These items produce a balance-sheet total of over £54,000,000, which is a record in the bank's history.

PROFIT AND DIVIDENDS

The profit for the year amounts to £399,733, which as usual is arrived at after providing for all bad and doubtful debts. This shows a small increase of £2,783 over last year's figure. A favourable experience regarding bad debts has served to counteract the effect of low interest yields and increased charges, and, in the circumstances, I think you will feel satisfied with the results.

As to the allocation of the profits, interim dividends have been paid on the "A" shares at the rate of 16 per cent. per annum, and on the "B" shares at the rate of 10 per cent. per annum,

and it is now proposed that a further distribution on both classes of shares be made at the same respective rates, subject to income tax.

WIDOWS' FUND

As I have already indicated, £50,000 has been added to the reserve fund, and there have also been allocations of £50,000 to property accounts; £30,000 to the trustees for the staff non-contributory pension fund; £10,000 to the widows' and orphans' fund, and £5,000 to a new fund for staff insurance. With regard to the last two items a word of explanation is necessary. The widows' fund, which is managed entirely by representatives of the staff, provides an annuity of £100 to all widows and orphan families of members, and at present there are 111 beneficiaries in receipt of annuities. The fund has been built up over a considerable period of years by staff contributions, which do not exceed £6 6s. per annum in the case of married members, and by the help of the bank, and at the present time the fund is actuarially sufficient to support the annuity which I have mentioned. It is the wish of the directors, however, to see the fund still further strengthened, in view of the present low interest yields, and the ultimate aim is to reach a point at which an increased annuity may be found possible.

NEW ALLOCATION EXPLAINED

With regard to the allocation of £5,000 to the insurance scheme, you may recall that in order to provide that pensions be granted to the staff as a right a large fund was handed over to trustees a few years ago, and by annual appropriations from profits since that time the fund now amounts to £545,000. Until such time as the fund is sufficient to bear the liability for pensions, which on the present basis will not be for a good many years, the trustees hold the bank's guarantee for payment of the annual sum required to meet pensions. Under the scheme, any member of the staff, after the qualifying years of service, has not only the right to a pension of two-thirds salary, but also an option to allocate a portion of such pension upon the life of his wife, in which case the pension so payable to a widow is in addition to the £100 per annum from the widows' fund to which I have referred. While this option has been much valued by the staff, the board have felt that where an officer dies in service before reaching the point at which the right to allocate pensions emerges, the widow is placed at a disadvantage, and it is with a view to the establishment of a scheme to provide for such cases that this first allocation of £5,000 has been made. The details of the scheme are at present under consideration and will be announced to the staff in due course.

You will observe that after the allocations out of the year's profits to which I have referred have been made the carry-forward to next account amounts to £65,230, or some £3,000 more than the amount brought in.

RE-ELECTION OF DIRECTORS

It is proposed that I should be re-elected governor, and that Lord Mackenzie be re-elected deputy-governor. During the year the directors had much pleasure, acting under the powers conferred upon them by the constitution, in appointing as extraordinary directors Sir Iain Colquhoun, Bart., D.S.O., of Luss, Mr George Balfour, M.P., and Mr William A. Bailey, and it is proposed that they, and the other extraordinary directors whose names appear on the list, be re-elected. It is further proposed that Sir William C. Johnston, the ordinary director who retires at this time, be re-elected. Mr Macfarlan and Mr Annan, the auditors, being eligible, offer themselves for re-election for the current year.

The Governor then moved the adoption of the report, and the motion having been seconded by Dr. Nasmyth, was put to the meeting and carried.

At the close of the meeting, on the motion of Mr Charles J. Munro, C.A., a vote of thanks was accorded to the directors and the staff for their services during the year, and acknowledgment was made by Mr Houston on behalf of the directors and by Mr Erskine on behalf of the staff.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

ANSELLS BREWERY LIMITED

36th ORDINARY GENERAL MEETING held at the Farcroft Hotel, Birmingham 21, on Friday, 4th December, 1936.

PROFITS	£495,927	13	10
(12 months ended 30th Sept., 1936), after deducting all charges and expenses for management (including Directors' Fees) and making provision for Interest on Debentures and Debenture Stock, taxation, depreciation, bad and doubtful debts, and other contingencies.			
BROUGHT FORWARD	£309,823	10	6
	£805,751	4	4
DIVIDENDS ON PREFERENCE AND ORDINARY SHARES (paid and to be paid)	£266,787	10	0
TO RESERVE FOR PROPERTIES, ETC.	£125,000	0	0
TO RESERVE ACCOUNT	£100,000	0	0
	£491,787	10	0
TO BE CARRIED FORWARD	£313,963	14	4

Points from the Chairman's Speech.

The undertaking to raise the gravity of the beer by 2 degrees given to the Chancellor of the Exchequer when he reduced the Beer Duty has, and always will be, honoured so long as it lasts.

Ordinary shareholders will receive an extra 2½ per cent., making 25 per cent. for the year less tax as well as an issue of new shares on Bonus Terms. I also congratulate them and especially those who formerly held Holt's shares and decided to throw in their lot with Ansell's by exchanging shares.

By issuing 504,275 bonus shares at £1 each we shall obtain £504,275, which we estimate will be ample to meet our commitments for recent acquisitions and expenditure in connection with the extensions and improvements of the Brewery, Bottling Stores and Licensed Houses of the Company.

We have spent over £720,000 of a Capital nature for the above purposes.

The greater portion of the new premises at Aston is completed and the new garages are capable of accommodating an extra 120 vehicles. Also large additions have been made to Offices and Bottling Stores. The Telsen works have been recently acquired for future development.

We have not omitted to adequately safeguard the future by allocating to reserve the respectable sum of £225,000.

I shall not attempt to prophesy as to the future. It will be abundantly evident that your Company is in the very enviable position of being able to take full advantage of the prevailing state of Trade, and should less favourable conditions be encountered it will still be able to give a good account of itself in consequence of the prudent and conservative policy your Directors have always pursued.

Copies of the Chairman's Speech may be obtained from the Secretary, Park Road, Aston, Birmingham.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

INCREASED NET PROFIT

MR MELVILLE TRITTON'S REVIEW

The eleventh ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 10th instant, at Southern House, London.

Mr H. L. Melville Tritton (the chairman), in the course of his speech, said:—The shareholders will remember that I told them last year of my intention to visit South Africa, and, though I was unable to go to Rhodesia, I visited Pretoria, Capetown, Johannesburg and other important towns in the Union. The Empire Exhibition which opened in Johannesburg in September has proved to be deserving of the highest praise, and the interest taken in it is great and well deserved.

The development of the gold-mining industry has played and will continue to play a most important part in the history of the Union of South Africa. The rise in the price of the metal has made possible the exploitation of resources previously regarded as unpayable. The policy of treating ore of a lower average grade has been responsible for the decline in the volume of output from the Transvaal from the record level reached in 1932, but last year there was an increase compared with 1934, and in 1936 production has again been on the up grade.

BREAK UP OF GOLD BLOC

Gold bullion accounted for 71 per cent. of the value of exports of South African produce in 1935 and the prospects of the industry are, therefore, of vital concern to the Union. Its future largely depends, however, on the demand for the metal as a basis for currency and, in particular as a medium for the adjustment of short-term fluctuations in the balances of payments between nations. The break up of the Continental "gold bloc" this year, through the re-adjustment of the values of the currencies of France, Holland and Switzerland, was accompanied by the definite fixing of upper and lower limits of depreciation in terms of gold for French and Swiss francs. The United States suspended the gold standard in April, 1933, but less than a year later a fresh gold content was fixed for the dollar, and although the new level was, and is, liable to further alteration within a definite limit at the discretion of the President, no such action has been taken. Belgium depreciated her currency at the end of March, 1935, but a provisional gold content for the belga was immediately fixed, showing a devaluation of 28 per cent., and the new rate was made permanent a year later.

FAITH IN GOLD

In this country, although sterling remains unlinked to gold, the Bank of England has continued to increase its holding. If further evidence were needed of the widespread faith in gold, strengthened rather than weakened by the world currency difficulties of recent years, it is to be found in the hoarding of the metal by nationals of countries the stability of whose currencies may, for any reason, be regarded as uncertain. Moreover, the decision of the United States Treasury to enable gold to be obtained in America, in exchange for dollars, by any country which gives reciprocal facilities, and the action of the British, French and, more recently, Belgian, Dutch and Swiss Governments, in according such facilities in their own countries to the United States authorities, is an indication of continued co-operation between the various countries.

SOUTH AND EAST AFRICA

Speaking generally of South Africa, wholesale and retail trading conditions in the Union have been satisfactory throughout the year, considerably more business having been done than during the previous year. Easy money conditions continue, and ample funds have been available for investment in mining, industrial and commercial enterprises, whilst the market for gilt-edged securities has been firm throughout the year.

In East Africa during the last twelve months there have been distinct signs of improvement in general conditions.

The export and import figures of the three East African territories for the first half of the current year show increases over the figures for the corresponding period of 1935. This autumn I was able to pay a visit to several of the branches in Egypt and see the progress being made there. During the last twelve months the negotiations entered into with Great Britain were followed by the successful conclusion of an Anglo-Egyptian Treaty, a factor

undoubtedly making for closer friendship between the two countries.

EGYPT AND SUDAN

The uncertainty of the international situation resulted in an unprecedented demand for Egyptian cotton early in the 1935-36 season. The crop was larger than in previous years, and prices showed a marked improvement. The 1936-37 season has made a promising start. A larger crop than last year is anticipated and enhanced prices prevail.

Business in the Sudan has been satisfactory, and crop prospects are good. The Gebel Aulia Dam is nearly completed and should be handed over this winter. In view of the serious and long continued disturbances in Palestine, shareholders will learn with-out surprise that the trade returns, compared with last year, show a marked decrease. Both imports and exports have fallen appreciably, the latter in consequence of the much reduced citrus crop. Fortunately, the new citrus crop, now being moved, is expected to exceed nine million cases. Government finances continue to be satisfactory.

Turning now to the West Indies and British Guiana, the price of sugar continues to be disappointing; record crops, however, have been reaped in Barbados, Trinidad, Jamaica and British Guiana, totalling 550,000 tons for these four Colonies. Trinidad is now the largest Empire producer of oil, exporting as it does about 400 million gallons a year. The West Indian Islands report a record number of tourists during the last season.

With regard to British West Africa, during the year the steady and material improvement noted in the previous year has continued in both the export and import trades, and the tonnage of cocoa shipped constituted a record. In addition, the gold-mining areas upon the Gold Coast have been actively developed. In Sierra Leone the export of diamonds is higher, and there has also been an increase in the output of gold and iron ore.

THE BANK'S ACCOUNTS

Turning to the balance sheet, it is interesting to note that in this, the bank's centenary year, the total has, for the first time, exceeded the £200 million mark, being an increase of over £10 millions compared with the previous year. Current, deposit and other accounts amount to £97 millions, an increase of £9,000,000 upon 1935, partly owing to an increased deposit of Government funds. Notes in circulation are £80,000 higher at £930,000, whilst acceptances, etc., at £4,947,000, show an increase of nearly £1,000,000. The bank's investments now stand at £27,843,000. This is an increase of over £4,000,000, whilst advances to customers, etc., at £32,205,000, show an increase of £3,000,000.

A change has been made in the manner of presenting the profit and loss account, the net profit, namely £401,000, having been shown, on this occasion, after provision for income tax has been deducted, whereas last year's profit of £473,000 was subject to the appropriation of £120,000 to income tax account. Compared with 1935 there is an improvement in profit of about £50,000. The cost to the bank of the centenary grant, announced in March last, of 10 per cent. of the salaries and pensions paid by the bank, totalled £177,846, and has been charged to the profit and loss account.

RESERVE AND DIVIDENDS

A further sum of £75,000 has been carried to the reserve fund, compared with £100,000 in the previous year, the total of that fund now being £1,925,000. Interim dividends at the rate of 8 per cent. per annum on the cumulative preference shares and 5 per cent. per annum on the "A" and "B" shares, less income tax at the rate of 4s. 5d. in the £, in all cases, were paid in June last. The board now recommends the payment of final dividends at the rate of 8 per cent. per annum on the cumulative preference shares, and at the rate of 6 per cent. per annum on the "A" and "B" shares, less income tax in each case at the rate of 4s. 5d. in the £. The dividend for the year, therefore, on the "A" and "B" shares is at the rate of 5½ per cent. After making these appropriations, there remains a balance of £128,903 to be carried forward. It is proposed to pay these final dividends on Monday, December 21st.

The report and accounts were unanimously adopted.

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY

IMPROVED RESULTS

PROBLEM OF JAPANESE COMPETITION

The ninety-sixth ordinary general meeting of the Peninsular and Oriental Steam Navigation Company was held, on the 9th instant, at the company's offices, 122 Leadenhall Street, London, the Hon. Alexander Shaw (chairman of the company) presiding.

The Secretary (Mr D. N. Black) having read the notice convening the meeting and the report of the auditors,

The Chairman, in moving the adoption of the report and accounts, said that on the whole allied companies had in the past year done rather better, and the improvement was reflected in the somewhat increased amount which appeared in the profit and loss account of the P. and O. Company under the heading of dividends from subsidiary companies. The liquid position of the group was strong, and this, he said, was fortunate in view of the necessity for the replacement of old tonnage by new vessels which lay ahead of all the subsidiary companies. The profit and loss account showed that the net receipts from voyages at £1,284,923 had improved by £230,000 as compared with last year, that being the best net result since the accounts appeared in their present form in 1932.

The improved result for the year was due in the main to better trade, of which the company had been able to reap the benefit through the policy of reorganisation, explained at some length at the annual meeting in 1932. He had been asked whether the distribution this year of 4 per cent. might be regarded as the precursor of larger dividends in future years, but while he sincerely wished that he could say "Yes" to that question, he added that the board was no collection of prophets, but that, quite frankly, in their view the uncertainties of British shipping were such that they could see no prospect whatever of a return to the larger distributions which were at one time made. The figures so far available for the current financial year were, up to the present, not so good as those last year.

IMPERIAL SHIPPING COMMITTEE

He recalled that at the meeting in 1933 he had put forward the proposal that the services of the Imperial Shipping Committee, representing as it did all the Governments of the Empire, should be invited to investigate and report upon just such a case as had risen in respect of the trade between Australia and New Zealand on the one side of the Pacific and North America on the other.

The report of the Committee upon the British Shipping trade between Canada and Australia and New Zealand had now been completed, but so far as the P. and O. Company was concerned, he wished to make it quite clear that its interest in that matter was rather remote. It would make no immediate difference to P. and O. finances, he said, if the Canadian-Australasian Line followed the New Zealand-San Francisco Line into the pit dugged for it by high American subsidies and British apathy, because the Canadian-Australasian Line was not a P. and O. subsidiary; and it was hardly conceivable that either its extinction or its survival could in itself make any substantial difference to P. and O. stockholders.

He thought that was a short view; and if the longer view were taken the interest of the P. and O. Company in that matter must be seen to be identical with the interest of all British shipowners and of the British public everywhere. That was a test case, and in its decision the interest of all British shipowners and of the Empire itself was great. If the Canadian-Australasian Line were also wiped out by wholly uneconomic competition, an example would have been given to other lands of how easy it was to extinguish British lines anywhere, and of how British hesitation, timidity and inaction lent themselves to the process.

ACTION BY THE DOMINIONS

Dealing with the aggressive shipping policy of Japan, which he said was, after all, only one aspect of the general question of the peril of British shipping in the face of State-fed foreign competition, Mr Shaw recalled that he had travelled round the world and did whatever he could to call attention at every British port to the subject and had returned here certain that even if Britain did not move to save Empire shipping the Dominions would take such action as was open to them. They knew that New Zealand had emphatically taken her stand and legislation had been placed upon her statute-book, designed to secure, at any rate in her own purely local trade, that British Empire shipping should still sail the seas. Well done,

New Zealand! Australia had shown an equal interest in the problem, and similar legislation had been introduced in the Senate at Canberra.

TO ABOLISH SUBSIDIES

What about Great Britain? Mr. Shaw asked. It was true that the tramp section of British shipping was greatly helped by the tramp subsidy, which enabled it to negotiate with other countries on something like equal terms. The whole country had endorsed the policy. It was a sign to other lands that the British Government was behind the industry. Now they were told that after 1937 the subsidy would not be paid and that the tramps must "make their plans accordingly." In short, the foreigner was informed that after 1937 British tramp shipping would again be entirely at his mercy. How could the British tramp-owner "make plans" to prevent foreign Governments sabotaging British shipping by high subsidies to their own vessels? To tell the tramp-owners to do so was to play with the question. The only way to put an end to lavish foreign subsidies with an aggressive aim was to let the world know that the Government of Britain was behind its shipping, not half-heartedly and for 1937 alone but altogether and all the time. That was the only way they could get rid of subsidies and get back to an economic basis.

CONCRETE SUGGESTIONS

On the subject of Japanese competition he would like, with all deference, to make two concrete suggestions. The first was that the Government of India should be pressed in its negotiations with Japan to use its bargaining power to the full in support of Empire shipping, and urged in particular to make any concessions to Japan dependent entirely upon fair play to the ships which served India and owed allegiance to his Majesty the King Emperor. His second suggestion was that without prejudice or delay to such immediate remedies as suggested themselves for a situation which might soon become desperate, the broad aspects of Britain's shipping position in the Far East should be referred to the Imperial Shipping Committee for their examination and advice.

MERCHANT SHIPS VITAL TO THE EMPIRE

The merchant navy was not a mere sideline of British industry which could be left to its fate with no other result than a measure of financial loss. On the contrary, it was to Britain bone of her bone and flesh of her flesh. Should it fail in time of trial the whole mechanism of defence by land, sea, and air would be revealed as a source of futile expenditure unable to save a nation which had abandoned to foreign domination the channels of its economic life. The mercantile marine was not merely as important to Britain as her navy, her army, and her air force. In simple truth, it was more important than all these put together, since it alone sustained the life which the other services protected. He thanked God that for those protecting services there was in high quarters enthusiasm, determination, and a real policy now. But for the life-giving service of the merchant navy how different was the picture—the cold shoulder, the averted look, years of delay culminating in a vague promise of help coupled with a definite threat of withdrawal of the only support ever accorded.

A CENTURY OF ENTERPRISE

The Chairman concluded that it was nearly a hundred years since the Peninsular Company received its first mail contract from the Admiralty. A century of private enterprise had built up in the P. and O. what in reality was a great branch of the public service. They had passed through lean years when the stockholders went without a penny of return upon their savings. They might have sold out at a profit to the foreigner, but such a thing was never suggested in any responsible quarter. They preferred to keep their house flag and the Red Ensign flying together, because above all considerations of dividends or personal advantage they had placed, and did still place, their duty as citizens to the great service committed to their charge.

Mr H. L. Urling-Clark congratulated the chairman and the board on the success of their management of the company during the past year, on the arrangements made for depreciation, and on paying a dividend on the deferred stock.

The Chairman thanked Mr Urling-Clark for what he had said, and added that he would like to make it quite clear that the question of depreciation had been in his mind since 1931, but it had been very difficult to carry through. The statement he made last year regarding depreciation was made with full knowledge of what might happen, and the qualification then stated by him still remained. On this matter the opinion of the board was unchanged.

The report was unanimously adopted.

ANGLO-TRANSVAAL CONSOLIDATED INVESTMENT COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

MR A. S. HERSOV'S SURVEY

The third ordinary general meeting of the Anglo-Transvaal Consolidated Investment Company, Limited, was held, on November 27, in Johannesburg, Mr A. S. Hersov presiding.

The Chairman, in the course of his speech, said: The accounts reveal another successful year, with the maintenance of dividend distribution to shareholders at the same rate as for the previous year, and the augmenting of the reserve fund by a further £250,000.

PROFIT AND LOSS ACCOUNT

Turning now to the profit and loss account, you will see that the company's operations resulted in a total profit from all sources of £667,180—as compared with £414,353 for the previous year, or an increase of £252,827.

The net profit for the year transferred to appropriation account, was £581,133 (compared with £355,481 for 1935). To this must be added the amount of £266,874 brought forward from last year—giving an available total of £848,007, which was dealt with as follows:—

Dividends Numbers 4 and 5 absorbed £150,000—an amount of £250,000 was added to the reserve fund, bringing the fund up to £500,000; provision for taxation absorbed £54,900—leaving a balance of £393,107 to be carried forward to the current year on the Appropriation Account.

Before dealing in detail with the mining and industrial concerns being administered by your company, I would like to touch on some of the events of the year which may be of interest to shareholders.

One of the most important of these has been the devaluation of the franc by France, and the agreement arrived at between France, Great Britain and the United States on the currency question. Whilst complete stabilisation is not yet an accomplished fact, this agreement goes a long way towards it, and, as the question of stabilisation is one of the most important factors affecting the continuance of the prosperity of the gold mining industry, any progress in this direction should be looked upon with very great satisfaction.

The mining industry, generally, has continued to expand, as is evidenced by the further increase in tonnages crushed to over forty-six million tons as against forty-two million tons for 1935. The average grade was 4.6 dwts. against 4.9 dwts over 1935, or a further decrease of .3 dwts. The expenditure for the same period was forty-three and a half million pounds, as against forty million pounds, or an increase of three and a half million pounds.

LARGE TRACTS CONTROLLED

Great activity has been evident in the attempt to discover extensions of the Witwatersrand series in other part of the country, and large areas of ground have been taken up by various interests in the Free State—north of Krugersdorp—Ventersdorp and Lichtenburg districts. Your company has participated in these activities and now, together with associated interests, controls large tracts of ground in all these districts.

The development and exploration that is necessary in order to prove whether this ground has an economic value, is of vital importance to the country, and it appears to me that there is room for greater co-operation between the various interests controlling these areas.

The mining groups act in close co-operation on all important principles affecting the industry, and it is apparent that a great saving would be possible, if, instead of each of the interested parties acting independently, a system of co-operation were introduced whereby all the data available could be co-ordinated and utilised for mutual benefit.

This would unquestionably result in a saving of large and avoidable expenditure, and greatly expedite the exploratory work that has to be done.

OIL FUELS

The Government has recently adopted the policy that lower transport costs are necessary for the general expansion of the

country, and it has been officially announced that, in the near future, substantial reductions in the cost of motor fuel in the hinterland will be made.

As your company is interested in the indigenous production of motor fuels, the prices at which these fuels are to be sold is naturally of importance to you.

There is, however, another aspect to this question. Oil fuels can be regarded to-day as one of the prime necessities of modern civilisation. The indigenous production of oil fuels has engaged the attention of the Governments of many leading countries in the world for some considerable time. Many of these leading countries to-day have sponsored, or are subsidising enterprises for the production of oil from coal and shale, as they realise the danger of being dependent on foreign fuel supplies.

In view of this country's huge coal resources—its enormous distances from sources of supply and its consequent vulnerability—the production of oil from these sources must be regarded as a matter of national necessity.

If low fuel cost is essential for the development of a country—fuel supplies should be regarded as its life blood. The whole fabric and economic structure of a country can be completely paralysed by an interference with its fuel supplies.

GOLD MINING INTERESTS

The Chairman then gave a detailed review of the company's gold-mining interests and, referring to Rand Leases (Vogelstruisfontein) Gold Mining Company, said:—

I am very pleased to be able to report that this company has continued to make rapid progress.

Milling operations were commenced on April 13, 1936, and the first declaration of output, made in June last, was 52,500 tons crushed, yielding a nett working profit of £23,749 15s. 4d.

The working results for a quarter ended September 30, 1936, were 165,000 tons crushed, with a profit of £72,180 3s. 9d., whilst, for October, 1936, the tonnage crushed was increased to 60,500 tons—resulting in a gross profit of £27,311 5s. 2d.

The development disclosures on the three principal Reefs which traverse this company's property, namely, south reef, main reef and main reef leader, continue to show consistent and encouraging values.

No. 11 shaft has been sunk to a depth of 3,310 feet, at which depth shaft sinking operations were suspended in order to permit of an extensive development programme being carried out from this shaft, and also to bring it into commission as a hoisting unit as early as possible.

All units of the plant are functioning smoothly and efficiently. The ore reserves as calculated at December 31 last, amounted to 2,460,000 tons of an average value of 4.7 dwts. over a stoping width of 42 inches.

MIDDLE WITWATERSRAND (WESTERN AREAS), LIMITED

This property has now reached a very interesting stage, as borehole results appear to confirm the opinion in regard to the Main Reef Series deduced from the initial geophysical surveys.

Additional boreholes are contemplated and will be commenced when sufficient information has been gained from the Welgegend borehole.

KLIP NIGEL ESTATE AND GOLD MINING COMPANY LIMITED

Operations up to date have confirmed that the Nigel Reef underlies this company's property at workable depth.

The directors have under consideration various possibilities for improving the prospects of this company.

In association with other interests, your company has acquired options over a large area in the Orange Free State embracing the estimated extension of the occurrences in which the Western Reefs have obtained payable values. Preliminary exploratory and prospecting work is proceeding.

Your company continues to investigate the mineral possibilities of various properties held under option.

The Chairman concluded by giving an exhaustive survey of the company's various industrial and base metal interests.

The report and accounts were unanimously adopted.

J. BROCKHOUSE AND COMPANY, LIMITED

JUBILEE YEAR'S RECORD FIGURES

The thirty-ninth general meeting of J. Brockhouse and Company, Limited, was held, on the 9th instant, at West Bromwich, Mr J. T. Brockhouse, J.P. (chairman and managing director), presiding.

The Chairman, in the course of his speech, said that their meeting was the completion of the fiftieth year since the firm's foundation in April, 1886, and at the same time the figures of the trading account and the balance sheet were the best that the directors had ever presented to an annual meeting of shareholders.

The history of the firm had been one of steady and organised development. At the same time, as might naturally be expected, fluctuation in the general trade of the country had been reflected in the trading results of the company. He did feel, however, that the firm was as young and vigorous to-day and far more firmly established in its fiftieth year than ever in its previous history. He laid a special emphasis on the vigorous vitality of the firm, as it would be wrong to suppose that there was any intention to rest upon the laurels already achieved. Rather did he feel that they had now reached the stage in their development when the company might take advantage of the tremendous opportunities which were always being offered to commercial enterprise. At annual meetings in the last preceding years he had told the shareholders that the company was reorganising, rebuilding and "setting its house in order," and he felt that their achievements in that respect were reflected in the results shown this year. It was true the building was not completed, and he hoped it never would be completed, but the rebuilding and reorganising of the old part of the company was completed, and they were now turning their attention towards further expansion.

The balance available to be dealt with this year was £87,021, and the directors now recommended a final dividend of 10 per cent., less tax, on the 448,000 ordinary shares, making 16 per cent. for the year, which compared with a total dividend last year of 10 per cent.

Their order books to-day showed better prospects of trade than ever before in the history of the company. They enjoyed a good proportion of Government work, but at the same time it did not represent too large a proportion of their total trade. Their orders for private customers were more than they had been, and they prided themselves in giving satisfactory service to all their customers. The report was unanimously adopted.

TIMOTHY WHITES AND TAYLORS, LIMITED

INCREASED PROFIT AND DIVIDEND

The eighth ordinary general meeting of Timothy Whites and Taylors Limited was held, on the 4th instant, at the Hotel Victoria, London.

Mr Philip E. Hill (the chairman) said:—Ladies and gentlemen, —The trading profit of the year at £327,339 is some £49,000 larger than that of the previous year, and it is reasonable to assume that it would have been still larger but for the unfortunate summer season experienced by our seaside branches, from which we had every reason to anticipate a bumper year. We are recommending a final dividend of 22½ per cent.—making 30 per cent. for the year—an increase of 7½ per cent. over that paid last year, which, under all the circumstances, I think we must regard as satisfactory.

As to our business generally, I am pleased to state that the expansion to which I referred last year has continued. During the period under review we served 48,649,807 customers at the 878 shops owned by the company and its subsidiaries. An extensive programme of reconstruction and reconditioning of the company's branches has been and is still being pursued.

Last year I spoke hopefully of the company's outlook. This year I feel justified in expressing a feeling of optimism as to our future. Increased employment throughout the country, particularly in the North, has materially increased the spending power of that part of the community which includes a large percentage of our customers. Our weekly returns from all parts of the country are reflecting this. Our policy is to give the highest value possible for money expended, and this should ensure our receiving a fair share of the increased national spending power.

We propose in future to end our financial year on December 31st. Our next accounts, therefore, will cover a period of 15 months. We propose to declare our first interim dividend on the ordinary shares in April as usual and your directors will also consider the possibility of a second interim dividend in October. If the business progresses as we anticipate, we shall be well rewarded for waiting another three months for our annual report, when, we hope, in addition, to distribute a final dividend.

The report and accounts were unanimously adopted.

BARTON AND SONS (1935), LIMITED

FULL ORDER BOOKS

The first ordinary general meeting of Barton and Sons (1935), Limited, was held, on the 9th instant, at Connaught Rooms, London.

Mr J. E. Hodgkin (Chairman) said that their first duty when the company commenced business was to take steps to co-ordinate the various businesses out of which the company was formed. Some time had been spent in organising a central selling department, which was now attached to their London office, and which was responsible for the general publicity of the group of businesses under their control. They had to some extent reduced their commitments in regard to the neon branch of the business and in the manufacture of the electric valves, which were not found to be very remunerative. Those two departments were the only ones which had not been completely successful from the beginning; but as stated in the report, they had made provision to cover the whole of the outstanding liabilities in connection with those two companies, and they were satisfied that better results would be obtained in the future.

Turning to the more prosperous side of the picture, the Works which they purchased at Netherton had already proved the wisdom of their decision. The order book for this Works and for its parent business—the Clydesdale Stamping Works—was more than full, and they had only recently obtained several very large contracts which would ensure the works being kept fully employed for at least the next 12 months.

During the year they were fortunate in securing on reasonable terms the Bolt and Nut Company of Tipton, and he was glad to say that this business had more than justified the prospects held out to them at the time of its purchase. Later still, they were able to acquire a controlling interest in the Vabest Company, which manufactured brass curtain rails and fittings and a variety of rather less well-known products, many of which were sold through the low-price stores in the country. In conclusion, he said that their books were full with profitable work, and they looked forward to a considerably increased profit in the new year.

The report was unanimously adopted, and a resolution was passed increasing the capital to £250,000 by the creation of 300,000 additional shares of 5s. each.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

INCREASED PROFIT

The twelfth annual general meeting of the British Tyre and Rubber Company, Limited, was held, on the 7th instant, at Winchester House, London, Sir Walrond Sinclair, K.B.E. (chairman and managing director), presiding.

The Chairman, in the course of his speech, said that their total profits at £204,659 showed an increase of £15,733. In addition to maintaining the dividend on the ordinary shares at 8 per cent. for the year the directors were glad to be able to recommend a cash bonus of 2 per cent., as compared with 1½ per cent. for the previous year. The extensive rebuilding and modernisation programme at the Silvertown works of their most important subsidiary was proceeding to schedule.

The tyre market in this country was at present suffering severely from over-production. For some years the board had consistently advocated a voluntary limitation of output more in line with actual requirements and it was very much to be regretted that no measure of agreement on that question had yet been achieved within the industry.

During the last year there had been an appreciable increase in raw material prices, particularly so in the case of crude rubber, but he was glad to say that so far that movement had been regulated in a gradual and orderly manner. The consumption of rubber had grown and seemed likely to grow in the near future to a considerable extent, and while they as manufacturers welcomed the recent increase of releases from 65 per cent. to 70 per cent. of the quota, he felt that the International Committee had failed to give that percentage of release which would ensure that degree of stability so fundamentally vital both to the rubber manufacturing and producing interests.

The report was adopted.

Mr W. T. Anderson, in proposing a hearty vote of thanks to the directors and the staff, expressed the thanks of the shareholders for the increase in the dividend and also for the steady improvement shown in the accounts. An examination of the balance sheet, he said, showed that the company was in a very healthy condition and that it was managed with great initiative, which should result in benefits to the shareholders in future years.

RHODESIAN CORPORATION, LIMITED

GOOD POSITION AND OUTLOOK

The eleventh ordinary general meeting of the Rhodesian Corporation, Limited, was held, on the 8th instant, at River Plate House, London, Captain H. B. Jameson (the chairman) presiding.

The Chairman, in the course of his speech, said that shares in other companies stood in the company's books at £642,642 and the quoted shares had a market value at July 31st last in excess of the book value. That excess amounted to over £300,000 and, after taking into consideration certain sales and purchases made since the close of the financial year, the value of the quoted shares as at the last Stock Exchange make-up prices amounted to over £1,000,000.

As to their mining interests, the profit from the Fred mine was £22,286, as compared with £35,153 for the previous year. Results in recent years had shown some falling off, but developments in the lower levels were now giving much better values and the outlook was distinctly encouraging. The company's principal shareholdings were in East Rand Consolidated, Spaarwater Gold Mining, West Spaarwater and Wanderer Consolidated Gold Mines, all of which were operating in South Africa, and the following companies operating in West Africa, Ariston Gold Mines, Amalgamated Banket Areas, Gold Coast Selection Trust and Gold and Base Metal Mines of Nigeria. The excellent progress made by the Spaarwater Gold Mining Company was specially worthy of note, while East Rand Consolidated was in a very strong position.

Although the profits earned had been less than during the previous year, he thought shareholders would realise that the general position was highly satisfactory, and he thought he was justified in saying that the general outlook for the company was excellent.

The report was unanimously adopted.

BRITISH BURMAH PETROLEUM COMPANY, LIMITED

TURNING POINT IN COMPANY'S CAREER

The twenty-sixth ordinary general meeting of this company was held, on the 8th instant, in London, Major E. Seaborn Marks, O.B.E. (the chairman), presiding.

The Chairman, in the course of his speech, said that the company appeared to have reached a turning point in its career. By the acquisition of the property of the Yenangyaung Oilfield Southern Extension Company, and the issue for cash of £400,000 5½ per cent. first debenture stock, two of their objectives had been achieved. The next objective was to increase the output of oil and to bring the refinery into line with modern practice, and both these were on the way to being accomplished.

In the enlargement of output a decided measure of success had already been met with, the production of crude oil at the end of the year being practically 50 per cent. higher than at the beginning. As a result they had been able to increase the throughput of the refinery and to produce larger quantities of kerosene and benzine, the major products. The former showed a substantial increase in price, but the latter had given less return notwithstanding the fact that shipments had increased by over 20 per cent. They were spending considerable sums in bringing the plant up to date; and the effect should become evident next year. Given a reasonable price for the manufactured products, the indications both in the field and at the refinery were such that they should experience better times.

The chairman went on to refer to the development of the South African Torbanite Mining and Refining Company, Limited, in which they were interested. A gradual improvement was reported in the production of torbanite crude: 300,000 gallons had been produced since the retorts began work last June.

The report and accounts were unanimously adopted.

CENTRAL AND SOUTH AMERICAN EXCHANGE RATES.—The following quotations apply to the two centres shown below:—

Bolivia. "Official" commercial rate was 50.17½ bolivianos per sterling on November 13, 1936.

Nicaragua. Official buying rate was 109½ cordobas per 100 United States dollars on November 18, 1936. Open market rate was 175 to 180 cordobas per 100 United States dollars, at same date.

Other Central and South American Exchange Rates, together with those of South Africa and Australasia, were given in the *Economist* of December 5th, on pages 497 and 498.

The Norwegian Bank Rate was increased on December 7th from 3½ to 4 per cent. Other Overseas Bank Rates were also given in the above issue.

GOLD AND SILVER

The following statistics of imports and exports of gold and silver for the week ended December 10, 1936, are issued by the Statistical Department of H.M. Customs and Excise

GOLD MARKET

Messrs Samuel Montagu and Company write—

The Bank of England and Company write on December 9, 1936:—
 £248,660,346 on December 2nd, showing no change as compared with
 November 25th. In the open market about £1,800,000 of bar gold was
 disposed of at the daily fixing. Conditions have been quiet, but demand
 has been more general and prices have included a small premium over
 dollar parity. The s.s. "Malaja," which sailed from Bombay on
 December 5th, carries gold to the value of about £296,000.

SILVER MARKET

There have been only small fluctuations in prices and the market has been quiet. The higher prices reached at the end of last week attracted some bear sales and there has been selling on China account, offsetting being offset by continued demand.

A slightly easier tendency was apparent on December 9th, following a decline in the New York and Bombay rates and, with buyers hesitating, prices declined $\frac{1}{2}$ d. to $21\frac{1}{2}$ d. on China selling and speculative resales. No important change is expected in the near future, but prices may ease further if Indian demand slackens.

Quotations for gold and silver are shown below :—

1936	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce •999 fine
			Cash	Two Months

(c) Paid on a larger capital of £100,000 against £29,731. † Free of income tax.

DE BEERS CONSOLIDATED MINES, LTD.—The board of directors has declared a dividend of £3 per share to all preference shareholders registered at December 31, 1936, in respect of the cumulative arrears of preference dividend from July 1, 1932, to June 30, 1935. The directors announce that the improved condition of the diamond market and arrangements which have been made to realise certain of the company's reserve investments enable them to pay the above dividend of £3 per share and to state that, if the present volume of trade continues, a further £2 per share will be paid in July, 1937, covering all the dividends due to preference shareholders at that date.

FIRST PROVINCIAL FIXED TRUST "B" SERIES.—Fourth distribution on Series "B" certificates payable on December 16th to all registered holders will be at the rate of 5.1274d. net per sub-unit. This amount includes 6714d. net per sub-unit, amount realised on bonuses and rights declared during the period. The managers having certified under the provisions of Clause 3 (a) of the Principal Trust Deed that it was desirable in the interests of the certificate holders to realise the holding of 200 fully-paid ordinary shares such holding has accordingly been sold, and the net proceeds of sale amounting to 4.691d. per sub-unit are being distributed to sub-unit holders with the income distribution on December 16th.

HUDSON'S BAY COMPANY.—A distribution of one half-year's dividend on the 5 per cent. cumulative preference shares will be paid on January 1, 1937. Dominion income-tax relief has been agreed with the Inland Revenue authorities at 6d. in the £; consequently, the net deduction for income-tax on the distribution will be 4s. 2d. in the £.

FOREIGN GOVERNMENT BOND TRUST.—The total value of the Trust at December 9, 1936, market prices shows an appreciation over the net proceeds subscribed by purchasers as follows: Year ending October, 1935, 5½ per cent.; year ending October, 1936, 5½ per cent.

REPORTS AND NOTICES

(Continued from page 544)

ROYAL INSURANCE COMPANY (Interim Bonuses on "Royal" Life Policies).—The directors of the Royal Insurance Company, Ltd., announce claims or be surrendered during the twelve months ending December 31, 1937, and which are entitled to an interim bonus, will be at the rate of 45s. per cent. per annum, which is the same rate as for the previous year.

MISCELLANEOUS

GAUMONT-BRITISH.—Combined assets and liabilities of Gaumont-British Picture Corporation, Limited, and 64 subsidiary companies at March 31, 1936.

BRITISH BURMAH PETROLEUM.—Report for year to July 31, 1936, shows trading profit £43,213, as compared with £14,578 in previous year. 7 per cent. "A" debenture stock sinking fund account. Profit on sale of shares, £65,416, compared with £21,479. Credit balance forward £823, from £1,616,988 to £2,139,430. Total assets have increased £49,632 on July 31, 1935. Debtors, £228,186, against £177,135. Creditors, £164,650, against £104,270.

MANBRE AND GARTON, LTD.—The Company's report shows an increase in net trading profits of £37,310, to £367,796, for the year to September 30, 1936. Debenture interest absorbed £17,500 and the year's fund (£7,500). After providing for debenture sinking interim on the ordinary shares, there remains £452,375. A final dividend for the year at 14 per cent., less tax. It is also proposed to repeat the £10,000 to reserve for special purposes. A sum of £5,000 goes to legal expenses reserve, which leaves a balance of £219,508 to carry forward compared with £193,212 brought in.

SCOTTISH AUSTRALIAN COMPANY.—This company secured a profit of £25,451 for year ended June 30, 1936, compared with a loss of £62,031 for the previous year. The balance brought forward amounted to £10,975. After meeting the Guaranteed Preference stock requirements, the directors propose a dividend of 4 per cent., against 3 per cent., less tax, on the Meeting, Winchester House, E.C.2, December 18th, at 12 noon.

In the United States the upward trend of quotations continued during the past week. Thus, Moody's index (December 31, 1931 = 100) rose to 196.2 on Wednesday, against 194.7 a week earlier, 186.4 a month ago, and 165.7 on the same day last year.

COAL

SHEFFIELD.—There is little change on the export market and a moderate demand for all qualities is maintained. Requirements for furnace coke are considerable and gas coke cannot easily be obtained. Demand for industrial purposes at home is growing. The household market is more active, but the fog of last week caused some dislocation of supplies.

NEWCASTLE-ON-TYNE.—The coal market in this area is very strong, there being a good inquiry for all classes. Every effort is being made to increase production, but this must necessarily take some time. North-umbrian steam classes have a good sale to Scandinavian countries; these consumers have paid higher prices and are disposed to cover ahead at current quotations. Collieries are now fully stemmed for this year and only odd parcels are available. Patent oven coke is just as scarce.

GLASGOW.—The market is firm, collieries being well booked up. Occasionally, however, odd lots can be obtained, especially in the export branch in which tonnage delays are still hampering the movement of coal. In this connection the outlook for meeting the pre-holiday pressure later in the month is not too bright. The shortage of waggons is less acute for landsale business, and the active demands of industry, public utilities and domestic consumers are being satisfactorily met. Quotations for house coal are considered likely to be further advanced.

CARDIFF.—Chartering for the French market has improved under the stimulus of the increased import quota, and, as shipments are a little more active in other directions, the heavy stocks of best large coals have been slightly reduced. The recent expansion in the volume of the inland trade is maintained. Except for certain classes of small coals, which continue very scarce owing to the contracted output of large coal, prices show no material alteration. The Control Board is aiming at a higher average price level, and the contract with the Egyptian State Railways has been renewed at about 5d. per ton higher. Both foundry and furnace coke continue very firm; patent fuel is unaltered at 22s. per ton f.o.b.; while the ex-ship price of French pitwood under the coal-pitwood barter agreement has been reduced for the balance of 40,000 tons for the October-December quarter from 24s. 10d. to 23s. 6d., owing chiefly to the recent devaluation of the franc. The arbitrators under the Central Council have considered this week a claim from the South Wales Executive Board for some relief from the decision of the Council prohibiting long-period contracts beyond March, 1938. Schemes are under contemplation for the installation of two important new works in the district, but the promoters of these enterprises have asked for long-period coal contracts, extending in the one case for seven years and in the other for twenty-five years, but subject to the usual rise and fall price clause, and also to arbitration in the case of the more important of the two projects. The arbitrators will announce their decision in the course of the next few days. Foreign and coastwise exports last week totalled 357,700 tons, compared with 386,981 tons in the corresponding week last year. Up to the end of the first week in December the decrease compared with the same period last year exceeds 2.1 million tons.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that no improvement has taken place in the stringent conditions which have ruled in the iron and steel markets for many weeks. Whilst it is expected that some relief will be afforded by the recent release of the Continental quota of steel, it is not likely that the quantity will be sufficient to affect the situation to any extent in view of the extraordinarily heavy demand.

In the pig iron section the recent increases in price have had practically no influence on the market and there is little material available for sale until the first quarter of next year. Most consumers have bought forward for some months and in a few cases until the end of June, 1937. Some anxiety is felt regarding future supplies of steel-making iron as well as of foundry qualities.

In the semi-finished steel department most of the British works have sold their production for several weeks to come, and it is not easy to place contracts for anything like near delivery.

