonal revival occurred.

In Czechoslovakia, the autumn Leipzig Fair proved a disappointment to the Bohemian glass industry. Makers of china goods are well employed, but the textile industries are sharing in the general world depression. The steel trades

have been adversely affected by the breakdown last July of the price control formerly imposed by the International Steel Cartel.

SOUTH AMERICA.

Argentine crop conditions are favourable, and the area under cultivation is larger than last year. Maize sowing has been completed. The exchange fell to 36½d. on October 13th, but has since recovered to 38½d., partly on the Provisional Government's decision to allow gold to be exported to meet the service of the external debt.

Chilean business remains dull, but the reorganisation of the nitrate industry is proceeding, and sales of the fertiliser, both prompt and forward, are progressing normally.

Brazilian news is still indefinite, and it is too early to tell when a definite outcome to the political disturbances will be reached.

In Peru, the general economic and exchange situation is still difficult.

Colombian trade is slightly better. Transport conditions have improved, and the tone of the coffee market is more hopeful.

FAR EAST.

The Shanghai market has lately become a little more active, and prices are steadier. Stocks of piece-goods are also falling to a low level. The slight improvement in the exchange that has taken place since August has been of assistance. The Hong Kong market in cotton piece-goods has also improved, and there is now a fairly good demand for certain specialities.

The return of the yen to parity with the pound is evidence of the steady improvement in the economic condition of Japan, and the report that Japanese spinners have recently been buying Indian cotton more heavily is additional proof. The news that a "Bankers' Committee of Industrial Research" has been formed to receive rationalisation schemes put forward by basic industries and to consider means of financing them is also indicative of the efforts being made in the direction of commercial reorganisation.

The Economist

MONTHLY SUPPLEMENT.

New Series.

SATURDAY, NOVEMBER 29, 1930.

No. 90.

In the following pages we have aimed at compiling tables which will show summary figures for as many nations of the world as possible, and have endeavoured to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations,* supplemented from our statistical records. We propose in these columns to give our own appreciation of the trade position, fortified by informed opinion, and to leave the figures to be interpreted by our readers each in his own way.

* "League of Nations Monthly Bulletin of Statistics." 1s. 6d.

THE STATE OF TRADE AT HOME AND ABROAD.

CURRENT indicators of the state of trade have lately become a little more conflicting than they were earlier in the autumn; and this on the whole is a good sign, for it means that one or two sporadic rays of light have begun to penetrate the general depression. To summarise the good and bad signs, among the former come the slight improvement over previous months shown by the October trade returns, the greater stability of some wholesale prices that has developed since early October, and the improvement in tone and also in employment in most of the textile trades. Bad signs include the poor October iron and steel production figures, the increase in unemployment in the heavy industries, and the uncertainties over the coal and railway wage negotiations. To these must be added such adverse foreign developments as the recent French and American bank failures, and the further break in wheat prices.

If these indicators be considered in greater detail, it must be admitted that in so far as the total dead-weight of unemployment is concerned, the increase in the heavy industries—coupled with the seasonal increases in unemployment in such trades as building, transport, distribution and hotel services—has outweighed the improvement in the textile industries, with the result that the total figure has risen. Fortunately the upward trend of unemployment was checked early in November, but the check was purely temporary, and there is little ground for hoping that the approaching winter is not going to be a hard one, both at home and abroad.

The October trade returns received full consideration in the *Economist* of November 15th. Here it is only necessary to repeat that too much reliance must not be placed upon the results of a single month, and that probably the most that can be deduced is that in October at least the normal seasonal up-swing in trade was sufficiently powerful to overcome the weight of the depression. In short, the returns provide a basis only for a very qualified optimism.

The trend of wholesale prices is in some respects more encouraging. According to weekly calculations published in this country, the net movement between October 1st and November 19th amounted to less than one per cent.; nor did intervening figures exceed the limits

of this range. Home industrial reports supplement the general impression given by these statistics, for in one or two trades greater confidence is now felt in prices, with the result that a better tone has developed. Unfortunately, contemporary foreign wholesale piece index numbers do not afford quite such definite evidence of the establishment of stability, and in view of such recent events as the bank failures in France and the Southern American States, and the November break in wheat prices,

it is difficult to feel confident that the world collapse in wholesale prices has yet been definitely and permanently arrested.

The wage negotiations begun between the railway men and their employers can fortunately still be regarded as containing no more than potential elements of danger. In so far as the railways are concerned, there is good reason for hoping that discussions will pursue their normal course, and will end in a settlement by compromise. The coal situation is more serious, because something definite has to be settled before December 1st, when the shorter hours come into force. Looking back over the past few months, it is clear that in view of the delays and difficulties that have attended the attempts to bring into force the marketing provisions of the new Coal Mines Act, and considering the set-back in our coal export trade, it would have been wiser to postpone the shortening of hours.

A general survey of the reports of home industries given upon a subsequent page is still rather discouraging in the conclusions to which it leads. Except for certain branches of engineering, the heavy industries are badly situated. The textile trades on the whole have made some headway, but even so they still remain in the majority of cases at so low an ebb that it is difficult to derive much satisfaction from the small improvement that so far has taken place. Seasonal expansions of limited dimensions have occurred in certain other industries, such as pottery and the motor trade, but the general impression—confirmed by reports from the retail trades—is that the trade depression has definitely reduced spending power, and that this year's Christmas trade is likely to prove disappointing.

Empire and foreign news show that the depression is still widespread. Countries such as France and Holland,

which previously had escaped the full effects of the depression, are now beginning to feel its weight, while in other countries, such as Australia and Germany, the depression is still unabated. Competent observers in the United States anticipate a hard winter, and the most they can say is that inventories are now very low, with the result that any revival in the public demand for goods will quickly be reflected in increased production. In short, the world seems now to be at a low point in the trade curve. There are, it is true, certain signs that the curve is beginning to flatten out, and that the bottom may have been reached, but there is as yet no certainty that the next turn in the curve will be upwards, or that recovery can be expected at an early date.

HOME INDUSTRIES.

Coal.—Apart from a fair export trade in Welsh anthracite, business remains very restricted, mainly because of the uncertainty regarding the outcome of the wage negotiations necessitated by the reduction in working hours due to take place on December 1st. The cold weather has stimulated a better demand for house coal, but other sections of the trade are still stagnant.

Iron and Steel.—The October production figures quoted on another page show that the industry has again lost ground. The depression in the shipyards has deprived steelmakers of one of the most important outlets for their products, and it is illustrative of the general absence of demand that the extremely low prices now being quoted for Continental "semis" are failing to bring out fresh business.

Engineering.—Structural engineers have improved their position, largely as a result of overseas contracts, such as the Zambesi bridge and the new Pretoria steelworks. The machine-tool industry will also benefit from the recent receipt of a Russian order of the value of £600,000. Locomotive builders can always rely upon a fair amount of business, and makers of power-house equipment, boilers and lifting machinery are holding their ground. Other sections of the industry are depressed, and unemployment became more intensified during October.

Electrical Industry.—The following index of production in the electrical industry is copyright by the Economical and Statistical Department of the British Electrical and Allied Manufacturers' Associations. An explanation of the manner in which it has been computed was given on page 888 of the *Economist* of November 28, 1925.

INDEX OF ACTIVITY IN THE ELECTRICAL INDUSTRY. (1920 = 100.)

December.....	69	160	92	December.....	60	228	102

The home market remains depressed, and unfortunately October witnessed a marked decline in export activity. Only one large order was placed during the month, this coming from Denmark.

Motor Industry.—Private car manufacturers are busier as a result of the Show, and exports have improved. Commercial vehicle builders are also more active, with a better overseas demand. It is too early to gauge the results of the Motor Cycle Show, but this should produce an encouraging volume of business. Regarding the industry as a whole, the last few weeks have witnessed a definite improvement.

Cotton.—The improvement noticed at the end of October has been succeeded by a quieter feeling, this being partly due to the reaction in raw cotton prices and to uncertainty as to the effects on prices of Federal Farm Board policy. Trade with Madras and Karachi is improving, but the boycott is still operative at Bombay, and the Indian demand as a whole is very limited. More inquiries are coming from China, but conditions are still unsettled. Other markets, both at home and abroad, are a little more active, and a few more looms are now running than was the case a month ago. Spinners have benefited from the revival in demand that occurred at the end of October. This has steadied prices and reduced stocks.

Wool.—The demand for tops is still limited, but makers of merino tops have lately been able to quote slightly higher prices. A substantial amount of business has lately been done in botany pieces, but it is noticeable that much of this has passed at prices which do not permit of any advance in raw wool or tops.

Linen.—Demand for yarns is still confined to immediate requirements, even though prices are now lower than they have been for years. A good volume of inquiry has been maintained for all grades of cloth, but only a small number of orders have materialised.

Rayon.—Business generally has improved considerably, and export trade has lately been better than for some time. In yarns the bulk demand is for fine filament viscose. Specialties have sold briskly, but among the cheaper yarns much price-cutting has been in evidence, and stocks are large. An official reduction in acetate prices caused a temporary disturbance, but demand has since improved.

Boots and Shoes.—Production, though unevenly distributed, is well maintained, and a few firms are very busy. Prices, however, have to be cut very fine, and export demand is relatively poor.

Pottery.—Some sections of the trade reported a seasonal improvement in employment during October, but short time remains general, and the outlook is still very obscure.

Chemical Industries.—Some slight improvement in the general tone is reported, and one or two manufacturers are fairly busy. The outlook, however, is far from settled, and the latest foreign trade returns are disappointing.

Building Trades.—Employment underwent a further seasonal decline during October, and, except in one or two districts, is now only moderate in the skilled trades and less satisfactory in the unskilled trades. Employment in the brick industry, though still fair, also declined seasonally during October.

Agriculture.—Potato lifting has been retarded by bad weather, but in the drier areas at least the bulk of the crop had been secured by the end of October. Disease was fairly prevalent, and some doubt exists as to the keeping qualities of the tubers. Yield, also, was slightly under average. Root crops are expected to turn out below average, but sugar-beet appears satisfactory. Drilling has proved difficult, and in many areas satisfactory seed beds could not be obtained. Grass makes good progress, and the outlook for winter keep seems satisfactory. Apart from sheep in wet and low-lying areas, livestock remained in good condition during October. Milk yields were normal.

Shipping.—Extremely dull conditions continue to rule in the freight market. Apart from a slight revival in demand from the Plate, chartering has been very restricted, and most of the seasonal improvement in rates witnessed in August-September has been lost.

Retail Trade.—A leading London store reports that the Christmas gift season has begun fairly well, and that certain sections have benefited from the recent cold weather. Business in general, however, is hardly coming up to expectations, and is undoubtedly being affected by the trade depression.

BRITISH EMPIRE.

Australian trade remains depressed, and unemployment continues to increase. Agricultural and pastoral prospects are good, and at the October wool sales demand for the better classes was well sustained and slightly higher prices were obtained. Even so, current prices, both of wheat and wool, are so low as to neutralise all the good effects of the present excellent season.

A few weeks ago a slight improvement in the general business tone was noticeable in Canada, but since then confidence has received a further shock from the November break in wheat prices. In view of the dependence of Canadian industries upon the Western farmers for their market, it is clear that the corner has not yet been turned, especially as activity in the construction, mining and lumber trade is still restricted.

As regards Indian trade, mail reports from Bombay state that demand for imported piece-goods was still restricted by the boycott. There was a fair sale for local goods, and Bombay mills were able to reduce their stocks, but trade was disturbed by the political situation, which leads to frequent interruptions of business.

South Africa reports some improvement in business in the Cape Province Coastal areas, but that conditions generally remain quiet. Good rains have fallen in the winter rainfall area. Maize prices are now the lowest recorded for many years past. The revised estimate of the season's sugar crop gives a raw mill production of 370,000 tons. This leaves a surplus of 170,000 tons available for export. Business in the motor trade is slow and difficult.

UNITED STATES OF AMERICA.

Irregular conditions prevailed during October, and, although some seasonal improvement is indicated by current statistics, it was slightly below normal. Steel mill operations have receded to 50 per cent. of capacity, and automobile production is extremely slack. On the other hand, commodity prices have become more stable, and retail trade is expanding towards its holiday peak. Consumption is in excess of current production, and inventories are being reduced. Greater activity is now noticeable in the textile industries.

The following indices of American economic conditions have been forwarded to us by Moody's Investors' Service, of New York and London.

EUROPE.

Some seasonable improvement is noticeable in the French coal trade, but iron and steel manufacturers are meeting with intense competition in export markets. Variable conditions are reported in the textile industries. Cotton is, on the whole, depressed, but some improvement is apparent in the flax and jute industries, and Roubaix top-makers and wool-combers are fairly busy, being still engaged on overtaking arrears arising out of last August's dispute.

The Belgian coal trade remains depressed, and heavy stocks are still being held. There is a slightly better tone in the iron and steel industries. Glass production is still very limited, but stocks are being reduced and prices are steadier.

Dutch industries are at last being affected by the depression, and short time is being extended to avoid dismissals of staff. Money remains easy, and the capital issue market inactive.

German trade is no better, and the unemployment figure had risen to 3,253,000 by October 31st. Export trade, however, is well maintained. Following the wage award in favour of the employees in the metal industries, numerous other awards are pending. The Government is endeavouring to prepare the ground for these by means of energetic action directed towards reducing the cost of living.

Scandinavia reports that the timber trade remains dull, partly because of Russian operations. In Denmark there has been a further fall in butter prices, and huge stocks of bacon are available for export.

In Switzerland the textile trades are dull, and most industries report a pronounced falling-off in exports. Money is very cheap and abundant.

In Austria no improvement took place during October, and trade was further restricted by the imminence of the elections. These, on the whole, had a reassuring result, but it is still too early to see what their effect will be upon trade.

In Czechoslovakia the coal trade reports a seasonal improvement in demand. The glass industry states that Christmas orders are now coming forward. Belgium is a keen competitor in foreign markets.

SOUTH AMERICA.

The agricultural situation in Argentina remains satisfactory. Apart from vague reports of rust damage to the wheat in the northern areas, cereals are in excellent condition. The commercial situation is still dull, and the low level of the exchange is restricting imports. Special arrangements, however, have recently been made for the export of gold from the Conversion Office, partly to meet the service of the external debt, and in this connection it is reported that gold to the total value of U.S. \$10,000,000 has already arrived in New York. The revolution in Brazil having ended by a *coup d'état* in Rio de Janeiro, the anxiety felt regarding the situation in that Republic has been considerably relieved. The appointments to the new Provisional Government inspire confidence, and a gradual improvement in the present depressed trade situation may be expected. For the time being, however, it has been found necessary to extend the moratorium in the Republic for a further period of 15 days, i.e., until December 15th. Commercial conditions in Chile show no appreciable signs of improvement. The Chilean Government is instituting economies in national expenditure, and negotiations are continuing in New York for the financing of the Cia. de Salitre de Chile, the national nitrate company, into which practically all the Chilean nitrate undertakings will be centralised. In Peru, trade continues to be extremely dull, although the local cotton and sugar markets have lately been firmer. Peru, however, has passed through a long period of economic depression, and, for the moment, the outlook is obscure. Credit conditions in Colombia are slightly better, although the general trade situation there continues dull. In Guatemala, Ecuador and Salvador an improved tone has been in evidence in the local coffee markets, although prices of the commodity are still at a comparatively low level.

FAR EAST.

Latest reports from China state that the Shanghai market is dull. It is true that prices are a little steadier, and that rather more inquiries for cotton goods are coming forward, but the outlook is still very unsettled.

In Japan stocks of raw silk are being reduced, and a better tone is in evidence. Production of printing papers is being curtailed. The restriction of output now in force in the spinning section of the cotton industry is serving to place business upon a more profitable basis. Gold shipments during October totalled 39,000,000 yen.

ELECTRICAL PRODUCTION.

In the *Economist* of July 10, 1926 (pages 57-8), we published a new index of electrical production in the chief industrial areas of Great Britain. We show below a *résumé* of the results achieved during recent periods:—

INDEX OF PRODUCTION OF ELECTRICITY.* (Monthly Average 1923-24 = 100.)

Date.	Britain, excluding London and Wales.	Coal Mining, Iron and Steel, Ship- building, Heavy Engi- neering.	General Engi- neering and Auto- mobile Construc- tion.	Chem- icals.	Marine Transport, Docks, etc.	Textiles, Cotton, and Wool.
1928.

† Increase due to special causes.

* Prepared by the economic and statistical department of the British Electrical and Allied Manufacturers' Association.

No real improvement is revealed by the October results, and in the Birmingham area and on the North-East Coast the depression remains very marked. Lancashire and the West of Scotland appear to be more active.

INDICES OF BUSINESS ACTIVITY.

With few exceptions our indices of business activity continue to convey the impression of an unabated slump in trade. In several cases the latest figures show a small improvement over those for the previous month, but it should be borne in mind that the method by which the three-monthly moving averages are compiled means that in the three months' period forming the basis for the figures published as relating to October, data belonging to that month replace those appertaining to July—a month in which summer seasonal slackness is nearing its maximum. Thus the October figures ought to show a strongly marked seasonal improvement, but in few of the cases where such an improvement is recorded can it be said that the recovery is of normal dimensions.

Turning to the index numbers in detail, it will be seen that both net imports of raw materials and exports of British manufactures continue to show a pronounced decline. In the case of manufactured exports the index figure for October was over 26 per cent. lower than a year ago, and the fall was only a little smaller in the case of net imports of raw materials, in whose case the downward movement of last month conflicts directly with the usual seasonal trend. In the case of both of these indices the figures for the third quarter have been revised in the light of the price changes revealed by the Board of Trade's latest revaluation of overseas trade. The following table shows quarterly averages for the past four years, together with those of our index of total foreign trade turnover—a weighted average of imports and exports:—

QUARTERLY AVERAGE, 1924 = 100.

	Net Imports	Exports	British Foreign Trade
	Raw Materials.	Manufactures.	Turnover.
July-September, 1927	90	105.5	102.5
1928	84	108.5	102.5
1929	95	112	109
1930	84	84	96

The figure of retained imports of non-ferrous metals is less unsatisfactory by comparison with that for September.

ber, but in this case also a substantial decline is recorded as against the corresponding month of last year.

Coming to the consumption indices, it will be seen that in the case both of iron and steel and cotton a slight recovery occurred in October, but the current level is significantly lower than a year ago. The same setback is to be seen in the consumption of electricity, the October figure for which is 9 per cent. lower than for October, 1929. Curiously, the index of consumption of coal showed last month an increase which conforms, it is true, to normal seasonal trend, but is much larger in extent than might be expected. It seems necessary here to bear in mind the possible qualification that, in view of foreshadowed wage difficulties, pit-head stocks, as well as stocks in large consumers' hands, may have been increased, thus exaggerating the apparent consumption.

The indices of the volume of employment have been revised in the light of the Ministry of Labour's census of the insured population last July, the results of which reflected the statistical disturbances caused by the modifications in the Unemployment Insurance Act which became effective last March. As a result of this revision, the index of the volume of employment in heavy industry is slightly higher for the past six months than was previously shown to be the case. But both in this case and that of general industry the fall which has taken place since the beginning of the year is very grave. When the latest figures are compared with those of a year ago, the discrepancy between the movements of the index of miscellaneous services and those of heavy and general industry prompts the reflection that production in a time of depression is carrying a heavy burden of ancillary employed persons.

With regard to the remainder of the indices, little comment seems necessary. Postal traffic is surprisingly well maintained, and London bank clearings are substantially higher than a year ago. Shipping movements, on the other hand, register a fairly marked recession, and provincial bank clearings, whose index, it may be added, is adjusted to allow for changes in the price level, continue to record a significant decline.

1924 = 100.

The Economist

MONTHLY SUPPLEMENT.

New Series.

SATURDAY, DECEMBER 27, 1930.

No. 91.

In the following pages we have aimed at compiling tables which will show summary figures for as many nations of the world as possible, and have endeavoured to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations,* supplemented from our statistical records. We propose in these columns to give our own appreciation of the trade position, fortified by informed opinion, and to leave the figures to be interpreted by our readers each in his own way.

* "League of Nations Monthly Bulletin of Statistics." 1s. 6d.

THE STATE OF TRADE AT HOME AND ABROAD.

THE main inference to be deduced from the past few weeks is that the faint promise of greater stability held out by some of the October and November trade statistics has once more ended in disappointment. More than once during the past twelve months the bottom of the trade depression has appeared to have been reached, but each time, after a few weeks' interval of hope, the curve has once more turned unmistakably downwards. The month of December has sadly repeated past history.

Wholesale prices, after a period of six or seven weeks' relatively greater stability, began to fall with renewed precipitancy at the end of November; and it seems highly probable that New Year's Day will coincide with the return of the *Economist* index number to its pre-war level. The unemployment returns, which for one week in November registered a slight decrease, have lately continued to grow, in contrast to the normal pre-Christmas tendency, and the last available weekly figure is no less than 2,306,962. Overseas trade, which in October showed signs of a little improvement, receded again in the following month; and here too there is no sign that the general trend of the curve has ceased to be downwards. Finally, the iron and steel production returns for November bear witness to a further contraction of activity; the coal industry has been hampered by uncertainty as to the outcome of the disputes over working hours; and the further weakness of raw material prices has deepened depression in Lancashire.

From the table, on a later page, of indices of business activity, equally little encouragement is to be derived. Net imports of raw materials show a further decline in volume; the apparent improvement in the in-take of non-ferrous metals represents little more than the generally recognised, though not statistically measurable, increase in stocks; and the indices of consumption of cotton, iron and steel, of employment, railway goods traffic, and exports of manufactured goods are all eloquent of an acute state of depression. The fractional rise in the highly significant index of provincial bank clearings is a purely seasonal movement, which leaves the current figure 10 per cent. below the level of a year ago; shipping traffic is substantially lower than at this time last year;

and the maintenance of the index of apparent consumption of coal at a figure somewhat higher than in November, 1929, must be largely discounted as a reflection mainly of higher factory stocks accumulated against the possibility of a stoppage in the mines.

The financial history of the past few weeks is equally disappointing. Early in November it looked as if there might at last be a chance of dealing comprehensively with the burden of the 5 per cent. War Loan, but with the

reaction in the gilt-edged market caused by the outflow of gold to France and Germany, these hopes have dwindled. The efflux of gold to France, which began early in November, shows no sign of abating, and each day that it continues increases the maldistribution of the world's stocks of monetary gold, and so renders it more unlikely that the fall in world prices can be rapidly arrested, much less redressed. For the moment, London is well able to stand the steady loss of gold without there being any need for a higher Bank rate, but this is mainly because the brunt of the loss falls ultimately upon such countries as Australia, Japan and South America, and the further restriction in these countries' purchasing power caused by their bullion losses—to which must be added the depressing effect of the fall in the price of silver on Eastern markets—must inevitably react unfavourably upon our foreign trade. Finally,

the recent banking and financial difficulties in France and the United States show that the process of liquidating the slump is still some way from completion.

The following pages contain a brief survey of the way in which the different countries of the world have been affected by the trade depression of the past twelve months. It shows very clearly that the field in which this country has suffered most is in that of its foreign trade. From this consideration two inferences follow which have an important bearing on the outlook for this country's industry and commerce. The first is that we, more than other nations, are dependent upon a general world recovery. The second is that we must use the interval in placing our costs upon a competitive basis. These are the two lessons which we all must take to heart at the opening of the New Year.

THE WORLD DEPRESSION.

International Comparisons.

THE end of the calendar year affords a convenient opportunity to take stock, and though it is only possible to carry the international statistical record for 1930 up to the end of October, returns extending even up to that date render it possible to form some idea of how the different countries of the world have fared in face of the almost universal depression. With this object in view, brief summaries, firstly, of comparative production indices and, secondly, of some of the statistics given on the later pages of our Trade Supplement have been compiled, and are reproduced below. The tables are self-explanatory, and it is only necessary to add the caveat that, owing to divergencies in methods of compilation, statistics obtained from different countries may not be exactly comparable in all respects. This consideration applies with particular force to the index numbers of production, set out in the first table, since the forms of output used as basic data in various countries, and the methods of "weighting," differ somewhat widely:—

PRODUCTION INDICES (1924 = 100).

	United Kingdom.	France.	Germany.	Canada.	United States.
	Board of Trade.	Statistique Générale.	Institut für Konjunkturforschung.	Monthly Review of Business Statistics.	Federal Reserve Board.

October.....	...	124.7	(c) 117.0	123.4	...

(a) Adjusted for seasonal variations. (b) Partly adjusted for seasonal variations. (c) Provisional.

With the foregoing qualifications the inference seems permissible that the depression hit Canada and the United States harder and earlier than England and Germany, while France, up to the end of September, had done no more than lose the ground gained in 1929. Much the same story is told by the detailed production statistics for the heavy industries quoted in the next three tables:—

COAL PRODUCTION (THOUSANDS OF METRIC TONS).

	United Kingdom.	Belgium.	France.	Germany.	Poland.	United States.
January, 1929.....	22,792	2,454	4,528	13,490	4,043	53,275
January, 1930.....	24,150	2,489	4,884	14,398	3,806	51,543
October, 1930.....	21,375	2,486	4,695	12,217	3,662	46,517

Percentage of change:						
Jan., 1929-Jan., 1930	+5.9	+1.4	+7.8	+6.7	-5.8	-3.3
Jan., 1929-Oct., 1930	-6.2	+1.3	+3.7	-9.5	-9.4	-12.7

PIG IRON PRODUCTION (THOUSANDS OF METRIC TONS).

	United Kingdom.	Belgium.	France.	Germany.	Luxemburg.	United States.
January, 1929.....	573	351	905	1,098	242	3,498
January, 1930.....	660	343	875	1,092	250	2,873
October, 1930.....	422	249	830	687	194	2,200

Percentage of change:						
Jan., 1929-Jan., 1930	+15.2	-2.3	-3.3	-0.5	+3.3	-17.9
Jan., 1929-Oct., 1930	-26.4	-29.1	-8.3	-37.4	-19.8	-37.2

STEEL PRODUCTION (THOUSANDS OF METRIC TONS).

	United Kingdom.	Belgium.	France.	Germany.	Luxemburg.	United States.
January, 1929.....	774	357	837	1,470	225	4,562
January, 1930.....	783	340	800	1,275	216	2,857
October, 1930.....	521	252	796	856	195	2,764

Percentage of change:						
Jan., 1929-Jan., 1930	+1.2	-4.7	-4.5	-13.2	-4.0	-15.5
Jan., 1929-Oct., 1930	-25.3	-29.4	-4.9	-41.7	-13.3	-39.4

With the exception of Poland, European coal production gained ground in 1929, whereas the curve of American output had already begun to turn downwards; and in the iron and steel trades the British experience of 1929 compares very favourably with that of the rest of the world. During 1930, in common with most other countries, we have lost

ground seriously. Taking the last twenty-two months as a whole, the reduction in British coal output shows up badly against the figures for Belgium and France, but compares favourably with the recession in Germany, Poland and the United States. In the iron and steel trades we have not suffered such proportionate losses as have Belgium, Germany and the United States, but the absolute amount of decline is very substantial. France, it will be noted, easily makes the best showing of all.

Coming now to unemployment, it is unfortunate that complete international statistics are not available, especially as France and the United States are among the missing countries. So far as the table goes, the British figures are bad, both absolutely and relatively to those of all the other countries listed in the table, except Germany, but doubts arise whether the official figures in many foreign countries are so comprehensive as ours.

UNEMPLOYMENT (per cent.).

* September, 1930.

Foreign trade figures of the various countries show a marked divergence. In some cases the comparison between January, 1929, and October, 1930, is partly vitiated by seasonal influences, and in all cases due allowance must be made for the fall in prices. For this reason the wholesale price index numbers for the countries concerned are conveniently included here, but the consideration should be borne in mind that wholesale price changes affect principally those components of the trade returns which consist of primary materials as opposed to finished goods.

* September, 1930.

During 1929, there was a definite similarity between British and American experience, with the majority of the European returns making a better showing. For the twenty-two months as a whole the British figures are not good. Exports have lost more ground than have imports, and all that can be said is that America has fared even worse than Great Britain. The divergence between the German export and import percentage changes is indicative of the efforts Germany is making to finance reparations payments, while a similar tendency is observable, though not for the same cause, in the case of Italy. The maintenance of the overseas trade of Belgium and Sweden is a noteworthy feature.

A conspectus of these statistics suggests that production in Great Britain has been maintained fairly well, when allowance is made for the intensity of the world depression. Though the export trades have suffered severely, and unemployment has consequently risen to a disquieting figure, British internal trade seems to have held its ground relatively well during recent months, thanks partly to the liberality with which unemployment "benefit" has been administered; and it should not be forgotten that a small proportion of the total numbers unemployed represents the results of rationalisation. At the same time, apart from the peculiar depression of so many of our basic industries, Great Britain as a whole is so dependent upon foreign markets that it is difficult to view with equanimity the changes in the direction and value of world trade revealed in the statistics summarised above. Here, both absolutely and relatively, we have lost ground, and it is no coincidence that it is in the export trades that unemployment is the most severe. In short, the crucial anxiety to-day is whether our competitive power can be sufficiently improved to enable us to regain the place in foreign markets which we have lost. Moreover, it should always be remembered that the developments of the 1930 slump found Britain in a situation very different from that of the United States and other countries in which the previous two years had been those of expansion. That is to say, even if in some directions we have lost less ground, we had much less ground to lose.

HOME INDUSTRIES.

Coal.—The threat of labour troubles stimulated a certain amount of "prompt" business at the end of last month, but the general labour uncertainty is still having a restrictive effect upon forward export business.

Iron and Steel.—The industry continues to lose ground, and the November production figures are the worst recorded for a

very long time. Stocks of pig iron are growing, and there is little demand even for attractively-priced foreign steel.

Engineering.—Marine engineering is more depressed than ever, but builders of locomotives, rolling-stock and prime movers are fairly well engaged.

Electrical Industry.—The following index of production in the electrical industry is copyright by the Economical and Statistical Department of the British Electrical and Allied Manufacturers' Associations. An explanation of the manner in which it has been computed was given on page 888 of the *Economist* of November 28, 1925.

November.....	60	228	102	89	November.....	61	171	89

November proved a disappointing month in both the home and export branches of the industry. Fortunately there are indications that December will prove more satisfactory.

Motor Industry.—Although trade is irregular, some car manufacturers are very busy as the result of the show. The motor and pedal cycle trades are experiencing their usual seasonal slackness, but the former should improve in January when the new licensing year begins.

Cotton.—Demand has fallen away after the improvement of the early autumn. The specific causes of the setback are the further decline in raw cotton prices, and the fall in the price of silver to a new record low level.

Wool.—The fall in prices recorded at the opening of the London sales came as a further shock to Bradford. Prices, however, remained steady at their new low level as the sales progressed. This has helped to restore confidence, but trade at Bradford is still very quiet.

Linen.—Russian flax is now being sold for shipment early next year. Fair yarn sales have been effected, and damask cloths are in request, but prices are not remunerative.

Rayon.—The recent reduction in viscose yarn prices has brought out a larger demand for the finer filament yarns. Acetate yarns are in poor request, and output is being limited.

Boots and Shoes.—Business is quiet, and only a few manufacturers were pressed for deliveries before Christmas. A few satisfactory orders for spring goods have already been received.

Chemical Industries.—Sales of heavy chemicals are still restricted. Prices are unchanged.

Agriculture.—Outdoor work has lately been seriously interrupted by rain. Autumn-sown corn appears healthy, but potato disease is prevalent. Cattle are in good condition, and milk yields normal. Supplies of winter keep are adequate.

Shipping.—Apart from a moderate improvement in demand from the Plate, homeward cargo business remains at a low ebb, and outward coal freights are weak.

Retail Trade.—Christmas trade this year appears to have been slow in developing. Purchases have tended to be concentrated more than usual on the less expensive lines.

BRITISH EMPIRE.

In Australia pastoral conditions are excellent; wool is selling well, but at unprofitable prices; and there is no improvement in the general business position. It now seems likely that the wheat harvest will be below the original estimate. In most parts of India November rainfall was seasonable, and standing crops were doing well. Canada is undergoing an increasing strain owing to the further slump in wheat, but the latest news is that sentiment is better. The financial situation is healthy, and plenty of credit and capital is available for business so soon as it arrives. No marked improvement in South African trade is reported, but weather conditions were favourable, and farming prospects good, except in a few areas where rain was needed.

UNITED STATES OF AMERICA.

Retail trade gained ground during November, but industry suffered a further setback. Steel-mill operations declined to 41 per cent. of capacity, but textile mills were more active. Freight movements showed a more than seasonal decline, and commodity prices continued to fall.

The following indices of American economic conditions have been forwarded to us by Moody's Investors' Service, of New York and London.

AMERICAN TRADE STATISTICS—NOVEMBER, 1930.

* Preliminary estimates made by Messrs Moody, subject to revision. † Based on reports of U.S. Labour Bureau and of Bureau of the States of New York, Wisconsin, and Pennsylvania. ‡ Average of actual prices. § Partly estimated.

EUROPE.

The French coal trade is experiencing a better demand for domestic than for industrial fuel. The pig-iron market is weak and foreign competition severe, but there are signs of improvement in the steel trade. The textile trades are dull and depressed. The further fall in cotton prices has had a bad effect in Lille, and Roubaix weavers are finding demand restricted.

In Belgium the coal trade is still depressed, but a better tone is apparent in the iron and steel industries. Dutch industrial news remains fairly reassuring, and the unemployment

figures are, under present circumstances, not excessive. Home agriculture and shipping and the Dutch colonies are seriously affected by the depression.

The German steel industry reports the receipt of fresh export orders, but the general position of the trade remains unsatisfactory. November coal deliveries were restricted by the prospect of the price reductions due to be made early in the following month. The outlook remains obscure, both on account of the general trade depression and because of the uncertainty arising from impending wage adjustments.

In Scandinavia, a better tone is evident in Sweden. Danish farmers are hard hit by the renewed decline in prices of agricultural produce, especially in those of Bacon, and some anxiety is felt as to their position.

There has been a further trade setback in Austria, and at the end of November the number of unemployed stood at 210,000, an increase of 70,000 on the year. Production is being reduced in certain branches of the heavy industries.

SOUTH AMERICA.

Good crops are being secured in the Argentine under favourable conditions. The damage to the wheat crop is less than had been feared, and, including last season's carry-over, 5,500,000 tons will be available for export. The Uruguayan agricultural situation is favourable, but business in wool and cattle is quiet. Apart from a more active movement in nitrate, Chilean trade is also quiet.

FAR EAST.

The fall in the price of silver to new record low levels, and the consequent depreciation of the tael, have had an adverse effect upon trade in China. Still later cables report the Shanghai market to be steady, and that there is a good demand for spring goods.

The adverse trade balance of Japan for the first eleven months of this year was only Yen 94,000,000, and, allowing for invisible items, it is estimated that the year's deficit will be only Yen 100,000,000. Against this gold shipments to November 30th had reached Yen 310,000,000. The Government are considering the issue of bonds to finance unemployment schemes, and long-term credits and other financial assistance are being granted by the Industrial Bank of Japan. Production of cotton yarn is to remain restricted until March, but yarn prices, together with those of raw silk and rice are now steadier. A brighter tone is in evidence on the bond and share market.

ELECTRICAL PRODUCTION.

In the *Economist* of July 10, 1926 (pages 57-8), we published a new index of electrical production in the chief industrial areas of Great Britain. We show below a résumé of the results achieved during recent periods:—

INDEX OF PRODUCTION OF ELECTRICITY.* (Monthly Average 1923-24 = 100.)

Date.	Britain, excluding London and Wales.	Coal Mining, Iron and Steel, Ship- building, Heavy Engineering.	General Engineering and Auto- mobile Construc- tion.	Chemical.	Marine Transport, Docks, etc.	Textiles, Cotton, and Wool.

Supplement to *The Economist*,
July 5, 1930.

GOLD AND THE PRICE LEVEL

A

MEMORANDUM

on

The Economic Consequences of Changes in the Value of Gold

By Sir Henry Strakosch, G.B.E.

THE RETURN TO THE GOLD STANDARD.

WHEN the International Economic Conference, which was held at Genoa in the spring of 1922, enjoined countries that had abandoned the Gold Standard to revert to it, it did so not because it regarded gold as a measure of value which could be relied upon to remain stable in all circumstances, but because it considered the obligation to exchange national currencies for fixed weights of gold (or their equivalents in money of other Gold Standard countries) as the most efficacious means of limiting the monetary circulations to the legitimate needs of exchange, and because it regarded stability of the exchanges—which this convertibility assures—as indispensable for the restoration and development of international trade, upon which the prosperity of the world largely depends. The Conference clearly perceived that, if left to the free play of supply and demand, the value of gold was in danger of being subjected to wide fluctuations. It was to obviate this that led the Conference to recommend the co-ordination of the “demand for gold” . . . “to avoid those wide fluctuations in the purchasing power of gold, which might otherwise result from the simultaneous and competitive efforts of a number of countries to secure metallic reserves.” It envisaged close co-operation of the central banks, and the regulation of credit “not only with a view to maintaining the currencies at par with one another, but also with a view to preventing undue fluctuations in the purchasing power of gold.”

The first of these recommendations, *i.e.*, the general adoption of the Gold Standard, has been carried out in a

measure and with a rapidity which probably far exceeds the most sanguine expectations of those days. Though the movement started in 1923 with the restoration of the Austrian currency, followed, in 1924, by the Hungarian, real progress only began to be made in April, 1925, when Great Britain, and, soon after, the Dominions re-established the Gold Standard. The movement made such rapid progress that, by the end of the following year, practically the whole of the civilised world inhabited by some 1,200,000,000 people—or 60 per cent. of the world's population—were handling money linked to gold. Being by law exchangeable into fixed weights of gold, or their equivalents, the money they handle will buy, either at home or abroad, what the weight of gold into which it is exchangeable will buy. It follows that the purchasing power of all the currencies of the Gold Standard world is determined, within a slight margin, by what gold will buy. If a stable value of gold, that is, a stable level of commodity prices, is beneficial to economic progress—as it is hoped to show in these notes—then such stability will bring economic progress and prosperity to these 1,200,000,000 people, and if, conversely, instability is an impediment to economic progress, then their progress will be impeded and their well-being detrimentally affected. It is well to bear this in mind if the importance and scope of the second set of the Genoa Resolutions are to be viewed in their proper perspective.

THE EFFECT ON COMMODITY PRICES.

The movement of the general level of wholesale commodity prices in this country since the end of 1925 may be taken to be a pretty faithful reflection of the fluctuations to which the purchasing power of gold was subject during that period. It would have been more satisfactory to take for this purpose the average of a wholesale commodity price index of this country and a similarly constructed index of the U.S.A. But this, unfortunately, is not possible, because none of the well-known American indices are constructed and weighted in the same manner as any of the recognised indices in this country. The American indices all include prices of more or less manufactured goods, whereas ours, such as the one regularly published by the *Economist*, are indices essentially of raw materials that have a wide international market. For the measurement of the purchasing power of gold internationally, the *Economist* index certainly seems more appropriate.

Taking the index numbers of wholesale commodity prices of the *Economist*, we get the following picture:—

	<i>Economist</i> Index Wholesale Com- modity Prices; 1913 = 100.	Corresponding Purchasing Power of Gold, 1913 = 100.
End of December, 1925	153.0	65.4
“ “ 1926	145.1	68.9
“ “ 1927	141.9	70.5
“ “ 1928	136.5	73.3
“ “ 1929	126.9	78.8
“ May, 1930	115.8	86.4

It will be seen that the general level of prices fell steadily, but moderately, from the end of 1925 to the end of 1928, while the subsequent 15 months showed a much more accentuated drop which, towards the end of the period, degenerated into a slump.

Gold may thus be said to have appreciated:—

During the year ending 1926 by 5.4 per cent.	
“ “ 1927 “ 2.3 “	
“ “ 1928 “ 4.0 “	
“ “ 1929 “ 7.6 “	
and during the five months ending May 31, 1930 “ 9.6 “	
or for the whole period from end December, 1925, to end May, 1930	32.1 “

It is clear, then, that “the wide fluctuations in the purchasing power of gold,” which the Genoa Conference enjoined the Gold Standard world to avoid, have not been prevented.

The appreciation of gold, as expressed in the fall of the general level of commodity prices during the period under review, is popularly being ascribed to “over-production” brought about in the main—so it is said—by the rationalisation of industries the world over. The fact that this fall of prices has been accompanied by substantial accumulations of unsold stocks of practically all the great staple commodities lends, on a superficial view, support to this interpretation. A closer examination, however, makes this thesis untenable.

T P

"Over-production."

Though the word "rationalisation" has found its way into our vocabulary comparatively recently, there is every evidence to show that rationalisation has been practised to a greater or lesser extent ever since industry has existed. The incentive to augment the gains of industry is an ever-present stimulus to improve, that is, to cheapen and intensify the production of industry. The twenty years immediately preceding the war were probably as prolific a period of scientific progress and of intensified production as any in the economic history of the world. Quantitative measurements, though unfortunately based on material of a comparatively scanty character, leave little room for doubt that production during that period increased at a rate far exceeding the increase of population. Mr. Carl Snyder (the Statistician of the Federal Reserve Bank of New York), measuring the progress of the United States of America by a wealth of statistical data, comes to the conclusion that the trade of the United States—that is, broadly, its production—has been increasing steadily during the last 50 years at a compound rate of 4 per cent. per annum; while his compilations respecting the production of the world at large led him to conclude that that has proceeded at a compound rate of 3 per cent. per annum. Mr. Joseph Kitchin, measuring the economic progress of the world by figures of the physical production of the chief commodities, arrives at a somewhat similar conclusion. The League of Nations, in a recently published volume entitled *Memorandum on Production and Trade*, gives figures of world production which correspond broadly to an increase for the period from 1923-27 of the same figure of 3 per cent. per annum compound. The population of the world, on the other hand, has increased during those periods at a rate of about 1 per cent. per annum. It is true to say, then, that there was an excess of production equivalent to about 2 per cent. per annum over and above the needs to maintain that increased population at a stationary standard of life. Yet, except for a brief period in 1907, none of the phenomena by which the last five years are characterised had made their appearance. Indeed, the general level of commodity prices rose steadily from the year 1896 to the outbreak of war.

A Popular Fallacy.

On this evidence alone, one is entitled to question the validity of the popular notion that the accumulation of stocks of commodities coincident with the fall of the general level of prices of recent times is due to an unduly rapid increase of production of industry. Indeed, it is self-evident that an increase of production, extending over the whole range of commodities in an orderly and symmetrical fashion, cannot lead to what is commonly called "over-production." An increase of production, in these circumstances, simply makes available to the population a greater amount of all the goods it currently consumes. Thus, if the volume of production of the whole range of commodities that enter into the economic life of the nations is, on an average, increased by 3 per cent. per annum, then the producers of the individual commodities will all, on an average, have 3 per cent. more of the goods they produce to exchange with each other. The farmers would exchange their greater production for the greater production of those who produce the things the farmers need, and the producers of these and other things would exchange them for the greater production of the farmers. A symmetrical increase of production of this kind in effect raises the standard of life of the people, and that, it is almost unnecessary to say, is capable of practically infinite expansion. No disturbance in the exchange of the greater output of commodities need, or does, arise in these circumstances, provided there are available media of exchange in the form of money of all kinds to an amount that corresponds to the increased volume of exchanges that this greater production necessitates. If it is available the general level of commodity prices will remain stable. It is only when the available amount of money is either less or more than is needed to effect these exchanges that

the general level of commodity prices will fall or rise, as the case may be.