Demand for finished steel shows no signs of declining and recent orders for new ships and extensions to factories and workshops will shortly increase the requirements of the market. There is little surplus left for export after the home demand has been dealt with. Tightness is apparent in the market for Continental steel for overseas destinations, and prices this week have been substantially increased.

SHEFFIELD.—The increase in pig iron prices has had little effect upon demand and the market remains strong. Foundry iron is in keen request, but only a few small parcels have been available this week. Demand for forge iron is somewhat less insistent than for foundry, but consumers are ready buyers. A distinct shortage of both East and West Coast hematite prevails and deliveries under contract are in arrears. The premium of about 10s. per ton already operating will, it is expected, shortly be officially added to quotations. There is no further change with regard to finished iron. The strongest feature is still common bars, in which business is very active. Marked bars are also a good market. The shortage of basic steel billets becomes more and more pronounced and producers are unable to accept all the business offering. Users are also pressing for bigger supplies of acid billets and in other sections of the market there is an obvious desire to cover requirements in view of the early likelihood of increased prices. The iron and steel scrap market remains very firm, prices showing no further change except that steel works heavy cast iron is now quoted around 56s. per ton delivered.

MIDDLESBROUGH.—Whilst buyers are anxious to purchase further quantities of Cleveland foundry iron, the quantity sold under contract is absorbing current output. Consequently, makers cannot see their way to enter into further commitments. East Coast hematite is in strong demand and until there is some official announcement regarding an increase in price, makers are not inclined to discuss new business. The prices of both Cleveland foundry pig iron and East Coast hematite remain unchanged, but the quotation for the latter is purely nominal. There is an increasing demand for semi-finished and manufactured steel, eleven new shipbuilding orders having been received on the River Wear in eleven days. It is expected that prices of certain steel products will be increased shortly owing to the rising cost of production and owing to the cessation of the railway rebates at the end of this year. Heavy steel melting scrap is firm at 60s. per ton delivered works, whilst good Durham blast furnace coke is readily disposed of at 24s. 6d. per ton, delivered at local furnaces.

GLASGOW.—Steel makers are quite unable to meet the demand, requirements being greatly in excess of the capacity of plants. Supplies of all grades are far short of the needs of users in the West of Scotland, and, although some relief has been afforded through deliveries of Continental material, total supplies are only sufficient to meet immediate requirements, and it is impossible for users to carry such stocks as are deemed necessary. At the present time makers both of semis and finished materials are refusing to quote except for delivery many weeks ahead, for in almost every branch the output of the next few weeks is booked up. In the Glasgow district, and manufacturers, involving heavy tonnages. Apart from the delay in securing supplies of material, the outlook is satisfactory in almost every branch of the trade.

CARDIFF.—Conditions in the South Wales iron and steel trades continue satisfactory. The blast furnaces in operation are working full time; the steel melting furnaces are also very active; while the tinplate factories are employed up to their allotted 65 per cent. output quotas. The quotations for tinplate bars are very firm at 46; galvanised sheets the inland trade; while tinplates, though nominally unchanged, are of tinplates at Swansea last week totalled 78,471 boxes, compared with 73,361 boxes in 1935.

OTHER METALS

COPPER.—With the cessation of liquidation, prices recovered sharply and closed on Wednesday £1 1s. 3d. higher on the week at £44 7s. 6d. per ton and are discounted in responsible quarters. This year's output is unlikely to be panies was considerably curtailed in the first seven months of the year. Moreover, stocks in home warehouses are now almost 50 per cent. smaller view of the upward trend of consumption. Sales on the London Metal Exchange: 700 tons on Monday, against 800 tons last week; 1,800 tons on Tuesday, against 3,800 tons last week; 1,250 tons on Wednesday, against 2,100 tons last week. Domestic spot was quoted at 10.52½ cents per lb. in New York on Wednesday, against 10.47½ cents a week ago and 10.52½ cents a month ago. Wednesday's official closing price for standard cash in London was £44 7s. 6d. to £44 10s., compared with £43 6s. 3d. to £43 7s. 6d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 45,181 tons, show an increase of 449 tons, while stocks of rough copper, at 715 tons, show a decrease of 52 tons.

LEAD AND SELLER.—Lead prices firmed up and at the close on Wednesday showed a gain of £1 6s. 3d. on the week. Demand from strong statistical and technical position of the market. World output of metric tons during October. But since no less than 8,645 tons was accounted for by the United States, which is not an exporter at present, the London market will derive little benefit from the higher output, and the present scarcity is therefore likely to persist. Spelter rose in sympathy with lead. output, from 120,090 metric tons in September to 127,870 in October. At 4.125 metric tons, daily production in October was higher than at any time since 1929. Here again, however, about half the increase—3,641 tons out of a total of 7,780 tons—was attributable to the increase—3,641 tons Sales of lead on the London Metal Exchange: 2,400 tons on Monday, against 1,000 tons last week; 1,650 tons on Tuesday, against 1,550 tons last week; 4,250 tons on Wednesday, against 2,000 tons last week. The New York quotation on Wednesday was 5.20 cents per lb., against 5.20 cents a week ago and 5.10 cents a month ago. The official closing quotation for lead in London for soft foreign for shipment during the current month was £24 1s. 3d. per ton, compared with £22 15s. a week ago.

Sales of spelter on the London Metal Exchange: 1,325 tons on Monday, against 1,400 tons last week; 1,000 tons on Tuesday, against 2,300 tons last week; 2,750 tons on Wednesday, against 1,650 tons last week. Wednesday's quotation in East St. Louis was 5.05 cents per lb., against 5.05 cents the week before and 4.95 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £17 per ton, against £16 5s. last week.

TIN.—After a sharp fall to £226 per ton, prices scored a recovery, both the cash and forward quotations closing on Wednesday at £231 10s. per ton. The disappearance of the "backwardation" is evidence that the Committee met on Friday of this week, and most London merchants expected them to recommend some reduction in the quotas—hence the sharp recovery of the market during the past few days. But it must be remembered that a reduction in the quotas would not necessarily mean a lower rate of production, for the basic quota of Siam and the Belgian Congo is mittee's decision is not known.

Sales of tin on the London Metal Exchange: 250 tons on Monday, against 225 tons last week; 300 tons on Tuesday, against 350 tons last week; 425 tons on Wednesday, against 275 tons last week. The New York quotation on Wednesday was 52.25 cents per lb., against 51.25 cents a week ago and 53.50 cents a month ago. Wednesday's official closing quotation in London for standard cash was £231 10s., against £231 5s. compared with £231 5s. to £231 15s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,171 tons, a decrease of 102 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was quoted at £14 5s. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £56 per ton ex warehouse, the same as last week. Chinese wolfram for "December-January" shipment was quoted at 32s. 6d. to 33s. 6d. per unit, c.i.f., as against 31s. 6d. to 32s. 6d. per unit last week. Refined platinum at £9 15s. per ounce remains unchanged.

TEXTILES

COTTON.—Manchester.—An encouraging inquiry has been experienced in the market during the past week, the tone being firm. Spinners and position. Buyers are keeping well covered owing to there being little probability of lower prices in the near future.

In raw cotton circles the feature of interest has been the slightly bullish crop estimate of the United States Government of 12,407,000 bales. The general position, however, as regards supplies, shows very little alteration. Important developments are not likely to take place until some announcement is made relating to the disposal of loan cotton and the Government's crop plans for next season.

Demand for American yarns has kept up fairly well. Some spinners have described buying as rather patchy, but the larger output is being well absorbed. A steady demand has been experienced in Egyptian qualities. The ballot of Egyptian spinners on the price maintenance scheme has not so far been successful, but it is believed that before the end of this week the necessary majority of 80 per cent. will have been obtained.

Demand in the cloth market has covered a wide range of goods, and although bulk lines have been few and far between, turnover has been good. Business offering for India has shown some improvement. Some very fair orders have been put through in mulls and light bleaching descriptions, generally for Madras and Karachi. Scattered transactions have been mentioned in white yarn dhooties and prints for Calcutta. Although the auction news from Shanghai continues better, there have been very few indications of more trade for China, but a persistent demand continues to be experienced for Java, especially in dyed fabrics. Heavy shirtings and prints have moved off fairly well for West Africa. Further buying has taken place in finishing and printing styles for South America. A varied business has been done for the Continent and the Dominions. The home trade section has been disturbed by the constitutional crisis and the possibility of the Coronation next May would restore trade to its recent state of activity, however, have been put through in household goods.

AMERICAN COTTON CROP.—On Tuesday last the Crop Reporting Board of the United States Department of Commerce estimated the cotton crop for this season at 12,407,000 bales, against 12,400,000 bales a month ago. The amount gained so far this season was stated to be 11,494,000 bales, compared with 9,357,000 bales a year ago. The average abandonment of acreage is 2.8 per cent. The statistics were very near market expectations, but on the whole the report was considered to be slightly bullish, and prices in New York and Liverpool have advanced a few points.

The general situation, however, shows very little change, and in cotton trade circles interest is now centred on the policy of the Washington Government concerning the disposal of the 3,000,000 bales held and the future of crop control. According to the facts available, there seems to be little probability of lower prices in the near future, especially in view of the heavy consumption in the United States which may exceed last season's by 1,000,000 bales.

WOOL.—Bradford.—The recent London wool auctions have been the most successful this year. They finished on a very good note, though prices for some merino qualities had receded slightly from the highest point. On the average, prices showed an increase of 10 to 15 per cent. over those realised at the previous sale, while crossbreds showed an increase in price varying from 20 to 30 per cent. Buyers went home feeling that current prices were resting on a sound foundation. The home trade was credited with purchasing 45,000 bales, the Continent 44,000 bales, and America 5,000 bales. The carry-over was only 11,000 bales, the smallest in London for many years.

The constitutional issue has upset all markets, and hesitancy has been in evidence. The position at the manufacturing end is still very sound, but a good deal of the improvement, particularly in crossbreds, has been due to the expected Coronation next May. Great preparations have been made for that event, and the trade is anxiously waiting to see what is going to happen. In the meantime a good deal of business is being held up, and merino tops have already eased slightly. A settlement of the present difficulties would considerably ease the situation, while a fulfilment of the Coronation next May would restore trade to its recent state of activity.

GRAIN MARKETS

WHEAT.—A further advance in quotations occurred this week. The continuance of Italian demand, the resumption of interest from the Far East and the receipt of "bullish" private estimates of the Argentine crop, were the factors mainly responsible for the movement. On Wednesday Liverpool futures closed at the highest level since April, 1930.

On Wednesday last, "December" futures were quoted in Chicago at 128 cents per bushel, against 124½ cents the week before and 114½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 47s. 9d. per 496 lbs., against 46s. 6d. a week ago; No. 2 Northern Manitoba, ex ship, 47s. 3d., against 46s. a week ago.

FLOUR.—Following the lead of wheat, flour prices have recorded a further advance. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 38s. per 280 lbs., against 37s. a week ago; delivered inner London, 37s. 6d., as compared with 36s. 6d. a week ago. Manitoba patents, ex store, 35s. 6d. to 36s., against 34s. 6d. to 36s. a week ago. Australian, ex store, 32s. to 32s. 6d., against 32s. to 32s. 6d. a week ago.

BARLEY.—Despite the strong tendency on North American markets, prices in this country are practically unchanged. "December" futures were quoted at 72½ cents per bushel in Winnipeg on Wednesday, against 64½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed" (new), at farm, 28s. to 29s., as against 28s. to 29s. a week ago; "English malting" (new), at farm, 34s. to 50s., against 34s. to 50s. last week; Californian (new), ex ship, 48s. to 58s., against 48s. to 58s. last week; Chilean, brewing, ex ship, 37s. to 42s. 6d., against 37s. to 42s. 6d. a week ago.

SOVIET NEWS FROM THE SOURCE!

MOSCOW NEWS

Illustrated Weekly. Indispensable for all interested in current events in the Soviet Union.
2d. per copy; 6 mths. 4/-, 1 year 8/-.

MOSCOW DAILY NEWS

A crisp and informative chronicle of day to day development in all spheres of Soviet life.
1d. per copy; 6 mths. 10/-, 1 year £1.

SOVIETLAND

Monthly, with fine coloured pictures. Outstanding Soviet writers describe everyday life among the many national groups that comprise the U.S.S.R.

Edinburgh: 35 St. Andrew Square
London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W.1

OATS.—In common with other grains, oats are dearer this week. On Wednesday, "December" futures were quoted at 49½ cents a bushel in Chicago, against 46 cents a week ago and 42½ cents last month. Quotations in London, Wednesday: "English Black" (new), at farm, 21s. to 22s. per 333 lbs., against 21s. to 22s. a week ago; "English White" (new), at farm, 21s. to 22s., against 21s. to 22s. a week earlier; mixed Canadian feed (Vancouver), landed, 22s. 3d. per 320 lbs., compared with 22s. 3d. last week.

MAIZE.—In sympathy with wheat and in response to an active demand, prices have again advanced. "December" futures were quoted on Wednesday at 109½ cents per bushel in Chicago, against 108½ cents a week ago and 101½ cents last month. Quotations in London, Wednesday: "Plate," landed, 25s. per 480 lbs., compared with 24s., a week ago; "Plate," ex ship, 24s., as against 23s. a week ago; "Plate," "December," 24s., as against 23s. a week ago; yellow maize meal, ex wharf, was quoted at £6 5s. to £6 10s. per ton, as against £6 5s. to £6 7s. 6d. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1934-35:—

NEAREST FUTURE	Jan. 3, 1934	Jan. 2, 1935	Dec. 11, 1935	Dec. 31, 1935	Dec. 2, 1936	Dec. 9, 1936
Winnipeg (No. 1, Manitoba) — Cents per 60 lb.	65½	82½	83½	84½	115½	114½
Chicago (No. 2, Winter) — Cents per 60 lb.	84½	98½	95½	75½	124½	128

The visible supply of wheat in Canada amounts to 65,887,000 bushels, against 73,454,000 bushels last week, and 141,684,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1932-33 to 1935-36:—

	1932-1933	1933-1934	1934-1935	1935-1936
Estimated sales of home-grown wheat:—				
1 week to December 5	267,045	380,540	318,377	298,075
14 weeks to December 5	4,810,449	6,234,072	6,125,842	4,451,638
Average price of English wheat per cwt.	s. d. 4 7	s. d. 4 10	s. d. 5 8	s. d. 8 5

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding week in each of the years from 1932 to 1935:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
December 3, 1932 ...	Cwts. 318,485	Cwts. 393,707	Cwts. 50,559	s. d. 5 5	s. d. 6 11	s. d. 5 9
December 2, 1933 ...	267,045	420,569	43,502	4 7	9 1	5 4
December 8, 1934 ...	380,540	312,573	41,241	4 10	8 7	6 8
December 7, 1935 ...	318,377	367,864	35,421	5 8	8 3	5 11
November 23, 1936 ...	274,372	534,339	53,814	8 5	9 8	8 10
December 5, 1936 ...	298,075	441,641	52,848	8 5	9 5	6 10

OTHER FOODS

BACON.—The market has been steady to firm, with prices showing little alteration. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 86s. to 92s.; Canadian 80s.; Danish, 90s.; as against 88s. to 90s., 80s. and 90s. last week. Arrivals in London last week included Danish, 12,115 bales; Canadian, 6,879; Dutch, 2,022; Lithuanian, 1,499; and Polish, 2,005; as against 11,618, 7,546, 1,994, 1,427 and 2,569 bales, respectively, in the previous week.

BUTTER.—After a quiet opening, the market showed a firmer tendency. Prices are about unchanged on the week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 104s.; Australian, choicest salted, 102s.; Danish, 118s., compared with 104s., 102s. to 103s. and 118s., respectively, a week ago.

CHEESE.—English was again firm this week, with other makes steady. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 86s. to 88s.; Canadian, finest coloured, 70s. to 72s.; and New Zealand, finest coloured, 63s. 6d., against 82s. to 88s., 70s. to 72s. and 63s. to 64s., respectively, a week ago.

COCOA.—Although the world supply-demand position has undergone no material change, the price of cocoa continued its upward movement, stimulated by speculative buying in New York. The spot quotation in New York on Wednesday was 11½ cents per lb., as against 11½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, "December-February," was quoted 49s. 9d. per 250 kilos, c.i.f. Continent, against 48s. 9d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 4,034 bags; delivered, for home consumption, 11,929 bags; exported, 117 bags; stocks, 98,066 bags, against 117,971 bags a year ago.

COFFEE.—The London spot market again ruled quietly steady. In New York, prices firmed up at the end of last week, and have since been steady. On Wednesday, Rio No. 7 (cash) was quoted at 8½ cents per lb. in New York, as compared with 8½ cents per lb. last week and 8½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, nil; delivered, for home consumption, 257 cwt.; exports,

nil, stocks, 9,217 cwt., against 12,138 a year ago. Central and South American, landed, 1,967 cwt.; delivered, for home consumption, 2,973 cwt.; exported 559 cwt.; stocks, 53,423 cwt., against 70,911 last year. Other kinds: landed, 3,644 cwt.; delivered, for home consumption, 4,329 cwt.; exported, 658 cwt.; stocks, 89,742 cwt., against 106,135 last year.

EGGS.—In consequence of a quiet demand, prices for some selections have shown an easier tendency. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 19s. to 20s. per 120; as against 19s. to 20s. last week; while Danish (15½ lb.) made 14s. to 15s. as against 15s. 3d. to 15s. 6d. last week.

FRUIT.—Business at Covent Garden, though still moderate, shows a tendency to improve, states *The Fruitgrower's* report. Imports of some of the principal December lines are below normal, owing to the United States shipping strike and the Spanish civil war. Apples remain in consistent demand and prices are steady at the moderate level now ruling. With limited arrivals of Californian pears at the moderate level now ruling. Grapes are also becoming dearer on shorter supplies, but Kent cobnuts are a point easier. French walnuts encounter a fair demand. Brazils are moderate and almonds dear. Chestnuts enjoy a steady sale. Oranges are a good item, but grapefruit are slow. Lemons remain at a moderate level.

MEAT.—Trade was not so good at Smithfield this week and prices were reduced in certain instances. On Wednesday last, Argentine chilled hind-quarters were quoted at 3s. 10d. to 4s. per 8 lbs., as compared with 4s. per 8 lbs., against 3s. 2d. to 3s. 10d. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,730 tons, a decrease of 1,115 tons on the corresponding week last year. Beef and veal bacon 1,182 tons, mutton and lamb 2,432 tons, and pork and in the same week of 1935.

PEPPER.—Wednesday's spot price for black Lampung (in bond) was 2½d. per lb., against 2½d. a week ago. Movements of pepper in London during the past week were as follows: Black, landed, 18 tons; delivered 8 tons; stocks, 1,827 tons, against 1,518 tons a year ago. White, landed, 67 tons; delivered, 67 tons; stocks, 11,840 tons, against 13,996 tons a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 9s. per cwt., ex warehouse, on Wednesday, as compared with 9s. per cwt. a week ago. "January-February" in singles to Continent and U.K. was quoted during the past week were as follows: Landed, nil; delivered, 81 tons; stocks, 1,738 tons, against 5,489 tons a year ago.

SUGAR.—The tone of the markets, both in London and New York, has been rather quiet, with prices showing little alteration. The spot price cents per lb. on Wednesday was 3-85 cents per lb., as compared with 3-85 sales of raw sugar in London included "January" delivery at from 4s. 9d., movements of raw sugar at public warehouses in London and Liverpool last week, and 31,289 tons in the same week of last year; deliveries 14,977 tons, against 15,947 tons last week and 16,717 tons last year; stocks, 156,000 tons, against 146,126 tons last week and 204,920 tons last year.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Dec. 5, 1935	12-61	12-31	13-58	13-04	10-27	11-56	12-83
Oct. 29, 1936	12-99	12-12	14-61	11-61	10-03	11-52	13-24
Nov. 5, "	13-03	12-51	14-85	11-93	10-12	11-97	13-40
Nov. 12, "	12-80	12-21	14-82	11-79	9-75	12-07	13-30
Nov. 19, "	12-69	12-27	14-72	11-58	10-24	12-07	13-12
Nov. 26, "	12-67	13-44	14-70	11-85	10-13	11-77	13-09
Dec. 3, "	12-67	12-44	14-50	11-61	10-24	11-61	13-03

The quantities catalogued for the public auctions in Mincing Lane this week comprised 51,529 packages of Indian and 19,859 packages of Ceylon tea. At the Indian auctions a good tone prevailed and prices were about steady. Competition for Ceylon grades was active at last week's rates.

VEGETABLES.—Tomato prices have eased at Covent Garden, according to *The Fruitgrower*, owing to larger supplies from the Canary Islands. Asparagus are in very limited supply, but are not inquired for. Forced peonies and chrysanthemums are a prominent item. Cabbages and savoy are doing better, but carrots, turnips and parsnips show no change. Cauliflowers and showing of Christmas trees, holly and mistletoe show no change. A fair buying is limited as yet. Meanwhile, the potato trade at the various London land King Edward again made 9s. to 9s. 6d. per cwt., ex market.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OLSEEDS.—Markets are buoyant and oilseeds and vegetable oils almost without exception are dearer. The decision of which had been in operation since last December, removed uncertainties. Continental crushers replenished their scanty stocks by large purchases of Plate seed. This re-stocking movement, coupled with the rise of the buyers were more interested in new crop for January and February. The Argentine Government is held to support the optimistic outlook. Doubts should be set at rest by the official estimate due next week. The quantity afloat for Europe is 135,000 tons, including 13,600 tons from India. The unshipped balance of the old crop in Argentina is now reported at advancing prices.

Vegetable oils have advanced in sympathy. Linseed oil ex Hull is now quoted at £26 per ton, naked, in all positions to August. Crude cotton oil ex Hull is held for £30 and refined for £32, prompt; but demand is not active. Oilcakes are in improved request and firm.

POTASH.—The Soviet potash industry is making rapid headway, the Kama, which commenced production early in 1934 and which are the

only working mines of the country, have been completely mechanised and their capacity extended. Their output, which is expected to total 1,800,000 metric tons of sylvinite (with an approximate K₂O content of 15 per cent.) in 1936 will probably be raised to 3,000,000 metric tons next year. It is also reported from Moscow that a new potash mine is being developed near Bereznyak, about 30 kilometres from Solikamsk, and that this mine will come into production before the end of next year. Even if these plans do not materialise, an output of 3,000,000 tons would be greatly in excess of Russian requirements—which apparently aggregate some 1,600,000 tons per annum at present. In the circumstances, it is possible that Soviet exports, which have recently shown a decline, will record a sharp increase next year. However, this would not necessarily have a depressing effect on prices, for the world market in potash is at present showing an improving tendency.

RUBBER.—The tone of the markets, both in London and New York, has been strong, and prices are higher on the week. The rise was mainly traceable to trade buying, although speculators also took a hand. The recent advance in quotations and the continuous decline in United Kingdom stocks now make it virtually certain that the International Committee will sanction an increase in production quotas at its meeting next Tuesday. The spot price in New York on Wednesday was 19 cents per lb., compared with 18½ cents per lb. a week ago and 17½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 9½d. per lb., as against 8½d. on the corresponding day last week. In forward positions, business has been done at 9½d. to 9½d. for "January-March" shipment, as against 8½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 85,285 tons, against 89,228 tons a week earlier. A year ago stocks amounted to 165,526 tons.

THE JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LTD., GROUP

DECLARATION OF DIVIDENDS

NOTICE IS HEREBY GIVEN that Dividends have been declared payable to Shareholders registered in the books of the undermentioned Companies at the close of business on 31st December, 1936, and to persons presenting the respective Coupons, detailed below, detached from Share Warrants.

The Dividends are declared in the currency of the Union of South Africa and become due on 2nd January, 1937, but Warrants in payment will be posted both from Head and London Offices on or about 30th January, 1937, this interval being necessary for the balancing of the books and preparation of the Warrants. Dividends payable from the London Office will be paid in British currency at par provided there is no material difference between South African and British currencies on 2nd January, 1937. Should there be any material difference between the two currencies the London Office will pay on the basis of the equivalent British currency calculated at the rate of exchange ruling on that date. Amounts payable to persons presenting Coupons will be on the same basis irrespective of the date of presentation of Coupons.

Warrants despatched from the London Office to persons resident in Great Britain or Northern Ireland will be subject to a deduction of United Kingdom Income Tax at rates to be arrived at after allowing for relief (if any) in respect of Dominion Taxes.

Shareholders with registered addresses outside South Africa who desire to have their Dividends paid to an address therein or vice versa must give notice to the Companies to that effect on or before 31st December, 1936.

The Transfer Books and Register of Members will be closed in each case from 1st to 7th January, 1937, both days inclusive.

The Dividends on the shares included in Share Warrants will be payable to the persons presenting the relative Coupons at the London Office, 10 & 11, Austin Friars, E.C.2, on or after 1st February, 1937, in accordance with a Notice to be issued by the London Office.

Coupons must be deposited FOUR CLEAR DAYS before being paid and, unless accompanied by Inland Revenue Declarations, will be subject to a deduction of United Kingdom Income Tax as above.

(In view of the Christmas Holidays, next week's issue of THE ECONOMIST will be published on Thursday, December 24th)

EPILOGUE

THE story of the Royal House of Windsor reached its dramatic climax on Friday of last week, when Edward the Eighth—of Great Britain, Ireland and the British Dominions beyond the Seas, King, Emperor of India—stepped down from his throne, spoke over the air for a few brief minutes to his people in five continents, and passed out, almost unseen and unattended, into the darkness of night and exile.

Despite ill-timed strictures addressed from a few pulpits on the Sunday after he had gone, the Duke of Windsor, as we must now call him, knows that he carries with him the goodwill of the great mass of the British peoples. Though they strongly desired that he should make a different choice, they deeply appreciate his frankness, his loyalty to the Constitution, the royal dignity of his last message, and the real consideration shown for his successor in the unobtrusive manner of his going.

In the opening words of his now historic broadcast—words heard by more human beings than have ever before listened to a single voice—he evinced his relief that the constitutional seal of silence had been removed.

At long last I am able to say a few words of my own. I have never wanted to withhold anything, but until now it has not been constitutionally possible for me to speak.

There could hardly have been a more forceful illustration of the limitations that hedge a constitutional monarch. Indeed, it is now known that a week previously King Edward had drafted and shown to the Prime Minister a short statement of his point of view which he wished to address to the people "over the air." But the Cabinet took the view that such a proceeding could hardly fail to give the impression of appealing to the people over the heads of his Ministers, and advised against it. This decision King Edward sorrowfully but loyally accepted. It is, in fact, not the least of his services to his country that he never in the

slightest degree attempted to challenge the constitutional authority of the Ministers of the Crown.

There has never been any constitutional difference between me and them or between me and Parliament. Bred in the constitutional tradition by my father, I should never have allowed any such issue to arise.

This statement, read in conjunction with Mr Baldwin's declarations to Parliament, shows how very wide of the mark were those newspapers and Parliamentary groups which conceived of the problem a fortnight ago as a clash between King and Cabinet and sought to rally the nation in support of the Constitution. Rivers of ink have been spilled on learned articles, which, because of this misconception, were entirely beside the point.

The issue was, indeed, personal and not constitutional; and it could not have been better put than by the chief actor himself. He prayed his people to believe that he had carefully weighed his duty to the country and to the Empire; but the deciding factor in his mind had nevertheless been his feeling that he could not efficiently "carry the heavy burden of responsibility and discharge my duties as King as I would wish to do without the help and support of the woman I love." This decision he had reached in spite of the efforts of "the other person most nearly concerned" to persuade him to take a different course.

In this statement, and the further reference to the happy family life of his brother, a lonely, not to say tragic, figure stood revealed. Though by no means blind to his deficiencies, the country realises that with the passing of King Edward it has lost a personality of immense possibilities. Those who were personally in touch with him during the last days were forcibly struck with his courage and his sense of what was due to the country from its King. These qualities inspired every word of his broadcast, and they deepened the regret universally felt by the British

peoples at his decision to depart. King Edward VIII will not be forgotten.

The new King was proclaimed at once. He has taken the title of George VI. The choice is apparently to be symbolical of the new reign; for the new King's endeavour is evidently to follow as closely as may be in his father's footsteps. With King Edward's abdication and King George's accession, public excitement vanished; and there has been a universal willingness to consider the whole episode of the preceding fortnight as past history. So strong is this feeling that considerable resentment has been shown at the persistence with which eager guardians of public morality such as the Archbishop of Canterbury and *The Times* have pursued King Edward even after his abdication. It is lamentable that the fundamental moral sense of the British people should thus be confused with a smug respectability.

The gradual lengthening of the perspective in which the whole episode can now be seen also serves to clarify some of the confusions so prevalent at the height of the crisis. The political importance of the King's action, for example, is now seen to be very much smaller than at one time seemed to be the case. His direct and democratic methods of demonstrating his interest in the lives of his subjects undoubtedly caused much shaking of heads in certain quarters. These same quarters were the first to proclaim that the vital constitutional principle of responsible government was at stake and to hint that the King was hesitating to take his Ministers' advice. It is now clear that there was no truth whatever in any of these suggestions. Politics, in this sense, played hardly any part at all in the crisis.

There was also much misunderstanding of the request made by the King for legislation to enable him to marry without making his wife Queen. That unfamiliar word "morganatic" was believed to imply something disreputable—a sort of concubinage without "rite of Holy Church." It was assumed far too quickly that if a lady is not fit to be Queen, she is not fit to be the King's wife. Clearly, however, there are many women who would be unsuitable to be the centre of the pomp and ceremony that surrounds the throne, but whom a private person could quite properly wed. Is a King barred from choosing a person in this category as his wife? This question has not been satisfactorily answered by the events of the past few weeks, and it may well arise again to plague the institution of monarchy.

Much of the blame for the confusion and bewilderment in which the public had to consider the issue thus suddenly sprung upon it can fairly be put upon the British Press. By a purely voluntary decision, the Press agreed not to give prominence to the friendship of the King with Mrs Simpson or to the divorce proceedings which took place in October. This decision was taken with much hesitation and was only acquiesced in by many newspapers in the belief that, if the friendship proved to be only a passing fancy, no good and much harm would follow from blazoning it abroad. The decision proved profoundly wrong—if only because in a non-totalitarian State which does not enjoy the blessings of an omnipotent Propaganda Ministry it is impossible to prevent the import of foreign newspapers which handled the matter with none of the self-imposed reticence of the British Press.

It is, however, doubtful whether a longer time for discussion or clearer understanding of the issue would have altered the last act of the drama. The King asked that his subjects should acquiesce in a course which would have given offence to a large proportion of them. If it had been carried out it would have been the cause of discord among them and possibly between different members of the Empire. For the sake of unity, they asked him to make a great personal renunciation, arguing that in a nation whose citizens had been, are, and may yet be called upon to sacrifice themselves for the good of their country, the King may be asked to do likewise. But King Edward believed that the renunciation would impair his capacity for kingship. On that he alone could judge. His decision taken, there was no course open to the public except to acquiesce in it with the deepest regret, and to transfer to his successor some at least of the affection with which he himself was regarded.

CHINA'S DILEMMA

EVEN the best seasoned observer of China must have been dumbfounded at the news that President Chiang Kai-shek had been placed under arrest by Marshal Chang Hsueh-liang. The President, setting out for Shensi with intent to dismiss the Marshal, took with him so small a bodyguard as to be powerless. Notice of dismissal was therefore promptly countered by the arrest of Chiang Kai-shek at the command of his recalcitrant subordinate.

Now President Chiang has a million or so of troops at his disposal to Marshal Chang's hundred thousand. He could easily have concentrated an overwhelming force at Sianfu, with the Lunghai railway to transport the troops and with his rear protected by the recent reconciliation between Nanking and Canton. To dismiss Chang Hsueh-liang without having the physical force to make the dismissal effective sounds like an elementary mistake in any system of power-politics; especially in the Chinese system, in which the opposing powers are accustomed to weigh up their respective strengths and strike their bargains in proportion, without resorting to the barbaric method of ordeal by battle. Chiang Kai-shek is one of the greatest living masters of this Chinese politico-military art. It is well-nigh incredible that he should have made so great a gaffe. Consequently it has been suggested that perhaps, after all, he has actually excelled himself by being an accessory to his own arrest; and that we are now really witnessing the formation, Chinese-fashion, of a Chinese "popular front" in which Chiang, Chang and the Communists will join hands in order to launch a national war of liberation against Japan.

In any case, a "popular front" of this kind, is the *dénouement* which Marshal Chang is demanding. Here we come up against an urgent problem which must be faced by all the statesmen responsible for China's destinies. The question is whether the Chinese are to continue to promote the progress of Japanese Imperialism at China's expense by spending their own energies on fighting one another; or whether they are to close their ranks in a supreme effort to bring the Japanese to a halt—and perhaps to push them back.

Hitherto, President Chiang has always been fighting on at least three fronts simultaneously. On the north he only got rid of the Chinese Northern militarists (of whom Marshal Chang Hsueh-liang's father, Chang Tso-lin, was the most effective) to be faced with the Japanese aggression which began in the autumn of 1931 and has continued ever since. On the south he has had—until the other day—rival Chinese Government at Canton. In the interior he has been fighting a truceless war with the elusive Communists. Chiang's policy has been to temporise with the Japanese, to come to terms with Canton, and to fight the Communists to the death. The second of these three policies has recently been crowned with success. Nanking and Canton are at last politically reunited; and this is a notable achievement. On the other hand, the policy of off the ever more sharply whetted aggressiveness of the Japanese militarists. And successive campaigns against the Communists have merely pushed them out of one province into another, without ever having wiped them off the map.

This interminable anti-Communist warfare was the task on which Marshal Chang's army of Manchurian Chinese soldiers of fortune was supposed to be engaged in Shensi. These troops are awkward customers. They are embittered and their camp—now pitched in the distant north-west—is all that remains to them of their country. It was perhaps a typical Chinese stroke of policy on President Chiang's part to wage his war against the Communists with troops whose loss he could bear with equanimity—like the seventeenth-century Turkish Sultan who laid siege to Candia as a means of killing off the Janissaries. Marshal Chang's Manchurians, however, seem to have been well aware of President Chiang's calculations and to have set themselves to frustrate them by the elegantly simple method of fraternising with the Communist armies. The Communists seem to have been no less adroit. They

realised that the Manchurians had one arch-enemy, in the shape of the Japanese, with whom they were eager to join battle. So they intimated to Marshal Chang's troops that there was nothing that the Communists would like better than to join up with them in this Holy War. This proposal has evidently taken the Manchurians' fancy; and it has now been put up by their leader, the Marshal, to his captive, the President.

In effect, President Chiang Kai-shek has been given the choice of falling in with Manchurians and Communists on an anti-Japanese front, or else taking the consequences. In this grim dilemma, which choice is likely to be made by the President of the Chinese Republic—or, rather, by his friends and representatives at Nanking?

The answer largely depends upon the feelings of the Chinese bankers and business-men in Shanghai. They hold the money-bags of the Kuomintang Party. This element in China certainly has no love for Communism; and the precarious alliance with the Communists which the Kuomintang contracted, on the initiative of their founder and leader, Dr. Sun Yat-sen, in their days of adversity a dozen years ago, soon ended in the bitter quarrel of 1927. Even after the Japanese opened their offensive in 1931, influential Chinese at Shanghai and Nanking still felt in private that a Red regime in Kiangsu Province would be a still more appalling disaster than a Japanese regime in Manchuria. The Japanese were a long way off, while the Reds were now uncomfortably near. Even the Japanese Army's destruction of Chopei, which was a passing incident, though a cruel one, was not enough by itself to change the point of view of the Chinese *bourgeoisie*. Since then, however, it has gradually been borne in upon them that Japanese Imperialism is insatiable. The point has perhaps been reached at which even a Shanghai Chinese banker would prefer a Chinese Communist ally to a Japanese Fascist master. If this is really the present state of mind in those Chinese circles in which the Nanking Government's policy is determined, then it is not impossible that Chang Hsueh-liang's *coup* may bring to a head the recent growing tendency for all parties in China to make common cause against the Japanese aggressor.

If President Chiang does find a happy issue out of his present afflictions by becoming the joint promoter, with Marshal Chang, of a nation-wide anti-Japanese crusade, then the tragi-comedy that is being performed at this moment in the far interior of China may affect the fortunes of countries as distant as Java in one direction and Czechoslovakia in another. A Chinese counter-offensive might be extremely awkward for the Japanese; and Japanese embarrassments in the interior of Eastern Asia, in the depth of winter, might do more than merely ease the anxiety of statesmen at The Hague who are responsible for the defence of the Dutch East Indies. Japan's plight might even upset the calculations of statesmen at Berlin who are dreaming of an eastward expansion of the Third Reich. For if Japan falls into difficulties, Russia's hands will be freed in the Far East. The less the statesmen at Moscow have to worry about the defence of Transbaikalia and Vladivostok, the better will they be able to honour the bond they have given to their friends at Prague.

ELECTRICITY SUPPLY PROBLEMS

THE electricity supply industry in this country has had much experience of investigation by official committees. The almost invariable result, however, has been that the bold recommendations which the committees have sometimes made have been emasculated on their way to the Statute Book. The economic framework of the industry had taken shape by 1920: its division into municipal and company undertakings, the location of generating stations, the nature of tariffs and commercial policies were all fairly well established by then. But it was already apparent, and had been since 1888, that the framework thus in process of formation was not economically sound. Nevertheless, it was only after the Great War, the appointment of three official committees ending with the Williamson Committee

of 1918, the abortive Act of 1919, the constant criticisms of the Electricity Commissioners formed by that Act, and the Weir Committee's recommendations in 1925, that passage was secured for the Act of 1926 setting up the Central Electricity Board, which at long last compelled the re-organisation of generation and transmission.

The central scheme was opposed for 20 years, not least by the industry itself; yet in the event it has proved a triumphant success. In fact, statistics of the progress made by the industry under Government tutelage are frequently advanced to prove that everything is now perfect, and that further progress can safely be left to the existing municipal authorities, and distribution and power companies. Certainly, the statistical measures of the progress of recent years are startling enough, as may be seen from the report* prepared by PEP (Political and Economic Planning).

Total output from public supply stations has increased from 10,294 million units in 1929 to 17,569 million units in 1935. This rate of increase was exceeded only by the U.S.S.R.; but it left Britain in 1935 with a consumption per head of population about equal to that of France, less than two-thirds that of Sweden, one-third that of Switzerland, one-fifth that of Canada, and only slightly more than one-half that of the United States.

In 1926, the capacity of the electrical plant connected to public supply stations was 7,301,403 kw. The total net maximum load put on the supply stations by this plant was 2,557,956 kw., and the generating stations had a capacity of 4,421,602 kw. In other words, the total connections were 286 per cent. of maximum load, and the surplus generating plant was 73 per cent. of the maximum load. Some very remarkable changes had taken place by 1935. Generating capacity had increased by 75 per cent., net maximum load had increased by 107 per cent., and capacity of total connections by 175 per cent. The generating plant was being much more efficiently used; surplus plant was only 47 per cent. of maximum load. Thermal efficiency in all steam generating stations had risen from 13.4 per cent. to 20.15 per cent. And the total number of consumers had risen from 2,007,604 in 1926 to nearly 7,000,000 in 1935.

Innumerable statistics can be quoted to show the progress made in efficient generation, but the situation in the distributing field is by no means so happy. The economic and commercial organisation of this side of the industry is almost what it was a generation ago. Practically the only innovation has been the development of holding companies, with doubtful benefits for the consumer in practice, no matter how much may be claimed for them in theory. Distribution is still in the hands of some 371 local authorities, 247 companies, 3 joint electricity authorities, 5 joint boards. The consumer may obtain alternating current or direct current supply at all manner of voltages, reasonable

* Report on the Supply of Electricity in Great Britain. PEP. London. 6s. 164 pages.

and absurd. His tariff may be simple or complicated, cheap or dear; he may be encouraged to increase his consumption by assisted wiring schemes, hire purchase, and promotional rates; or he may be treated by the supplying authority as if he were a necessary but hardly tolerable nuisance.

PEP reports that in March, 1936, out of 951 undertakings analysed, 32.2 per cent. had a lighting flat rate over 6d.; 16.4 per cent. had no assisted wiring schemes; 17.4 per cent. had a lighting flat rate of over 6d. with no two-part tariff, or where a two-part tariff was in force, had a running charge in excess of 1d. Of the sample, 85 per cent. had two-part tariffs, but only 25.4 per cent. had a running charge of ½d. or less. Classified by size, local authorities selling 200 million units and over in 1935 charged an average price per unit for domestic and lighting purposes of 1.79d.; below 25 million units a year the average price rose from 2.14d. for the 10-25 million units group to 7.62d. for undertakings selling less than 50,000 units a year. The price charged by companies was somewhat higher in each size group.

The burden of most criticisms of the existing system is that there can be no proper expansion of electricity consumption, particularly for domestic and rural uses, in the absence of certain overdue developments. One is the complete standardisation of the system and voltage of supply throughout the country; another is efficient management of areas with a demand sufficiently diversified to permit the maximum benefits in operation. Other essentials are a progressive commercial policy, operating in conjunction with a simple and reasonable method of charging; and an intimate and public system of financial and economic control to ensure that the consumers are not exploited by monopolist local authorities for the benefit of local rates, or monopolist companies for the benefit of shareholders.

In these circumstances it is regrettable that the PEP report should be as timid in handling the problem as was the McGowan report of last June. The latter made a bow in the direction of control by regional public authorities, and then postponed the solution for not more than 50 years. The former suggests a framework which gives the appearance of good intentions; but just what amalgamations are to be made, by whom, and when, if at all, is left for yet another Committee of Inquiry, with instructions to reject nationalisation, and not to be misled by arguments in favour of greater size.

If the Committee which time and again recommended the Central Electricity Board solution had been as cautious as the present committees, we should presumably be still without any Board, and disorder would be reigning in generation as it now is in distribution. Surely the alternation of investigation and procrastination has gone on long enough, and a time limit should be set for definite action?

There are obviously many things upon which more information is needed—a comprehensive analysis and comparison of distribution costs is an outstanding example. But it is equally clear that technical standardisation of systems of supply will no more be achieved by the existing companies and local authorities than standardisation of frequency, or concentration of generation, was obtained without Government intervention. The same point applies to rates and tariffs. And since it is essential that these things should be standardised if the consumer is to obtain the maximum benefit, immediate steps should be taken to require adherence to the desired standards. The most drastic suggestion would be to form a number of distributing areas, within each of which control both of policies and of actual operations would be handed over to a Public Distribution Authority. The existing undertakings would be taken over in much the same manner as the bus, tram and tube undertakings were taken over at the formation of the London Passenger Transport Board. If this is thought to go too far, an alternative proposal would be to allow existing undertakers to continue their separate existence so long as they lived up to standards of performance set by the Electricity Development Board proposed by PEP, which would exercise the functions of a management company. In either case holding companies would be subjected to close regulation, if they were allowed any say in the economic operation of their subsidiaries.

Comments may be made on two points among the many possible objections. It is sometimes argued that the industry suffers from too much legislation, not too little, and that if only it were left to go its own way the virtues of capitalism would bring their rewards to consumers as well as to stockholders. True, our legislation has tended to promote inefficiency, rather than to protect the consumer from exploitation. But electricity supply is naturally a monopoly, and the consumer must be protected. If it is impossible to do this and maintain efficient private management, then the solution is to set up a public board.

Secondly, it is frequently objected that compensation of private owners for handing over their concerns to a public board will raise impossible problems. There will obviously be great discussion over the principle upon which compensation should be paid. The McGowan Committee recommended cost less depreciation for local authorities, with no allowance for past, or prospect of future contributions to rates; but companies were to be allowed compensation for loss of future profits in addition to the valuation of their fixed assets. There seems no rational basis for such discrimination; nor will compensation on market value bear justification, since it rewards most the organisation which has most exploited its monopoly position. A fairer basis in both cases might be the principle of compensation for "prudent investment," which has been developed in the United States of America.

But all these are problems which can be settled within a margin of reasonableness once it is decided that the existing state of affairs can no longer be tolerated. Within a few years after the change is made the objections will have been reduced to their proper proportions. We believe that the distribution of electricity should be efficiently organised, not within fifty years, but within five at the most.

THE LORRY AND THE LAW

UNDER the first section of the Road and Rail Traffic Act of 1933, no person may engage in the business of carrying goods by road unless he has a licence. There are three types of licence. "A" licences are issued to full-time public carriers, and last for two years. "B" licences are issued to operators whose vehicles are employed part-time as public carriers and part-time on private work in connection with the business of their operators (other than haulage). These licences are granted for one year and limit the operator, as far as his public carrier work is concerned, to a certain radius and to particular types of goods. "C" licences, issued to operators who use their vehicles in their own service and not for public haulage, are granted for three years. There are also "A" Contract licences, issued to firms who are under contract to provide the road transport required for some concern not employed in haulage work.

The Ministry of Transport has just issued its first return of the number of licences issued, which shows the position at April 30, 1936:—

GOODS ROAD VEHICLES					
	No. of Licence Holders	Per cent. of Total	No. of Vehicles in Possession	Per cent. of Total	Average No. of Vehicles per Licence Holder
"A" Licences	25,671	11.51	85,337	18.55	3.32
"A" Licences (Contract)	2,084	0.93	5,156	1.12	2.47
"B" Licences	34,119	15.29	52,809	11.48	1.55
"C" Licences	161,221	72.27	316,714	68.83	1.96
Total	223,095	100.00	460,016	100.00	2.06

If the railway companies (which owned 9,140 vehicles) are excluded, some 54½ per cent. of the "A" licensees had only one vehicle, and only 12½ per cent. owned more than four. Of the "B" licensees, 78 per cent. had only one vehicle, and 40 per cent. were colliery proprietors or coal merchants, etc.

Although the "C" licensees outnumber all others by nearly three to one, and own twice as many vehicles, the position of "A" and "B" holders has inevitably given

rise to most controversy. Under the Act of 1933, the Chairmen of the Area Traffic Commissioners, established by the Road Traffic Act of 1930, are constituted Licensing Authorities. In exercising discretion to grant or refuse these licences, each Authority is directed to have regard primarily to the interest of the public, and to consider

any objections to each application which may be made by persons already providing facilities, whether by rail or road, for the carriage of goods for hire or reward in the district or between the places which the applicant intends to serve on the ground that suitable transport facilities, either generally or in respect of any particular type of vehicles are (or would be) in excess of requirements, or on the ground that any of the conditions of a licence have not been complied with.

Appeal from any decision of an Authority lies to a Tribunal for goods cases, which is quite independent of the Minister of Transport.

Carriers already in business were entitled to claim licences for vehicles equivalent to those operated in the base year, April 1, 1932, to March 31, 1933, but those who have set up since or have applied for additional vehicles have been required to prove their case before the licensing authorities. Newcomers have had to prove, first, that there were persons able and willing to employ them, and secondly, that the haulage work they proposed to do could not be done by already existing operators, by rail or road. The first point has generally been established by the production of letters from prospective customers, but in recent cases the Appeal Tribunal has expressed dissatisfaction with letters, and has been demanding the attendance of customers' representatives as witnesses. The initiative, further, must come from the trader and not from the haulier. Under the second point, an application will be lost if an objector can show that the work the applicant is proposing to do is already being done satisfactorily by some other carrier, by rail or road, or will be obtained at his expense, since this will be regarded by the licensing authorities as evidence of "wasteful" competition. It will be lost, too, if there are suitable vehicles standing idle, or if the intending haulier has not made a serious effort to hire the necessary vehicles. But proof that the applicant has himself been hired by other hauliers is proof of public need for his services, and he will win his case. An application will not succeed merely because additional facilities would be a convenience to the traders concerned, or because a particular trader may wish to employ a particular haulier. A successful application must show that the type of service offered is not provided by anyone else (e.g. a daily parcels service) or that the applicant can offer specialised facilities (e.g. particular skill in handling fragile articles).

An established carrier must prove a general expansion in his business if he wishes to obtain licences for additional vehicles. But it is not enough for him to show merely that the traffic he carries has increased. He must satisfy the authority that this is due to an increase in the business of his customers, an increase shared by their own trade or industry; and that additional transport facilities are consequently necessary in the districts where the applicant operates. He must be prepared to meet the objection that the additional traffic has been abstracted from other carriers by rail or by road, or obtained by charging rates uneconomical to the applicant. Finally, his application may fail if it is evident that he might have hired the necessary vehicles from other "A" licensees, unless he can show that his business requires a special type of vehicle, such as a furniture van, which is not generally available on hire.

The upshot of the legislation passed since 1930 has been to impose a strict licensing system on an industry formerly free, whose peculiar problems turn, in fact, on questions of administration rather than of law. The position is complicated by the fact that appeals on passenger cases go, under the 1930 Act, to the Minister of Transport, who has consistently refused to be bound by precedent, while appeals on goods cases are decided by an entirely separate Tribunal, which has adhered strictly to the precedents laid down in its earliest cases. Some of the Licensing Authorities might well have preferred, in the early years of the new system, to allow the transport industry to reach an equilibrium by the help of its own concrete experience,

rather than to compel its conformity with rigid principles drawn up shortly after the passing of the Act. One of the most important of these, laid down in *Ridgewell's Case*, concerned the maintenance of the *status quo*, and declared that no radical changes were to be made in the extent of the facilities offered to the public by the industry. Now, "A" licences are granted for two years and "B" licences are granted for one year only, and a case must be satisfactorily made out for all vehicles when a licence is renewed. But the precedent set by *Ridgewell's Case* applied only to the first currency period of a licence, and does not bind the Licensing Authorities in considering applications for renewals.

The Tribunal has been hearing two appeals this week, from decisions of the Licensing Authorities in what are generally regarded as test cases. Last October, the Metropolitan Licensing Authority renewed Messrs. Bouts-Tillotson's licences, not for the whole of the vehicles they already owned and operated, but only for their vehicles actually in use; and the Authority for the West Midland Area declined to renew Messrs. McNamara's licences for certain vehicles which had been put into service since the date of the application in the preceding July. The decisions of the Appeal Tribunal have not been handed down as these words are written. But as neither applicant had asked for more than the vehicles he was already operating, the Tribunal's decisions, whatever their nature, will not, unfortunately, throw any light on the all-important question of the attitude of the authorities to applications for "A" licences for additional vehicles.

Is future road haulage business to be confined to the position it occupied in the base year 1932-33, a year of industrial depression? Or will it be allowed to expand in response to any increased demand for its services which may follow improvements in the facilities it offers the public? The Metropolitan Licensing Authority, in deciding on the Bouts-Tillotson case, considered it prudent to apply the principle of *Ridgewell's Case*, "notwithstanding that the first currency period of the licences under the Act had expired." So long as that restrictive precedent is followed the road transport industry can rise above the depressed level of 1932 only to the extent that an increase occurs in the traffic offered for transport generally. But the framers of the Act of 1933 can scarcely have intended to exclude the possibility of using improvements in the efficiency of road haulage as an argument for the licensing of additional vehicles (even at the expense of the railways) since Section 6 (2) lays down that the Licensing Authority, in exercising discretion, is to have regard to the interests of persons requiring as well as to those providing transport.

The issue, in short, is whether existing legislation is to be interpreted so as permanently to stereotype the relations which existed between road and rail in 1932, without regard to any evolutionary increase in the efficiency of the newer service. It may be hoped that a decision on a matter which closely concerns the entire business community will be reached without undue delay.

THE PLIGHT OF SOUTH WALES

THE Government are pledged to introduce new legislation early next year for the relief of the Special Areas, whose distressed condition was vividly described by a correspondent in *The Economist* of October 31st and November 7th last. The draughtsmen of the Bill will presumably work the harder for the castigation which the Government's existing policy received in the House of Lords this week. But if really effective measures are to be devised it is essential that due account be taken of the special needs of particular areas. The percentage reduction in the number of unemployed in all the Special Areas between December, 1935, and September, 1936, was 10.9 per cent., against 13.1 per cent. for the whole country. During this period, however, Durham and Tyneside recorded a decrease of as much as 20 per cent., while South Wales showed a negligible decline of 0.6 per cent. South Wales, in other words, has been unaffected by prosperity elsewhere.

The percentage of unemployed in the county of Glamorgan last September was 33.4. The figure for Great Britain as a whole was 12.9; for Greater London and for Birmingham it was under 10. The insured population of the South Wales Special Area was 414,260 in July, 1935. The number of registered unemployed was nearly 150,000 in January last, 163,476 in March and 141,771 in September. These figures acquire additional significance when they are related to the returns showing the duration of unemployment. In Great Britain as a whole about 50 per cent. of the registered unemployed have been unemployed for three months or less, and only about 15 per cent. have been out of work for twelve months or more. In South Wales, on July 20, 1936, only 19.6 per cent. of the men unemployed had been out of a job for less than three months; as many as 54.7 per cent. had been out of work for more than a year and 12.4 per cent. for more than five years.

It may be instructive to relate these figures to their industrial setting. The Special Area embraces the central portion of the South Wales coalfield. To the west lies the anthracite section, and on the eastern boundary is a narrow belt of bituminous coal mined for domestic use. These two "wings" are relatively prosperous. It is in the central section, which comprises about one-half of the coalfield and produces steam coal, chiefly for shipping and for export, that depression has been most severe. The area was first developed about the middle of the eighteenth century, when local supplies of ore attracted iron masters to South Wales at a time when charcoal was being superseded by coal. In the nineteenth century the local iron ore supplies became exhausted, the iron industry moved gradually down the valleys towards the coast, and coal displaced iron as the principal industry of the district.

The geographical nature of the area is itself a handicap to industrial development. The Special Area consists of a series of long, narrow valleys running south to the coast, which have been subjected to a species of ribbon development. Most of the mining towns and villages are little more than one long street of grey houses. The population of the Special Area (which excludes the anthracite section and the coast) is about 40 per cent. of the population of Wales. Lord Portal's investigation in 1934 showed that 68 per cent. of the insured persons in the area were engaged in coal mining, 4.8 per cent. in iron and steel, 2.6 per cent. in the tinplate industry and 24.6 per cent. in other industries. Lord Portal estimated that there was a permanent labour surplus of 39,000 in the area. But his estimate was based on the capacity of existing industries and made no allowance for the probability that part, at least, of any future increase in the coal output would probably be met initially by an increase in the number of shifts worked by miners already in employment, and eventually by acceleration of the process of mechanisation.

It is unlikely that the coal output of South Wales will again be expanded to its full capacity. Between 1920 and 1935 it fell from 48 million tons to 35 million tons, and over 10 million tons of this decrease was due to lower coal exports and bunkers. Replacement of coal by oil fuel and its increasingly economical use for industrial purposes are tendencies which are likely to progress further rather than

to be reversed. An estimate of the surplus labour of South Wales, based on the absorption of 34,000 workers into the coal industry, is therefore in all probability over-optimistic. The surplus labour supply is probably nearer 50,000, and may well be greater.

Though unemployment is widespread throughout the area, pockets of unemployment exist in a number of towns and villages which have become practically derelict. The problem is greatest higher up the valleys, where the coal measures lay close to the surface, and, consequently, were the first to be worked. As these measures were exhausted, mining moved further down the valleys, and towns like Brynmawr became mere dormitories whose population travelled many miles to work. When these miners lost their employment, practically the whole population of the town lost their means of subsistence. Even in 1934 Brynmawr had an insured population of 2,620, of whom 1,941, or 74.1 per cent., were unemployed. Blaina, a town of approximately the same size, had some 71.7 per cent. unemployed. In September, 1936, Merthyr Tydvil (the great centre of the iron industry in the early nineteenth century) had 60.6 per cent. of its insured population out of work.

A serious hindrance to the development of industries in South Wales is the high level of local rates. The present rate in Merthyr Tydvil is 27s. in the pound, and the public assistance charge is equivalent to 17s. The rate in Brynmawr is 21s. 6d. and in Blaina 21s. Although factories pay only 25 per cent. of the ordinary rate, this facility applies to the whole country and leaves the relative disadvantages of sites in South Wales unchanged.

A second hindrance is the lack of adequate road connections between South Wales and other parts of the country. For any industrial centre in South Wales the south-west region of England is a natural market. But the journey by road between Cardiff and Bristol is over fifty miles longer than by rail. Sooner or later the building of the proposed Severn road bridge will be recognised as essential if the area is to attract new industries. Opposition from the railways is natural to any scheme which affects their special position in South Wales; and the coal-owners, as such, would not benefit greatly from the project. But road transport is being increasingly used by the lighter industries, and adequate facilities are an indispensable condition of their establishment in South Wales. Moreover, the development of parts of South Wales as a tourist area is very largely dependent on the building of the Severn Bridge.

In any case, the siting of new industries in South Wales presents various intractable problems. The economic disadvantages of the area include such factors as distance from great centres of population; a railway rate classification which charges more for manufactured goods than for materials, and consequently stimulates the development of factories in proximity to markets for finished goods; the strong traditions of trade unionism in South Wales; and the absence of local amenities. It is becoming more and more evident that such disadvantages as these can only be overcome by Government action. In its absence, the position of South Wales will not only fail to improve, it will deteriorate. A mere ban on the further development of Greater London, for example, would not necessarily solve the problem, for other areas would still have competitive advantages over South Wales. Short of compulsory location of new factories, which Mr Malcolm Stewart has rejected, the State may have to provide inducements sufficient to overcome the disadvantages of the area. But these should certainly not be offered promiscuously to any employer willing to establish a factory in the Special Areas, lest the public be laden with a heavy burden in perpetuity.

Detailed preliminary investigation must determine which industries are likely to prosper, and to them alone should national support be accorded. Secondly, it has to be decided which parts of the Area should be re-developed and which relieved mainly by transfers elsewhere. It is fairly clear, for instance, that the upper parts of the valleys other than Ebbw Vale cannot be industrial centres in the future. Every survey of the problem brings us, in short, back to Mr Stewart's statement: "Preferential treatment, involving unconventional principles, is still required for the Special Areas."

NOTES OF THE WEEK

The New Reign.—On Friday, December 11th, the day following the announcement of King Edward VIII's abdication, which we reported last week, an Abdication Act was passed through both Houses of Parliament. At 1.52 p.m. the Royal Assent was given to the Bill by a Commission in the House of Lords; and the former Duke of York became King with the title of George VI. Late in the evening the ex-King, who has now been invested with the title of the Duke of Windsor, broadcast a speech of farewell to the nation and Empire. He left the country the same night. Earlier in the day the Australian Parliament had passed a resolution giving effect to King Edward's abdication. In Canada, South Africa, and New Zealand it was not found necessary to summon Parliament. The Canadian Government authorised the British Government to include the Dominion in the British Act; and the New Zealand and South African Governments decided to ratify the abdication later. On Saturday, December 12th, King George VI attended the Accession meeting of the Privy Council, which gave orders for "proclaiming His Majesty." The same day, the Accession was proclaimed in the traditional manner both in London and throughout the Empire. On Monday, December 14th, King George VI's birthday, a message from the King was read to both Houses of Parliament, and both Houses afterwards adopted loyal addresses to the King. These addresses were presented to the King at Buckingham Palace next day. So the old reign ended and the new began.

* * *

The Free State and the Crown.—The crisis over the monarchy was at once an embarrassment and an opportunity for Mr de Valera's Government. It was an embarrassment, because it forced them to make up their minds between resigning from the Commonwealth altogether and acknowledging the authority of the British Crown in Ireland. It was an opportunity, because the awkwardness of that same choice had already held up their promised new Free State Constitution, which could now be hurried through as a matter of urgency before opposition on either side had had time to crystallise. Although the vision of a "united Ireland" has not yet been finally destroyed by the declaration of a 26-county republic, the legal connection between the Free State and the Crown has been radically altered by two measures passed by the Dail last Friday and Saturday. The first does away with the office of Governor-General, and therefore with all those parts of the royal power and prerogative that are entrusted in the Dominions to the King's representative—the signature of Bills, the convening and dissolution of Parliament, and so on. These functions are now to be performed by others, generally by the Speaker of the Dail or the President of the Executive Council. This change may, perhaps, be welcomed as abolishing an unwholesome sham. Is it not more appropriate to the dignity of the Crown to be removed from the internal affairs of the Free State than to be personified in an obscure shopkeeper wielding a rubber stamp? The second measure authorises the King to act for the Irish Free State (by and with the advice of his Ministers there) in external affairs, such as the signing of treaties or diplomatic representation. It remains questionable, nevertheless, how far the royal authority has thus been circumscribed; for the Constitution of the Free State still contains the clause describing it as a co-equal member of the British Commonwealth, whose members, according to the Balfour formula, are "united by a common allegiance to the Crown." That even Mr de Valera had doubts on this point was shown by his hasty introduction of an amendment making it clear that King Edward's abdication held good, not only as regards the specified external functions, but also as regards "all other, if any," functions of the Crown. It is a curious phrase with which to write off one of the fundamental issues in the history of Ireland.

Mr Eden's Speech.—Mr Eden's speech at Bradford on Monday was in several respects a timely supplement to his foregoing speech at Leamington. It is encouraging to observe that, on almost every point on which the Foreign Secretary has now gone beyond what he said on that previous occasion, he has laid emphasis on British responsibilities instead of minimising British commitments. He now adds, with specific reference to his previous utterance:—

If I were to say that Britain's interests in peace are geographically limited, I should be giving a false impression. If our vital interests are situated in certain clearly definable areas, our interest in peace is world-wide. . . . We cannot disinterest ourselves from this or that part of the world in a vague hope that happenings in that area will not affect us. We must neither mislead others nor be misled ourselves by any of those comfortable doctrines that we can live secure in a Western European glass-house.

In effect, Mr Eden is now telling the dictators that, after all, they cannot count upon British neutrality if they attack any non-British country whatsoever. An equally important point in the present speech is the Foreign Secretary's definition of the kind of international behaviour which the British Government regard as a *sine qua non* for international co-operation. After reiterating our British refusal to be herded into the camp of either Fascism or Communism, Mr Eden stated clearly what he meant by sincere co-operation for peace: "Observance of treaties and willingness to resort to free negotiation in case of disagreement constitute together the only true basis of international confidence." The most important passage in the speech was his reference to the contribution which could be made by Great Britain towards giving economic aid to other nations:—

If a lasting settlement of world difficulties could be reached, including—and this is indispensable—an arms agreement, our help would be willingly, and indeed wholeheartedly, given. But—and this is fundamental—this country cannot be expected to render help to others either in the economic or in the financial sphere if the only result of such action is to be a further piling up of armaments and a consequent further stress and strain upon the fabric of world peace.

We trust that Dr. Schacht, General Goering and Herr von Ribbentrop will convey its meaning to Herr Hitler.

* * *

Spain and the Powers.—While at Geneva the League Council has been drafting its resolution on the Spanish Government's indictment of Germany and Italy under Article XI of the Covenant, the German and Italian replies to the Franco-British mediation proposal have reached the hands of the Non-Intervention Committee in London. The Spanish Government have also agreed in principle to international supervision to ensure non-intervention. The Council's resolution declares that a good understanding between States ought to be maintained without regard to their internal regimes; recalls the duty of all States to respect one another's territorial integrity and political independence; spurs on the London Committee; and blesses the Anglo-French *démarche*. The German and Italian replies to the Anglo-French suggestion were manifestly drafted in close consultation between the two Governments; and their common policy is to damn the Anglo-French proposal with faint praise. Mediation, they say, would be a fine thing if it were practical politics; and, as for stopping the flow of volunteers, the two Fascist Powers repeat their formula that from the beginning they have been in favour of preventing indirect intervention; but that they do not see why the effort should be confined to the single point of volunteers, instead of being extended as well to gifts of money and even expressions of sympathy. Moreover, there is one passage in the German reply which is extremely disquieting. "The German Government has, however, by its recognition of the

Boom in Commodities.—One of the most important developments in recent weeks has been the steep and almost uniform rise in the prices of primary products. It appears that the gradual upward movement in recent years, punctuated by occasional spurts, is now entering a phase during which quotations are pushed up rapidly by mass suggestion. World consumption of primary products is rising more rapidly than at any time since recovery began. Stocks of materials, though still adequate, have been reduced during the depression. There is some danger, therefore, of a scramble among consumers to lay in heavier supplies, in order to be neither caught short later on nor nipped by increasing prices now. During such a re-stocking movement, especially if sellers invariably adopt a Fabian attitude, quotations frequently rise above the level justified by the current and prospective position. Thus, the quotation for rubber has risen from 9½d. per lb. to 9½d. per lb. during the past week in spite of the decision of the International Rubber Regulation Committee last Tuesday to raise export quotas to 75 per cent. of capacity in the first quarter, and to 80 per cent. in the second quarter of 1937. The facts that exports and estimated consumption will probably balance if these rates of release are effective and that the Committee may well decide to raise quotas still further, have been given scant consideration by the market. We discuss the Committee's decision in greater detail on page 593. Doubts that the Argentine linseed crop may not reach 2,000,000 tons, as had been previously estimated, have started a sudden buying movement which has driven up the quotations for linseed oil this week by £2 to £27 12s. 6d. per ton. Wheat prices, too, have risen sharply on substantial buying, but the market position has remained fundamentally unchanged. The Tin Committee's decision to reduce quotas from 105 per cent. to 100 per cent. of the "standard" tonnages during the first quarter of 1937 (announced at the end of last week) does not involve a curtailment of supplies. The price for tin, however, has risen £5 to £236 15s. per ton. In fact, production during the first quarter of next year is expected to be at least as high as the current rate of output, for both Siam and the Belgian Congo have been conceded appreciably higher quotas under the new regulation agreement. Lead, early supplies of which are somewhat scarce, has been pushed up this week by £2 to £25 17s. 6d. per ton, compared with an average of £23 5s. per ton in 1929. In contrast, spelter, at £18 1s. 3d., though £1 per ton dearer than a week ago, is still well below the 1929 average of nearly £25. The price of copper, finally, has taken a further sharp upward turn this week. Quotations for primary products clearly cannot continue long to rise at this week's pace, and an early breath-taking pause would not be unwelcome even to producers. Already a movement which is bringing relief and increased purchasing power to many raw material-producing areas threatens manufacturing countries, like Great Britain, with an unwelcome rise in industrial costs. Many observers who are prepared to look complacently on the trend are becoming uneasy over this gradient of prices.

Cotton Recovery and Wages.—As a result of an improvement in business the number of spindles in operation has increased in recent months. The greater interest attaches, therefore, to Dr. Burgin's statement in the House of Commons last week concerning Lancashire's spinning capacity. He stated that the number of spindles on September 14th was 46 millions, and that 6.2 millions had been completely idle during the preceding six months. The remaining 39.8 million spindles were working at 89 per cent. of capacity during this period. Meanwhile, the General Committee of the Master Cotton Spinners' Federation met in Manchester a fortnight ago to consider the demand of the spinning operatives for an increase in wage rates. The Federation left the matter in the hands of the Wages Committee, which at a meeting on Tuesday last week decided to request a meeting with the trade union representatives to take place this week. No progress, however, had been made by

Wednesday evening. The operatives' demand for an increase in wages of 1s. 8d. in the pound drew an offer of 7d. in the pound from the employers. As this was rejected outright, a further offer is understood to have been made, but as we go to press the trade union has given no sign of its willingness to accept a compromise. As the strike notices expire on Saturday, there is not much time to be lost if a stoppage of work is to be averted.

Proposed Rise in Wool Wages.—A general increase of 10 per cent. in the wages of wool textile workers is recommended by the Report of the Board of Inquiry published last week. The change, which should take effect from January 1st, will affect about 200,000 workers. In making its recommendations the Board took account of the "almost complete control of the home market" secured by the industry as a result of the tariff, of its increased share of the world's exports, of the probability of a further increase in internal and international purchasing power, and finally of the rise in the cost of living. Various additional recommendations were made affecting piece-rates, overtime and night work. The Board also remarked that "it is very much to be hoped that both sides will endeavour to strengthen their organisation and thus facilitate collective bargaining," and it expressed the opinion that the employers need not be afraid of the institution of a trade board in the worsted spinning section. If, as is generally expected, the Board's report is accepted by both employers and workers, another important step forward will have been taken in the distribution of the fruits of recovery to the wage-earning population.

Indices of Business Activity.—A paper was read to the Royal Statistical Society on December 15th by Dr. E. C. Rhodes on "The Construction of an Index of Business Activity." Dr. Rhodes based his paper on the figures of *The Economist* Index of Business Activity and endeavoured to discover whether the system of weights employed could be improved upon. The weights at present assigned to the 14 component series from which the Index is calculated are confessedly arbitrary and dependent upon judgment, after assessing a variety of considerations. Dr. Rhodes set out to enquire whether there was a more scientific method of arriving at the weights. "Can we discover from the data themselves," he asks, "how far the guess-work was right?" His method is that known as factor-analysis, a lengthy and complicated algebraical process which is designed, broadly speaking, to give the component series weights in accordance with what may be called their conformity to the final index. By this method Dr. Rhodes concludes that the most trustworthy indices are those of Employment, Electricity Consumption, Commercial Motors in Use and Building Activity, while he would reduce the weights assigned to Cotton Consumption, Shipping, Town Clearings, etc. The paper is interesting and valuable, both for its statistical method and also for the conclusions reached (though it is noteworthy that Dr. Rhodes' final index is almost identical with that of *The Economist*). But it is doubtful how far Dr. Rhodes' criteria for the assignment of weights could be accepted, even if his method were not too lengthy for use every month. Conformity with the ultimate average is not the only, or even the chief, test of the value of a constituent series. Coal consumption, for example, is a poor conformer. But are we therefore to say that it is unworthy of inclusion, or that its weight should be reduced? What real justification is there for increasing the weight of series which happen to conform well, especially if, as is the case with three out of the four series which Dr. Rhodes especially favours, their conformity is the result of statistical accident rather than of the inherent nature of the phenomena measured? There is a Parliamentary constituency in Lancashire which is reputed to have voted on the winning side in every General Election since the Reform Act of 1867. But that would hardly be accepted as sufficient reason for giving every voter in that constituency ten

votes, still less for dispensing with the General Election and allowing the one constituency to elect the whole House of Commons.

Iron and Steel Developments.—Activity in the iron and steel industry continued at a high level during November. Pig-iron production during the first eleven months of 1936, at 7,014,300 tons, exceeded output during the whole of 1935 by 588,300 tons. Similarly, the output of steel ingots and castings during January-November this year showed an increase of 836,600 tons over the whole of 1935. The recent increase in pig-iron prices by 6s. per ton has had little effect on business. There is still acute stringency in numerous sections of the industry, and many manufacturers appear to be quite unable to satisfy all requirements within the time specified by consumers. The downward trend of exports, therefore, continues:—

(In thousands of tons)				
Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855.0	638.6	185.9	414.1
1929 " "	632.4	803.0	235.2	364.9
1932 " "	297.8	438.5	132.7	157.4
1933 " "	344.7	585.3	80.9	180.2
1934 " "	488.2	738.3	113.8	187.8
1935 " "	535.3	821.6	96.0	197.7
1936—August	543.4	759.9	74.3	193.6
" September	529.6	855.9	89.3	183.8
" October	544.3	907.3	101.2	219.4
" November	529.5	903.3	77.0	212.0
" December	559.3	811.5	113.0	190.3
1936—January	595.5	911.7	119.9	164.8
" February	584.7	938.5	123.2	167.8
" March	633.6	980.1	130.3	163.4

" May	661.0	963.0	117.5	204.1
" June	644.1	965.9	110.6	173.5
" July	665.6	974.1	170.3	216.1
" August	635.8	872.7	141.8	164.0
" September	650.8	1,027.0	165.0	183.0
" October	670.3	1,060.5	101.0	194.4
" November	643.1	1,001.3	90.7	193.3

In the finished section of the industry an attempt is now being made to resuscitate the International Steel Tube Cartel which collapsed at the end of March last year. As a result of intense competition and price-cutting, British exports of wrought steel tubes declined from 223,560 tons during the first eleven months of 1934 to 209,114 tons and 181,853 tons, respectively, during the corresponding periods in 1935 and 1936. Moreover, the decline in total exports has been accompanied by a fall in the average price per ton, from £21 in 1934 to £18.7 in 1935 and £17.9 in 1936. In order to prevent a further fall in prices, the former members of the Continental Tube Cartel and British producers have recently entered into tentative price arrangements in various export markets. The discussions concerning the renewal of the Cartel are to be continued.

Overseas Trade in November.—The total value of both imports and exports showed a decline last month compared with October. But as November contained two less working days than October and one less than the corresponding month last year, a true comparison can only be made in terms of working-day averages. On this basis, imports showed an increase both compared with last month and a year ago, while the daily rate of British exports was only slightly lower than in October, but higher than a year ago. The movement of re-exports was similar to that of British exports. The increase in the value of imports, where raw materials predominate, is due partly to the recent rise in prices. The following tables give details for the past three years:—

OVERSEAS TRADE IN NOVEMBER

(000's omitted)				
	1934	1935	1936	Change between 1935 and 1936
Total imports.....	64,657	71,455	78,671	+ 7,216
British exports	36,125	39,400	38,441	- 959
Re-exports	4,008	4,572	4,343	- 229
Total exports	40,133	43,972	42,784	- 1,188
Excess of imports over exports	24,524	27,483	35,887	+ 8,404
Transshipments under bond...	2,001	2,485	2,724	+ 239

OVERSEAS TRADE—FIRST ELEVEN MONTHS

(000's omitted)				
	1934	1935	1936	Change between 1935 and 1936
Total imports.....	£ 669,515	£ 683,556	£ 765,875	+ 82,319
British exports	361,874	391,037	400,254	+ 9,216
Re-exports	47,683	49,821	54,326	+ 4,504
Total exports	409,556	440,858	454,579	+ 13,721
Excess of imports over exports	259,959	242,697	311,296	+ 68,598
Transshipments under bond...	21,844	22,946	26,046	+ 3,100

The rise in imports was fairly well spread between the different categories, the largest increases being recorded under grain and flour, dairy produce, wood and timber, and wool. Among British exports, the decline was most marked in the raw materials group, for which reduced coal exports were mainly responsible. In the manufactured goods group, exports of non-ferrous metals and chemicals fell, but those of machinery and vehicles showed some increase.

Trade by Commodities.—The following table shows recent changes in the more important categories of imports retained in this country:—

RETAINED IMPORTS—MONTH OF NOVEMBER

Item and Measure	1934	1935	1936
Wheat	'000 cwt.	8,096	9,835
Beef and veal	'000 cwt.	1,098	1,051
Mutton and lamb	'000 cwt.	350	380
Sugar (unrefined)	'000 cwt.	2,954	2,879
Iron ore and scrap	'000 tons	429	422
Raw cotton	'000 cents	944	1,616
Sheep's and lambs' wool	'000 cents	339	483
Flax, hemp and jute	tons	25,874	23,890
Crude petroleum	'000 galls.	50,235	37,893
Hides, wet and dry	'000 cwt.	124	149
Wood pulp	'000 tons	203	208
Rubber	'000 cents	356	66
Unwrought copper	tons	30,398	13,591
Pig lead	tons	24,474	28,429
Tin	tons	4,036	3,650
Ore and concentrates	tons	262	1,652
Blocks, ingots, slabs and bars	'000 tons	104	77
Iron and steel manufactures	'000 tons	4,803	5,569
Machinery	tons		8,998

Shipments of wheat are slightly lower than last year, reduced supplies from Argentina and Russia being made good to some extent by increased imports from Canada, Roumania and India. Meat imports are lower, supplies from Argentina, Australia and New Zealand showing a decline. Cuba is again mainly responsible for the increase in sugar imports, though larger quantities have also come from the Union of South Africa and Peru. The strong demand for textile fibres continues. Machinery imports show a further increase. The principal British exports are shown below:—

BRITISH EXPORTS—MONTH OF NOVEMBER

Item and Measure	1934	1935	1936
Coal	'000 tons	3,318	3,496
Iron and steel scrap	tons	24,670	18,557
Pig-iron and ferro-alloys	tons	13,690	14,036
Railway material	tons	13,576	18,344
Total iron and steel manufactures	tons	217,951	211,954
Textile machinery	tons	6,910	5,510
Total machinery	tons	31,412	33,038
Cotton yarns	'000 lbs.	10,642	12,414
Cotton piece-goods	'000 sq. yds.	172,397	158,489
Wool tops	'000 lbs.	3,799	4,607
Worsted yarns	'000 lbs.	2,621	3,249
Woolen tissues	'000 sq. yds.	4,998	5,584
Worsted tissues	'000 sq. yds.	2,206	3,166
Linen piece-goods	'000 sq. yds.	5,996	5,966
Leather boots and shoes	doz. pairs	42,978	40,853
Leather	cwt.	20,426	24,203
Paper and cardboard	cwt.	299,196	336,767
Locomotives (complete and parts)	tons	2,158	993
Motor vehicles and chassis	number	5,754	6,800

There has been a considerable falling off in coal exports. No coal was exported to Italy in November, and demand from Mediterranean countries in general is lower. Canada, Scandinavia and the Netherlands have also taken less. Exports of all commodities in the iron and steel group show a decline, the industry being fully occupied with home demand for industrial purposes and for re-armament. The market for linen piece-goods continues strong, especially in China and the United States. Exports of British motors have been maintained and remain well above the level of recent years.

OVERSEAS CORRESPONDENCE

From our Correspondents in each centre

UNITED STATES

WASHINGTON TALKS FOREIGN POLICY

AFTER a political campaign obsessed with domestic issues, Washington has experienced the novelty of talking again about foreign policy. The President's dramatic visit to the Pan-American Conference at Buenos Aires, the growing sense of the possibility of building a concert of Pan-American Republics to deal at least with dangers from a European war, the President's cryptic remark about new legislation to halt the investment of foreign funds in American securities, the revival of war-debt gossip, and the events in the Far East, have supplied a plethora of challenging topics for discussion.

Besides the resignation of Dr. Tugwell, and the sittings of the Supreme Court, there has been little home news of commanding interest. The President's second term promises to be more active internationally than the first. He has less to worry about at home, and a larger majority and greater prestige in Congress. Matters which were inexpedient to fight over, like the St. Lawrence Treaty, now become politically safe. And the election, though foreign affairs were subordinated, did supply a mandate to continue Secretary Hull's policy of reciprocal trade agreements, endorsed the "good neighbour" policy, and in general supported the slowly forming conception of a new neutrality.

Exciting and concrete proposals had been expected of the President's Argentine speech, but when it was made they were not there. One was an announcement of the United States' readiness, if other nations co-operated, to join in economic and financial sanctions against an aggressor. This would have appeared like a daring revival of the sanctions idea, and even a burst of impetuosity. But it is not so far from the thinking of leading Democrats as may be supposed. The chairman of the House foreign relations committee, Congressman McReynolds, has announced that he will introduce neutrality legislation when Congress meets next month, authorising an embargo on raw materials as well as munitions in the event of war, and allowing the President some discretion in determining an aggressor.

DEMOCRACY IN SOUTH AMERICA

Mr Roosevelt, if he did consider speaking at Buenos Aires of implementing the Kellogg Pact, thought better of it, and produced instead a carefully weighed speech in favour of democracy. Nor is this to be summed up merely by saying that he was in favour of it (to parody Mr Coolidge's description of a sermon "which was about sin, and the preacher was against it"). Mr Roosevelt is credited with having grave apprehensions about the more distant future, seeing it within the bounds of possibility that a European war might end in the victory of a dictator who would thereafter proceed to establish a colony in South America. A Fascist republic in Latin America could be chosen partner in such an enterprise, and unless Pan-America adopts democracy with more courage and tenacity than at present there will be little mutual support of the Monroe doctrine. Not counting the United States and Canada, only Mexico, Colombia and, perhaps, Costa Rica, of western hemisphere countries, can be said to have genuinely democratic governments to-day. So the President's address at Buenos Aires was really a clarion call to the people of Latin America, and it must have rung somewhat jarringly in the ears of conference delegates.

The speech was sobering to his own countrymen, who have imagined that rapid results might be expected from the new cordiality in the Pan-American family. Obviously

Mr Roosevelt sees that democracy must come first before there can be any trustworthy collaboration for peace in the Americas. In this connection the visit of Lord Tweedmuir, returning the President's call in Quebec, is sure to raise the important question of Canada's co-operation in any agreements the Pan-American union may bring forth. If Mr Roosevelt's dream is to assure the future of democracy in the western hemisphere, the value of Canadian co-operation cannot be under-estimated. Loose talk has drifted down from Canada that Washington is trying to loosen that country's ties with the British Commonwealth. But this is not in the background of any thinking one hears here from responsible men. Nobody sees any contradiction in Canada remaining a full and intimate member of the Commonwealth and of the League of Nations, and still acknowledging a special position as a sovereign state in the western hemisphere. If anything, Washington believes Canada's prestige would be enhanced if it filled a dual function as a Pan-American member and a link between the western hemisphere and Great Britain.

MORE WAR DEBT PAYMENTS?

With the newspapers again speculating about the probability of negotiations over debt payments, it is appropriate to repeat that this question lies exclusively within the domain of Congress, which has not delegated to the President or the State Department any authority to make new offers or to accept them. The President's view has been and remains that a debtor must always have access to his creditor, but the onus of making a proposal lies exclusively with the debtor. French talks of renewing debt payments comes about a year too late to arouse much public sympathy, and there is still less enthusiasm for the report that Italy, too, is preparing to resume payments.

The motive of Italy, if payments are resumed, is assumed to be Mussolini's need for a loan to colonise Abyssinia. France's need is for money for re-armament. Neither purpose is looked upon with favour in Government circles. The Johnson Act closing the money markets to governments in default of their debts to the United States was intended as a slap, but has changed in the public mind into a kind of anti-war insurance. So the question of war debts enters a new stage. At a time when the heavy investment of foreign funds in the United States removes most of the difficulty of transferring debt payments, payment is desired only if it is not a prelude to vast new borrowing for war or imperialistic purposes. The debts still remain a barrier in the way of good feelings toward Europe. But paying them with the patent intent of incurring new debts will not reduce the barrier.

WASHINGTON, December 2.

PREVENTING A "BOOM"

THE change in temperature in economic discussion since the election is striking in its abruptness. In the Washington despatches the present emphasis, instead of being on recovery, is upon the urgent necessity of preventing the development of a boom and of establishing such controls as will avert the sequence of the late 'twenties. The business atmosphere of November, 1936, was comparable with that of November, 1928, with production, industrial share prices and bank credit indices almost identical. There are three major differences: (1) The commodity price level is now lower; but in 1928 the price level was steady with a slight sagging tendency, while now it is rising vigorously. (2) Money rates are much lower than in 1928; in November, 1928, three-six months' Treasury bills were 4½ per cent.

and long-term Treasury bonds about 3½ per cent.; for December 15, 1936, the Treasury has just announced an issue of five-year notes at 1½ per cent. and of 13-17-year bonds at 2½ per cent. (3) Statistically, there was no unemployment in 1928; now the unemployed are estimated at a variety of large numbers—although it must be stated that, except for the "visible" official unemployed on relief, there is not only no visible evidence of unemployment, but audible evidence of a labour scarcity.

However, the memory of the depression is so vivid that it is but natural that the enjoyment of the present prosperity should be haunted by the recollections of 1929. Nothing has so strongly impressed Americans who have visited London in recent months as the contrasts in the intellectual reactions to recovery in the two countries—the timidity of Wall Street and the confidence of the City of London.

Since the President's statements on "hot money" the subject of controlling the "boom" has been uppermost in the Press. The "hot money" conference has been followed by a monitory and almost minatory address by the chairman of the Securities and Exchange Commission (Mr Landis) before the convention of the investment bankers, stating that "recovery cannot follow the traditional cyclical patterns. Any interpretation of our national aim as looking for the shallow prosperity of boom days is false." From this point he developed the theme that at times the financial mechanism may become subjected to strains and stresses, and added that "instead of trying the hopeless task of constructing a mechanism that will absorb the huge pressures . . . effort must be diverted toward closing the investment machinery to the play of irresponsible force of such a character."

FURTHER REDUCTION IN BANKS' EXCESS RESERVES?

Simultaneously with these warnings, Washington announcements continuously affirm that the Federal Reserve authorities are intent upon another action to reduce the banks' excess reserves. It is commonly expected that this will take the form of another increase in Member Bank reserve requirements, similar to that of last August, when they were raised 50 per cent. Such an act would exhaust that particular power, although open-market operations by the Reserve Banks would still be available. In other words, the reported intention of the reserve authorities is to regain control of the credit base.

The sentiment of Wall Street is more than friendly to these views. Indeed, to Wall Street they are a rather belated political acknowledgment of the dangers inherent in the bold fiscal policy of recent years. More than a year ago the President of the Stock Exchange stated: "When the Stock Exchanges have done all they can, when the Member Banks of the Federal Reserve System have done all they can, when the Securities and Exchange Commission has done all that it can, there still remains the immense outside factor—an abnormal money market, with a gigantic volume of excess reserves . . . My earnest wish is that . . . we may be spared another season of madness."

INTEREST RATES AND THE BUDGET

All these statements, however, should be read in the light of facts, and specifically of one particular fact of current significance, viz. the announcement of the Treasury issue of long-term bonds on a 2½ per cent. basis. If the long-term money rate is 2½ per cent., as exemplified by that issue, it carries certain implicit consequences, which have by no means fully permeated our economic structure. Furthermore, the announced intention of introducing an effective measure of credit control in the presence of a very low long-term rate immediately raises the question of the Budget. In short, Wall Street fully shares Washington's apprehensions of the possibility of prosperity developing into boom; but it finds difficulty in reconciling the actions of the Treasury with the warnings of the chairman of the S.E.C. and the rumoured intentions of the Federal Reserve Board.

The two-year labour truce which began in the autumn of 1934 seems to have expired. The only major strike in

progress is the maritime, which remains complete on the Pacific Coast, but is only partially effective on this side. Its long duration has imposed occasional hardship and some general economic setback on the coast. Probably more serious are the bottle-neck strikes—that is, strikes by a comparatively small number of workers in some key position that interrupts the chain of production. In a long and intricate manufacturing process—for example, the manufacture of a motor car—there are several points at which, like Horatius on the Bridge, the activities of "a thousand may well be stopped by three." However, these disturbances, while troublesome, are not of sufficient magnitude or frequency to be economically decisive.

NEW YORK, December 8.

FRANCE

BUDGET RAPIDLY VOTED

THE fresh presentation of the Budget, its increased deficit and the need for huge loans, might have seemed likely to prelude long debates in Parliament. Actually, no Budget was ever so quickly voted by the Chamber. This speed was due to three main facts: (1) the urgency required if the law is to be duly passed by January 1st; (2) the desire of the Minister of Finance to avoid controversies which would have emphasised the Budget deficit and excited new conflicts between the advocates of orthodoxy and the defenders or beneficiaries of Government expenditure; and (3) the urgent need to launch in the most favourable possible atmosphere a new loan for re-armament and public works. The last hopes of the Conservative minority are now that the Senate will once more make its solemn but sterile warnings heard.

The reimbursement of the English £40 millions loan, which led to a new fall of 4,000 million francs in the gold stock of the Bank of France, was accompanied by a re-opening of the "New advances to State" (which had been closed by devaluation) for a sum of 700 million francs. This double change shows that the French Exchange Equalisation Account had no supplementary gold and the Treasury no surplus money for the repayment of this loan.