Symmetry in the production of the various classes of goods is not a matter of accident; it is constantly forced upon producers by the movement of prices of individual commodities relative to one another. If one or other of the commodities is being produced in quantities relatively greater than the production of the rest of the commodities, stocks of those commodities accumulate, their price falls, and so compels a reduction of their production until they once more conform symmetrically to the production of the rest of the commodities. In the reverse case, a reverse reaction on the price and consequently on the volume of production of individual commodities takes place and restores symmetry of production. The inter-play of relative prices—that is, of price movements of individual commodities relative to one another—is thus an automatic and infallible corrective of deviations from the line of symmetric production.

An Invisible Impediment?

Let us now observe the course of individual prices in this country during the period from the end of December, 1928, to the end of May, 1930. The Table in Annex "A" sets out the individual commodities on the prices of which the *Economist* index is based, and shows the percentage rise and fall in the price of each commodity for the period in question. In summary, the table shows that:—

	Falls.	Rises.	Un- changed.
13 commodities of the cereals and meat group had	10	2	1
9 commodities of other foods group had	8	1	—
11 commodities of the textiles group had	11	—	—
11 commodities of the minerals group had	5	5	1
14 commodities of the miscellaneous group had	7	3	4
58 commodities had	41	11	6

Of the 58 commodities included in the index given, 41, or 71 per cent., show falls, 11, or 19 per cent., show no change, while 6, or 10 per cent., show rises.

If it were true that the fall in the price of 71 per cent. of the principal raw materials that enter into our daily life is due to their "over-production," then the producers of each of these commodities would have on hand, and would be anxious to exchange, the surplus of the particular commodities they produce for the commodities they do not produce but need to maintain or improve their material comforts. Moreover, most of these other goods also are in superabundant supply, and the producers of these other goods would be equally anxious to exchange them for the goods they do not produce but need. There is thus a superabundance in nearly three-quarters of the various kinds of raw materials the world needs currently, there is an anxiety of the producers of each of these materials to exchange them for others, and yet they are not exchanged.

We are, in these circumstances, entitled to conclude that these exchanges failed to be made, not because goods generally were in excessive supply, but because the process of exchange was in some way impeded. And if—as is the case—there are no observable impediments of a physical or moral character, the theory of "over-production" fails and we are driven for an adequate explanation to the only remaining factor affecting the process of exchange—viz., the adequacy of the amount of money that is available to effect these exchanges.

The Money Factor.

It is clear that an increase of production, involving as it does an increased turnover of goods and services, calls for a corresponding increase in the amount of money and credit to effect this turnover, if the general level of commodity prices is to remain stable. If the amount of currency and credit that the Gold Standard world as a whole will permit to be created on a given amount of gold remains the same; if, in other words, the ratio of currency and credit to monetary gold reserves remains the same

then the general level of commodity prices, i.e., the value of gold, will only remain stable if there is an increase of monetary gold reserves corresponding to the increase of production. Conversely, if the increase of monetary gold reserves does not keep pace with the increase of production, then general prices will only remain stable if the ratio of currency and credit to monetary gold reserves is appropriately increased. But as the national currencies of Gold Standard countries are all by law exchangeable for fixed weights of gold (or their equivalents in currencies of other Gold Standard countries) price stability can only be achieved by co-operative action, if not of all, yet of the principal Gold Standard countries. Supposing the production of the world increases at a compound rate of 3 per cent. per annum, and supposing the monetary gold reserves of the Gold Standard world were to increase at a similar rate, then the general level of prices will only remain stable if every member of the great Gold Standard partnership does, in fact, build upon the gold reserves they have, and may be receiving, a structure of currency and credit which, regard being had to the state of development of the credit system in each country, is appropriate. To the extent to which they fail to do so, they are depriving the Gold Standard world of the additional currency and credit it needs to exchange its greater production, with the effect of increasing the value of gold, that is, of depressing the general level of commodity prices. Gold upon which an appropriate structure of currency has not been built in these circumstances ceases to perform monetary functions, to the detriment, not alone of the country responsible for it, but of the whole Gold Standard world. It is rather extraordinary how widely spread the belief still is that the Gold Standard leaves the country adopting it in a position of independence, and that the benefits it confers can be had without any responsibilities. The truth that the Gold Standard has bound together the civilised world for good or evil in the greatest international partnership ever known in history, that this partnership, while conferring benefits on each partner, also imposes upon them stern duties, and that transgressions by any one partner inflict hardships on the rest, is hardly realised.

Maldistribution of Gold.

The exigencies of the war have disorganised the monetary systems of most countries. Much of their monetary gold found its way to America and neutral countries. When they restored their currencies after the war and returned to the Gold Standard, they found the free flow of commerce impeded by barriers of the most diverse kind, and with it the flow of gold. This, coupled with an ill-directed monetary policy pursued by some of the Gold Standard countries, accounts for the persistence of the maldistribution of the world's gold reserves and their partial sterilisation. That sterilisation is most pronounced in the case of America, the Argentine Republic, and, since 1928, of France, these countries having accumulated gold reserves far in excess of their reasonable needs. Any gold that flows into the reserves of these countries is not used as a basis for the expansion of currency and credit, and therefore does not perform its monetary functions. The Gold Standard world is, to that extent, deprived of the currency and credit it needs to exchange its increasing production.

In a table (Annex "B") which is appended, are set out in the order of their size, the gold holdings of the central banks (and treasuries) in the principal Gold Standard countries of the world, at the close of each year since the end of 1925. In separate columns appear the changes, from year to year, in those holdings. In another part of the table, figures are given showing what the gold holdings represent per head of the population of each country, and, finally, figures are furnished of the new supplies of gold which have become available for monetary purposes year by year.

To assess the bearing, from a monetary point of view, of the changes recorded in the principal table, it is necessary to consider their effect on the currency and credit structure of the Gold Standard world as a whole in relation to its needs for currency and credit. It being generally accepted that the production of the world increases at the rate of 3 per cent. per annum, an increase of the world's monetary

gold reserves at the same rate would, in the absence of any economy in the use of gold for monetary purposes, provide an amount of currency and credit adequate to maintain prices. But when we consider the gold movements recorded in the table, we have to distinguish between gold that serves truly monetary purposes and gold that does not. The table showing the gold holdings per head of the population in the several countries is of particular interest in that connection. It shows that whereas the amount of Great Britain's gold reserves per head of her population was £3.3, that of the U.S.A. was, on an average, about £6.7, and that of France £6.1 in 1928 and £8.0 in 1929. Though their credit systems have attained a state of efficiency which cannot be said to be much inferior to that of Great Britain, the gold reserves per head of the population in the U.S.A. were roughly 100 per cent. greater than those of Great Britain, while those of France in 1928 were roughly 85 per cent., and, in 1929 no less than 140 per cent. greater than those of Great Britain. The gold reserves of the Argentine Republic, at an average of about £9.4, even if the fullest allowance is made for the less efficient credit system in that country, are far and away in excess of its legitimate requirements. Any gold, therefore, that flowed into America, Argentina and, since the beginning of 1928, into France, serves no monetary purpose, for in none of these countries is it permitted to support a structure of currency and credit that it would be permitted to support if it had flowed into other countries whose credit systems are in as high a state of development as theirs. In the appended table (Annex "C") account has been taken of this fact when comparing the amount of monetary gold needed to increase gold reserves by 3 per cent., and so support an increase of production at the same rate, with the amount of monetary gold that has actually become available in each year.

The Gold Deficiency.

The correlation of the figures of the last two columns, and particularly the figures for the year 1929, is significant. The deficiency of supply of monetary gold in relation to the assumed requirements of 3 per cent. per annum was moderate in the three years to the end of 1928, and so was the fall of the general level of commodity prices during that period. But when we come to the year 1929, we find a deficiency of well over 100 per cent. of requirements, accompanied by a sharp fall of prices which continued into the present year. Not only was the whole of the new gold that had become available for monetary purposes in 1929 absorbed by the U.S.A. and France, but the two countries have, in addition, managed to deplete the reserves of some of the other Gold Standard countries to the extent of £14,000,000, after due allowance has been made for the release of £36,000,000 by the Argentine. Together they have in this manner sterilised gold to the value of £110,000,000, and deprived the Gold Standard world of the possibility of augmenting the amount of currency and credit that was needed for the exchange of its increased production. That sufficiently explains the catastrophic fall of the general level of commodity prices in 1929 and the beginning of this year. It also suggests that co-operative action for the purpose of co-ordinating the demand for gold by the central banks of the principal Gold Standard countries, which the Genoa Conference so strongly advocated, was either absent or ill-directed.

The Economic Repercussions.

The fall in the general level of commodity prices clearly can have no effect on the physical equipment of the world. The lands, houses, factories, roads, railways and harbours remain, for all practical purposes, what they were when prices were higher. Nor can it have any effect on the possibility of and the need for employing that physical equipment for productive purposes. The population has remained the same and so have its wants. Indeed, the experience of the past leaves little room for doubt that, whatever the movement of general prices, production as a whole increases at a remarkably steady rate, though that rate of increase is perhaps accentuated in times of rising prices and somewhat retarded in times of falling prices.

Whence, then, arises the disturbance that impedes the smooth course of exchange of the commodities the world produces?

We all know that, in our complex economic organisation, the vast majority of transactions are not settled when they are concluded, but that they almost always involve contracts expressed in money amounts, the settlement of which is deferred over widely varying periods. In our Gold Standard world, it is the purchasing power of gold, as expressed in the general level of commodity prices, that determines the real obligations (in terms of goods, in which only they can be met) of all these contracts. If the general level of commodity prices falls by 20 per cent., or, in other words, if the purchasing power of money increases by 25 per cent., then a contract entered into before that fall has taken place will compel the debtor to give to the creditor a title to goods 25 per cent. greater than the two parties had bargained for when they concluded the contract. The total available volume of goods, that is, broadly the income of the community, has thus to be divided among the creditor and debtor sections of the community in different proportions than before. But, as the total volume of production increases relatively slightly from year to year, the greater title to goods of the creditor class can only be met by the share of the National Income falling to the debtor class being curtailed. It is this re-distribution of wealth, and the fact that the greater title to goods in the hands of the creditor section of the community is, in times of falling prices, exercised haltingly and in a class of goods quite different from that which the debtor class foregoes, that causes the profound disturbances in the exchange of goods.

The Distribution of Wealth.

It will be easier to appreciate the reactions brought about by such a redistribution of wealth if we examine a concrete case. Professor Bowley and Sir Josiah Stamp published in 1927 a monograph on the "National Income" of Great Britain in 1924. Largely based on the figures given in this publication, Mr. Joseph Kitchin has compiled for the writer an account in which the national income of that year is apportioned among the principal classes of the community who are particularly affected by a redistribution of wealth due to a change of the general price level. The account does not pretend to represent statistical facts (and the authors of the monograph must not be held responsible for the allocations made), but they are put forward as the best estimate that the available data permit to be made. They are believed to be sufficiently near the truth to serve the present purpose. The account is set out below:—

NATIONAL INCOME AND DISTRIBUTION ACCOUNT.

Income. Money Value, £ Millions.	Distribution.	
	Money Value, £ Millions.	% of Total Income.
4,060	(a) Public debt service.....	405 10.0
	(b) Interest and rent.....	665 16.4

	(3) Wages and salaries	2,020 49.8
	Residue	2,990 73.6
4,060		4,060 100.0

The distribution of the national income has been split up, it will be observed, into the constituents of (a) public debt service and (b) interest and rent, which are grouped together under the main heading of "Fixed Money Obligations," and (1) Other Governmental Expenditure, (2) Profits of Enterprise, and (3) Wages and Salaries, grouped under the main heading of "Residue." The first group, as the heading implies, comprises the obligations in respect of contracts involving fixed money payments. It includes, apart from interest and redemption charges on the National Debt, the debts of public bodies and private undertakings, also rent on landed and house property and pensions. These obligations may be said to constitute a first charge

on the national income. They have to be met whatever the income may be, if default is to be avoided. The second group, headed "Residue," represents the balance of the national income that is available to meet (a) Governmental Expenditure other than debt charges; (b) Profits of Enterprise (*entrepreneur*)—which includes all dividends of a variable type, such as accrue to holders of ordinary or deferred shares of companies—and, finally (c) Wages and Salaries.

Rentier and Entrepreneur.

A fall of the general level of prices increases immediately and automatically the share of the national income which falls to the section of the community that has fixed money claims. That increase takes place without any apparent friction as between that section and the rest of the community; indeed, most people do not realise that it has taken place. But, even if it were realised, it is not likely to be resented. The greater purchasing power of money is regarded as a windfall to the lucky ones who have claims to it, and is generally thought to be due, if not to an act of God, then to the folly of the *entrepreneur* class for having increased production unduly. There are few who realise that the greater purchasing power of the money in the hands of those having fixed money claims can only be satisfied by a corresponding increase of production, or, failing that, by a curtailment of the income of the remaining sections of the community, or (using the global term employed for the purpose of the account) of the "Residue." It is here that the fiercest friction at once and automatically arises. There is less to be divided among the *entrepreneur* and the wage-earning classes. Sacrifices have to be made. Who is to bear them, and if they are to be borne by both sections, in what proportions? The wage-earner resists having his money wage reduced, even if that wage were to buy correspondingly more goods. But we know that a fall of the general level of wholesale prices does not at once bring down the prices of the goods the wage-earner needs and buys. The cost of living, in other words, does not, except very sluggishly, follow wholesale prices. Besides, the reduction of wages is, in any case, a long and difficult process, often involving strikes which reduce production when increased production is the only means to restore the income in terms of goods of the classes comprising the "Residue."

The whole of the burden of the fall has thus at first to be borne by the *entrepreneur* class. Those among them whose enterprises are less exposed to foreign competition will try to lighten their burden by combining for the purpose of maintaining or raising the prices of the commodities they produce or the services they render. The result is that the burden falling on the *entrepreneur* class whose industries are more exposed to foreign competition, and who are therefore less able to control the prices of the goods they have to sell, is further increased. Hence the well-known phenomenon of the unsheltered industries being the first to be badly crippled or put out of action by a fall of general prices. But even if both the sheltered and unsheltered industries were prepared to shoulder the burden rateably, they would only be able to support it if the fall of prices were relatively unimportant, simply because their share of the National Income, even in times of stability, is but a small proportion of the whole. The National Income and Distribution Account shows that their share in 1924 has amounted to just over 16 per cent.

Dividing the National Income.

To aid the reader in visualising the nature and the relative extent of the changes in the distribution of the National Income consequent on changes in the general level of prices, a diagram (coloured Annex I.) is inserted which attempts to show this. It is built up from the figures of the National Income and Distribution Account given earlier in this paper, the vertical line above the figure 100 at the bottom of the chart representing the National Income as distributed in that Account. To the left of this vertical line can be read off the effect which any given fall, and to the right any given rise, of the general level of commodity prices has on the distribution, on

the supposition that the National Income remains stationary, and that the "Residue" is divided between its constituents in exactly the same proportions as it is divided in the original account shown in the vertical line above the figure 100. It will, of course, be understood that the presentation in this form is a purely schematic one, and does not—indeed could not—take account of the innumerable subsidiary influences which are constantly at work in the direction of accelerating or retarding the re-distribution of the shares in the National Income as between one section of the community and another.

It, however, faithfully represents the change in the proportions of the National Income that fall to those having fixed money claims on the one hand, and to the "Residue" on the other, consequent upon changes in the general level of commodity prices on the assumption that the National Income neither increases nor decreases. But the division between the main constituents of the "Residue," viz., the wage-earning and *entrepreneur* classes shown in the diagram is an ideal one. The line denoting that division has been drawn simply to illustrate how each of these classes would be faring if they bore rateably the burden consequent on a fall, and enjoyed rateably the benefit consequent on a rise in the level of prices. In point of fact it is the process of dividing the "Residue" (especially if the "Residue" becomes smaller as a result of a falling price level) that causes the struggle and friction between the two classes which right through history has accompanied every violent change in the level of prices.

The Burden on Enterprise.

Of far greater significance in that connection are the lines shown on the diagram which denote the wage-earners' share of the National Income if money wages remain constant (*AB*) and their share if their standard of living is to be maintained stable (*CD*). The first, in particular, illustrates strikingly the friction that even a relatively small fall in the general level of commodity prices sets up between the wage-earning and *entrepreneur* classes. It shows how deeply the wage-earners' share cuts into "Profit of Enterprise" while money wages remain unaltered and how urgent, therefore, a re-adjustment of money wages becomes. Line *CD*—which pre-supposes a readjustment of money wages to a point at which the real wages, i.e., the standard of living, is maintained unaltered—shows that even this involves a rather substantial encroachment on "Profit of Enterprise." Conversely, if the latter is incapable of bearing the burden (and there is, of course, a limit beyond which "Profit of Enterprise" cannot be curtailed without killing enterprise), it shows that a fall of prices forces upon the wage-earning community a debasement of their standard of living. An increase of production alone is capable of mitigating that situation. But if it is considered that an annual increase of production of 3 per cent. will counteract the ill-effects of a fall in the general level of prices of only about 2.9 per cent. per annum, the profoundly disturbing effect of the fall of 16 per cent. during the last seventeen months will be appreciated.

Little imagination is required to visualise the many implications which spring from this state of things. Thus it is clear that industries which are most vulnerable to competition are the first to suffer, and that, failing very large resources to meet losses, they are quickly reduced to impotence and compelled to suspend operations. Unemployment is the result, but that unemployment is not merely confined to the particular industry that has to suspend operations but spreads over most other industries, for the suspension of operations by one industry immediately reacts on others through the curtailment of the requirements by the former of goods produced and services rendered by the latter. A reduction of money wages, possibly to a level constituting a debasement of the standard of living, becomes inevitable. Wage reductions of so drastic a character can hardly be expected to be accomplished without strikes. These in turn aggravate the evil; production is further curtailed and unemployment further increased and that at a time when an increase of production alone can remedy the disequilibrium!

Demand Curtailed.

Meanwhile, the greater title to goods which the fall of general prices gives to those having fixed money claims remains unexercised. While money appreciates, a reluctance to exchange it for goods is only natural; and that is particularly true of those having fixed money claims, for they can afford it, the greater title to goods they so acquire constituting, in fact, an increment over and above their accustomed standard of life. They are thus unlikely to exercise it until they believe that the fall of prices has come to an end, and when they do, it will be in goods of a different character from those in which it would be exercised if it were in the hands of the wage-earning community. The latter would exercise it mainly in the purchase of consumable goods, while the former would exercise it in the purchase of capital goods through the acquisition of bonds and shares.

In a period of falling prices, there is thus a falling-off in the demand for consumable goods owing to the reduction of income of the wage-earning classes, and of capital goods owing to the reluctance to exercise their increased purchasing power by those having fixed money claims. Added to this, there is the psychological factor of falling prices reacting on the *entrepreneur* class in the direction of limiting their purchases of commodities to their immediate needs. Hence the curtailment of demand for both classes of goods, and the consequent accumulation of stocks of most primary commodities.

This cursory analysis supplies—it is submitted—a far more cogent explanation of the phenomenon that is observable not merely in this country but, to a greater or lesser extent, the Gold Standard world over. The phenomenon is due, not to "over-production," but to the retardation in the process of exchange, and therefore of consumption, caused by a drastic redistribution of wealth resulting from the fall in the general level of commodity prices which, in turn, owes its origin to an inadequate supply of currency and credit.

The Real Shortage.

Before concluding this part of our analysis, let us consider the monetary aspect of the developments just referred to. The fact that the general level of prices has fallen and that production and trade have suffered a curtailment reduces the need for currency and credit. The amount that was insufficient before the fall occurred will probably be substantially in excess of the needs of exchange in the altered circumstances. The fact, moreover, that the increased purchasing power in the hands of those having fixed money claims is not being exercised in the purchase of capital goods through the investment market, but is being temporarily diverted to the short credit market, is a sufficient explanation of the abundance of the supply of credit in periods of rapidly falling prices. This abundance is the one element in the situation which can, and invariably does, set into motion a trend in the reverse direction. Cheap credit revives confidence, and with it enterprise. The fall of general prices is stayed. Those who have temporarily diverted their surplus purchasing power to the short credit market take heart and direct it to the investment market, and through it, to the production of capital goods. Employment increases, and so does the demand for consumable goods. General prices take an upward trend and the spirit of enterprise broadens until both are once more checked by currency and credit having reached the limit to which the central banks consider it prudent to expand them in view of the available supply of monetary gold.

It is well to restate these well-known phases of a trade cycle in order to show that there is ample ground for the contention that such cyclic movements are of monetary origin and by no means beyond control. Our analysis shows that the recent fall in the general level of prices has its origin in an insufficiency in the supply of currency and credit, and that that insufficiency was brought about by the very reverse of economy in the use of the monetary gold that became available. It showed that a drastic redistribution of wealth was thus forced upon the world, that this caused the free flow of exchange to become badly clogged, with the result that the fall of general prices was

accentuated and that the available amount of currency and credit became superabundant.

It is legitimate to conclude that, if the Gold Standard world had been supplied with an adequate amount of currency and credit by the exercise of reasonable economy in the use of its monetary gold supply, there would have been no fall of general prices. If there had been no fall there would have been no redistribution of wealth, no clogging of the flow of exchange, no superabundance of currency and credit to supply the stimulus for a reversal of the movement, and therefore no trade cycle.

The Diagram on p. 9 and the figures in Annex "D" strikingly illustrate the close correlation of the deficiency in the supply of monetary gold (on the assumption that an addition to the monetary gold reserves of 3 per cent. per annum is needed to meet the requirements of an increase of production at the same rate), with the movement of the general level of prices and the state of unemployment in the period under review. A graph is added showing the movement of the Bank of England's liabilities in respect of other deposits, together with the total note circulation (currency notes in issue being added to the Bank of England notes before the former were taken over by the Bank). When examining the unemployment chart, it should be remembered that the coal stoppage in 1926, and its repercussions in 1927, are no doubt largely responsible for the violent movements shown in that period.

If Prices Rise.

Not much space need be devoted to the analysis of the consequences of a rise in the general level of prices. They are pretty well the reverse of those of a fall. The diagram (coloured Annex I.) clearly shows how the share in the national income accruing to those who have fixed money claims is reduced, how the "Residue" is correspondingly increased, and how the "ideal" division of the "Residue" among the wage-earning and *entrepreneur* classes (i.e., its division in the same proportions as those of the original National Income and Distribution Account) raises the standard of living of the former and yet leaves the latter with a greater profit. The need for a readjustment of money wages is again strikingly illustrated by the lines AB and CD, but it will be apparent that the readjustment, though no doubt liable to cause friction, is a much less difficult matter than in the case of falling prices. To divide the benefit of a surplus is a much less unpleasant affair than to divide the burden of a deficiency.

The increased title to goods which accrues to the "Residue" is exercised at once, both consumable and capital goods are in brisk demand, the former mainly by the wage-earning community and the latter by the *entrepreneur* class, as well as by those having fixed money claims. The exchange of goods proceeds unchecked and at an accelerated rate. This, and the psychological effect of rising prices, stimulates enterprise, sometimes much beyond its legitimate limits, until it is fiercely checked by the supply of currency and credit being no longer capable of expansion owing to the limitation put upon it by the available supply of monetary gold. The trend in the reverse direction is set in motion with all the evil consequences to which reference has been made.

Stable Prices.

Having illustrated diagrammatically (coloured Annex I.) the effect on the distribution of the National Income of fluctuations of the general level of commodity prices, it may be helpful to show, in similar form, the development of things when general prices are stable. A further diagram (coloured Annex II.) has been drawn for the purpose. Like the earlier diagram, it is built up from the figures of the original account, the vertical line above the figure 0 at the bottom of the chart representing the distribution in that account. It assumes that the National Income increases at the rate of 3 per cent. per annum compound, that the Public Debt service remains at a constant figure, but that "Interest and Rent" (Private Debt) increases at the same rate as the National Income, viz., 3 per cent. per annum, it being assumed that the additional capital equipment needed to produce

the 3 per cent. increase of the National Income will be provided by a rateable increase of Private Debt. The "Residue" is divided in the constant proportions of the original account, viz., Other Government Expenditure (9.5 per cent.), Profits of Enterprise (22.8 per cent.) and wage-earners (67.7 per cent.).

It will be seen that (except for the increase of Private Debt on the assumption made) those having fixed money claims will be receiving the same amount of real income right through the period, and that practically the whole of the increase of the National Income accrues to the "Residue." It would be difficult to show that this distribution does not do full justice to all sections of the community; those having fixed money claims will be receiving the same amount of money of the same purchasing power they bargained to receive when the Creditor and Debtor position was created. In accepting a fixed money claim and receiving in return for it the superior security of a first charge on the income, they clearly gave up their claim to a share in any increase of income that arises from greater productivity. Those, on the other hand, to whose enterprise, energy and willingness to bear risks the greater productivity is in the main due, i.e., the wage-earners and *entrepreneurs*, are justly entitled to share between them the fruits of having created it. The division of the "Residue" between wage-earners and *entrepreneurs* in the constant proportions of the original account, secures to both an increase of income at a rate somewhat greater than 3 per cent. per annum. The line AB drawn across the diagram indicates the proportion of the National Income that is needed to give to the wage-earners a constant standard of living, on the assumption that the population increases at the rate of 1 per cent. per annum. That line brings out in a particularly striking manner how an increase of production in conditions of monetary stability makes available for the improvement of the standard of life of the wage-earners a steadily increasing margin, and yet satisfies the just claims of the *entrepreneur* class to a rateable share in the increased production.

The Smoother Flow.

The diagram thus indicates that, in the conditions assumed, the standard of life of the wage-earners would be doubled in thirty years, indeed, that no section of the community benefits as much from an increase of production as they do. That increased production does not reach the wage-earner unless money wages are increased accordingly. Friction may, but need not arise in the process, for, as in the case of rising prices, it is a question of dividing between wage-earners and *entrepreneurs* not the burden of a deficiency, but the benefit of a surplus. Besides, in conditions of stability, it should not be beyond the wit of man to devise a system by which the wage-earner's due proportion of the increased production is currently—almost automatically—transferred to him. But even if friction were to arise here and there, it can affect but slightly the immeasurable benefits which arise from the fact that in conditions of price stability a re-distribution of wealth is avoided, and, with it, the profound disturbances that spring from it. There would be no check to the smooth flow of goods, the steadily increasing income accruing to the "Residue" being currently exercised in the purchase of consumable as well as capital goods. There would be no undue stimulus or deterrent to enterprise, nor would the smooth flow of savings to the capital market be interfered with. In a word, there would be no check to economic progress.

The Hope for the Future.

The conquest of the forces of nature by the human race is increasing at a rate undreamt of only a little while ago. We are justly proud of it, and also of our achievements in the direction of co-operation for the purpose of "rationalising" physical production. Yet the world permits itself to be robbed of much of the fruits of this conquest by the failure to "rationalise," by co-operative action, the monetary use of gold, though that alone can secure for it the undisturbed economic progress which is the very foundation of social and political peace.

There are some—alas, probably many—who will deny the possibility of controlling, or even of influencing, the course of the general level of prices by co-operative action of the central banks. In their eyes, it is an ideal unattainable in practice—a Utopian dream. In holding that view they must be suppressing their sense of humour, for, in denying the possibility of influencing the general level of prices, they deny the possibility of the very existence of the Gold Standard. They forget that no country could remain on the Gold Standard unless its credit policy were constantly directed to suitably increasing or decreasing the purchasing power of the national currency (that is, of lowering or raising the general level of commodity prices in that country), so as to keep it in step with the purchasing power of the national currencies of other Gold Standard countries (i.e., their general level of prices). Their attitude of mind vividly reminds one of the arguments not infrequently adduced, even in the best circles, in the countries that allowed themselves to be nearly overwhelmed by monetary

inflation. The increase of the monetary circulation was, in their view, a necessary consequence—and not the cause—of the rise of prices. The same line of reasoning, but in the reverse direction, seems to possess those who regard the disastrous fall of prices in recent times (which, as has been shown, is clearly traceable to the deflationary effect of the sterilisation of gold) as an inevitable evil due to forces beyond human control.

We can only hope that the inquiry into the gold question, which is at present being carried on by a Delegation of the Financial Committee of the League, will achieve results no less effective than those yielded by the Report of the Brussels Conference, and that the Bank of England will once more lead the other principal central banks along the path of intelligent co-operation towards the common objective—economy in the use of gold, which alone can obviate the otherwise inevitable recurrence of disturbances such as those which are so grievously afflicting the world to-day.

GENERAL RESULTS OF THE YEAR.

In accordance with our custom, we propose in this introductory article to pass in review the results of the year and to consider them as a whole, reserving for the separate sections of this review the more detailed analysis of the progress of each department. This method of treatment is more suited to a general understanding of the extremely technical and complicated character of insurance business; and the fact that the figures have been extracted on a uniform basis facilitates comparison between one office and another, and with the results achieved in former years.

The 1929 results as a whole may be considered most conveniently from three main aspects:—

- (1) The total underwriting surplus in relation to the premium income from which it has been earned;
- (2) the relation between interest earnings and the cost of the dividend;
- (3) the strength of the departmental and general reserves in relation to the premium income.

The first five columns of the appended table are concerned with the presentation of the underwriting results. It should be explained that the figures in the table do not necessarily agree with those in the accounts of the companies, since accounting methods vary greatly between different concerns. In order to ensure uniformity, the departmental profits have been calculated on the assumption

tion of a reserve for unexpired risks of 40 per cent. of the premium income, whereas some companies maintain a 45 per cent. or a 50 per cent. standard, while others are content with less, and, again, additional reserves in some cases are kept, fluctuating from year to year. It is not possible to adopt a uniform system for the marine department owing to the nature of the business, and, in this case, therefore, the company's own method has been followed. The departmental accounts for the most part relate only to the business of each department, but the net trading surplus shown in column (2) takes account not only of the aggregate of the departmental profits, calculated in the manner described above, but also of the balance of the items charged to profit and loss and properly regarded as appertaining to the business of the whole company.

Column (4) indicates the amount of the contribution to profits available for distribution from the life and sinking fund. It is scarcely necessary to explain that life profits are ascertainable on a different method by reference to the difference between the value of the assets constituting the fund and the present value of the liabilities as determined by the actuary. In accordance with the requirements of the Assurance Companies Act, 1909, these periodical investigations must be made at least once in every five years. Modern practice tends increasingly to more frequent stocktakings, in some case triennial and even annual. Thus in some instances the figures given represent five

years' or three years' profits, though it is sometimes the practice for the quinquennial contribution to be set aside after ascertainment and for one-fifth or one-third, as the case may be, to be credited each year to profit and loss. It follows also from what has been said that where there is no contribution in the table from life profits in 1929 it merely means that no valuation was due to be made last year. The Prudential is in a special position owing to the fact that the table is concerned only with the "B" shareholders, whose interest is confined to the other departments and who have no rights to any portion of the life profits.

Columns (6) and (7) exhibit the extent to which dividends have been met out of interest earnings. By custom and tradition, insurance companies seek to confine dividend distributions to interest earnings, so as to leave underwriting surpluses available for strengthening of reserves. The custom has much to recommend it since, on the one hand, it tends to free dividend rates from undesirable fluctuations and, indeed, conduces towards steady increases corresponding with the growth of the business and, on the other hand, helps to build up general resources for meeting any exceptional losses.

LIFE ASSURANCE.

GENERAL FEATURES OF THE YEAR.

THE year 1929 was overshadowed by happenings on the Stock Exchanges of the world, and these in their turn had their inevitable repercussions on the business of life assurance. The effect was twofold: firstly, a general slowing down in the rate of expansion of new business, and secondly, the universal depreciation which overtook the values of invested funds of all corporate investors. The substantial losses suffered by individual investors naturally reduced the amount available for life assurance; there was in particular a scarcity of large policies; and this tendency was aggravated later in the year as the ominous signs of trade depression manifested themselves.

In a very real sense the collapse of stock exchange values was in itself an object lesson in the value of insurance, and the moral was quickly drawn to point out the advantages of endowment assurance policies as investments contrasting favourably with the vagaries of stock exchange securities. Again, a strong case can be made out for life policies payable at the end of a term of years or on previous death as a species of sinking fund to replace stock exchange losses. The issue last autumn of Mr Snowden's 5 per cent. Conversion Loan provided an additional opportunity for the transaction of profitable business taking the form of twenty-year endowment assurance policies payable in 5 per cent. Conversion Loan at the end of the term, or previous death, or on redemption at par. At least one office is known to have issued a considerable number of policies on this plan. The difficulties of securing an accretion of business were, notwithstanding, very real and formidable, and the fact that increases were general, as will be shown later, is creditable to the vitality and efficiency of new business organisations.

The year 1929 was the first, since prices reached their bottom in the post-war slump of 1919 and 1920, in which life offices in general have not experienced profits on their invested funds. It is safe to say, however, that profits earned in previous years were on such a scale that not a

The two final columns, (9) and (10), furnish a valuable criterion for measuring the cumulative effect of financial prudence in the past. There is inherent in the conduct of fire and accident insurance a catastrophic and conflagration hazard, and the existence of this requires reserves in excess of the usual 40 per cent. departmental fund. The ideal position is generally considered to have been attained when total resources are equal to one year's premium income, and it will be seen that this exacting standard has in many cases now been surpassed.

In order to assist comparison with results of previous years, a table has been added to show the aggregate figures of each of the past four years. From the figures in this table the unfavourable features of 1929 are clearly reflected in the decline in the total net trading surplus. The years' operations have resulted in a total net trading surplus of only 2.4 per cent. of the premiums, which is the lowest figure in any of the last four years and seems an inadequate return for the vast liabilities assumed for a premium income of £120 millions. It is satisfactory to observe, however, that a smaller proportion of underwriting profits has been drawn on for dividend purposes and that, as a consequence of this, the relative reserve position is in the aggregate stronger than a year ago.

single company found itself at the end of the year without adequate free resources wherewith to write off all losses incurred. The traditional policy of carrying investment profits as hidden reserves has meant, in fact, that no hint of the existence of 1929 losses is to be found from a perusal of published accounts, the effect merely being to reduce the previously accumulated hidden reserves.

NEW BUSINESS.

The table which follows exhibits the new business secured by forty-nine British offices and six Dominion offices, the former being grouped into mutual, proprietary, industrial-cum-ordinary, and composite offices.

The total results of the British offices show an increase of about £1½ millions, equal to under 1 per cent., this being the smallest rate of increase recorded for two or three years. It is noticeable that the mutual offices show in the aggregate a falling off, and that the best showing is made by the composite group. The good results of that group are a recurring feature each year and indicate an awakening on their part to the great natural advantages for the acquisition of life business afforded by their fire and accident organisations.

Turning to the individual offices, it will be seen that the results are curiously mixed, for twenty-seven offices have achieved an increase and nearly as many, namely, twenty-two, record a decrease. In so difficult and distracting a year as 1929 an increase of as much as 10 per cent. is highly creditable. Only one purely life office, namely, the Scottish Provident, achieved this distinction. The Wesleyan and General figures are very satisfactory, with an increase of nearly 20 per cent., while in the composite group the Atlas, the British Equitable, the Eagle Star and British Dominions, the General Accident, the Law Union and Rock, the London Assurance and the Northern, all show increases in excess of 10 per cent.

The Dominion offices are inserted in the table for the sake of completeness, but their figures relate in all cases to total business, by far the greater proportion of

which is transacted outside the United Kingdom. In this group the Sun Life of Canada stands out with a striking total of £134½ millions, in itself greater by almost 50 per cent. than the corresponding total of 1928.

SINGLE PREMIUM POLICIES.

Once again policies effected by single premiums contributed a considerable proportion of total new business in 1929, although the table which follows indicates a slight diminution in volume. By far the greater part of these special policies are created as paper assets subject to initial loans of 90 per cent. or more of the single premiums and for the express purpose of saving surtax on the annual payments of interest in connection with the loans. Negotiations with the Inland Revenue have, as is well known, resulted in a clause in the new Finance Bill for the purpose of stopping this loss of revenue.

EXPENSE RATIOS.

Of all the factors by means of which comparison is commonly made between one office and another, there is none so treacherous as the expense ratio. The published expense ratio of an office is merely the crude percentage resulting from the ratio of expense and commission to premium income. Obviously this calculation will produce

a high or a low figure according as the rates of premium charged are lower or higher than the average, or according to whether the existing business includes a larger or a smaller proportion of low-rated policies, such as temporary or non-profit policies. Again, an office which is pursuing an aggressive new business policy will, owing to heavy initial commission and other charges, show a higher expense ratio than one which is expanding but slowly.

The actual course of expense ratios in each of the past three years may be studied in the following table, in which is included a column showing, for comparative purposes, the corresponding figures in 1913. The figures in the table differ from published figures in that one of the more obviously disturbing factors, namely, the incidence of single premiums, has been eliminated. It is evident that little change has occurred in the last three years, and the figures appear to exhibit a tendency to stabilise themselves around 15 per cent., though the proprietary group seem to be definitely higher and the industrial-cum-ordinary group slightly lower than the average of all.

EXPENSE RATIOS (Adjusted for Single Premiums by deducting 4% of their Amount from the Expenses).

RATES OF INTEREST.

The rate of interest earned is the most important criterion of comparison between offices, as it is also by far the most important source of what may be termed trading profits, *i.e.*, profits arising from interest, mortality, and expenses, and excluding profits from investments, which are discussed in a separate article.

Correctly interpreted, interest profit arises if the rate earned exceeds that allowed for in calculating the premiums. But in actual practice profits are distributed as a result of periodical valuations of liabilities conducted at a conventional rate of interest, usually 3 per cent., and from this point of view, therefore, interest over and above 3 per cent. is referred to as profit. As will be seen from the appended table of interest rates earned by

the different offices, profits from this source now average 1½ per cent. and upwards on the funds, whereas the margin before the war was little more than 1 per cent. The table shows also that the margin has again risen during the past year by about 1s. per cent. Even this small increase represents an additional £5,000 per annum on a fund of £10 millions.

It is probable that interest rates have now reached their zenith, although possibly the average may be sustained to some extent by increases among those offices which have hitherto earned less favourable rates than the majority. The rise in the standard rate of income tax to 4s. 6d. in the £ will inevitably be reflected in lower net rates of interest as will also the higher value of all fixed interest securities. The effect of the former is somewhat mitigated by the peculiar basis of assessment of life offices under which the effective rate corresponding to the standard of 4s. 6d. works out to about 3s., but, allowing for this, the rise in the standard rate will reduce the net yield in the case of an office formerly earning £4 15s. per cent. to about £4 13s. 6d. per cent.

NET RATE OF INTEREST.—Life and Annuity Funds (including Reversions).

ABSOLUTE SECURITY.

Chief Administration: 7, CHANCERY LANE, W.C.2.

GOVERNOR: F. W. PASCOE RUTTER.

SERVICE

There is no house in the whole country which gives such service as the 'W. & G.' In addition to its normal service to its policyholders, which is acknowledged to be of an unusually high standard, the W. & G. also offers free periodical medical examination to all who insure for £500 and upwards, a unique house purchase scheme, and a Health Service Bureau.

All classes of Insurance Business transacted (Except Marine).

Send your Enquiries to:

WESLEYAN & GENERAL ASSURANCE SOCIETY
Chief Office—Birmingham.

THE STRONG LINK

STABILITY

The financial position of the W. & G. is stronger than ever. The total amount paid in claims is nearly sixteen and a half million pounds; the premium income has increased from £160,228 in 1910 to £568,572 in 1929 in the Ordinary Department and from £714,074 in 1910 to £1,195,353 in 1929 in the Industrial Department; the sums assured in the Ordinary Department have increased from £3,225,189 in 1910 to £11,152,924 in 1929, and in the Industrial Department from £14,173,183 in 1910 to £25,307,031 in 1929..... and a bonus of no less than £2.8.0% on whole life, with-profit policies declared for the year 1929.

LIFE OFFICE INVESTMENTS.

It used to be considered that profits of a life office arose from three main sources, all connected with its trading operations, namely, interest, mortality and expenses. Any profits which happened to emerge from investments were more or less an act of God and were rigorously set aside and conserved and their amount, or even their existence, rarely disclosed. The depreciation caused by the war and the subsequent rise in prices have made this attitude no longer possible, but traditional caution in the disposal of capital profits continues to be observed, and nearly every office has, as a consequence, large surplus resources accumulated from this source during the past ten years.

A feature of the annual meetings held this spring has been the frank disclosure of capital losses suffered last year with, in many instances, an indication of their amount. These have naturally varied very greatly and range from about 2 per cent. to about 6½ per cent. of total funds. That they have not been larger, seeing that British Government long-term securities alone lost 6 per cent. of their value during the year, is due to the fact that some 40 per cent. of the funds are invested in securities not subject to temporary fluctuations in value.

The broad nature of Life Office investments is depicted in the appended table which groups the assets under four main heads:—

- (1) Mortgages and Loans, i.e., Mortgages on Properties at home and abroad, Loans on Rates, Loans on Securities and Policy Loans.
- (2) British Government Securities.
- (3) Stock Exchange Securities other than British Government Securities.
- (4) Reversionary Interests, Properties, Ground Rents, Uninvested Assets.

It will be seen that all types of investment policy are represented in the table, and each of the groups has its particular devotees. The marked preference of the Composite Offices for Mortgages is accounted for by the opportunities which such investments yield for insurance business. Some of the Life Offices, especially those with a predominantly legal flavour, specialise in mortgages, and also in reversionary investments. Those Offices which pursue a forward investment policy find scope for their activities by confining themselves more particularly to Stock Exchange securities.

The comparison between the grouping of 1929 and of 1928 again exhibits the same characteristics that have been apparent for a number of years past. Further illustration of these is afforded by the following table, which carries the figures back to 1925.

	1925.	1926.	1927.	1928.	1929.
Mortgages and Loans	25.3	26.3	27.7	28.1	29.2
British Government Securities	28.7	26.6	23.4	19.6	17.1
Other Stock Exchange Securities	33.8	36.2	38.5	42.3	44.2
Reversionary Interests, Properties, &c.	12.2	10.9	10.4	10.0	9.5

The increasing importance of the first group is, of course, largely artificial, being simply the result of loans set up in connection with single-premium surtax-saving policies. The gradual realisation of British Government securities and the reinvestment of the proceeds in higher yielding stocks is a movement which has clearly not yet exhausted itself. The tendency has been given added impetus by the increasing popularity of ordinary stocks and shares, which in 1928 accounted for 5.7 per cent. of total assets against 3.1 per cent. in 1922.

VALUATION RESULTS.

Our customary analysis has been made of the results of the valuations made in the case of all those offices where periodical investigations were due to take place last year. In order to facilitate convenient reference and comparison, the analysis has been made by the same method in every case. In cases where effect has been given in the Revenue Accounts to any profits or losses on investments, these items have been separated from what may be termed trading profits resulting from the ordinary conduct of the business. The distinction is important because it is the traditional policy of British Life Offices to conserve all capital profits, and to limit bonus distributions to trading profits only. While information has not been made available in every case, the cost of interim bonuses, where known, has been included in

the cost of the declared bonuses, while transfers to reserve and to staff pension funds have been treated as allocations out of profits.

While in every case of offices valuing quinquennially or triennially the surplus earned shows a considerable increase, it is not without significance that not a single office valuing annually has seen fit to increase its rate of bonus. An increase in the trading surplus does not, of course, necessarily connote increased prosperity, since it is often largely a reflection of quantitative expansion in the business. A truer measure of prosperity would be a comparison between the rate of bonus earned in each valuation period, but for various reasons it is not always possible to institute such an investigation from the published figures.

Once again, therefore, we are led to the general conclusion that the factors making for trading profits cannot be expected indefinitely to favour bonus increases, and the future is likely to see a stabilisation of existing bonuses rather than any further increases, although in some cases even this may not be found to be practicable.

Quinquennial Valuations.