GOLD HOARDERS AND THE NEW LOAN

These circumstances give a particular significance to the proposal of the Government—which has been immediately voted by Parliament—to extend until February 1st the period in which hoarders of gold are permitted to declare it, and to the exceptional conditions of the new loan, whose issue has just been announced by the Minister of Finance. Subscription to these new 100-franc bonds, paying an interest of 4 per cent. or 3½ per cent., will be reserved to holders of the pre-devaluation "baby bonds" and holders of gold certificates. The new bonds will be reimbursed, after nine or three years respectively, at 140 per cent. The difference of 40 per cent. equals the difference between the 1928 franc and the 1936 franc. Other advantages are also accorded to the new bonds. They will be accepted (at their reimbursement value of 140 francs) in payment of death duties and in repayment of advances from the Bank of France. This issue, for which no subscriptions in specie will be accepted, does not appear as a Treasury issue, since the Treasury can utilise the remaining 9,000 millions of the "new advances of the Bank," but rather as an indirect abolition of the tax on gold. It is thus designed to favour the dishoarding of gold, which the Government specially desires.

The new loan will certainly produce results, particularly among financially well-informed persons. It may be feared, however, that the mass of small hoarders will interpret it as a simple exchange of gold against public funds.

The subscriptions to this loan will probably be accelerated by the evidence of business revival now statistically apparent. The yield of taxation is steadily increasing; and greater monetary liquidity is emerging in

the short-term market, as the following table of the deposits of the big Parisian banks shows:—

	Oct. 31, 1935	('000 Franc) September 30, 1936	October 31, 1936
Crédit Lyonnais	11,053,949	9,826,522	10,425,100
Société Générale.....	9,304,871	8,012,027	8,645,240
Comptoir d'Escompte ...	7,015,456	6,056,729	7,076,799
Créd. Ind. et Commerc. ...	1,365,357	1,241,820	1,401,796
	28,739,633	25,146,098	27,548,938

The new loan might, however, be embarrassed by the stagnation of rentes prices, by the prospects of the huge sums to be borrowed in the future, by persistent social conflicts and controversies between employers and the Government, and finally by recurrent rumours of new controls on the exchanges, the banks, etc., which have already provoked a slight tightening of the money market.

NEW STRIKE METHODS

Capitalists may also be troubled by a certain recrudescence of social conflicts, notably in the North of France. The employers do not endorse the provisional solution of the strikes which has been accepted by the Government and which consists in substituting the "neutralisation" of factories for the former "stay-in strikes." "Neutralisation" means that the strike pickets stay in front of, instead of behind, the factory gates, under the supervision of the police. This procedure was devised by the trade unions to hinder the employers from "mobilising" non-strikers against strikers.

On the other hand, a recent speech of M. Jouhaux, general secretary of the trade unions, complained that devaluation had not supplied new money to the State for public works, that the banks' credit policy had been directed against a revival of business, and that the nationalisation of the banks and larger industries had thus been rendered necessary. This speech is in contradiction with the latest effort of the Minister of Finance to promote dis- hoarding.

FURTHER RISE IN PRICES

The rise in prices continues, as the following figures show:—

	June	Sept.	Nov.	Dec. 12th
Wholesale prices	372	407	473	482
National products	415	457	504	512
Imported products	296	319	418	428
Food products	396	447	483	495
Industrial products	352	373	466	471
Retail prices (13 articles)	458	483	520	...
(Paris) (29 articles)	461	494	534	...
Lighting and heating	79	88	93	...
Clothing.....	57.6	61.2	69.8	...

The Statistique Générale has just published its monthly figures, showing industrial production in France (1913 = 100):—

	Oct., 1935	Aug., 1936	Sept., 1936	Oct., 1936
General index	95	93	95	97
Engineering	96	98	97	98
Iron and steel	80	73	81	86
Textiles	70	51	64	70
Mines	100	87	91	103
Building (adjusted figures).....	66	62	58	56
Leather (adjusted figures)	91	108	106	100
Paper (adjusted figures)	117	165	159	151
Rubber (adjusted figures)	814	949	952	955
Motors (adjusted figures)	387	413	492	498

In the motor industry, 14,059 cars and 1,810 lorries were put on the road in October, compared with 10,482 cars and 1,484 lorries in September. The figures for the cotton industry are as follows:—

	July, 1936	Aug., 1936	Sept., 1936	Oct., 1936
Spinning (average per spindle in kilograms):—				
Production	1.606	1.191	1.722	1.969
Deliveries	1.704	1.485	1.844	2.052
Stocks	1.652	1.714	1.642	1.469
Unfulfilled orders.....	5.069	4.765	4.926	5.474

Weaving (average per loom in
pieces of 100 metres):

Production	5.46	3.21	4.74	6.00
Deliveries	6.23	3.95	4.90	6.28
Stocks	6.74	6.02	5.74	5.28
Unfulfilled orders.....	22.02	22.39	21.85	23.89

The total of bankruptcies in November was 672, against 605 in October and 321 in September; and of bankruptcies and judicial liquidations 870, against 816 in October and 452 in September.

PARIS, December 17.

GERMANY

INTEREST IN BRITISH MONARCHY

FOR reasons unknown information about the British throne crisis was withheld from the German public until the crisis had ceased. That was unfortunate. While most Germans are friendly towards Great Britain, and while their leaders probably realise the unwisdom of adding British antagonism to the already existing antagonism of powerful Continental States, it cannot be said that Anglo-German relations are tending to improve. Misleading information about British affairs is a cause of this. The campaign conducted in authoritarian countries against the system of government prevailing not only in Great Britain, but in most of the world's orderly and quiet countries, has required a certain forcible shutting of eyes to the truth. British Government methods and social and economic conditions have been represented in a very unfavourable light, have indeed been condemned as effete, inefficient and anarchical. It would have enlightened Germans, and would probably have conducted to improve the Anglo-German atmosphere, if they had been allowed to follow the course of the crisis and to see that in a Europe of which one disturbing feature is the blind fury aroused by trifles the most momentous issues may be handled with policy and calm.

AMENDMENT OF BERLIN CITY ADMINISTRATION

The only noteworthy new political measure is a law amending the Government of Berlin, which comes into force on January 1st. The separate offices of Oberbürgermeister and State Commissary (the latter with supervisory functions) disappear. The new city head will have the joint title Oberbürgermeister and City President, which will be held by the present State Commissary, Dr. Lippert. State and municipal functions will thereby be fused at the top. Lower down the separation will be maintained in that a Bürgermeister will act as deputy of the Oberbürgermeister and a vice-president as deputy of the City President. As a City President cannot exercise supervisory functions over himself as Oberbürgermeister, these functions will be transferred to the Reich Minister of the Interior. The Oberbürgermeister will henceforth be a State official. The Berlin district leader (*Gauleiter*) of the Nazi Party will become Nazi Party Commissioner for the city. The present district leader is the Minister of Propaganda, Dr. Goebbels. The exact working of this system is difficult to foresee. It seems that the Minister of the Interior and, as Party Commissioner, the Minister of Propaganda will have a say in all matters of importance.

THE RISE IN PRICES

The Finance Minister declares that the future of the Four-Year Plan depends upon preventing the "quantity boom" from becoming a "price boom." The wholesale price of men's clothing is now returned at 28.4 per cent. of cloth 30.4 per cent., above the level of April, 1933. An attempt is being made to divert consumption from scarce and mostly high-value foods to relatively plentiful and low-value foods. The public is advised to consume more potatoes, sugar and fish, and less beef, bacon, butter and other fats. The winter cereals report for December 1st is that of the same date of 1935 (rye being worst). It seems since the quantity available is below the normal demand of the mills. Owing to the meat shortage, consumption of

wheat in the months of the crops year which have already elapsed was higher than usual. It is unofficially reported that measures to ensure imports are already under way. In the South-Eastern European markets, where, in accord with the principles of the New Plan, Germany would prefer to buy, competition from other wheat-importing countries would have to be met. It is therefore expected that Canada will supply the deficit.

New restrictive measures affecting non-ferrous metals and wood have been taken in connection with the Four-Year Plan. An official list (which, however, is not complete) shows that 26 compulsory cartels have been founded since 1932. The number of voluntary cartels founded since 1932 exceeds 100. Most are in the finishing industries.

The number of unemployed increased in November by 121,000 to 1,197,000, as against 1,984,000 in November, 1935. Christmas business seems to be better than last year, but provincial centres report that the public is mainly buying clothing and other necessities, and that the market for luxury goods and seasonal trifles is dull.

The home cement syndicates have been prolonged until the end of 1937. Sales (including exports) this year are estimated at 11,500,000 tons, as against 8,630,000 tons in 1935. An official return for the end of 1935 shows that of 7,840 share companies with a combined capital of Rm. 19,550 millions, 584 companies were partly or wholly capitalised with foreign money.

CHANGES IN MUNICIPAL FINANCE

Radical changes in the financial relations of municipalities, States and Reich were announced last week. The statistical basis of this reform is as follows. The tax receipts of all three in the financial year 1935-36 totalled Rm. 13,245 millions, having risen since 1932-33 from Rm. 10,210 millions. The 1935-36 total was composed as follows ("Reich subvention taxes" are those of which part goes to the States):—

	Millions of Marks
Reich subvention taxes	5,697
Other Reich taxes.....	2,609
Customs.....	1,249
All Reich taxes	9,555
State and Municipal taxes	3,690
Total public tax yield	13,245

Of all these tax groups only the "Reich subvention" group has materially increased its yield. The total in 1932-33 was Rm. 3,307 millions, which means an increase of 72 per cent. in three years. The subvention taxes (in the main income, corporation income and turnover) naturally benefited most from the trade recovery. This made it possible to reduce the subventions. The reason given for this is that Reich initiative and credits caused the recovery and that the Reich bears the new expenditure on armaments.

At present the two real estate and industrial taxes are regulated independently by 32 laws of 16 States. In future they will be regulated by two uniform Reich laws, by which, however, the local assessing authority will have discretion about its rate. This authority is henceforth to be the municipalities, by which the entire yields, at present shared with the States, will be retained. In general, revenue from the real estate tax, being relatively stable, will go to cover such municipal expenditure as is also relatively stable, e.g. schools and roads, while the uncertain industrial tax yield will cover expenditure which depends mainly on the state of trade. The States will not only lose their shares in these taxes, but will be entirely eliminated as taxing bodies, and will depend upon Reich subventions. Thereby the reversal of Reich and State financial relations which began after the war has been completed. Before the war the Reich was largely dependent on State subventions. After the war the States, having lost income tax to the Reich, and also railway profits, and other sources, were subsidised by the Reich, but retained considerable taxing power. Henceforth the States will have no financial sources except Reich subventions. This reform has a political side, since it is connected with the curtailing of State independence and the disappearance of certain State functions.

NATIONAL BANK OF GREECE

Established in 1841

Head Office: Athens

Branches and Agencies throughout Greece

Branches and Agencies in Egypt:
CAIRO, ALEXANDRIA, ZAGAZIG

Affiliated Bank:

HELLENIC BANK TRUST COMPANY
51 Malden Lane, NEW YORK

Capital paid up and Reserves Drs. 1,205,000,000

Last week and early this week money was tight in consequence of a demand for income-tax payments and wages. Last week's day-loan rate was about $\frac{1}{2}$ per cent. higher than in the corresponding week of November. In general the money market continues to be under the influence of the Reich Loan flotation.

BERLIN, December 15.

SWITZERLAND

SIGNS OF RECOVERY

THE foreign trade figures show that the effects of devaluation in October were smaller than had been anticipated. Imports in October totalled 128,010,744 francs, compared with 96,555,289 francs in September and 116,572,206 francs in October, 1935. This rise was partly due to a relaxation in certain import quotas, partly to renewed activity in home industry, and partly also to heavy purchases made in anticipation of a new rise in prices. Exports totalled 84,595,315 francs, compared with 75,808,295 francs in September, and 75,859,666 francs in October, 1935. The situation of the four chief exporting industries was much better in October; for sales of watches, silk and cotton goods and machines totalled about 39,000,000 francs, or 5,000,000 francs more than in October, 1935, and 3,000,000 francs more than in September, 1936. Imports from Great Britain were 7,708,988 francs in October, against 6,667,908 francs in October, 1935; and exports to Great Britain were 10,719,890 francs, against 8,645,627 francs in October, 1935.

Devaluation has slowed down the seasonal rise in unemployment. There were 86,800 unemployed at the end of October, against 82,300 last year. But the increase between September and October was 4,000 this year, compared with 13,000 last year.

AN END OF HOARDING

Devaluation has ended the hoarding of gold and bank notes; and money is so abundant that the National Bank has reduced the official discount rate from 2 to $1\frac{1}{2}$ per cent. as from November 26th, and the rate of interest for advances on securities from 3 to $2\frac{1}{2}$ per cent. The Swiss Bourses show a great activity, as hoarded funds are being employed in buying securities of all kinds, mostly Swiss, British and American. There has been no rise in the cost of living.

The Federal Government has submitted the Budget of the Confederation for 1937 to the examination of the Financial Committees of the two Chambers of Parliament. The Committee of the Council of States, or first Chamber, has unanimously opposed the estimates and sent back the Budget for further study by the Government. The Government will thus be compelled to reshape its Budget.

which at present estimates expenditure at 525,000,000 francs and revenue at 483,000,000 francs. The public debt, which had been reduced to 2,088,797,000 francs in 1932, now totals about 2,308,253,000 francs. From 1932 to 1936 the yearly deficits of the Federal finances aggregated 181,707,000 francs.

The Socialist Government in Geneva was defeated in the recent election. Three years ago the Socialists, who secured 45 seats out of 100 in the Cantonal Parliament, succeeded in gaining a majority in the Geneva Government, in which they held four seats out of seven. The Cantonal Parliament and Government were re-elected last month. The Socialist leaders, who are nearly all extremists, allied themselves with the Communists; they nevertheless lost five seats in Parliament, and the national parties, which had united on a common programme, secured sixty seats out of 100.

GENEVA, December 15.

TURKEY

ECONOMIC POSITION "STRIKINGLY IMPROVED."

CONSIDERABLE attention is being focussed upon the new import regulations to be enforced on January 1, 1937. These regulations mark the end of a period of which the quota was the main feature. They also mean the possibility of larger imports. Several other restrictions have been eliminated and replaced by restrictions of a different order. A few years ago, when Turkey tentatively embarked upon a foreign trade policy the ultimate aim of which seemed increasingly to be autarky, her balance of payments was in a disastrous state, her traditional export goods were finding few buyers, and she had entirely to rely upon foreign sources of supply in defence. The drastic measures she then took were based on the principle that her population, being poor, ought to do without luxury goods, and that, if her raw material was not absorbed by foreign markets, factories transforming such raw material into finished goods should be called into existence. It was in such economic and, partly also military, necessities, that the "Kadro" theory of "stateism," which has since dominated the economic life of the country, and the various industrialisation plans found their first and lasting foundations. For reasons which may be connected with Turkey's sound financial policy, her continued reforms, the recent extensive German and Italian purchases at prices considerably above the world level, Turkey's economic situation has strikingly improved. For the past seven years, the trade balance has been favourable and the foreign exchange situation is now understood to be quite satisfactory.

A reduction of the cost of living designed to reduce the cost of production has been the keynote of recent policy. On the one hand, the Government has accentuated its price-cutting policy in the case of certain State-manufactured goods, and on the other it has threatened private manufacturers with the importation of a number of protected goods if they continue to maintain high prices. In certain cases such importation has actually taken place. The new regulations specify which goods are absolutely barred from importation; and these require Government licence. The remainder, representing by far the greater part of Turkish imports, are subdivided into three lists corresponding to the countries of origin, and these receive three different degrees of protection. Thus, by authorising the importation of goods formerly prohibited, the Government has manifested its determination not to grant perpetual protection to private industry, particularly in the case of luxury goods.

At the same time, the Government has strengthened its grip on commodities regarded as vital for Turkish economic life. Noteworthy additions to the already extensive list of regulated commodities are cotton yarns, steel tubes, and coffee.

ISTANBUL, December 10.

NORWAY

BANK RATE RAISED

IN the elections in October the Labour Party failed to obtain a majority in the Storting. There was a considerable increase in the number of votes given to the party, but the increase in number of their seats in the Storting was only two. The Conservatives advanced by about 30,000 votes and six seats. The composition of the new Storting will not differ materially from the last one, and there is at present nothing to indicate any change in the colour of the Government. The coalition between the bourgeois parties effected during the election was only an emergency precaution, and apparently there exists no agreed platform on which to base Governmental co-operation between the bourgeois parties.

The Bank rate was raised this week to 4 per cent. This step is in accordance with the general trend of foreign money markets, and although the note circulation of the Norges Bank is now considerably lower than a month ago, the tendency has been upwards during the latter half of the month. At the same time, deposits at the Bank have decreased by a few millions. Further, there has been a decrease of deposits in savings banks during October of about 25 million kroner. This decrease is thought to be partly due to a strong dislike of the deposit tax which was enforced last spring. The Government have therefore announced their intention to propose certain amendments, which will modify the untoward effects of the tax.

FURTHER EXPANSION OF FOREIGN TRADE

The foreign trade statistics present a brighter picture. The value of imports during October amounted to 87 million kroner, against 78.8 million kroner in September, and 77.7 million kroner in October, 1935. Exports were 65 million kroner, against 62 million kroner in September and 59 million kroner in October, 1935. Trade in the first ten months of the year, as compared with the same period last year, is shown in the following table (in 1,000 kroner):—

	Imports	Exports	Import surplus
1935.....	656.5	484.0	172.5
1936.....	735.6	541.7	193.9

Great Britain ranks foremost both as buyer and seller of Norwegian goods.

The industrial production index for September was 7 points above that for August. The figure for export industries alone rose from 104 to 117 and home industries from 133 to 136. During the first three quarters of the year that of the same period of last year.

The recent fall in laid-up ships has been remarkable; on November 1st laid-up tonnage represented 2.2 per cent. of the whole fleet (apart from coasting vessels), against 3.3 per cent. on October 1st.

Activities on the Bourse have been exceptionally brisk during recent weeks, and the turnover has reached record-breaking figures. Whaling and shipping shares have been favourites; but industrials have also been in good demand. Bonds have failed to attract attention.

OSLO, December 11

JUGOSLAVIA

NEW TRADE AGREEMENTS

FREQUENT conferences of the Serbian opposition leaders with Dr. Macek, an interview of the Croatian leader with the Prince Regent, and, more lately, discussions between the Government Radical group and the Croatians, all suggest active attempts to bring to an end the Croatian deadlock. Although Dr. Macek is reported to have declared the time ripe for a settlement, all depends on the terms offered by Belgrade. No data of any moment about the actual progress of the negotiations find their way into the press. Thus it is difficult as yet to estimate whether the

present effort will be more successful than the many previous ones.

Interest in external relations in the last month or two has centred mainly on the conclusion of a series of trade agreements. Following a supplementary agreement with Holland on September 25th regulating the mode of payment for imports, and another with Greece giving reciprocal increases of the quotas for livestock and dried fruits, and the re-opening of trade with Italy from October 1st, negotiations have now been successfully concluded with Turkey and Great Britain and are beginning with France and Roumania. The terms of the agreement with Great Britain are not yet published, but new quotas are expected for Yugoslav cereals, timber and poultry in return for relaxation of the Yugoslav restrictions on British goods. After the application of import control, imports from Great Britain fell by more than half—to 20.4 million dinars (average from June to September) against 41.2 millions (January to May). Yugoslav exports to Britain, on the other hand have shown an enormous increase this autumn and, in October, for the first time since 1918, Britain has headed the list of buyers from Yugoslavia with 74.1 million dinars, or 15.8 per cent. of the total. For ten months exports to Britain totalled 299.3 millions and imports 303.4 millions, thereby reducing the import surplus to 4.1 millions, compared with 148 millions in 1935. Heavy purchases of wheat and timber during October were responsible for the increase.

Trade returns for the last two months are as follows:—

	1935				1936			
	Exports		Imports		Exports		Imports	
September	Tons	Mill. dinars	Tons	Mill. dinars	Tons	Mill. dinars	Tons	Mill. dinars
October...	314,075	384.1	84,282	287.7	338,112	504.1	81,013	353.1
October...	359,095	493.5	121,433	395.3	273,430	468.5	91,631	345.8

The recent commission at Dresden revised and improved the relations with Germany arising out of the clearing system, by which Germany is still Yugoslavia's debtor to the tune of 16.6 million marks. The principle of 100 per cent. interchange of merchandise was established, and the fixed rate of the mark for clearing transactions has been abolished. Germany has also promised to give better prices for Yugoslav products, which, after being exported under the quotas, were priced lower than Hungarian and Bulgarian goods. Exporters' bonds under the clearing arrangement are now negotiable on the Bourse.

INCREASED BUDGET EXPENDITURE

The Budget for 1937-38 submitted to Parliament last week estimates revenue and expenditure at 10,949 million dinars, or 625.5 million dinars (6 per cent.) more than the current Budget. The chief increases are allotted to the following Budgetary headings: 251 millions for State and agricultural debts under the recent peasant debt liquidation scheme; 30 millions for railway annuity services; 150 millions for national defence; 83 millions for State-run enterprises such as posts, railways, monopolies, etc., which are calculated to cover this increase from their own increased revenue; 50 millions for the transfer of previous expenditure into the new Budget; 27 millions for the Ministries of Social Welfare; and 18 millions for pensions. No new taxes are imposed to meet the greater expenditure which, it is estimated, will be covered by increased yield from direct and indirect taxation and the collection of arrears. The Minister expects a rise of 6 per cent. in national income this year.

In pursuance of its policy of pressing on the liquidation of the floating debt, of increasing the cash holding of the Treasury, and of paying off some of the outstanding State accounts, the Government has issued another 500 million dinars of Treasury bills (500 millions were issued earlier in the year) with a term of two years and interest at 5 per cent.

BELGRADE, December 12.

AUSTRALIA

A SMALL NET DEFICIT

THE Budgets of the Commonwealth and six States for 1936-37 show in the aggregate a net deficit of £1,171,366, after providing for sinking funds. The accounts issued by the various State Governments, which differ in form, show estimated expenditure at £118,031,852 and estimated revenue at £116,815,486. The Commonwealth expenditure is estimated at £81,505,000 and revenue at £81,550,000. The two sets of figures are subject to some duplication on account of Commonwealth payments to or on behalf of the States. Surpluses are estimated by the Commonwealth at £45,000, New South Wales £5,874 and Tasmania £1,247. Deficits are estimated by Victoria at £110,045, Queensland £650,664, South Australia £168,452 and Western Australia £294,326. The original Western Australian estimate was for a surplus of £5,674, but the reduction of £300,000 in the special grant from the Commonwealth Government has converted this into a deficit of £294,326. The estimated revenue of the Commonwealth and States includes taxation aggregating £97½ millions, which, however, does not include certain items not credited to the ordinary "Consolidated Revenue" accounts. The inclusion of such items would raise the total taxation to over £100 millions.

The Budgetary position as a whole shows improvement as compared with a few years ago. Besides the reductions in interest on public debts and the suspension of interest and sinking fund payments on account of war indebtedness to the British Government, Australia has had the benefit of seasons which have been on the whole favourable. On the other hand, the depreciation of the currency has added to the amount required in Australian currency to meet the service of the external debt. Approximately £5½ millions, is now required for exchange on payments in London and New York. Much of the activity in the cities is due to the building boom; while some other forms of activity are due to Government expenditure of loan money.

NEW INTERNAL LOAN OF £7,500,000

The Commonwealth Government is now offering locally a 3½ per cent. loan, repayable in 1951, of £7,500,000 at £97 10s. (yield, including redemption, £3 19s. 4d. per cent.) on behalf of itself and the State Governments. The Governments at first desired to issue a loan of £10 million, but in view of market conditions the Commonwealth Bank did not see its way to underwrite more than £7,500,000. Some of the politicians have expressed resentment at the refusal of the Commonwealth Bank to underwrite whatever amount might be desired by the Loan Council, and they consider that the Bank should be subordinate to Government policy. The position of the Commonwealth Bank is that the Governments are free, if they desire, to approach the market without underwriting, and that the responsibility for public finance does not rest upon the Bank but upon the Governments.

MELBOURNE, December 1.

LETTER TO THE EDITOR

EMPIRE IMPORTS AND THE SPECIAL AREAS

TO THE EDITOR OF THE ECONOMIST

SIR,—We are all deeply concerned about the problem of the Special Areas, and agree that a solution must be found. But it is useless to create employment in one district at the expense of employment in another, as may well happen unless the ground is first carefully surveyed. Are there not already, in districts suffering heavily from unemployment, well-established industries which, if given adequate support, could find work for many thousands more men?

Import statistics continue to furnish an interesting if ironic commentary on our economic life. I think it could easily be shown, for example, that industries in the Special Areas are suffering through competition from low-wage countries. Indeed, is it not a fact that, within the Empire itself, we are encouraging competition at the expense of employment in the United Kingdom? I notice, on glancing through the returns, that there is a considerable import of carpets and leather goods from India, and rubber footwear from Canada and Hong-Kong.

Canada is not a low-wage country; and one can only imagine that the English market attracts the Canadian producer as a relief

to his costs of production. But surely the low-wage problem is raised in an acute form in the imports from Eastern Empire countries? It would seem to me as an onlooker, that, if these imports are permitted, not only does United Kingdom employment suffer, but, inevitably, wage rates suffer too. Can it be disputed that these imports are a menace to the standard of living in Britain?

No doubt many of your readers could, from their own experience and knowledge, cite a number of instances of unfair competition from Empire countries. It has always seemed to me somewhat puzzling that certain United Kingdom exports to Empire countries are subject to a duty, whereas similar exports from those countries to the United Kingdom are free of duty. Is it not opportune, while the future of the Special Areas is being dis-

cussed, that this question of Empire import competition also be reviewed? Otherwise we may find ourselves relieving the burden of unemployment in one area only to create a like distress elsewhere.

Yours faithfully,

J. W. BANFIELD, M.P.

[We cannot accept Mr Banfield's view that a reduction of imports of such commodities as carpets, leather goods and rubber footwear would assist employment in the Special Areas. Unemployment in the Special Areas is largely concentrated in the exporting trades, particularly that of coal. A reduction in manufactured imports would not increase our coal exports; on the contrary, it would eventually reduce them by impoverishing our overseas customers.—Ed. Econ.]

BOOKS AND PUBLICATIONS

LIMITED LIABILITY

WHEN the King in "Utopia, Limited," asked whether Great Britain was governed upon the joint-stock principle, he was told that progress had been so rapid in that direction that the date could not be far distant. Gilbert's quip was written almost midway between the first Companies Act of 1844 and the present day. The development of the limited company since his time invests his words with a jesting truth. Yet in his own day of ripe Victorian prosperity the long struggle to obtain limited liability was still within memory.

These two books* both cover that period of British company history, but they treat it from rather different angles. Both are excellent examples of the best type of research which American universities have made their peculiar *genre*, and they are valuable supplements to the work of Professor Clapham and Mr H. A. Shannon. No account of the Industrial Revolution is complete without a parallel study of the Financial Revolution which necessarily accompanied it. In the absence of joint-stock companies, industrial enterprises would still have been governed by the fantastic partnerships in which it was difficult for members to transfer their interests, and to sue—or be sued. Without the invention of limited liability, the economic development of the nineteenth century would never have been adequately financed.

Yet the battle for these commonplaces of company finance was long and bitter. The Bubble Act of 1720 left a century's legacy. Persons "acting as if they were corporate bodies" were punishable as public nuisances, and liable to the fearful consequences of a *praemunire*. Only by Charter could joint-stock enterprises be formed, and the malicious statute was still sufficiently powerful in the early stages of the Industrial Revolution, a hundred years later, to prevent any general grant of incorporation. The boom of 1824 and 1825 was still accompanied by bitter criticism of the base character of joint-stock enterprise.

It is difficult, at this distance, to understand the reasons for this hostility, which was to continue for the next two decades, until the first Companies Act was passed. Dr. Hunt explains it in terms of the rooted objection to monopoly, which had frequently been an incident—though not an essential—of early charters. But the spirit of Adam Smith still prevailed. McCulloch, a "last ditcher" of the *laissez-faire* school, declared that companies were unsuited for the prosecution of ordinary industrial pursuits, and that it would be visionary to expect vigilance and sound judgment from the directors or servants of a joint-stock association. Noble lords were apprehensive lest the creation of so many companies might prove dangerous to the Constitution. *The Times*, in turn, spoke sorrowfully of "the leprous infection of avarice which had seized noblemen who used for the most part to be men of high spirit," but who now lent their distinguished names for prospectuses. Yet the Bubble Act had to go, and it was repealed in the summer of 1825.

* "The Development of the Business Corporation in England, 1800-1867." By Bishop Carleton Hunt. Humphrey Milford, 182 pages. 10s. 6d. "British Corporation Finance, 1775-1850." By George Heberton Evans, Junr. Humphrey Milford. 208 pages. 10s. 6d.

Then came crisis after the speculative boom, and Parliament did not act again until 1834, when certain privileges of incorporation, particularly the right to sue or be sued in the name of a principal officer, were made available under Letters Patent. Immediately a rush of applications coincided with a banking and railway boom, and the repugnant notion of limited liability for banking companies was openly argued in Parliament: "limited liability; paid-up capital; perfect publicity."

Fortunately for our subsequent economic progress, the report of the Committee of 1844 was surprisingly modern in outlook. It recommended regulations for the incorporation of companies and fuller publicity, and was followed by the epoch-making Act of 1844, which is still the basis of British company law. Twelve years later, limited liability was made available to all except joint-stock banks, and in 1862 a Consolidation Act tied all the legislative threads together. Dr. Hunt's history of this period is fully documented, but yet his narrative is never lost in detail.

The history of the preference share is a subsidiary topic of the same period. Professor Evans' book describes in detail how the early companies raised their capital. The depression of the 'thirties closed the ordinary capital market to the new railway ventures and threatened the stagnation of their projects. The solution was found in the preference share. But the new form of share, beginning as an expedient, ended as a new type of investment, with a clearly defined non-equity status. And where the railways led, industrial enterprises followed; and this essentially curious hybrid became firmly embedded in British company finance. Investors, with the recent treatment of preference share rights fresh in their minds, may be even more doubtful of the fundamental investment nature of these shares after reading this book.

SHORTER NOTICES

"Spain in Revolt." By Harry Gannes and Theodore Repard. Gollancz. 287 pages. 5s.

Here is the process of political development in Spain as seen through the Marxist lens. Blithely disregarding the warning of Friedrich Engels about Spain's persistent feudalism (quoted on page 31) Messrs Gannes and Repard present the civil war as the outcome of a conflict between the "toiling masses" and "the Fascists." That the democratic cause derives a considerable part of its strength from the industrial capitalists of the Basque and the Eastern provinces, they conveniently ignore. Spain is a country whose social phenomena do not fit the Communist categories. It is all the more distressing that this flagrant over-simplification by the Foreign Editor and Assistant Foreign Editor of the *New York Daily Worker* should be trumpeted forth over here as the book on Spain.

The authors begin, appropriately enough, by focusing attention on the land question, without a settlement of which democratic and social progress is impossible; but a later chapter discussing it in some detail is disappointing and inadequate. Other chapters give a tolerably clear picture of the different elements constituting the background of the present bloody assizes. But there is no "history of the civil war," and, since the authors have evidently never developed

any feeling for Spain's spiritual climate, the whole never rises above the level of competent book-making. The style is insipid, not to say irritating—unless one likes Marxian *clichés* such as accompanied the early Soviet films. And there are a number of more or less important inaccuracies. To say, for instance, that "Premier Lerroux would not enforce measures prohibiting religious education" obscures two important facts: (1) that the lay State, as set up by the 1931 Constitution, does not prohibit religious education but only ordains that it shall be carried on outside the State schools; and (2) that Señor Lerroux, though fiercely anti-Socialist, was a life-long anti-clerical, and made definite efforts to resist the pretensions of the Catholic forces.

"Saving and Investment." By W. E. Armstrong. George Routledge and Sons. 270 pages. 12s. 6d.

In this book Mr Armstrong sets out a theory of capital in a developing community from which he attempts to deduce an ideal monetary and banking policy for the real world. Starting from slightly different assumptions, he arrives at a theory of capital almost identical with that of Professor Hayek. Capital, to put it briefly, in no way depends on money, and is to be measured by an amount of labour expended on it and a "period of production." The exposition of this theory is at many points very tedious and obscure. In no place does Mr Armstrong give a really clear definition of what he means by "period of production," and his concept of an average period of production is even more mystifying. Nor is there any adequate answer given to the objections of Professor Knight and others to this kind of theory.

It is difficult to understand the exact relationship between Mr Armstrong's barter economy and the real world. His assumption that the introduction of money is merely an addition to an already determinate system is surely untenable. Is a dynamic world of free exchange conceivable without the presence of money, and, even if it is, how relevant would its analysis be to the problems of the world of reality? Indeed, on page 173, Mr Armstrong, having completed his theory of capital without reference to money, has to admit that the existence of money is implied, as it underlies the whole conception of equilibrium development.

The concept of neutral money leads directly to the view that credit policy is responsible for the trade cycle, and that "banking as such must be recognised as an evil." The present banking system should, it is argued, give place to a system of State savings banks, which would neutralise hoarding by the purchase and sale of securities.

In spite of the difficulties and obscurities of most of the book, Mr Armstrong makes some good points which should be appreciated by specialists in economic theory. His emphasis on the inapplicability of static theory to the problems of interest and saving, and his discussion of inventions, deserve special mention. This is no book for the general reader, but professional economists may be interested in a spirited defence of what, in this country at least, has always been a lost cause.

"England Since the Industrial Revolution. 1815-1935." By J. Hampden Jackson. Gollancz. 312 pages. 4s. 6d.

"This book," the author states, "is intended for people knowing little or nothing of English history who want to find out something of the causes of present discontents." The book sets forth in an intelligent and straightforward way the main problems and events of the years 1815-1935. The arrangement and general balance of the book are admirable.

Particularly happy is the blending of economic and political history; though even the simple reader should perhaps be told something of constitutional developments. The author is at his best in his explanation of the effects on the workers of economic and political changes, his description of the reactions of poets and Christians to the Industrial Revolution, his contrasting of early-Victorian doubts and mid-Victorian certainty, and his comments on British educational backwardness in the nineteenth century. Mr Jackson's lucid analysis of Irish history, in a single chapter, is also invaluable. The diagrams are original and instructive.

The book suffers slightly from over-simplification. Englishmen, in 1815, suddenly find themselves living in a new world, and the early-Victorian age dies with Peel. There is also a touch of text-book anecdotalism, typified for instance by the irrelevant mention of Huskisson's sensational death. But even the less simple reader could not fail to be entertained by the story of Raglan, who was so old when commanding in the Crimean War that he always referred to the enemy as "the French." Altogether this is a useful book.

"A Plan for the Distressed Areas." By Lt.-Col. K. E. Edgeworth. Unwin Brothers. 11 pages. 4d.

Colonel Edgeworth suggests that industrialists should be induced to put new factories in the Distressed Areas by the grant of a temporary State subsidy to wages in those areas. His plan is not so far different from Mr Malcolm Stewart's proposal for income-tax and rating relief. It certainly deserves consideration.

MONEY AND BANKING

THE BANK'S GOLD PURCHASE

ON the afternoon of December 15th the daily return of the Bank of England revealed that the Bank had bought £65 millions of gold—the record amount for any single purchase. The Chancellor of the Exchequer, in the House of Commons, described this as a temporary measure, and proceeded to announce that as the step by itself would mean a sharp and unjustified expansion of the credit base he had, at the request of the Bank, directed the reduction of the fiduciary note issue by £60 millions. He refused to explain in public the object underlying these huge and unprecedented operations, but assured the House that their effect would not be deflationary or prejudicial to trade revival.

The gold, obviously, can only have been purchased from the Exchange Equalisation Account, and the mechanics of the operation can be readily described. We may begin by setting out the Bank returns for December 9th and 16th:—

	Dec. 9th	Dec. 16th	Intervening
Issue Dept.:	£ mill.	£ mill.	Change
Gold	248.7	313.7	+ 65.0
Fiduciary issue	260.0	200.0	- 60.0
Note circulation	458.9	467.7	+ 8.8
Notes in reserve	49.8	46.0	- 3.8
Banking Dept.:			
Securities, etc.	110.7	116.6	+ 5.9
Reserve	50.5	46.6	- 3.9
Public deposits	17.5	10.4	- 7.1
Bankers' deposits	87.0	96.2	+ 9.2

On balance, there has been an expansion of £5 millions in the credit basis, but at the moment this has been more than absorbed by the week's increase of £8.8 millions in the note circulation, so that the Reserve has dropped by £3.8 millions. An increase in the Banking Department's securities and a drop in public deposits—both routine movements unconnected with this week's gold operations—explain the rise of £9.2 millions in bankers' deposits. All that can be said is that the gold operations only affect the Banking Department to the extent of £5 millions. Without them the Reserve would have been £5 millions lower, and in the absence of any changes elsewhere bankers' deposits would have been £5 millions less than they actually were on December 16th. Incidentally, valued at 140s. per ounce, the Issue Department now holds £517 millions of gold, equal to a 111 per cent. cover of the note circulation. Also this week's purchase was, at its full market value, £108 millions, so that the Exchange Equalisation Account has had to stand a loss of £43 millions in sterling.

The absence of any substantial change in bankers' deposits traceable to these operations shows that Mr Chamberlain was justified in describing them as non-deflationary. It is easy to detect their *raison d'être*. Last May we made a tentative attempt to assess the amount of gold then held by the Exchange Equalisation Account. We hazarded the guess that between January, 1935, and May, 1936, the Account had acquired about £150 millions of gold, but could find no reason to believe that the Exchange Equalisation Account was congested with gold to the point of discomfort. We pointed out, however, that the Account had a statutory limit of £375 millions, plus its accrued profits to date, and that at the contemporary rate of progress that limit might be reached at no very distant date. Since then the Account has admittedly made heavy sales of gold to the Bank of England, whose gold increased by £43 millions during the summer. But the Account must also have bought large quantities of gold from France. Since the devaluation of the franc there has been no considerable repatriation of French funds from London, but the Account may have sold gold to Holland. On the other hand, the Account has been requested to buy £38 millions of French gold during the past few weeks in order to cover the repayment of the French Government credit of £40 millions last February.

It is quite possible, therefore, that the Exchange Equalisation Account has lately become uncomfortably full of gold. If so, there were only two ways of obtaining relief. The first was the statutory enlargement of the Account by fresh legislation similar to that of 1933. The second and simpler way (for which there was equally a precedent in 1932 and early 1933) was that the Account should re-sell some of its gold to the Bank of England in exchange for Treasury bills. That expedient has, in fact, been adopted.

The effect on the money market will be very small. If the Treasury bills held in the Issue Department are normally acquired through the "tap," the Exchange Equalisation Account will in future apply for these £60 millions of bills through the "tap" and the Bank of England will cease to do so. If the bills were "tender" bills then, admittedly, there will be a gradual reduction of £60 millions in the "tender" issue (equal to £4.6 millions a week) and an increase in the "tap" issue. On the other hand, the Bank will eventually be tendering for £60 millions less of bills (equal, similarly, to just over £4 millions a week). The supply of and demand for Treasury bills at the weekly tender will be reduced *pari passu*, and the quantity of bills circulating in the market will remain unchanged.

On the other hand, once the Christmas currency has returned from circulation there will be an increase of £5 millions in the Bank's Reserve. Unless the Bank reduces its securities in the Banking Department, or unless public or "other" deposits are increased, this will cause an equal increase in bankers' deposits. To that limited extent credit will be easier, and the operation will be inflationary. There is, however, another possibility. It is not easy to interpret the relevant Act of 1928, but our own belief is that as long as the fiduciary issue does not exceed £260 millions, it can be raised in the direction of that limit by administrative action without the need for new legislation. For example, in a few weeks' time, the fiduciary issue might be raised from £200 millions to £215 millions. To do this, £15 millions of securities would be transferred from the Banking to the Issue Department, in exchange for £15 millions of notes to be added to the Reserve. Fresh Treasury bills could be acquired by the Banking Department to make good its surrender of securities. Whether these new bills were bought in the open market or taken up direct from the Treasury, the result would be an inflationary increase in bankers' deposits and the joint-stock banks' cash.

We stress this possibility for various reasons. One is the possible absence of Parliamentary control so long as the total fiduciary issue is not raised above £260 millions. The next is the fact that, whether or not the trade cycle has reached the stage of incipient boom, the demand for banking credit is certainly beginning to take up a larger part of the present supply. This last fact is suggested by the past year's growth in Bank advances, by the October drop in the Banks' cash ratio to just below 10 per cent., and by the more general fact that firmer money rates have appeared from time to time, as a result of causes which in earlier years might have passed unnoticed. Finally, given eventual trade recession as long as possible, and the prospect of heavy expenditure on re-armament, the Government may at least be tempted, sooner or later, to view complacently some expansion of the supply of banking credit.

This risk is at the moment hypothetical, and apart from it we can say unhesitatingly that these operations represent a normal, natural and proper working of the new monetary system evolved by us since 1931. Several times during the past year we have argued that the real function of the Exchange Equalisation Account is to act as a buffer between international movements of funds and our internal trade and credit. To-day it so happens that the Exchange Account cannot by itself withstand the shock, and so

the fiduciary note issue is being introduced as a subsidiary buffer. This procedure is to be commended, for it adds elasticity to our monetary system, and there ought to be nothing sacrosanct about the normal fiduciary issue of £260 millions. We go further than this. If Continental funds are repatriated from London, then the time may arrive when the Bank of England ought to replenish the Exchange Account's gold stocks, which will have been depleted by the Continental withdrawals. In that event, the Bank should surrender its gold freely and the fiduciary note issue should be increased; and this should happen without any disturbance to public opinion. We hope that Mr Chamberlain had this possibility in mind when he used the expression "temporary measure." We agree that its adoption shows that we hold unprecedentedly large gold reserves to-day, but we do not see that any inconsistency will have been established even if we begin to lose gold within the next few weeks and have partially to reverse this week's operations. The one danger of the greater elasticity implied by such movements is its possible abuse, and this must not be overlooked, especially at the present state of the trade cycle. With this reservation, we regard this week's gold operations as evolutionary in character. But we stress the fact that those responsible for our new and more elastic monetary machine must be able and willing to drive it properly.

FINANCIAL NOTES

The New French Loans.—The French Government have now bowed to the inevitable and have recognised that so long as penal taxation is imposed on the repatriation of privately-owned gold, no gold is likely to be repatriated. Last Wednesday M. Vincent-Auriol announced the revocation of the instructions, given to the French banks just before devaluation, to discourage all transfers of capital. Henceforward, all exchange dealings, both spot and forward, will be free. This liberty applies not only to capital movements but to investments. M. Vincent-Auriol then announced two new Government loans. The first is an exclusive offer to gold hoarders. They may subscribe in gold, on the basis of the old parity of Fr. 1 per 65.5 milligrammes of gold, but their scrip will bear interest at 3½ per cent. and will be redeemable at a premium of 40 per cent. in three years' time. By way of a further psychological appeal, all subscriptions and payments may be made anonymously, while owners of gold are not bound to tender it exclusively as subscriptions to the new loan, but may pay all or part of their gold to the Banque de France in exchange for a certificate. The second loan is offered exclusively to the holders of the baby bonds issued last July and August, who have since had the legitimate grievance that devaluation followed hard on the heels of the baby bond issue. They are now invited to convert at par into a new 4 per cent. loan redeemable in nine years' time at a premium of 40 per cent. On the whole, this represents a fair compromise between the political arguments against profiteering from devaluation and the more practical arguments in favour of offering some inducement for repatriation, but doubts are already felt if the inducement will prove sufficient. Also no offer has yet been directed towards the large hoards of French currency. In view of the urgent needs of both the Treasury and French industry for fresh funds, this week's offer may prove to be only the first movement of the Government.

Empire Trade with Germany.—With the object of developing trade in both directions between Germany and the British Empire, a new company has been formed in London under the aegis of two leading firms of merchant bankers, and with the title Compensation Brokers, Limited. The new company has a nominal capital and will act purely as an intermediary, being remunerated on a commission basis. The initial procedure will be to establish contact between a potential German exporter of, say, machinery, and potential buyers in the Dominions. Through the co-operation of the German authorities it may prove possible to make use of various blocked mark

accounts and to arrive at a price acceptable to both buyer and seller. Once this outward transaction is arranged, the company will proceed to arrange for a German purchase of, say, raw wool, and again steps will be taken to ensure that while the German importer pays an acceptable price in marks, the Dominion shipper receives the full world price in his own currency. Blocked mark accounts may again be used, but this time in the contrary direction. On balance, therefore, there will be no unfreezing of blocked marks, and the whole object of the scheme is to create new trade and not to liquidate past debts. The promoters of the scheme undertake that no export business will be diverted to German industrialists which might otherwise have come to England. They will also refuse to facilitate German imports of such raw materials as are exclusively used for re-armament. In principle, this scheme is worthy of support, but there is no need to warn the promoters of the many dangers and difficulties that can arise in connection with trade on a compensation basis financed by some form of aski-marks. Dr Schacht knows all there is to know about this form of trade, of which, indeed, he is the inventor. It may also be assumed that Mr Eden knew about the scheme when he said at Bradford on Monday that we cannot be expected to render help to others, either in the economic or financial sphere, if the only result of our action is to be a further piling up of armaments. The City shares this view very strongly, and this is another warning which the promoters of this new scheme should bear in mind.

The Foreign Exchanges.—It has been a fairly quiet week in the foreign exchange market. The main feature has been the strength of sterling following on the reduction of the fiduciary issue. Over and above this, however, the dollar has latterly been displaying a weakness of its own, and during the week the rate has moved from \$4.90½ to \$4.91½. As far as can be ascertained, nearly all the selling pressure has come from American sources, and there has been a general lack of buyers. The outward flow of francs has continued, but with the Control intervening the rate has not moved very much. Forward francs have been irregular and on occasion have moved out as far as Frs. 2½ discount for three months. Guilders, too, have been held by the Dutch Control and have moved narrowly between Fl. 9.02 and Fl. 9.00. There have been substantial dealings in guilders for the covering of forward positions falling due. On Thursday evening, however, the breakdown of the Anglo-Spanish Clearing Agreement was officially announced, and a Treasury order has been issued to the effect that debts due on goods imported into the United Kingdom after December 19th are not payable to the Anglo-Spanish Clearing Office.

The Money Market.—Money has been usable every day of the week, although nothing like stringency has developed. The Bank return shows an increase in bankers' deposits which has relieved the pressure on the banks' cash resources. Bill brokers have been good borrowers from the clearing banks, but one or more of the clearing banks has called on each day of the week.

	Nov. 26, 1936	Dec. 3, 1936	Dec. 10, 1936	Dec. 17, 1936
Bank rate.....	2	2	2	2
Clearing banks' deposit rate ...	1	1	1	1
Short loan rate:—				
Clearing banks	1-1*	1-1*	1-1†	1-1*
Others	1	1	1-1	1-1
Discount rates:—				
Treasury bills	1	1	1-1	1-1
Three months' bank bills	1	1	1-1	1-1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

† This week's rates were 1-1; 1-1; and 1-1½ per cent., for the three classes of loans, respectively.

Discount rates are firm, but they eased slightly on Thursday owing to the psychological effect of the Bank's gold purchases. The banks are not buying bills freely, and the effective rate for three months' bank bills is now practically 1½ per cent.

THE STOCK EXCHANGE

COTTON TEXTILE SHARES

Two articles published in *The Economist* of November 21st and 28th sounded the hopeful note that, during the depression period, Lancashire had progressed further with the process of adjustment than was generally realised. A measure of recovery, it was suggested, is in sight, given favourable conditions. The Spindles Act of 1936, which aims at elimination of surplus plant, is one contribution. Within the last few days the Egyptian section has obtained the necessary majority for a price agreement, backed by statutory force. Elimination of redundant plant and the maintenance of "economic" charges are being sought by the finishing section. Even a partial revival of export trade is not impossible. Although a wage dispute threatens in the spinning section, there is hope that settlement may be achieved without serious damage to the industry. Wages in this section account for about 50 per cent. of total costs, and in the weaving section for about 70 per cent. A 10 per cent. increase in wages, which is somewhat more than the present demand, would therefore increase spinning and weaving costs by about 5 per cent. and 7 per cent. respectively. Since the objective of the spinning section is to increase its margin by about 20 per cent., a moderate increase in wages would not impose a serious burden on recovery.

It must not be assumed, however, that Lancashire can envisage a recovery comparable with that of other post-war cripples—the steel, engineering and shipbuilding trades. Lancashire produces consumption goods which cannot enjoy an expansion of demand comparable with that of the capital goods trades. Her industry is still dependent on export markets for more than 50 per cent. of its piece-goods output, and must compete fiercely to retain those markets. Finally, it has yet to be seen whether the recent increases in spinning margins, and the similar increases at which other sections are aiming, will be maintained in the face of competition. Lancashire has preserved her relative share of the world's total cotton trade by allowing her prices to fall to the level demanded by competition. The Spindles Act and analogous redundancy legislation was designed mainly to reap the economies of full-time running of plant, and also to avoid the excesses of price-cutting. If, however, the trade uses its new powers substantially to increase its charges, overseas competitors may steal away the benefits otherwise obtainable. A skilful gradation of charges may concentrate the increases in the home market, and in Empire markets where Japanese competition is controlled by quotas. By this means lower prices could be quoted in free markets, and a net advantage would result—for a time at least.

Our recent general reviews of Lancashire's prospects showed that the American, or coarser, section of the spinning industry was now among the more hopeful departments. To the general investor outside Lancashire, this section offers only one substantial investment: the debenture stock of the Lancashire Cotton Corporation. This must be considered among the most promising of the Lancashire recovery holdings. Under the scheme which was recently approved, the existing debentures are to be converted as to 75 per cent. into a new 5 per cent. debenture, and as to the remaining 25 per cent. into a 5 per cent. preference stock which carries an option to convert into ordinary shares at any time up to March 31, 1951. By this means, investors obtain access to the equity of the chief American spinning concern. For the six months to April 30th last, profits amounted to £59,247, before depreciation or interest on the existing debenture stock, equivalent to nearly £120,000 in a full year. Depreciation at 5 per cent. on the Corporation's written-down assets would now require some £160,000 a year. It would appear, therefore, that a relatively modest improvement in the difficult conditions prevailing to last Spring would enable the Corporation to cover its costs, including a moderate depreciation

charge. The whole of the "recovery equity," accordingly, lies with the new debenture and share capital. The present output of the Corporation is not known, but when the original prospectus was issued in 1931, it was stated that, in full production, the mills would turn out some 300,000,000 lbs. of yarn annually. The Corporation then controlled 6,000,000 spindles, a total since reduced to 5,000,000. It would not be unreasonable, therefore, to assume a present potential output of some 250,000,000 lbs. of cotton. Consequently, if by economies of full-time working and by a modest increase in the margin, profits per lb. were increased by as much as a farthing, the annual addition to profits would exceed £250,000. In fact, the recent addition to margins has substantially exceeded a farthing, but part will be required for higher wages and part may prove transient. Nevertheless, additional profits of £250,000 a year would provide full debenture service, including sinking fund, which is not due to begin until 1942. In addition, such earnings would cover full preference dividends, leaving 5 per cent. on the ordinary stock. By the capital reorganisation the Lancashire Cotton Corporation has thus brought itself within reasonable expectation of dividends. It is not impossible that vigorous recovery would produce very satisfactory distributions. The capital valuation per spindle or per lb. of output is now well below the average for the industry. If the current offered price of about 88 can be considered to include £75 of the new 5 per cent. debenture stock at par, the balance represents a price of 51 for the new preference stock. At this level the stock clearly has possibilities.

The fine spinning section of the trade is already well known to investors through the great amalgamations. Among them Fine Cotton Spinners and Doublers stands out. Though the late-maturing troubles of the trade brought sudden depression upon Fine Cotton Spinners about 1929-30, and has uncovered both preference stocks since 1931, the Association has been able to provide £100,000 for depreciation each year, which, though its adequacy is questioned by the auditors, has sufficed to fend off the formidable arrears of depreciation which weigh on all other sections of the trade. Stocks absorb a large proportion of working capital, but the liquid position is good. In this connection it may be observed that as the fine spinners are denied, in the Egyptian market, the facilities for hedging which exist in the American market, they may now hope, on rising prices, to make inventory profits, as some compensation for the losses of previous years. Neither the Association, nor any other public company in the trade, can offer a capital-to-output ratio comparable with that of the reorganised Lancashire Cotton Corporation. Nevertheless, an improvement of ½d. per lb. in the Fine Spinners' margin would probably cover adequate depreciation and preference dividends. At 14s. 9d. and 10s. 9d. respectively the two preference issues, each of which carries arrears of 4s. 2½d. net, offer much better stakes in Lancashire recovery than does the ordinary stock at 10s.

The manufacturing section, so far as it is open to investors, is represented mainly by specialists. These concerns include such excellent producers of branded goods as Barlow and Jones, and Tootal Broadhurst Lee. Both can show an unbroken dividend record throughout the depression. Both will no doubt benefit from a general revival in Lancashire, but in each case current share prices appear to accord full recognition to that possibility. The manufacturing section, however, does include one bargain-hunter's share, the 7 per cent. cumulative preference of Joshua Hoyle. At the end of the present scheme of arrangement, a year hence, some £150,000 will be due to debenture holders. But throughout the depression the company has been able to avoid serious losses. The business is predominantly in the home trade, and the ~~last~~ chairman's

speech showed that the company has a distinct interest in the redundancy schemes.

Other characteristics are shown by the group of textile finishers. Like the fine cotton spinning section, this group includes a number of old-established and well-known combines of the first magnitude. Their trade is almost entirely on commission, so that large sums are not absorbed in stocks. Consequently, the liquidity of each of the leaders is good, and in the case of Calico Printers may be fairly described as excellent. There is no doubt that if future earnings were forthcoming they would be distributed. But during the early 'twenties the finishing trades were making profits, on a smaller volume of business, substantially higher than those of pre-war days. It might, therefore, be unwise to judge recovery possibilities by the super-normal profits of the middle 'twenties alone. Moreover, the yardage of business available has fallen steeply and permanently since those days. The following table shows, as a percentage of the 1924 level, the yardage of goods now finished in each of the three sections of the trade, the average charge made, and a combined index to include the two movements:—

	1924 = 100 Yardage Index	Charges Index	Combined Index
Cotton piece goods:			
Bleached only	52	85	44
Dyed only	87.5	61	53
Printed	76	71.5	54

It would appear that the bleachers offer the smallest prospects of revival, while dyers and printers have preserved a higher proportion of their volume, and have apparently more room for raising their charges. Investors may conclude, therefore, that of the "recovery" stocks Calico Printers is most promising, with the preference stock standing at 13s. 9d. cum 1s. 1½d. net of arrears. Bradford Dyers preference standing at 12s. 6d. cum 3s. 0½d. arrears has also possibilities, while Bleachers preference standing at 12s. 9d. cum 2s. 11d. net of arrears should probably be ranked after these two. The ordinary issues of these concerns appear to be priced too highly by comparison with the preferences. The group also includes two stocks of investment standing, British Cotton and Wool Dyers 5s. ordinary shares, and Yorkshire Dyeing and Proofing 10s. ordinary shares. As the above table shows, both stocks offer a fair yield at present prices.

Recovery in Lancashire, however, is still "just around the corner," rather than an accomplished fact. But the improvement in the basic factors which determine the profitability of all sections of the cotton industry is slowly making itself felt. No reasonable investor can anticipate a return to the classical prosperity of pre-war days, nor a recovery as steep and spectacular as that of the steel industry since 1932. If, however, the coming year gives further evidence that Lancashire is translating the promise of recovery into fact, the opportunities outlined in this article may kindle the market's interest in our last remaining depressed industry.

SECURITY : STABILITY : STRENGTH

SPREAD YOUR RISK by spreading your money, is a sound maxim for all investors.

Through any of the Unit Trusts of the well-known "15 Moorgate"

Group, investors can do this with maximum convenience and maxi-

mum safety, securing at the same

time a good return on their

capital. More than £10,500,000

has already been invested in

Trusts of this Group by small

and large investors in amounts

of from £20 to £25,000: evi-

dence of their soundness and

universal popularity.

Reserve Funds of over £175,000

have been deposited with the

Trustees of the Trusts in the

"15 Moorgate" Group to provide

for their future operation.

INVESTMENT NOTES

After the Crisis.—After a display of exemplary fortitude in wholly unprecedented circumstances, the Stock Exchange accepted the abdication of King Edward VIII with personal regret, and the accession of King George VI with profound thankfulness. Appreciation of the former King's strength of will merely increased the House's relief that all danger of a clash between Crown and Parliament had passed. The recovery in market sentiment was attested by a rise in the *Financial News*' Ordinary Share Index from 119.1 on December 9 to 122.6 on December 16th, but the Index is still appreciably below its peak level of 124.9 a month ago. Professional operators do not like the three weeks' Christmas account, and investors are waiting for the inevitable batch of New Year diagnoses and forecasts before taking more definite steps. The general situation is far more complex than it was a year ago. In a world of changes two things stand, at the moment, like stone. One is the persistent rise in primary commodity prices; and the other is re-armament. The boom in commodities is, in a sense, the fulfilment of what has been the Government's avowed policy ever since Ottawa. And, under the present dispensation of world trade, it may be the most effective of all means of bringing about a revival in British exports. But investors are not entirely convinced that the various restriction committees have the power—even where they have the will—to function as effective sky-pilots. And at home the possibility of rising costs provokes two reflections. Would it not have been more considerate of the pace-makers in the European arms race so to have timed the firing of the pistol that re-armament activity and trade activity should not collide on the straight? And will the rise in prices, if prolonged, have any repercussions on the rate of interest, and on the levels of gilt-edged stocks?

Railway Rebates Loan.—The Railway Freight Rebates Fund loan issued by the Railway Clearing House this week closely follows the general lines suggested in *The Economist* of November 28th. The "insolvency" of the Rebates Fund to meet the railways' over-payments of rates, for which the issue provides, has been analysed in detail on earlier occasions. Its solution has afforded the corporate investor one of the most interesting securities of recent times. The loan consists of some £9,300,000 of 2½ per cent. stock, redeemable between 1937 and 1952, and offered for sale at 94 10s. per cent. Its immediate attraction, therefore, is a flat yield of £2 12s. 11d. per cent., and redemption yields of no less than £3 5s. per cent. to the average date of repayment 8½ years hence, and £2 18s. 9d. per cent. to final redemption. Loans of such short effective life, issued at a significant discount, are all too few for the market's needs. Further, the application of a cumulative sinking fund at the high rate of 5.12 per cent. implies repurchase on such a scale, so long as the stock remains below par, that fairly prompt appreciation in the stock towards that level is reasonably to be expected. In terms of security, the stock will rank as one of the best non-trustee issues extant. Its service is covered by the railway companies' payments into the Railway Freight Rebate Fund, which are obligations ranking among their working expenses and are treated as payments of rates. On the basis of the contributions fixed for the 1936-1941 quinquennium, the annual requirement for interest and sinking fund (£708,807) will be met more than three times by the annual sum of £2,330,000 payable by the companies into the Fund during the period. The loan, therefore, appears to be more than adequately covered, except on the supposition that two-thirds of the income of the fund is likely to disappear. This, however, can be ruled out as a practical consideration, for even where the railways' rating assessments would be reduced to nil, on the strict letter of the law, the companies concerned have agreed to reasonable assessments. The companies themselves have applied for £4 millions of the issue on underwriting terms. Incidentally, as this procedure will postpone the repayment of nearly two-fifths of the sums due to the companies, it may provide a clue to their intentions over the allocation of the total repayments between reserves and dividends to stockholders.

Industrial Profits in November.—Industrial profits continue their advance, and the reports published in November show a rise of 13.49 per cent. over the previous year. As in October, this rate of improvement is less steep than for 1934-35, but the trend of the percentages is not yet conclusive. It suggests only that recovery has become more general, and less dependent on a smaller number of outstandingly good results. The following table shows the rise in profits for the past seventeen months:—

Reports published in	No. of Companies	Rise in Profits*	Reports published in	No. of Companies	Rise in Profits*
1935—			1936—		
July	232	13.44	March	236	17.39
August	38	5.93	April	254	9.66
September ..	77	9.28	May	269	9.41
October	166	29.19	June	214	13.50
November ..	160	17.47	July	228	15.69
December	159	12.27	August	47	14.21
1936—			September ..	107	12.32
January	128	13.66	October	146	18.09
February	205	9.00	November ..	177	13.49

* After payment of debenture interest.

The total net profits covered by the November reports amounted to £15,591,516, compared with £13,737,907 for the preceding year. Of this increase iron, coal and steel, and the motor and cycle industries together account for £1,043,781. Textiles are still not sharing in the general trend, but the month's loss was due entirely to the disappointing British Celanese results. Rubber companies, while making only the usual modest contribution to the total, now reveal a more uniform improvement. The total profits include no less than £3,782,949 from 23 breweries, though this represents a net increase of under £260,000.

Building Society Reports.—Recently published building society reports show an increase in advances, though the results are now being presented with a word of caution. The directors of the National Building Society point out that a record expansion cannot take place every year, while those of the Woolwich Equitable Building Society refer to growing competition among the societies and also to the prevailing low interest rates, which seem likely to continue. The National Building Society's warning is merited, for the increase of 35 per cent. in advances—from £5,259,422 to £7,126,396—during the latest year cannot be repeated indefinitely. Out of a balance of profit amounting to £1,159,806, interest absorbs £853,479, while £291,303 is placed to reserves. The report refers to the growing demand for houses encouraged by rising wage distributions, which may be expected to contribute to the spread of improved housing conditions and ownership in the lower income groups. The Woolwich Equitable Building Society, on the other hand, records a slower rate of progress. Advances totalled £7,462,762, compared with £7,158,855 in 1934-35 and £6,403,957 in 1933-34. The "C" shareholders have been notified that in view of the low interest rates now obtainable, the additional bonus must be discontinued in the coming year. Some diminution in the volume of business is foreshadowed in the directors' report. It is satisfactory that the building society movement is considering its policy in the light of present indications that some decline in residential building is approaching. Industrial building progress continues, but the value of plans for dwelling houses approved in the first nine months of this year amounted to £57,090,000, showing a reduction of nearly £800,000 compared with the corresponding period of 1935. The problem of providing additional business for the building societies may shortly become very relevant.

Actuaries' Investment Index.—The general recovery in the market this week is reflected by a rise in the Actuaries' Investment Index of 178 industrial ordinary shares to 89.9, compared with 89.3 a week ago and 91.6 at the time of the mid-November boomlet. These indices are based on end-1928 prices. The corresponding yield figures are 3.70 per cent., both this week and last, and 3.54 per cent. a month ago. A selection of component indices is given on the next page.

Group (and No. of Companies)	Prices (December 31, 1928 = 100)			Yield (%)		
	Month ago (Nov. 17, 1936)	Week ago (Dec. 8, 1936)	This week (Dec. 15, 1936)	Month ago (Nov. 17, 1936)	Week ago (Dec. 8, 1936)	This week (Dec. 15, 1936)
Building materials (5)	107.4	103.0	104.9	4.67	4.88	4.79
Coal (7)	117.6	117.5	118.3	3.07	3.18	3.18
Cotton (6)	48.5	46.7	48.1	1.97	2.00	1.99
Motors (5)	60.9	58.5	59.2	3.70	3.99	3.95
Oil (5)	92.0	88.9	93.1	2.95	3.06	2.91
Home Rails (4)	87.9	80.9	83.4	1.25	1.28	1.24
Breweries & Distilleries (21)	160.5	156.9	159.1	3.73	4.02	3.97

Except for the commodity share groups this week's rise has restored the larger part of the previous week's fall. The oil share index, however, differs from the rest, for it is now at the highest level in many months.

COMPANY NOTES

Boom in Rubber Shares.—The International Rubber Committee is being sorely tempted to believe that the normal processes of supply and demand have ceased to be relevant to the industry. Tuesday's announcement of an average release of 77½ per cent. during 1937 was followed by a jump in the commodity, on Wednesday and Thursday, to 9½d. per pound, and also by eager public purchasing of rubber shares. It proved the signal for heavy buying by consumers, particularly in the United States, who are becoming increasingly anxious regarding the depletion of stocks. Further rises of this order cannot fail to promote the criticism that the Rubber Restriction Scheme, with the very best intentions, is succumbing to temptations which, in a rising market, beset all controlling authorities which consist predominantly of producing interests. Cautious voices on the producing side, indeed, are already stressing the need for moderation. Further rises—always dangerously sharp when stocks are sub-normal as at present—would have a very undesirable effect upon consumption in the long run. Again, in taking a somewhat short view of the potential demand, the Committee may have unwittingly prejudiced the interests of the plantation industry. The latter, indeed, having been given short notice of the 70 per cent. release, has been allowed even less time to arrange for 75 per cent. production from January next. In short, the only immediate safety-valve is the lowering of the export tax on native production. Far more important, however, than any present "squeeze" is the question of future capacity. We urge the most serious consideration by all concerned of the question whether the time has not come for lifting the ban on new planting. If world consumption maintains its long-term trend, a most dangerous deficiency of efficiently produced supplies may otherwise result in six or seven years' time, which no mathematical manipulation of quota percentages will obviate. Meanwhile, no investor will deny that with rubber averaging 9d., costs at 5d., and production at 77½ per cent., the majority of estates would earn highly satisfactory profits. The following table, for typical companies, may be compared with that given in our leading article as recently as November 28th:—

Company (latest accounts all Dec., 1935) and denomination	Estimated earnings, with 70% quota and 8d. price	Prospective rise in earnings on 1d. rise in rubber (70% quota)	Prospective full year's earnings on 77½% quota, 9d. price, as % of equity capital	Share prices		Yield: latest dividend	Potential earnings yield
				Nov. 26	Current		
Batu Tiga.....(£1)	13.2	3.9	18.9	s. d.	s. d.	%	%

The third column gives an estimate of equity earnings on a 77½ per cent. quota over a full year, with rubber at 9d. per lb. Even after the sharp rises of the past three weeks,

estimated earnings yields of less than 7½ per cent. are unusual. Evidently, the industry faces a very satisfactory year, in terms of profits, but these fruits may turn to ashes unless the industry is governed in its real long-term interests.

Commodity Share Rises.—In other commodity share markets, besides rubber, the effects of rising prices have been operative this week. The results confirm the suggestion, now being expressed with increasing frequency, that as the steep recovery in industrial profits gives place to a more moderate rise, owing to increasing materials costs, the stronger forces of appreciation will be felt by producers of primary products. Such considerations have been at work in the base metal share groups and among oil shares. On Monday lead touched a new high level of £26. On Tuesday copper jumped 17s. 6d. to £46, and spelter to £18 12s. 6d., also new "highs" for the recovery movement. Between Monday and Thursday tin jumped from £231 15s. to £236 15s. Some typical base metal and oil share movements are examined below:—

Share (and Denomination)	Dec. 11	Dec. 14	Dec. 15	Dec. 17	Rise this week
Rhokana (£1)	11½	11½	12½	11½	½

One expects to pay a little more for a cigarette of such excellent Quality

one degree less propitious than those of the Rhodesian copper producers. The reduction of the tin quota to 100 per cent. for the first quarter of 1937 has produced no market reactions, since a fall in the total output of the industry is not anticipated. The encouraging prospects for the industry were underlined by Mr C. V. Stephens at the Malayan and Southern Malayan Tin Dredging meetings this week, and recorded with equal confidence in the share market. For oil shares, the bird is still in the bush, and waves of uneasiness on the part of nervous French operators have prevented the major advance which was promised earlier. Yet the market is confidently awaiting the benefits of rising prices for American crude oil. Already certain "independents" have announced price increases, and the major companies are widely expected to follow. Even potential dividend yields, among the leading shares, are, however, little in excess of 4 per cent. and a search for better possible returns, among Trinidad and Ecuadorian issues, particularly, has accompanied the faithful support of the high-priced leaders.

Turner and Newall Prosperity.—This company's accounts take a high place among the year's most impressive reports. Turner and Newall ordinary stock units have been a favourite industrial investment throughout 1936, and the advance from 70s. 3d. earlier this year to the present level of 113s. is fully justified by the results, which received preliminary comment in *The Economist* of November 28th. The rate of increase in the total profits of Turner and Newall (which, incidentally, represent the group's net profits) is 43 per cent., compared with a mere 6 per cent. advance in the preceding year. And even these disclosed results have been conservatively computed. Once again, nearly £260,000 have been provided for depreciation by all the undertakings, and large sums have been spent on maintenance. In this light, the past year's progress, which has produced equity earnings of 22.2 per cent., against 14.2 per cent., is the more impressive:—

	Years to September 30th		
	1934	1935	1936

Like Tube Investments, the company has made a substantial new issue of capital for extending its activities. This is, perhaps, the feature of most interest to stockholders. From the chairman's speech (circulated with the report) it is evident that, in almost every branch, the company's capacity for the home market has been taxed. Asbestos textiles, brake linings, welding products, and asbestos pipes and cement—all these record exceptionally good progress. The company, then, having assured its raw materials supplies, has developed its manufacturing businesses in this country to a high pitch of efficiency. That work is to continue—extensions to the asbestos cement and to the enlarged Rochdale works are already contemplated. But a large part of the new issue proceeds is required for overseas operations. The new Havelock Asbestos property is to be opened up, replacing the Amianthus Mine, which is now nearly worked out. In addition, it is proposed to acquire the balance of the shares (about one-third of the total) and all the bonds of Keasbey and Mattison, which has been completely reorganised since Turner and Newall acquired their

interest in 1934. Thirdly, two additional factories are to be constructed in India. Geographical extension of the manufacturing plants has become, in fact, a leading feature of the company's policy. It is announced this week that British Oxygen has acquired the Turner and Newall interest in Quasi-Arc. Although earnings must inevitably be subject to the swing of constructional activity, expansion is likely to be the keynote for some time to come.

R. M. Realisation.—There have been no dramatic developments in the position of the Royal Mail and Elder Dempster Realisation Companies since we discussed their prospects on February 8th and May 30th last. The market prices of the ordinary stocks, especially those of R.M. Realisation, have, however, risen sharply. At present R.M. are quoted at 62s. 6d. and E.D. at 56s. This rise has undoubtedly been inspired by the improved outlook for the operating company, Royal Mail Lines. In our former calculations, the shares of this company were taken at par. They showed earnings of 6.2 per cent. and paid a dividend of 3½ per cent. in respect of 1935. Although the figures for 1936 may show some further modest improvement, nothing sensational is expected, and the market's optimism has been based largely on the brighter long-term prospects of the shipping industry as a whole. The Argentine Agreement will not particularly help the valuable meat trade of the Nelson Line. On the other hand, increased passenger receipts may follow the holding of the Coronation and the re-engining of the "Asturias" and the "Alcantara," thanks to which the company's "A" ships now take only one day longer to Europe than their German competitors, against four to five days previously. On the other hand, the company must sooner or later face a fairly large rebuilding programme. It was recently announced, for example, that a new ship for the North Pacific route, involving an investment of perhaps three to four hundred thousand pounds, had been put in hand, and it is understood that a new "A" class vessel, which would involve, say, a million and a quarter, is also under consideration. At the date of the 1935 balance sheet, the company had net current assets of £1,305,319, and gross earnings, less outpayments, have added possibly another half million during 1936. On the whole, given the present outlook, an assumed price of par for Royal Mail Lines looks too conservative—though some recent estimates of 35s. or so appear equally wide of the mark on the other side. Even allowing for changed shipping prospects, a price of 27s. would appear fully reasonable. This represents to the R.M. Realisation an extra 7s. per share on 1,040,000 shares directly held and an extra 4s. per share on 1,760,000 shares held by the Nelson Company, representing the surplus over the bills and accrued interest which have to be first discharged. This gives a total increment of £716,000, or 14s. 4d. per share of the Realisation Company. Each additional rs. on the price represents 2s. 10d. per R.M. Realisation share. Incidentally, the Realisation Company's contingent equity in the 1,200,000 Royal Mail Lines shares held by the Meat Transports Company is probably of no practical importance, since the charges thereon, with accrued interest, may well approximate to about 50s. per share.

Indian Investment Prospects.—The issue of first and convertible debentures and ordinary shares by the Indian Iron and Steel Company this week has been eagerly subscribed. Reference was made on page 20 of the Survey of India, published with *The Economist* last week, to the range of Indian investment opportunities open to the British investor, and in particular to the improved organisation of the Indian steel industry, which this merger will facilitate. Although reasons of space prevented the tabulation in our Survey of the results of some of the leading Indian concerns, they show, in fact, an impressive record. Accordingly, we give below the combined profits record of Indian Iron and Steel and Bengal Iron, based on this week's prospectus, the earnings of two leading banking

institutions, a public utility concern, and a jute manufacturing company:—

Company (and date of accounts)	Total profits	Net profits	Ordinary shares				Yield (%)
			Earned	Paid	Price (and denom.)	s d.	
Indian Iron and Steel (Mar. 31) 1934 1935 1936	£ 120,099 171,242 286,441	£ 43,827† 92,793† 175,084†	%	%	Rs. 10	38 0	(a)

* Tax free. † After depreciation, before charging interest. ‡ After management expenses. § Gross. (a) Potential earnings yield, subject to reserves and sinking fund (when inaugurated), 15 per cent. on issue price.

A striking stability of earning power is shown by the two banking concerns represented in the table. The Mercantile Bank of India, indeed, is now disclosing a rising trend in its published profits. Its dividend rate has been maintained at 12 per cent. since 1930. In addition to its Indian business, this institution has branches in Burma and Ceylon, and an important connection with Malayan trade, which has considerably improved during the past year as a result of increased production and rising prices for tin and rubber. Between 1933 and 1935, deposits increased from £12,248,000 to £13,917,000. The "C" shares, which are fully paid, provide the satisfactory return of £3 18s. 6d. per cent. The National Bank of India, after maintaining a 20 per cent. dividend for many years (tax free up to 1930) reduced the rate to 18 per cent. for 1934. Low interest rates, coupled with trade handicaps, contributed to this decision, and in March last the chairman took a cautious view of prospects. The higher yield shown on the bank's shares is largely attributable to their uncalled liability. The present valuation of Calcutta Electric shares reflects, in part, market uncertainty as to the outcome of the Bengal Government's recommendations for reductions in the company's tariff, which would cost £225,000 annually. Meanwhile, the Corporation of Calcutta has given notice, in terms which the directors do not regard as valid, of its intention to purchase certain parts of the undertaking in 1938. The company's progress has continued to be satisfactory, despite depression in the jute industry, which involved a reduction in the dividend of Victoria Jute from 15 to 10 per cent. for 1935.

Argentine Railways and the Peso.—Accompanying the open discussion of the freeing of the peso exchange this week, a minor boom has been staged by Argentine rail stocks and by the shares of companies operating in the Republic. Any step which enables the companies to remit pesos on less expensive terms must be welcomed, provided that the appreciation of the peso is not carried to the point at which Argentina's external trading position is affected. Liberation of the peso would have the greatest significance for holders of the railway stocks. During this year the railways have enjoyed special exchange privileges, whereby they have remitted at a rate 5 per cent. above the official buying rate—representing an effective rate of \$15.75 to the £, compared with over \$17 to the £ in previous years. But their exchange differences since 1931 have consisted of two distinct parts. The first are losses sustained on the year's remittances; the second includes reserve against the depreciation, in terms of sterling, on the net current assets held in pesos. The first category are forever bygone, but already some credits have been taken for the subsequent appreciation of peso current assets, and further credits are to be expected owing to the recent appreciation of the currency. Investors, therefore, may be interested in the magnitudes involved, since substantial sums were first

Preliminary Notice.

KINEMAS LIMITED

(Incorporated in the Union of South Africa)

Authorised. SHARE CAPITAL
£400,000 IN 1,600,000 ORDINARY SHARES OF 5/- EACH Issued or to be issued. £400,000

LOAN CAPITAL
£475,000 5½ PER CENT. FIRST MORTGAGE DEBENTURE STOCK £475,000
£50,000 6 PER CENT. UNSECURED NOTES £50,000

(The principal premiums and interest on the 5½% Stock will be payable in Sterling of the United Kingdom.)

The lists will open and close on Tuesday, 22nd December, 1936, for an

ISSUE OF £475,000 5½ PER CENT. FIRST MORTGAGE DEBENTURE STOCK AT 100 PER CENT.

The Stock is redeemable by a 2% annual cumulative Sinking Fund commencing in 1939 and operating by purchases at or under 102 or drawings at 102%. The Company will have the right at any time after 1939 to redeem the whole of the Stock at 104%.

The Prospectus will show, *inter alia*, that:—

(1) The Company carries on the business of:—(a) owners, through its subsidiaries, of cinema theatres which are let on long leases, and (b) owners of investments in cinema theatres and film distributing companies.

(2) In 1932, to avoid unprofitable competition, the Company and its chief competitors African Theatres Limited and African Films Limited, effected an amalgamation by (a) transferring their entire businesses as going concerns and leasing their respective theatres to African Consolidated Theatres Limited and (b) transferring their film distributing interests to African Consolidated Films Limited.

These two Consolidated Companies own or control the greater part of the entertainment industry of Cinemas, Theatres and Music Halls in Africa south of the Equator.

The Company owns 22 per cent. of the share capitals of each of the Consolidated Companies. The revenue received from them in the year ending 30th June, 1936, was £44,440.

(3) Freehold Properties.

The Company's five subsidiaries own five freehold properties consisting of modern super-cinema theatres with shops and offices, all in prominent positions, in Cape Town, Kimberley, Johannesburg and Pretoria. These five Cinemas are let to African Consolidated Theatres Limited for terms of 40 years from 1st November, 1936, at rents aggregating £45,227 15s. 0d. yearly.

(4) Assets.

The Company's Net Assets total £831,088 sufficient to cover the nominal amount of the Debenture Stock approximately 1½ times. Included in the above Assets are Freehold Properties, Plant, Fixtures and Fittings, which stand in the Company's Books at £565,313 and have been valued at £699,050.

(5) Profits. The auditors' certificate shows the combined profits after depreciation and management, but before charging Income Tax and interest on loans to be repaid or already repaid:—

For the year ended 30th June 1933	£39,310	14 6
" " " " " 1934	58,881	10 6
" " " " " 1935	64,425	6 3
" " " " " 1936	78,397	9 8

The profits for the year to 30th June, 1933, were for the first complete accounting year after the amalgamation.

The above figures show that the profits for the year to 30th June, 1936, amounting to £78,397, are sufficient to cover the interest (£24,937 10s. 0d.) on the Debenture Stock now being issued OVER THREE TIMES.

The Directors estimate that the profits for the current financial year, ending 30th June, 1937, will amount to £83,000 after providing for all management expenses. As a steady improvement in revenue from the Consolidated Companies is anticipated, profits should, in the Directors' opinion, be substantially increased in future years.

Prospectuses and Application Forms are now available from:—

LLOYDS BANK LIMITED, 39, Threadneedle Street, London, E.C.2, or any of its Branches; and from the Brokers,

MYERS & CO., 19, Throgmorton Avenue, London, E.C.2, and Stock Exchange.

charged for the year to June, 1931. The following table, accordingly, analyses the exchange differences of the four principal companies under the two headings:—

ARGENTINE RAILWAYS—ANALYSIS OF EXCHANGE PROVISIONS, 1931-36

Years to June 30	B.A. Gt. Sthn.		B.A. Western		B.A. & Pacific		Cent. Arg.
	Remittances	Floating Assets	Remittances	Floating Assets†	Remittances	Floating Assets	
1931 ...	£ 632,560	430,892	197,039	103,848	430,829	£ 789,915	
1932 ...	527,820	631,657	303,996	Cr. 12,413	476,500	1,013,875	
1933 ...	524,540	249,349	40,277	102,826	182,524	365,480

Total ...	5,421,937	1,489,020	1,569,041	98,193	3,636,039	114,198	5,423,790

* Of which £317,047 for previous years charged to general reserve.
† Includes "Other exchange differences."
‡ No specific provision made. Depreciation amounted to £135,000, June, 1932; £235,000, June, 1933.
§ Provision for exchange differences, including loss on remittances.

It will be seen that B.A. Great Southern has made the largest provision against the depreciation of its peso current assets. The B.A. Western figures under this head include "other exchange differences," and the credits taken into the last two years' accounts leave only a small balance. B.A. and Pacific, similarly, has recouped the major part of the large reserve made in the 1933-34 accounts, while the Central Argentine provision is not specifically analysed.

Relief for the Railways.—In the light of the facts discussed in the preceding Note, investors in Argentine railway stocks may expect relief from exchange losses from two sources. On remittances, a free exchange slightly above their present preferential rate would considerably reduce last year's remittance losses, which for the first six months resulted from an average exchange of rather over \$17 to the £. It may be emphasised, however, that at any "free" rate of \$16.40 or over no net advantage would result. Secondly, the crediting of sums no longer needed against depreciation of current assets will depend upon the present level of these peso accounts and upon the peso rate if and when the exchange is freed and stabilised. Our figures suggest that B.A. Great Southern and, perhaps, Central Argentine, may be the chief beneficiaries, though not, of course, to the extent of the totals shown in the table. These represent depreciation from a parity which will, in all probability, never be seen again. Meanwhile, the apparent safety of the wheat crop is encouraging the liveliest expectations of the second half-year's traffics, and has produced all-round rises in all the stocks—from marginal preferences to wholly uncovered ordinaries. The speculative investor may well confine his interest in Argentine recovery to the former class.

Further Rand Dividends.—The December declarations of the largest of the Kaffir groups, the Rand Mines Central Mining undertakings, prove on the whole slightly disappointing. The cut in the Consolidated Main Reef distribution is more than had been expected, although the payment is above that of a year ago, and makes the total for 1936 substantially higher. The decline in the value of the ore treated provides the chief explanation for the half-year's reduction. In the case of New Modder, the same factor, plus the incidence of taxation, necessitates a fresh cut in the dividend, and consequently the total for the calendar year shows a substantial fall. On the other hand, Durban Deep, by expanding its scale of production, has been able to maintain its dividend rate upon an increased capital. In view of the record returns announced some months ago, a further increase in the East Rand Proprietary distribution was generally expected, but it is not forthcoming, although the year's total compares favourably with that of 1935. Nourse maintains the higher rate declared in June. Rose Deep makes the largest distribution for a considerable time. Reduced capital outlays would appear to account for this increase. While

Crown Mines makes no increase in the preceding half-year's distribution, the total for 1936 is well above that of 1935. The latest payments, with comparisons, are set out in the accompanying table:—

	Dec. 1935	Total 1935	June 1936	Dec. 1936	Total 1936
<i>Rand Mines—Central Mining:</i>					
City Deep	1/-	2/-	1/-	1/-	2/-
Consolidated Main Reef	2/6	4/9	3/6	2/9	6/3
Crown Mines	9/-	17/-	9/6	9/6	19/-
Durban Deep	1/3	2/3	1/-	1/3	2/3
East Rand Proprietary	1/6	2/9	1/9	1/9	3/6
Geldenhuis Deep	2/-	4/-	2/-	2/-	4/-
Modder "B"	1/6	3/-	1/3	1/6	2/9
Modder East	2/9	5/3	3/6	3/-	6/6
New Modder	5/6	10/6	4/3	3/6	7/9
Nourse	2/-	3/9	2/6	2/6	5/-
Rose Deep	-/6	1/-	-/6	1/-	1/6
<i>Union Corporation Group:</i>					
East Geduld	4/6	8/9	4/9	4/9	9/8
Geduld Proprietary	7/3	14/-	7/6	7/6	15/-
Modder Deep	2/-	4/6	-/9	-/9	-/9
<i>Anglo-American Group:</i>					
Brakpan	1/6	2/7½	1/4½	1/6	2/10½
Daggafontein	5/-	8/9	4/9	5/-	9/9
Springs	1/6	2/8½	1/2½	1/5½	2/7½
West Springs	1/-	2/-	1/-	1/-	2/-

Among the Union Corporation companies, the two Gedulds merely maintained their June rates, but the aggregates for the current year show an appreciable increase. Since Modder Deep is now in liquidation, no further dividends can be declared. Future returns to the shareholders will consist of winding-up distributions. For purposes of record we set out the distributions of the Anglo-American group, outlined in last year's issue.

Diamond Dividends.—At one time optimistic market quarters were hoping that the whole of the accumulated arrears on De Beers preference, amounting to £4 per share, with the 10s. due for the current half-year, would be cleared off in one payment. The actual payment of £3 announced last week, however, satisfies more recent expectations and leaves only 30s. in arrears. Provided the diamond trade continues its recent progress, payments should be brought up to date in June next. Cape Coast Exploration, which operates in the rich field of Namaqualand and is associated with De Beers, has announced a dividend of 10 per cent. with a bonus of 15 per cent., compared with only 7½ per cent. for each of the two preceding years. Another company in the group, Consolidated Diamond Mines of South West Africa, has declared a half-year's dividend on the 7½ per cent. cumulative preference shares, payable on February 15th. The satisfaction of 4½ years' arrears was announced towards the end of October and shareholders will receive the amount due on December 28th.

Other Company Results.—The reports of 44 other companies are analysed on page 615. Recent brewery results include substantial improvements by *Leeds and Wakefield Breweries*, with profits of £73,360 against £52,112, and by *Newcastle Breweries*, whose dividend is raised from 9 per cent. to 11 per cent. The net earnings of £164,901 reported by *H. and G. Simonds*, however, show a small increase of £2,457 only. *Cleveland Bridge and Engineering* have recorded a setback, a loss of £10,785 (before the transfer of £15,000 from reserve), comparing with profits of £9,996. The results of *Duffield Coal Products* are again disappointing, but *Shotts Iron* have increased their profits by no less than 189 per cent. to £74,425, and are recommencing dividends with a 2½ per cent. payment. For the first time since 1929 *Guy Motors* are also paying a dividend. The 7½ per cent. distribution is made possible by the conversion of a loss of £26,347 into £8,624 profit. Losses on contracts, due partly to damage and also to work undertaken at low prices, have saddled *Constable Hart* with a loss, for the fifteen month period, of £54,076. Although *Agar Cross* have made a profit of £21,590 against a loss of £95,407, provision has also been required for exchange differences of £69,305, but the effective improvement for the year is still as high as

SETTLING DAYS

TICKET JANUARY 5 | ACCOUNT JANUARY 7

In a week of general recovery, the chief honours have gone to commodity shares. The "House" opened with a new spirit of confidence on Monday, and after the fervent singing of the National Anthem to roll of drum and fanfare of brass, prices made an immediate response in almost every section of the market, and rested about mid-afternoon well content with the day's recovery. The emphasis on commodity issues was suggested from the first, however, by the sharp rise in oil shares. On Tuesday, base metal issues joined the circle, and by mid-week a boom in rubber shares was in full swing, which continued on the following day. Rising material prices, therefore, have been the major factor in the week's dealings, and are discussed in some detail on pages 578 and 593.