	1920-1924.	1925-1929.
Trading surplus earned during quinquennium	£ 487,201	£ 816,421
Profits on investments and on reversions	272,983	190,603
Brought forward from previous quinquennium	33,357	116,635
	793,541	1,123,659
Allocations—		
To Bonuses to policyholders	539,451	798,285
Shareholders' account	59,939	88,698
Investment reserve fund	50,000	...
Staff pension fund	27,516	33,047
Carried forward to next quinquennium	116,635	203,629
	793,541	1,123,659

The with-profits policyholders and the shareholders alike have cause for gratification with these results. The policyholders' share of profits amounts to 90 per cent., and this is allotted in accordance with a special system as reversionary bonuses at rates varying both with age

at entry and with duration in force. On this occasion the average rate of reversionary bonus works out at 53s. 11d. per cent. per annum for the quinquennium, compared with 49s. 2d. per cent. per annum for the preceding valuation period.

The shareholders' one-tenth share is also greatly increased, and has enabled the dividend for the ensuing five years to be fixed at 8s. 6d. per share free of tax, which gives a yield on the shares now valued at 10½ of 5 per cent. gross.

	1920-1924.	1925-1929.
Friends' Provident and Century.	£	£
Trading surplus earned during quinquennium	377,441	682,552
Brought forward from previous quinquennium	86,885	24,402
	464,326	706,954
Allocations—		
To Bonuses to policyholders	439,924	676,626
Carried forward to next quinquennium	24,402	30,328
	464,326	706,954

For the quinquennium just ended, a reversionary bonus at the rate of 42s. per cent. per annum has been declared, this being 6s. per cent. higher than the bonus for the quinquennium 1920-1924. This increase has only been made possible by distributing almost the entire profits earned, and it will be noticed further that the bonus paid for the preceding quinquennium was not wholly earned out of profits.

ASSURANCE

The increase in the surplus earned is really a good deal greater than appears from a comparison of the figures above, since the 1929 valuation was made on a much more stringent basis, the exact effect of which has not been disclosed. The Gresham has suffered hitherto from the handicap of a relatively low bonus, and it is therefore pleasurable to record not only the strengthening of the valuation basis, but an increase in the rate of bonus from 25s. per cent. per annum to 35s. per cent. per annum.

The shareholders are entitled to one-tenth of the divisible surplus.

	1920-1924.	1925-1929.
Surplus earned during quinquennium	£ 655,667	£ 909,273
Investment profits taken credit for	12,223	8,075
Brought forward from previous quinquennium	18,974	39,864
	686,864	957,212

Allocations—	1920-1924.	1925-1929.
To Bonuses to policyholders	500,000	720,000
„ Shareholders	125,000	180,000
„ Investment reserve fund	22,000	...
„ Carried forward to next quinquennium	39,864	57,212
	686,864	957,212

The system of bonus distribution employed for many years by the Guardian has the effect of allotting reversionary bonuses varying according to both age at entry and duration in force, and exact comparison with the more usual simple or compound reversionary bonus is not possible. However, the range of reversionary bonuses now declared compared with that for the preceding quinquennium is as follows:—

	1920-1924.	1925-1929.
Whole Life Assurances	Per cent. 26/- to 72/-	Per cent. 30/- to 95/-
Endowment Assurances	28/- to 79/-	33/- to 95/-

Hitherto, almost alone among the proprietary offices, the shareholders have been entitled to as much as 20 per cent. of the profits, but it has now been announced that this percentage will in future be brought into line

with modern practice and will be limited to 10 per cent. Furthermore bonuses will in future vest immediately on declaration instead of only after payment of five years' premiums.

	1920-1924.	1925-1929.
Trading surplus earned during quinquennium	£ 596,206	£ 999,748
Brought forward from previous quinquennium	355,696	70,351
	951,902	1,070,099
Allocations—		
To Bonuses to policyholders	785,861	857,862
„ Shareholders	95,690	103,138
„ Carried forward to next quinquennium	70,351	109,099
	951,902	1,070,099

Although the rate of bonus of 45s. per cent. per annum compound previously declared has not been increased the rate was already so high that further increase could hardly be expected. It is important to realise, however, that the maintenance of this high rate has been accomplished on this occasion with a large margin to spare, whereas five years ago the declaration necessitated a substantial inroad on carry-forward.

The shareholders' proportion is based not on the amount of surplus, but on a percentage of premium income, which on both occasions has yielded for them rather more than the customary 10 per cent. of profits.

	1920-1924.	1925-1929.
Surplus earned during quinquennium	£ 300,225	£ 474,785
Investment profits taken credit for	17,233	...
Brought forward from previous valuations	1,400	15,616
	318,858	490,401
Allocations—		
To Bonuses to policyholders	303,242	406,753
„ Carried forward to next valuation	15,616	83,648
	318,858	490,401

This fine society has largely increased its rates of bonus for the five years 1925-29, and has introduced also the now familiar principle of declaring higher rates of bonus

for whole-life policies in recognition of their superior bonus-earning power. The bonus for the previous quinquennium was 40s. per cent. per annum compound and those now declared are as follows:—

	Per cent.
Whole Life Assurances	50/-
Endowment Assurances—	
Original Term 30 years or over	50/-
„ 20 „ to 29 years	48/-
„ „ under 20 years	46/-

A further favourable feature is the considerable increase in carry-forward in spite of the more generous bonus distribution.

	1920-1924.	1925-1929.
Surplus earned during quinquennium	£ 1,516,357	£ 2,654,796
Brought forward from previous quinquennium	95,263	311,611
	1,611,620	2,966,407

Allocations—	1920-1924.	1925-1929.
To Bonuses to policyholders	1,170,009	1,854,879
„ Shareholders	130,000	200,000
„ Carried forward to next quinquennium	311,611	911,528
	1,611,620	2,966,407

The distribution of profits has always been on conservative lines and it is clear from the above table that this tradition has been maintained in the 1929 valuation. Nevertheless, the rate of bonus has been increased from 30s. per cent. per annum to 42s. per cent. per annum, and an interim bonus on claims occurring in the current year will be paid at the rate of 45s. per cent.

Triennial Valuations.

	1924-1926.	1927-1929.
Surplus earned from trading during triennium	£ 201,213	£ 225,736
Investment profits realised	12,124	— 18,096
Brought forward from previous triennium	27,229	1,824
	240,566	209,464

1924-1926. 1927-1929.
£ £

Allocations:—	1924-1926.	1927-1929.
To Bonuses to policyholders	153,173	205,947
„ Strengthening of reserves	57,000	...
„ Investment reserve fund	11,319	— 18,522
„ Staff pension fund	10,000	5,000
„ Shareholders' account	7,250	10,000
„ Carried forward to next triennium	1,824	7,039
	240,566	209,464

A reversionary bonus for the triennium 1927-1929 has been declared at the rate of 40s. per cent. per annum for whole life assurances, and 38s. per cent. per annum for endowment assurances, these rates comparing with 34s. per cent. per annum for the preceding triennium. Thus the *Abstainers and General* is another example of the many offices which now recognise the superior claims of whole life policies to special treatment.

United Kingdom Provident.

	1924-1926.	1927-1929.

The reversionary bonus in the Ordinary Branch has been maintained at the same rate as was declared in 1928, namely, 42s. per cent. In the Industrial Branch for the first time a modest sum has been set aside for distribution to the policyholders. This distribution is to take the form of a "mortuary" bonus at rates varying from 5 per cent. on policies ten years in force up to

20 per cent. on policies 40 years in force, and payable only on claims by death or maturity occurring prior to April 1, 1931.

The Ordinary Branch bonus for 1929 is at the rate of 42s. per cent.—the same as in 1928.

The amount allocated to policyholders in the Industrial Branch has been rapidly increasing in recent years. This year's appropriation permits of the maintenance of last year's rate of reversionary bonus, £1 per cent. in respect of certain classes of policies, together with a reversionary bonus allocated to policies issued since 1922 to bring them into line with those granted under the Society's current prospectus.

The bonus distribution in the Reduction of Premium Fund takes the form of a reduction in the full normal premium, commencing after seven full years' premiums have been paid and increasing thereafter. The rate of reduction applicable to the current year has again been increased on all series by 3 per cent., with the result that the full premium is subject to reductions varying from 51 per cent. in the most recent to 136 per cent. in the oldest series. The company announces, however, that these bonuses can no longer be extended to new entrants, and a new series is therefore to be opened with a commencing rate of reduction limited to 46 per cent.

The reversionary bonus in the other with-profits fund is again to be at the rate of 40s. per cent. compound.

This society has made two separate and distinct bonus distributions on this occasion. In the first place the normal bonus has been maintained at the high rate of 51s. per cent. compound for Whole Life Assurances, and 45s. per cent. for Endowment Assurances. In addition a special distribution has been made in order to mark the centenary of the society, which was reached at the end of 1929. This "centenary" bonus has been carefully devised in order to meet the interests of the older policyholders whose reserves have mostly contributed to the large carry-forward which has made the distribution possible. Accordingly 1929 policies have been entirely excluded, while the bonus for earlier policies commences at the modest rate of 4s. 6d. for 1928 policies, rising very steeply to a maximum of 200s. per cent. for all pre-1901 policies.

The Only Way to provide at once for the heavy and increasing burden of DEATH DUTIES is by means of a Life Assurance Policy.

After the payment of only one annual premium an immediate capital is created sufficient to meet the duties and a special clause in the policy provides for the proceeds being applied in payment of Death Duties before Probate is granted.

THE ANNUAL CASH BONUS POLICY OF THE STANDARD LIFE

is pre-eminently suited for Death Duty Assurance.

The necessary fixed sum assured is provided at the outset at a low cost, but a share is given in the profits of the Company by means of a cash bonus annually which may be set off against the premium payable, thus ensuring an annually decreasing outlay.

A bonus of 46s. per cent. has again been declared out of the 80 per cent. share of surplus belonging to the Ordinary Branch policyholders.

The new profit-sharing scheme for the Industrial Branch has been inaugurated by an appropriation of £506,671. This sum has been used for the purpose of a reversionary bonus to pre-1923 policies at the rate of 16s. per cent. for Whole Life Assurances, subject to weekly premiums of 1s. and 12s. per cent. for Endowment Assurances, subject to the same premium.

In the Ordinary Branch reversionary bonuses at the same rates as before have been declared, viz., 50s. per cent. for Whole Life Assurances, and 46s. per cent. for Endowment Assurances.

In the Industrial Branch all post-1922 policies share in bonus on the same lines as policies in the Ordinary Branch, except that the rate of bonus in their case is 34s. per cent. For pre-1923 policies an extended "mortality" bonus is declared at rates varying from 11 per cent. on policies seven years in force to 70 per cent. on policies seventy years in force and payable only on claims by death or maturity occurring during the next fifteen years. As compared with 1928, the rates have been increased somewhat on policies of short duration, while the term during which they are payable has been extended from fourteen years to fifteen years.

This company was the first among the Industrial Offices to give effect to differential rates of bonus for Whole Life and Endowment Assurance policies. The same rates of bonus have been declared in the Ordinary Branch as before, viz., 48s. per cent. for Whole Life policies, and 42s. per cent. for Endowment Assurances.

In the Industrial Branch, the policyholders were granted two years ago definite rights to three-fifths of the divisible surplus, the remainder being shared equally by the Ordinary Branch and the Outdoor Staff. It is the directors' declared intention to utilise the policyholders' share for the purpose of waiving ultimately payment of all premiums after age sixty-five, and so to bring existing contracts into line with those now offered in the

current prospectus. This is necessarily a lengthy process. This year's allocation will have the effect of making premiums cease at age seventy-two after twenty-two years instead of at age seventy-three after twenty-three years as before.

FIRE INSURANCE.

The history of 1929 is one consisting for the most part of a declining premium income combined with mounting losses. At home, in the United States, and in most parts of the world, statistics of fire losses suffered show a heavy increase on those of previous years. Whatever may have been the cause elsewhere, it seems that in the United Kingdom the reason can be assigned largely to the effects of the severe winter and frost of 1928-29 followed by the succeeding drought in the summer, a combination of circumstances which led to an increase not only in the number of fires but more particularly in their severity. The result of all these factors is seen in the rate of underwriting profit; this, in the aggregate, is considerably lower than that earned in any of the past five years. For purposes of comparison the aggregate results of the past five years are set out below.

From this table it will be seen that every factor, broadly speaking, combined to operate against profits last year. A specially disquieting feature, to which attention has been previously drawn, is the recurrent tendency for commission and expenses each to absorb a larger proportion of premiums. That 43.8 per cent. of the total premiums should be absorbed in commission and expenses is not creditable to the offices, and still more difficult to justify is the fact that in order to collect a premium income of £780,000 more than in 1925 it was necessary to spend an additional sum of £1,353,000. There must surely be room for a great deal of economy by the application of the principles of rationalisation in conditions such as these.

An index of the trade situation can be gathered from the gradual decline, commencing from 1926, in total

premium income, due in part to the continuous fall in wholesale prices and in part also to the depressed condition of various important industries. The customary analysis has been made of the individual results of each office, and for this purpose the allocation to reserve has been made on the commonly accepted basis of 40 per cent. of the increase or decrease in premium income compared with the preceding year.

AMERICAN FIRE BUSINESS.

The fact that, according to credible estimates, approximately one-half of the total premium income of the British fire offices is derived from business in the United States, makes it necessary that particular attention should be paid to American business when considering fire underwriting results as a whole. While American losses were on a higher level last year than in previous years, the increase was probably not incommensurate with the natural rise in sums insured exposed to risk of fire. Hence American fire business in 1929 provided a satisfactory contribution to total underwriting profits. The aggregate results have been extracted for each of the past six years and recalculated on the British model, allowing for a 40 per cent. unexpired risk reserve. The figures are as follows:—

Year.	Premium Income.	Underwriting Profit. Amount.	Percentage of Premium Income.
1924	£ 31,085,285	£ 726,648	2.3
1925	32,814,506	392,925	1.2
1926	33,601,253	752,354	2.2
1927	31,710,646	2,110,373	6.7
1928	31,417,664	2,540,633	8.1
1929	31,224,583	2,236,280	7.1

A further decline in premium income is again noticeable, a result in part of a careful pruning policy, but more particularly due to the growth of competition from American offices.

MARINE INSURANCE.

Those companies which transact marine insurance only, or mainly, adopt the practice of presenting their accounts in a form which indicates the results of the underwriting of two years previously. The method adopted is to keep open each year's underwriting account for two years, and thereafter to close it by a transfer to suspense account, any balance remaining being regarded as profit. So it is that the 1929 reports of those companies exhibit results for the most part of the underwriting account of the year 1928. These results for a number of representative companies are shown below, and it is encouraging to find that in every case there has been an improvement in the situation.

Of the two main branches into which marine insurance is divided, namely, hull and cargo insurance, it is probable that the all-round increase in rates by 10 per cent. some two years ago has now begun to exercise an increasingly favourable effect, though it was doubtful at the time if so moderate a rise was sufficient for the purpose. Cargo insurance, on the other hand, is still suffering from the effects of unrestricted competition in a market too large for the business available. This, and the failure of the interests concerned to come to any sort of understanding,

combine to produce an unfavourable effect on the results.

In addition to the figures relating to marine companies the results of the marine departments of a number of large composite offices are also set out in detail. It is the usual practice for the marine account of a composite office to be drawn up on the same form as for fire and accident business, so that claims are completely unrelated to the premiums. Consequently it is only possible to contemplate the figures as a whole over a series of years.

MISCELLANEOUS.

EMPLOYERS' LIABILITY, ACCIDENT, AND MISCELLANEOUS.

The attached table indicates the detailed results of the underwriting of each of the last two years for all the principal companies in respect of accident business, employers' liability business, and miscellaneous business. Accident business and employers' liability business are classes of insurance specifically brought under the provisions of the Insurance Companies Act, 1909, but no provision is made for miscellaneous business. Hence it has happened that while a number of companies publish separate accounts for the three classes of business, others again include all these types of business in one conglomerate account, though necessarily separate returns have to be made to the Board of Trade. The figures on which the table is based have been calculated on the commonly accepted standard reserve allocation of 40 per cent. of the increase or decrease as compared with the previous year's premiums, and the column showing this allocation includes also any increase or decrease in the provision for outstanding claims where such is separately mentioned.

Accident business, which in this connection means personal accident, has never made a wide appeal in this country and the premium income grows therefore but slowly. The results for the last year's underwriting, whilst slightly less favourable than those for 1928, produced a higher ratio of profit than in any year since 1925.

The figures for employers' liability business relate entirely to business transacted within the United Kingdom, where all such business is regulated by the terms of an agreement made some few years ago

between the Home Office and the Accident Offices' Association. The object of this agreement was to ensure that a rising proportion of premium income should be absorbed in claims, this result being produced by reduced charges for commission. The effect of the agreement, which has worked smoothly in practice, has been to stabilise the underwriting profit at around 10 per cent. of the premium income, and the result of the underwriting in 1929 is little different from the experience in 1928.

The term "miscellaneous" insurance is applied to cover all classes of insurance outside fire, personal accident and home employers' liability. It includes, therefore, burglary, motor car and all forms of casualty insurance, and comprises the vast business conducted in the United States under the heading of "casualty" insurance. Apart from the underwriting results it will be observed that the premium income shows a small decline, a fact of some significance since it is the first year for a long period during which the premiums have failed to expand. The circumstance is really a reflection in part of a deliberate policy to eliminate all undesirable risks, and partly of the tremendous growth in competition from native companies all over the world. The falling off in the rate of underwriting profit has been brought about largely by an unfavourable experience in America. The course of progress among the principal British offices doing business in the U.S.A. has been as follows:—

Year.	Premium Income.	Underwriting Profit.	
		Amount.	Percentage of Premiums.
	£	£	Per cent.
1926	25,939,085	— 206,014	— .8
1927	27,196,037	— 593,723	— 2.2
1928	28,126,188	774,478	2.8
1929	28,243,388	105,787	.4

THE ENGLISH BANKING FIGURES.

In contradistinction to the high discount rates and stringent monetary position which prevailed right into the autumn of last year, unusually low money rates have characterised 1930. Indeed, there has been a plethora of short money, not only in London, but in New York, Paris and other centres. The causes of this are not far to seek. A year ago, almost to the day, the Hatry crisis in London and the collapse on Wall Street shook confidence throughout the world and precipitated the headlong fall in commodity prices for which the ground had already been prepared by the gold absorptions of France and the United States. Confidence suffered a shock, and as each month witnessed a further fall in the world price-level, enterprise disappeared, trade dwindled away, and unemployment became more and more intense.

Unemployment affects money as well as labour. Thus the nine English clearing banks' advances which had previously risen from £923 millions at the beginning of 1928 to the peak of £986 millions in April, 1929, had by August last fallen to £934 millions. During this latter period, deposits, with the exception of one or two isolated months, only fluctuated within narrow limits, and thus the contraction in advances threw money back upon the banks' hands, and so into the money market. Again, depressed trade and lower commodity prices combined to reduce the total volume of commercial bills coming forward for discount. Thus it is not surprising that as 1930 progressed the London discount market found itself choked with funds and starved of bills, while the banks in their turn had to invest money, which normally would have been put to other and more remunerative uses in financing industrial and Stock Exchange operations, in Treasury bills and in gilt-edged stock. During 1930 to date the clearing banks' bill portfolios have swollen in the aggregate from £243 to £279 millions, and their investments (including those in affiliated and subsidiary banks) from £260 to £276 millions.

The effect of these developments upon money rates, both in London and elsewhere, was very marked. At the beginning of 1930, Bank rate in London was 5 per cent., and the market rate for three months' bank bills 4½ per cent. By May, Bank rate had been reduced to 3 per cent., at which level it has since remained, while by the end of September, market rate was barely 2 per cent. Rates were just as low elsewhere—in New York, for example, at the end of September, the rediscount rate was 2½ per cent., call rate 2 per cent., and the discount rate of 90 days bank acceptances also 2 per cent.—and until trade revives, and short money can find its normal employment, rates cannot be expected to improve.

It is inevitable that these low rates should have affected the earnings of the banks. In normal times, advances carry interest at "one above Bank rate, minimum five," and this is the most remunerative way in which a bank can employ its resources. To-day, bank advances have dwindled to their lowest level for over two years, the banks can earn little more than 2 per cent. upon their swollen holdings of Treasury bills, and only 2 per cent. (namely, "one below Bank rate") on their weekly loans to the money market. Investments, it is true, are rather more remunerative, for British Government securities still yield about 4½ per cent. on the average. The ordinary deposit rate also is down to one per cent., but fixed deposits, which form an appreciable part of the banks' resources, have to be paid for at higher rates. In fact, last spring, when Bank rate and discount rates fell two points in five months, fixed deposits arranged at the beginning of that period must have involved the banks in an actual loss.

The banks have thus shared in the untoward effects of the trade depression, for Treasury bills at 2½ per

cent. are a poor exchange for advances to industry and commerce at 5 per cent. Bad trade has also deprived the banks of much of their acceptance business, for their liabilities on acceptances and endorsements have fallen from £164 millions in January to £122 millions in August. Fortunately deposits have been well maintained, with recent fluctuations mainly of a seasonal character. Thus there was a contraction in March due to tax payments, and another at the time of the August holidays.

The Bank of England has not had so anxious a year as it had in 1929, when London was being drawn upon by New York and Paris at once. The Wall Street collapse sent a certain amount of money back to Europe, and the dollar exchange was in favour of sterling for a large part of the year. Paris, however, has continued to draw upon London, but although the franc exchange has remained below the normal gold point, the outflow of gold from the Bank itself was checked by the Bank's decision, made at Whitsun, to exercise its legal right of delivering only standard gold. As was pointed out in the *Economist* at the time, this decision was inspired solely by the gradual exhaustion of the Bank's fine gold stocks, but, in practice, it has served to confine Paris demands on London mainly to the new gold arriving each week from the Cape.

Thus the Bank has been able to replenish and maintain its own gold holdings during the year, and at the end of September its stock of gold amounted to £157 millions. This has enabled the banking department's reserve to be increased to £62 millions, and its proportion of reserve to liabilities to the substantial figure of 55 per cent. This means that the Bank can view any likely losses of gold during the autumn with equanimity, while alternatively, should trade revive to the point where it absorbs existing funds now available in the banks and money market, the Bank can increase the supply of credit without driving the proportion down too low. Meanwhile, the supply of money, as measured by "Other Deposits" at the Bank and by "Cash" in the hands of the clearing banks, has been maintained at a constant level, through both the stringency of last year and the pronounced ease of this year, in a very striking fashion.

Among changes in British banking organisation must be mentioned the foundation of the Bankers' Industrial Development Company in the spring, and the absorption last summer by the Royal Bank of Scotland of Williams Deacon's Bank. The Royal Bank has also taken over the Bank of England's Western Branch. The object of the Bankers' Industrial Development Company is to establish closer contact between industry and the City, mainly with the object of facilitating the supply of new capital, but as a recent controversy with the cotton trade has shown, the task of building the necessary bridge is not so easy as some people imagined. The union between the Royal Bank and Williams Deacon's is a good move, for it will strengthen two institutions, both of which depend to some extent upon depressed areas and industries. The transfer by the Bank of England of its Western Branch simply means that it is confining itself more closely to its main function of acting as the nation's central bank.

The last few weeks have witnessed several changes in banking personnel both at home and abroad. The City of London is the poorer for the retirement of Mr John Rae from the active management of the Westminster Bank, though he still retains his seat on the Board. In Paris, M. Moreau has resigned the governorship of the Banque de France, and has been succeeded by the deputy-governor, M. Clément Moret. In the United States, Mr Eugene Meyer has succeeded Mr Roy Young as Governor of the Federal Reserve Board.

THE BANK FOR INTERNATIONAL SETTLEMENTS.

(BY A CORRESPONDENT.)

ON March 8, 1929, the Conference of Reparations Experts which was sitting in Paris announced that it had been agreed to propose the establishment of an international bank to take charge of reparations payments and to fulfil important functions in the domain of international finance. The announcement was received in banking circles with mixed feelings. While the scheme was welcomed as a means towards the solution of the reparations problem and of international monetary troubles in general, many quarters were inclined to regard the proposed institution as a dangerous rival to existing banks. These fears were not wholly dispelled by the publication of a detailed scheme in the Young Report in June, 1929, nor by the publication of the statutes of the bank in November, 1929, as although the latter precluded the bank from certain kinds of banking activities, such as the issue of notes or the granting of acceptance credits, it allowed the management a fairly wide freedom of action. This, however, was inevitable, as the scheme was entirely without precedent and it was difficult to determine the exact scope of the institution otherwise than on the basis of practical experience.

One of the main difficulties was the choice of the seat of the bank. London had a natural claim for it, being the most suitable banking centre for the purposes of the bank. For political considerations, however, the British claim met with the uncompromising opposition of other interests, and had to be abandoned. The selection of Switzerland as the home of the bank, though not ideal, was certainly the next best choice that could be made.

The scope of the bank may be divided into two sections: the reparations functions and the general international banking functions. The former are strictly determined by the statutes; in respect of the latter the statutes are necessarily vague. The bank is to provide the means, among others, for closer co-operation between central banks for mutual assistance; for facilitating the international circulation of capital; for preventing international transfers from interfering with the stability of the exchanges; and eventually, perhaps, for the prevention of excessive demands for gold. If it fulfils its task satisfactorily it will provide ample compensation to banking interests—and to the London market as a whole—for any loss of business it may possibly cause through its competition.

The statutes of the bank, elaborated by the Organisation Committee at Baden-Baden, were passed practically unaltered by the second Hague Conference in January, 1930, and after the ratification of the Hague Agreement the bank began to operate at Basle in May last. Its first important transaction was the issue of the first instalment of the Reparations Loan, which was negotiated under the auspices of the bank. The proceeds of this loan, pending their distribution between the creditor Governments, and the official deposits made by the interested Governments in virtue of the Young Plan, provided the bank with considerable initial funds. Its resources underwent a rapid increase in the course of the first three months of its existence, as is shown by the following table comparing the three monthly returns of the bank:—

(In Millions of Swiss Francs.)

	End of			
ASSETS.	June.	July.	August.	Sept.

Miscellaneous items	1.8	3.7	7.6	10.5
Total liabilities	1,085.7	1,303.6	1,563.6	1,700.4

These figures show that central banks have deposited with the bank considerable amounts, both for their own accounts and for the account of "others" (which is understood to indicate their respective Governments). As the bank is still at the initial stage of its development there is every reason to expect a further considerable increase of its resources in the course of the next twelve months or so. As to the reinvestment of its resources, in August it allowed its bill portfolio to run down, but the September return shows that this was merely a temporary tendency, due possibly to the decline of bill rates, and, it may be, to the desire of the bank to refrain from accentuating the present abnormal demand for bills.

Almost one of the first important decisions of the board was to emphasise the predominant importance of maintaining the liquidity of the bank. Although it is desirable to balance as far as possible assets and liabilities in the same currencies, the management is instructed to transfer the assets into another currency rather than invest them to the detriment of the bank's liquidity. Thus, if large Reichsmark deposits are received and there are no adequate short-term investment facilities in Germany, the funds have to be converted into another currency rather than reinvested in Reichsmarks in an illiquid form. Another important decision of the board was to agree that the bank should act as trustee to the new Austrian external loan. There is reason to believe that this precedent will be followed in regard to other international issues. This has the advantage of increasing the non-reparations activities of the bank, and incidentally of providing another source of revenue which is especially welcome at a time when low interest rates make it difficult for the bank to work profitably.

The bank has established relations with a number of European central banks, in addition to the founder institutions. For the time being it wishes to confine its activities to Europe, and has not invited central banks outside Europe to participate in its share capital. This restriction must be considered as essentially temporary; the bank has to settle down first and consolidate its position before expanding its activities to other continents. The ultimate end must be, however, to make it into a world bank, not merely a Bank of Europe.

Although it would be premature to form a definite judgment after such a short experience, the rapidity with which the bank has succeeded in establishing itself as an important factor in the international money market justifies the hope that it will fulfil the expectations of the authors of the scheme. With resources of little more than £60 millions, it has already begun to make itself felt in the foreign exchange market. It is in a position to assist central banks requiring support, and there is reason to believe that the next stabilisation scheme—that of the Yugoslav currency—will be

carried out with the assistance of the Bank of International Settlements.

At the same time, it would be unduly optimistic to expect the bank at this stage of its development to be able to exert a substantial influence upon the international price level and to check the downward trend of prices. Its resources will have to increase to a multiple of their present figure before it is in a position to influence the international volume of credit

in the desired direction. Meanwhile, its beneficial influence in that respect is confined to bringing about a closer co-operation between central banks. It is hoped that the personal intercourse of heads of central banks at the board meetings of the bank will lead to a better understanding as to the employment of the world's gold stocks and other problems affecting general prosperity.

THE WORLD'S MONETARY GOLD.

THE Gold Delegation of the Financial Committee of the League of Nations has just issued an Interim Report. This is concerned mainly with the future of the world's gold supply and with its effect upon the general long-term trend of prices. The main text of the report is followed by several annexes compiled by recognised authorities, both public and private, and reviewing in

In their subsequent deductions, the Committee have adopted the latter estimate.

The next point the Committee had to consider was the size of the non-monetary demand. Here, as the following table shows, the Committee anticipate a steady growth in this item of one per cent. per annum. They do not think it safe to count upon any material

TABLE I.—ESTIMATES OF FUTURE PRODUCTION OF GOLD.

* Official or semi-official estimates furnished to the Gold Delegation.

detail the prospective output of gold up to 1940; the present and future world demand for monetary gold on the basis of central banking legislation and practice; and recent changes in and the present situation of the distribution of the world's monetary gold stocks.

The Committee's estimate of the world's probable gold output during the next ten years is summarised very clearly in the following table. Two totals are given, one derived from official or semi-official estimates for the countries concerned, and the other compiled by Mr Joseph Kitchin, a well-known private authority.

reduction in Indian absorption for many years to come, and they have no definite information as to the likely industrial demand for gold. Hence this section of the following table appears to be somewhat tentative.

The net result is that the amount of new gold available for monetary purposes is likely to fall away from \$226,000,000 in 1932 to \$170,000,000 in 1940. The Committee proceed to apply this to what they calculate to be the normal world needs of monetary gold in order to keep pace with the gradual increase in production, and to provide adequate cover, according to existing standards, for the notes and sight liabilities

TABLE II.—ESTIMATE OF FUTURE MONETARY DEMAND FOR GOLD IF NO ECONOMY IN ITS USE IS MADE.

* On the assumption that the non-monetary demand for gold increases at the rate of 1 per cent. per annum.

required to be maintained by central banks in order to finance the world's business as it gradually expands. Two rates of expansion, amounting respectively to 2 and 3 per cent. per annum, have been postulated in the absence of any more definite evidence, while two gold ratios for the world's central banks have also been assumed. The first ratio of 33 per cent. corresponds to the average legal minimum requirements of the world's central banks as laid down in their constitutions; and the second one of 40 per cent. makes allowance for the extra 7 per cent. cover which in practice central banks maintain as a "cushion" to protect them from being suddenly forced down to or below their legal minimum.

Table II. thus contains four alternative estimates, together with "difference" columns which show how each estimate compares with the amount of gold likely to be available. The Committee's conclusions are that on every one of the estimates made, except the first, the supply of new gold available for monetary purposes will be inadequate in 1934, and they add that the assumption implied in the first estimate is incompatible with existing currency requirements and practice. Thus "the evidence points, in our opinion, conclusively to the prospect of a serious situation arising as soon as or shortly after business activity revives, unless steps to alleviate it are taken in time."

In addition to the actual shortage of monetary gold which the report envisages, there is also the question how far such gold as is available is equably distributed. Considerable light is thrown upon this question by a table prepared for the Committee by Mr A. Loveday, which is reproduced at the foot of the page.

This table, which divides the countries of the world into two groups, according to the relative importance of their gold holdings, shows very clearly the present maldistribution of the world's monetary gold stocks, and the Committee recognise that the question of the most effective distribution of gold is likely to become of increasing importance as the supplies of new gold diminish. The Committee, however, are rather inclined to hold that the present distribution is the

result of exceptional movements due to special causes which will gradually work themselves out. Thus the possibility of an optimum distribution being achieved later by means of intelligent co-operation should steadily increase.

As regards remedies, the Report points to the advantages already derived from the replacement of gold by notes for domestic use, and trusts that the concentration of monetary gold in central bank reserves and its limitation as a means of payment to international transactions may shortly become generalised. It looks for the gradual extension of the cheque habit and calls attention to the restrictive effect of stamp duties upon cheques. It also suggests the substitution of subsidiary coinage for bank-notes of small denomination.

These last recommendations are designed to reduce the demand for currency based directly upon gold, but the Report goes further and calls into question the size of the legal minimum reserves many central banks have to maintain. These minima, the Report roundly states, are the outcome of past tradition, convention and habit, and of the natural fear which each individual legislature has that a departure from general practice may impair confidence in the currency. The Committee believe that it should be possible to reach an international understanding whereby both the legal minima and also the extra proportion of gold cover which central banks hold in practice could be reduced without weakening the general credit structure. This would permit of a considerable economy in the need for monetary gold.

For the rest, the Committee favour the adoption of the gold-exchange standard by those countries that have still to stabilise their currencies. They warn those countries now upon the gold-exchange standard of the serious consequences that would arise from the conversion of foreign assets into gold upon any considerable scale. They suggest that reserves of foreign assets should be concentrated in central banks, and that they should be immune from seizure or confiscation in time of war.

IRISH FREE STATE BANKING.

(BY A CORRESPONDENT.)

BANKING conditions have been normal this year, and there are no outstanding events to be recorded. The new system of currency is working smoothly, and no shocks to the banking or credit system of the country have been administered as the result of the recent changes that have taken place. The average weekly amount of legal tender notes in circulation is greater than last year, and the average weekly circulation of bank-notes shows that the banks still exercise their right of note issue to its maximum extent. The volume of clearings in the Dublin Clearing House in the first six months of the present year shows a decline of less than one per cent. on the amount during the corresponding period last year. The general impression conveyed by these figures is that the Free State has escaped from the worst effects of the prevailing trade depression. The increase in the note circulation indicates that trade is active, and this conclusion is corroborated by the clearing returns, the percentage decrease in which is considerably less than the fall in prices during the period under review. Optimistic statements regarding the

rate is at present as low as 1½ per cent., while the rate charged for accommodation is at least five or six per cent. The proportion of bad debts to total advances is also comparatively small.

The Government has introduced a Bill to widen the class of securities which can be held against legal tender notes. Hitherto the Currency Commission has had to hold either gold coin or bullion, Bank of England notes, or British Government securities maturing within one year but, in future, it will be allowed to accept certain other classes of security, principally United States Government loans. This extension of the cover behind the currency is tentative and cautious, and there is no reason to fear any unorthodox step that might in any way weaken the security of the issue. Confidence on this matter has been confirmed by the attitude displayed by Mr Brennan, chairman of the Currency Commission, who gave evidence before the Committee on De-rating in opposition to certain proposals of an inflationary character that had been put forward. The principles enunciated by Mr Brennan on this occasion

present and future conditions of Irish trade characterised the statements of many of the bank chairmen at the half-yearly meetings of shareholders held during the last couple of months.

The decline in bank profits experienced in 1929 has been arrested, and has in many cases given place to an increase in earnings in the first half of this year. This is mainly accounted for by the reduction in bank rate, which has diminished the burden in respect of fixed deposits without effecting any equivalent reduction in the banks' earning capacity. Fixed deposits constitute a far higher percentage of the banks' total liabilities in Ireland than in Great Britain, owing to the habit of Irish farmers of keeping a large part of their loose funds on deposit account, and a high bank rate is therefore regarded as undesirable by Irish bankers. The deposit

were thoroughly in keeping with the highest standards of monetary orthodoxy, and the effectiveness of his evidence is best attested by the discomfiture displayed by his antagonists.

The long-standing complaint that the Irish banking system has not done its duty to the agricultural industry of the country can no longer be made in view of the excellent record of the Irish Agricultural Credit Corporation which was established in 1927 for the express purpose of catering for the needs of the farming community. The first report of this body, covering a full year's working, has recently been issued, from which it appears that business was conducted at a profit during a period of a very high bank rate. In spite of the adverse monetary conditions that prevailed, the rate of interest on loans was never raised above six per cent., and it is

* Irish Free State.

hoped that easier conditions in the money market will enable loans to be granted in future on even cheaper terms. From the commencement of its business up to October 31, 1929, the Corporation issued loans amounting to £526,108. The number of loans comprised in the above total is 4,337, classified as follows:—Loans under £500, 4,240; loans between £500 and £1,000, 61; loans over £1,000, 36. The average amount per loan is £121, a position which, in the words of the chairman of the Corporation, "makes for a broad, stable and safe basis in lending operations." The loans are secured on land, and are in no case more than one-half of the estimated market value of the land on which they are secured. Advances are repayable by yearly or half-yearly instalments, the length of the repayment period varying with the purpose for which the advance is made. Thus loans for the purchase of machinery, seeds and manure are repayable in five years, loans for the purchase of live stock in seven years, loans for extensive repairs to buildings and land improvement in fifteen years, and loans for the erection of permanent buildings in twenty years. So far the repayment of instalments has been

most punctual, the amounts in default being less than two per cent.

The criticism has been heard in certain quarters that the Agricultural Credit Corporation has not done what might have been expected of it in the matter of encouraging the growth of co-operative credit. It is true that the development of co-operative credit societies on the approved Raiffeisen plan seems to have come to an end, but the Corporation has devised other and possibly more suitable methods of linking the granting of credit with the co-operative movement. One such method is the system of granting loans to farmers who supply milk to co-operative creameries, the repayment of the loan being effected by a stoppage from the sums due from the societies to their members. Loans of this kind have proved very popular, and they are exceptionally secure, inasmuch as they are granted only to applicants who are approved by the co-operative societies by which they are also directly repaid. Suggestions are being made that a similar system of lending should be provided for farmers marketing their poultry products through co-operative selling societies.

CANADIAN BANKING.

(BY A CORRESPONDENT.)

BANKING in Canada has, within the past twelvemonth, undergone a rigorous process of consolidation. Following the now historic "slump" of October, there was a period of feverish retrenchment. Apart from this, it is an open secret that in the preceding two and a-half years Canadian chartered banks had built up exceptionally strong reserves from which to draw abundantly.

wheat "pool" managers decided a year ago that if the 150 or 180 million bushels of the 1929 crop in their hands could be withheld from the prompt market, they might, because of a reported scarcity in other exporting lands, expect to get an enhanced price for the 140,000 farmers in the "pool." Throughout the winter the grain elevators (warehouses) and even the steamers ice-bound at the ports of the Great Lakes

* Includes profit and loss balance of the Standard Bank of Canada, now merged with the Canadian Bank of Commerce.

Apart from the general economic depression, Canadian banks have this year had a problem uniquely their own. It is the obligation they assumed of financing the extraordinarily unsettled wheat trade of the three prairie provinces of Manitoba, Saskatchewan and Alberta. The facts are brief. The Western Canadian

bulged with wheat. As is now well known, there was no shortage elsewhere, but, even so, it was late in June before wheat exports from Canada began. Meanwhile, prices continued to fall, and in the middle of August, with a heavy carry-over from 1929, the "pool" management fixed 60 cents a bushel as the

basic figure for the first payment to farmers for the 1930 crop. That was about half of what had been expected for a crop estimated to yield 340 million bushels.

The trend of events naturally has been disconcerting for the banks who had been carrying the wheat "pool" for over a year. Various announcements have been made in the last three months, which were interpreted to mean that the Governments of the three provinces would, if necessary, give the requisite financial backing to banks and "pool." The Dominion Government had also been urged to pledge its support. The general election at the end of July, however, prevented any governmental declaration of policy which might affect economic conditions.

Thus, Canadian banking is, this year, tightly bound up with the marketing of two wheat crops in one. It will, therefore, easily be realised that banks are taking a more than usually prominent part in the maintenance of commercial credit. They are doing it courageously and with a steadiness that, whatever may be the outcome of the "pool's" plans, calls for recognition both in Canada and without. There is, of course, much discussion of the assumption of so heavy a national responsibility by private enterprise. As to the fundamental and, perhaps, imperially important cause—the best measures for storage of wheat destined largely for consumption in England—one departmental bank manager pithily remarked: "If England would build sufficient elevators for her wheat imports at home, she would stabilise Canadian prices and relieve our bankers of an annual problem."

Early in September there was an easier tone in the money market. Index numbers show credit to be

less stringent than for a year. The Dominion Bureau of Statistics reported bank debits at the end of July (the latest available) as \$3,094 millions, or a decrease of 9 per cent. on the previous month. In this item the prairie provinces recorded a drop of 15 per cent., which is an indication that the pinch is being most felt there. It should be explained that the Canadian Bankers' Association six years ago adopted a Government suggestion that bank debits, i.e., cheques charged against accounts, should be substituted for clearings as a measure of banking activity, because the variation in number of the branch banks for the last ten or fifteen years has made clearings too erratic as a measure of credit.

There are three reasons for believing that even though the banks have been recently faced with such severe problems, they have been, in reality, consolidating their position in the last few months. First, almost all the interim dividends declared this year compare satisfactorily with past records. Secondly, in almost every province there is an activity noticeable in the opening of new branches. Much investment is being made in this way, because the Dominion Bank Act stringently restricts a bank's holding of real (landed) estate. Thirdly, a minor yet gratifying proof of consolidation is that, while the clerical staffs of almost all other Canadian businesses have been reduced recently, the personnel of banks has suffered hardly any reduction. It may be deduced, therefore, that Canadian bankers are both confident of their own resources and recognise that the economic set-back of the present time will be succeeded in due time by a buoyant recovery.

AUSTRALIAN BANKING.

(BY A CORRESPONDENT.)

The past year has undoubtedly been a very difficult and trying time for the Australian banks. So difficult, in fact, that it is a remarkable tribute to their management and financial stability that they have weathered the storm and have so far shown such small evidence of damage.

exports, due to the fall of wool and wheat prices, and the maintenance of imports at the high levels of 1928, had its inevitable effect, and precipitated a rush on the part of Australian importers for the available supply of London balances in the hands of the banks. This rush was counteracted to some extent by movements

* Free of income-tax.

The dividend distributions of the Bank of New South Wales, the Union Bank, the Australian Bank of Commerce, and the Queensland National Bank, have been reduced, and all the banks' business has naturally suffered from the effects of what is believed to be the worst depression since 1893. Australia, as an agricultural country dependent on the sales overseas of two great staple products, is, of course, used to more of the ups and downs of economic life than this country, but the position this year has unfortunately been much aggravated by the increasing difficulty of providing for the service of the external debt. An acute exchange crisis soon developed. The shrinkage of Australian

of exchange against the importers in the autumn of 1929, but the gold point was soon reached and a heavy gold outflow started about October. There seemed no sign of a change for the better, and eventually the directors of the Commonwealth Bank wrote to the Federal Treasurer asking for legislative protection for their diminishing gold reserves. The Government then introduced an Amendment to the Commonwealth Bank Act, providing for the compulsory acquisition by the Bank of Australia's gold supplies, and this was passed in November, 1929. Up to June, 1930, £12,000,000 of gold (of an aggregate of £26,500,000 for the year) had been shipped overseas under this Act, but London

funds continued to remain scarce, even though the exchange was moved still further against Australia. Rationing of exchange had to be carried out so ruthlessly that interest payments in London by the Commonwealth Government became impeded, and an arrangement had ultimately to be made by the Commonwealth Bank, and the trading banks to pool London funds so as to assure priority to Government needs. It is clear that the shortage of exchange is mainly due to the fact that rates, as fixed by the Associated Banks, are much too favourable to Australia. Present rates "under-value" London funds so much, in fact, that it is stated authoritatively that 15 to 20 per cent. of exchange operations are now carried on outside the banks, presumably at rates nearer the true economic level.