Gilt-edged, after a steady opening, later turned slightly easier, and business remained restricted until the import of the Bank's gold purchase and the strength of the £ seized the market's imagination. Home Corporation scrips tended to improve, although dealings were not wide. Livelier conditions, indeed, were witnessed in the foreign bond market. The detention of General Chiang Kai-Shek produced a sharp fall in Chinese bonds, and the market remained uneasy and subdued when rumours and counter-reports from China were later received. Brazilian bonds opened the week in active style and remained prominent. It was significant that demand spread from the Funding issues to the more speculative bonds in lower grades. With the exception of Czechoslovakian 8 per cents., European issues remained quiet.

Home Rail stocks were subdued. The opening tone was firm, with Great Western higher, but second thoughts on the cost and labour outlook produced quiet conditions. Apart from support for Southern preferred, fractional losses were general, although prior charges remained firm. A partial recovery in London Transport "C" stock was recorded. Argentine rails, however, opened with a semi-boom, stimulated by rumours of the freeing of exchange control. The ordinaries no less than the marginal preferences enjoyed substantial gains, and although the movement received a check through quite natural profit-taking on Wednesday, the firmness of the market was in no degree impaired. On Thursday, Central Argentine 6 per cent. preference made a further advance to 89.

Business in the industrials market has not been active, but the tone has been cheerful. Prices were firm in the iron and steel section on the increased steel production, and Tube Investments and Stewarts and Lloyds profited from reports of good progress in negotiations for a new Tube Cartel. In mid-week, William Beardmore were prominent on talk of reconstruction plans. The terms of the Dorman Long issue were in accordance with market anticipations. In the aircraft section, Handley Page went ahead on good production reports, but prices became a little irregular later. Standard were in demand in the motor group on trading reports, and Triplex on bonus hopes. Electrical equipment shares were in good demand, although Crompton Parkinson weakened slightly later.

Brewery issues still proved attractive, with Distillers prominent, and in the tobacco group Carreras "A" were supported early in the week. The Stores group became firmer later, although Woolworth lost a little ground. The miscellaneous industrials section showed an all-round improvement in mid-week. Building material and general engineering issues were all firmer. Turner and Newall were supported after the report was published, and promptly regained a slight reaction.

Dealings in oil shares were brisk at the beginning of the week, but interest was not maintained at the same level. The leading issues were all in demand, and Shell went ahead to new high levels on hopes of resumed interim dividend payments. Reports of a strike on Venezuelan Oil Concessions property put the shares down. French sales in mid-week

Investment For Appreciation

produced easier conditions, but shares were well held on the decline. The rubber shares market was dominated by the decision of the International Committee to fix next year's export quotas at 75 per cent. for the first quarter and 80 per cent. for the second. The commodity price jumped rapidly, and in mid-week there were very active dealings in rubber issues, with some substantial price increases. The tea shares market was dull throughout.

Kaffirs were firm at the beginning of the week, and on Cape support West Witwatersrand shares went ahead to new high levels. Interest was well maintained throughout the week by the encouraging outlook as shown by recent dividend declarations. Venterspost were among the leaders. There was a slight improvement in the West African section, which remained firm, but changes were not of much importance. Rhodesian copper issues were firm at first, but declined later on profit-taking, and came on offer in mid-week. Tin shares improved rapidly on the outlook for the metal and the rising price.

Conditions on the Paris Bourse at the beginning of the week were affected by the Far Eastern troubles, and by Government action at home. Later the tone became much brighter on the terms of the new Government loan. At Berlin industrial shares made good advances in the opening days of the week, while in Amsterdam rubber issues continued to be the outstanding feature.

NEW YORK STOCK EXCHANGE

The uncertainty of the previous week gave way on Monday to considerable strength, based mainly on the signs of rising commodity prices, particularly grains and copper, and on the higher steel mill activity, which it is now anticipated will

maintain its level for some weeks. The market, which has been uncertain about the regulatory intentions of the Government, found some consolation in an expression of Government opinion to the effect that present stock prices were not too high. There was active trading in steel and rail shares, and in shares of utility and rail equipment companies. Utilities were encouraged by news that the Supreme Court had ordered a re-trial of the Duke Power case, in which this company had tried to prevent loans from the P.W.A. to help build municipal power stations. Monday's burst of activity did not last into the rest of the week, when profit-taking hindered any general improvement. On the bond market Treasury issues were easy in mid-week, but railway bonds met with a good demand. Business news is still excellent, particularly the rise in steel mill activity, as estimated by *Iron Age*, to 79 per cent. of capacity compared with 76.5 per cent. last week. Electricity output for the week ended December 12th was 14.9 per cent. higher than for a year ago.

CAPITAL ISSUES

WITH a total of nine prospectuses this week, the new issue market is concluding the first part of the winter season in active style. The week's feature is provided by eager subscription of the *Railway Freight Rebates Fund* loan, which is discussed on page 592. The subscription lists for the first and second (convertible) debentures and ordinary share issues of *Indian Iron and Steel* were also promptly filled on Tuesday. These issues give effect to the acquisition of the Bengal Iron undertaking, and assuming that the rights of holders of that company's securities were exercised, the participation of the general public in the issues could only have been small. Important economies are envisaged from the merger. The two debentures (of which the junior issue carries conversion rights into ordinary shares until 1943) are satisfactorily covered, and the ordinary shares carry good long-term earnings prospects. *Pease and Partners* have issued 1,250,000 5 per cent. £1 preference shares at 21s. to repay loans, to compensate debenture holders for variation of their rights under the recent re-organisation, and for general purposes. While the company's financial structure will be greatly strengthened by the issue, it is only on recent profits that the cover for the new shares is satisfactory, and investors must for the time being value them with the transition from a somewhat unstable

earnings record in mind. *Eagle Transfer* and *Dictograph* each issue 2s. shares at 25 per cent. and 12½ per cent. premiums, respectively. The prospectus of the former shows an earnings peak for 1935, although current estimates are higher. The latter concern is larger and now doing record business, and its shares seem a reasonable speculative investment. *Thorn Electrical Industries* offers 6 per cent. preference shares at a 5 per cent. premium and 5s. ordinary shares at 125 per cent. premium. This concern also shows a geometric profits record, including those of one undertaking acquired, which has transformed a loss of £25 for 1933-34 to £13,632 profit for the year to March last. The company has a mixed business of lamp and radio manufacturing and dealing and the relation between the issue price for the ordinary shares and the latest earnings, therefore, justifiably shows a larger earnings yield ratio than a number of recent prospectuses. *Radio Rentals* is a young undertaking which rents and services radio receivers to the public. It has enjoyed considerable success, but since its record is somewhat short for judgment of permanent profits potentialities, the preference and ordinary shares must be allowed time to show their investment ranking. *K. & L. Timbers* is another South African industrial equity, issued in London at 62½ per cent. premium. The turnover of this building materials concern has advanced rapidly together with building activity in the Union, and is still advancing. The shares are a satisfactory speculative investment, but subject to cyclical swings in earning power. The ordinary shares of *George Ward (Barwell)* qualify for this week's record premium—no less than 160 per cent. They show an earnings return of 9 per cent. The Company is well-established, but not immune from fluctuating earnings. Investors may regard the "goodwill" element included in the offer price as being somewhat generously measured. Statements "for information only" have been published this week by *General Funds Investment Trust*, *Leeds Piston Ring and Engineering*, *Mitchell Main Colliery*, *South African Clothing Industries*, *Associated Coal Distributors*, and *David Rosenfeld, Ltd.*

ISSUES OF THE WEEK

January 1 to December 12, 1936, including conversions, Old Basis, £464,827,999.
January 1 to December 12, 1936, excluding conversions, Old Basis, £240,045,776.
January 1 to December 12, 1936, including conversions, New Basis, £617,014,542.
January 1 to December 12, 1936, excluding conversions, New Basis, £469,137,062.

Net Sales National Savings Certificates, week ended December 12, 1936, Dr. £100,000.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield is calculated on a profit or loss on redemption; when the stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

one director within a year. (Permission to deal sought from Birmingham Stock Exchange). Lists closed 9.5 a.m. Over-subscribed.

Thorn Electrical Industries.—Offer for sale of 50,000 6 per cent. cumulative £1 preference shares at 21s. and 266,668 5s. ordinary shares at 11s. 3d. Dealers in electrical and radio goods; makes lamps, also owns Chorlton Metal Company and Lotus Radio (1933). Combined profits, before fees, after depreciation, years to March 31: 1934, £11,867; 1935, £23,987 (Lotus, 17½ months); 1936, £43,364. Combined net assets, £89,950. Gairloch Trust purchase or subscribe for issue at about 20s. per preference and 11s. per ordinary share (including expenses). Company received 10s. each for 44,600 ordinary shares, remaining 222,068 being part of capitalised profits. Lists closed 9.5 a.m., 17th December, heavily over-subscribed.

K. and L. Timbers.—Offer for sale of 350,000 5s. shares at 8s. 3d. (200,000 unissued shares under option to vendors at 8s. 3d. until end 1938). Incorporated in South Africa to acquire two timber merchants and building material dealers. Combined profits, after depreciation, before interest and S.A. taxes, years to June 30: 1934, £14,491; 1935, £23,899; 1936, £29,276. Combined net assets, £67,974 (stocks £56,109), purchased for £67,974 cash. Vendors take at par 600,000 shares, of which this offer is part, receive £7,500 commission and option, and pay expenses (cost of shares, about 6s. per share in all).

George Ward (Barwell).—Offer for sale of 200,000 15s. ordinary shares at 26s. Boot and shoe makers since 1900. Owns since 1935 G. Geary and Son. Profits, after depreciation, G. Ward, years to September 25: 1934, £45,337; 1935, £35,653; 1936, £43,511. G. Geary, 1933, £371; 1934, Dr. £2,894; 1935, Dr. £4,885; January 1-June 25, 1936, £2,261. Net assets, £225,753. Charterhouse Investment Trust buy issue (part of 251,488 issued as capitalised reserves and profits) at 23s. 9d. (or 25s. 1d. with expenses).

BY STOCK EXCHANGE INTRODUCTION

General Funds Investment Trust, Ltd.—Issue of £100,000 3½ per cent. debenture stock repayable at par 1956, or at 103 per cent. on voluntary liquidation. Power to issue further stock ranking *pari passu*; maximum one-third of capital. Phoenix Assurance Company take issue at 99 less one per cent. commission.

Mitchell Main Colliery Company, Ltd.—Particulars of £350,000 4½ per cent. guaranteed first mortgage debenture stock (taken by Erlangers, Ltd., at 98), redeemable from 1938 by drawings at 101, from 1940 on notice at various rates, or at 101 in 1970. Guaranteed by Shipley Collieries, Ltd. Proceeds to repay loans. Owns two collieries, also royalties and rights over 2,700 acres. Guarantor company's net assets, £853,235; net profit after depreciation, 15 months to March 31, 1934, £76,443; years to March 31, 1935, £43,248; 1936, £65,753.

South African Clothing Industries, Ltd.—Robert Benson and Company and Charterhouse Investment Trust, Ltd., take jointly 150,000 5½ per cent. cumulative £1 preference shares at par, for 5 per cent. commission, and 100,000 10s. ordinary shares at 10s. 6d. (sterling). Incorporated in Union of South Africa to acquire three clothing manufacturing concerns. Combined profits of two concerns: 1933, £40,050; 1934, £44,019; 1935, £46,717. Six months to June 30, 1936, £24,254. Profits of third company, years to June 30: 1934, £3,861; 1935, £3,899; 1936, £2,713. Combined net assets, £213,558, acquired at par in shares.

Leeds Piston Ring and Engineering Company, Ltd.—Capital, 800,000 2s. ordinary shares. Piston ring specialists; founded 1923. Net assets, £80,922 acquired for £80,000 payable by 799,993 shares. Profits, after depreciation, years to March 31: 1934, £9,616; 1935, £12,181; 1936, £14,857; half-year to September 30, 1936, £8,225. Standard Industrial Trust take 400,000 shares at 2s. 6d. (or 2s. 9d. with expenses).

Associated Coal Distributors, Ltd.—Issue of £300,000 4½ per cent. first mortgage debenture stock. Acquires J. R. Wood and Company (owning Dibles, Ltd.) and Fraser and White. Coal merchants, wharfingers, etc. Proceeds to repay sums borrowed by subsidiaries for repayment of £1 preference shares in Fraser and White. First charge on subsidiaries' properties. Redeemable at par by drawings, 1938-1967, or from 1957 on notice. Net assets, £322,357. Combined profits before depreciation: 1933, £37,102; 1934, £41,570; 1935, £53,896. Prudential Assurance take at par the balance of stock not required for preference redemption for commission of 1 per cent. on whole issue.

David Rosenfield, Ltd.—Issued capital, 300,000 ordinary shares. Motor car distributors. Net assets, £77,033. Profits after depreciation on plant, before leasehold amortisation and depreciation on buildings, years to March 31: 1934, £15,329; 1935, £15,846; 1936, £16,891; half-year to September 30, 1936, £8,278. Provincial Stockbrokers Trust acquire 300,000 shares at 6s. 11d. average (including expenses).

FORTHCOMING ISSUES

Kinemas Limited.—Lists will open on Tuesday next, December 22nd, for an issue of £475,000 5½ per cent. first mortgage debenture stock at par. The prospectus will show that the company owns interests in cinemas in South Africa. Net assets amount to £831,088 and profits for the year to June 30, 1936, to £78,397 covering the interest on the debenture stock over three times.

BY TENDER

Godalming Gas and Coke Company, Ltd.—Sale by tender of £13,350 4 per cent. debentures at a minimum price of 102 per cent. Net profits, before charging debenture interest, years ended June 30: 1934, £5,220; 1935, £5,273; 1936, £6,049.

ISSUES TO SHAREHOLDERS ONLY

Halford Cycle.—Issue of 25,000 new £1 ordinary shares to holders registered on December 17th, on the basis of one new share at 40s. for every eight shares held.

Imperial Tea.—In order to provide further working capital, the directors will issue 75,000 5 per cent. cumulative preference shares of £1 at par to shareholders on register on December 2nd in the proportion of one new preference share for every seven preference or ordinary shares held.

Rubber Regenerating.—The directors propose to offer the 9,400 unissued ordinary shares of £1 to holders at par.

Laycock Engineering.—Issue of 133,333 new 5s. ordinary shares at 6s. each.

Van Emden (Dutch Guiana) Gold Mines.—The directors are issuing 50,000 5s. shares at 21s. each in the proportion of one new share for every six held on December 14th.

Chambers' Wharf and Cold Stores.—It has been decided to issue at par 136,663 ordinary shares of 5s. to existing ordinary shareholders registered on January 1, 1937, at the rate of one new ordinary for every share then held.

Dorman, Long and Company, Ltd.—Issue of 672,167 new £1 ordinary shares at 35s. each in proportion of one new for each two ordinary and preferred shares now held. Proceeds to provide for repayment of bank loans and to provide additional working capital. The new shares will rank for dividend in respect of the current year ending September 30, 1937. List remains open until December 31st.

COMPANY MEETINGS

BANK OF LONDON AND SOUTH AMERICA, LIMITED

INCREASED PROFIT—ENCOURAGING OUTLOOK

LORD WARDINGTON'S SURVEY OF CONDITIONS IN SOUTH AMERICA

The seventy-fourth ordinary meeting of the Bank of London and South America, Limited, was held on the 15th instant at the head office of the bank, 6, 7 and 8 Tokenhouse Yard, London. The Right Hon. Lord Wardington (chairman of the bank), presiding.

The Secretary (Mr J. A. Stark) read the notice convening the meeting and the report of the auditors.

The Chairman, in moving the adoption of the report and accounts, said:—

Twelve years ago I referred to our annual meeting as one which had constituted a distinct milestone on the path which the bank had then travelled for sixty-two years. That was on the occasion of the amalgamation of the London and River Plate Bank, Limited, with the London and Brazilian Bank, Limited, when our present title was assumed. Difficult years have since been encountered, but the bank has successfully come through them, and to-day another milestone has been reached by the arrangement, completed in August last, whereby the business of the Anglo-South American Bank, Limited, now in voluntary liquidation, has been taken over by us. We, in our seventy-fourth year, are now the sole English bank operating in South and Central America. Your board feel confident that the future will prove the step to have been in the right direction. The best of relations are maintained with our large and increased clientele, who continue to receive that same consideration and good service which have earned for the bank a reputation second to none.

With regard to the balance-sheet, you will see that its total is approximately £75,000,000, or £32,000,000 more than last year. Our advances and other accounts last year included a sum of £1,490,000 in respect of depreciation on capital employed abroad. In addition the sum of £2,848,000 appeared in the balance sheet of the Anglo-South American Bank, Limited, under the same heading of depreciation of capital. These two amounts, as you will see from the report in your hands, have now been entirely removed from the combined balance sheet.

PROFIT AND LOSS ACCOUNT

In reviewing the profit and loss account it must be borne in mind that only for a period of some six weeks have the items of expenditure and revenue been affected by the increased turnover resulting from our recent deal. The economies foreshadowed and the benefits to be derived from the elimination of competition had scarcely begun to manifest themselves, but satisfactory progress is now being made in this respect. The net profit, after providing for bad and doubtful debts, is £252,000, which is £43,000 in excess of last year's figure. I would here mention, however, that the improvement has not come by way of increased earning capacity, but through our having had to make a smaller provision for bad and doubtful debts in the year under review. This, after many years of heavy writing-down, is a good sign, but it would be far too venturesome to suggest that we are yet free from this process. On the other hand, I do feel that our prospects in regard to future earnings are now more encouraging than they have been for some time past.

BOARD'S CONSERVATIVE POLICY

You will see that the available balance of profit and loss account is £420,124, from which the directors recommend the following allocations:—To payment of a dividend of 3 per cent. on £3,540,000 (namely, on shares Nos. 1-708,000, inclusive, of £5 each) payable December 21, 1936, subject to income tax, £106,200; to writing-off special legal and other expenses incurred during the year in connection with the acquisition of the Anglo-South American Bank business, £25,000; to contingency reserve, £120,000, leaving a sum of £168,924 to be carried forward. Some of our shareholders may have expected a larger distribution on this occasion, but until the board are able more clearly to appreciate the benefits that future developments may bring, I feel sure you will be in full agreement with the conservative policy adopted.

PROGRESS IN ARGENTINA

Due largely to the steady adoption of the comprehensive scheme of financial reform promulgated in March, 1935, of which the new Central Bank was the nucleus, the economic situation

continues to be strengthened and consolidated. The national fiscal position is improving. The satisfactory state of the national credit is reflected in the fact that the yield on Government securities is now below 5 per cent., whilst Treasury bills are subject to keen competition and are placed at low rates of interest. The new Central Bank is now regulating the basis of international credit as well as controlling the external value of the peso, which is particularly important to an agricultural country liable to fluctuations in overseas trade. A feature during the year has been the absence of currency inflation.

In view of the indications of Government policy we were hardly surprised to receive the welcome news on Thursday last that the Central Bank had been instructed by the Government to reduce as from that date the selling rate for official exchange from 17 to 16 pesos per pound sterling, the official buying rate being meanwhile retained at 15 pesos. This means, of course, that the Government's profits in the official exchange market have been halved, with resultant benefit to importers and other remitters of official exchange.

The new trade agreement which has been brought to a successful conclusion gives practical expression to the reciprocal nature of Anglo-Argentine trading relations, and there is reason to hope that under it there will be a further expansion in commerce between the two countries. Gratifying also is the repetition by the Argentine Government of its declaration that it intends to accord benevolent treatment to British utility and other undertakings in Argentina.

Following favourable weather, the outlook for the fine cereal crops is encouraging, and a good average wheat crop appears almost secure. The general economic outlook therefore inspires confidence.

BRAZIL AND URUGUAY

Since the military outbreak in November last year there has been no public disturbance or political agitation of any significance in Brazil. Civil life is normal, and the commercial and industrial activities of the country are progressing in an encouraging manner. During the past year the Federal Government have regularly fulfilled their obligations, and the service of foreign loans has been duly paid on the reduced scale established under the Aranha debt scheme of February, 1934, as have also the monthly commitments on their commercial debt agreements.

During the past few months Brazil has sought to improve her commercial relations with foreign countries, including Great Britain, through the revision of trade agreements and the mutual application of the "most-favoured-nation" treatment, whereby the reciprocal interchange of products and merchandise will be stimulated by the reduction of Customs tariffs to a minimum scale. The position has become increasingly complicated, however, by reason of the "compensation" agreement with Germany, which has enabled that country substantially to undersell competitors, and the outstanding feature is the growth in German imports.

It is gratifying to note the trend towards a greater diversification of Brazil's products for export, in which, with few exceptions, there has been marked expansion since 1933.

Uruguay effected further consolidation of her financial position during the year. Uruguay continues to adhere to a policy of reciprocity in foreign commercial relations, which finds expression in various trade agreements, and the year 1935 closed with a substantial trade balance in favour of the Republic, with Great Britain heading the list on both export and import account. Uruguay may be said to be enjoying a period of mild prosperity. The political situation is stable, and the coming year should see a further consolidation of the improved position already attained, although much naturally depends upon the internal situation of various countries which purchase Uruguayan commodities.

In Paraguay the past year has inevitably been a period of readjustment following the conclusion of the Chaco hostilities, the financial strain of which has been withstood in a remarkable manner.

The improvement in the internal situation in Chile has been maintained during the past twelve months. There has been a notable expansion in foreign trade during the year 1936 as compared with the two preceding years.

FOREIGN TRADE OF THE REPUBLICS

After reviewing the conditions in other countries in which the bank operates, the chairman continued: It remains for me to say now that whilst the partial recovery in South America has mainly been in internal conditions, there has also been during the year 1935 and in 1936 to date an expansion in the foreign trade of most of the republics on both import and export account, and the rise

NELSON FINANCIAL TRUST, LIMITED

GRATIFYING PROGRESS

The ordinary general meeting of Nelson Financial Trust, Limited, was held, on the 14th instant, at Southern House, E.C., the Rt. Hon. Viscount Goschen, G.C.S.I., G.C.I.E., C.B.E. (the chairman), presiding.

Mr W. A. Porter (general manager), having made a sympathetic reference to the death of Mr Harold Nelson and welcomed Viscount Goschen as his successor in the chairmanship.

The Chairman, dealing with the accounts, said that the investments stood in the company's books at £1,521,933 and their market value on October 31st was in excess of that figure. The actual break-up value of the ordinary stock on that date was 108½ per cent., which compared with 82 per cent. on the same date last year. This position arose not only from the appreciation in the market value of many securities, but also from the steady writing down of holdings out of surpluses realised. As to the geographical distribution of their investments, the figures indicated that they were now over 82 per cent. an all-British Trust; the relative figure last year was 75 per cent. The net income of the year, at £30,286, showed an increase of £4,273, and the directors recommended a final dividend of 2 per cent. on the ordinary stock, making 4 per cent. for the year; they were transferring £3,000 to revenue reserve and increasing the carry-forward to £21,217.

With regard to the current year, industry generally was enjoying a period of prosperity, stimulated by Government orders and the improvement in housing and transport facilities. Shipping reflected an increase in overseas trade, and money was still cheap and plentiful. High-class industrial shares now only yielded a return, at present market prices, which seemed to discount a long period of prosperity, and it was difficult under present world conditions to make any forecast as to the future. This rendered it necessary for the directors to proceed with caution. The company was in a very sound position, and their first object must be to continue to strengthen it; but if in the current year nothing of a serious nature occurred, they hoped they might be able to make some little addition to the distribution to ordinary stockholders.

The report was unanimously adopted.

BOOKER BROTHERS, MCCONNELL AND COMPANY LIMITED

IMPROVED RESULTS

The annual general meeting of Booker Brothers, McConnell and Company, Limited, was held, on the 14th instant, in London.

Sir Alfred P. Sherlock (the chairman) said that the profits for the year ended June 30th last amounted to £77,146, approximately £22,000 more than the previous year, which he thought shareholders would agree was very satisfactory. The increase was accounted for by a 5 per cent. dividend from Bookers Demerara Sugar Estates instead of a 3 per cent. dividend for the previous year, and also by considerable improvement in trading results by the Demerara and home branches.

The improvement in trading was due principally to the increased sugar crop which they had been getting. The colony was also benefiting from the expansion of the hinterland industries, amongst them gold. He looked for still greater expansion in that industry, and they themselves had taken up concessions in a gold-bearing district. They had also taken an interest in a gold company. The improvement in the results of the home branches was more or less consequent upon the greater trade done by the Demerara branch.

For some years past their estates had had to work on extremely economical lines, and the fact that Bookers Demerara Sugar Estates, Limited, had been able to pay a 5 per cent. dividend reflected the greatest credit on the efficient management in Demerara. There was no doubt that the results they had achieved were largely due to better methods of cultivation and improved seedlings, but it must not be forgotten that the company had an income of approximately £20,000 from interest and dividends received on its liquid capital.

Statistically, the position of sugar in the world to-day was not unsatisfactory, as stocks had declined during the year by approximately 1,000,000 tons, but production in a good many countries was likely to increase in the next twelve months. That increase, however, might be absorbed internally and, they hoped, would not affect the position. Although they were practically the most economical producers in the British Empire, they were at a disadvantage in having practically no local market at remunerative prices like other producers.

The report was unanimously adopted.

in world prices leads to reasonable hopes of further expansion in the value of aggregate exports. It must be remembered, however, that—as a result of world economic trends since 1930—the foreign trade of the South American Republics with the chief industrial countries is now mainly of a reciprocal nature and finds expression in special trade agreements, compensation arrangements, quotas, etc. In effect, much of South America's trade is now of a "barter" character, and the recorded export surpluses do not in many cases give a true indication of the real balances of payments or of the balances of free exchange cover available. Much of the activity on import account also is for material or equipment for the national manufacturing industries, which have made very definite progress—a result of the present world phase of economic self-sufficiency which cannot but permanently affect to an important degree the South American markets for foreign manufactured goods.

HEAVY IMPORTS OF GERMAN GOODS

Chief among the countries conducting business on a compensation basis is Germany, and the operation of the "Aski" mark system has resulted in increasingly heavy imports of German goods into such countries as Brazil, Chile, Peru, and Central America, to the detriment of other supplying countries, including Great Britain.

The recent international currency agreement may, by effecting stabilisation of the chief currencies, assist towards the removal of trade barriers, but this will have to be followed by general endeavours to relax other restrictions, including bilateral trading arrangements, which serve to confine the flow of world commerce within set channels. Unfortunately, however, these restrictions are often bound up with the intense economic nationalism and political creeds of certain European countries, and the immediate future in this respect is not too encouraging. Obviously, whilst such countries still pursue national self-sufficiency to an extreme degree the delicate mechanism of international trade balances cannot be fully adjusted.

To conclude, our position as the only English bank in twelve South and Central American Republics carries with it obvious privileges and responsibilities. Principal among these is the continuance of whole-hearted co-operation with the Governments and business communities in furthering the well-being of the Republic. The report and accounts were unanimously adopted.

NATIONAL BANK OF SCOTLAND, LIMITED

A POSITION OF LIQUIDITY

The one hundred and eleventh annual general meeting of the proprietors of the National Bank of Scotland, Limited, was held, on the 17th instant, at the bank's head office in Edinburgh.

The Most Honourable the Marquess of Lothian, C.H. (the governor of the bank), who presided, said the net profit of £272,440 was fully £2,000 more than for the previous year. After setting aside £134,200 to meet the usual dividend of 16 per cent., the board had made allocations to reserve and staff funds amounting to £135,000, and there remained a balance of £84,065 to be carried forward. In regard to the balance sheet, the bank's notes in circulation at October 31st last amounted to £2,720,480, showing an increase of £125,000, and this, taken in conjunction with similar increases in each of the two previous years, indicated steady improvement in industrial activity in Scotland. Deposits had reached the high figure of £36,532,000, an increase of £1,319,000. Acceptances on account of customers were higher by £350,000 at a total of £1,078,000—a clear indication of the greater volume of imports.

On the assets side of the balance sheet, cash and readily realisable assets were £9,780,000, representing nearly 25 per cent. of the deposits and notes in circulation taken together. Their holding of British Government securities stood at £18,280,000, a figure considerably below their present market value. Bills discounted showed an increase of almost £300,000, the small holding of Treasury bills included under bills discounted being practically the same as a year ago. Loans and advances at £11,275,000 showed an increase of £375,000. Some importance could be attached to that increase because it indicated that the decline in advances had been arrested and that a movement in the other direction had begun. He need not, he said, enlarge upon the liquidity and strength which characterised the balance sheet, and the directors were satisfied that the bank was in a favourable position to play its part in meeting the requirements of reviving trade and industry in this country.

The indications of recovery in trading conditions at home to which he had referred a year ago had been fulfilled, and in most directions the period had been one of revival.

The report and accounts were unanimously adopted.

RHODESIAN ANGLO-AMERICAN, LIMITED

INVESTMENT POSITION—OUTLOOK FOR COPPER

The seventh ordinary general meeting of Rhodesian Anglo-American, Limited, was held, on the 14th instant, in London, Sir Edmund Davis, J.P. (deputy chairman), presiding.

The Chairman, dealing first with the balance sheet, said: Investments stand at a total figure of £6,801,033, which is much larger than the corresponding figure a year ago. The increase is due to the fact that the reserve for depreciation of investments, which had hitherto been deducted from the cost price of the investments for balance-sheet purposes, has been re-allocated in the manner described in the directors' report. The directors felt satisfied that the maintenance of such a very large reserve, provided at a time of severe depression, was no longer necessary and therefore, after applying a portion of the reserve to writing down the company's investments to what they considered conservative figures, they authorised the transfer of £1,200,000 to a general reserve account.

At the date of the balance sheet the market value of the investments showed a surplus over book values of £1,136,742. The value of our present investments, including our additional holding of shares in Rhokana Corporation recently subscribed at £10 per share, at to-day's market prices is £15,638,586, showing a surplus over the book value of no less than £8,526,176.

The net profit for the year, subject to income tax, comes out at £200,674, which compares with £120,965 for the preceding fifteen months. The balance brought in from the last account was £291,221. After deducting income tax, £17,277, and the proposed dividend of 6d. per share, less income tax, and the directors' additional remuneration there is left £296,064 to carry forward, which is about £5,000 more than a year ago.

I think it is now necessary to refer at greater length to our interest in Rhokana Corporation, Limited, and at the same time give you my views on the future operations of that important company. In this connection may I draw your attention not only to the statement made at our last ordinary general meeting on the subject of the possible increase in the production of copper should the market warrant it, and a general increase in consumption, but also to Sir Auckland Geddes's remarks at the meeting of shareholders of Rhokana Corporation, Limited, held on October 29th last? He then stated that the average cash price for standard copper on the London Metal Exchange was £38 6s. for the month of August, £38 19s. for the month of September, and £40 14s. 8d. for the first 26 days of October. I am now able to supplement this information by giving you the figure for the whole of October, which was £41 os. 4d., and for November it further increased to £43 19s. 5d. All the figures I have quoted relate to long tons. Rhokana Corporation, Limited, profits naturally depend on the market price of copper, which in turn is influenced by production and consumption.

In this connection you will also have learned from Sir Auckland Geddes's speech that the stocks of refined copper throughout the world had gradually fallen from 854,133 short tons in 1932 to 379,727 short tons in September, 1936. Since that statement was made there has been a further fall in world stocks of refined copper, which amounted to 356,785 tons at the end of October.

Consumption, which was only 804,974 short tons in 1932, is at present apparently at the rate of about 1,750,000 short tons per annum, this estimate being based on world consumption, which for the first ten months of 1936 was a little over 1,460,000 tons. On this basis consumption for the whole of 1936 should be about the figure I have mentioned.

The gradual reduction of stocks and rise in the market price has of course been followed by a gradual increase in production by the Northern Rhodesia Copper Mines. Rhokana Corporation's output is now at the rate of about 84,000 short tons per annum, and the estimated total copper output by the three mines at present producing in Northern Rhodesia—based on the existing rate of production—should be over 200,000 short tons per annum.

While on this subject I would also draw your attention to the formation of a new company to take over Rhokana Corporation's Chingola special grant with a capital of £5,000,000 in £1 shares, of which 2,000,000 shares are to be allotted to Rhokana Corporation as vendor's consideration for the properties transferred and 400,000 are to be subscribed by Rhokana Corporation in cash at par to constitute the initial working capital. Eventually the remaining 2,600,000 shares of the said new company will be offered for subscription to the ordinary and "A" shareholders in Rhokana Corporation, Limited. Our net interest in the said 2,600,000 shares when issued will be over 1,000,000 shares, which should in course of time prove to be a valuable investment.

The report and accounts were unanimously adopted.

GOLD COAST BANKET AREAS, LIMITED

STRONG CASH POSITION—PROMISING OUTLOOK

The third ordinary general meeting of Gold Coast Banket Areas, Limited, was held, on the 14th instant, at Winchester House, Old Broad Street, London, Mr Robert Sweeny (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, said, that, bearing in mind that they had a gold mine to develop and equip on a scale commensurate with the large size of the property and being well aware that this inevitably would require large financial resources, the board had adopted the policy of assuring that the necessary cash should be definitely available when required. In pursuance of that policy, during the year covered by the accounts 213,000 shares in Amalgamated Banket Areas, Limited, were sold, and the considerable excess of realised value over book value transferred to capital reserve. Also on the assets side of the balance sheet mine development expenditure and the cost of additional plant equipment, totalled £48,324.

Since the close of the year the company's financial resources had been further increased, and the total of cash and quoted investments at to-day's market values approximated £650,000. Their company owned a considerable stretch—approximately 7,000 ft.—along the outcrop of the formation, and their properties covered a large area on the dip of the reef. They knew that the great Rand mines of to-day had required anything from five to ten years to reach large-scale production and commensurate profits work took time, and, to start with, a great deal of it was of cutting, driving off reef, and through faults, which did not itself open up ore. In every case there were special peculiarities that had to be learned from experience.

In view of their initial comparatively limited cash resources, the policy was adopted of installing the first small unit of a production plant for the purpose of obtaining some contribution towards development costs. That policy had also had the advantage of enabling them to build up a good organisation of labour, which was being continually trained, together with their European staff, to the requirements of their mine.

A second unit of the mill to raise the plant capacity to 12,000 tons per month had been authorised by the board and the equipment had been on order for some months. The increased plant was planned to be in operation by next March.

INCREASED ORE RESERVES

The extensive development programme was achieving satisfactory results, and their ore reserves as at October 31st were 28.29 inches, showing an increase of 52,928 tons in the first four months of the current financial year. The most encouraging feature of their development was the increase both in value and width of reef in the lower levels.

Their company had an extensive holding in South Banket Areas, Limited, namely 1,500,000 shares, and, in addition, they held an option to subscribe for 500,000 shares at par which had been renewed last February for one year. The South Banket company was also pursuing an extensive development campaign. According to the latest development report, ore reserves of 233,584 tons, averaging 5.39 dwts. over 45.49 inches, were estimated to have been developed in the Tamsoo section of their property.

THE FUTURE

As regarded the future, the outlook was promising. They anticipated that development work in 1937 would open up sufficient additional ore to enable the mine to supply the extended reduction plant to its capacity of 12,000 tons a month.

They would push on with development in depth as rapidly as possible and they would be able to judge the progress from the monthly reports.

With operations at increased capacity, the limit of payable ore should be 4 dwts. per ton, if the price of gold was maintained, as appeared probable, at £7 per ounce. That being the case, it seemed that the very large extent of banket reef underlying their properties must surely be a good business proposition, provided a little patience was exercised, that operations and development were capably handled, and that they did not take the risk of making of a big mine.

He thought shareholders would feel satisfied that, as far as it was humanly possible to see, the portents were propitious. The report was unanimously adopted.

LONDON AND RHODESIAN MINING AND LAND COMPANY, LIMITED

DIVIDEND OF 10 PER. CENT.

PROGRESS OF COMPANY'S INTERESTS

The ordinary general meeting of the London and Rhodesian Mining and Land Company, Limited, was held, on the 14th instant, at Winchester House, London, E.C.

Lord Lurgan, K.C.V.O., who presided in the absence of Sir Abe Bailey, the chairman, said that the company's interest and dividend revenue of £65,410 compared very favourably with the figure of £51,818 in the previous year and £44,183 in the year before that, and showed that the revenue they were receiving under this head was steadily increasing. Of the £65,410, £62,934 came from dividends and represented a return of nearly 12 per cent. on their total investments. The profit on realisation of investments, at £32,151, compared with £45,685, the lower figure being, of course, simply due to the fact that they had not seen fit to realise investments on which they had a book profit. Rents, etc., were £14,313, compared with £12,483 in the previous year. The bulk of the figure came from rents received from the different buildings owned by the company, mainly in Salisbury and Bulawayo. Mining revenue at £9,625 showed a falling off of about £1,600.

YEAR'S RESULTS

To the net profit of £120,569 had to be added £96,128 brought forward, giving a total available of £216,697, compared with £188,379 in 1935.

In the balance sheet farms and ranches at £404,273 was very much the same as in the previous year. Stands and buildings stood at £64,785, and the municipal valuation was about double that figure. Mining properties and other interests at £37,165 could not be considered over-valued in view of the revenue that was received from them, and including, as they did, the Rennie-Tailyour concession and other interests.

The most important of their assets—share investments—at or under cost, stood at June 30th at £534,673, approximately £51,500 more than in the previous year. The valuation was £914,837, of which no less than £815,263 represented the market valuation of their quoted securities, and they had a total appreciation on their investments as at June last of £380,163. That figure was, of course, an unrealised profit. The unquoted investments were valued at £99,573, a figure which had been arrived at on a conservative basis. If the investments were taken at their value and had added to them the cash surplus—that was to say, what might be described as their liquid assets—those alone were practically equal to the capital of £1,000,000, and, in addition, they had the whole of their other assets, such as their land, stands and buildings, cattle, mining interests, etc.

SHARE INTERESTS

Dealing with the various share interests, the chairman said that the position of the Cam and Motor Company was very satisfactory, and at the annual meeting last month the chairman had forecast an increased distribution for the current year.

The South African Coal Estates Company had a record year, their sales of coal being up by 115,728 tons. Increased dividends had been received from this interest and the future of the company looked distinctly good. The Rezende Mines was increasing its profit, and dividends seemed to be assured for many years to come. The African Investment Trust had had a successful year and had again paid 5 per cent. The company was still interested in a number of Kaffir dividend-paying companies.

As to mining interests, the royalties received from the tributaries of the various small properties were quite substantial. They continued their policy of inspecting and, if thought advisable, taking up options on any likely propositions, and they trusted that sooner or later they would be successful. During the past three years the value of gold produced in Southern Rhodesia had shown a steady increase, which had continued in the current year.

In the balance sheet the land-holding remained unchanged at 1,640,644 acres. Since June 30th, Glass' Block had been sold to the Government for 3s. 6d. an acre, and they now had only three ranches running. The ranching position had improved considerably, and they had every hope and expectation that this year they would be able to show a surplus on their ranching which they could use to replace the large sums written off during the past three years.

A final dividend of 5 per cent. was recommended, making 10 per cent. for the year, and an interim of 5 per cent. on the current year was also being made.

The report was unanimously adopted.

IND COOPE AND ALLSOPP, LIMITED

PROFITS AND DISTRIBUTION INCREASED

The twenty-fourth ordinary general meeting of Ind Coope and Allsopp, Limited, was held, on the 14th instant, in London.

Colonel Sir G. L. Courthope, Bt., M.C., M.P. (the chairman), said that the progress he was able to report last year had been well maintained. The amalgamation of Ind Coope and Allsopp had proved an undoubted success, although the full benefits of the fusion had not yet been reached.

Trading profit was up by £200,000, interest by £19,000, compensation and income tax payments by £75,000, and the net profit by £125,000. The increase in trading profit was mainly due to the following facts. They had had the benefit of direct trading in all the Showell houses for twelve months, as against seven months in the previous year; in the Lichfield houses for twelve months, as against three months; and in the Leicester Hotels for one month, as against nothing; and the trading profit on bottling increased by some £40,000.

The cash position of the company was strong. In addition to £1,121,000 of cash and Government securities in the parent company's hands, the subsidiaries held £478,000 and trustees £219,000.

The condition of their properties and plant was satisfactory. The new bottling plant at Burton was giving excellent results as regarded both output and quality. A new plant at Romford was nearly completed, and would enable them to deal with the growing demand for bottled beers, as well as the trade of the Nalder and Collyer houses recently acquired. Considerable progress had been made with rebuilding and reconstruction.

With regard to the future, they might face it with confidence. The industries of the country were, for the most part, prosperous; and he had little doubt that they would share in the general prosperity.

The net profit amounted to £618,000, and with the balance brought forward there was £977,000 available. It was proposed to pay a final dividend of 17½ per cent., less tax, on the ordinary stock, making 25 per cent. for the year, and a bonus of 2½ per cent., less tax; to transfer £57,900 to public house improvements reserve, making this up to £250,000, and £100,000 to general reserve, making this up to £950,000, and to carry forward £379,000.

The report was unanimously adopted.

MESSINA (TRANSVAAL) DEVELOPMENT COMPANY, LIMITED

DIVIDENDS RESUMED

The annual general meeting of the Messina (Transvaal) Development Company, Limited, was held, on the 16th instant, in London.

Lieut.-Col. John P. Grenfell (the chairman) said that the outstanding feature of the report was that, after some few years of low copper prices and no dividends, they had been able to earn a profit substantial enough to recommend a dividend. For the six months since the close of their year the price had averaged over £40, and to-day was considerably higher, so that during the present year their profits would be greater than for that ending June 30th last. As a result of the year's working there was a balance of £47,800. The balance on profit and loss account was £115,589, against £68,952.

The general manager in his report stressed the promising outlook of the prospecting at Campbell mine. They had encountered at least two lodes, which occurred over a considerable length, but were low grade. At Harper mine they had developed a large tonnage of ore and the lodes had considerably expanded both in width and length on the strike. The bottom level, the 19th, had just recently come into ore, and that should add a considerable tonnage to their ore reserves. In the Messina mine they had found new ore bodies, and enlarged old ones in the levels above 2,100 feet.

The ore reserves showed an increase of 50,200 tons to a total of 1,268,300 tons.

Taking a broad view of the whole Messina copper field, the year had been interesting. They had some 16 miles along the strike of the copper lodes, and at two localities they had opened up payable mines, namely, Messina and Harper. The Messina mine carried copper for some 3,200 feet on the strike; the Harper mine for some 3,700 feet, and they were now opening up Campbell, which, as at present known, had copper-bearing lodes for some 5,000 feet. Although they had been at Messina for twenty-five years, it was probable that there were ore bodies of which at present they knew nothing.

The report was adopted, and a final dividend, making 20 per cent. for the year, approved.

DAVIS ESTATES, LIMITED**EXPANSION OF BUSINESS**

The second ordinary general meeting of Davis Estates, Limited, was held, on the 17th instant, at Winchester House, London, E.C.

Mr M. S. Myers (the chairman) said that the year's trading had resulted in a net profit of £86,000 compared with just over £66,000 in the previous year. That was a large and satisfactory increase and entirely due to a natural expansion of the business which they hoped and had every reason to believe would continue. The whole of the profits, after paying the preference dividend and the service of the preference share redemption fund, had been retained in the business. No profits had been distributed upon the ordinary shares since the incorporation of the company and nearly £100,000 of such profits had been divided as to an allocation of £78,000 in the reserve accounts and £21,000, the sum carried forward; that in addition to the amount of £35,000 which stood to the credit of income tax reserve account and which they trusted would not be wholly required.