But exchange difficulties are not the only troubles the banks have had to face. Drastic changes in the whole banking system were foreshadowed when, on April 2nd, the Commonwealth Treasurer introduced the Central Reserve Bank Bill, providing for the establishment of a true Reserve Bank for Australia, in addition to the Commonwealth Bank, which is a hybrid institution doing both commercial and government business. The new bank was to have a capital of £2,000,000, provided from the funds of the Commonwealth Bank, and it was to possess the normal powers of a Reserve Bank, such as the management of the

note issue and the clearing settlements, and the care of the reserves of the trading banks. In addition it was to be allowed a restricted power to accept current accounts. Its direction was to be in the hands of a Government-appointed board of nine persons, representing vocational interests. As might be expected, the introduction of a controversial measure at such a critical time, with the much more pressing problems of the external debt still awaiting solution, evoked considerable protest from the banks, apart from other criticisms that were made of the possibility of political interference with the board, and the chilling prospect for the banks of more State-aided competition from a much freer Commonwealth Bank. And in the interest of effective banking co-operation in Australia it is probably just as well that the Bill has been quietly buried for a year, by the Senate, on account of several alleged imperfections. Sir Otto Niemeyer, on his recent visit to Australia, was apparently not asked officially for advice about the ultimate shape to be taken by the Reserve Bank, but the project will almost certainly be further considered, and revived again next year. It is to be hoped that the general economic position will be much clearer then.

At present Australia is certainly not free from economic troubles, but her banks appear to have survived the first shocks well, and they should have a worthy part to play in the recuperative process.

AFRICAN BANKING.

(BY A CORRESPONDENT.)

THE three outstanding recent events have been the amendment of the powers of the South African Reserve Bank, the passing of a Warehouse Act and the general trade depression. As regards Reserve Bank amendments, the Currency and Banking Act of 1920, which provided for the establishment of the South African Reserve Bank, was passed in a time of stress, and in the absence of any public demand for such an institution. Moreover, notwithstanding the totally different situation prevailing locally, where the banking business is in the hands of three powerful institutions, the constitution of the Reserve Bank resembled that of the American Federal Reserve System to a considerable extent. As a result this institution has been considerably handicapped in its activities, and for years the Governor of the Bank has been pleading for a widening of the Bank's powers to enable it to get into touch

with commercial and industrial finance in ways other than through the commercial banks which up to now have not made use of the Reserve Bank to any considerable extent.

An Amendment Act was accordingly passed by Parliament in May last, re-stating the powers of the Bank, modifying the basis of its note issue and restricting the use of the term "bank." The more important changes in the Bank's powers are as follows:—

The maturities of commercial paper that may be bought, sold or rediscounted are increased from ninety days to 120 days, while loans and advances may now be made against the security of Union or local Government stock, debentures or bills of any maturity, whereas previously bills eligible for this purpose had to mature within six months.

Entirely new provision is made for the granting of loans and advances against the security of:

(a) "Such non-speculative dividend or interest bearing securities having a ready sale on the stock exchange as the board may approve for that purpose from time to time at intervals of not more than six months";

(b) "One-name promissory notes of any bank carrying on business in the Union, with a maturity not exceeding fifteen days, and covered by any collateral security which the Bank is empowered to discount or accept as security for a loan or advance"; and

(c) "One-name bills of exchange or promissory notes, secured by documents of title representing staple commodities having extensive and active markets, to an amount not exceeding 75 per cent. of the value of such commodities at current market prices."

In the case of authorised investments the Bank may now invest a sum not exceeding its paid-up capital and reserve in Union Government Securities of any maturity, whereas previously these had to mature within two years.

The basis of the note issue has also been radically altered. Originally the Act required that the notes be secured by a gold reserve of not less than 40 per cent., and for the rest by commercial paper or trade bills and by a first charge on all the assets of the Bank. From 1923 to 1928 the Bank was allowed to substitute Union and British Treasury Bills, within certain limits, for commercial paper. Henceforth, however, they are to be secured by not less than 40 per cent. in gold "and as to the remainder by a first charge on all the assets of the Bank."

Finally, in view of the difficulty of adequately defining a bank, this Act authorises all existing institutions calling themselves "banks" to continue to do so, but in future the name can only be adopted with the written consent of the Treasury.

After years of agitation Parliament has at last passed a Warehouse Act. Though it is restricted exclusively to agricultural products, it is a vital piece of legislation which is sure to prove of the utmost significance to the

Union's largest industry and to the banks. In addition to providing for the issue of negotiable warehouse receipts, the Act also provides for the granting of "rail surety notes," covering the conveyance of grain intended for export to a harbour in the Union.

In harmony with the rest of the world, South Africa too is experiencing a trade depression which is hitting agriculture particularly hard. The South African Reserve Bank gave a warning signal on August 17, 1929, when it raised its bank rate from 5½ per cent. to 6 per cent. Though within and without Parliament it had long been urged that the rate should again be lowered, it was not until September 29, 1930, that the Bank deemed it desirable to do so.

The following figures give some idea of the effects of the depression:—

	Bank Debits to Indivi- dual Accounts. (£1,000,000.)		Insol- vencies.	Imports. (£1,000,000.)	Exports. (£1,000,000.)

Domestic bills discounted at the South African Reserve Bank varied during the following limits during the periods shown below:—

Sept. 20, 1929-Dec. 6, 1929...	from £1,757,000 to £1,040,000
Jan. 3, 1930-March 28, 1930	" £1,274,000 " £150,000
April 4, 1930-June 27, 1930...	" £1,609,000 " £295,000
July 4, 1930-August 22, 1930	" £575,000 " £28,000

The figure of £28,000 appears in the last published return for the week ending August 22, 1930. In this same return notes in circulation also reached the lowest figure for the period, viz., £7,214,000, as compared with £9,541,000 on January 8, 1930. Bankers' deposits, however, have remained fairly constant.

INDIAN BANKING.

(BY A CORRESPONDENT.)

THE Reserve Bank Bill, which was designed to create for India a central financial institution on modern lines, was reluctantly dropped by the Indian Government in 1928 on account of the insistence of the Legislative Assembly that the board of directors should include representatives of that political body. The desire for a central bank is nevertheless general in commercial circles, and it is in the hope of clarifying opinion on the essential functions of such an organ that a banking inquiry has been undertaken throughout British India in the current year. The Central Banking Inquiry Committee, over which the Member for Industry, Sir B. M. Mitra, himself presides, is now considering the reports submitted by the committees of the several provinces, and is taking evidence on questions which concern the whole country. When this process is completed, a group of banking experts will be invited from England or elsewhere to confer with the Central Committee, and to report to the Government of India early in 1931. The identity of these advisers is not yet known.

The chief problems in Indian banking are (1) to find a means of extending further credit to the agriculturist, who suffers at present, wherever co-operative credit societies have not come into being, from the activities of moneylenders and unsatisfactory

grain dealers; (2) to make use of these indigenous agents in ways which will promote agriculture and industry without involving loss to the borrower or to investing third parties; (3) to set up an apex bank for India which will control the currency and the note issue, hold the reserves of the major joint-stock banks, and facilitate internal trade by rediscounting traders' bills. The provincial committees deal only with the two former questions. They are unanimous in recommending, both for the agriculturist and the smaller industries, an increase in the number of co-operative societies of credit, production and sale, as well as land mortgage banks. The moneylenders and indigenous bankers are invited to unite themselves in new joint-stock banks or to become local agents of those which already exist. It is highly improbable that they will welcome such a restriction of their independence. The Indian joint-stock banks are unable effectively to invade their field, and they will stand fast until co-operative banks gradually displace them.

Much criticism has been passed in recent years on the Imperial Bank of India, on the ground that it discriminates against Indian applicants for credit. The same charge has been repeated before the Central Committee by the Indian Merchants' Chambers of Calcutta and Bombay. It appears, however, to be

£6,669,000—

paid in claims to LIVERPOOL & LONDON & GLOBE policyholders in 1929!

This vast claim figure was distributed as follows:—

Fire	£2,306,000
Accident, Employers' Liability, Burglary and Miscellaneous	£2,214,000
Motor	£1,314,000
Life	£ 505,000
Marine	£ 330,000

Total claim payments in 1929 .. **£6,669,000**

SVENSKA HANDELSBANKEN - - Stockholm.

joint-stock banks can venture freely to finance them. The private trader or moneylender borrows on his personal credit, which is only known and acceptable to a private Indian banker or *shroff*; the latter has then only a pro-note to offer, his own or that of his client, to the joint-stock bank, and it is not reasonable for the Inquiry Committees to urge the banks to discount such documents. Attempts to popularise the trade bill have not hitherto succeeded, and those committees which demand the use of trade paper make no specific suggestions as to the manner of introducing it. The opening of licensed warehouses and the organisation of co-operative marketing societies, as proposed by the United Provinces Committee, will render it easy to draw trade bills, but may fail to tempt the dealers, who are content with the present system of purchases for cash, to alter their traditional procedure.

There is a growing appreciation of the value of banking education. An Institute of Bankers has now been in existence, though not very active, for three years, and a diploma in banking can be obtained from more than one college or university. What is needed is rather prudence than technical skill, important though the latter may be. More than one hundred joint-stock banks in India have failed in the last ten years, usually through imprudent advances and inadequate audit. Private firms are even more unstable, and the business world of Karachi has recently been disturbed by a considerable and unexpected failure of an Indian banking house. The Central Committee are therefore unlikely to advocate State support of so-called "industrial" banks, as frequently proposed. There is no lack of money in India, and surplus funds have been available throughout the present year. Deposits in the Savings Bank and in co-operative banks are rising and savings certificates are as popular as ever. No sound industrial scheme, therefore, will lack funds. The Committee may regard with more favour the idea of closer control over banks through official examiners, who will strive to protect the amazingly credulous Indian depositor. If the banks will follow prudent rules and if the Indian merchant will employ trade bills, a Reserve Bank can foster a bill market and finance the country's trade; but little more than a pious hope of these events has yet emerged from the proceedings of the Banking Committees.

AMERICAN BANKING DEVELOPMENTS IN 1930.

(BY A CORRESPONDENT.)

BANKING developments since the New Year have been of a nature to cause both severe criticisms of policy and some anxiety as to immediate results. This is reflected in the recent decision of the President to re-organise the Federal Reserve Board, and explains his acceptance of the resignation of Mr Roy A. Young, the former Governor, and the appointment of Mr Eugene Meyer as his successor. Mr Meyer's appointment has also necessitated the resignation of the former Vice-Governor, Mr Edmund Platt, as the Reserve Act makes it illegal for both officers to come from the same district, and both Mr Meyer and Mr Platt are residents in New York. These changes are the result of a long-gathering dissatisfaction with the management of the Reserve system, and, in consequence, with the conditions which prevail in the banking system of the country at large.

It is not difficult to state what has occurred in American banking during the past few months. The following brief table, representing the condition of the member banks of the Federal Reserve system, which report each week to the Board, illustrates the general situation among the city institutions which, between them, own 50 per cent. of the assets belonging to the commercial banks of the country:—

WEEKLY STATEMENT OF REPORTING MEMBER BANKS.
(Amounts given in millions of dollars.)

		Change from Aug. 29th. a Year ago.
Loans and investments	23,122	+ 717
Loans, total	16,793	- 157
On securities	8,377	+ 862
All other	8,416	+ 1,018
Investments, total	6,329	+ 873
U.S. Government securities	2,909	+ 202
Other securities	3,420	+ 672
Reserves with Federal Reserve banks	1,814	+ 151
Cash in vault	211	- 27
Net demand deposits	13,606	+ 621
Time deposits	7,439	+ 673
Government deposits	46	+ 9
Due from banks	1,494	+ 472
Due to banks	3,302	+ 762
Borrowings from Federal Reserve system ..	40	- 645

These figures show an advance in loans on security, since a year ago—shortly before the autumn crash—amounting to the sum of \$826 millions. Early in the year, it seemed as if there might be a possibility of getting the security movement under control, and there were sporadic declines in advances; but these lasted only a little while. The decline in loans on commercial account, amounting to more than a billion dollars, and thus more than offsetting the increase in security loans, has little to do with the situation except to accentuate its gravity. The contraction of the commercial paper holdings of the banks reflects the bad business conditions that have prevailed, the tendency to liquidate commitments on account of lack of demand, and—in some regions—the unwillingness of the banks to make straight advances on business credit, at charges that permit the business man to accept them.

The striking feature of the developments thus set forth is manifestly afforded by the circumstance that, despite the warnings furnished by the panic, credit is still going so largely into stocks while study of discount rate policies reveals a continuance of the intent to make money abnormally cheap. Rates for money in New York have been the lowest since the close of the war, although in the interior funds have been about as scarce and high as they have ever been, and the cost of borrowing for house construction has been

prohibitive. The Reserve system has, apparently, been guided throughout by the belief that, by making money "cheap," a fresh advance in stocks could be encouraged, and therewith a return to the "prosperity" frame of mind founded upon steadily-rising quotations that was characteristic of last year.

Country banks have not increased their commitments on stocks as city institutions have done, chiefly for the reason that they had already reached almost the end of their ability to lend in this way. They have found themselves distinctly "frozen," and at the same time have, in many parts of the country, suffered from a general "silent run," due to the steady withdrawal of funds by depositors who have been forced by bad trade and unemployment to draw upon their existing resources. As these drafts have been met, the banks have had all they could do to pay off the claims against them, and in order to get resources, have been obliged to force borrowers to sell collateral. Such sales have kept the market in a condition of depression, while they have reflected an indisposition, and, in many cases, an actual inability, to make fresh advances on any score except in the most urgent situations. Just how seriously all these conditions have pressed upon the country banks may be inferred from a rate of failure which, in some months, has run as high as 100, with the expectancy of not less than 1,000 bank failures for the calendar year 1930. The criticism which has been generally visited upon the management of the banking system may be briefly expressed in the statement that whereas most panics were followed by a clearing up and restoration of liquidity among the banks, the panic of 1929 has seen but a sporadic improvement of this sort. In fact, the banks as a whole are rather less liquid than they were before the breakdown of last year.

It is this situation with which Mr Meyer, the new Governor of the Federal Reserve Board, will have to deal. He has before him a most difficult problem, closely intertwined with the urgent issue of bringing about business recovery, while his hands are sure to be more or less tightly tied by what is called "politics." The United States retains an enormous hoard of gold amounting to nearly \$4,250,000,000, of which \$3,000,000,000 is in the vaults of the Reserve system, and has thus far lost but little, relatively speaking, through exportation. This great ownership of gold in no way relieves the domestic problems which result directly from the interior banking condition and from the fact that so many of the banks are directly controlled by stock market considerations which have given their portfolios a distorted appearance.

BANK SHARES.

BRITISH bank shares, through their security and the constancy of their dividends, have come to be regarded by the investing public as almost equivalent to gilt-edged stock. Consequently, their prices move largely in sympathy with those of British Government securities, and are subject to the same main influences, namely, the cheapness or dearth of money and the extent to which the public are being attracted by shares of a speculative character. Thus dear money explains the fall in the value of the shares of the leading British banks during the year ended September 30, 1929, while cheap money and the disfavour with which the more speculative markets have recently been viewed, explains their partial recovery during the year now closed.

The fact that the recovery was not complete, even though money is to-day much cheaper than it was two years ago, may be due to several causes. One is a realisation of the fact that the earning capacity of the banks is to some extent dependent upon the general state of trade, while another is the knowledge that low, and especially falling money rates make certain inroads into bank profits. Point is lent to these facts by the slight dividend reductions made by two north-country banks during the past year.

Foreign and Colonial bank shares are naturally governed to some extent by the course of events in the countries to which they belong. Thus the fall in Australasian bank shares is easy to understand, while the decline in Canadian bank shares may be due to

the repercussions of the recent Wall Street collapses. The Eastern banks have naturally felt the effects of the slump in silver, while South American bank shares

reflect the commercial difficulties of that Continent. In general it would be true to say that foreign and colonial bank shares are regarded as being more subject to "industrial" influences than are those of British banks.

For the benefit of those who dislike holding partly-paid shares, even though the chance of the leading banks calling up any of their unpaid capital is extremely remote, a separate table is given below, which is confined to fully-paid shares.

Bank.	Denomination.	Price Sept. 28, 1928.	Price Sept. 30, 1929.	Price Sept. 30, 1930.	Yield %

Reference to the table shows that the yield on fully-paid shares in the leading British banks is very little higher than that obtainable upon gilt-edged stock. Shares in other banks, however, even when fully-paid, are clearly regarded as being of a slightly more speculative character.

It is not easy to determine the future course of bank share prices. The main question to be answered at present is to what extent the banks, both at home and abroad, have been affected by the general trade depression and the consequent lack of employment for some of their resources. For this it is necessary to await the year's banking results and the bank chairmen's analyses of the situation.

GREGG PUBLICATIONS

For Commercial and Professional
Students.

PRINCIPLES OF BANKING

A Book for the Practical Bankman and the Student of
Banking.

By S. EVELYN THOMAS, B.Com.(Lond.).

Provides an inexpensive, clear and up-to-date book of reference unburdened
by abstruse intricacies and inessential details. Covers syllabuses in the
Practice and Law of Banking of the Part I examination of the English
Institute of Bankers, and the Preliminary examination of the Irish Institute
of Bankers. 8s. 6d. net.

BANKING AND EXCHANGE

By S. EVELYN THOMAS, B.Com.(Lond.).

Specially prepared to assist those who, though neither bankers nor exchange
dealers, would find a general knowledge of the principles of Banking and
Foreign exchange invaluable.Clearly and simply written by a triple prizeman of the Institute of Bankers
and author of books widely recommended by examining bodies. Covers
Syllabuses of the I.C.A., C.I.S., I.S.A., C.A.A., R.S.A. and London Chamber
of Commerce. 11s. 6d. net.

BANKER AND CUSTOMER

By S. EVELYN THOMAS, B.Com.(Lond.).

Invaluable to the practical bankman as well as to the students preparing
for banking examinations. 733+xxvi pages, bound in cloth. 12s. 6d. net.

ELEMENTS OF ECONOMICS

By S. EVELYN THOMAS, B.Com.(Lond.).

Deals comprehensively and in a clear and interesting manner with the
whole field of economic theory. Covers examinations of the C.I.S., Bankers'
Inst., C.A., etc. 683+vi pages, bound in cloth. 10s. 6d. net.

Obtainable from all Booksellers and

The Gregg Publishing Company, Ltd.

THE AUSTRALIAN BANKING AND
CREDIT SYSTEM.By A. L. GORDON MACKAY, Lecturer in Economics at
the University of Adelaide, South Australia. 12s. 6d.P. S. KING & SON, LTD.,
14 Great Smith Street, Westminster.

DÍA DE LA RAZA!

Under this name—the Feast of the Latin Race—is
commemorated, on the 12th of October each year
throughout South and Central America, the historic
voyage of discovery by Columbus in 1492.Since then, the development of the vast resources
of the New World has been phenomenal.To-day a great and growing volume of overseas
trade is transacted annually by the Latin American
Republics, and complete facilities for every descrip-
tion of modern banking business are afforded byTHE ANGLO-SOUTH
AMERICAN BANK LTD
117 OLD BROAD ST, LONDON, EC2

AUSTRALIAN BANK OF COMMERCE, LIMITED.

In 1909 acquired the business of the Australian Joint Stock Bank, founded in 1853.
In 1917 purchased City Bank of Sydney.

EVERY MODERN BANKING SERVICE

TO INDIVIDUALS

All classes of trusteeship and executorship can be entrusted to the House, thus relieving you of responsibility and anxiety and ensuring expert management. The House will also serve you in practically all your affairs with which the handling of money or property is concerned; such as, for example, income tax and surtax returns, letters of credit for foreign travel, etc.

TO COMPANIES

The special and responsible duties of stock and share registration and transfer cannot usually be handled so efficiently as a department of your own business. These duties can be undertaken by the House both efficiently and economically.

THE ANGLO-FRENCH BANKING CORPORATION, LTD.

The report of the directors submitted at the ordinary annual general meeting on January 18, 1930, stated that the year 1929 represented the first full working year of the bank. The profit for the year, after making full provision for all expenses, rebate of discount and commission, bad and doubtful debts, amounts to £85,846, to which is to be added the balance carried forward from last account, £2,133—£67,979; from this is to be deducted directors' fees and remuneration of management committee, £7,686, leaving a balance of £60,293. At this early stage of the bank's existence the directors consider it advisable to apply the whole of the profit to writing off all preliminary expenses, and to the formation of reserves. Accordingly it is proposed to appropriate the available balance as follows:—In writing off all preliminary expenses, £32,607; in writing off cost of installation, furniture, etc., £3,864; to provide for taxation, £11,632; to carry to reserve, £10,000; leaving a net balance to be carried forward to next year of £2,190.

BANCA COMMERCIALE ITALIANA.

According to the annual report, the profit and loss account shows a net profit slightly in excess of the previous year and makes it possible to maintain the dividend at the rate of Lire 65 per share, i.e., at 13 per cent.; this after passing to the reserve fund an amount of Lire 20,000,000, leaving a carry forward of Lire 28,500,000. Distribution of profits on the following lines is proposed: Net profit, as per balance sheet, Lire 114,350,900; 10 per cent. to the ordinary reserve, in accordance with Article 3 of the Royal Decree of September 7, 1926, No. 1511, Lire 11,435,090; 5 per cent. dividend on the capital of Lire 700,000,000, Lire 35,000,000; 5 per cent. to the board of directors, Lire 3,395,791, leaving Lire 64,520,019; out of which it is proposed to pay an additional dividend of 8 per cent. on the paid-up capital, Lire 56,000,000, which will leave a balance of Lire 8,520,019, to which is to be added the amount carried forward from previous years, Lire 28,481,934—Lire 37,001,953; out of which it is proposed to transfer to the ordinary reserve fund (in order to increase it altogether by the round figure of Lire 20,000,000) a further amount of Lire 8,564,910, leaving a balance to be carried forward of Lire 28,437,043.

BANK OF LONDON AND SOUTH AMERICA, LIMITED.

According to the annual report, the net profit, after making ample allowance for doubtful debts, income tax and rebate of interest on bills not due, amounts to £435,145 to which has to be added £208,828 brought forward from last year, making a total of £643,973, out of which an interim dividend of 4 per cent., paid in June last, amounted to £141,600. From the unappropriated balance, viz., £502,373, the directors recommend the following distribution:

to dividend of 7 per cent., payable December 23, 1929, making 11 per cent. for the year, subject to income tax, £247,800; to contingency reserve, £45,000; to profit and loss carried forward, £209,573.

BRITISH BANK FOR FOREIGN TRADE, LIMITED.

The scheme of arrangement for writing down the bank's issued capital passed by the shareholders on March 26, 1929, was sanctioned by the High Court on April 30, 1929. Effect has been given to the scheme in the accompanying balance sheet by writing off the adverse balance on profit and loss account shown in last year's accounts, and by writing down investments and loans and advances. Sufficient provision has been made for reducing investments to current value, and in the opinion of the board the loans and advances (of which less than 3½ per cent. are unsecured) are good and recoverable. The year's trading shows a profit of £18,637, which it is proposed to allocate as follows: Reserve for contingencies, £5,000; dividend of 8 per cent. on £48,000 issued capital, £3,840; carry forward to next year's account, £9,797—£18,637.

BALANCE SHEET—April 30, 1929.

We report to the Members that we have obtained all the information and explanations we have required. We have verified the Securities representing Investments of the Company, those held against Loans made by the Company, and all Bills discounted in hand. We have also verified the Cash Balances and vouched the Securities and Bills given as collateral Security for Loans, and we have now to report to the Members that the foregoing accounts agree with the books, and that, in our opinion, the above Balance Sheet is properly drawn up, so as to exhibit a true and correct view of the state of the Company's affairs, according to the best of our information and the explanations given to us, and as shown by the books of the Company.

THE BRITISH BANK OF SOUTH AMERICA, LIMITED.

The report for the financial year ended December 31, 1929, states that the gross profits, after allowing for rebate of interest on current bills and drafts, for interest on deposits, and after making ample provision for bad and doubtful debts and contingencies, amount to £314,363; this, with the balance of £108,648 brought forward from the previous year, makes £423,011. After deducting all charges at the head office and branches, including directors' remuneration, government taxes in Brazil, &c., amounting to £214,386, there remains £208,625 available. A dividend on account of 10s. per share, amounting to £50,000, was paid in September last, and it is recommended that a further dividend of 10s. per share, amounting to £50,000, be now declared, making, for the year, a distribution of 20s. per share, or 10 per cent., subject to income tax, on the paid-up capital of the bank of £1,000,000. After making this transfer and paying this dividend, there will remain the sum of £108,625, which the directors propose to carry forward.

BALANCE SHEET—December 31, 1929.

THE BRITISH ITALIAN BANKING CORPORATION, LIMITED.

According to the report of the directors presented at the general meeting on May 20, 1930, the net profits for the year 1929, after making provision for bad and doubtful debts, amount to £25,022, which the directors propose to carry forward to new account. The directors have utilised the amount carried forward from 1928, and other provisions previously made, for the purpose of writing down

the investments by £50,000 to £149,418 (which compares with the market value of £165,424), and of increasing the reserve account by £75,000 to £300,000.

HAMBROS BANK LIMITED.

According to the report presented at the general meeting on May 29, 1930, after payment of all expenses, making provision for rebates on bills discounted, bad and doubtful debts, and income tax, the accounts show a profit of £340,148. Deducting the directors' remuneration of £19,279 and adding the balance brought forward from last year of £91,073, there remains an available total of £411,942. After setting aside £125,000 to contingency reserve account and allowing the sum of £60,000 for the interim dividend on the £10 shares and £9,600 for the interim dividend on the £1 "A" shares paid on October 29, 1929, the directors now recommend the payment of a further dividend of 15 per cent., less income tax, on the £10 shares, making a total of 22½ per cent. for the year, less income tax, and a further dividend of 3 per cent., less income tax, on the £1 "A" shares, making a total of 6 per cent. for the year, less income tax, and that the balance of £91,792 be carried forward.

THE HONGKONG AND SHANGHAI BANKING CORPORATION.

The report submitted to the general meeting on February 22, 1930, stated that the net profits for the year ending December 31, 1929, together with \$3,397,813 balance brought forward from last account, after paying all charges, deducting interest paid and due, and making provision for bad and doubtful accounts and contingencies, amount to \$17,546,022. The directors have transferred \$5,000,000 at 2s. = £500,000 from the silver reserve to the sterling reserve. They recommend the transfer of \$500,000 from

the profit and loss account to the silver reserve. They also recommend writing off bank premises account the sum of \$750,000. After making these transfers, deducting the interim dividend of £3 per share, viz., £480,000 at 1s. 11½d. = \$4,981,622, and remuneration to directors, there remains for appropriation \$11,264,401, out of which the directors recommend the payment of a final dividend of £3 per share, viz., £480,000, and a bonus of £1 per share, viz., £160,000, amounting in all to £640,000 which, at 1s. 7½d., the rate of the day, will absorb \$7,876,923. The balance \$3,387,478 to be carried to new profit and loss account.

THE IMPERIAL BANK OF PERSIA.

At the general meeting held on July 2, 1930, the directors submitted the balance sheet and profit and loss account for the year ended March 20th last. The profits for the period mentioned, after making provision for expenses of management, general charges in London and at chief office and branches, income tax, royalty, and bad and doubtful debts, amount to £124,279, to which has to be added £35,602 brought forward from last account, making a total of £159,881. The directors recommended payment of a final dividend of 7s. per share, and a special bonus of 2s. per share, making with the interim dividend of 4s. per share a total for the year of 13s., free of income tax. It was also proposed to add £40,000 to reserve, which is thereby increased to £850,000, the amount of the issued capital; to write off bank premises £10,000, and to carry

INTRODUCTION.

THE account of certain aspects of contemporary Russia contained in the following pages embodies the results of an investigation conducted for the *Economist* by a Special Correspondent who visited that country this summer, and whose impressions are those of an unprejudiced observer familiar with Russian conditions before and since the Revolution. Our own reflections on the picture which our Correspondent presents will be found in an article in this week's *Economist*. As an aid to clearer appreciation of the bearing of the developments which he notes, we propose in this Introduction to summarise a few of the salient features of the structure of Russia to-day.

The historical background of current phenomena in Soviet Russia falls naturally into three sections. The period from the overthrow of Kerensky's Government, in November, 1917, to the announcement of the new Economic Policy, on August 11, 1921, was usually referred to as the time of "War Communism," when the exigencies of war and civil disturbance led to an extreme measure of centralised control of production and distribution, grain requisitions, and abortive experiments in "pure communism." Under the system of modified Socialism (N.E.P.), which Lenin introduced four years after the Revolution, private individuals were once again allowed to take part in trade and industry and supplement the activity of the State. The period from 1921 to 1927 was devoted to "reconstruction," accompanied, incidentally, by the steady elimination of the private trader as the interests of the State expanded. The third period, that of economic "development," began with the launching, in October, 1928, of the Five Years' Plan for the industrialisation of the country.

The constitution of the new republic, which was promulgated in July, 1923, is, in theory, if not in practice, democratic. With certain "class" exceptions, the franchise is universal. The system of election is extremely indirect, and its basis is partly occupational and partly geographical. The Soviet or Council, whether of a district, factory or workshop, is regarded as the unit, and a pyramid of congresses—district, provincial, and regional—has its apex in the Union Congress of Soviets, which ordinarily meets once a year. Voting for the election of delegates is by show of hands, and any voter can nominate a candidate. In practice, election meetings seem useful for the airing of grievances, but there is no reason to think that the degree of apparent unanimity often reached is any clear reflection of the electors' wishes. Town voters are judiciously "weighted," in comparison with the peasants, so that the actual composition of the second rank of congresses does not reflect the comparative numerical position of urban workers and peasants.

Once elected, the Union Congress of Soviets itself appoints a Central Executive Committee to which each national republic has the right to send representatives.

The Central Executive Committee meets ordinarily about three times a year and, when it is not sitting, is represented by a small elected committee or Presidium, and by the Council of People's Commissaries, which is the executive organ. The whole constitutional machine is overshadowed, however, by that of the Communist Party and its hand-maiden, the State Political Police, or G.P.U., though the extra-constitutional influence of the Communist Party is professedly temporary in nature. Local administration is in the hands of the various local soviets, and is subject to little interference from the centre as long as it follows the general lines of policy laid down by the Party Congress.

As far as the economic side of the U.S.S.R. is concerned, practically the whole of large-scale industry is now in the hands of the State; and, as will be seen in the ensuing pages, revenue from this source figures largely in the State budget. State industry is under the control of Vesenha, the Supreme Economic Council of the Union, and the various industries are administered by "Trusts" which are responsible to the Supreme Council. The activity of these trustified State industries forms the keystone of the Five-Years' Plan—formulated by the State Planning Commission, or Gosplan, and its various branches, in conjunction with Vesenha, Narcomfin (the Commissariat of Finance) and the co-operative organisations.

The current forms of agricultural organisation fall into two main groups. The first consists of State farms, or Sovhosi, owned and controlled by the State, and employing labour for a fixed wage; the second consists of co-operative farms, more spontaneous in origin, which occur in three stages: (1) The "Soz," or "Society for the Common Working of the Land," in which for the first time the land is ploughed and sown in one *massif*, and labour, land, and working stock are pooled; (2) the "Artel," in which not only land, but labour and working stock are commonly controlled; (3) the Commune, where everything but personal property is owned and administered in common, and dwellings, dining rooms, and the like, are reorganised on communal lines.

The internal and external trade of the Soviet Union, like industry and agriculture, is subject to the closest supervision by Government bodies, and particularly by the People's Commissariat for Trade, Narcomorg. Internally, by far the greater part of the wholesale trade is confined to the State and co-operative organisations, while present policy appears to be aimed at depriving the private traders of even the opportunities in the retail trade which the New Economic Policy gave to them. Thus, whereas in 1928-29, the first year of the Plan, private individuals were responsible for 13.9 per cent. of the total trade turnover, while the co-operatives took 48.5 per cent. and the State 37.6 per cent., it is estimated that by 1932-33, the final year of the Plan, private trade will have

shrunk to 3.2 per cent. of the whole, while the proportion of the co-operatives will have reached 59.2 per cent., and that of the State have remained stationary at 37.6 per cent.

State trade is organised by means of a large number of "syndicates" concerned in many cases with the goods produced by the corresponding "trusts." These syndicates are joined in a Union of Syndicates, which also embraces many other trading organisations, and is concerned, *inter alia*, with the fixing of prices. In addition to the syndicates, there exist sundry State "joint-stock companies" whose capital is contributed by some or all of the State and co-operative institutions which are interested. Such, for instance, are the Khlebo-product, or State Grain Company, and the Sherstj, or State Wool Company. The co-operative machine is largely controlled by Centrosoyus, the Wholesale Society, and by Selosoyus, the Agricultural Co-operative Society. Apart from the retail shops, much of the trade takes place in the "goods exchanges," both central and provincial, and, particularly in the east, in the great trade fairs which were revived in 1922, and have again become a prominent feature of economic life.

AN IMPRESSION OF RUSSIA

(BY A SPECIAL CORRESPONDENT.)

THE more closely one follows what is going on in Russia to-day the more clearly one becomes aware of the exceptional character of the events that are there taking place, events which constitute an attempt to carry out an Industrial Revolution. The outward and visible signs of this revolution can be seen on every side. They permeate Russian life—political, economic and social. The magnitude and profundity of the change in which industry, agriculture and social and cultural relations are involved as a consequence of the execution of the Five Years' Plan are such that the October Revolution itself seems by comparison but a dramatic episode.

By 1927, the revolutionary impetus in the country seemed to have spent its force. Not only had the New Economic Policy, which Lenin inaugurated in 1921, restored in Russia to a certain extent the ideas of evolutionary Socialism, but the Communists were learning, in Lenin's words, to "trade well." The result of the reopening of the market and the tacit recognition of property was not only changing the economics of the country but the very psychology of the people. Private capital was making a miraculous recovery; in less than two years after the promulgation of the N.E.P. over 90 per cent. of the re-established retail trade was in the hands of private traders; while even the wholesale trade, the stronghold of the cherished "commanding heights" of the new State, was being continuously invaded by private capital. In 1923 private capital in that branch of trade was represented by a mere 10 per cent.; but in 1924 it controlled more than 30 per cent.

Vanguard skirmishes against the N.E.P. began as early as 1925, when some of the "Nepmen" were taxed out of existence and others were banished to Siberia on charges of "speculation." But these measures had a purely political purpose. In the economic sense, the new policy was strongly entrenched, and could not easily be dislodged. If this was not exactly the Thermidor of Bolshevism, as Trotsky warned the party, it was at any rate dangerously near to it. Yet the economic need for Lenin's policy was so vital that the managers of the party machine were resolved rather to quarrel with their own Left Wing than to fight the Kulaks (rich peasants), as Trotsky challenged them to do. In 1927 the "Nepmen" of the villages were the mainstay of the food supplies; and any attempt to fight them then would have been not only useless, but would have resulted in a crushing defeat of the Communists. Only in 1929, when the growth of the Socialist section of agriculture was enabling the State to become independent of the supplies

Foreign trade is a State monopoly, and the monopoly is jealously guarded. The Soviet State is represented abroad, in a trading capacity, by its various trade delegations, which are responsible to Narcomorg, the sole issuer of export and import licences. In addition, the right to carry on foreign trade has been granted to certain co-operative organisations, including Centrosoyus and Selosoyus, while a number of joint-stock companies, such as, for instance, Russavstorg and Sovpoltorg, have been created to attract foreign capital into trade with Russia. All these organisations are under the general supervision of the trade delegation in the country in which they carry on their operations. Since the launching of the Five Years' Plan, the lines on which the trade policy of Russia is organised have intensified. In order to obtain the capital which is essential to the fulfilment of the Plan, Russia is concentrating more and more on the export of agricultural produce, oil, timber and other raw materials, and on the import of machinery; and the outbreak of "dumping," at a time when the market is in the worst possible state to absorb forced sales, is attributed to the urgency of Russia's capital requirements.

of the Kulaks, could the Government begin to "liquidate" them.

The year 1929 marked a crisis of policy; for in that year not only was the class war renewed but the great scheme of industrialisation on Socialist lines had been launched. When, in the summer of 1929, I first came into contact with the new situation I was not quite certain whether I was moving in an atmosphere of revolution or of war. The atmosphere seemed to contain elements of both.

My impressions when I revisited Russia this summer were essentially the same, only intensified. The outlook was sterner and grimmer, the privations of the people more accentuated, the tasks seemed more formidable and onerous; but while a certain "war-weariness" was unmistakable, the enthusiasm in many quarters appeared unabated. Propaganda, however, had become more intense, more insistent, and the drive more bitter and more ruthless. The country still seemed midway between revolution and war. Yet the whole spirit of the time was different from that of either war or revolution. The significant feature of the situation was that an attempt was being made to play on mass-psychology for the accomplishment of a vast economic plan.

The present stage of the revolution is remarkable for its dramatic suddenness and gigantic sweep; but it may pass into history as an audacious attempt to change not only property rights and relations of classes, but even human nature itself. For, indeed, the industrial revolution which is now being carried out can never achieve even the most moderate success unless it can fundamentally change the spirit and the productive capacity of labour.

The Five Years' Plan.

There are many aspects from which the Five Years' Plan can be regarded. It may be conceived simply as a programme of work, that is to say, as an outline of what it is contemplated shall be done in the domain of mining, transport, building, electrical, chemical, and engineering industries, forestry and agriculture. Or it can be described as a financial instrument, a programme of taxation, loans, capital outlays and investments. Or again, stress can be laid on the endeavour to raise the educational level of the country by the training of hundreds of thousands of technicians, engineers and agronomists. It is equally possible to dwell upon the military aspect of this industrial preparedness. And there are other points of view from which the Plan might

be considered, such as the security of Russia's economic independence and the widening of the industrial basis of the Socialist State. But these and similar aspects of the Plan contain no element of revolutionary upheaval. Even the gigantic scale of the Plan hardly invests it with a revolutionary character.

What gives it this character is not the scale of the endeavour, nor the scope of its applications, nor the amount of energy it liberates. The essential distinction of the new order which this transformation is designed to bring about is that it involves not only a new technique, but a new spirit, not only up-to-date machines, but a change of attitude towards the machines. The result will be dependent on the human factor, on how far labour is willing and competent to employ these machines to the limit of their capacity. This is sufficiently well understood in Russia to-day. And this is why such a terrific propaganda for a more enthusiastic devotion to work, for working better and more intensively, is being conducted in the Press and in the factories. All the methods and devices that can be used to inculcate this spirit of labour and devotion—coaxing, cajoling, intimidating, entreating, threatening, appealing to the workers' national pride—are in turn being assiduously employed.

"Work More" Propaganda.

To enumerate all the forms assumed by this propaganda for the stimulation of higher productivity is no easy task. Moreover, like all propaganda in Russia, these appeals are couched in a military jargon which makes it difficult to disentangle the meaning from the tedious terminology. That a good deal of the reported enthusiasm and devotion is fictitious and grossly ineffective may be taken for granted. But judging from my own personal observation, and from evidence furnished by actual results, I should say that the movement, although in its initial stage, is very far-reaching. That the former dreaminess of Russian workers can be displaced by an active attitude to life, that more work and more intensive work is being done in the factories and in the fields, I am genuinely convinced. That the speeding-up methods employed are thoroughly healthy I am not prepared to admit. On the contrary, when I was last in Russia, I could not help being struck by the fever, excitement and impulsiveness of the pace, which hardly seemed steady or native.

The most typical and the most prevalent method of trying to speed up work is the so-called Socialist "emulation" campaign, in which groups of crack workers in one or more shops or factories enter into competition for a higher level of productivity and solemnly undertake to work more intensively, to turn out more than the prescribed quota and to produce it at less cost and with a minimum waste of raw material and fuel. These competitions are assuming the character of a football match in England, publicly played and publicly rewarded. The progress of the competitors is announced each day on boards in the shops, reported in the Press, and discussed in numerous "wall news-sheets." The victorious group or factory gains in most cases, in addition to public approval and praise, rewards and prizes. How seriously and with what attention these methods are being followed by the Government and the country can be gathered from reading a single number of any Russian newspaper.

A copy of the *Izvestia* of October 1st, which lies before me, contains a number of instances of the prizes awarded to the best factories, to crack groups and to crack workers. The factory AMO in Moscow, for instance, which produced 3 per cent. above the yearly quota, is to receive a prize of 750,000 roubles for the purpose of building houses for workers. The Laps factory in Moscow is awarded 500,000 roubles for the same degree of proficiency. The Karl Marx factory in Leningrad, which completed its annual programme in 11 months, is adjudged 750,000 roubles towards building a dining-room and a meeting-room. The Lenin mine at Krivoi Rog, which was one of the first in the district to complete the full annual programme, secures 300,000 roubles, to be devoted to the construction of workers' buildings. The

Ilych metallurgical works at Kharkov, which completed the full second year's programme on September 23rd and "gave the country production worth 58 million roubles," obtained a special recompense. Four of its crack workers and two of its crack engineers are awarded travelling scholarships abroad. Alongside with these rewards the papers publish lists of workers, shops and factories which are pilloried for bad work.

What makes life in present-day Russia so dramatic and intense is the consciousness that a great social experiment is being made. Can higher productivity be reached in the short period of a few years? Can it be reached under the stimulus of any other motive than that of mere wage-earning? Can it be reached by pride of achievement or by the sense of part ownership in social wealth? These are the questions raised by the Bolshevik experiment which are awaiting their answer. And according as the answer is favourable or unfavourable the experiment will have succeeded or have failed.

The problem of labour remains the most important and the most puzzling of all the phenomena that are under observation in the Russia of to-day. And this is why visitors returning from Russia are found bringing back such contradictory reports. Some are struck by "the unprecedented enthusiasm of labour" for the Plan. Others bear witness to the intensity of Government propaganda and to "the ruthlessness of the drive." Some speak of the Plan as the Royal Road to Socialism. Others bring back a vision of a Russia which is about to become a servile State. Some are convinced that labour in Russia is being pampered and spoiled by the privileges and flattery lavished on it. Others are lamenting that it is in chains, forced, coerced and dragooned. Some see labour enthroned as the new nobility; others regard it as degraded to a new serfdom.

Speculations of this kind are natural enough. But they are about as valuable as the outcry here during the war that British labour had been hopelessly spoiled, or that civil liberties would never be restored. The drive in Russia, ruthless and brutal as it is, bears more than a superficial likeness to the wartime methods employed in this country and elsewhere. While the distant objective may be the creation of new standards and values for labour, its immediate and most vital aim is "to win the war," in this case to ensure the success of the Five Years' Plan at any cost and at any sacrifice.

Miracles—at a Price.

It must be realised that industrialisation in Russia is not a normal process of growth but the outcome of an urgent need. In most industrially backward countries such a development usually proceeds on foreign loans, and is spread over a number of decades. The Five Years' Plan is quite different; for Russia has neither accumulated capital of her own, nor can she procure capital from abroad. In fact, the Plan can only be financed by the mobilisation of the national income, and can only be completed within the specified time by the most devoted sacrifices. There were in the circumstances only two ways to reconstruction, either to slow down the process, that is to say, to rebuild the State slowly out of a gradually accumulated surplus, or to speed it up by lavishing on it all the wealth of the State that could be made fluid. The latter alternative, expressed in economic terms, cannot but mean a great degree of privation.

The tragic misfortune of Russia, however, is that the very generation which has to make this new sacrifice has hardly had time to recover from the threefold sacrifice which it has already made in the Great War, in the Revolution and in the Civil War. It is these older men who have to shoulder that cost of industrialisation, which in normal circumstances would have been defrayed by later generations. Their attitude towards reconstruction and towards the privation entailed by reconstruction is radically different from that of the younger people, who have been brought up to regard the times of Revolution and of Civil War as the heroic period of Russian history. To this generation the gospel of labour and of sacrifice

makes, and is indeed probably calculated to make, a more or less natural appeal. The ambition, not only to rebuild Russia but to rebuild Russia on the most gigantic scale has captured the imagination of many of the young.

The task which the present rulers of Russia have set themselves cannot but be regarded as approaching perilously near the fantastic, as this term is generally understood. Dozens of projects are in course of execution in Russia, all of which would be considered ambitious even in America. In Russia the contrast between to-day and to-morrow gives them the appearance of projected miracles. The eagerness to construct the biggest water dam in the world, the largest paper works, the most extensive tractor factory or cotton mill, to erect them in the shortest possible time, and to equip them with the most up-to-date machinery is not simply the outcome of ordinary economic development; nor is it merely part and parcel of a policy which deliberately aims at impressing the popular imagination. It is the expression of the delight which Young Russia feels at the sudden discovery of the country's vast and hitherto unexploited material resources. The younger generation of Russians is deeply thrilled, and believes that the Five Years' Plan is the gateway to a new epoch.

Problems of Population.

But among the problems with which Russia is faced, one of the biggest is that of the immense increase of her population. On April 1, 1930, the total population of the country was estimated at 158 millions, which is 20 millions more than the numbers of those who lived on the territory of the present Union in 1914. By 1924 the population had nearly regained the pre-War level; that is to say, the natural growth of the population after the Revolution had been so great that it had already repaired the heavy vital losses entailed by the great War, by the Civil War and by epidemics and emigration. In the next three years, from 1924 to 1927, the net gain was 9½ millions; while in the last three years it has been 11 millions. The average annual increase for the last six years is to be reckoned therefore at about 3½ millions.

These are arresting figures. How striking they are can be gathered from a comparison of Russian expansion with that of the rest of Europe. The net annual increase of population in Europe, excluding the U.S.S.R., is 2¼ millions on a population of 370 millions; while in Russia it is 3½ millions on a population of 150 millions. The significant fact, moreover, is that this accelerated net increase is due not to an increase in the birth rate, but to a decrease in the death rate. The birth rate in the three years 1911-13 was 46.8 per thousand; in the three years 1926-28 it was only 40.0. The respective figures for the death rate are 30.5, pre-War, and 17.4 in 1926-28. Thus, whereas the natural growth of the population in 1913 was 16.3 per thousand, in 1928 it was 22.6 per thousand.

THE INDUSTRIAL PLAN.

WHAT distinguishes the present industrial situation of Russia from that of other countries is its virtual freedom from "selling" problems. Whereas under Capitalism, an economic crisis is usually a crisis of "over-production," the permanent crisis in the Soviet Union is a crisis of "under-production." So far as the internal market is concerned, lack of demand is a problem which the Soviet statesman never has to consider. One hundred and fifty million people are, as it were, standing in a queue and waiting to be served. Indeed, the strange paradox of the situation in Russia is that the producer's difficulty consists not in finding buyers, but in having to avoid them. And this freedom from the anxieties connected with selling is not merely a result of shortage. Beyond doubt, real shortage is intensifying a hundredfold the demand; but the situation has a deeper significance, due, if I am not mistaken, to three main causes—the vastness of the ever-growing internal market;

This large increase of population raises problems of great consequence. If one considers the enormous area of the country, its great natural resources and the small density of population (7.6 per sq. kilometre), one may be inclined to regard this expansion of population with complacency. But, whether in the future it proves a source of strength or of weakness, to-day these soaring population figures might well arouse a certain degree of apprehension. Yet, to my surprise, I failed to find any evidence of such apprehension, or indeed any admission that there is a population problem. My enquiries in official quarters only elicited a suggestion that I should consult the employment statistics. "Surplus population," I was abruptly reminded, is a conception founded on nothing but Liberal and Social Democratic prejudices. Soviet Russia does not recognise such antiquated theories. "Over-population" merely means that the productive resources of a country have not been adequately developed; and they cannot be so developed under the handicap of Capitalism. But in the U.S.S.R., where there are no limits to the development of the country's productive forces, such theories can have no validity.

This sweeping and dangerous assurance on the part of the Bolsheviks is partly to be explained by the fact that at the moment the demand for industrial labour is growing even more quickly than the population. In the last 2½ years the number of urban workers has increased by 22.8 per cent. It was 8,866,000 in 1927, and by the early part of the present year it had grown to 10,887,000. Not only so, but the drift of the population from the villages to the towns has latterly to a certain extent been reversed. This is remarkable, as it might have been expected that mechanisation and rationalisation of agriculture would have displaced human labour in the villages and that these displaced peasants would have flocked to the towns. But this invasion has so far not taken place; and this probably because collectivisation is a part of the mechanisation scheme. Machines undoubtedly are displacing labourers in the villages; but though the labourers have less to do, they are under no compulsion to flock to the towns. On the contrary, there is a marked tendency on the part of labourers, who used to do seasonal work in the building industry, to leave this town employment and to return to the collective farms.

Whether the decrease of unemployment in Soviet Russia during the last year or so is due partly to the social and economic changes in the villages, or is to be explained solely in the light of the immense expansion of enterprise involved in the Five Years' Plan, it is too early to say. It is equally impossible yet to form an opinion whether this drift back to the land is merely temporary, or whether collectivisation and rationalisation of agriculture will ultimately avert the threat of agrarian over-population. At this stage one is left with the sense that though the problem of population may not be consciously on the mind of the rulers of Russia, it is nevertheless the background of their present vast experiment.

the organisation of the consumers; and the control by the Government of both producers and consumers and of their finances.

The growth of the internal market is essentially, and logically, a post-revolutionary phenomenon. In Tsarist Russia the 120 million peasants were never regarded as constituting a market; for Russian capitalism, adolescent as it was, was eager only to conquer foreign markets. The development of the internal market was impossible; for no increase of the purchasing power of the peasant could be brought about without attempting to solve the land question, i.e., without provoking a conflict with the landlords. The State, the landlords and the bourgeoisie, therefore, were all absorbed in dreams of conquest, of expansion and of outlets to warm waters; for they believed that once they were able to secure sufficient foreign markets they need no longer concern themselves with the plight of the moujiks.

During the Great War and the Revolution, however, the peasants succeeded in acquiring not only new tastes, but a consciousness of their own power and rights. Their key position as the chief source of supplies of food and raw materials made them the chief market for manufactures. To realise the potentialities of this market, one should visit a village co-operative store during threshing time, that is, immediately before grain deliveries to the Government agents have started. The anxiety of officials to rush manufactured goods to the villages in time, the newspaper outcry against the inefficiency of transport arrangements and against the slackness of the co-operative societies in coping with this most urgent task, and the sight of the peasants examining the store and taking a mental measure of their chances of obtaining an adequate supply—all indicate in the most lively fashion the importance of the Russian village as a market.

At present, it is impossible to satisfy this market; for there are not nearly enough manufactured goods to go round. Nor will it be possible to satisfy it for many years. For, even if production increases manifold, the standard of living and the new needs of the peasants will still increase at a greater rate. But the opening of this vast market means not only the eventual supply of the needs of the peasants as consumers. The peasants as producers constitute a still more important market. Indeed, this is likely to be the greatest market of all for the metal, the engineering, the wood-working, and the chemical industries. Among goods badly needed by the peasants one need only mention tractors, lorries, motor cars, ploughing, reaping and threshing machines, utensils required for dairywork and machines essential to various village industries, not to speak of petroleum and fertilisers. Moreover, it is claimed that the demand will be free from the fluctuations of the ordinary capitalist market.

Though the organisation of the peasants as producers is still in its initial stage, the number of bodies acting as buyers has already been reduced to half-a-dozen. These are the Grain Trust, the Tractor Centre, the Kolhos-Centre, the Cotton Grower, and two or three other such bodies, which decide how many and which machines should be ordered to supply the needs of agriculture. Another important circumstance which gives the Russian internal market a peculiar character is the fact that the producer of goods is entirely free from anxiety about the financial soundness of the buyer; for the Government controls the finances of buyer and producer alike.

And the peasants' market is not the only one. That furnished by the urban population must not be overlooked. This market is smaller, but big in possibilities of development. Here, again, not only is there a large number of buyers eager for goods, but the producer is the State itself, which controls everything, from raw materials and employment to prices, currency, wages, rates of profit and saving. Moreover, State control of the market is made absolute by the monopoly of foreign trade, which enables the producer to disregard entirely the fluctuations of the world market.

Maximum Expansion.

As far, then, as demand is concerned there is no restriction on the development of production. The only limits imposed are those due to the lack of capital equipment, of raw materials and of technical skill. Within these limits the Government policy is that of maximum expansion of production, or, as the Bolsheviks put it, to the "utmost tempo of industrialisation." The Communist use of the word "tempo" needs explaining. There is no other cant word spoken in Russia to-day so often and with so strong an emphasis. The phrase is generally heard with the epithet "storm" or "Bolshevik" attached, and has quite a complex of meanings. "Tempo" is indeed not merely expressive of a belief that Socialism permits of a rate of economic development which is impossible under capitalism; it also proclaims the conviction that Soviet industry will ultimately outstrip any other in the world. But the main doctrine or implication of "Bolshevik tempo" is a scorn-

ful denial of "pseudo-scientific" theories of gradualness in economic development and an emphatic assertion of the all-important necessity for the concentration of the workers' will-power. And the culminating expression of Bolshevik "tempo" is the Five Years' Plan. To regard the Plan as a rigid programme is to misjudge it for registers, and is meant to register, a tendency of maximum expansion. It sets forth only the goal. The actual scheme is settled by the annual tables, called the "control figures," which are proposed by the State Planning Commission and then adopted by the Government. But these control figures should be taken as a minimum only; and the tendency, as has been said, is to exceed them, if possible, and by as much as possible.

In the most general form the goal which the Plan aims at realising can be seen in the following table, which indicates the expected increases during the five years of the total population, of the number of wage earners, of the rate of production and of the national income:—

INDEX OF DEVELOPMENT OF NATIONAL ECONOMY.

(Percentages of Increases for the Five Years, 1928-33.)

Total population	11.8	Light industry	144
Wage earners	18.2	Agricultural production	151
All industry	181	National income	101.5
Heavy industry	255		

It will be noted that the Government contemplate, and ordain, a doubling of income in five years' time, and a practical trebling of industrial production—a really dazzling "tempo"! And even more dazzling if it be remembered that by 1927 Russian economic development had already nearly regained the pre-war level. But, according to the Bolsheviks, salvation can come only from activity and not from a slavish reliance on the natural development of economic forces. This latter attitude the Bolsheviks describe and stigmatise in their contemptuous use of the word *samotek*, which means "running automatically." A present-day Russian worker, who, instead of intervening actively in the true Socialist fashion, relies on *samotek* or on the operation of natural forces, will hardly escape the condemnation of being "void of lively faith"; for he violates the fundamental doctrine of Bolshevism.

Speeding up the Tempo.

It is no wonder, then, that the Five Years' Plan, which, when first promulgated, seemed a purely fantastic scheme, should have been subsequently revised—not in the sense of retardation, but in that of acceleration. The "tempo" has already been changed several times; and during the last few months a propaganda has been carried on all over the country for a complete revision of the Plan with the object of completing it in four instead of five years. The slogan "Piatiletka in Four Years" is posted up on the walls of every town, is advertised on the mural news-sheets, flashes out at night from hundreds of electric signs, and forms a pattern on the flower-beds in every park and public garden. The new industrialisation loan which is being floated is itself called "The Piatiletka-in-Four-Years Loan."

This determination to accelerate the pace may be taken, and is, of course, meant to be taken, as an indication that the Plan is certain to be completed well within the scheduled time. In some respects the progress made in industrialisation is, it may be admitted, considerable enough to warrant the expectation that speeding up is possible. But the vehement propaganda for shortening the period within which the Plan must be completed is probably inspired by political and psychological considerations. The tension and privation entailed by the execution of the Plan are tolerated only because a definite and proximate period is to be put to them. If, then, this period can be reduced to four years it will signify that the first and worst half of the workers' travail is already over. The remaining half will then seem shorter and easier. "The Piatiletka in four years" has indeed a double aim, to accelerate the "tempo" of production and to make the tension created by this "tempo" less intolerable by shortening its duration.

The Burden of the Cost.

The first estimate of expenditure under the Five Years' Plan was fixed at 76,000 million roubles. This was the programme submitted to the Government in 1928. But before it was finally accepted by the Central Executive Committee of the Union, it was revised; and the Plan finally adopted allowed for an expenditure of 86,000 millions. This total has not since been revised; but in view of the fact that the annual appropriations have been considerably augmented, it is safe to predict that when the Plan is ultimately completed it will be found to have involved an expenditure of close on 100,000 millions.

The full significance of expenditure on such a scale cannot be measured simply by the amount of money spent. It is essential to realise the proportion which this expenditure bears to the national income of the country. From this point of view there can be no doubt about the very severe burden which this financing of reconstruction is imposing on the country. Indeed, it is said to represent no less than the setting aside of half of the national income for five years. Whether this figure is correct or not, it undoubtedly means that an exceptionally large proportion of the national income is to be withdrawn from consumption and diverted to purposes of production. Even during the War years it is doubtful whether the belligerents actually withdrew such a proportion of their national incomes.

The authors of the Plan are obviously aware of the social and economic implications of their scheme. Nor do they attempt to deny that the tension and sacrifice involved in carrying it through are similar to those called for in the financing of a big war. But though they claim, with justice, that there is an essential difference in aim between a war expenditure and one for economic reconstruction, the fact remains that the expenditure on the Five Years' Plan represents an unprecedented burden on peace-time finance. On the other hand, it appears to be the case that the amount of active resistance to the Plan is small and is directed not against its general purpose, but against its growing incidence. For the finances of the Plan are indeed portentous; the amount to be spent is increasing at a greater pace than the national income itself; and a similar disproportion is seen if the expenditure is compared with any other index of national economy—the growth of production, the increase of goods in circulation, or the expansion of transport.

The Budget.

It should be appreciated, of course, that the instrument still known as the State Budget is something radically different from a normal budget. The new and complex system of Russian national finance, commonly known as the State Finance Plan, has not yet had its scope and method clearly defined. But its contours are sharp enough to give us some idea of its wide scope. Briefly described, the Finance Plan embraces all revenues which are usually included in a budget, together with those accruing from socialised industries and trade, from banking and credit, as well as from a number of other sources such as local government budgets, social insurance funds, and internal loans. Obviously the full scope of such a comprehensive system of centralised State finance can only be reached in a completely socialised State. In the Soviet Union, where the majority of the peasants still adhere to the system of private property and where not only trade but even industry is to some extent privately owned and run, such a unified instrument of finance cannot fully operate. So in this period of transition the Soviet State is formally adhering to the system of a State Budget. But the budget in operation in Russia to-day (the closed accounts for 1928-29 and the estimates for 1929-30 are reproduced in the Appendix) deviates considerably, alike in scope and method, from that of any other State.

If the budget of 1929-30 be compared with that of 1928-29 it will be seen that the income derived from taxa-

tion is growing at a smaller rate than that which comes from State domains and the socialised section of industry. In 1928-29 tax-revenue amounted to 48.7 per cent. of the total budget; while this year it is only 47.3 per cent. Loans last year constituted 8.8 per cent. of the budget; this year they provided 10.4 per cent. The total revenue increased in this one year from 8.2 to 11.6 thousand million roubles.

In this connection it is interesting to recall a controversy which was waged for some time last year in the Bolshevik Press. The Commissariat of Finance was urged to use the simple device of increasing prices for the products of State industries as a sure way of increasing State revenue. Since any increase of prices would have had to be made good by a corresponding increase of monetary wages, which would have led to inflation and so defeated its own purpose, the Government refused to employ the manoeuvre of high prices. On the contrary, the Five Years' Plan is based on the paramount necessity for bringing down prices. But at the particular time referred to the temptation to increase prices was so irresistible that a very peculiar compromise was arrived at, namely, a double scale of prices—one the fixed Government price for the stipulated "ration"; the other, often a double price, for any larger "free" quantity of the same goods. This manoeuvre, which the Bolsheviks claimed was not violating the interests of the workers, together with an increased excise duty on "goods which though of mass consumption are not prime necessities," such as beer, vodka, tobacco, scent and powder, gave the State an additional revenue of 450 million roubles. This device of "differential prices" or "class" prices has, however, been abandoned, probably because of the deficiency of supplies.

Taxation and Expenditure.

The main incidence of taxation can be seen from the budget figures for the years 1928-29 and 1929-30 in the Appendix. General taxation, it will be seen, has risen this year by 1,503 million roubles, an increase of 37.6 per cent., which is distributed fairly equally between direct and indirect taxation. The biggest single items are the tax on the turnover of industry, Excise duties, State industry, State loans and transport. The decrease in the revenue from the agricultural tax is particularly interesting in view of the concessions and rebates made by the Government to the peasants with a view to stimulating agricultural production and interest in collective farming.

Colossal as the expenditure of nearly 12,000 million roubles appears, it represents only a part of the annual expenditure on reconstruction. The full amount of expenditure is expressed by the Finance Plan which, as has been explained, embraces the local government budgets and the revenues accruing from social insurance, credit systems and all expenditure of industry and such bodies as the Co-operative and Trade Union Movement, in addition to the State Budget. The total amount of resources which are absorbed and redistributed through the Finance Plan is estimated at 19,000 million roubles for 1929-30. Of this sum, 12,500 millions are devoted to reconstruction of industry and agriculture, and 4,000 millions to social and cultural needs (Education and Health Services); 2,000 millions are earmarked for Administration and Defence, and 500 millions for all other needs. In other words 63 per cent. of the national revenue is absorbed by Industrialisation, 21 per cent. is used for the needs of what is termed the "Cultural Revolution," 10 per cent. is spent on Administration and Defence, and 6 per cent. on the remaining needs.

This brief analysis of revenue and expenditure may serve to show the scale on which reconstruction is being financed. Accumulation and redistribution of wealth on such a scale is quite unprecedented. Is this feasible? The authors of the Plan seem to have no doubts on this point, though others may not share their confidence.

Progress of the Plan.

Is the plan succeeding? And is it likely ultimately to succeed? This is a question easier to ask than to answer. All that can now be done is to record the physically measurable progress of the Plan during its first two years of operation. The first year, which began on October 1, 1928, and ended on September 30, 1929, was considered by the Government to be a signal success. The general increase in production was declared to be 23.4 per cent., or 2 per cent. above that provided in the Plan. According to the official statements, the fixed capital of industry increased by 18.7 per cent. Ninety-one new factories started production, and their output was valued at 168 million roubles. Many industries, such as those connected with oil, agricultural machinery and implements, electrical goods, rubber and non-ferrous metals turned out a larger output than that fixed in the Plan. The building and chemical trades, sugar and fertilisers were behind in their output; but the remaining industries kept more or less ahead.

Against these favourable indices, however, must be set a deterioration in the quality of the output; and this is equally true of consumers' and of producers' goods. That is to say, not only were textiles and leather and rubber goods poor in quality but rails and agricultural machines were also faulty. This deterioration was the result partly of the inferior quality of the raw materials worked up, but mainly of the excessive dilution of industry by unskilled and semi-skilled workers, and costs of production also remained excessively high.

Recent Difficulties.

The second year of the Plan's operation was generally expected to be a most onerous year. The task allotted to labour in 1930 in the original scheme was already exacting enough. But stimulated by the comparative success of the first year's operations, the Government had revised the programme and raised the increase of output for the second year from 21 to 31 per cent. The full extent of the privation consequently involved only became evident in the winter and early spring of 1930, when the lack of meat and fats became acute, and strict rationing of food had to be enforced. But hardships were not the only difficulties. Early in the spring a radical change of policy in connection with the peasants had to be hastily effected. The renewal of the class war which had contributed in no small degree to the general tension had to be called off. The unrest in the villages had affected not only the food supplies—I refer to the peasants' wholesale slaughter of cattle—but also the supplies of agricultural raw materials such as cotton and flax. The year was also remarkable for radical innovations in labour conditions. The introduction of the five days' uninterrupted week, with its two or three daily shifts, was on the whole much less favourable to the increase of production than had been hoped. The indiscriminate change of shifts would itself obviously have had a lowering effect on output; for the difficulty of adjusting the machines to the idiosyncrasies and *tempi* of each batch of workers was bound to put a very severe strain upon them. This strain proved the more damaging because the sudden increase of labour necessitated by the introduction of the second shift could only be met by the inclusion of more semi-skilled and unskilled workers.

Another and more special difficulty that occurred this year was the so-called "fluidity" of labour. Thousands of men would move from one job, and from one region, to another in search of better food conditions, or of a higher rate of pay. This fluidity of labour may, of course, only be a particular phase of that immemorial *wanderlust* which has always been a characteristic of the Russian; but it has now become so widespread that in the summer months the country gives visitors the impression of a huge camp. Touring and seeing the country have become unprecedentedly popular; but how far the fluidity of labour is a result of the general craze for movement it is hardly possible to say. The fact that it is most prevalent in the coal-mining districts, which have an evil reputation in the matter of housing, food supplies and labour conditions, must not be overlooked.

Retarded Productivity.

In any event, the increase of the general rate of production in 1930 seems to have been no larger than that of 1929. When account is taken of the enormous investments made this year in industry, of the increase in the number of workers employed, and of the new factories opened, it becomes evident that there has been a certain lowering of the *tempo*. In the case of some of the key industries, such as building, transport and coal-mining, the retardation of the rate of production has indeed been considerable; and on September 3rd the Central Committee of the Communist Party circulated an appeal, published in all the newspapers and addressed to its members, to Trade Unionists and to young Communists, calling for a fresh and increased effort. It put all the blame, for the shortcomings on the bureaucratic minds and methods of the managerial element, who were accused of lacking energy and initiative and—greatest crime of all—of being unable to realise the tremendous creative activity of the masses. The reasons given by the factory managers for their inability to realise the full rate of the prescribed increase of production can be summarised as shortage of raw materials, of capital equipment and of fuel. The validity of these reasons was and is disputed by the Central Committee of the Communist Party, which points out that in those factories which have exploited to the full extent the initiative and devotion of the workers the full programme of work has been executed.

The Central Committee also declared that the Socialist system of labour, which had demonstrated its efficiency so convincingly in the course of the execution of the Plan, was quite powerful enough to overcome the intrinsic difficulties of the situation. They claimed that if the activity of the masses had been given more scope, it would have retrieved the position. All that was wanted was to invite the masses not only to execute schemes prepared from above, but to participate in the adaptation of the Plan to the requirements of their own trades and shops.

The New Drive.

This "planning from below" is now the order of the day in Russia, and with their customary impetuosity and frenzy the Bolsheviks are throwing all their energy into the development of this particular kind of "Socialist emulation." Workers, especially young workers, have discovered a great enthusiasm in participating in the framing of plans, hitherto the preserve of the managers. They are investigating the internal resources of the factories and they are ready to *promise* to fulfil a programme of output greatly in excess even of that fixed by the Planning Commissioners. Workers in a factory who have made this promise challenge their comrades in another to compete with them in executing it. This new enthusiasm on the part of the younger workers is now being assiduously employed to arrest the "fluidity" of labour. It is now considered a patriotic duty to promise, to remain at the same factory for the duration of the Plan.

The ominous fact remains, however, that the second year's operation of the Plan has been less successful than that of the first. In no respect has the anticipated progress during the second year been realised. Yet, comparing the progress actually made in 1929 and in 1930 an observer must be struck by the close proximity of the actual achievements in these two years. In the first of these years he would notice that the output was larger than that provided for in the programme, whereas in the second year it was smaller. But he would also observe that the rate of progress in the two years was practically identical—a 24 per cent. increase on that of the previous year. If this annual increase constitutes the limit of progress attainable, then it is clear that the chances of completing the Five Years' Plan in four years are doomed.

Whether a 24 per cent. increase represents something of a norm, or whether the pace will slacken or increase, only time will show. The year 1931 is bound to be a crucial year. But the next three months, which the Bolsheviks have made an "interregnum" period, may make an important contribution to our knowledge of the productive

forces and possibilities of the Union. These three months are called "the shock period," and the word has gone forth that "Moscow expects every man to do his duty." But, when all is said, an annual increase of even 24 per cent. is so enormous that grave doubts are bound to linger whether it can be maintained.

The Key Industries.

The importance of developments in the basic industries under the Five-Years' Plan is so great as to merit brief examination in detail.

Mining and Metallurgy.

No metallurgical magnate in the capitalist world is so much preoccupied by and enamoured of iron and steel as these Marxian Socialists. To them "black metal" is the embodiment of Socialism in the making. That is why no effort is too exacting, no sacrifice too big, when iron and steel are at stake. To regain and outstrip the pre-war production of iron and steel has been the greatest ambition of the Bolsheviks.

The pre-war output of pig iron was about four million tons. The Revolution and the Civil War reduced this output practically to zero. In 1921 it was only 7 per cent. of the pre-war production. Progress in increasing production has been extremely slow; and when the authors of the Piatiletka fixed the rate of production of pig iron for the period of the Plan at four, five, six, eight and ten million tons for the series of years 1929-33, the programme seemed impossible of accomplishment. This summer, however, the Central Committee of the Communist Party declared that the output of 10 million tons stipulated for 1933 would be quite inadequate for the growing needs of agriculture and industry, which could only be satisfied by a production of at least 17 million tons. How far this new programme will prove merely chimerical will depend on the output of metallurgical works which have still to be erected. The new foundries which are under construction, the Magneto-Gorsky, the Kuznetsky and the Zaporozhsky, are to have an output of 4½ million tons. These giant foundries, supported by the smaller foundries which are now being enlarged or erected, may possibly give an output as large as that contemplated in the original draft of the Plan, that is to say, 10 million tons. The production of an additional 7 million tons appears at present to be megalomania.

If one passes from those dreams of the future to a record of actual production in the last two years, one has to record real and solid progress. Yet this progress can in no way be said to justify the fantastic estimates of expansion which are seemingly based upon it. Here are the figures:—

PRODUCTION OF THE HEAVY INDUSTRIES.

	1928-29. Thousand tons.	1929-30.* Thousand tons.	Percentage of Increase.
Pig iron	4,018	4,988	24
Rolled iron	3,878	4,439	14.5
Steel.....	4,720	5,551	17.6

* Provisional.

The following are the percentages of increase of the 1929-30 production as compared with the pre-war level: Iron, 24.7; rolled iron, 26.5; steel, 30.7.

The output of the mines has also been very satisfactory, as will be seen from the following figures:—

	1928-29. Thousand tons.	1929-30.* Thousand tons.	Percentage of Increase.
Iron ore.....	7,208	10,148	40
Manganese	1,262	1,561	23.8
Copper	777	900	15.6

* Provisional.

Although these figures represent considerable increases, they are a good deal below the increases estimated for the current year.

Coal.

The pre-war output of coal was 23 million tons. In 1927-28, the output is given as about 36 million tons, and

the Plan provided for the trebling of the pre-war output in five years. The production in 1928-29 equalled 40 million tons, and the programme for the current year has been increased from 46 million tons, as provided originally in the Plan, to 52 million tons, while the output for the third year of the Plan, which was fixed originally at 52 million tons, has now been altered to 75. So, in the revised estimate, the Five Years' programme is to be fulfilled in three years.

The actual output for 1929-30, however, was short of the revised figure, but was exactly equal to that provided in the Plan for the current year, namely 46 million tons. The fulfilment of the plan of coal production in three years is, therefore, not likely to materialise, unless the frenzied efforts which are being made to improve the situation give speedy results. The Donetz Basin has now been declared the danger spot of the front, and great efforts are being made to reorganise this field as speedily as possible. In the first place, an effort is being made to mechanise output; secondly, labour conditions are being improved and intensive propaganda is being set in motion for the application of more stringent methods in this region.

Building.

The building programme outlined in the Plan is probably the most ambitious of all its schemes. The capital investment, including that for equipment of factories and for workers' houses, amounts to 18.6 thousand million roubles, based on prices prevailing in 1928. The actual investment, it is hoped, will be less. To grasp the meaning of these figures it is enough to say that the fixed capital of the entire industrial undertakings of the country amounts only to 10 thousand million roubles. The biggest part (78 per cent.) of this fresh investment is assigned to "heavy" industries such as power stations, iron and steel foundries, tractors, motor-cars, tools, chemical industries, agricultural machines and the mining industry; and only 22 per cent. is allotted to the building and equipment of factories devoted to "light" industries. This development was planned originally to take place within the period of five years; but, in accordance with the general tendency for increasing tempo it has now been decided to complete it in three or three-and-a-half years. The expenditure for 1930 therefore, which was to have been 2,331 millions, has now been raised to 3,960 millions.

The accelerated tempo, however, proved too exhausting, and the revised programme has not been maintained this year, the causes being lack of skilled labour, and the insufficiency of building materials. This insufficiency is another instance of the effect of the tension. The production of all sorts of building materials, cement, timber, brick, glass, iron girders, has increased over 30 per cent.; and yet there has been such a virtual scarcity that a competition for securing such materials has been going on between various building syndicates to the general dismay of the Bolshevik leaders and Press. Many reasons have been put forward for this retardation. Strangely enough one of them is that only 51 per cent. of all the buildings under construction have got finally approved working plans and drawings, while the rest have to be erected from sketch drawings.

Petroleum.

Oil, electrification and agricultural engineering are the three industries which have not only fulfilled the programme of output of the original Plan, but have more than fulfilled the revised figures which have been imposed upon industry under the stimulus of success during the first year of operation of the Plan. The increase of output of oil during 1928-29 amounted to 14.4 per cent. During the second year of the Plan this rate rose to 26 per cent. The actual output in 1928-29 was 13,547,000 tons; in 1929-30, 17,066,000 tons. The original figure of the Plan for 1929-30 was 14,000,000 tons; later it was revised to 16,000,000. The actual output, therefore, was 1,000,000 in excess of this revised figure. The progress of drilling operations has been as satisfactory as that of output. In 1928-29 drilling extended to 438,000 metres; in 1929-30 it reached 551,000 metres.

Electrification.

Electric power is the pet industry under the Plan. The Bolsheviks remain true to Lenin's formula that "electrification plus Soviets equals Socialism." The progress made in the last ten years is bigger than that in any other industry, yet the disproportion between the need for power, and the actual output is hardly less to-day than it was ten years ago, a fact which throws an interesting sidelight on the rate of industrial development of the country. This progress, as well as the eagerness to develop power as quickly as possible is seen from the following investments made during the last two years:—

In 1928-29 investments amounted to 320 million roubles; for the current year the figure is 640 million roubles, and the estimate for next year is 1,180 million roubles. These figures are not at all surprising in view of the tremendous construction which is going on, including the Dnieprostroy, which, when finished in 1932, will be the biggest water power station in Europe.

Figures of the power generated for the two years under the Plan are as follows:—1928-29, 2,319,000 kilowatts; 1929-30, 3,320,000. It is stated that the progress in electrification would have been much more marked if new construction did not have to depend on foreign imports of turbines and generators. In order to increase the rate of progress of electrification of the country, attention will therefore have to be turned to engineering in general, and electrical engineering in particular.

Electrical Engineering.

This, like electrification, is practically a new industry in Russia. Even to-day, when it is still in its initial stages, comparison with pre-war figures has no validity, and the annual increase for the last few years dwarfs previous production. For instance, production in 1928-29 had a value of 272 million roubles, while in the current year it has risen to 503 million, thus nearly doubling itself in a year. The estimated increase for next year is more than a doubling of this year. But the satisfaction which engineering and electrical engineering are giving to the Soviet Government is based not only on the output but also on the fact that the Russian factories are now able to turn out machines which only a few years ago would have been beyond the range of possibility, i.e., turbines and electrical generators.

The production of machines for agriculture increased in the past year by 54 per cent., and was nearly five times as big as the pre-war output of such machines. But nothing shows more clearly the ambitious scale of the Plan and of its revision than that this increase of output of over 50 per cent. in one year is below the task allotted to this branch of industry for the current year.

Light Industries.

If we pass from the "heavy" industries, producing producers' goods, to the "light" industries, producing consumers' goods, we find that the rate of progress in output is greatly diminished. That light industry is progressing more slowly than heavy is the result of a deliberate policy, though the decrease of production in the light industries during the present year is due not only to design but also to circumstance, mainly to a lack of raw materials. But whatever the reason, it is remarkable that in many of these industries the output is actually lower than that of last year. Thus, the output of cotton goods was this year 16.7 per cent. below that of 1928-29, when it totalled 2,826,000,000 metres. In 1929-30 it was only 2,353,000,000 metres. The production of woollen and linen goods has been slightly better, but the increases were comparatively small. The output of woollen goods in 1928-29 was 115,000,000 metres, in 1929-30, 124,000,000 metres, an increase of 8 per cent. The output of linen in 1928-29 was 182,000,000 metres, in 1929-30, 205,000,000 metres, an increase of 12 per cent. The latter industry made considerable progress, and in some branches there was a rise in production of 27 per cent. The manufacture of shoes and boots increased very heavily; in 1928 production amounted to 38 million pairs, in 1929 to 62 million pairs, a rise of more than 60 per cent.; but the quality of the goods deteriorated badly.

RUSSIA TODAY AND YESTERDAY

By Dr. E. J. DILLON

With 16 illustrations. 16s. net.

FORTNIGHTLY REVIEW: "One of the most remarkable studies of a country that I have ever read. All Dr. Dillon's affinities in Russia, during a constant intercourse of thirty years from 1877 to 1913, were with those Russians who have been displaced or exterminated; he went back in 1928 to a land where horror abounded, and he denies nothing of the worst that has been alleged. Yet one feels throughout his vivid pages the response to a new vitality in Russia's frame."—Stephen Gwynn.

A HISTORY OF RUSSIA

By N. BRIAN CHANINOV

Translated by C. J. HOGARTH. Illustrated. 8s. 6d. net.

This book gives the general reader every conceivable fact in the history of Russia he could want to know, from the earliest time (ninth century) of which much record exists, to the assassination of the Imperial Family in July, 1918, together with a plentiful store of descriptions of institutions, customs and so on. It is a "popular" history, recognizing the history of a nation as made up not solely of the doings of her rulers, officials, diplomats, and fighting forces, but also of the reactions of the mass of the people itself, without which the rulers and the rest could not even exist.

The Problem of Labour.

THE rise and fall of the figures of unemployment in Russia are a particularly interesting study. Up to 1929 the number of the unemployed steadily increased. It then began to fall; and at present, so it is declared, not only are there no registered unemployed, but there is a real scarcity of labour. Admittedly, the number of registered unemployed is in few countries a full and complete record of the actual state of unemployment, since some groups of the unemployed may be by law or custom refused registration. The Soviet Union is certainly no exception to this rule; on the contrary, records of unemployment among the dispossessed classes, peasants and some grades of unskilled labour are probably very imperfect. But, even so, the oscillation of the figures for registered unemployment still remains remarkable. Here are the figures:—

On April 1, 1927, the number of registered unemployed was 1,477,000. A year later it grew to 1,576,400. On April 1, 1929, it reached the maximum, standing at 1,741,100. On April 1, 1930, it had been reduced to 1,079,100. Since then it has rapidly fallen. In June it was 936,000; in July it fell to 725,000. The latest report is that registration has been totally abandoned, that unemployment benefits have ceased to be paid, and that all registered unemployed (about 300,000) have been offered the opportunity of enrolling themselves for industrial training.

The peculiarity of unemployment in Russia was that the skilled unemployed constituted only 10 or 12 per cent. of the total number. The majority of the registered unemployed were peasants settling in the towns in search of employment. The other big group consisted of women and unskilled boys and girls, who had never been employed before. In July, 1930, when 725,000 were still unemployed, 231,000 were peasants, and 415,000 were women, boys and girls. This explains the paradox that the Labour Exchanges had always a greater demand for skilled labour than they could supply. For every 100 unemployed there were vacancies in 1928 for 125, in 1929 for 142, and the first half of 1930 for 181, though it must be realised that many of these vacancies were to be filled in industrial undertakings which were being organised in the provinces. And the disparity between vacancies and the unemployment is to be explained also by the immobility of the unemployed, who often showed a reluctance to move too far from home, or to places in which labour conditions had an unsatisfactory reputation such, for instance, as the coal mines in the Donetz basin.

A year or two ago there was a considerable increase of unemployment among non-manual workers which was due to the cutting down of clerical staffs in Government offices all over the country. But the subsequent enormous demand for all kinds of such workers caused by the Five Years' Plan has abolished this unemployment. The Kolhosi (collective farms) alone employ at present no less than 200,000 book-keepers and accountants.

The problem of securing skilled labour, engineers and technicians is still very acute and is likely to be acute for some years. The number of trained men, manual workers

and technicians needed by industry and agriculture, and likely to be needed, cannot immediately be supplied. Take, for instance, the need for engineers and technicians. There are at present some 300,000 engineers in the country. The authors of the Piatiletka demand 1,200,000 such men for the execution of the Plan. The question then arises whether it is possible to train 900,000 engineers in so short a time. Obviously, the only way is to sacrifice efficiency to speed; and this is actually being done. The curriculum in all the technical middle and higher schools has been cut down from four or three years to a two years' course. But even this drastic cut in the period of training will only partly solve the problem. Another way of tackling it which is being adopted is that of sending picked young factory workers to short training courses.

Accelerated Training.

The entire technical education has become practical and utilitarian. The technical schools, even the highest, are now regularly attached to the factories; and all the new factories have special shops where workers are trained by the methods recognised by the Central Institute of Labour. The training shop, indeed, is usually the first shop in a factory to be opened. These factory training schools and shops have two functions, one to train ordinary pupils and to prepare them for an engineering career, the other to give additional training to promising factory workers with a view to their promotion to the rank of engineers. Needless to say, all technical schools are working day and night, and most of them have two shifts.

How far these speeding-up methods will succeed in solving their specific problem in turning out really qualified men it is too early to decide. The business of securing an adequate supply of skilled and semi-skilled workers is no less formidable than that of obtaining a qualified technical staff. The need for skilled labour to fill the enlarged factories and the new ones which are opening next year is estimated at 500,000 men. How formidable this task is can be gathered from the fact that at present the number of skilled workers in industry is estimated at only 1,600,000 men. This figure, it will be seen, will have to be increased in a single year by one-third. Can this be done? And how can it be done? The factory training shops are already filled to capacity, and can accept no more than probably 30,000 people. Many projects for coping with this difficulty have been suggested. But it is obvious that there is only one way of dealing with it, and that is by the dilution of labour. The steady importation of German and American workers and engineers may be prompted by the idea that an influx of highly skilled men may serve to strengthen the weakness caused by dilution.

The training of hundreds of thousands of workers for the task of industrialisation is one of the most baffling problems of the Five Years' Plan. The number, quality and devotion of these *cadres*, as the industrial army is called in Russia, will in the end decide the fate of the Industrial Revolution. The Five-Years' Plan may have succeeded in alleviating the problem of unemployment. But the problem of technical *cadres* still awaits solution.

THE PLAN IN AGRICULTURE.

THIS year no less than 40 million hectares, or nearly one-third of the whole area actually under cultivation in Russia, have been brought under the scheme of socialised agriculture, that is, have been included either in State or Collective farms, which have supplied quite half of the marketable surplus of grain. And of these 40 million hectares, 12 millions were ploughed by tractor-power and were cultivated by correspondingly mechanised implements and machines. These are two of the outstanding facts of the Russian agricultural situation, the significance of which it is difficult to exaggerate.

In order to understand the origin and character of this trend towards mechanised and large scale agriculture on a Socialist basis, it is necessary to describe the main phases of the land crisis through which post-

Revolutionary Russia has passed. If we only compare pre-war and post-war areas under cultivation, and the general yield of crops, we are forced to the conclusion that the primary cause of the persistent shortage, long after the worst of the war havoc had been made good, does not lie in the war, but must be looked for elsewhere. If we take the area under cultivation, and the gross yield of crops in 1913 as 100, we discover that the corresponding figures for the last two years are as follows: Area, 1928, = 94.7; 1929, = 98.2. Yield, 1928, = 90.8; 1929, = 94.4. These figures show clearly that the recovery of grain production has been extremely slow, and that even 11 years after the outbreak of the Revolution it was still some 10 per cent. below the pre-war level. But a drop of 10 per cent. should not in the

ordinary nature of things have assumed a menacing character, for the 1913 standard allowed an export surplus of between 12 and 15 per cent. of the gross production.

In a sense, these export figures never represented a real surplus. Russia was considered the granary of Europe rather in view of her potential than of her actual production. Considered from the point of view of what the country produced per head of population, Russia should have ranked among the grain-importing rather than among the grain-exporting nations. In fact, compared with grain-exporting countries overseas, such as the United States, the Argentine or Canada, Russia was never a really "great" producer. Canada's average production per head was nearly 5 times bigger; and that of the United States and of the Argentine 2½ times as big. In any case, however, whether Russian pre-war grain exports constituted a real or a "fictitious surplus," the cessation of such exports should have resulted in the 1927-29 supplies being adequate for the home market.

Allowance must be made, it is true, for the increase of population and for the increase of grain consumption in the villages. With regard to the first factor, the population statistics in Russia have fluctuated very remarkably. The Great War, the Civil War, famine, epidemics and the lack of provisions cut off many millions. This gap was approximately filled by the natural growth of the population up to 1925, and the net increase in population by 1928 was not much more than 10 per cent. over the pre-war level. Moreover, though the post-war peasant consumed more food, this increased appetite was less for grain than for more intensive stuffs such as meat, eggs and poultry. The level of grain production reached in 1928 should, in fact, have sufficed at least for all domestic requirements. Yet in that year Russia had to import grain from the Argentine.

The Lack of Real Surplus.

Obviously the figures representing agricultural production in general cannot in themselves sufficiently explain the situation. The fact of the matter is that what determines the amount of grain that comes into the market from any given area, is not merely the amount sown and not even the amount reaped. The marketable surplus is not merely a surplus which is left after the needs of the peasants have been satisfied, but the amount of grain *deliberately produced* for the market. In pre-war times it was the landlords and the well-to-do peasants who produced grain for the internal and external markets. Roughly estimated, the gross production and the marketable proportion of grain furnished by the three main groups of producers—the landlords, the well-to-do peasants and the multitude of small-holders—were as follows:—For the quinquennial period of 1908-13, of the total production of 5,000 million poods, the landlords furnished 600 millions, of which nearly half (47 per cent.) reached the market. Their share of the gross yield was 12 per cent.; while their share of the marketable surplus was 21 per cent. The well-to-do peasants, now a diminishing race called Kulaks, produced 1,900 million poods, of which one-third (34 per cent.) was brought to the market. The Kulaks' share of the gross yield was 38 per cent., while their share of the marketable surplus was 50 per cent. The middle and small holders, called respectively *seredniaks* and *bedniaks*, produced 2,500 million poods, of which 14.7 per cent. was intended for the market. The proportion contributed to production by these cultivators was 50 per cent.; but they only contributed 28.4 per cent. to the marketable surplus.

It will be seen, then, that the smaller the holding the bigger proportion of its produce will be retained for home consumption. When, therefore, the large estates, those belonging to the landlords and the Kulaks, were broken up and the land redistributed among millions of smallholders the production of grain for the market practically ceased. Grain was no longer brought there and offered to the consumers; the latter were compelled to take the initiative and to search for the grain themselves. The general fall in agricultural production that took place after the Revolution only accentuated a crisis which would have occurred in any case. In this anarchical situation in which consumers and their agents,

THE HOW AND WHY

we'll help to explain

Trade with Russia, reading about Russia . . . at once the point arises that this is something very different as well as something pretty big (geographically anyway). Different in ideas and how it got there . . .