The placing back of profits into the business had enabled the company to expand its activities and incidentally enhanced the ultimate value of the ordinary shares, and they must envisage a distribution on those shares in the near future. The company's investments in properties had increased by £61,000, bringing that item up to £142,000. The income derived from those properties already amounted to nearly one-half of the preference share dividend, and it would be the directors' endeavour to cover the whole of the preference dividend and redemption service from that source.

The company's balance sheet was made up at a time when they usually employed all their funds, and with their increased activity the change in the company's cash position over that of the same period last year was marked. Last year they had cash available of £46,000; this year they had a bank loan of £88,000, but that overdraft, offset by increased debtors to the company, would tend to be reduced during the first half of the ensuing calendar year.

Notwithstanding the materially more active state of their trade, their sundry creditors had only increased by the nominal figure of £1,000. They now came to the item of stock at cost, which included houses in course of construction and those constructed and those which had been contracted to be sold. It would not be wise to publish details of those figures.

He was a wise man who said as little about the future as he could, but so far as they could say, and based upon the present foundation, the company's developments were such as to give them confidence, for they were able to gauge conditions which they thought were likely to prevail for some years to come. The company was among those who might claim to be specialists. They did not compete in the low-priced dwelling-house, but held the premier position in medium-priced homes.

The report was unanimously adopted.

ORIENT STEAM NAVIGATION COMPANY, LIMITED**DIVIDEND MAINTAINED AT 5 PER CENT.**

The thirty-seventh ordinary general meeting of this company was held, on the 16th instant, in London.

Mr I. C. Geddes, the chairman, said that earnings were down and expenses up. Both passenger and cargo earnings had been reduced by the effects of the Italian campaign in Abyssinia. Homeward much cargo space was vacant. Shippers, ship-owners and consignees were all partners in Australia's export trade, and, given goodwill, it should be possible to secure more economical transport by better forecasting of the cargo to be carried at different seasons. Expenses had been increased by the restoration of cuts in pay to crews and transport workers on shore. The change-over from third class to tourist had meant additional expenditure and disturbance of programme with longer stays in port. It was proposed to regard this as an exceptionally bad year and to pay a modest dividend of 5 per cent., tax free, from reserves accumulated for the purpose.

The tourist class marked a big step forward in the general standard of cheap travel and should result in a flow of holiday traffic in both directions. Australia wanted and needed migrants, and, looking to the future, there must be room for them in that favoured land, but the movement seemed likely to be more selective than it had been in the past.

Looking back, the curve of migration had been one of ups and downs. Looking to the future, a flatter curve would be better suited both to Australia and to those who migrated, and when migration did start he hoped it would be directed with economy in the use of ships. At the present time there was vacant space

at certain seasons of the year which could accommodate considerable numbers without disturbance to existing traffic.

While their ships were refitting, they had taken advantage of their being in the builders' hands to adapt some of their spaces for the carriage of chilled meat, and now all ships, with the exception of "Ormonde," were so equipped. That expense had been incurred in advance of the requirements of the trade, but as the conversion was too extensive to be carried out in the normal "turn round" of the ship, it was economical to alter the ships while they were withdrawn from service.

Since the close of the financial year, "Orsova" had made her last voyage and had been sold for breaking up.

On December 1st "Orcades" was launched at Barrow. Certain modifications, and, they hoped, improvements, had been effected on the plan of "Orion." They had confidence that when she came into service in six months she would prove a worthy product of Messrs. Vickers-Armstrongs' craft. She would be nearly twice the size and would cost more than 2½ times as much as "Orsova" had cost twenty-seven years ago.

In April of this year the shareholders had approved an extension of the powers of the company to include transport by air. Since then they had, in conjunction with certain Australian interests, formed a company to develop air services in Australia. The report and accounts were unanimously adopted.

LUIPAARDS VLEI ESTATE AND GOLD MINING COMPANY, LIMITED**DIVIDEND INCREASED TO 50 PER CENT.**

Presiding at the ordinary general meeting of the Luipaards Vlei Estate and Gold Mining Company, Limited, held, on the 16th instant, in London, Mr E. Turk (the chairman), in moving the adoption of the report and accounts, said that the net profit resulting from the year's operations was £146,042, an increase of £7,431 on last year, and the total available on profit and loss account was £200,118. An interim dividend of 25 per cent. had already been paid, and the directors now recommended a final dividend of 25 per cent., making the total dividend for the year 50 per cent., or 1s. per share. This would leave approximately £19,000 to be carried forward to next year's accounts.

The work done during the year in the mine was fully dealt with in the report by the general manager, Mr Krone. The Tudor shaft had now been sunk to below 2,600 ft., and both main reef and south reef were being opened up at several horizons with excellent results. Developments in this section must be regarded as more than ordinarily important, occurring as they did at considerable depth in an area which was entirely intact.

After supplying to the mill 557,500 tons during the year, the fully developed and immediately available ore reserves stood at June 30th at 2,289,900 tons, averaging 4.9 dwt. over stopping width, with a further 355,800 tons developed but not immediately available at an average of 5.47 dwt.

On August 1st last the secretaryship of the company in Johannesburg and the technical administration were taken over by the New Consolidated Gold Fields, Limited. The board had every reason to think that the co-operation between their management and the experienced technical staff of the Gold Fields would have beneficial results for the company.

PROGRAMME OF EXPANSION

The company's big programme of expansion was still before them. Such a scheme would not only have to envisage the erection of a new reduction plant, either by replacing the present one or as an addition to it, but might also have to include the sinking of another large working shaft. Suggestions had been made which, in the meantime, were likely to bring about an increase in the productive capacity of the existing milling plant before the larger scheme became feasible.

Summing up the position of the company in a few words, the chairman said he could safely say that it had never been better than at present. Their output had reached record figures; the ore reserve was not only keeping up with the requirements, but gaining steadily; developments were excellent and likely to be better, and the spade-work done during the last three years was now bearing fruit in facilitating the more rapid development of the important eastern section of the mine. The life of the mine on the present basis of output could be estimated as from 30 to 40 years, and possibly even longer. It afforded the directors a great deal of satisfaction to be able to put such a sound and promising position before the shareholders that day.

Sir Frederick Hamilton seconded the resolution, which was carried unanimously, and cordial votes of thanks having been passed to the local board and secretaries in Johannesburg and to the general manager and mine staff, as well as to the chairman and directors, the proceedings terminated.

GOLD COAST MAIN REEF, LIMITED**DEVELOPMENTS AT THE BONDAYE MINE**

The third ordinary general meeting of Gold Coast Main Reef, Limited, was held, on the 16th instant, at River Plate House, London.

The Rt. Hon. Lord Dorchester, the chairman, said that cash at bankers amounted to £58,703, and there was a further sum of £60,000 due upon shares allotted and only partly paid up. Their cash position might, therefore, be considered strong and certainly adequate to finance operations until such time as they commenced crushing.

Referring to the development work accomplished during the year, the Chairman said:—The most satisfactory aspect is represented by the tangible figures of ore reserves blocked out to date on the first and second level workings of our Bondaye Mine. These reserves have been detailed in our report, but I may be permitted to reiterate them as follows:—Indicated ore reserves down to the second level, including main ore-body and spur reef, 52,794 stope tons, averaging 8.4 dwt. per ton over a width of 60 inches; in addition to which there are indicated on the north ore-body 5,978 reef tons, averaging 5.3 dwt. per ton over a width of 63 inches; and on the north-east ore-body 5,100 reef tons, averaging 7.7 dwt. per ton over a width of 34 inches.

These figures were contained in a cablegram received from the general manager, Major D. Gilchrist, on the 3rd instant. Major Gilchrist states that, on the second level, the length of the main ore-body is 275 feet, averaging 13.1 dwt. per ton over a width of 41 inches, and that the spur reef on this level is 342 feet long and carries 16.7 dwt. per ton over a width of 30 inches. Combining the two, we have a total length of 617 feet, averaging 14.8 dwt. per ton over 35 inches. Concluding the cablegram, Major Gilchrist records that results to date are encouraging, and if the third and fourth levels develop satisfactorily the question of equipping the mine for production will be brought up for consideration. Major Gilchrist states further that Mr G. M. O. Barclay is in agreement with the cabled summary. Mr Barclay is the consulting engineer to the West African Gold Corporation, Limited.

As a board we are well satisfied with the progress and full of hope for the future; and unless I am very much mistaken, by the time we meet again next year I shall be able to talk about Bondaye, not as a promising development proposition, but as a proven mine with a great future.

The report was unanimously adopted.

SECOND COVENT GARDEN PROPERTY COMPANY, LIMITED**INCREASED REVENUE AND DIVIDEND**

The third ordinary general meeting of the Second Covent Garden Property Company, Limited, was held, on the 11th instant, at the Hotel Victoria, Northumberland Avenue, London.

Mr Philip E. Hill (chairman of the company) said:—Ladies and Gentlemen,—The forecast of increased profits made at our annual meeting last year has materialised, and the revenue figures for the year ended November 30, 1936, of £165,762, show an increase over those of the previous accounting period of £54,179. During the period under review the company has purchased and contracted to purchase properties of the particular type in which this company specialises to the extent of £139,949, of which £118,000 odd are freehold and £21,000 odd leasehold.

We have other negotiations in hand, and should these materialise the board might possibly consider the desirability of making a further issue of share capital. Should this be done, the existing shareholders would, of course, be given preferential consideration. The difficulty in obtaining properties of our type on the terms we feel justified in offering continues, and this, of course, tends to a much slower development than I had hoped for when this company was formed three years ago, but I am sure everyone will agree that the progress, if slow, has at least been sure.

The directors have decided to recommend a dividend on the ordinary shares at the rate of 7½ per cent. per annum, less tax, comparable with 6 per cent. paid last year, and the balance carried forward has been increased to £23,118.

I regard the properties owned by this company as being definitely of a gilt-edged character, and having regard to this fact, I consider the dividend now being paid to be most satisfactory, and there is no reason to assume that the business of the company will not continue to progress along the same lines as hitherto.

The report was unanimously adopted.

CENTRAL WASSAU GOLD MINES, LIMITED**AGREEMENT WITH TANO ALLUVIALS, LIMITED**

The thirty-sixth annual general meeting of this company was held, on the 16th instant, in London.

Mr C. E. Parr (the Chairman) having dealt with the figures in the balance sheet, then referred to the Stock Exchange Committee's withdrawal of permission for recording dealings in the company's shares. Continuing, he said:—Turning to the development of your properties, operations have been confined solely to opening up the Beposo and Obuoso properties in Ashanti. As regards our alluvial areas in the Denkerawah district, we are just entering into a new agreement with Tano Alluvials, Limited. Under this agreement we give Tano Alluvials, Limited, the right of working approximately 3½ square miles of ground. They have declared 350 acres at least to be payable. We have, meanwhile, obtained two leases from the Chief embracing all this ground.

It is slow work, securing titles on the Gold Coast, and when they are obtained Tano Alluvials, Limited, must have adequate time to make their arrangements for the provision of capital to work the areas. We have every reason to anticipate that Central Wassau will receive next year at least £26,000, half in cash and half in shares, or wholly in cash. This is at the option of Tano Alluvials, Limited.

The report and accounts were unanimously adopted and an informal resolution was unanimously passed by the meeting expressing confidence in the chairman and directors and requesting that it should be conveyed to the Committee of the Stock Exchange with a request that that body should further reconsider their decision with a view to the early reinstatement of markings of dealings in the shares.

A vote of thanks to the chairman and directors closed the meeting.

KILLINGHALL TIN, LIMITED**DIVIDEND OF 35 PER CENT.**

The seventh annual general meeting of Killinghall Tin, Limited, was held, on the 17th instant, at 7 Martin's Lane, London.

Mr W. Arthur Addinsell, the chairman, moved the adoption of the report and accounts and the declaration of a final dividend of 12½ per cent., making 35 per cent. for the year. He said:—The net profit amounted to £62,798, compared with £37,986 in the previous year, and this was after paying £17,406 in royalty to the Malayan Government and £11,468 in tribute. Further, the annual premium on the policy redeeming the issued share capital in 1949 has been provided for in the year's expenditure. The accounts include the profit of the company's contribution of 58 tons to the Buffer Pool stock, amounting to £6,709.

The quota percentages allowed the company's mine to export 921 tons of ore last year, against 500 tons during the previous year. The dredge turned over 2,931,500 cubic yards in the year—considerably more than double the total quantity dredged during the previous year.

The board recommend a final dividend which, with the two interim dividends, absorbs a total of £52,500. It is also recommended that the amortisation premium reserve should receive a contribution equivalent to one half-year's premium. The prudence of this measure will be obvious to you. The position of the balance sheet, already strong, will, after these operations, be practically impregnable.

You are aware that the International Tin Committee recently recommended the Governments of the countries interested to renew the restriction regulations for a further period of five years. This promises well for the immediate future of your company.

Mr Archibald G. Glenister, M.Inst.M.M., seconded the motion, which was unanimously adopted.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached: To Publisher, "Economist Newspaper Ltd."

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. .....

MALAYAN TIN DREDGING, LIMITED.

25 YEARS' PROGRESS

The 25th annual meeting of Malayan Tin Dredging, Limited, was held, on the 16th instant, in London.

Mr C. V. Stephens (the chairman) said that the profit for the year was £184,749. The directors recommended the payment of a final dividend of 22½ per cent., making 80 per cent. for the year. That compared with 45 per cent. for the previous year and 36½ per cent. for the year before, and was a record for the company. It constituted, he believed, a record for any dredging company operating in the F.M.S., and it was, he considered, a tangible tribute to the merits of co-operation as opposed to cut-throat competition.

Their dredge had commenced to operate at the end of 1912, and the success it had achieved in digging and treating ground of a varying consistency and in operating on a limestone bedrock had quickly attracted general attention to the possibilities of bucket dredging in the F.M.S.

From its early days the company had been in the van in the endeavour by experimental work to effect improvements in dredging efficiency and technique. The progress made was perhaps best summed up by comparing their first dredge with the dredge now on order. The "first" dredge, a steam-driven machine, was estimated to cost £25,000, and was designed primarily for a capacity of 50,000 yards per month. The dredge now under construction was designed to treat approximately seven times that yardage; it would be electrically operated, and the cost was estimated at approximately £110,000.

The report and accounts were unanimously adopted.

SOUTHERN MALAYAN TIN DREDGING, LIMITED
RECORD DIVIDEND

The tenth annual general meeting of Southern Malayan Tin Dredging, Limited, was held, on the 16th instant, in London, Mr C. V. Stephens (chairman of the company) presiding.

The Chairman said: After charging depreciation, £20,387, the profit for the year is £222,777. The directors recommend payment of a final dividend of 10 per cent., making 45 per cent. for the year, and leaving £24,264 to be carried forward. The dividend of 45 per cent. is the highest your company has yet paid, and I think you will agree that it is the outcome of a very satisfactory year's work. For the previous year 22½ per cent. was paid, and for the year before 20 per cent.

The International Tin Restriction scheme, which commenced in March, 1931, with four signatory countries, has functioned most successfully and has proved of the utmost value in helping the industry through the recent years of depression. It is therefore gratifying to hear that there appears to be every likelihood of a decision being arrived at shortly to continue the control scheme for a further five years as from the first of next month. The new scheme embraces seven signatory countries with a corresponding number of viewpoints on which to reach agreement, and you will readily appreciate the difficult task it has been to reconcile the different viewpoints and to arrive at an agreement acceptable to all parties.

If control functions as smoothly as it has done in past years and a reasonable degree of amity continues to prevail among the nations of the world then the future prospects for tin would appear to be very encouraging.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended December 12, 1936, amounted to £11,539,000, against ordinary expenditure of £15,800,000. After allowing for an increase in Exchequer Balances of £193,037, the operations for the week, as shown below, increased the gross National Debt by £4,454,000 to approximately £8,042 millions.†

GOLD MARKET

Messrs Samuel Montagu and Company write on December 16, 1936:—

The Bank of England gold reserve against notes amounted to £248,660,346 on December 9th, showing no change as compared with December 2nd. The changes effected on December 15th will be shown in the next return. The Bank of England, on December 15th, announced the purchase of £65,000,313 of bar gold; this is easily the largest daily movement ever recorded. This influx brings the amount of gold held against notes to £313,660,659, valued at the statutory price; at the current market price of gold the value is £522,700,000, which is £14,000,000 in excess of the total note issue shown in last week's return. In the open market about £2,000,000 of bar gold was disposed of at the daily fixing. Offerings were taken mainly for New York, prices continuing to rule at about dollar parity. The s.s. "Naldera," which sailed from Bombay on December 12th, carries gold to the value of about £371,000.

SILVER MARKET

The market was very steady for the first half of the week, during which prices remained unchanged at 21½d. China sales had been sufficient to meet the moderate Indian demand, but on the 14th instant a sharp increase in the latter had the effect of raising prices by ½d. to 21¾d. The demand was not maintained, and quotations eased slightly in consequence, being quoted to-day at 21¾d. for cash and 21½d. for two months' delivery. No wide movements are anticipated in the near future, but the market remains sensitive and prices may continue to show small fluctuations.

Quotations for gold and silver are shown below:—

1936	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce .999 fine
			Cash	Two Months	
Dec. 10 ..	142 0½	11 11-54	21½	21½	Dec. 9 45½

EDMUNDSONS ELECTRICITY CORPORATION, LTD.—The results of the operations of the Edmundson group of companies during the month of November, 1936, as compared with the corresponding month of 1935, show an increase of 15 per cent. of units sold.

CARRERAS, LTD.—The balance-sheet total at October 31, 1936, shows an increase of £752,063 on the year to £7,133,712. Cash amounts to £553,078, against £793,034 at October 31, 1935, and investments, excluding subsidiary companies, to £1,117,595, £1,116,845, together £1,670,673, compared with £1,909,879. Stocks have risen by £1,048,153 to £2,687,621. Debtors at £1,043,439 contrast with £1,134,375 in 1935. Reserve fund remains at £1,000,000.

TRUST OF INSURANCE SHARES, LTD. (Commissions on Purchases of Units and on Re-sales by Unit holders).—The directors of Trust of Insurance Shares, Ltd., have decided that in future the company will allow stockbrokers commission at the official minimum rate in accordance with the practice of the Stock Exchange not only on purchases of units in these Trusts by stockbrokers on behalf of clients, but also on sales of units to the company by stockbrokers on behalf of certificate holders. The net result of the new arrangements will be that the unit holder who wishes to sell his units will obtain the ruling unit bid price without any deduction for charges whatever.

MANCHESTER OIL REFINERIES, LTD.—This concern has been registered as a private company with an authorised capital of £250,000, and a paid up capital of £200,000. It will develop the production of high grade lubricating oil by solvent processes, but no public issue is contemplated for several years. The plant will be equipped for vacuum distillation, solvent extraction by the "Edeleanu" process and solvent de-waxing, and its annual capacity will be about 80,000 tons. The Board of Directors includes Major A. G. Church, Messrs. John Cohen, H. Stuart Ebben, G. Tugendhat and L. H. Watts.

H. AND G. SIMONDS, LTD.—Net profit £164,901, against £162,444. The balance brought forward was £101,105, and after meeting the year's preference dividend and the interim on the ordinary, there remains £223,077. The total distribution for the year on the old ordinary capital (£540,240) is again 18 per cent., less tax, with a final of 14 per cent. It is proposed to add £6,350 to pension reserve, making £105,000, £25,713 to property improvement account, making £110,000, and £22,000 to contingencies reserve, making £150,000. This is a balance of £109,693 to carry forward.

GUY MOTORS, LTD.—Trading profit, £20,550 for the year ended June 30, 1936. After adding £6,159 profit on sale of investments, £780 from reserve no longer required and £960 from various other sources, there is a balance of £28,449. A sum of £12,153 was written off for depreciation and, deducting debenture interest and directors' fees, leaves £8,723. Ordinary dividend, 7½ per cent., less tax.

LAUTARO NITRATE COMPANY.—For year to June 30, 1936, proceeds of sales to, and participation in profits declared by the Sales Corporation amounted to £451,706, against £416,522 in 1934-35. Other receipts, interest, etc., bring the total credit up to £521,181, against £453,654. After providing £9,127 for oficina stoppage expenses, placing £110,749 to working capital reserve and allowing for other expenses, tax, exchange differences, etc., there is a net income, subject to interest on indebtedness, of £362,165. This compares with £296,249 in the previous year. A deficit of £271,295 transferred to surplus account, against £250,920 last year.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

THE past week witnessed a sharp upward movement of the prices of many important primary products. A widespread anxiety to "buy before the next rise," supplemented by speculative operations, has become noticeable on the commodity markets. The implications of these tendencies are discussed in a Note of the Week.

In Liverpool, wheat futures (March) were forced up this week by 6d. to 8s. 10½d. per cental on Tuesday; despite a reaction on Wednesday, quotations closed well above last week's level. A number of countries, including Italy, bought substantial quantities, but on the supply side little change took place this week. Raw sugar, one of the few commodities which have not yet participated in the upward rush of prices, was slightly dearer than a week ago. Lower crop estimates for West Africa and Brazil, supported by speculative activity in New York, provided the occasion for a further rise in cocoa prices. At Smithfield, beef realised higher prices than a week ago. Bacon was also marked up in price, but butter was cheaper.

Among industrial raw materials, non-ferrous metals rose to new high levels, lead now being considerably dearer than in 1929. Curiously, the price of spelter, which was above the quotation for lead in 1929, is now relatively much cheaper. The market in rubber took little notice of the decision of the International Rubber Regulation Committee to increase quotas next year, and promptly pushed up quotations still further. Linseed oil prices took a jump of £2 per ton to the highest level this year on rumours that Argentina's crop may not reach the predicted two million ton level.

In the United States, too, the rising trend of prices persisted during the past week. Thus, Moody's index (December 31, 1931 = 100) rose to 201.3 on Wednesday, against 196.2 a week earlier, 188.2 a month ago, and 164.4 on the same day last year.

COAL

SHEFFIELD.—There is an optimistic note throughout the coal market. Collieries are making good time in preparation for the holiday at the pits. There is a good demand for household coal, and prices are firm. Gas coal is also moving more freely. The shortage of small coal is becoming more pronounced. Coke requirements are very heavy. A fair demand

OIL OUTPUTS

ANGLO-IRANIAN OIL COMPANY, LTD.—Production in Iran for the month of September amounted to 641,000 tons, making a total of 6,157,000 tons for the first nine months of 1936.

THE BRITISH BURMAH PETROLEUM COMPANY, LTD.—Production of crude oil by this company for the month of November was 36,839 barrels.

BRITISH CONTROLLED OILFIELDS, LTD.—Production for week ended December 12th: Venezuela, 17,123 barrels; Trinidad, 26,772 barrels; total, 43,895 barrels. Production for November: Venezuela, 76,124 barrels; Trinidad, 122,787 barrels; total, 198,911 barrels. Deliveries for 228,586 barrels.

THE KERN RIVER OILFIELDS OF CALIFORNIA, LTD.—The total production during the month of November amounted to 141,997 barrels, or approximately 20,285 tons.

THE MEXICAN EAGLE OIL COMPANY, LTD.—Production for the week ended November 21, 1936, was 576,000 barrels. Production for the week ended November 28, 1936, was 401,000 barrels. Production for the week ended December 5, 1936, was 484,000 barrels.

PHOENIX OIL AND TRANSPORT COMPANY, LTD.—The gross production of crude oil of the Phoenix Group for November was 76,845 tons.

TAMPICO OIL, LTD.—The total production from the company's properties in Mexico during November was 10,597 barrels, in respect of which the Royalty due to Tampico Oil, Ltd., amounted to 795 barrels.

TRINIDAD CONSOLIDATED OILFIELDS, LTD.—This company has just brought into production Well No. 17, which is proving to be the most important one so far drilled in its Oropuche field. The company only commenced operations towards the end of July, the production for August and September was 23,749 barrels and 26,000 barrels respectively; the October figure is not yet to hand, but should exceed 30,000 barrels. November output was 43,500 barrels.

TRINIDAD LEASEHOLDS, LTD.—Oil produced during October, 43,301 tons; oil purchased during October from other companies, 68,354 tons. November from other companies, 43,024 tons; oil purchased during November from other companies, 69,751 tons.

THE VENEZUELAN OIL CONCESSIONS, LTD.—Production for the week ended November 14, 1936, was: Bolivar District, 806,749 barrels; Maracaibo District, 25,254 barrels; total, 832,003 barrels. Production for the week ended November 21, 1936, was: Bolivar District, 814,895 barrels; Maracaibo District, 25,877 barrels; total, 840,772 barrels. Production for the week ended November 28, 1936, was: Bolivar District, 816,857 barrels; Maracaibo District, 25,525 barrels; total, 842,382 barrels. Production for the week ended December 5, 1936, was: Bolivar District, 868,190 barrels; Maracaibo District, 23,373 barrels; total, 891,563 barrels. Production for the week ended December 12, 1936, was: Bolivar District, 828,160 barrels; Maracaibo District, 25,481 barrels; total, 853,641 barrels. Well LS. 373 at Lagunillas has been brought in, producing 870 barrels per day through a ½-inch flowplug.

exists for all qualities of coal for export, and supplies are on the short side. Numerous enquiries are to hand for forward delivery.

NEWCASTLE-ON-TYNE.—Northumberland screened steam coals are more scarce than ever for early delivery, and are likely to remain so over the first quarter of next year. Graded steam coals under a strong seasonal demand are in a similar position. Durham coals, particularly coking and bunkers, are unobtainable for this year. Under active home trade, the renewal of shipments to Italy, and an increased import quota from France, prospects of this coalfield are better than for a long time. Patent oven coke is firm under a brisk export trade and a good home demand.

GLASGOW.—Collieries are well booked until after the turn of the year, some far into 1937, and on occasion inquiry relates to supplies into 1938. Meantime, however, producers are not greatly disposed to accept further business. Prices all round are firm, any odd lots available through and the shortage in turn affects the supply of wagons for land-sale delivery. House coal is now in active demand, and in Lanarkshire an advance of 1s. 6d. per ton has been made.

CARDIFF.—This week the South Wales docks have had the unusual experience of a pressure of tonnage for prompt positions, and there are indications that the pressure will be maintained till the Christmas holidays. The spurt has been so unexpected that available loading facilities have been taxed to the utmost, and representations have been made to the dock authorities to resume operations at tips which have been idle for a considerable time. The most important of the factors which have contributed to the improvement is the expansion in French demand, but there is a temporary scarcity of supply in other Continental markets, but the first cargo for Italy under the new trade agreement has been cleared and this week. In these circumstances, prices of sized and other small coals have hardened, but with large coals finding readier markets, there are prospects of larger output and, therefore, of an increase in the supply of Railways have placed orders for 200,000 tons of large and 15,000 tons of sized coals for delivery over next year. Patent fuel prices are unaltered, but coke prices are showing a firmer tendency. The arbitrators of the Central Council under the 1930 Coal Mines Act have rejected the application of the South Wales Executive Board to vary its rule limiting contract periods to March, 1938.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that the scarcity of iron and steel has become accentuated and that the anxiety of consumers to secure supplies is the principal feature but little surplus is available for overseas customers. In the pig iron department the foundry iron position has become somewhat easier. New business has been transacted for delivery up to September, 1937. Nervousness is still shown regarding future supplies, and this is not confined to users of foundry iron. Consumers of hematite and this basic iron are displaying some anxiety concerning supplies next year and are apprehensive of a world-wide scarcity of pig iron.

In the semi-finished steel section tight conditions again prevail and consumers are finding it difficult to cover requirements. Few British works are in a position to accept orders for near delivery and some have retired temporarily from the market owing to the congested state of their order books.

The feature in the finished steel market is the continued heavy pressure to secure supplies of practically all descriptions. In many departments a system of rationing is in force, but although production is at a record rate, it is impossible fully to meet demand.

MIDDLESBROUGH.—There is a steady demand for increasing quantities of iron and steel from home consumers, whilst inquiries are being received in larger volume from abroad.

There is practically no Cleveland foundry iron to be purchased for early delivery, but, for further ahead, buyers have been able to purchase at the fixed minimum prices.

East Coast hematite is in heavy demand, and, although prices are officially unchanged, it is expected that an announcement will be made very shortly of an increase in price. Under the circumstances, makers are not keen to quote for delivery ahead, whilst current production is all sold. It is also anticipated that the prices of all classes of semi-finished and finished steel will shortly be increased owing to the rising costs of production. Quotations for black sheets and galvanized corrugated sheets for export have been advanced, the quotations for No. 24 gauge being £11 10s. per ton f.o.b. and £13 5s. per ton f.o.b.

There is insufficient semi-manufactured steel being produced to cover requirements, but further quantities are arriving from abroad. The output of finished steel is being maintained at top pressure, but difficulty is experienced in getting early delivery of some descriptions.

It is reported that the Furness Shipbuilding Co. have secured an order for an 8,000 ton vessel.

The demand for heavy melting steel scrap continues to increase, and, although works are offering 60s. per ton, merchants are holding for 2s. 6d. per ton more.

Good Durham blast furnace coke readily realises 24s. 6d. per ton delivered at the furnaces.

Imports of foreign ore into the Tees during the first 15 days of December amounted to 79,000 tons against 87,000 tons during the first fortnight of November.

SHEFFIELD.—Business in the iron and steel market continues at a high level, with consumers showing more interest than producers. A few odd parcels of forge and foundry pig come into the market and these are at once taken up. The recently expanded output from Derbyshire blast furnaces has helped to meet increased demand to some extent; nevertheless there is still a considerable shortage. Some iron producers are now booked into the third quarter of next year, but this appears to be the limit to which they will commit themselves at present. There is little variation with regard to hematites. Makers are not accepting all the business offering, and transactions are subject to an unofficial premium of 10s. per ton. Demand for finished iron is good, with common and marked bars as the feature. The ever increasing pressure for basic steel billets makes it impossible for makers to accept all orders in full. Acid billets are coming into heavier request. No price changes have been made this week. Output of steel in this district continues to expand. Special qualities are very well taken up, stainless steels being particularly active.

GLASGOW.—Steelmakers are still unable to deal with the heavy demands made upon them, and they cannot accept orders for near delivery. This situation is general throughout the iron and steel industries in the West of Scotland. Users of semis are unable to secure sufficient supplies to meet their requirements, while manufacturers are similarly unable to obtain deliveries of finished steel to enable them to carry through their processes without interruption. There is no falling off in the volume of new work on the market, and steelmakers and others have sufficient orders on book to keep plants operating for some months. Notwithstanding the large volume of work on hand, it is probable that there will be little or no curtailment of the holiday period, because of the unusually large number of repairs which must be undertaken.

CARDIFF.—On the Swansea Metal Exchange on Tuesday it was announced that for the current month the tinplate output quota under the pooling scheme would be increased from 65 per cent. to 70 per cent. of the allotted capacity of the works. Demand is active, particularly for the inland trade, and although the scheduled prices are still nominally unchanged current business is taking place at an additional 9d. to 1s. per basis box. Galvanised sheets are also in better demand, and on the strength of a decision of the European Thin Sheet Cartel in Paris this week the export price has been raised to £13 15s. per ton f.o.b. Shipments of tinplates at Swansea last week totalled 65,303 boxes compared with 88,399 boxes a year ago, and stocks have increased to 116,693 boxes compared with 86,270 boxes the previous week.

OTHER METALS

COPPER.—The market was again firm and prices closed on Wednesday, with a rise of £1 12s. 6d. on the week, at the highest level since 1931. There was a fair demand by consumers, and holders were prepared to sell only at rising prices. The U.S. domestic quotation was raised by 0.5 cents to 11 cents per lb. on Monday, the news of which reacted favourably on the London market. This increase, which came as a complete surprise in view of the quiet tone which has recently prevailed in the United States, was probably designed by the large American concerns to secure a higher valuation basis for their stocks in end-year balance sheets. Meanwhile, the omission of any reference this year to an "ideal" price, in Sir Edmund Davis' speech at the annual meeting of the Rhodesian Anglo American, Ltd., may serve to indicate the present attitude of the copper "restrictionists." In November, according to unofficial American statistics, world copper stocks fell by 3,268 to 353,258 short tons. This decline was much smaller than in recent months, owing to the rising trend of production, and it is possible that stocks may show an increase this month.

Sales on the London Metal Exchange: 3,000 tons on Monday, against 700 tons last week; 4,950 tons on Tuesday, against 1,800 tons last week; 5,000 tons on Wednesday, against 1,250 tons last week. Domestic spot was quoted at 10.87½ cents per lb. in New York on Wednesday, against 10.52½ cents a week ago and 10.42½ cents a month ago. Wednesday's official closing price for standard cash in London was £46 to £46 1s. 3d., compared with £44 7s. 6d. to £44 10s. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 46,046 tons, show an increase of 865 tons, while stocks of rough copper, at 856 tons, show an increase of 141 tons.

LEAD AND SPELTER.—In response to an active demand, coupled with short supplies, both metals were strong this week, lead at one time touching £26 1s. 3d., and spelter £18 11s. 3d. per ton. As in the case of

1/- per copy; 6 mths. 5/-, 1 year 10/-.

copper, an additional stimulus was the marking up of quotations in the United States. It may be noted that, whereas in America lead and spelter are now quoted at the same price, the margin between the two quotations in London widened this week to between £7 5s. and £7 10s. per ton. Meanwhile, the indications point to a further advance in prices—especially in the case of lead—when consumption expands in the new year.

Sales of lead on the London Metal Exchange: 3,750 tons on Monday, against 2,100 tons last week; 3,650 tons on Tuesday, against 1,650 tons last week; 2,800 tons on Wednesday, against 4,250 tons last week. The New York quotation on Wednesday was 5-50 cents per lb., against 5-20 cents a week ago and 5-20 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £25 17s. 6d. per ton, compared with £24 1s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 3,000 tons on Monday, against 1,325 tons last week; 4,400 tons on Tuesday, against 1,000 tons last week; 4,050 tons on Wednesday, against 2,750 tons last week. Wednesday's quotation in East St. Louis was 5-35 cents per lb., against 5-05 cents the week before and 5-05 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £18 11s. 3d. per ton, against £17 last week.

TIN.—After wide fluctuations, tin prices closed on Wednesday at about the week's highest. At its meeting on Friday of last week, the International Committee decided to reduce the quota for the first quarter of 1937 from 105 to 100 per cent. of the standard tonnages. But, as indicated a week ago, this will not lead to an increased output, since the basic tonnages in certain instances have been raised. In fact, an increased production may be expected since several countries have fairly large unused quota transfers from the present quarter. However, in view of the fact that consumption is on the increase and that consumers' stocks are low, no major price decline can be looked for in the immediate future. The new restriction agreement has not yet been ratified, but is expected to come into force on January 1st and to run for five years. The I.T.C. will have full powers under the new agreement to fix quotas, and not merely to make recommendations to the Governments concerned. In fact, however, this change is more apparent than real.

Sales of tin on the London Metal Exchange: 140 tons on Monday, against 250 tons last week; 450 tons on Tuesday, against 300 tons last week; 775 tons on Wednesday, against 425 tons last week. The New York quotation on Wednesday was 52-87½ cents per lb., against 52-25 cents a week ago and 51-25 cents a month ago. Wednesday's official closing quotation in London for standard cash was £236 15s. to £237 per ton, compared with £231 10s. to £231 15s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,005 tons, a decrease of 166 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, at £200 to £205 per ton, remains unchanged. Quicksilver, on the spot, was quoted at £14 5s. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £60 per ton ex warehouse, as against £56 per ton last week. Chinese wolfram for "December-January" shipment was quoted at 32s. 6d. to 33s. 6d. per unit, c.i.f., as against 32s. 6d. to 33s. 6d. per unit last week. Refined platinum at £9 15s. per ounce remains unchanged.

TEXTILES

COTTON.—Manchester.—The better tone in the market has been maintained. Business has not been so spectacular as a few weeks ago, but there is a persistent inquiry, accompanied by steady buying. Raw cotton prices have tended to rise. The Secretary of Agriculture of the United States Government has announced that the soil conservation plan will remain in operation next season. No definite information is so far available with regard to the disposal of loan cotton, but the Washington officials are not likely to take any action which will have the effect of depressing prices. In the meantime consumption, especially in the United States, remains on a high level.

Although there has not been heavy buying in American yarns for home use, a fair amount of business has been done, and the improvement in the spinning section, especially coarse counts, is being maintained. Current output is being well absorbed. Considerable satisfaction has been expressed at the necessary majority being obtained on the price maintenance scheme in the Egyptian spinning branch. Rather more contracts have been arranged in fine numbers.

There has been no shortage of inquiry in the piece-goods section and fairly active negotiations have taken place between buyers and sellers. Demand for India has continued more cheerful. Some fairly substantial contracts have been reported in mulls and other light cloths for Madras. Moderate orders have been secured in dhooties and prints for Calcutta and in dyed fancies for Bombay and up-country. Poplins have been sold for Hong Kong, dyed goods for Java, and specialities for the Straits Settlements. Printed and dyed fabrics have again moved off fairly well for South America and demand has been maintained in shirtings and coloured cloths for West Africa. Freer operations have occurred in fine goods for Switzerland. Home demand has improved again, and losses on coronation fabrics will probably be smaller than expected.

COTTON PRICES.

LANCASHIRE AND JAPAN.—For some time there has been serious concern in Lancashire about the growing Japanese practice to send grey cotton cloth for finishing processes to Great Britain and to export them subsequently as though made in Lancashire. This development was

discussed this week by the board of directors of the Manchester Chamber of Commerce. It is pointed out that British imports of cotton piece-goods from Japan totalled 3,900,000 square yards during the first three months of this year, 5,443,000 square yards during the second quarter, and 5,006,000 square yards in the third quarter. According to information obtained by the Chamber of Commerce 90 per cent. of these piece-goods were entered under security for subsequent re-export. Although this trade is not yet large, it is tending to grow. Grey cloth imports from Japan rose from 120,000 yards in 1933 to 850,000 yards in 1934, and 8,060,000 yards in 1935. A special committee of the Manchester Chamber of Commerce has been investigating this problem for several months. It is suggested that the acceptance of the "spun, woven and finished" formula should receive wider recognition.

JUTE.—Dundee.—Prices in all sections of the jute trade are firm, with a rising tendency. The raw jute supply-demand position is strong. Buyers continue to absorb all imports into Calcutta, which are now declining, and higher prices are expected. The present crop is likely to fall short of world requirements, estimated at over 11,000,000 bales. Consequently, consumers will have to draw on stocks. The Indian mills continue to work 54 hours per week, compared with the non-Associated Mills' 108 hours per week, yet the increased output is being disposed of satisfactorily. Dundee absorb production, and they are able to maintain their prices at recent levels. Jute yarns are particularly firm, as the result of good export orders for hessian descriptions. There is a good inquiry for jute cloth. As a result of the larger turnover, purchases of raw jute have been increased. Actually Dundee spinners have in view about 100,000 bales more than at this date last season. Business in cloth on the continent is also better, and, in spite of keen competition from Calcutta, all producers are participating in the improvement.

Daisee-2/3 has advanced to £19 7s. 6d. per ton for the full group, after business at £19 5s. being done, with single marks quoted at £19 17s. 6d. and Daisee-4 at £18, while Tossa-2/3 has been raised to £20 7s. 6d. and fours to £19 7s. 6d. for full group, December-January. Good First Marks have advanced to £22 15s. per ton, and Lightnings are sparingly offered at £20 15s. to £21 5s., while Hearts are lowest at £19 15s., December/January.

The placing of export orders of 600 tons of hessian yarns has steadied the yarn position and prices are firm at 2s. 2d. for common 8 lb. cops and 2s. 3d. for 8 lb. spools. Twist has been sold fairly freely at 3½d. for 3-ply 3½d. for 8 lb. chains. Rove is dearer at £20 10s. for 48 lb. and £16 10s. for 200 lb., while the finer yarns are firm at 2s. 9½d. for second quality 8 lb. warp, 2s. 6½d. for third and 2s. 4½d. for fourth. Carpet yarns are receiving a fair amount of attention at 3½d. for 14 lb. warp.

A steady business is being done in jute cloth and prices rule firm at 2½d. for 10 oz. 40 in. and 2½d. for 8 oz. Inquiries include meat wrappers, sugar bags, etc. If the firm tendency of raw jute continues, an improvement in the volume of business may take place. The market in linoleum hessians is quiet, but heavy goods are in steady request.

Calcutta goods have steadily advanced in price until 17s. 8½d. is now quoted for 10 oz. 40 in. and 14s. 0½d. for 8 oz., December, and 17s. 6½d. and 14s. 0½d. for January.

GRAIN MARKETS

WHEAT.—Mainly in response to renewed purchasing on Italian account and the influence of speculators, prices have again recorded a sharp advance. The movement has been reinforced by a week of unsettled weather in Argentina, which has caused some delay in harvesting operations in that country.

On Wednesday last, "December" futures were quoted in Chicago at 134½ cents per bushel, against 128 cents the week before and 117½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 51s. per 496 lbs., against 47s. 9d. a week ago; No. 2 Northern Manitoba, ex ship, 50s. 3d., against 47s. 3d. a week ago. According to the *Corn Trade News*, total shipments of wheat and flour last week totalled 1,069,000 quarters, against 1,525,000 quarters in the previous week and 1,232,000 quarters in the corresponding week a year ago.

FLOUR.—Flour has again advanced in sympathy with wheat. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 40s. per 280 lbs., against 38s. a week ago; delivered inner London, 39s. 6d., as compared with 37s. 6d. a week ago. Manitoba patents, ex store, 37s. 3d. to 38s. 9d., against 35s. 6d. to 36s. a week ago. Australian, ex store, 34s., against 32s. to 32s. 6d. a week ago.

BARLEY.—Imported varieties of feeding barley have again been a firm market. "December" futures were quoted at 80½ cents per bushel in Winnipeg on Wednesday, against 72½ cents a week ago. Quotations in London, Wednesday: "English feed," at farm, 28s. to 29s., as against 28s. to 29s. a week ago; "English malting," at farm, 34s. to 50s., against 34s. to 50s. last week; Californian (new), ex ship, 48s. to 58s., against 48s. to 58s. last week; Chilean, brewing (new), ex ship, 39s. 6d. to 45s., against 37s. to 42s. 6d. a week ago.

OATS.—Quotations for oats have continued to advance. On Wednesday, "December" futures were quoted at 51½ cents a bushel in Chicago, against 49½ cents a week ago and 45 cents last month. Quotations in London, Wednesday: "English Black" (new), at farm, 22s. 6d. to 23s. 6d., against 21s. to 22s. a week ago; "English White" (new), at farm, 22s. 6d. to 23s. 6d., against 21s. to 22s. a week earlier; mixed 22s. 3d. last week.