At Martin Lawrence we have a number of books that will throw light on it. LENIN, for instance; it is important to understand his rôle in it all. We publish his COLLECTED WORKS and we have just done his wife's MEMORIES of him. "A.R." in the *Manchester Guardian* writes that it "must become a principal authority . . . nothing is so revealing." (5/-)

The novels of Russia are not only gripping in a quite new way but evidence of what is on towards there. Try "CEMENT," a story of one sort of industrial revival, or "BRUSSKI," a Soviet village epic, or "the NINETEEN," a civil war book. (7/6 each.)

Among theoretical works we have a complete textbook of their—the Marxian—economics, with special attention to Soviet organization, in "AN OUTLINE OF POLITICAL ECONOMY," by LAPIDUS. (5/6 pp. 12/6.)

We have a pat up-to-date and authoritative account of that enormous effort at social planning—"The FIVE-YEAR PLAN of the SOVIET UNION," by Grinko. (8/6 cloth.)

G. T. Grinko is Vice Chairman of the U.S.S.R. State Planning Commission.

GEORGE G. HARRAP & CO., LTD.
39-41, PARKER STREET, LONDON, W.C.2

the bagmen, were competing with one another for the favour of obtaining such grain as was available, and were offering in exchange anything from gramophones to sables, the Government soon intervened, and in the interest of the State organised campaign after campaign with a view to requisitioning the supplies from the villages. But, though the pressure exerted by the Government became more and more stringent, and the peasants were compelled to part with some of their grain, the bread war proved inconclusive, for the simple reason that a real surplus, as the peasants stubbornly insisted, did not exist.

We have seen that even in pre-war times the smallholders delivered to the market only 14 per cent. of what they produced. Subsequently, when the total number of smallholders increased from 16 to nearly 26 millions and the average area they cultivated progressively decreased, their contribution to the production of a marketable surplus became practically nil. The appearance in the villages between 1917 and 1928 of 10 million new smallholders and the consequent diminution of the average holding is, in my view, not only the most important single fact of the post-revolutionary period, but the key to the understanding of all the currents and under-currents of the present agricultural situation.

The 1928 Crisis.

The year 1928, as I have already stated, was crucial. The aggregate production of grain nearly reached the pre-war level; while the machinery for "collecting" the surplus was so perfected that by one means or another, by economic, administrative or financial pressure, the Government should have been able to extract every pood of surplus in the villages. Yet the amount of grain that came into the market from all sources represented only half the amount which used to be brought to the market. This was the more disquieting because even of this proportion a quarter was contributed by the new class of prosperous peasants who rented land, and employed hired labour. It had become quite evident that the production of grain for the market would be increasingly monopolised by this class. The rest of the 26 millions of cultivators were just able to feed themselves; and a crisis of the first magnitude had evidently arrived.

The alternatives were either to encourage that social differentiation in the villages which was a direct consequence of the new economic policy and to acquiesce in the aggrandisement of the Kulaks, or to organise a regular scheme of co-operative cultivation among the less prosperous smallholders. The choice of an alternative was, however, only possible theoretically. Aware that private ownership of the land was (in Lenin's words) "creating capitalism every day and every hour," the Bolshevik Government was already committed to a policy of collectivising and mechanising agriculture and of "liquidating" as speedily as possible the Kulaks.

The Communist Party accordingly decided forcibly to

interfere with a vigorous drive towards co-operative and mechanised agriculture as the only effective counterblast to Kulakism. But to render possible any interference with the development of Kulak agriculture, which at the moment was the main source of grain supplies, another source had to be tapped at once. The big American and Canadian farms served as a model for the new experiment and American agronomical engineers and experts were engaged to start it, while the great plains of virgin soil in the South-East of Russia, where the meteorological and soil conditions resembled those of the wheat belt in America, were chosen as the scene of the experiment. Yet, ambitious as this scheme was, it was intended originally merely as a stop gap. The real plan of the Government was the inauguration of large-scale collective peasant farms which should have the double mission of superseding individualist holdings and of producing enormous quantities of grain for the market. The consequent organisation of large-scale and highly mechanised State farms on which the Government embarked, and the lavish expenditure of money, energy and propaganda on the infinitely more ambitious plan for promoting co-operative farming, are the satient features of the great agricultural experiment.

The State Farms.

ALTHOUGH the term "Sovhos," Soviet Farm, is employed to describe other large State enterprises such as beet, flax or cotton plantations, it is now mainly applied to the immense "wheat factories" managed by "Zernotrest," the Grain Trust, a company, which, though created and financed by the Government, conducts its own business on commercial lines. The first principle on which these farms were organised was a strict understanding that they should consist of entirely fresh and uncultivated land. The Grain Trust has been assigned an area of over 12 million hectares (28 million acres) over three-quarters of which are either virgin soil or areas left derelict. Of these 12 million hectares, over 8 millions are situated in European Russia, but only a small part of the land assigned to the Trust has so far been brought under cultivation. This year the actual sown area was 1,200,000 hectares; for the coming winter and spring sowing 4½ million hectares are to be ploughed; while according to the Trust's programme the complete assimilation of the land assigned should be completed by the end of 1932.

The chief regions in which the Trust operates are in order of assignment as follows: the Northern Caucasus, the Southern Steppes of the Ukraine, the Middle and Lower Volga lands, the South-Western parts of Siberia, the Urals and the Bashkir Republic. It also manifests a tendency to move the wheat-belt as far as Kossackstan, the area between the towns of Uralsk and Semipalatensk. Meteorologically regarded, most of the districts which are the scene of the experiment belong to the semi-drought zone, which has a rainfall of 350 to 400 mm.; while the Steppes of the Ukraine and the areas in the Northern Caucasus are practically included in the drought zone, having a rainfall of only 300 to 350 mm. The districts

in the Northern Caucasus, in Kossackstan and the Ukraine suffer also not only from lack of rain but from the *Sukhovey*, or dry hot wind, which blows away the upper layer of earth. In respect of soil, however, the lands administered by the Grain Trust are on the whole satisfactory. They belong to the typical wheat zone; and most of them are Chernozem (Black Soil), which shades off into dark and light "chestnut" soil.

The natural climatic conditions sufficiently explain why these lands have remained unpopulated and uncultivated. They could never have been broken up by horse-power, and the primitive implements of the ordinary settler. Deep and rational ploughing, selected and drought-proof seed, and, most important of all, speed in ploughing, sowing and reaping to defeat the ravages of the wind—all these were required and could only be supplied by modern mechanised technique. In cultivating these domains it was decided to make no attempt to fight meteorological conditions and to adopt the American plan of wheat—bare fallow—wheat, that is of sowing the land with wheat in the spring, and of ploughing it in the autumn with a view to its accumulation of moisture. The experts of the Grain Trust seem, indeed, to have reconciled themselves to the possibility or even likelihood of periodical failures of crops; but they hope that the use of high technique and the hundred per cent. mechanisation of all processes of cultivation will make the recurrence of such failure occur at longer intervals, once, say, in five or even once in seven years.

The argument employed in justification of this policy, which the agronomists claim will prove to be the truly economical policy, is well worth following. These experts maintain that in any given year a failure of crops will never extend over the whole cultivated area, for the simple reason that this area extends from the Black Sea to Siberia. A failure in one district will be compensated for by good harvests in others. And at any rate the extensive cultivation of wheat which will take place under this system will in their opinion more than compensate for any possible loss from practical failure of crops. They point out that an experiment of the kind is only made possible by the specific character of the farms, which contain no population dependent on the yield. Here, therefore, failure of crops merely means a loss of seeds and labour, but does not involve famine.

The area of most of the State Farms varies between 30,000 and 60,000 hectares; but there are some with over 100,000 hectares and one, the "Gigant," contains 220,000 hectares. The question of the optimum size of such a farm is not quite settled; but the tendency is towards larger and larger areas on the ground that the bigger the farm, and the more tractors and machines it employs, the sounder economic basis there will be for the

upkeep of the repair shops, for warehouses, parks, fuel, and for the housing of the engineering staff. The personnel on such a farm is 90 per cent. engineers, and only 10 per cent. agronomists. The limit of size is imposed by communications.

Of the financial basis of the Grain Trust, it is difficult to furnish a complete account; one can only give the figures published in the Press or communicated by the officials concerned. The sum invested in the area actually ploughed is 70 roubles per hectare, which comprises the expenditure on machines, buildings and road-making. This, for Russia, represents a very high investment. And yet the investment is being increased; for the Government propose to extend and to intensify cultivation on these farms by investing 620 million roubles on them in 1931, as compared with an expenditure in 1930 of 234 million roubles.

The result of the first two years of work on the farms is declared to be highly satisfactory. The harvest reaped this summer was 40 million poods, or over 650,000 tons, excluding grain consumed by the 110,000 labourers employed on the farms, and that reserved as seeds. This means an average yield of 9½ centners, i.e., 56 poods per hectare, or about 16 poods more than the average yield in Russia. The cost of production on the farms managed by the Grain Trust has been published only for 1929, and is put down as 5 roubles a centner.

Life on a Sovhos.

The State Farms were started as an experiment, and the aim was to produce a moderate amount of grain so as to enable the Government to undertake the much bigger experiment of running Collective Farms. It was soon realised, however, that the State Farms had greater potentialities than was at first imagined; and to-day the State Farm is nearly as important an instrument for developing Russian agriculture as the Kolhos movement itself. This being so, when I went to Russia this summer, I gladly seized the opportunity of making first-hand acquaintance with the "Sovhosy." I inspected two of them, one styled "The Gigant," the other rejoicing in the more modest name of "Soviet Farm, No. 2." This latter, a combination of agricultural college and farm situated near the town of Rostov on the Don, in the Northern Caucasus, is designed to train special engineers for mechanised agriculture. And the college, which has at present a teachers' staff of 70 and 525 students, is called "The Institute of Engineer Mechanics of Socialist Agriculture." In the spring of 1929 the area of the future farm, comprising 115,000 hectares, was an uncultivated steppe. Of this area 41,000 hectares were sown this spring, while 60,000 hectares are to come under cultivation next

year. At present it embraces the college buildings, a number of two- or three-storied dwellings which constitute the living quarters of the students and of the workers, and a large building containing a club-room, a library, a reading-room and a fair-sized theatre.

The whole settlement, which is about five miles from a railway station, and is electrically lighted and centrally heated, gave me the impression of something exotic and foreign. Whether this was due to the character of the buildings, to the tropical heat and the sparsely-clad figures of the workers with their wide-brimmed straw hats, or to the unfamiliar tractors and other machines which were setting off in various directions, I cannot exactly say; but it all seemed to me much more like a film of life in the Wild West than a piece of real Russia. Another thing which struck me particularly about this settlement was the youthfulness of the entire personnel. The director, the administrators, i.e., the engineers and instructors, as well as the students and workers—all were under thirty. In all the places I visited in Russia this summer, I saw nothing to approach this farm in efficiency, strict discipline, natural friendliness and camaraderie.

Can the State Farms Pay?

The question to which I tried to get an answer on my visit to these two Soviet farms was, whether mechanised large-scale agriculture in Russia was likely to pay. Can these farms produce grain more cheaply than the peasants? And can grain so produced compete in the world markets? The answer I got both at "Farm No. 2" and at "The Gigant" was a definite and emphatic "Yes." These are the figures for "Farm No. 2":—Average yield of wheat per hectare was, in 1929, 52 poods; in 1930, 70 poods. (The peasants' average yield for the two years was respectively 40 and 42.) The cost was, in 1929, 112 kopeks per pood; and in 1930, 80 kopeks. The figures of the "Gigant" farm are still more striking. The yield, in 1929, was 54 poods; in 1930, 65 poods. The cost, in 1929, was 88 kopeks per pood; and in 1930, 62 kopeks. As to the future, while M. Margolin, the director of "Farm No. 2," would not commit himself to anything save a general statement that cost of production could and would be brought down, M. Bogomolkin, the director of the "Gigant" farm, unhesitatingly declared that he could promise that by 1932 the cost would be reduced to 45 kopeks per pood.

I need hardly point out that these figures, as given to me, fail to represent the full cost of production, for items (e.g., rent and interest on capital) which would enter into the calculation in any ordinary capitalist-run farm are here left out of account. But, while the exact cost of wheat on State farms must for the present remain somewhat uncertain, one thing is, in my opinion, definitely established, namely, that grain produced on these farms is already cheaper than that produced by the peasants, and is likely in the future to be cheaper still. That the quality of the grain is considerably better is recognised by experts (native as well as foreign) and is reflected also in the price paid for it by the Khlebocentre or Grain Centre, the monopolist buyer for the Government. In the extensive tour of Russia, which I made this summer, I encountered only one farm in the Northern Caucasus, the "Seattle" Commune, a Commune started in 1921 by Finns repatriated from the United States, the wheat of which fetched a higher price than that of these two State farms. "Farm No. 2" got 175 kopeks per pood, the "Gigant" 128 kopeks; and the Seattle farm got 193 kopeks, as against an average price of 120 kopeks paid to the peasants. I may add that the grain produced on these farms is all selected and carefully graded. So far, the whole of the crop which is said to be of good weight and drought-proof is marked "not for sale," but will be

used as a "seed fund" to be distributed to the Collective farms and to the peasants in exchange for their own inferior "victualling" grain.

The general impression, however, produced on me by what I saw of the "Gigant" farm, the biggest single farm in the world, was not so favourable as that I derived from going over "Farm No. 2." I doubted whether the administration was efficient, and I disliked the general atmosphere of the place. And when later I compared my own views with those of other recent visitors to the "Gigant," I found that our common impression was that thoroughness was sacrificed to hustle, that the farm was overstaffed, and that the average breakage of machines seemed to be too high.

When, in 1928, the Sovhoses were started, they had a definite function to perform—to supply the State in three or four years' time with an amount of grain equal to that which the Kulaks produced in 1927, that is, with approximately 100 million poods. But such has been the impetus of the drive, in respect of investments, tractor-power and area of land, that by the spring of the present year the programme outlined had been outgrown; while the official estimate is that the sown area of the State farms will yield next year over 200 million poods. Apparently this success has changed the perspective of the Government, and has induced it to regard this method of purely State cultivation as an important element in the solution of the complex agricultural crisis. The result is that now the most complicated problems, such as that of repairing the deficiency of meat, milk and vegetables, and that of raising the production of cotton and flax, are all expected to be solved by the creation of State enterprises similar to the Grain Trust. Consequently, huge companies have already been formed such as the "Skotovod," the Cattle Breeder, the "Svinovod," the Pig Breeder, the "Ovzevod," the Sheep Breeder, the Flax Grower, and the Cotton Grower.

"Collectivisation."

THE experiment of collectivising agriculture is only two years old,* and the spring sowing of 1930 was in reality the first collective effort on a large scale. And yet the experiment is already extremely rich in dramatic episodes symptomatic of its alternate ebbs and flows of popularity. Like every other section, the agricultural section of the Five Years' Plan was drafted in a spirit of complete optimism; for it contemplated the farming on co-operative lines of no less than 22 million hectares of land by the end of 1933. When this programme was promulgated it excited derision outside the party and was stigmatised as Utopian. Inside the party it was severely criticised by the Right Opposition and attacked as wildly optimistic.

The Serebniaks, or "middle-size" cultivators, it was believed, would stand aloof from the plan, because they would be naturally unwilling to sacrifice their comparative prosperity to the common good. The plan would, therefore, result merely in wasting enormous sums without either raising production or bringing nearer Socialism in the villages. Yet, contrary to all anticipations, the Serebniaks were attracted by the Kolhos movement and joined it in considerable numbers, especially in the areas of predominant grain cultivation. Whether the prospect of raising the level of production by means of tractors and machines appealed to them, or whether they were scared by the growing insecurity of their own position between the Bedniaks and the Kulaks is not quite apparent. To remain neutral in a situation in which the Bedniaks

* Attempts to organise collective farms (Kolhosi) and agricultural communes were made soon after the Bolsheviks came into power. They relied entirely on the principle of co-operation and must not be confused with the movement which started in 1928. One of these earlier collective farms would consist of not more than forty householders; and, consequently, under this system anything like large-scale cultivation was out of the question; nor of course was mechanisation possible or even attempted.

appeared as an organised force supported by the full administrative, economic and political power of the Government had become increasingly difficult and indeed dangerous. To join the Kolhosi was, at any rate, safe, and promised both economic and social advantages. By the autumn of 1929 at least half of the cultivated area of Russia was registered as belonging to the movement.

The Central Committee of the Communist Party seemed to be greatly impressed by this; for at two consecutive plenary sessions, one held in November, 1929, and the other in January, 1930, they passed resolutions expressing not only their delight in the victory of Collectivisation, but their conviction that the scheme could be speeded up. Consequently, they divided the country into three areas, (1) that of predominant grain-cultivation, (2) that of intensive crops such as flax and cotton, and (3) those parts of the country which are mainly grain-consuming. The first of these areas was to be completely collectivised by the end of 1931; the second by the end of 1933, and the rest of the country by 1935. At the same time, they declared that the "remarkable success" of the Kolhosi, and the possibility of their becoming the chief sources of grain supplies, justified a change of policy towards the Kulaks, who now, instead of being crippled financially, were to be economically and administratively destroyed or, as the phrase goes, "liquidated." This new policy was to be applied in exact proportion to the intensification of the scheme for collective farming. That is to say, from "areas of uninterrupted collectivisation" the Kulaks were to be expropriated; while in other areas they were for the time being to be left alone.

The resolutions passed by the Central Committee were promptly regarded by the local Kolhos and Communist agents as an additional encouragement to an energetic pursuit of the policy of collectivisation, which, translated into action by these ardent propagandists, became a drive for the completion of collectivisation by the end of 1931, or even earlier, not only in some of the most promising, but if possible, in all areas. Moreover, the local

agents aimed not only at extending, but at *deepening* the drive, that is to say at giving it a deeper tinge of full-blooded Communism. They at once proceeded to violate the voluntary character, the fundamental basis, of collectivisation by treating all peasants as Kulaks who refused to join the movement; while they prosecuted the campaign against the Kulaks and all peasants whom they stigmatised as Kulaks with such vigour that, not content with confiscating their property, they arrested and banished them and deprived them of voting rights.* They went further, and converted many of the Kolhosi into Communes with the result that cows, sheep, pigs and even fowls, which in a Kolhos are recognised as individual property, were forcibly socialised; while in accordance with this new interpretation of the meaning of "uninterrupted area of collectivisation" they prohibited all private trading in the villages or between villages.

The Initial Failure.

Nor was this drive limited to the economic sphere; it involved the peasants in the full consequences of life under Communism. In such an atmosphere the closing of churches and the pulling down of church bells became epidemic; and, strangely enough, this zeal for instant collectivisation was shown not only in predominantly grain-producing areas, where mechanisation was applicable, but also in areas of highly intensive culture such as those of flax, beet and cotton, where labour is the main

* The number of Kulaks who were expropriated is obviously impossible to obtain. But there is an indirect way of forming some idea of the number. In the report made by Stalin to the last Congress of the Communist Party he stated that the confiscated property of the Kulaks which had been handed over to the Kolhosi amounted to 400 million roubles; while on the same occasion M. Yakovlev, the Commissary for Agriculture, declared that this confiscated property constituted 15 per cent. of the total capital of the Kolhosi.

factor, and not machines, and even in the backward national republics, where farming is deeply primitive and individualistic. All this created resistance on all sides, with the result that official optimism gave way to anxiety and alarm.

Secret instructions were accordingly sent to the local Communist agents to moderate their zeal and to adopt a less provocative policy; while in order to pacify and to reassure the peasants it was decided to make a public declaration of policy, which took the form of an open letter from Stalin, entitled "Dizziness from Success," in which he denounced the stupidity and arrogance of the local Communist agents, who had become so intoxicated by their triumph that they had lost all sense of reality. A strongly worded manifesto to the same effect was addressed by the Central Committee of the Party to all republican, regional, and provincial committees. And then were published a series of Government enactments in which the peasants were told that all injustices which they had suffered should be repaired, that the basis of collectivisation must remain voluntary, that if they had been compelled to join the Kolhosi they could leave them with all their possessions, while if they preferred to remain they could reclaim them.

The effect produced by Stalin's letter and by the subsequent decrees of the Government was immediate. Peasants who had been forcibly enrolled in the Kolhosi left in their thousands; while many registered Kolhosi were discovered to be "paper" Kolhosi or "dead souls." Trading, local and between village and towns, was re-established. Many churches, closed previously, were re-opened and restored to believers; and Socialised cattle and other individual property were promptly decollectivised. As a consequence of this purge the Kolhos movement suffered a drastic setback. In some areas collectivisation, which had previously incorporated 50 or more per cent. of the peasants, fell to about 3 to 7 per cent. Even in the South-East of Russia

and in other areas, where Collectivisation had been almost completed, it was reduced to 25 per cent.

For all this, Stalin's dramatic intervention must be acknowledged to have been an astute stroke which saved the situation for the movement. It cleared the air, and killed the germs of what might have been a serious revolt. But it needed to be supplemented by positive enactments in order to encourage those who adhered to the movement and still more those who were inclined to rejoin it.

Revised Collectivisation.

In a number of further decrees published early in April, the Government announced that new privileges were to be granted to all members of the Kolhos movement. These privileges were of three kinds. Taxes and fines were to be abated or remitted. Members of Kolhosi were now to pay much less taxation than individual peasants of the same category. All arrears of taxation which had accumulated, all fines which had been imposed on them by summary administrative action, or by a court of law were to be remitted. And all pending actions for the recovery of fines were quashed. Secondly, relief was to be given in aid of improvements in agriculture. All areas freshly brought under cultivation by members of the Kolhosi were to be free of taxation for two or four years. And thirdly, special efforts were made to conciliate the Serebniaks, who resented the arrangement by which the Bedniaks, who contributed little or nothing to the capital of a Kolhos, shared equally with them in the revenue. It was now decided that 5 per cent. of this gross revenue must be divided among members in proportion to their contributions to the capital of the Kolhos. At the same time it was declared that the Government had determined to credit the Kolhos Movement with the additional sum of 500 million roubles.

These lavish concessions to the peasants were prompted, of course, by the imminence of the spring sowing. The position, indeed, was menacing. Such of the Kulaks as had not been "liquidated" were naturally indisposed to sow a larger area than would suffice for their own needs. Such of the Serebniaks as had not joined the Kolhosi were probably equally indisposed. But even had they been disposed they could have done little. The enlarged area which they could have sown had not been ploughed, since all the tractors were employed on the Kolhos fields. Moreover, the Government, which had given the Collective Farms selected seeds and other economic aid, did little to encourage the sowing of the individual farmers. Consequently, when it was realised that the Kolhos movement was weakening, the spring sowing campaign, on the success of which so much depended, seemed to be in considerable danger. But the prompt and determined action of the Government in making the concessions I have enumerated retrieved the situation. In the new atmosphere created by them, the campaign for sowing started auspiciously and soon became a campaign for re-absorbing the former members of the Kolhos movement. The result of both campaigns proved decidedly satisfactory. Despite the fact that most of the Kulaks were driven out of the field, or had voluntarily reduced their holdings, the area sown increased by something like 7 per cent. The Collective Movement soon showed signs of considerable revival and now includes no less than 25 per cent. of the peasants throughout the Union. In the purely grain-producing districts, the South Eastern part of the Ukraine Steppes, the Northern Caucasus and the Volga areas, collectivisation embraces 48 per cent. of the cultivators. In the more industrialised part of the Ukraine and in Central Russia, the percentage reached is 25; while in the so-called grain-importing lands of the country, that is to say in Central and Northern Russia, it is 8.

When I visited several Kolhosi this summer during the threshing season I carried away an impression that the need for joint effort and for large-scale cultivation seems to have taken deep root in the minds of the peasants. My observations, I should add, were made in

such predominant grain-producing areas as the Southern Ukraine and the former Don Cossack lands. In one respect these areas must be considered unfavourable to an experiment in collective cultivation, for the population has a decided bias towards individualistic farming. This is especially true of the inhabitants of the Don Cossack lands, where many of the peasants used to live and to work individually on the so-called Khutor or single farm. But, technically regarded, they are most favourable for such an experiment, if devoted to the production of a single crop, wheat, rye or sunflowers. Moreover, the prairie-like configuration of the land lends itself admirably to the employment of mechanical traction.

Kolhosi and their Results.

Speaking of this part of the country, I can summarise the situation as follows: On the technical side the progress of the collectivist movement seems considerable. I mean that the industrialisation and mechanisation of agriculture seems to be accepted by the peasants, as is also the need for joint effort and the pooling of resources. How far the economic and social consequences of collectivisation are acceptable to the peasants only time can show. At present a considerable divergence of interest, mood and sympathy is quite noticeable. The questions which are to-day exciting the Kolhosniks and which are likely to continue to excite them are those connected with the division and organisation of labour and the distribution of profits. The idea with which the Kolhos movement started, that all members should be equal, has broken down. This is conclusively proved by the Government's decision, already mentioned, to permit a 5 per cent. dividend on capital. But quite apart from this, a Kolhos village is still a village composed of holders more or less prosperous and more or less industrious. Some have got cows, pigs, fowls, and some cultivate considerable vegetable gardens on which they grow melons and cucumbers. Some, too, go to the towns as seasonal workers and earn good money. But apart from the inequality in individual possessions, there is a more important inequality inherent in the constitution of a Kolhos. The basis for the distribution of profits is the quantity and quality of labour contributed. And while every effort is made to give every member an equal chance, the best-paid jobs inevitably go to the most skilled men. In general, work is organised and paid for on a five-grade tariff, the basis of which is a 10-hour "labour day."

What a "labour day" actually represents is only discovered after the harvest has been reaped, and is calculated in the following way. From the gross revenue there are first deducted debts, general expenses, seed grain, the amount of grain needed for the support of children and persons unable to work, for cultural requirements, and for the 5 per cent. bonus. The rest represents the amount available for distribution. This is divided by the registered number of "labour days." The result will express in grain the value of a "labour day" of the first grade.

The basis on which the work of a Kolhos is organised and still more the basis on which wages are calculated must inevitably give rise to a good deal of irritation and is bound to accentuate inequality. But the divergence of opinion inside the Kolhos is not only in respect of property and of the division of profits. Here, as everywhere else in present-day Russia, the real and outspoken antagonism is that between the young and the middle-aged. The older people look at the Kolhos from a purely economic point of view, and their attitude towards it will in the end be decided by its economic advantages or disadvantages. It may be assumed that the advantages of the Kolhos will have to be very considerable to reconcile them to its encroachments on their social, religious and family life. The young people, on the other hand, are mainly attracted by the changes in social and family relations which the collective movement entails. Even the economic side, in which on the whole they are less interested, is valued by them as helping to liberate them from parental control. The machine with which, for the first time, they have come into contact has

Category "P"—most comfortable and in every way excellent service. Category "W"—fully satisfactory service. Category "T"—plain, but absolutely satisfactory service.

The above are inclusive of all attendance and accommodation, i.e., hotels, meals, transportation of luggage, guide-interpreter, entrance to exhibitions, museums, etc.

Under Category "T" only groups of not less than 5 people can be booked.

Bookings should be made through:—

seized their imagination and has given them the vision of a new epoch.

Tractor Stations.

To realise how machines are affecting the whole attitude to life of the younger generation in the villages one should spend a few hours in a "Tractor Station." A village lad need not now migrate to the towns to get into touch with the ideas and technique of the industrial world. The whole apparatus of the industrial world comes to him with the tractor. The primary task of the "Station" is to provide the necessary mechanical energy for the ploughing, sowing, reaping and threshing of the Kolhos's crops. But soon it becomes the source of a new attitude to life. It not only creates new values in the purely agricultural domain, but is the centre of a cultural upheaval. The "Station," with its repair shop, becomes a centre from which radiate all sorts of activities that appeal to the young. It teaches the boys to produce electric light; it enlists a voluntary fire-brigade to which it lends its motor lorries; and it organises courses for the "liquidation of illiteracy," for tractor and motor driving, for teaching stoking and the use of the new "milkers." One "Tractor Station" which I visited at Shkurinsky had even installed pumps for the irrigation of the local market gardens, which contain 210 hectares, and I was told that 250 boys and girls gladly volunteered for service on this work. But the "Tractor Station" provides amusement as well as instruction. The Shkurinsky Station, for instance, had eight radio and cinema moving platforms, which are regularly sent to give performances in all the neighbouring villages.

Losers and Gainers.

The struggle between the younger and the older generation is probably only in its initial stage. All the evidence, however, goes to show that youth is determined to break with the traditional mode of village life and, incidentally, with a good many of the more irksome family ties. One of the most fruitful sources of dissension is the question whether wages should be paid in the old-fashioned way to the parents or directly to the boys and girls themselves. The young people want to receive the money and to spend it as they like; and the officials of the Kolhos are in most cases sympathetic to this demand. I remember meeting one of the employees of a Kolhos dairy farm—a man about 50—who told me that his only complaint against the new movement was that it forbade him to claim his daughter's wages. And this was a substantial grievance: he declaimed against it for quite an hour.

In all the places I visited I was told that there could be no doubt of the increase in production which the Kolhosi had effected. In the first place, the assistance of tractors has made it possible for a Kolhos to cultivate a larger area than its members would have done if they had been compelled to rely on horse traction and their individual implements. According to official statistics, in 1929 individual peasants who are now members of the Kolhosi cultivated 24 million hectares. In 1930, under the collective system, they cultivated 35 million hectares, an increase of 45 per cent. (Part of this increase is, of course, the appropriated Kulak holdings.) Still more advantageous has the adoption of the system proved if one considers the yield per hectare. On the average this is about 54 poods, or 10 poods more than was produced by the individualist holders. Apart from deeper ploughing this is due to the selection of seeds and to the better timing of all operations.

When one considers the economics of a Kolhos, a mechanised large-scale farm, one realises at once that the Bedniaks, the poor peasants, who have very scanty resources, have much to gain from its permanent success. But the gain of the Bedniaks is not in itself sufficient to assure this success. The Kolhos movement could never have attained its present dimensions without the participation of the Seredniaks, the great body of middle peasants. In the same way, it will never prove

an economic success unless the Seredniaks can feel definitely that it is improving *their* position. Whether the Seredniaks will be satisfied with their position under it, it is too early to say.

The Stock Crisis.

"The great problem—that of grain—has been solved. Now for the solution of the meat and dairy problems." Such is the current talk in Communist circles. These problems are, indeed, very urgent—probably more acute than the grain problem ever was. In the first place, the number of livestock, although increased after the Civil War, has never re-attained the pre-war level; and secondly, alike as meat producers and milk producers, the cattle have always been inferior. Moreover, since 1928 a fresh diminution of the numbers has taken place. How great this diminution was can be gathered from the following figures:—

	1928.	1929.
Horned cattle	70,667,500	67,230,600
Cows (only)	30,754,500	30,338,000
Sheep	133,592,300	132,758,800
Pigs	26,120,000	20,502,000

The present situation is hard to state, since the figures for 1930 are not available. But that these will fall very considerably below the 1929 figure is generally accepted. It is officially stated* that between March, 1929 and March, 1930, the slaughter of cattle was catastrophic. Horned cattle decreased by one-fifth, cows by one-eighth, sheep by one-third, and pigs by two-fifths.

The cause of this epidemic of slaughter is known to have been the result of the drive to collectivisation, and of the anti-Kulak campaign. The attempt to socialise livestock was met by the peasants in this way. It is obvious that the Kulaks killed off their cattle because they could not get a fair price for them in the atmosphere created by the Government's determination to "liquidate" their owners; while the poorer peasants killed theirs as a protest against the attempts to include these animals in the scheme for collectivisation. When, in March, 1930, the Government became alarmed at the situation, and made frantic efforts to save it, the destruction had already been effected. The chronic deficiency of meat and dairy produce in the country became a famine. The question now is that of re-stocking the country, and of creating new sources of meat, milk and butter.

Meat and Milk Shortage.

Generally speaking, the cattle problem is similar to the grain problem. That is to say, there is not only a deficiency of production, but a very acute deficiency of a marketable surplus. Even when the number of cattle was increasing and should have been sufficient for the regular supply of the market with meat and milk, this supply was badly organised. For instance, in the autumn, after the work on the land was over, the peasants would drive off their cattle to the market to save themselves from having to feed them during the winter. The markets would then be swamped with cattle; and this period of artificial plenty would be necessarily followed by one of artificial scarcity. The problem then to-day is not only that of raising the level of production, but of ensuring a regular supply of meat to the towns.

The Government seem to be convinced that the radical solution of the meat and dairy problem must be found in the organisation of a collective system of cattle-breeding, and in the creation of large-scale State cattle farms. But even if the best system of stock-breeding be adopted, it will take years to increase the stock of cattle to the number required. The alternative, the importation of cattle, is obviously excluded. The only way, then, of improving the meat and milk supply is to increase the quality of the existing stocks. This question is increasingly engaging the attention of the Government, which has now adopted a comprehensive plan for the increase

* By M. Yakovlev, Commissar for Agriculture, at the recent Congress of the Communist Party at Moscow.

and improvement of fodder supplies. It is the lack of pasture land, the absence of adequate fodder, that has impoverished the stock of cattle, both in numbers and quality. Russian cattle used to be fed upon hay and straw, with a very small addition of more intensive, juicy foods. It is recognised that a change of diet is of paramount importance, and that the animals' food should be a mixture of juicy and dry fodder in the proportions of two-thirds of the former, and of one-third of the latter—an exact reversal of the conditions prevailing to-day.

This revolutionary alteration of diet will involve tremendous changes in the area under cultivation, and is bound up, of course, in the general improvement of agriculture. The doubling of the production of meat and milk—the minimum programme—can only be carried out by the devotion of at least 40 million hectares to the cultivation of special fodder crops, such as maize and potatoes, and special kinds of grass, beet and beans. Further, there is the most urgent need of a general improvement of pasture lands, which are totally wild in Russia, and have never been cultivated even in the most primitive way. But the question of a change of diet for cattle is a matter not simply of growing the crops, but of transforming them into intensive and fattening fodder. This has been best effected in the last ten years or so by the so-called Sylos process, which consists in storing a mixture of dry and juicy fodder in high cemented towers in which it is subjected to a mild fermentation. The product, a sort of pickled vegetable compost, is stimulating and intensive fodder which has been found very acceptable and fattening to cattle in Canada and the United States. Accordingly, a lightning-like campaign has been going on in Russia for the building of thousands of Sylos towers, and of tens of thousands of Sylos trenches.

Socialised Livestock Breeding.

The attempt is now being made to interest the members of the Kolhosi in adopting cattle-breeding as an important section of their economy. This is being done in two ways, by propaganda and by government subsidies. This year's appropriation for this purpose is 170 million roubles, which will be spent mainly on building pig-styes and on acquiring a stock of milch cows and pigs. But, even if the change in the fodder supply is effected immediately, the meat position of the country can only begin to improve in two or three years' time. In the search, therefore, for some immediate relief, the Government are devoting a good deal of their immediate attention to the breeding of pigs, which are much more prolific than cattle, and can be relied on to be ready for the market in about 14 months as against three years required by cattle. The pig is now regarded by the Bolsheviks as the potential meat factory; and the slogan heard on every side is "Breed pigs!"

The Russian peasants never had any instinct for breeding cattle, and whether those organised in collective farms will develop such an instinct time alone will show. Recognising this, and stimulated by the success of the State grain farms, the Government has decided to concentrate largely on the creation of State-owned and State-managed large-scale stock-breeding farms. These farms will be under the management of three trusts, called respectively "The Cattle Breeder," "The Sheep Breeder" and "The Pig Breeder." The first has been given a stock of over half a million horned cattle, to be increased during 1931 to over 3 millions. The area of this trust consists of 15 million hectares of pasture lands, mostly situated near existing State grain farms, the idea being that the trust could utilise some of their enormous stocks of straw. The Sheep Breeder has been given 11 million hectares, situated mainly in the trans-Volga regions, and in some of the Eastern Republics of the Union. The Sheep Breeders' stock is at present 2,600,000 sheep, which it is expected to raise to nearly 5,000,000

during 1931. These animals will be bred not only for meat but for wool. The State farms devoted to pig-breeding are at present the worst-off of all the State stock farms. There are 250 of these farms; but their stock is given as 85,000 only, and the area allocated to them, too, is only 500,000 hectares. At present, the activities of these State farms are being mainly confined to the erection of cow-sheds, sheep-folds and pig-styes, and to the acquisition of stocks.

Apart from a limited number of sheep imported from Australia, and of pigs imported from England, the stocking of these farms is being effected mainly by the acquisition of cattle inside the country. The decrease of stocks has rendered the acquisition of millions of head of cattle no easy task; and the consequence of such extensive stocking for breeding purposes exclusively is bound to make the meat situation still more acute for the next two years at least.

The efforts being made to improve the milk supplies of the country are mainly the business of the Kolhosi, which now possess a collective stock of over a million cows, apart from the animals belonging to individual members. This stock is regarded as the source of milk supply for the towns; and the Government is insisting on the necessity of increasing not so much the numbers of cows as the yield of milk per cow. This yield was always notoriously low in Russia, a circumstance due not so much to the low breed as to insufficient feeding and the neglect of sanitary conditions. It is hoped that the installation of cows in warmer sheds, and putting them on Sylos food will result before long in the doubling of their milk supply.

Flax and Cotton.

In reviewing the progress made by industry in the first two years of the Five Years' Plan, the most striking feature to be noticed is the discrepancy between the achievements of the two groups (A and B) into which it is divided. Group A represents "heavy" industries, such as mining, metallurgy, machine-making, transport and power, or, in other words, industry engaged in "producing means of production"; and Group B stands for "light" industries, those engaged in producing consumers' goods. This discrepancy is by no means accidental; it is part and parcel of the Plan. In a programme of industrialisation which aims above all at rendering the country's industrial development independent of that of a "hostile world," heavy industries must obviously come first; for only a sufficient supply of coal, oil, iron, tools, and machines will ensure the free and unhampered development of the light industries. Yet, conditioned as it is by the position given to them in the plan, the retardation of the development of light industries is due in no small degree to lack of raw materials. The textile industry, at any rate, is held up mainly by the lack of cotton and flax. This summer, for instance, most of the textile factories were closed for 75 days because the supply of cotton failed.

The question, then, of growing more cotton and flax is one of the most serious which the Union has to face. But this is not simply a matter of enlarging the area in which these crops are grown. As a matter of fact, this area has been considerably enlarged within the last few years. Last year the area under cotton was already 30 per cent. above the pre-War level; but the yield was only 2 per cent. above it. The area under flax has grown less quickly; but it is now at least as large as it was before the War; yet the yield is only 52 per cent. of what it was then.

These poor results are attributed by the Government to the disabilities under which the system of small cultivation labours; and consequently the remedy proposed has been the creation of large-scale cultivation of such crops by the aid of a mechanised technique. In other words, it is proposed to solve the cotton and flax shortage by the establishment of huge State plantations and by

the assembling of the small holding devoted to the cultivation of these crops into cotton and flax kolhosi.

This year, out of 1,760,000 hectares under cotton, 200,000 were cultivated by tractors; and the results are considered by the Government highly satisfactory in two respects: First, there has been a considerably greater yield on these fields; and secondly, this has stimulated the interest of the Dakhans, the Turkestan peasants, in the system of intensive cultivation. The programme, therefore, outlined for 1931 is to plough and sow over 1,000,000 hectares with the aid of tractors.

The cotton problem in Turkestan is largely involved in the general grain-growing problem. In order to give Turkestan the importance it naturally has as a cotton-growing country, it is necessary to release it from the need of growing its own supplies of wheat and rye. Since the outbreak of the Revolution and the consequent dislocation of grain supplies, the natives of the country have had to grow grain instead of cotton. The slogan now is: "No more grain-growing in Turkestan." So, the supplying of that country with a sufficiency of grain, a large programme of irrigation, under the supervision of high American experts, and the buying up in bulk by contract of the whole of the cotton crops are the chief measures which the Government's advisers are adopting in solving the cotton problem. But, apart from these measures, they are making an attempt to grow cotton on a large scale, on unirrigated areas, as a pure gamble. They attempted this year to cultivate by the aid of tractors 150,000 hectares of such land in Middle Asia; and the results of the experiment are reported to be satisfactory enough to warrant a repetition of the attempt in 1931 on double the area. For the calculation appears to be that even poor crops, produced with the aid of machines on land which requires no irrigation will be worth while.

I mention this novel experiment because it seems to shed an instructive side light on the mentality of the dictators of Russia's economic policy. The mere fact that they are dealing with vast areas of practically virgin soil seems to inspire them with an enthusiasm for expansion rather than for intensification. This trait, called "Americanism" in Russia, manifests itself in many ways, and I shall have occasion to deal later with the audacious project for moving the wheat belt to the very confines of the desert.

The measures proposed for the increase of the production of flax are similar to those to be carried out for the production of cotton. They can be summarised as follows:

- (1) Specialisation of certain areas as flax-growing lands.
- (2) Organisation of flax-growing State enterprises and of flax-growing kolhosi.
- (3) Supplying the flax growers with grain imported from other parts of the country.

Of the success of these measures it is yet too early to judge.

Tractors, Implements and Machines.

THE value of agricultural machines and implements turned out in Russia in 1930 is likely to reach 321 million roubles. This means that the present output is more than five times larger than that of pre-war times. In fact, the manufacture of such machines is far ahead of all other industries; and, if the increase continues at the same rate, the output is likely soon to become the largest in the world, even larger than that of the United States.

But quantity and quality are different things; and the poor quality of the Russian agricultural machines is due partly at least to the fact that the factories have had to be reconditioned to adapt themselves to the new demands introduced by mechanical traction. Up to 1928 all agricultural machine works were equipped to produce only peasant "equipment," that is, only horse-drawn machines. In that year only 3 per cent. of all machines produced were designed to be used with tractors. This year 24 per cent. of the machines will be tractor-drawn, while in 1931 the

percentage will be 60. This constitutes a very revolutionary and expensive change, for it means that all the equipment of the factories will have to be replaced by new and heavier models. It will also necessitate supplying the factories with different raw materials, with harder steel and stronger wood.

The "Selmash," the huge new factory at Rostov, which I visited this summer, had to be reconditioned three times while it was in the course of erection. Devoted originally to the production of horse-drawn rakes and other small machines, it has now finally been equipped for the manufacture of tractor-drawn binders and other reaping machines. In the case of this and other new factories the tractor revolution has caused only loss of money and time. But the reconstruction and the re-equipment of old factories as a preliminary to the production of the most modern models has meant also a decrease in output and very often inferior quality.

Mechanisation of agriculture involves, however, not only the production of tractors and complex agricultural machines; it necessitates a constant supply of motor lorries, repair shops, tank stations, grain elevators and machines for sorting and for grading grain, as well as telephones, wireless and a number of other services, such as trucks, caravans, field kitchens. And every day the industrialisation of the countryside is provoking new demands for commodities which cannot yet be satisfied.

The main effort of the Government is, however, the production of tractors. Three new factories for this purpose are in course of erection, at Stalingrad (Volga), Kharkov (Ukraine) and Cheliabinsk (Siberia); while the Putilov works at Leningrad are being enlarged so as to allow for an output of at least 20,000 tractors per annum. The Stalingrad factory, which has just been completed, is considered the largest and best equipped of all tractor factories. Its annual output will be thirty thousand 20 horse power tractors of the International Harvester type. The Kharkov factory, which will open early in 1932, is designed to produce fifty thousand 15-30 horse power tractors; and the Cheliabinsk factory, due for completion in the summer of 1932, is being equipped for the production of 25-60 horse power "caterpillar" tractors, and will turn out forty thousand of these a year. The "International" type of tractor is to be used on the Kolhosi; while on the State farms and for the breaking up of virgin soil the "caterpillar" kind will be used.

When these factories are ready and start production, the annual output of tractor power in Russia will amount to over 3,000,000 horse power. The question then arises whether an economic employment of such a power is possible, whether trained men can be found to drive these tractors, and whether enough machines can be turned out for them to drive. The inevitable reply to such questions is that the output, great as it may seem, will soon be inadequate to the growing needs of the country. The Bolsheviks are indeed confident that in three years' time they will have 100 million hectares tilled by mechanical power. They claim that the collective farms, the State grain farms, the need for an additional 40 million hectares for fodder crops, the cotton, flax and other technical crops, and the projected enlargement of the wheat belt by 20 million hectares of virgin soil will not only absorb the output of tractors but will render it inadequate to the country's needs.

Geographical Re-distribution of Crops.

A REVOLUTIONARY epoch is one in which everything seems possible. Theoretically, indeed, nothing is too daring or too difficult to be attempted by the Bolsheviks. If anything appears difficult, it is only because it has not been approached in "the Bolshevik spirit." If anything

goes wrong, it is at once attributed to lack of "activity." Initiative, energy and persistence are reckoned the certain creators of success.

There are many departments in which this peculiar trait is finding expression; but nowhere is it so clearly manifest as in the Commissariat of Agriculture. And of all the grandiose schemes with which this Commissariat has been identified the most daring is that of attempting to reshape the agricultural geography of the country. That mechanisation of agriculture should influence the agricultural zones of the country is natural enough. But what we are witnessing in Russia to-day is an endeavour completely to uproot century-old divisions of crops. And the most daring and the most fateful is the moving of the wheat belt up to the confines of Asia.

At present, the Ukraine, the Kuban and the Northern Caucasus constitute the main granary of Russia. But it is contended that it is wasteful to grow wheat in such areas, which could more profitably be utilised to raise more valuable crops such as soya beans and sunflowers. Wheat, on the other hand, it is claimed, can be grown on areas which are too dry to produce the more intensive crops. Hence the decision to cultivate regions in the Trans-Volga district, in Kazakhstan and in South-Eastern Siberia. The total acreage of these areas is, in round figures, 400 million hectares, of which less than 35 millions are actually under cultivation. It is now proposed to increase the area under cultivation in the next three years by at least another 20 million hectares, of which 8 millions are to be added in the Volga districts, 8 to 10 millions in Kazakhstan and 4 to 5 millions in Siberia.

Crop Redistribution.

To realise the magnitude of the enterprise which the young Commissar of Agriculture is undertaking, it is necessary to remember that most of the areas in question belong to the drought zone, are very thinly populated, and possess a most primitive agriculture. Even M. Yakovlev admits that the scheme sounds fantastic. But he is confident that with the help of tractors it can be accomplished. The argument employed by M. Yakovlev when he outlined the scheme at the Congress of the Communist Party and the enthusiastic reception given to it there are so typical of the spirit of Bolshevism that his remarks are worth quoting:

"The key to the solution of the problem," said M. Yakovlev, "consists in the fact that it must be undertaken with a minimum of men and of animals in order to obviate the necessity for keeping large stocks of grain to meet possible failures of crops. This means that the areas will have to be cultivated only by machines, which must be worked to the utmost limit of their capacity. One man will have to look after 200 hectares. That this idea is feasible was proved by our experience on the State farm, where as many as 210 hectares require only a single man. And this is not the limit. We are not going to stop here. Therefore, if that is so we can solve the wheat problem with only a slight addition to the actual population of these regions. What will be needed is to transfer the people in accordance with the requirements of the plan, and to employ every human power fifteen times more productively than it is employed at present."

"The system to be adopted will be that of tractor-stations and State farms. But the State farm must be different from those we already have. Here we need farms embracing not tens of thousands but hundreds of thousands of hectares. And here we shall have to erect very few and very simple buildings. Or rather the same buildings will have to serve a vastly larger area. Another essential difference is that the machines employed will have to be less complicated than those used on the State farms. The enlargement of the area should compensate for the low quality of the cultivation. There is obviously a risk of periodic failures of crops. Against such failures in drought zones there is at present no guarantee. But the only guarantee we need is not against occasional failures of crops, but against famine. Our only safeguard will be to increase the area under cultivation as much as possible, and to lay in a sufficient stock of food and seeds to meet such failures. These are the conditions in which this problem will be solved, and the fantasy will become a reality. By the spring of 1933 we shall have an additional 20 or 25 million hectares under wheat."

Less spectacular, but not less radical, are the other suggestions for the redistribution of crops which the

Institute of Economics and Organisation of Socialist Agriculture—a branch of the Lenin Academy—has put forward, and the Government has accepted. In accordance with these suggestions, the country will be divided into five zones.

The first, that of technical crops and intensive stock-breeding, will comprise the South-West Ukraine, the Central Black Soil Belt, the Northern Kuban, and some parts of the Far East. Here will be cultivated hemp, sugar beet, maize, soya beans, tobacco, cotton, sunflowers and kenaff.

The second, that of flax, dairy produce and market gardening, will embrace waste lands and pastures of the "grain-concerning" districts, an area extending from the Baltic through Moscow to the Urals.

The third, that of sub-tropical culture, will stretch from the Southern Crimea through the Caucasus to Middle Asia. The main crops to be grown here are cotton, tea, grapes, plums, apples, melons and oranges; and the idea is to transform the whole district into a Russian Florida and California.

The fourth, that of extensive stock-breeding, is to be situated in the mountainous parts of the Burjat Mongolian Republic and in the South-Eastern Steppes of Trans-Volga. This will be the scene of operations of the "cattle breeder" and the "sheep-breeder" trusts. (The pig-breeder's farms will be mainly confined to the first two zones.)

The fifth zone, that of forests, which extends from Archangel to the Pacific and occupies about a quarter of the country, is regarded by the Institute as a future reserve of arable land.

Conclusions.

I HAVE endeavoured to outline the trend of the ambitious and grandiose schemes which are being put in operation by the Bolsheviks with a view to socialising Russian Agriculture. Will those schemes succeed? As I have pointed out, there are two objectives in view. One is to raise agricultural production by mechanisation and by inducing the peasants to employ large-scale methods of cultivation through co-operation and pooling their holdings. This movement is still in its early stages; but I am confident myself that, where it has been tried, the mechanisation of technique can be said to have been accepted by a section of the peasants. The progress of mechanisation will depend entirely on the progress of the industrialisation of the country. That is to say, it will depend on whether the industries are able to supply the machines necessary to mechanisation. As to co-operative effort and the pooling of holdings, my view is that mechanisation makes an escape from collectivisation impossible. Once tractors and combines are used on an extensive scale, small individual holdings must disappear.

The other objective of the Five Years' Plan—the establishment of Communism in the villages—is quite a different matter. It would be unwise to dogmatise on the subject; for there is no material to start a discussion. All that is known is that the shock-methods employed last year to "deepen" collectivisation by giving it a Communist tinge proved a failure. Obviously mechanisation and even collectivisation cannot create Communism. Neither can conversion to Communism take place as the result of sheer relentless compulsion. Even the sanguine and impatient Bolsheviks admit that collectivisation is only a road and a long road to Communism. It may prove a longer and a more devious road than they expected. But while the odds seem not to favour the chances of Communism in the villages, there are some factors which make such a development less impossible than it would seem at first sight. And the main factor, in my opinion, is the idea of a new life which has been awakened among the active members of the younger generation.

STATISTICAL APPENDIX.

PRODUCTION OF PRINCIPAL CROPS.

	(In million tons.)				
	1925.	1926.	1927.	1928.	1929.
Rye	23.0	23.9	24.4	19.1	20.2
Wheat	21.3	24.9	21.1	21.6	20.1

POST-WAR HUNGARY.

TWELVE years ago the political and economic structure of Central Europe was profoundly modified as a result of the World War and of an attempt to apply the doctrine of nationality to this mixed racial area. A comparison between the new order thus created, and legally established in the treaty settlement which followed, and the old system which it displaced, is ever present in the thought of all politically minded people in this much-harassed part of Europe, victors and vanquished alike, and no account of the new Hungary would be complete without some reference, however brief, to this acutely controversial topic.

	Area sq. miles.	Population. 20,886,487	Population per sq. mile. 166
Pre-War Hungary (1910)	125,609		
Post-War Hungary (1920)	35,866	7,980,143	222

1920 as per cent. of 1910 28.5% 36.4% 133.7%

It is estimated that the population in the present year amounts to 8,661,787.

In the old Kingdom of Hungary, with a story stretching back a thousand years into the middle darkness of historic time, the Magyars represented the dominant and very conscious majority of the population. According to the census of 1910 approximately 54.5 per cent. of the inhabitants spoke Hungarian as their mother tongue. The leadership in politics and economics alike was in their hands. The old kingdom of St. Stephens, within boundaries long established as the result of historical and geographical, if not of racial, influences, had developed as an economic unit. It formed part, it is true, of the larger area of the Dual Monarchy, and thus enjoyed an assured market for its surplus agricultural products in the industrial areas of the Austrian Empire, but even before the end of last century the awakening national consciousness of the Magyar people had come to demand a greater share in commerce and in industry. From 1907 onwards the Hungarian Government, assured of what was virtually an independent status under the terms of the famous Compromise Agreement with the Habsburgs, concluded in 1867, did all in its power to encourage the industrial development of the lands under its sway. Budapest was the centre of this new activity, with its

banks and industrial undertakings, and with a population which, by 1910, already amounted to over 880,000 souls. Timber, salt and iron from the pasture lands of Transylvania, coal and iron ore from the mountains of Slovakia, and the rich resources of the fertile Danubian plains were the basis on which the Government endeavoured to build this industrial development. Tariff policy was settled every ten years, in theory if not always in practice, with the Austrian partner; otherwise defence and foreign policy, with the financial arrangements they necessitated, were the only common bonds which linked the two halves of the Dual Monarchy together. In the years immediately preceding the outbreak of the World War, economic nationalism was in the ascendant in Hungary, though her industries were small in scale, every possible device was used to stimulate them.

This process was rudely interrupted by over four years of hostilities and a treaty settlement disastrous to Hungarian aspirations. The new Hungarian State became, at birth, a mere fragment of the old kingdom; the area under Magyar rule was only 28.5 per cent. of that of former days, and the population was reduced to barely one-third. This was, in itself, a bitter pill to swallow, but Magyar patriotism was wounded still further by the fact that, of the thirteen and a quarter million people transferred to other allegiances, nearly three and a quarter million, or over 80 per cent., were Hungarian in speech and outlook. The political importance of this factor, even at the present day, is well known. But it is not the purpose of this Supplement to discuss the politics of Hungary. Its object is rather to consider the economic structure and possibilities of what is termed, in patriotic parlance, "Rump" Hungary.

The new State, a kingdom without a king, contains some of the richest corn-growing land in Europe, and has inherited much of the industrial equipment of pre-war days. It is, however, deficient in coal, iron ore, and timber—to mention but a few pre-requisites of industrial development—though many of its leading men are imbued with the Protectionist leanings of Habsburg times. This, as all experience proves, must inevitably lead to a divergence of interest—particularly in a country which is predominantly agricultural—between the agrarian and industrial portions of the population, and at the moment market conditions are forcing the difficulties of

agriculture to the front of the stage. What this means for Hungary is illustrated by the following analysis of the principal occupations of the people:—

OCCUPATIONS (Post-War Territory).	1910.		1920.	
	Per cent.		Per cent.	
Agriculture	56.0		55.7	
Mining and industry	21.2		20.6	
Commerce	4.6		5.1	
Transport	4.1		4.4	
Public services and liberal professions	4.0		4.7	

The growth of the distributing and professional services shown in the above table has almost certainly proceeded still further since the last census year. The proportions shown in the last group are to some extent the reflection of the unduly large proportions of the civil services—the result in part of the *morcellement* of Central Europe.

Unlike that of the pre-war kingdom, the population of modern Hungary is very nearly homogeneous in ethnic character. Approximately 90 per cent. of the total speak Magyar as their mother tongue, while, of the minorities, the Germans come first with 6.9 per cent. and the Slovaks a poor second with 1.8 per cent. For an understanding of the political situation, a consideration of the distribution of population as between the principal types of religious belief is also of interest. According to the census of 1920, Roman Catholics accounted for 63.9 per cent. of the total, Calvinists came second with 21 per cent., Lutherans

third with 6.2 per cent., and Jews fourth with 5.9 per cent.

Such, then, in brief outline, is the Hungarian State as it exists to-day. In the articles which follow our readers will find the principal features and problems of the present economic situation described by experts. It has not been easy for the Magyar nation to settle down to the rôle of a small people in a region which it had dominated for so many centuries. The difficult problem of reconstruction after years of warfare were made still harder of solution by the break-up of a well-established economic system. The Bolshevik interlude of Béla Kun, in 1919, followed by an inevitable swing to the extreme right, made social confusion worse confounded. In the countryside, although a measure of agrarian reform has already been carried out, there is still an unsatisfied demand for peasant holdings. In the sphere of national finance much solid progress has been achieved since financial reconstruction was effected under the ægis of the League of Nations and its genial High Commissioner, Mr Jeremiah Smith, six years ago. A world-wide crisis, reflected worst of all, perhaps, in the present price level of agricultural produce, naturally raises immediate problems of great magnitude in a predominantly agricultural State like Hungary, but the agricultural wealth of the country, no less than the vigour and energy of its peasant population, promise well for an economic recovery which, it may be hoped, will not be long delayed.

I.—FOREIGN TRADE AND INDEBTEDNESS.

COMMERCIAL POLICY AND FOREIGN TRADE.

By DR. JOHN DE BUD, Minister of Commerce and Economic Affairs.

HUNGARY is one of the chief victims of the economic dislocation caused by the treaty settlement in Central Europe. The old Austro-Hungarian Monarchy, with a population of 50 millions, was an ideal economic unit. This was broken up, and the Successor States at once indulged in a vigorous protectionist policy, though none of them could hope to be self-sufficing in the economic sphere. The ravages of the war resulted in a chronic shortage of raw materials, and this, in its turn, was only responsible for the introduction of close State control over economic activities, in Hungary as well as in her countries. When currency depreciation came to an end in 1924 and more normal economic conditions were established, Hungary was the first of the Central European States to do away with prohibitive restrictions on foreign trade. Import and export prohibitions were abolished, State control was relaxed by degrees, and liberty of trade was restored. Unfortunately this example was not followed by Hungary's neighbours, and the export trade of the country is still hampered by various restrictions in force in adjoining countries. As examples of this we might cite the system of contingents and the unwillingness to conclude veterinary agreements.

One of the main causes of the economic crisis now prevailing in the world in general, and in the Danubian States in particular, is undoubtedly the policy of high protection practised by all the leading industrial countries. As Hungary is above all an agricultural country, her purchasing power abroad depends upon the willingness of the industrial countries to take her agricultural surplus in exchange for their industrial products. Hungary took part in the agrarian conferences of the Eastern European States held at Warsaw, Geneva and Bucarest this autumn, and she will continue to work for concerted economic action with a view to overcoming the present crisis in agricultural exports.

After the war the old Austro-Hungarian Customs Tariff was taken over as a basis for Hungarian fiscal policy, though successive amendments were necessary to meet the radical changes in economic structure brought about by the Peace Treaties. In 1925 a new Autonomous

Tariff was passed, with a view to facilitating the negotiation of commercial treaties. A very considerable number of the items in this tariff schedule have been steadily reduced as a result of the conclusion of commercial treaties, based on the most-favoured-nation clause, with practically all countries trading with Hungary. The importance of these reductions can be shown statistically; whereas Customs receipts amounted to 15 per cent. of the value of total imports in 1925, they had declined to between 10 per cent. and 11 per cent. in 1929 and 1930.

The recommendation of the World Economic Conference, held under the auspices of the League of Nations in 1927, that tariffs should not be increased but lowered, has been faithfully observed by Hungary. Unfortunately this policy has not been applied by her industrial neighbours, Austria and Czechoslovakia, which have both raised their Customs duties on agricultural products, to the great embarrassment of Hungarian agriculturists. The negotiations for concerted economic action which took place at Geneva in March, 1930, were followed with great interest in Hungary, who, for her part, would readily have ratified the Commercial Convention but for the refusal of Austria and Czechoslovakia to do so. It is, indeed, obvious that a small country like Hungary cannot inaugurate a new commercial policy without reference to that adopted by her neighbours. An analysis of her foreign trade returns shows that more than half of the total is with the Successor States—Austria, Czechoslovakia, Roumania and Yugoslavia—in spite of the high tariff barriers they have erected. Apart from these, Germany and Italy also play a most important rôle in her foreign trade. The large table on page 3 shows the direction of trade for the first nine months of this year as compared with that of the corresponding period of 1929. It will be seen that a favourable balance existed with Austria and Italy, while Germany, Czechoslovakia and Roumania exported more to Hungary than she did to them. The expansion of exports to Italy, made up chiefly of cereals and livestock, deserves special mention. An increase in our exports to Great Britain, the principal articles being poultry, flour and vegetables, is also a welcome feature.

In spite of all the restrictions and hindrances, to which brief reference has already been made, the foreign trade of Hungary has developed fairly steadily during the past ten years, as may be seen from the next table:—

FOREIGN TRADE OF HUNGARY IN THE YEARS 1920-29.

(In million pengő.)

Year.	Total trade.	Imports.	Exports.	Balance.
1920	674.7	484.1	190.6	- 293.5
1921	898.6	604.0	294.6	- 309.4
1922	1,008.6	625.7	382.9	- 242.8
1923	882.9	490.7	392.2	- 98.5
1924	1,482.3	815.3	667.0	- 148.3
1925	1,712.6	864.6	848.0	- 16.6
1926	1,817.7	941.0	876.7	- 64.3
1927	1,989.9	1,182.3	807.6	- 374.7
1928	2,037.4	1,211.4	826.0	- 385.4
1929	2,103.0	1,062.8	1,040.2	- 22.6
First nine months:				
1929	1,484.6	806.1	678.5	- 127.6
1930	1,295.7	627.8	667.9	+ 40.1

Both imports and exports have increased considerably over this period, and, after ten years with an unfavourable balance of trade, this present year will probably show a surplus of exports over imports for the first time. From 1920 to 1922 there was a heavy import surplus, owing to the fact that stocks and implements had been sadly depleted as a result of the war, and the deficiency had to be made good at all costs. The situation improved somewhat in 1923, but it was not until two years later that the volume of foreign trade attained to something like normal proportions. The restoration of the currency was followed by a period of economic recovery, reflected in the small deficits of 1925 and 1926. In the two following years, however, the inflow of foreign funds in considerable quantities provided a great impetus to imports at a time when exports were falling off slightly. In 1929, however, the situation changed completely. Foreign funds were no longer available to anything like the same extent, and the Government did all in its power to increase exports by the granting of cheap export credits, the remittance of taxes and the reduction of railway rates. This movement was, of course, greatly facilitated by the good harvests of 1928 and 1929, and by an increased export of livestock.

Detailed results for the first nine months of the present year, which are shown in the following table, show that

Country of origin or Destination respectively.	Imports.				Exports.				Balance.	
	1929.		1930.		1929.		1930.		Imports—1929.	Exports—1930.

FOREIGN LOANS.

By M. BÉLA DE SCHOBER, Director-General of the National Bank of Hungary.*

THE modern economic development of Hungary really began in the third quarter of the nineteenth century. The compromise made with Austria in 1867 secured her existence as an independent State within the framework of the Dual Monarchy, and made it possible, though subject to certain important limitations, for her to embark upon an

* The author has to thank Dr. Judik, of the National Bank, for verifying the statistical references in this article.

export values have been maintained at the high level of 1929, while imports have declined substantially:—

The principal exports consisted of live stock, wheat, flour, sugar, poultry, eggs and machinery; while the chief imports were textiles, timber, paper, coal, oil, machinery and ironware. When we bear in mind that agricultural prices have fallen during the past year, the recent volume of exports affords a striking proof of Hungary's power of resistance in times of economic stress. The decline in imports partly reflects the fall in the prices of industrial products, though the reduced purchasing power of the country and the absence of long-term loans are also factors of the first importance in this connection.

The Hungarian Government is fully aware that the future welfare of the country depends upon whole-hearted collaboration with the rest of the world. Hungary is anxious to increase her share in international trade, and would welcome a general reduction in tariffs. She needs outlets for her surplus agricultural products because only thus can she purchase the goods she cannot produce at home and meet the service of her foreign debt.

economic policy of her own. She took up the arduous task of transforming and modernising her whole economic structure with all the vigour and enthusiasm of youth. Between 1867 and 1913 nearly 14,000 miles of railway line were built, important works of river regulation were carried through in the interests of Danube navigation, and a modern seaport was constructed at Fiume. These years witnessed a marked development in agricultural production, and great progress was made not only in the industries more directly connected with agriculture but in certain branches of the so-called heavy industries as well. A modern banking system was created and, at the time of the outbreak of the World War, the deposits of

the various Hungarian banks amounted to a total of some 4,500 million kronen.

This rapid economic transformation was only possible thanks to the co-operation of foreign capital. As a partner in the Dual Monarchy, it was natural that Hungary should borrow largely from Austria. Indeed, in pre-war days, more than half the total of her long-term foreign loans came from this source. Next in importance came Germany, which provided nearly 40 per cent. of the foreign capital invested in the country, while the balance came for the most part from France, England, Switzerland, Holland and Belgium.

Much the most important share in foreign borrowing fell to the Hungarian State, whose long-term foreign indebtedness amounted to £144,100,000 at the end of 1913; to this total should also be added the sum of £56,200,000, which was Hungary's share in the old Austrian State debt contracted prior to 1867. But other borrowers also acquired very considerable sums from abroad, and the total long-term indebtedness of the country at the end of 1913 amounted to about £350,000,000, which was made up as follows:—

	Million £
The State Debt, including Hungary's share in the Austrian Debt contracted prior to 1867.....	200.3
Foreign Debts of the City of Budapest.....	12.5
Mortgage and Communal Bonds placed abroad by Hungarian Banks.....	87.4
Railway Shares and Bonds.....	33.3
Mortgage Loans granted by foreign banks on real estate.....	20.8
Total.....	354.3

This foreign debt, of which rather over one-third was in foreign currency denominations, was naturally a charge on the whole territory of the former kingdom, which was more than three times the size of the present Hungary. In allotting the responsibility for those State debts which enjoyed no special security amongst the various Succession States, the Reparations Commission made the new Hungary liable for 45.7 per cent. of the total. Her share of the pre-war private indebtedness was, however, considerably greater, since the private debtors, who were mainly the banks, operated for the most part inside the frontiers of present Hungary. After a disastrous war, the dismemberment of the treaty settlement, a Bolshevik interlude, and foreign occupation, this total of pre-war indebtedness represented an intolerable and crushing burden, which was made all the worse by currency inflation. At the same time, depreciation reduced the value of such foreign debts as were in krone denominations and not subject to valorisation.

If the credit of the country was to be restored, it was essential that some arrangement should be arrived at with regard to the whole question of pre-war indebtedness. Individual debtors opened negotiations with their foreign creditors with the result that, in the vast majority of cases, agreements were arrived at which were acceptable to the latter. So far as State debts, in gold or foreign currencies, were concerned, provisional agreements were reached at Innsbruck in 1923 and at Prague in 1925. The Hungarian share in these debts was fixed, as we have already indicated, at 45.7 per cent., and the service of the four principal loans was regulated on a uniform basis for all the Succession States of pre-war Hungary. For the time being, interest payments are made at 32 per cent. of the original rate, calculated on a gold basis, in the case of the 4 per cent. gold loan, and at 27 per cent. in the case of the 4 per cent. (1910), 4½ per cent. (1913) and 4½ per cent. (1914) Sinking Fund loans. The final regulation of this difficult question is still pending. An agreement was also reached at Ostend, in 1925, between the City of Budapest and its foreign creditors in respect of its loans issued in 1910, 1911 and 1914. Interest payments are made on the basis of 75 per cent. of the gold value down to 1930, and thereafter in full. Sinking Fund operations are suspended down to 1934, when a new redemption scheme will come into force, according to which the three loans will be completely redeemed by January, 1934. The foreign currency indebtedness of the banks, in respect of mortgage bonds, communal obligations and the like, has been settled in almost every case by agreement with the creditors, while debts due to ex-enemy citizens and payable, according to the terms of the treaty, in the cur-

rency of the creditor's State, if not settled by agreement, have been dealt with, in a large number of cases, under the clearing procedure established for this purpose.

In the post-war period there has been a great demand for new capital to make good the ravages of the years of war and currency inflation, and also to transform the economic organisation of the new dismembered country. Down to 1924 the uncertain economic and political situation of Central Europe acted as a limiting factor, and foreign credits were largely confined to financing relief purchases of flour and the expenses incurred in repatriating prisoners of war. The issue of the Reconstruction Loan, under the aegis of the League of Nations, changed the whole situation. This loan was of the nominal value of £14,400,000, of which the greater part (£7,900,000) was issued in England. From 1924 onwards there has been a considerable influx of foreign capital into the country, though the movement received a marked setback in 1929.

Immediately prior to the Reconstruction Loan of 1924, the foreign indebtedness of Hungary amounted to some £46,700,000, or, if we valorise the pre-war State loans on the percentages agreed upon for interest payments at Innsbruck and at Prague, to approximately £25,200,000. From that date to the end of 1929, Hungary has received long-term loans to the nominal amount of £49,900,000, the actual proceeds totalling £44,100,000. During the same period, sinking fund payments have decreased the total by £4,100,000. In addition to this, £18 millions have come into the country in the form of short-term foreign loans and other capital transactions. At the end of 1929, the total foreign indebtedness of Hungary thus amounted to roughly £110,000,000, or to some £90,000,000, if the pre-war State loans are calculated on the Innsbruck and Prague percentages.

The long-term foreign loans raised between 1924 and 1929 may be grouped as follows:—

	Million £ Nominal.
For the State.....	12.6
For Counties, Towns, Communes and Churches.....	12.3
For Agriculture.....	15.5
For Urban Real-estate owners.....	3.9
For Industry.....	5.6
Total.....	49.9

Of this total about £20.2 millions came from the United States, £19.1 millions from England, £1.7 millions from Holland, and the balance of £3.9 millions from the rest of the world. More than half England's share (£10.5 millions) is made up of her quota in the League Reconstruction Loan, the \$20 millions Loan of the City of Budapest, 1927, and the Hungarian Counties Loans, 1926 and 1927, with a total nominal value of £2.3 millions. The Hungarian banks have placed mortgage bonds in England to a nominal value of £4.3 millions, while £3.6 millions have been raised for industrial purposes. The bulk of this latter sum consists of two loans of the Trans-Danubian Electricity Company, issued in 1928, and amounting to £3.3 millions.

The proceeds of some of these loans, and more especially of those raised in the earlier years by local authorities, had perforce to be employed in large measure for public utility purposes which did not result in a direct increase of production, and only about two-thirds of the capital investment programme of the State was directed to what can strictly be called economic purposes. This was in large measure inevitable after the neglect of long years of war and inflation. But almost with the first influx of foreign capital there began afresh the process of capital accumulation within the country itself, and an increasing proportion of the sums required for productive purposes were raised in the home market. Deposits in the twelve leading Budapest banks and in the Post Office Savings Bank, which were only 4.8 per cent. of their pre-war level at the end of 1924, had risen, by the end of August, 1930, to £54,400,000, or 81.4 per cent. of the pre-war figure. Even so, however, the national savings are still insufficient to satisfy all the country's needs. The amount of new capital for long-term investment remains very small, and the demands, more especially of the State and of the agricultural community in this direction cannot be satisfied in the near future without recourse being had to foreign sources of supply.

At the moment the State needs capital above all for the development of the railways and for road building. In one sense this latter form of expenditure is not a direct income-yielding investment, though it would certainly contribute greatly to the economic efficiency of the country as a whole. It is essential that roads should be built to connect the outlying districts and farms with the railway stations and with the main road arteries in order to open up these territories to trade and commerce. Moreover, any real improvement in agriculture, which is much the most important Hungarian industry, would also call for capital investments which, in the very nature of things, can only be obtained in sufficient quantities abroad.

It is the general conviction nowadays that no new foreign borrowing should be indulged in save for productive purposes. Capital so applied would be of inestimable service and would contribute in marked degree to the more efficient organisation of the economic life of the whole nation.

THE BALANCE OF PAYMENTS.

By DR. BÉLA DE IMRÉDY, Managing Director of the National Bank of Hungary, Head of the Intelligence Department.

The importance of a careful study of the various items which enter into the balance of payments of a country hardly needs stressing nowadays. Definite conclusions are, of course, hard to draw with any degree of certainty, but a study of these data over a period of years throws considerable light on the productive forces of a country and on its power to adapt itself to changing international conditions. In the case of Hungary, the modifications brought about by the Treaty Settlement led to a shortage of certain basic commodities, such as wood, metals, high-grade coal and water power, and made the country more dependent than ever before, and, for that matter, more dependent than most other countries, upon foreign sources of supply. Under these circumstances, the various problems associated with the balance of payments are of the very greatest interest to the leaders of economic policy.

For the six years or so of inflation which followed immediately after the war, the development of Hungarian foreign trade was quite abnormal. It was a period of restrictive interference with the exchange of goods and the movement of capital. Attempts have been made to establish the balance of payments during these years, but, for an understanding of present conditions, it will suffice to give the various items for the period since stabilisation was effected. The most complete picture is given in the compilations published by Dr. Julius Szigeti, of the Central Statistical Office, and originally drawn up according to the scheme recommended by the League of Nations. In the table overleaf, however, this has been somewhat simplified. The various items are divided into two main groups, those relating to current transactions—or, in other words, the balance of trade taken in its widest sense—and those showing the movement of capital. We can thus trace the changes in the foreign debts and claims of Hungary. Insistence upon the movement of capital is especially important in a country poor in capital equipment, for an adverse balance of payments is a most disturbing symptom if it is not accompanied by a corresponding growth in national wealth.

Amongst the current items it will be seen that the movements of merchandise are of dominant importance and do, in fact, determine the balance in this group. The increase of imports in 1927 and the marked rise of exports last year are most interesting for the light they throw upon the close relationship existing between the balance of trade and the influx of foreign capital. This latter has naturally led to a steady growth of payments on account of interest charges and dividends. It should be pointed out that the decrease shown under the heading of interest on State debts in 1929 was mainly due to a change in the methods of compilation: certain items which formerly figured as interest payments now appear

under the heading of amortisation of capital. It will be noticed also that while there is a permanent adverse balance in respect of tourist services, remittances from emigrants are a significant source of national income. Railway, shipping and postal services together show a surplus in Hungary's favour, but the other items of lesser importance combine to make an adverse balance. The big increase in these other entries from 1928 onwards, both on the credit and the debit side, is due to the introduction of gross figures in the estimates of insurance premiums and agents' commissions. For the future no striking change in these less important items is, at all likely, with the exception of increased receipts from the tourist traffic, since foreigners are now visiting Hungary in larger numbers than before. The general balance of current payments must perforce continue to be dominated by the very variable items of imports and exports of merchandise, and by the steadily increasing charges in respect of foreign loans and credits.

On the capital side the influx on account of long-term loans rose from 168.7 million pengő in 1926 to close on 300 millions in 1927 and 1928, though it fell back to 234 millions last year. This latter figure, however, only partially indicates the change in capital movements, since it includes two instalments of the loan contracted with the Swedish Match Trust in the previous year for the purpose of financing agrarian reform. These payments amount to over one-half of the capital imported in 1929. The figures for short-term credits are naturally based to a considerable extent upon estimates and cannot pretend to complete accuracy. They nevertheless indicate a general upward movement in 1927 and, though to a less extent, in 1928, followed by repayments in 1929. Of recent years dealings in shares have only played a relatively minor rôle in the movement of capital into the country. Foreign concerns have, indeed, participated in Hungarian enterprises, especially when the latter have increased their capital. By so doing they have played an important part in supplying capital to individual banks and business undertakings. From a national point of view, however, these items have only been of minor importance as compared with the loan transactions. It would appear, from the data available, that the same has been true of movements of securities dealt in abroad, though it is naturally most difficult to make reliable estimates of stock-exchange transactions of this type.

The influx of foreign capital down to the year 1927 led to a rise in the foreign exchange holdings of the National Bank. In 1928 and 1929, however, the adverse balance in respect of current items was made good in part, at least, at the expense of these holdings.

It is, of course, too early to do more than estimate the probable trend of the balance of payments for the current year. Statistical data are already available for the first eight months, and these can be supplemented by careful observation in competent quarters. For the period January to August, 1930, imports exceeded exports by 40 million pengő, while payments on account of interest, dividends and other smaller current items, amounted to between 140 and 150 millions. There was thus an adverse balance on current account of something over 100 million pengő. On the capital side there was an influx of about 150 millions, partly from long-term, but mainly from middle-term loans. In addition, the short-term indebtedness, excluding commercial merchandise credits, increased by some 50 millions. Share issues accounted for a further 10 millions, so that the total capital import stood at over 200 millions. Even when we allow for an increase of 30 millions in foreign exchange holdings, the total is considerably in excess of the adverse balance on current items. It is probable that outstanding commercial credits have decreased with the decline in imports, while there are reasons for supposing that Hungarian securities held abroad have been to some extent brought back by Hungarians. This repatriation of securities, together with the purchase of foreign securities by Hungarians has almost certainly been greater in amount than the advent of new foreign capital participation in Hungarian undertakings.

We may now summarise the general movement of the last five years. An adverse balance of 150 million pengő in 1926 rose in the two following years to some 500 millions. A radical change made itself felt in 1929. The general world situation was reflected in the marked fall of capital imports into Hungary, amounting in that year to but little more than 200 millions. The balance of trade, which in the first half of 1929 was still under the influence of the abundant credit supplies of previous years, reacted suddenly in the second half of the year, with the result that, for 1929 as a whole the adverse balance had been reduced to 40 millions. This tendency has continued in an even more striking form during the present year.

The relationship between capital movements and the exchange of goods suggests some interesting questions. Is the formation of the balance of commerce a mere reflex phenomenon, in which case the large adverse balance in 1927 and 1928 appears simply and solely as the result of the heavy influx of foreign capital? Or, on the other hand, did the easy situation then prevailing in the international money market stimulate a demand for investments believed to be useful in themselves, though perhaps not entirely justified from the economic point of view, or even for goods for immediate consumption? Of more immediate importance, however, is the further question as to whether the transformation of the balance of trade, which started in 1929, can last indefinitely. It cannot be denied that the expansion of

exports was made possible to some extent by the liquidation of stocks. The abundant grain crop of 1928, for example, was not exported until quite late, and showed for the most part in the returns for the second half of 1929. With medium crop results it is hardly likely that the level of grain and flour exports reached last year could, in fact, be maintained.

Of course, the present situation in Hungary is dominated by the general world depression which is notoriously acute in the case of agricultural products. The catastrophic fall in grain prices has naturally reduced the purchasing power of Hungary abroad, and if a more adequate relationship were established between the prices of agricultural and those of industrial products this alone would go far to compensate for the fall in the import of capital. If such a price readjustment does not take place, other methods must be discovered of adapting methods of production to the changed circumstances of the world market. This task will call for great energy and no little patience, of both of which the nation has frequently given proof in the past. In developing its productive capacity, Hungary will be obliged to have recourse, for many a year to come, to foreign capital. In the lean years, however, the qualities of its people and the greater power of resistance enjoyed by an agricultural country in facing a period of general depression, will enable Hungary to attack a set of problems difficult enough in themselves though by no means impossible of solution.

II.—CURRENCY, BANKING AND FINANCE.

CURRENCY STABILISATION.

By Dr. ALEXANDER POPOVICS, President of the National Bank of Hungary.

THE policy adopted by the National Bank of Hungary was laid down in its statutes and determined by the practical problems with which it was faced at the very outset of its activities. Its foremost task was to maintain the stability of the national currency. During the negotiations which preceded the actual formation of the bank it was decided that stabilisation should be effected at the level ruling when the League of Nations Reconstruction Scheme should first come into operation. This was regarded as feasible provided that the State stopped having recourse to the printing press and re-established budgetary equilibrium by increasing taxation and, for a transition period at least, by using temporary credit facilities which the reconstruction scheme placed at its disposal. It was an essential part of the programme that a well-organised central bank, independent of State control, should be entrusted with the management of the new currency.

This plan seemed simple enough in theory, but it was by no means easy to apply in actual practice. The currency position of a country is determined by the free development of all its economic forces. When, however, stabilisation was first planned in 1924, Hungary was still suffering from the pernicious after-effects of the war period. Imports and exports were subject to prohibitive barriers, and dealings in the foreign exchanges were under State control. As the stabilisation scheme aimed at the re-establishment of normal economic conditions, the bank had to consider what would be the probable consequences of freeing trade from the prohibitive restraints then ruling, and of removing the barriers which surrounded dealings in the foreign exchanges. When, in April, 1924, the old krone currency reached its lowest level—equal to one twenty-thousandth of its nominal gold value—it seemed as though depreciation was due almost as much to psychological as to purely economic causes.

Before it began its activities, the National Bank informed the Government that the gradual removal of restrictions on trade and finance was an essential preliminary to stabilisation because, until that was done, the bank could not properly decide upon the level at which the value of the new currency should be fixed. This was all the more apparent, since stabilisation was to be effected not by deflation, but by fixing a new ratio between the paper currency and gold.

An accidental circumstance greatly helped in the solution of this problem. The principal feature of the reconstruction plan was, of course, the restoration of budget equilibrium with the aid of a Reconstruction Loan to be issued in 1924. The National Bank was also dependent upon this loan, as its own capital, and what remained of the exchange holdings of the *Devisenzentrale* would not provide an adequate metal cover for the new institution, and a portion of the proceeds of the loan itself would have to be made available for this purpose. Early in 1924 the success of the whole scheme was threatened by the refusal of the United States to participate in the flotation of the Reconstruction Loan. When matters were most critical, however, the Bank of England advanced £4,000,000 to the State Note Institute, which was to be taken over by the new National Bank, on the understanding that Hungarian currency was to be stabilised on a sterling basis. As the success of the whole scheme would otherwise have been endangered this condition was accepted by the directors of the new central bank, although the statutes prescribed stabilisation on a gold basis and the pound had not as yet returned to its gold parity.

The National Bank was able to commence activities on June 24, 1924. A few weeks later the directors stabilised the paper krone at the rate of 346,000 kronen to the pound. Favourable developments made it possible to maintain this rate in spite of the upward movement of the pound, which finally reached par in the spring of 1925. Ever since that date, Hungarian currency has remained stable in terms of gold.

The gold and currency holdings of the new National Bank increased considerably in the early months of its existence and provided a strong backing for the stabilised currency. When the bank was entrusted, by Act of Parliament, with the control of the foreign exchanges, it was, therefore, able to grant considerable facilities in this respect until the last limitations on free exchange dealings were done away with on November 20, 1925, and full liberty was restored to the money and credit markets.

As stabilisation *de facto* had now been achieved, the time was ripe for *de jure* stabilisation also. An Act passed in 1925 (No. XXXV.) introduced a new currency unit, the pengő. One kilogramme of fine gold is minted into 3,800 pengő, from which it follows that one pengő is equal to 0.863158 gold kronen, or to 12,500 paper kronen, while

one pound sterling is worth 27.82506 pengő at the par of exchange.

The credit policy of the bank was, at the outset, a matter of considerable difficulty. Years of currency inflation combined with the fundamental economic changes brought about by the Peace Treaty to exercise a most demoralising effect on the nation as a whole, while the depreciation of the old krone currency had destroyed the working capital of the country. People had long engaged in the disastrous practice of constant borrowing in the hope of being able to pay back in currency still further depreciated. The pressure of demand was too strong for the State Note Institute, the immediate predecessor of the National Bank, and an attempt made by the Government early in 1924 to introduce a stable nominal currency (the sparkrone), the purpose of which was to valorise advances made on the basis of the dollar and gold franc exchanges, had proved quite inadequate to check further depreciation. This temporary expedient was discontinued when the National Bank began its activities, though speculation with borrowed money for a fall in Hungarian currency also disappeared when it became clear that stabilisation had, in fact been effected.

In the changed circumstances of the post-war period, a whole series of factors, which are dealt with in other articles in this Supplement, made it imperative that the encouragement of industry should be one of the main features of government policy. This process began during the inflation period, and is still being continued, albeit on a smaller scale, with the aid of foreign capital. More rapid development is hampered by the slow rate of capital accumulation in the country, and by the heavy tax burdens imposed in order to maintain budget equilibrium.

These factors have exercised a considerable influence on the credit position of the country, and thus on the credit policy of the National Bank itself. This operates through a regulation of the volume of credit and through the rate of discount. As to the former it should be noticed that a portion of the portfolio of the State Note Institute was not taken over by the new central bank, as it was not considered an adequate backing for the creation of credit. These items increased the indebtedness of the State, which was transferred from the State Note Institute to the National Bank. Even among the bills taken over, however, there were some which, on the soundest principles of classical banking, were not sufficiently liquid to serve as cover for the note issue, and care had to be taken that these holdings should be diminished as and when possible. The difficult economic conditions prevailing at the time certainly justified the policy actually pursued.

The regulation of currency by means of the rate of discount is less effective. The shortage of capital in Hungary hampers the development of a domestic money market. Indeed, the money market is dependent, in the main, upon short-term foreign loans, as home resources are too insignificant to influence the market rate. There is thus a wide margin between the official rate of discount and the rates ruling in the country, and more especially in the provinces. The National Bank is doing all it can to lessen this margin, and a very considerable measure of improvement has already been achieved in this respect. A final solution will, of course, only be reached when the productive forces of the country are developed to the point at which they will themselves provide capital resources sufficient for the economic needs of the country. Until this objective is achieved, the discount policy of the National Bank will be only partly effective, and its influence will be confined, in the main, to the sphere of the foreign exchanges and the inward and outward movements of short-term foreign credits.

THE FINANCIAL LIQUIDATION OF THE WAR.

By BARON FREDERIC KORÁNYI, former Minister of Finance.

THE financial liquidation of the war will remain as a crushing burden in almost all civilised countries for a generation and more. The difficulties are perhaps greatest of all, however, in the countries where, as a result of the treaty settlement, economic and political institutions which had

taken centuries to build up were overthrown in a single day. Economic reorganisation after long years of hostilities was an immediate and pressing problem which merely intensified these fundamental difficulties; and a series of crises, including the interlude of Bolshevism and the Roumanian invasion which followed, combined with the closing of their frontiers by the neighbouring States and the complete dislocation of long-established commercial and financial connections to make confusion in Hungary worse confounded. Inflation was inevitable, and the krone fell to one twenty-thousandth of its nominal value. Deprived of almost all its capital resources, Hungary was faced with the enormous burdens imposed upon it by the Treaty of Peace. These were all the more disastrous in that their amount was not fixed until 1930, and this very vagueness made financial reconstruction an almost impossible task.

Down to 1924 Hungary lived as best she could from day to day. The Reparations Commission had a first lien on all the wealth of the country, and foreign borrowing was therefore out of the question. Moreover, the Reparations Commission and various inter-allied commissions compelled the Government to make many vexatious deliveries in kind. Down to 1930 deliveries of live-stock, horses and coal amounted to a total value of 30 million gold crowns, ships and river vessels to 132 millions, rolling stock and foodstuffs to 316 millions. In addition, 330,000 Hungarians who had lived in territories which were now under foreign rule, were either expelled from their homes or else migrated voluntarily to Hungary. Thousands of these were State officials or persons receiving pensions from the State, and they naturally needed assistance. This alone meant an addition of over 80 million gold crowns a year to Government expenditure. Nor should we forget the enemy holders of pre-war Government loans, who demanded interest payments in gold. In a word, disaster was staring the country in the face, and every foreign payment or delivery in kind merely added to the financial difficulties of the situation. The balance of payments became progressively worse, and foreign exchange holdings were conspicuous by their absence.

Early in 1923 the Reparations Commission was forced by the facts of the case to give up all hope of receiving thousands of millions of gold crowns from Hungary by way of reparations. This was primarily the result of a careful expert study of the situation, in which the impartial rôle played by the British representatives will always entitle them to the gratitude of the Hungarian people. It was now obvious that the vicious circle must be broken. No financial reconstruction was possible without the aid of foreign capital, and no foreign capital would be forthcoming until sufficient revenue was made available to guarantee interest payments, and this again implied a limitation of the claims of the Reparations Commission. On the initiative of the British experts, with the support of their Italian colleagues, the Hungarian question was brought before the League of Nations. The majority of the members of the Reparations Commission, however, was opposed to the Anglo-Italian plan and proposed, in return for lifting their lien on certain State revenues for twenty years, a schedule of reparations payments which would have wrecked the whole reconstruction scheme. A compromise was not actually arrived at until March, 1924. The Commission then renounced its claims for twenty years in favour of the future bondholders and, in return, was to receive an annuity of 10 million gold crowns for the same period. The reconstruction plan drawn up by the economic and financial section of the League envisaged a period of two years for budgetary reconstruction to be carried out under the control of an American High Commissioner, Mr Jeremiah Smith. The scheme succeeded beyond all expectations, thanks to the sympathetic understanding shown by the High Commissioner and to the common-sense and self-control of the Hungarian people, who accepted the most heavy financial burdens. This work of reconstruction is really the first important step in the financial liquidation of the war in Hungary. It gave her a breathing space of twenty years, and thus opened her doors to foreign capital once again. But two great problems—and many smaller ones—still awaited solution. The total debt of the country on reparations account had to be fixed once and for all, and the economic organisation

of the new territory had to be delivered from the chaotic condition in which it then was.

The new reparations policy contained in the Young Plan opens the second chapter in the history of war liquidation in Hungary. The enormous reparations payments which had once been talked of were now seen to be absolutely impossible, even at the cost of the complete ruin of the country. But even moderate demands, combined with various so-called "treaty charges" which had not as yet been discussed, acted as a disturbing factor, since they amounted to claims of upwards of one milliard of gold crowns. Of more immediate importance was the existence of the lien on her wealth and revenue which made it impossible for Hungary to contract any new loan. The Government was therefore obliged to maintain taxation at an exorbitantly high level in order to provide the necessary funds for road making, for railways and other State enterprises, the cost of which should really have been spread out over a number of years. But this method soon became impossible in its turn.

Negotiations were conducted for nearly six months at Paris, The Hague and then again at Paris. Political and economic obstacles in the way of good relations between Hungary and the countries of the Little Entente had to be overcome. The principal of these was the refusal of the Little Entente to negotiate the financial liquidation of the war until Hungary first abandoned the claims of certain of her subjects—rather inaccurately described as optants—which arose out of Article 250 of the Treaty of Trianon. These claims were the result of the expropriation of landed property, situated in certain of the ceded territories, without adequate compensation, in the interest of what was called "agrarian reform." The most eminent international lawyers of the world were divided in opinion on this question. It was long a source of great embarrassment to the League of Nations, which, for political reasons, refused to allow it to be referred to the Mixed Arbitral Tribunals specially set up, under Article 250 of the Treaty of Trianon, for disputes of this kind. She could not abandon the claims of her citizens, which amounted to a total of at least one and a half milliards of gold crowns, and insisted that the treaty should be put into force. At long last, however, the generosity of the Great Powers enabled a settlement to be arrived at which, by leaving the legal question on one side, overcame the opposition of the Little Entente and enabled the whole complex of financial questions arising out of the Peace Treaties to be dealt with once and for all. In addition to the annuities fixed for twenty years in 1924 (10 million gold crowns a year), Hungary undertakes to pay, from 1944 to 1966, an additional annuity of 13½ million gold crowns. In return for this, she is freed from all special Treaty charges. Moreover, the first charge established by the Treaty on all the assets and revenues of the country shall definitely cease to have effect, so soon as France ratifies the Agreements signed at Paris on April 28, 1930.

Such, in brief outline, has been the final solution arrived at in regard to reparations and allied problems. The regulation of Hungary's share in the pre-war debt is discussed in another article in this Supplement, and it is to be hoped that this question will soon be settled once and for all as a result of negotiations now in progress. In addition, a whole series of agreements has been arrived at with the countries of the Little Entente. They deal with the various financial problems arising out of the dismemberment of the financial, economic and administrative unity of the pre-war kingdom. In the economic sphere, war liquidation will not be complete until production is adjusted in a rational manner to meet the needs of the present sadly diminished territory of the new Hungary. This will call for foreign capital, and the immediate outlook in the international sphere naturally makes this a matter of some difficulty. But during the last ten years the Hungarian people have given proof, under conditions of almost unbelievable strain and stress, of those psychological factors of courage and of hope which cannot but lead to success.

PUBLIC FINANCE.

By Dr. ALOIS DE SZABÓKY, Under-Secretary of State,
Ministry of Finance.

THE Reconstruction Scheme, drawn up in 1924, aimed both at the financial and the economic restoration of Hungary. Financial reconstruction was essential to economic prosperity, and this, in its turn, is the only sound basis of financial stability. Great progress has been achieved during the last six years, but while financial reconstruction was accomplished even faster than was originally anticipated, economic recovery has been much more gradual.

With the restoration of budget equilibrium, the Treasury did everything in its power to further the economic rehabilitation of the country. The budget surpluses were used for a programme of capital expenditure, while reductions were granted in nearly every direction with a view to reducing the heavy burden of taxation. The major part of the proceeds of the League Loan, originally raised for the sole purpose of meeting anticipated budget deficits, was also devoted to a programme of capital expenditure. This has totalled £33,500,000 during the past five years. Not only has the neglect of the years of war and inflation been made good in this respect, but State undertakings, such as the railways and the postal service, have been improved and expanded, while help has also been given to agricultural production. Capital expenditure on social and cultural services, which were indispensable if Hungary was to keep pace with other civilised countries, has included the building of elementary schools and agricultural training schools, of hospitals, and the provision of urban and rural housing schemes.

Taxes imposed in consequence of the exceptional circumstances of the post-war period have been either abolished or reduced. Thus the share of the Treasury in house rents was given up entirely, while the general turnover tax was reduced from 3 per cent. to 2 per cent. as early as 1925, and then gradually abolished altogether on dealings in primary necessities such as foodstuffs and livestock. The house tax and the land tax have been repeatedly reduced and the excise on sugar and petrol has been lowered. The yield of Customs duties has also declined, in consequence of reduction in several items of the autonomous tariff. These tax reductions amount altogether to a total of some 220 million pengő (£8 millions) a year, and have clearly been most beneficial to trade and production. On the other hand an effort is being made to increase the yield of income tax, first introduced in Hungary during the war.

The improvement in the general economic situation, which was greatly stimulated by tax reductions and the capital investment policy of the Government, the local authorities and various private undertakings, reacted favourably, in its turn, on the public revenue. The upward movement of Treasury receipts was, however, checked first by the extension of tax reductions and later by the general economic depression. During the past three financial years public revenue has been approximately stable. It amounted to 961.4 million pengő in 1927-28, to 964.9 millions in 1928-29, and to 953.9 millions in 1929-30. The general progress of Government revenue since 1924 is shown in an adjoining table. It will be seen that the yield of taxes proper decreased in the financial year 1929-30, though this movement was counterbalanced by an increase in departmental receipts. With certain relatively unimportant exceptions, this latter rise is mainly due to the fact that departmental receipts include certain taxes which serve a special purpose such, for example, as contributions paid for the maintenance of invalids, or the motor tax, which are really in the nature of direct taxes, and show an upward tendency. Interest and amortisation payments on investment loans granted in previous years also figure under this head, and they increased during the past financial year.

The world economic crisis naturally affects Hungary, and it is, therefore, not surprising that receipts from taxation should show a falling tendency at the present time.

GOVERNMENT REVENUE SINCE 1924.

	Collected in						Estimates for 1930-31.	Collected in the first 4 months of 1930-31.
	1924-5.	1925-6.	1926-7.	1927-8.	1928-9.	1929-30.

Other revenue	3.1	15.3	7.9	5.8	5.2	2.1	1.8	0.6
Total of direct taxes	111.5	156.6	166.5	178.0	193.1	186.8	176.8	55.3
Turnover taxes	177.8	135.9	141.3	140.8	131.8	104.4	111.4	25.0
Stamps and dues	72.7	85.2	106.6	109.7	111.9	112.0	103.4	33.0
Excise	69.5	83.5	86.1	97.4	102.0	95.5	101.0	30.0
Customs	119.9	120.2	141.8	148.1	124.5	96.6	108.1	29.0
Tobacco monopoly	107.1	123.0	135.2	151.2	154.4	151.8	158.0	48.0
Salt monopoly	20.1	24.2	24.7	24.8	25.0	25.1	24.2	8.0
Saccharine and lottery monopolies	0.5	0.8	1.3	1.6	1.6	2.0	2.0	0.9
Tax on railway traffic	11.9	15.4	15.2	15.9	16.2	15.4	16.0	5.0
Departmental receipts	60.8	70.0	82.4	93.9	104.4	164.3	95.8	29.8
Total	751.8	814.8	901.1	961.4	964.9	953.9	896.7	264.0

This calls for energetic measures on the part of the Government; while budget equilibrium must be maintained at all costs, help must be given in every direction in which help is possible. The crisis in agriculture is now particularly acute, but, paradoxical though it may sound, the fact that Hungary is essentially an agricultural country is actually an advantage in some respects. The agricultural community is very largely self-sufficing, while the low price of foodstuffs is of great assistance to the industrial population. Government assistance to agriculture is, however, essential. It takes the form of schemes for increasing production, facilities for marketing, and the remission of taxes. The granting of bounties (*Boletta*) should also be included under this head. Efforts are being made to provide work for the unemployed on roads, railways, river regulation and the like. To cover this exceptional expenditure, and to meet the fall in revenue, steps are being taken to reduce general expenditure in every possible direction. The administration is being simplified, and the cost of personnel and supplies cut down. The budget estimates for the year 1930-31 already show a falling tendency. Administrative expenses have been reduced to 895.7 million pengő, as against 920.8 millions in the previous year, while the expenditure on State enterprises shows at 502.4 millions, as against 507.8 millions. In consequence there is an estimated surplus of 3 million pengő, apart from the sum of 47.3 millions, earmarked for capital investment, which represents an important budgetary reserve.

The real significance of these reductions is that they help to stem the rising tide of State expenditure, and even make it possible to meet certain unavoidable increases, such, for instance, as the advance in pensions—for as old pensioners die their place is taken by others who, on the basis of their present salaries, are entitled to higher rates of pension—in treaty charges and certain other items. The estimates of the principal heads of expenditure for 1930-31 are as follows:—

	Million pengő.	
	Administration.	State Enterprises.
Public Debt and Treaty charges	101.5	3.9
Personnel	303.4	141.0
Pensions	125.6	80.6
Subsidies to autonomous bodies for pensions and personnel	55.6	—
Supplies and working expenses	284.9	254.3
Investments	24.7	22.6

Estimates now in preparation show that expenditure will be still further cut down in the Budget for 1931-32. But in view of the present economic position, which may lead to a decrease in revenue and, possibly, to an increase in expenditure, over and above the provisions of the Budget, attempts are being made to economise still further. A scheme has been adopted by which the number of officials will be reduced by 10 per cent. over a period of six years.

As dismissals would only lead to social unrest, it has been decided that vacant posts shall not be filled. In addition, immediate reductions have been effected in certain supplementary allowances of the State employees, and other economies include those made in supplies, which are greatly facilitated by the fall in prices. These measures together should lead to a reduction of at least 25 million pengő in administrative expenditure, and 20 millions in the State enterprises. This, however, will not suffice to cover the expected fall in revenue, so a special progressive tax on official salaries and directors' fees is to be introduced. This new burden may be justified by the fact that, while the income of other classes of society has been reduced owing to the unfavourable economic situation, those receiving a fixed salary have benefited by the fall in prices. The cost of living index number for a family of four now stands at 103, as against 120 eighteen months ago.

Now that the agreements of the Hague and of Paris have settled the reparations question once and for all, the last obstacles in the way of contracting a foreign loan have been removed. When the position of the international money market is such as to make possible the raising of a long-term loan, the Government will be able to proceed with its investment programme, and thus contribute still further to the improvement of economic conditions. In the meantime it has discounted Treasury Bills to a total of £3,150,000 for a period of one year to enable it to carry out urgent public works.

According to the monthly returns of the Finance Ministry, expenditure in the last four financial years has been as follows:—

	(In million pengő.)	
	Expenditure.	Surplus of Revenue over Expenditure.
1926-27	779.6	+ 121.5
1927-28	864.4	+ 97.0
1928-29	964.6	+ 0.3
1929-30	953.9	+ 0.2

According to the Budget for 1930-31, the total National Debt on June 30, 1930, excluding amounts due for Reparations (which amount to 200 million gold kronen for twenty years from 1924) amounted to 1,496.0 million pengő (£53,750,000), as against 1,516.2 millions at June 30, 1929. The amounts of internal and external debt at June 30th last were as follows:—

	Internal Debt.	External Debt.	Total.
	Pengő.	Pengő.	Pengő.
Consolidated Debt	84,582,559	1,242,397,724	1,326,980,283
Floating Debt	82,802,968	86,250,321	169,053,289
Total Debt	167,385,527	1,328,648,045	1,496,033,572

Further details of the total debt are given on p. 13.

* Under the Innsbruck Protocol of 1923, Succession States to the Empire of Austria-Hungary agree to provisional arrangements or apportionment and service of Austro-Hungarian pre-war debt involving the establishment in Paris of a Caisse Commune (on which various national groups of bondholders are represented) to manage the service of debt and payment, spread over twelve years, 1926-37, the arrears since the Austrian and Hungarian Peace Treaties to the end of 1924 at 32 per cent. for gold rentes and 27 per cent. for 4½ per cent. loans, and payment of current service from April 1, 1925, at same rates, these terms to be subject to revision before 1931 if the financial position of States concerned improves.

BANKING.

By PHILIP WEISS, President of the Hungarian
Commercial Bank of Pest, Member of the Upper
House.

THE Treaty of Trianon, by reducing Hungary to nearly a third of its former size, has had a most important influence on banking business, the present volume of which is naturally very much less than that in the pre-war kingdom. Every effort has been made to reduce the number of banks and savings institutions, originally created to meet the needs of a much larger country. Banking amalgamations lead to considerable economies, more especially as regards overhead charges, and thus enable the leaders of the banking world to provide cheaper credit facilities for commerce, industry and agriculture.

In 1923, at the height of the inflation period, there were 698 banks and savings banks controlled by the Central Corporation of Banking Companies. This number had decreased to 529 at the end of 1929. Thanks to the efficient control of the smaller institutes by the Central Corporation of Banking Companies no failure of importance has occurred in Hungary since the end of the war, in spite of the serious financial difficulties of the upheaval following the war and the demoralising effects of inflation.

In 1925 all financial institutes drew up gold balance sheets. Since the reconstruction of the national finances banking shows a steady development. Whereas the total resources of all financial institutes controlled by the Central Corporation of Banking Companies in 1925 amounted to 1,688.6 million pengő (£60,000,000), at the end of 1929 they totalled 4,424.1 million pengő (£159,000,000).

In order to illustrate the expanding activities of the ten principal Budapest banking institutions it will suffice to point out that their total assets have more than doubled in the last three years, totalling 2,177.2 million pengő (£78,000,000) at the end of 1929, as against 1,058.7 million pengő in 1926. Net profits rose within the same period to 34.6 million pengő (£1,250,000), as against 17.3 millions in 1926. The half-yearly balance sheets of the main banking institutions, which are summarised on page 15, reveal that their position is strong and that business, in spite of the economic depression of the present year, was satisfactory.

The substantial increase in the capital, reserves and deposits of the banking institutions is due in a considerable degree to the participation of foreign funds which were placed at the disposal of Hungary through the intermediary of the main institutions of Budapest in the form of short and long-term loans. Thus Hungarian banking has played a very important part in the financial recovery of the country. The recent trend of internationalism in banking is shown by the fact that foreign capital is interested in almost all Hungarian banking institutions of importance, and shareholders include British, American, German, Austrian, French, Swiss and Italian groups.

It is of interest to note that there is practically no difference, so far as business is concerned, between banks and savings banks, since both are not only interested in accumulating deposits and making advances to their customers, but are more or less engaged in financing and participating in commercial and industrial undertakings. The provision of mortgage loans to landed and urban property is one of their main activities.

In those States whose frontiers were enlarged by the Peace Treaties—and above all in the so-called Succession States—large new banks have been formed. The Hungarian institutions, established in what was formerly Hungarian territory and working there up to the overthrow of the old monarchy, are thus faced with very serious competition. In consequence of its geographical position, Budapest was formerly one of the international banking centres for the South-East European States—Serbia, Bulgaria, Roumania, Greece and Turkey. Prior to the outbreak of war several large Budapest banks were heavily interested in the principal banking institutions of these countries, whether by direct capital participation, by the granting of credits, or in various other ways. The financial and economic relations between Budapest and the Balkans were becoming closer and more intense each year. Budapest was marked out as an intermediary between the East and the West, not merely by its geographical position, but also by the fact that Hungarian bankers, with many years of experience behind them, have very wide first-hand knowledge of financial and economic conditions in the Balkan countries.

As railway and air connections, together with the telegraph and telephone, bring the Balkan countries each day nearer to the financial markets of the West, the leading bankers of these countries will come to realise more and more that it is in their own interest that advantage should be taken of the exceptional facilities offered them by the well-conducted and experienced banking institutions of Budapest and Vienna. These latter, thanks to years of close business relations, know the outlook of the Western banking centres, more particularly as regards credit business, better than do their colleagues further East, and are thus in a position to assist them in a whole variety of ways. In Hungary, Austria, Serbia, Bulgaria, Roumania, Turkey, Greece and even Albania, Western capital could find a most profitable field for investment, both in finance and in industry, and there can be no doubt as to the value and importance of the rôle which leading Hungarian bankers could play in any activity of this kind.

Hungarian Discount and Exchange Bank

(Magyar Leszámitoló- és Pénzváltó-Bank)

INCORPORATED BY

THE CO-OPERATION OF BANKS AND INDUSTRY.

By Dr. TIBOR DE SCITOVSZKY, former Minister of Foreign Affairs, General Manager of the Hungarian General Credit Bank.

The principal Hungarian banks have, from the very beginning, taken a leading part in the industrial life of the country. This is due, above all, to the fact that Hungary was always short of funds and that private individuals with adequate supplies of capital were not forthcoming in sufficient numbers to take the lead in establishing industrial undertakings. The principal banking institutions, however, had greater capital resources and were in a much better position to market the shares of the leading industrial undertakings. This situation was, of course, very similar to that prevailing in Austria and in Germany. In consequence, the large Hungarian banks became both shareholders and creditors, a combination which implied a very wide measure of influence and control in the nascent industrial undertakings of the country. Moreover, in establishing this close co-operation in the organisation and development of industry, they were actuated not merely by their own immediate interests, but also by economic considerations of a more general character. The need of encouraging industrial development had long been felt, though, so long as the Dual Monarchy remained, this policy was hard to carry through to a successful issue in face of the keen competition of the older-established Austrian industries. Even in pre-war times, however, certain Hungarian industries had succeeded in achieving a remarkable measure of success.

The Treaty of Trianon dislocated the economic structure of Hungary and made the need for industrial development still more apparent. A country so densely populated as the new Hungary, with 93 inhabitants to the square kilometre, as against 65 in the old kingdom, was obviously compelled not merely to adapt its agriculture to the new conditions, but also to promote industrial production in every possible way, in order to afford an outlet for so dense a population. Industrialisation would make the country less one-sided, by diminishing its exclusive dependence on agriculture—a factor of the very greatest importance in view of the unfavourable world outlook for agricultural produce—it would strengthen the home market, improve the trade balance, and reinforce the very basis of the public revenue. Moreover, this course was further dictated by the general movement towards self-sufficiency in all the surrounding countries.

Under these conditions, it was most fortunate that the banking organisation of the country was both ready and able to meet the needs of industry. Indeed, the rôle of the banks became even more marked than it was before the war, since the period of hostilities and of general inflation had reduced the working capital of industry to the merest fraction of its former self. The banks not only helped with their own assets and with the resources placed

at their disposal by people living within the country itself, but also obtained foreign credits with which to increase the working capital of the various industrial undertakings, then so sadly depleted. They came to participate more and more in industrial companies and also placed industrial shares, both at home and abroad. Their support was all the more valuable since Hungary, now independent in the economic sphere, was able to adopt a Customs and trade policy of its own, with a view to encouraging home industries. Even though the present network of commercial treaties has somewhat relaxed this protectionist system, Hungarian industrial life has undergone a considerable transformation during the past decade and many branches have progressed in a truly remarkable manner, in spite of adverse trade conditions. This is in itself a proof that the foundations have been well and truly laid. A favourable factor is, of course, that, with one or two exceptions, Hungarian industries produce for the home market: at the present volume of production, exports play only a subordinate rôle. The relative smallness of the industrial equipment has the further advantage that works carried out for the State, the municipalities and other public bodies are proportionately of greater importance than in other countries where governmental activities are of similar magnitude, but where industrialisation has gone much further. Moreover, this fact accounts for the low rate of unemployment, which is only really of importance since the general world crisis has become more acute. Even to-day the number of unemployed registered by the trade unions amounts to no more than some 23,000. This is obviously an important consideration when assessing the present standing of the principal Hungarian banking institutions.

As the industrial participations of the banks were often of long standing, they were estimated on a very conservative basis when gold balance sheets were introduced. Indeed, the decline in share quotations has affected the banks relatively little, and this has made them the more willing to continue their financial support to the industrial undertakings in which they are interested. By helping the transition from agriculture to industry, the banks have rendered great service to the economic life of the country. They have also profited by the extension of credit business which has naturally followed.

The wisdom of this policy of co-operation between banks and industry has been confirmed by the endeavours recently made in Great Britain and France with the same end in view. Even in these highly developed countries, where development has been on entirely different lines, the need for the banks to take a more active interest in industry has been recognised in these hard times.

The future of Hungarian industry is full of great possibilities, and the prospects facing the banks are most promising. It is, therefore, highly desirable that the intimate co-operation of banking and industry, which has been so beneficial in the past, should continue in the future.

III.—HUNGARY'S ECONOMIC ACTIVITIES.

AGRICULTURE.

By OUR BUDAPEST CORRESPONDENT.

HUNGARY is predominantly an agricultural country. More than half of its population is directly dependent on the products of its soil. It is natural, therefore, that the world-wide agricultural depression should be keenly felt. The export of surplus products is being made more and more difficult by the low export prices and the protective duties of the importing States. Hungary is unable to protect her agriculturists by the imposition of Customs duties because, since she is an exporting country, her prices adjust themselves to the extremely low export prices of the world market.

The Hungarian farmer who, in pre-war times, enjoyed the protected market of the Austro-Hungarian monarchy, is hardly hit by the changed conditions. In addition, Hungarian agriculture is adversely affected by the discrepancy between industrial and agricultural prices. The protective duties accorded to domestic industries inflict a heavy burden on agriculture. Whereas the price of cereals and live-stock is below pre-war level, both wholesale and retail prices of industrial commodities needed by farmers are far above pre-war prices. The Government is endeavouring to help the farmers by bounties, tax remissions, cheap export credits and freight reductions, but no effective aid could be given by national action in a world-wide agricultural depression like the present. Only a concerted action of the agricultural States could materially improve the situation.

In consequence of the land reform carried out after the war, 70 per cent. of the arable land of the country is owned or rented by small holders. It is true that land reform in Hungary was less ambitious in scale than in the South-Eastern European States, but the good effect of its moderate character is demonstrated by the fact that total Hungarian production was not only maintained but even increased, whereas in the neighbouring countries, where the reform was more violent, the consequences were a serious reduction of the sown area and production. This proves that Hungary, while realising the social and political urgency of agrarian reform, did not carry it to extremes but carefully observed the economic and financial aspects of the problem. The compensation for the land "allotted" was financed out of the \$36 millions loan granted by the Swedish Match Trust on satisfactory terms. A considerable part of that loan, not absorbed by the financing of land reform, is being used to aid with cheap credits the small holders.

The most important problem of Hungarian agriculture besides low prices and marketing difficulties is the provision of credit. In the absence of sufficient domestic resources, recourse had to be made to foreign borrowing in order to enhance the productive capacity of the soil. But credit facilities, especially for rural districts, are far from being satisfactory. Whereas in pre-war times land mortgage bonds were placed on the principal foreign markets at 4 and 4½ per cent., long-term loans issued in recent years bear interest of 7 and 7½ per cent. Hence, the debts contracted by farmers are far more onerous than in pre-war days, both for long- and short-term loans. The cost of mortgage loans is around 10 per cent., and 14-15 per cent. is often paid in rural districts for short-term credits. As a considerable portion of the farmers' debt is not consolidated, it is highly important that these should be converted into mortgage loans at the earliest period.

The provision of credit for agriculture is in the hands of the big banks of Budapest and the small but well-established provincial institutions. There are also certain credit institutions working on a non-profit-making basis with Government control and participation, whose aim is to help the farmers with cheap credits, to finance land allotments, settlements, etc. Although the indebtedness of agriculture is by no means great, it amounts to

about 1,428.7 million pengő (£50,500,000) at the end of 1929, as against 3,000 million pengő (£108,000,000) in 1913, its annual burden amounts to 170 million pengő (£6,000,000), as against 160 million pengő in 1913, as a result of the higher rate of interest.

The Government has recently appointed an independent commission to acquire the land of the heavily indebted large holdings on satisfactory terms for allotments to small holders. This plan is sound, because in times of agricultural depression the small holders cultivating their own land are better placed to withstand the crisis than the big landowners dependent on expensive credit and labour. The fact that two-thirds of the small holdings are free from debt and only one-third moderately indebted affords good evidence of the sound basis of our agriculture. The indebtedness of the medium-sized and large holdings is proportionately greater than that of the small holdings, but none the less more than half of these holdings are entirely free of debts. The following tables show the sown area and the crops harvested in the last ten years, and demonstrate that after the collapse of the war and the chaos caused by revolution and inflations the average production of pre-war years has been attained and even surpassed in the last few years. Yet agriculture is far from being in its full development, and with ample credit resources and better marketing conditions Hungary's economic position may be considerably improved.

The greater part of Hungary's national wealth is the land, and the main item of its national income is the produce of its land. It is therefore of paramount importance for the welfare of the country that agriculture should receive every assistance from the Government, and from the credit institutions, as the excellent quality of the soil and the energy of the farmers will always be the economic backbone of Hungary. The cost of production of agriculture must be reduced by all means and all fiscal measures ought to be taken to secure that end.

INDUSTRY.

By M. HENRY FELLNER, President of the Federation of Hungarian Industries, Member of the Upper House.

THE industries of Hungary date back to the middle of the nineteenth century. At that time there were steam mills, distilleries, hemp mills, all of which worked up the raw materials of agriculture, and, in addition, a few iron-foundries and machine shops. In course of time, these developed into large-scale undertakings, around which there sprang up representatives of almost every type of industrial production. This expansion was favoured by a plentiful supply of coal and a sufficient reserve of iron ore, by cheap labour, by the steady growth of credit institutions and, finally, by the existence of a relatively large home market. These factors would, indeed, have led to an even greater measure of industrial development, but for the fact that the existence of the large free-trade area of the old Dual Monarchy, of which Hungary formed a part, acted as a limiting factor. The industries of Austria proper and of Bohemia were of much older standing, and Viennese industrialists were sufficiently influential at Court and in Government circles to prevent the establishment of an independent Hungarian tariff administration, which was ardently desired by Hungarian political and economic opinion. Hungary thus turned her attention primarily to agricultural production, in which she was favoured by her geographical and climatic position, and neglected her resources in coal and minerals generally.

The failure to satisfy Hungarian aspirations in the industrial sphere led, in 1907, to the passing of an Act for the encouragement of industry. Under its protection the industrial life of the country developed steadily, in spite of certain temporary setbacks. This upward process was only checked as a result of the World War and the Treaty

of Trianon. Important raw materials and the greater part of the former home market passed under the control of the neighbouring States. The difficulties of the situation were enhanced by the fact that factories had sprung up above all in the neighbourhood of Budapest, and the treaty settlement thus left an overwhelming proportion of the industrial undertakings inside the frontiers of the new Hungary, while of the total consuming population, which stood at some 22 millions before the War, approximately 13½ millions were lost to Hungary.

The country as now constituted was thus over-equipped in the industrial sphere. To solve this difficult problem, superfluous factories in one line of production have, so far as possible, been re-equipped for the production of other industrial products and if, even at the present day, many factories are compelled to produce at well below their actual capacity, it is none the less true that the situation has much improved in this respect, since the termination of hostilities twelve years ago.

This development has been made possible thanks to the internal consolidation of the country, to the financial reconstruction carried through under the ægis of the League of Nations, and to the introduction of a policy of protection. It is true that the duties laid down in the autonomous tariff of 1924 have been modified in practice by the conclusion of a number of commercial treaties, and even these reduced duties have not always come into full play on account of changes in the general economic situation. Nevertheless, this measure of Protection has enabled industrial production to advance to such an extent that, in 1928, the last year for which statistics are available, it accounted for 2,847 million pengő, or 46 per cent. of the total national output of 6,174 million pengő. The share of the principal branches of industrial production was as follows:—

	Million Pengő.
Industries producing foodstuffs, &c.....	1,106
Textiles	440
Iron and metals	317
Machinery	236
Chemicals	203
Stone, porcelain and glass	148
Leather, brushes, &c.	101
Timber	92
Paper.....	29

It will be seen that foodstuffs still hold the first place, but the progress effected in certain other branches, and notably textiles, has been quite remarkable of recent years.

As foreign trade is dealt with elsewhere in this supplement, it will suffice here to remark that the export of industrial products has been increased. Thus, partly-manufactured goods stood at 72 million pengő in 1929, as against 64 millions in the previous year, while the export of wholly manufactured goods amounted to 345 million pengő, compared with 285 millions in 1928.

Of course the general depression under which the whole world is now suffering has naturally had a profound effect upon Hungarian industries. The great falling off in the purchasing power of the consumers, which, in Hungary, is due above all to the catastrophic fall in the value of agricultural products, and the acute agricultural crisis, which is its natural outcome, is a source of constant uncertainty. At the moment, indeed, a retrograde movement has made itself felt in the output and the price-level of most branches of industry. Although the index numbers of industrial products are lower in Hungary than in many European States, it cannot be denied that there is to-day a certain opposition between industry and agriculture which comes to the fore more especially in the question of Customs tariffs. But there is no reason why Hungarian industrialists should not look forward with confidence to the future. The important part they play in the total output of the country combines with fiscal, financial and general considerations, and more particularly, their ability to create new opportunities for their various activities, to bind their future very closely with that of the nation as a whole. The limiting factors that are making themselves felt at the present moment may delay, but they cannot possibly prevent the future development of industrial life in Hungary.

COME TO BUDAPEST

The romantic Spa-Capital.

Season All the Year Round.

35-44 hours by train from London. Through carriages on all routes. Return fare:—
1st class about £23, 2nd class about £15.
4½ hours by train from Vienna.

In summer by air, a day journey of 11 hours, about £18.

Very moderate living expenses.

Winter cures and sports.

Radio-active mud-baths, etc.

Beautiful surroundings. Cheap Excursions to the countryside, and to the lake of Balaton, only two hours from Budapest by train or car.

Our foreign department furnishes all kinds of information.

TRANSPORT.

By Dr. GÁZA DE TORMAY, Under-Secretary of State,
Ministry of Commerce.

Railways.

The total railway network of post-war Hungary, amounts to 5,539 miles, of which 2,024 miles (or approximately 37 per cent) are owned by the State. The other lines are owned privately, though they include 2,465 miles of local line, managed and operated by the State Railway Administration. The network as a whole was in a very bad state at the end of the war, and the following years of revolution and currency inflation made reconstruction work impossible. With the restoration of the currency, however, a new period began; considerable sums were made available out of the proceeds of the League Loan, as well as from internal sources, for the re-equipment of railway plant and rolling stock. In the five financial years 1924-25 to 1928-29, a total of 127.3 million pengő has been spent on capital investments and, as a result of this, the railway system has been restored to the standard of pre-war days. Further improvements will be financed out of the proceeds of the proposed State Loan in order to increase the efficiency of the railway system still further. Passenger rates are below those ruling in most other countries, and are not much above the pre-war level. Goods rates are drawn up with a view to encouraging the export of agricultural products. Substantial freight rate reductions have already been granted to this end, and still more are now under consideration.

The expansion in railway traffic of recent years can be seen from the following table:—

Year.	Goods Traffic (in million tons).	Passenger Traffic (in millions).
1924-25	35.4	92.8
1925-26	33.5	104.9
1926-27	39.1	111.3
1927-28	40.6	121.0
1928-29	40.7	125.4

In the present year the goods traffic has somewhat declined owing to the general economic depression now prevailing.

The geographical situation of Hungary is favourable to the development of transit traffic, which increased by over 20 per cent. between 1926 and 1929. Everything is being done to facilitate the expansion of international railway services, like the Orient Express, which was resumed in 1921, through Hungarian territory. It is worth noting, in this connection, that the shortest and quickest route from London, Paris, Berlin, Prague and Vienna to the capitals of South-Eastern Europe—Belgrade, Bucharest, Sofia, Athens and Constantinople—passes through Budapest. Both passenger and goods services are reliable, and the trains are as punctual in Hungary as they are in the States of Western Europe.

The main railway line which connects Budapest with Vienna and the West will be electrified in the course of the next few years. A huge power station has already been erected, with the aid of British capital, to provide electric current for the 123 miles of line from Budapest to the Austrian frontier. When this work is completed it is hoped that considerable economies will be effected in operating what is much the most important stretch of line in the country. The current will be generated from Hungarian low-grade brown coal. This will reduce the imports of high-grade coal and thus help to improve the balance of trade.

Waterways.

The most important navigable waterway in the country is, of course, the Danube. It is open to navigation for about ten months, on the average, each year, and carries a considerable proportion of Hungarian imports and exports. Ships and barges, flying the flags of many nations, maintain services on this main arterial waterway of Central Europe.

The total length of navigable waterways in post-war Hungary amounts to 1,052 miles, as against 1,795 miles

in the old kingdom. Vessels flying the Hungarian flag include 137 ships, with a total tonnage of 11,839 tons, and 296 barges, totalling 139,937 tons. Last year they carried 790,532 tons of goods and 2,690,000 passengers. The Government pays annual subsidies to the shipping companies to enable them to maintain regular services for passengers and for goods.

The Free Port of Budapest, which has recently been completed at a cost of 26½ million pengő, is undoubtedly the largest and most up-to-date harbour on the Danube. Its turnover last year amounted to 185,000 tons, consisting mainly of cereals, timber, coal and iron, while the total turnover of the commercial port of Budapest as a whole was 390,000 tons, of which shipping traffic accounted for 340,000 tons. The Trianon Treaty deprived Hungary of direct access to the sea, but by an agreement arrived at with Italy in 1927 she obtained a free port on the Adriatic at Fiume, which was formerly Hungarian territory.

Roads.

The state of the roads is unsatisfactory and, with but few exceptions, they are not yet fit for motor traffic. A big road construction scheme has, however, been worked out by the Ministry of Commerce, and special attention has been paid to those districts where transport facilities are still very backward. Last year a sum of 24.8 million pengő was devoted to the building of new roads and to the maintenance of existing ones. A Motor Vehicle Tax was instituted in the budget of 1928. Its proceeds are paid into a special Road Fund, which is intended to finance the upkeep of the roads. As motor traffic is developing very slowly, the income of this fund is far from sufficient to meet the expenditure called for by the road schemes of the Government, and recourse will have to be had to home and foreign borrowing until such time as the fund becomes adequate.

The modernisation of the road system is a matter of the greatest importance in an agricultural country, more especially for the marketing of perishable goods such as fruit and vegetables. Hungary has been seriously handicapped in the past by the absence of satisfactory means of transport in the outlying parts of the country, but these defects are now being slowly remedied. The main arterial roads are being rebuilt with a view to the needs of international motor traffic, and a modern road has just been completed which links up Budapest with Vienna. The Hungarian sector of the proposed road from Calais to Constantinople will be entirely reconstructed during the course of the coming year.

At the end of 1929 there were 29,417 motor vehicles of all types in the country. This total included 11,582 cars, 4,400 lorries, 690 buses and 10,865 motor cycles—of which 4,060 were of British make. The improvement of the road system has already led to an increase in tourist traffic, and this should expand still further in the future. It will certainly be helped by the reasonable charges made at the principal summer and winter resorts of the country.

Airways.

During the summer season London, Paris, Rome, Berlin and Constantinople can each be reached from Budapest by air in one day. The London-Egypt-India service of Imperial Airways calls regularly at the Budapest aerodrome, and Hungarian aeroplanes, piloted by Hungarian pilots, maintain a regular service to Vienna, where they link up with the Luft Hansa lines to the rest of Europe.

The Ministry of Commerce exercises supreme control and supervision over all means of transport—by rail, road, water and air—within the country. Transport facilities have improved enormously during the course of the last ten years, and have done much to stimulate the economic recovery of the country. There is, therefore, every reason to believe that the improvements now under consideration, for the realisation of which the co-operation of foreign capital is essential, will lead, in the fullness of time, to still further progress in the economic equipment of the country as a whole.

PRICES AND WAGES.

By OUR BUDAPEST CORRESPONDENT.

DURING the war prices were inflated; indeed, inflation was one of the main characteristics of the economic and financial chaos prevailing in Hungary from 1919 to 1924. With the currency stabilisation carried out in 1924, thanks to application of the League's Reconstruction Scheme, prices have become stable. Prices were considerably above the gold parity of world prices in 1924, but they have subsequently receded, as the population's confidence was restored in the national currency.

The index prices from 1924 on are as follows:—

1913 = 100.

	Wholesale Index.	Cost-of-living Index. Without Rents.	With Rents.
1924, December 31.....	100	116	149
1925, ".....	130	109	119
1926, ".....	126	105	119
1927, ".....	135	113	115
1928, ".....	135	117.6	120
1929, ".....	107 (a)	112.5	110
1930, March 31.....	100	111.4	119
1930, June 30.....	94	106	112
1930, September 30.....	92	105.3	110
1930, October 30.....	94	102.7	108

(a) From 1929, weighted index.

It will be seen from the above table that wholesale prices fell considerably during 1925, the fall of 30 points in that year representing an adjustment to world prices. In 1926 and in 1927 prices increased slightly owing to the economic recovery stimulated by foreign funds. In 1929, however, the economic depression and the heavy fall of agricultural prices caused a general recession of wholesale prices which was continued throughout the present year. It is worth while to note that in 1929 a weighted wholesale index was worked out by the Statistical Department in order to show the discrepancy existing between the various groups of commodities.

According to the new, weighted, wholesale index, on September 30, 1930, the index for agricultural products is returned at 80, and that of industrial products at 122. But even these figures do not reflect sufficiently the existing discrepancy between the protected industrial and the unprotected agricultural products. The fact that the wheat index on October 31st is shown at 58, and that of rye at 88, will better demonstrate the extent of the diminished purchasing power of the farmer. Owing to the high prices of coal, machinery, textiles, artificial fertilisers, he is compelled to give twice, in many cases, and even three and four times, more in quantity of cereals and livestock in exchange for industrial products than was the case in pre-war years. It is of paramount importance that the inflated prices of the staple industrial commodities should adjust themselves to the general fall of world prices, because the whole economic system of the country will be paralysed if the present highly injurious discrepancy is maintained by artificial means.

The cost-of-living index, which is based on the needs of a working class family of four, does not reflect the true position. There is little doubt that the real increase in the selling price of manufactured goods is understated; and the actual rise in the cost of living of the working classes, as well as the middle classes, is, to-day, much greater than the increase of 2.7 per cent. indicated by the Statistical Department. The differentiation between the index with and without rents is due to the fact that rents for old tenants are regulated at 86 per cent. of the pre-war level by the Rent Restriction Act, but the rents of new houses are about 40 per cent. and even more above 1913.

Wages compare unfavourably with those in Western countries. The agricultural labourers' standard of living is very low and generally they receive the major part of their wages in kind. The industrial working class is somewhat better off, but their wages, both skilled and

unskilled, are far behind those of the neighbouring industrial countries. An illustration of the comparatively low wages is the fact that in 1928 out of a total industrial production valued at 2,847 million pengő (£108,000,000) only 366.6 million pengő (£13,200,000), that is less than 13 per cent., were paid out in wages to 241,305 employees. This means that the average income of the artisans is about £1 per week, and even fully-skilled artisans do not earn more than £2 10s. per week. Considering the protective duties accorded to industry it appears that either such low wages are not justified or that the high tariffs are reacting unfavourably on the standard of living of the whole population.

Another difficult problem of post-war Hungary is how to deal with the tens of thousands of the educated classes, from the lost territories, who took refuge in the country, and for whose services there is no economic demand. Accordingly, they are a heavy burden on the whole community, either by keeping salaries and wages low or by receiving pensions at the charge of the Treasury. This fact accounts for the substantially reduced standard of living of the middle classes as the refugees were mostly State employees or came from the professional class.

The development of social services was delayed by the economic chaos and the scarcity of means in the period of inflation, when help was most urgently needed. With the restoration of public finances and the economic recovery experienced in 1926 and 1927, considerable sums were devoted to the building up of social services. Large sums were spent on education, housing, hygienic services, perhaps on too ambitious a scale. A compulsory insurance scheme against sickness and old age has been introduced, covering about one million people, though agricultural workers are not yet included. Provision has also been made for orphans and widows. The heavy burden of the insurance system and its expensive management is not unjustly criticised by the workers as well as by the employers.

There is no compulsory insurance against unemployment, an omission resented by the industrial workers, who are organised and aided while not employed by their trade unions. It is difficult to give a correct estimate of the number of unemployed in Hungary, because there are no trustworthy figures in respect to agricultural labourers, of whom a considerable number—perhaps 100,000—are workless in the winter. The number of industrial unemployed registered by the trade unions amounted in November, 1930, to 23,000, or about 10 per cent. of the total.

The National Income in 1924 at the outset of the Reconstruction Scheme was estimated at 3,600 million pengő and private estimates range from 4,400 to 5,500 million pengő in 1927 and 1928, when the economic recovery of the country was reflected in the increased volume of production and trade. In 1929 and in 1930, however, owing to the serious decline in the agricultural prices, the National Income in money value has certainly diminished, although the volume of production and trade shows only a comparatively slight decrease. The fact that more than half of the population living in the rural districts is practically self-sufficient, consuming mainly its own products, makes it extremely difficult to give a correct estimate of the National Income in money value. An average of 500 pengő (£45) per capita income for the present year is perhaps on the safe side. This is more than the average income per capita in the South-Eastern European agricultural States, but considerably less than that of the Western countries.

The total tax burden on the National Income is about 20-22 per cent. per annum on the average in the last five years. The distribution of the National Income leaves very much to be desired. Although the situation has considerably improved since the currency stabilisation, wages are still very low, and considering that the cost of living has not fallen to anything like the extent warranted by decrease in wholesale prices, the purchasing power of the population, especially in the agricultural districts, has greatly diminished.