MAIZE.—Despite a reaction on American markets, maize is again dearer this week. "December" futures were quoted on Wednesday at 107½ cents per bushel in Chicago, against 109½ cents a week ago and landed, 25s. 6d. per 480 lbs., compared with 25s. a week ago. "Plate," ex ship, 24s. 6d., as against 24s. a week ago; "Plate," "December," 24s. 6d., as against 24s. a week ago; yellow maize meal, ex wharf, was quoted at £6 12s. 6d. to £6 15s. per ton, as against £6 5s. to £6 10s. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1934-36:—

NEAREST FUTURE	Jan. 3, 1934	Jan. 2, 1935	Dec. 18, 1935	Dec. 31, 1935	Dec. 9, 1936	Dec. 16, 1936
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.....	65½	82½	85½	84½	114½	121½
Chicago (No. 2, Winter) —Cents per 60 lb.....	84½	98½	101½	75½	128	134½

The visible supply of wheat in Canada amounts to 63,557,000 bushels, against 65,887,000 bushels last week, and 141,623,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1932-33 to 1935-36:—

	1932-1933	1933-1934	1934-1935	1935-1936
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to December 12	338,534	349,100	352,153	280,690
15 weeks to December 12	5,148,983	6,583,172	6,477,995	4,732,328
Average price of English wheat per cwt.	s. d. 4 7	s. d. 4 11	s. d. 5 9	s. d. 8 7

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding week in each of the years from 1932 to 1935:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
December 10, 1932 ...	Cwts. 267,558	Cwts. 346,273	Cwts. 54,633	s. d. 5 4	s. d. 6 11	s. d. 5 9
December 9, 1933 ...	338,534	375,163	45,712	4 7	9 2	5 3
December 15, 1934 ...	349,100	263,989	47,901	4 11	8 4	6 8
December 14, 1935 ...	352,153	325,391	32,911	5 9	8 2	5 10
December 5, 1936 ...	298,075	441,641	52,848	8 5	9 5	6 10
December 12, 1936 ...	280,690	389,768	61,967	8 7	9 4	7 1

OTHER FOODS

BACON.—Quotations were higher last week-end and there has since been a sustained demand for all descriptions, with the market showing a firm tone. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 88s. to 92s.; Canadian, 82s.; Danish, 92s.; as against 86s. to 92s., 80s. and 90s. last week. Arrivals in London last week included Danish, 12,180 bales; Canadian, 7,501; Dutch, 2,104; Lithuanian, 1,372; and Polish, 2,291; as against 12,115, 6,879, 2,022, 1,499 and 2,005 bales, respectively, in the previous week.

BUTTER.—The market turned quiet this week, and prices were easier. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 103s.; Australian, choicest salted, 100s.; Danish, 114s., compared with 104s., 102s. and 118s., respectively, a week ago.

CHEESE.—The market has shown no new features, but prices are well maintained. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 86s. to 88s.; Canadian, finest coloured, 70s. to 72s.; and New Zealand, finest coloured, 63s. 6d., against 86s. to 88s., 70s. to 72s., and 63s. 6d., respectively, a week ago.

COCOA.—The rise in the price of cocoa continues. The spot quotation in New York on Wednesday was 11½ cents per lb., as against 11½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, "December-February," was quoted 50s. per 50 kilos, c.i.f. Continent, against 49s. 9d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 11,312 bags; delivered, for home consumption, 5,488 bags; exported, 153 bags; stocks, 103,737 bags, against 110,705 bags a year ago.

COFFEE.—A quiet, but steady, tone has been displayed both in New York and London. On Wednesday, Rio No. 7 (cash) was quoted at 8½ cents per lb. in New York, as compared with 8½ cents per lb. last week and 8½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 52 cwt.; delivered, for home consumption, 37 cwt.; exports, 118 cwt.; stocks, 9,114 cwt., against 12,154 a year ago. Central and South American, landed, 3,813 cwt.; delivered, for home consumption, 1,996 cwt.; exported, 753 cwt.; stocks, 54,487 cwt., against 65,893 last year. Other kinds: landed, 3,915 cwt.; delivered, for home consumption, 2,807 cwt.; exported, 1,137 cwt.; stocks, 89,713 cwt., against 70,537 last year.

EGGS.—In Tooley Street on Monday, the market was again quiet and prices were lower. The seasonal peak has now been passed and gradually

declining quotations are to be expected. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15-15½ lb.) realised 18s. 6d. to 19s. 6d. per 120, as against 19s. to 20s. last week; while Danish (15½ lb.) made 14s. 6d. to 14s. 9d., as against 14s. to 15s. last week.

FRUIT.—Business at Covent Garden has improved despite the inclement weather, states *The Fruitgrower*, and all the regular Christmas lines are firm. Apples have been in steady request and all dessert sorts are inclined firmer. Pears continue to go out well at steady rates. South African peaches, apricots and plums are now receiving more attention, while hot-house grapes are generally dearer. Large supplies of Tunis dates are available at moderate prices. Cobnuts are a point dearer and all other nuts are in more active demand with the approach of Christmas; almonds are short and dear. Oranges are an active trade, but lemons keep at a comparatively low level, and grapefruit are rather slow.

MEAT.—At Smithfield this week, fresh killed supplies were ample for the demand and prices were easy. For chilled beef and frozen mutton and lamb, however, trade was good and quotations were higher. On Wednesday last, Argentine chilled hindquarters were quoted at 4s. 2d. to 4s. 6d. per 8 lbs., as compared with 3s. 10d. to 4s. a week ago. New Zealand frozen mutton was 3s. 4d. to 3s. 10d. per 8 lbs., against 3s. 2d. to 3s. 10d. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 10,705 tons, an increase of 440 tons on the corresponding week last year. Beef and veal accounted for 5,754 tons, mutton and lamb 2,613 tons, and pork and bacon 1,197 tons, as compared with 5,066, 2,820 and 1,076 tons, respectively, in the same week of 1935.

MILK.—Information relative to the operation of the Milk Marketing Scheme during November, as issued by the Milk Marketing Board, is given in the following table, together with comparable statistics for earlier months:—

	Nov., 1935	August, 1936	Sept., 1936	Oct., 1936	Nov., 1936
Regional pool prices* (per gallon):	d.	d.	d.	d.	d.
Northern	13½	9½	11½	13	13½
North-Western	13½	9½	11½	13	13½
Eastern	13½	10	12	13½	13½
East Midland	13½	9½	11½	12½	13½
West Midland	13	9½	11½	12½	13½
North Wales	13½	9½	11½	12½	13½
South Wales	13½	10	12	13½	14
Southern	13	9½	11½	12½	13½
Mid-Western	13	9½	11½	12½	13½
Far Western	13	9½	11½	12½	13½
South-Eastern	14	10½	12½	13½	14½
Liquid milk price (per gallon, all regions)	17	13	15	17	17
Manufacturing price (per gallon, average)	5-804	5-256	5-656	5-766	5-778
Total sales under contract	64-85	80-00	73-65	72-98	64-64
For liquid consumption	45-59	45-82	46-80	47-65	46-51
For manufacturing	19-26	34-18	26-85	25-33	18-13

* On account to the nearest farthing.

Accredited producers receive 1d. per gallon in addition to the above prices. Premiums for level deliveries and for Grade "A" or special services are paid to the producers concerned in addition to the pool price. Transport charges are payable by individual producers and are deducted from accounts.

PEPPER.—Wednesday's spot price for black Lampung (in bond) was 2½d. per lb., against 2½d. a week ago. Movements of pepper in London during the past week were as follows: Black, landed, 8 tons; delivered 19 tons; stocks, 1,816 tons, against 1,512 tons a year ago. White, landed, 53 tons; delivered, 52 tons; stocks, 11,841 tons, against 13,900 tons a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 9s. 6d. per cwt., ex warehouse, on Wednesday, as compared with 9s. per cwt. a week ago. "January-February" in singles to Continent and U.K. was quoted at 9s. 6d. per cwt., against 8s. 9d. last week. Movements in London during the past week were as follows: Landed, 18 tons; delivered, 166 tons; stocks, 1,590 tons, against 5,252 tons a year ago.

SUGAR.—While the London spot market has shown a rather firmer tendency, prices in New York have eased this week. The spot price in New York on Wednesday was 3-77 cents per lb., as compared with 3-85 cents per lb. last week and 3-65 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "January" delivery at 4s. 9½d., against 4s. 9d. a week ago. The movements of raw sugar at public warehouses in London and Liverpool last week were as follows:—

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Dec. 12, 1935	12-53	12-28	13-46	12-07	10-01	11-61	12-66
Nov. 5, 1936	13-03	12-51	14-95	11-93	9-12	11-97	13-40
Nov. 12, "	12-80	12-21	14-92	11-79	9-75	12-07	13-30
Nov. 19, "	12-69	12-27	14-72	11-58	10-24	12-07	13-12
Nov. 26, "	12-67	12-44	14-70	11-85	10-13	11-77	13-09
Dec. 3, "	12-67	12-44	14-50	11-61	10-24	11-61	13-03
Dec. 10, "	12-55	12-42	14-51	11-47	10-30	11-58	12-92

The quantities catalogued for the public auctions in Mincing Lane this week comprised 50,349 packages of Indian and 18,616 packages of Ceylon tea. Competition was good and prices in most instances—especially for Ceylon teas—showed a hardening tendency.

VEGETABLES.—At Covent Garden market this week, says *The Fruit-grower's* report, salads generally have been in slow demand. A fair showing of forced asparagus encountered a fair inquiry, while forced rhubarb has now put in an appearance. Demand has improved for cabbage, savoy, sprouts, cauliflowers, carrots, turnips and parsnips. Celery continues to sell well, mint is scarce, and onions are inclined firmer. Meanwhile, the

potato trade at the various London markets has been rather quiet, with prices about unchanged. At the Borough on Tuesday, best siltland King Edward again made 9s. to 9s. 6d. per cwt., ex market.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—There has been great activity and marked firmness in oilseeds, particularly in linseed, in which a substantial business was done earlier in the week at rising prices. Both Britain and the Continent were considerable buyers. The advance in prices has been helped by the rise in shipping freights and adverse reports concerning the new expected yield of two million tons. The balance of the old Plate crop has at a fair level. It seems probable that this year's exports from Argentina will exceed a million and a half tons. New crop is being dealt in freely to now afloat for Europe is 125,200 tons, including 16,400 tons from India. America is also taking larger quantities. The firmness in seed has been £3 since the beginning of the month, thus passing the highest previously recorded this year.

Cotton seed continues to advance, and the highest price for some years has been reached, up to £9 5s. having been paid for black Egyptian, quiet, but in common with other vegetable oils the market is firm and higher figures are quoted. Oilcakes are in very good demand and are firm.

FURS.—The last of the silver fox sales to be held in London this year opened on Monday last, at Beaver House, Garlick Hill, when offerings comprised between 40,000 and 50,000 Canadian and Norwegian skins,

The attendance was good, the bulk of the purchases, as usual, being made by French buyers. Since many French operators had been out of the market recently, in consequence of the devaluation of the franc, their interest in the current sales was not unexpected. Prices, which had risen by some 10 to 15 per cent. between the end of September and mid-November, were well maintained. One of the most notable features of this week's sales was the interest displayed in Norwegian skins, which, although of inferior quality to the Canadian furs, are of a colour which is more fashionable at the present time. They were accordingly in active demand at high prices.

RUBBER.—The event of the week was Tuesday's decision of the International Rubber Regulation Committee fixing production quotas at 75 per cent. of the standard tonnages for the first quarter of 1937 and

at 80 per cent. for the second quarter. Although this represents an advance on the present level of production, the increased supplies will not be available for some time, and the announcement of the decision caused the market to advance. The tone has since been strong.

The spot price in New York on Wednesday was 20½ cents per lb., compared with 19 cents per lb. a week ago and 18½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 9½d. per lb., as against 9½d. on the corresponding day last week. In forward positions, business has been done at 9½d. to 9¾d. for "February" shipment, as against 9½d. to 9¾d. for "January-March" a week ago. Stocks in London and Liverpool at the end of last week totalled 82,486 tons, against 85,285 tons a week earlier. A year ago stocks amounted to 163,636 tons.

OUTSTANDING VALUES IN AMERICAN SHARES.

Many shrewd British investors will welcome the opportunity to read the reprint of an important analysis just published in THE FINANCIAL WORLD of America under the heading "Previous F.W. Share Recommendations Still Regarded as Attractive." This timely analysis gives a list of all earlier FINANCIAL WORLD recommendations that still appear to have more than average long term possibilities. The outlook for American business and American securities over the next two or three years makes it important for you to keep well informed through a dependable American authority. This you can quickly and easily do by reading America's leading and oldest investment weekly.

THE FINANCIAL NEWS

Special articles due to appear next week on the Leader
Page of THE FINANCIAL NEWS are as follows:

MONDAY, DECEMBER 21—THE ECONOMIC CONFLICT
IN FRANCE.—The clash between the Left Wing forces in
the French Government and the capitalist forces of finance
and industry has still not shown much sign of being solved
by conciliation. In this article our Paris Correspondent ex-
plains the present stage of the struggle and examines the
chances of an outcome which will assist French recovery.

TUESDAY, DECEMBER 22—BASE METAL SHARES:
RETROSPECT AND PROSPECT.—Our Special Mining
Correspondent, MINOTAUR, makes the Christmas week the
occasion for a review of progress and prospects in that
section of the Mining Market which has recently attracted
more interest than any—the Base Metal Companies.
A further article by our Correspondent, dealing with progress
and prospects in the Gold Share Markets, will appear at a
later date.

WEDNESDAY, DECEMBER 23—THE WHEAT BOOM.—
As forecast in earlier issues of THE FINANCIAL NEWS, the
feeling that a shortage of supplies is in prospect has taken a
firm hold on the Wheat Market. The Argentine Crop
Estimate, published this week, has done nothing to allay that
feeling. This article examines the present position with
regard to supplies and discusses the possibility of the Boom
continuing.

THURSDAY, DECEMBER 24—BRITAIN'S IRON ORE
SUPPLIES.—The uncertainty of our normal iron ore supplies
from Spain has focused a certain amount of attention on the
Iron Ore question, particularly owing to the existence of
abandoned or unworked deposits in this country. This article
surveys the British Iron and Steel Industry's present sources
of supply and suggests the probable effects of changes that
are likely to take place.

THE CHRISTMAS HOLIDAYS
In common with all other London morning newspapers, THE
FINANCIAL NEWS will not be published on Christmas Day,
December 25, or Boxing Day, December 26.

THE FINANCIAL NEWS
(Twopence Daily)

On sale at all railway bookstalls and good newsagents everywhere

RETROSPECT

NOTHING marks the passage of time better than Christmas. There is something about this holiday season which makes it of man's life a thing apart. It is a season regularly set athwart the current of time, like a breakwater behind which, for a moment or two, we can all take our temporal and spiritual bearings, before being once again swept into the tide of men's affairs.

Christmas, with the long momentum of its past behind it, with its gifts, and with its orientation towards the New Year, is a season of greater unselfishness than any other festival. We really begin at this time to think of others; of families as units, which we seldom do during the year; of friends scattered over the seven seas; of children, and of old men in the chimney corner; of those less fortunate than we; of the mutability of human affairs. And so we begin to think of Time itself, the shape of things to come, the destinies of the nations and of our own, and what lies before us. Let us, then, ride into the smoother waters of Christmas, 1936, and try to take our bearings.

We are all certainly better off in this country than we were five or six Christmases ago. Then, the greatest economic depression the modern world has ever experienced had settled down upon it, as if the war of 1914-18 had exacted a postponed reckoning. Men talked at Christmas, 1931, as though the world were cracking beneath their feet. Yet it was purely an economic fear. Politically, the world retained the façade of ordered unity which the Peace Treaties had imparted to it. Only in the Far East could the cloud of aggression be discerned. So it was in 1932, a sense that the world was economically disintegrating; that politics could be managed somehow, but that the nations' economic systems were rotting; that a strange economic era, without precedent or principle, yawned at our feet. World-wide values, their inter-relations through

the gold standard, the contractual solidity of the debtor-creditor relationship, the future security of capital—these fundamentals seemed gone beyond hope of recall.

Yet now, at Christmas, 1936, economic recovery has proved our saving grace, whereas political unsettlement is the dynamite that threatens to blow up our civilisation. In our economic affairs, it is true, we still have in this country our chronically unemployed, our Distressed Areas and our languishing export trades, just as the world at large still has its hard-hit, primary-producing countries like Bulgaria, Greece, or Chile. But 1936 has at last brought some unity, of which we had despaired since 1931, to the trading world. In September, the French, American, and British financial authorities co-operated to render devaluation of the franc easy. The devaluations of the other erstwhile gold bloc currencies quickly followed; and a movement towards enlarging import quotas and reducing tariff barriers in these countries began. This first faint foreshadowing of financial and commercial unity in a distraught world is now gaining its advocates in many quarters and many countries. At the same time, during 1936 those commodity prices whose abrupt fall in 1929 ushered in the Great Depression made an equally sudden spurt upwards; and this came as a final move in a slowly ascending curve which had begun to mount in 1933. With the rapid rise of these prices, world purchasing-power revived; the value of trade increased with its volume; debtors began to envisage resumption of debt services with greater equanimity, and creditors even to contemplate the possibility of fresh loans. Shipping revived; the yield of foreign investments recovered; unemployment fell; industrial capacity was more occupied.

Our first thought must be one of surprise that in a world which, in five years of depression, had raised hindrances to international trade to a higher pitch than ever before,

recovery should have become so widespread in many countries, and in so short a time after the trough of depression. America, Australia and New Zealand, Africa, India, even China, Britain, Belgium and Scandinavia; these are the high spots of world economic recovery. In every case they have been associated with radical monetary readjustment, scaling-down of costs, and the lowering of the rates which must be paid on borrowed capital.

But the Christmas retrospect and prospect has certain obscure and even gloomy patches. In all Western countries—from America to Denmark and Switzerland—"public works" have come, unhappily, to take more and more the shape of giant armaments and munitions of war.

Compare, for example, our present state with that in so recent a year as 1932. In that year the Disarmament Conference opened; and, just before Christmas, on December 12, 1932, Germany was accorded "equality of rights in a system which would provide security for all nations." At that time, our hopes ran high. Those hopes were brought to nought. The year which is now drawing to its close began, as almost every New Year begins, in an atmosphere of sanguine expectancy. The League of Nations had been made effective against Italy's aggression, largely by the pressure of British public opinion. Our Government had deeply pledged itself to support the League in order to win a General Election. But within the first few months of 1936 the League had been stultified by Italy's swift victory in Abyssinia; Nazi forces invaded the Rhineland and tore up the Locarno Treaty; and there followed an understanding between Germany and Italy over Austria in July. In the same month, the active sympathy of the two European Fascist Powers for Fascism abroad declared itself when the rebel officers in Spain struck their *coup de main*. From that day to this, Germany, Italy and Japan have stood together. Russia alone stands on the other side of the fence; and perched on the top are the remaining democracies, furiously arming to the teeth in case the fence collapses.

Thus, when we look about us this Christmastide we find greater political perils than before, but better economic conditions. Now this economic recovery cannot stand up indefinitely against political trouble; and even if we could be certain of keeping the peace there is still much to be done in the international field to make our prosperity secure. In short, our present well-being is conditional. We may safely say, however, that the omens for a further improvement in our economic lot by co-operative effort would be highly propitious were it not for the lowering political storm clouds which obscure the advent of 1937. Our economics are fast becoming a product of two disastrous political expedients: self-sufficiency and armaments.

These things apart, 1936 has been a year of especial importance to the British peoples. A year ago we wrote in this column—almost with prophetic sense—an article entitled "The Old Order Changeth." To-day we look back on twelve months which have seen the death of a King who came to the throne four years before the last war, the advent of his successor, and then—a sequel which not the wildest imagination could have foreseen—the voluntary abdication of a young and popular monarch in favour of his younger brother, without anything approaching either an Imperial or a popular conflict. It almost seems as if the immediate post-war epoch has already passed, while the links with pre-war days are snapping one after another. What of the new era into which we are plunging so rapidly?

There are some reasons why we should take heart at the outset of 1937. In the past few months we have seen the consolidation of democratic forces behind the Government of M. Blum in one of the great Western democracies; and we have seen the crushing and complete victory of President Roosevelt in another. In the third, our own, we have seen a sudden firm rally on the part of the Government against para-Fascist disturbances, and a welcome access of clarity and firmness to official pronouncements on foreign affairs. What surprises 1937 may bring we do not know. But the countries of liberty may at least console themselves with the knowledge that they are strong and that they have made some recovery from the more serious rebuffs of a year on which few statesmen can look back with satisfaction.

EUROPE LOOKS AT PAN-AMERICA

THE Pan-American Conference which is just ending after being in session at Buenos Aires for a month, has displayed a constructive energy. Such energy would have been noteworthy in the proceedings of any international body of the kind in either hemisphere; but it is particularly striking by contrast with the negativeness, caution and reserve that characterised earlier conferences in this American series.

The two principal diplomatic instruments that have emerged from the present session are a convention of December 12th for the maintenance of the American peace, and a treaty for co-ordinating, amplifying and ensuring the fulfilment of the existing treaties between the American republics. True, the action to which the signatories of these two agreements pledge themselves does not go beyond an undertaking to consult one another in the event of any threat to the objects which it is the purpose of these agreements to secure. This consultation will have to be *ad hoc*, owing to the rejection by the Conference of the United States Government's proposal for the establishment of a permanent consultative body.

The history of the Washington Four-Power Treaty, which likewise went thus far and no further, gives a warning of the possible ineffectiveness of such an instrument when the time comes to make use of it. On the other hand, where there is a will to co-operate, even an imperfect treaty can serve the purpose of statesmen who have made up their minds to take the initiative. And the will to implement the inter-American convention of December 12, 1936, may be expected to prove effective; for the scope of the treaty is not confined to the distressing yet not superlatively perilous contingency of a fratricidal war, of the Bolivian-Paraguayan type, between two or more Latin-American States. The obligations of this treaty are also expressly made to apply "in case of war outside America threatening the peace of the American republics." In that situation all American States alike would be under the strongest incentive to stand and work together.

The world-wide scope of the new inter-American consultative agreement has inevitably raised the question of the relation between the convention of December 12, 1936, and the Covenant of the League of Nations. To the Covenant, sixteen out of the twenty-one Latin-American republics are parties. The United States Government has assured these sixteen States members of the League that it had no intention of suggesting they should undertake any new obligations that would either supersede or conflict with their duties under the Covenant. This assurance has undoubtedly been given in entire good faith.

At the same time, certain of the American States members of the League, led by Argentina, have taken care on their side to see that their rights and duties under the Covenant are preserved intact. In general terms, this point has been made in Article 7 of the treaty for the fulfilment of existing inter-American agreements. In particular the group led by Argentina has successfully opposed the inclusion in the new treaties of the United States Government's proposal that the contracting parties should bind themselves to withhold the supply of arms and credits indiscriminately from all belligerents—a pledge which would have inhibited any signatories who were also States members of the League from fulfilling their existing obligations to discriminate between the covenant-breaker and his victim. And Argentina has expressly reserved her own freedom of action in such a case.

The negative aspect of the Conference's achievements is the determined attempt that has been made at Buenos Aires under the leadership of the United States, with a minimum of opposition from Argentina, to insulate all the Americas from the rest of the world. America is to be an *alter orbis* which can and will keep out of the pandemonium of international rivalry and warfare by refusing to take social responsibilities outside its own regional frontiers. The positive aspect of the Buenos Aires conference is the profound change in the relation between the United States and the other participants.

The crux of inter-American politics is the enormous disparity in physical strength between the North American republic and its Central and South American neighbours—a disparity which is as great as that between the German Reich and Czechoslovakia, or between the United Kingdom and New Zealand. And the fundamental question of inter-American relations, ever since the emancipation of the Americas from European political control, has always been this: shall the attitude of the Latin-American republics towards the United States be like the attitude, in 1936, of Czechoslovakia towards Germany, or like the attitude of New Zealand towards Great Britain? During the war and the post-war years the Latin-Americans came to view the prospect of economic penetration and naval domination from the side of the United States with an increasing suspicion and even alarm. It should be added that anything that could reasonably be described as a United States imperialism was restricted to the limits of Central America and the Antilles; while, even within these limits and in its most extreme manifestations, it was mild indeed by comparison with the full-blooded imperialism of the European Great Powers and Japan. The measure of the present achievement of President Roosevelt is given by the new relation between the United States and her Latin-American neighbours—a relation which has been fructifying at Buenos Aires and can now be expressed in terms of the relation between Great Britain and the other self-governing Dominions of the British Crown. In that case, as in this, the overwhelmingly superior strength of one of the parties is now looked on by this physically predominant partner's associates as an asset for themselves, and not as a liability.

Inter-American co-operation and Pan-American isolation are thus the two complementary tendencies in American affairs which the Buenos Aires Conference has thrown into relief. This American spectacle will move the European observer to inquire, further, how far each of these two tendencies is likely to go.

How closely, for example, will it be possible for the relations between the United States and Argentina to approximate to those between the United Kingdom and Australia? The entente between the self-governing States members of the British Commonwealth manifestly rests upon an identity of ideology. There is, of course, at least the rudiment of a similar ideological bond between the American States members of the Pan-American Organisation. They are all of them republics which originally won their sovereign independence by throwing off the yoke of European monarchies. That, however, is now rather an old story; and the great and growing ideological differences between different American republics at the present day may come to count for more. The test question is that of the weight to be given to the formal common allegiance of all the American republics to the political ideal of parliamentary democracy. In Latin America this institution is at least as exotic as it is in Continental Europe. In some Latin-American countries at the present day even the presence of parliamentarism is being discarded in favour of

new-fangled and avowedly high-handed ideologies that are much more closely akin to the Fascism of Italy and Germany and to the Communism of Russia.

Supposing that the New World, like the Old World, divides into three distinct ideological camps, may not the Pan-American organisation fall into the same difficulties as the League of Nations? And, by the same token, may not the insulation of the Americas from the rest of the world break down? Revolutionary political ideas are even harder to keep at bay than bombing planes; and Communism and Fascism may leap an Atlantic whose western waves are still physically ruled by the United States Navy.

BORROWERS IN THE BOOM

CAPITAL is the proverbial handmaid of industry. If wassail in the kitchen appropriately accompanies high jinks in the hall, then the year 1936, when British industrial activity reached its highest level for all time, ought to be memorable in the new capital market. Actually the total new money offered publicly to investors, which rose, according to *The Economist's* computation, from £169.1 millions in 1934 to £236.1 millions in 1935, has made a further modest gain to £255.7 millions. That figure is two and a half times as large as the total for 1931, the worst year of depression, but it is little more than two-thirds that of 1928, the best pre-depression year.

The market, in fact, has been active, but not consistently active. Its constituent sections have varied from a state of incipient boom to idleness scarcely distinguishable from atrophy, as the following table shows:—

TOTAL BORROWING BY DIRECT PUBLIC OFFER
(Million £)

Calendar Years	British				Empire	Foreign	Total Issues	Index 1928 = 100
	Government	Home Corporations*	Others	Total Home				
1928.....	83.9	14.9	164.8	263.6	63.2	42.3	369.1	100
1929.....	65.4	8.3	124.3	198.0	61.0	26.2	285.2	77
1930.....	65.6	41.7	63.3	170.6	61.4	35.8	267.8	73
1931.....	10.7	8.0	35.8	54.5	38.5	9.1	102.1	28
1932.....	102.7	28.8	31.6	163.1	25.5	0.3	188.9	51
1933.....	150.8	24.5	34.9	210.2	29.2	5.4	244.8	66
1934.....	44.1	36.1	57.5	137.7	29.9	1.5	169.1	46
1935.....	88.0	51.1	81.6	220.7	15.2	0.2	236.1	64
1936.....	60.2	79.5	90.6	230.3	24.7	0.7	255.7	69

* Including county and public board loans.

Foreign issues by prospectus have become almost non-existent; Empire issues have been the lowest for any year, save 1935, shown in the table; and British Government borrowings (involving the subscription of new money or the funding of the floating debt, as distinct from pure conversion operations) have been on a moderate scale. That total home borrowings (representing 90 per cent. of all "public" issues) have been higher than in any year since 1928, has been due partly to a further rise in the total raised

TO OUR READERS

With the first issue in the New Year
THE ECONOMIST

will present an altered appearance.

All editorial matter will be so presented as to conform to the highest standards of typography and lay-out. Among the changes are clearer type-faces, less solid arrangement of editorial matter, heavier and whiter paper and stiffer covers.

Our aim has been to provide easier and more pleasurable reading.

These improvements complete the process begun three years ago, when the first significant change in the appearance of the journal was made since its foundation in 1843.

by home companies and partly to further revival in the market for new issues by municipalities and public boards.

It would be difficult for any observer from Mars or the moon to deduce from our figures, either that 1936 had been a year of outstanding domestic prosperity, or that the interest-cost of new borrowing had continued to be anything from $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. lower than in 1928-29. Among the many explanations of an anomalous situation, pride of place must be given to the perpetuation of a system of unofficial, non-statutory but highly effective Treasury "control." It has been harder for a camel to thread the needle's eye than for a foreign prospectus to win the imprimatur of the Committee to whom, this year, the authorities have remitted the task of interpreting their "requests" to issuing houses. But home company issues have remained entirely free, while the queue of home corporation borrowers has, on the whole, been kept steadily moving, and favoured issuers like the railways have even been stimulated by a Treasury guarantee.

Official canalisation of part of the stream of new issues, however, does not explain why prospectus offerings by domestic industrial companies, which have been limited only by the borrowers' appetite and the market's powers of digestion, have been no more than 63 per cent. of the average for 1928-29. Undoubtedly, the latest revision of the Companies Act, and the zeal with which the Stock Exchange Committee is exercising its Petrine function of guarding the market's door, have had a salutary effect in checking the issue of many "bubble" prospectuses of a type which disgraced the boom of seven or eight years ago. The favourite speculative company of 1936, moreover, has been a relatively small unit, usually in the aircraft, machine tool, engineering or armament trades. A number of these companies may have been prone optimistically to capitalise the earnings of a single prosperous year; but at least they have been anchored to reality by the market's insistence on some earnings rather than the gold-brick-manufacturing hypotheses of the gramophone, photographic and patent corkscrew enterprises of 1928. Established concerns, being unusually well provided with liquid resources at the end of the depression (for non-liquidity arises normally from over- rather than under-trading), have financed a fair instalment of recovery without recourse to the market. And the incidence of high modern taxation is encouraging directorial boards increasingly to reserve annual profits for eventual bonus share issues, rather than to pay high dividends and subsequently ask shareholders for new capital.

Our figures, however, almost certainly exaggerate the falling-off in new borrowing since 1928-29, since they do not allow for the increasing popularity of the method of "placing" new capital on the Stock Exchange, instead of offering it direct to the public by way of a prospectus. Though the Stock Exchange Committee has announced its determination to limit "placing" facilities for companies

which are newcomers to the market, the method is both legitimate and expedient for many concerns which desire to make additional "lines" of shares available to investors. The much-discussed Morris Motors ordinary share issue of 1936 was a "placing" which admirably illustrated both the advantages and disadvantages of this practice.

Actually, the amount of new capital which comes to market by way of "permission to deal" on the Stock Exchange, without preliminary ordeal by prospectus, is very large, as will be seen by comparing the figures in the following table with those given earlier in this article:—

TOTAL BORROWING, INCLUDING "PERMISSION TO DEAL"
(Million £)

Calendar Years	British				Empire	Foreign	Total Issues
	Government	Home Corporations*	Others	Total Home			
1935.....	88.0	54.9	183.9	326.8	29.3	1.2	357.3
1936.....	60.2	82.1	306.1	448.4	39.8	11.7	499.9

* Including county and public board loans

The figures show the value of all borrowings, by prospectus or otherwise—the former being calculated at issue prices and the latter at opening prices for official dealings. Our totals are swollen by such issues as that of F. W. Woolworth, whose 3,750,000 new 5s. ordinary shares obtained "permission to deal" this month, and opened at a market price of 44 ros. per share. We publish the figures, therefore, tentatively and experimentally, as an indication of the upper limit assignable to the public creation of new capital in the last two years. It is noteworthy, however, that these all-comprehensive totals give a far more striking impression of the increased tempo of the market in 1936, compared with 1935, than the "public offer" figures alone.

On page 656 will be found our usual detailed tables showing the nature and distribution of the issues of the last two years, both on the old and the new bases. The figures suggest two supplementary observations. In the first place, the process of converting existing capital obligations to lower rates of interest continues, but since the War Loan conversion was effected in 1932, the chief beneficiaries have been borrowers other than the British Government.

CONVERSION ISSUES

(Million £)

	1932	1933	1934	1935	1936
British Government... Other Conversions ...	2,478.9 91.8	50.7 172.4	105.0 138.9	204.0 108.2	37.2 187.6
Total.....	2,510.7	223.1	241.9	312.2	224.8

Secondly, the ordinary share tends increasingly to be the favourite medium of new company finance. In 1932, out of company prospectus issues of £33.6 millions, only £6 millions (18 per cent.) were in ordinary shares. In 1936, out of £113.6 millions, some £70.3 millions (62 per cent.) were in ordinary shares. Of all company issues on our "New Basis" (i.e. inclusive of "placings") last year, as much as 78 per cent. were in the form of equity securities.

Taken by and large, the increased element of selection, official and unofficial, now present in the capital market appears to have perceptibly shifted the centre of gravity towards home as distinct from foreign investment and towards established companies as distinct from new enterprises. Undoubtedly, one result has been to raise the investment quality of the average new issue; for it is to the more speculative sections of the market that restriction's axe has been chiefly applied. The broader economic repercussions, however, of a policy which restricts new borrowings in time of recovery and low interest rates, and emphasises the domestic side of British industrial activity in a period of rising world prices, may be more doubtful.

INDIA'S FOOD PROBLEM

(BY A CORRESPONDENT)

INTEREST in the relationship between nutrition and incomes has recently been spreading all over the world. The League Assembly's committee has issued illuminating reports on the subject; and Sir John Orr's Report on "Food, Health and Income" in Great Britain discussed the nutritional problems of the leading industrial country in the world. Quite other are the nutritional needs, and therefore the nutritional problems, of the population of an Oriental country, living very much nearer the pure subsistence level. In this article we propose to estimate the volume of British India's food supply, analyse its dietetic content, and compare the resulting food values available, per head and per day, with the quantities laid down as desirable minima in the Report of the British Medical Association's Sub-Committee on Nutrition. Our inquiries are based on the year 1931-32.

The following table gives estimates of the gross output of food grains, livestock products, oils, fruits and vegetables; columns 4, 5 and 6 give details of the necessary deductions; while column 7 contains figures of the net quantities available for human consumption:—

FOOD PRODUCTION IN BRITISH INDIA 1931-32

(Figures in thousands of tons)

Item	Description	Gross Production	Deductions and Additions			Net Quantity available for Human Consumption
			Seed and Wastage	Consumption by Cattle	Export - Import +	
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1	Rice	31,637	1,898	...	- 2,347	27,392
2	Wheat	7,234	434	...	- 81	6,719
3	Barley	2,374	142	...	- 24	2,208
4	Juar	4,593	270	...	...	4,323
5	Bajra	2,309	138	...	...	2,170
6	Maize	2,248	135	...	...	2,113
7	Grain	3,526	212	...	...	3,314
8	Other food grains..	11,120	667	7,453	...	3,000
9	Sugar	2,589	222	...	+ 539	2,906
10	Vegetables	10,714	1,339	...	+ 06	9,375
11	Fruits	6,928	...	...	...	6,928
12	Milk	21,612	...	...	+ 7	21,619
13	Fish	1,809	...	...	- 8	1,801
14	Meat	399	...	...	...	398
15	*Rape and Mustard seeds.	1,013	61	...	- 57	340
16	*Sesamum	374	22	...	- 12	85
17	*Groundnut	2,262	136	...	- 672	640

* Figures in Column 7 against oil-seeds relate to the oil equivalents of the seeds, as it is only the oil which is used for human consumption, the oil cakes being fed to cattle. The rates used for estimating oil extraction from seed are 25 per cent. for sesamum, 38 per cent. for rape and mustard, and 44 per cent. for groundnuts.

For most of the production figures, either official estimates have been used, or calculations have been made by assuming the same average yields over the total areas as occur in certain districts. For item 12, "milk," no official statistics are available beyond the number of cows and cow-buffaloes. We therefore obtained, from various sources, estimates of the average period of lactation, the yield of milk per day per cow and per cow-buffalo, and the extent to which cows in India do not yield any milk beyond the quantity required for feeding their calves. This gave a figure for aggregate yield. Secondly, we obtained from the health officers of a number of Indian towns figures of estimated consumption of milk per head per day. We also worked out an estimate of per capita rural consumption. From these particulars we arrived at a figure of aggregate consumption. Our production and consumption figures showed close agreement (to within 6 per cent.); and the estimate in the table is the mean of these two sets of figures.

For item 14, "meat," no official data are available. Consumption of meat is mainly confined to the towns. We obtained, from over 150 municipalities out of a total of 700, statistics of slaughter of cattle, sheep and goats; and applying the average of animals slaughtered, per head of the population of these towns, to the remaining urban population we were able to build up an estimate of urban meat consumption. We were also able to estimate the rural consumption of meat. The estimates for items 10 and 11, "vegetables" and "fruits," are less reliable than the others.

Thus, the estimate of British India's net food supply

Sun Life Assurance Company of Canada

(Incorporated in Canada in 1865 as a Limited Company)

The Company has been rendering service to the public in Great Britain for more than 41 years by enabling prudent men and women to safeguard their own and their families' future, through comprehensive Life Assurance and Annuity plans.

Sums assured by new, paid-for Life Assurance policies issued during 1935 in Great Britain and Ireland total

£5,500,000

Total Assurances in force at November 15th, 1935, in Great Britain and Ireland

£69,500,000

H. O. LEACH (General Manager), 2, 3 & 4 COCKSPUR ST., LONDON, S.W.1

gives the following per capita daily ration of food, amounting to 2.4 lbs. in weight:—

	lbs.
Cereals, including pulses.....	1.150
Vegetables and fruits	0.410
Milk and milk products.....	0.490
Vegetable oils.....	0.240
Sugar	0.066
Fish and meat.....	0.005

The population of British India (according to the 1931 Census) is 271 millions; but for purposes of consumption the equivalent man-units are only 186.4 millions. The following table gives the value of foodstuffs available for consumption per man-unit per day in British India, and compares it with the standard diet recommended by the British Medical Association.*

Description	Quantity Available	B.M.A. Scale	Quantity Available compared with B.M.A. Scale	
			Surplus +	Deficiency -
Protein 1st class (grms.)	19.2	50	- 30.8	
Protein 2nd class (grms.)	78.0	50	+ 28.0	
Fats (grms.)	38.8	100	- 61.2	
Carbohydrates (grms.)...	679	500	+ 179	
Calories.....	3,543	3,390	+ 153	

These results correspond with a priori expectations. The food available per day has a high calorific value. In fact, if these statistics can be trusted, there is a surplus of calories over the minimum which must be consumed to maintain working efficiency. Poverty in the food supply shows itself rather in a deficiency of the more costly items—first-class proteins and fats—and in an excess of the cheaper carbohydrates. Thus, precisely the same phenomenon is observed in British India as when one compares the diet of the poorer classes with that of the well-to-do classes in a country with as high a standard of life as that of Great Britain.

There is a substantial deficiency in animal proteins; but against this there is an equally substantial surplus of vegetable proteins. It should be remembered, however, that Colonel McKay's detailed investigations into the jail dietaries of Bengal and the United Provinces have shown that only about 60 per cent. of the protein available from Indian cereals is actually absorbed into the human system. Thus, in fact, there may not even be a surplus of second-class proteins to offset the large deficiency in those of the first class. Moreover, our calculations do not take into account infants' needs of milk, if they are less than twelve months old. In fact, in a country with as large a vegetarian population as that of India, the consumption of milk per head should be higher than in countries with large meat-eating populations, like England and Sweden. Yet the per capita consumption of liquid milk in India is only half of that in England and a quarter of that in Sweden.

* The table of food values used for this purpose is based on figures given in Dr. B. S. Yajnik's pamphlet on "Dietaries for Cultivators," published by the Provincial Hygiene Institute of the United Provinces of Agra and Oudh, and corresponds closely with those given in Dr. Ghosh's standard work on "Hygiene and Public Health in India."

Clearly, the most important task confronting the social reformer who seeks to make India's food supply satisfy decent standards of nutrition is to increase milk production in India. The increase has to be as large as 100 per cent. A doubling of India's milk supply will not only increase the quantity of animal protein available per head, but will also increase the element of animal fat in Indian diet, which at present is largely supplied by vegetable oil. This is not as hopeless a task as may appear at first sight. India has a large stock of milch cattle—14.7 million cow-buffaloes and 38 million cows. It is true that the percentage of cows yielding no surplus of milk for human consumption is considerable; while the average yield per head, even of the stock which does yield milk, is deplorably low compared with that of the milch cattle of other countries—in fact, between a third and a fourth of the yield in England. But milk yield depends to a considerable extent on the quantity of food fed to cattle. And part of the vast quantity of cereals and other food grains now used for human consumption in India could with advantage be spared for cattle.

The main conclusion arising from the survey is the grave deficiency of milk in Indian food supply. This brief study suggests that the whole subject of India's food supply in relation to her nutritional requirements is in urgent need of more thorough and organised investigation.

I AM SPLENDID

(By Mr Smith)

In the crisis through which we have just passed the nation, by universal consent, behaved magnificently. Parliament behaved magnificently. The Press behaved magnificently. The Stock Exchange behaved magnificently. Lloyd's Register of Shipping behaved magnificently. The licensed victuallers behaved magnificently. Sir John Reith behaved magnificently. Above all, the common people behaved magnificently. And it is as the embodiment and representative of the common people that I write this article.

We English are notoriously unemotional and have but little use for self-admiration. We tend rather to depreciate our merits than to display them in the shop window. That fact is, of course, recognised everywhere both at home and abroad. When we happen to have something specially fine to our credit we invariably pass on without asking for praise, like the hero who first rescues a dog from the Thames and then hurries away to escape the onrushing reporters. But sometimes we don't get away in time; and then the weight of evidence, proving how splendid we are, is too much for us and reluctantly we have to give judgment in our own favour.

That is what has happened in the last few weeks. Wherever I have gone as representative of the common people I have been told that I was wonderful. Archbishops, bishops, city editors and leader writers have all refused to leave me unadvised of my almost unimaginable greatness. If any one of these important folk had told me about it, I should have been impressed. But when they all combine to tell me, the effect is overwhelming.

Let us start with the Bishop of St. Albans—not one of my warmest admirers, but a pleasant *hors d'œuvre* to the richer fare that follows. He says:—

During these last terrible days, however accustomed we had grown to all sorts of things, yet the heart of the nation rang true.

That's not bad, but a bit vague; and I like the Foreign Secretary much better. He says of me:—

The most remarkable feature of the crisis has been the steadfastness and forbearance of the great British public. They have again displayed those qualities of coolness, dignity, wisdom and restraint which have characterised them at critical moments in the Empire's history. They have given expression to that innate political instinct which is, perhaps, their greatest gift.

That restrained appreciation of Mr Eden's rings (as the Bishop of St. Albans said about my heart) true. Now for the Archbishop of Canterbury. He cannot, I fear, approve of all the topical jokes, limericks and riddles with which we

common people solaced ourselves during and after the crisis. Notwithstanding them, however, he says this about me:—

Some strong tide of instinct rather than of reasoned thought, flowing deep beneath the surface eddies of excitement, had borne the people through the rapids of the crisis. It is right to be proud of the way in which the nation has stood the test; yet let there be no boasting in our pride.

I do think that is lovely. Whatever some may say of the Archbishop's sermon I take off my hat to him, as the first person to detect both the eddies on the surface and the tide of instinct flowing deep within me. And, of course, I shall be very careful not to boast about it. Now I come to *The Times* leading articles, which are, I think, the best of all. They say:—

The nation has treated a great issue worthily; its thought moving steadily and soberly, with reluctance but without sentimentality, with searching of heart but without tumult, towards a firm conviction.

And again:—

The British people, facing its ordeal under an unprecedented glare of foreign publicity, has earned the wonder and admiration of the world. A sudden emergency has enabled the British people to prove its native greatness.

So, you see, it isn't only in England that I am admired and well spoken of. It's all over the world. In Reykjavik and Chicago, in Milan and Lourenço Marques, on the Potomac and on the Yangtze—everywhere men are turning to each other and exclaiming: "How wonderful is Mr Smith, and how admirable!"

To be quite frank, there is, in spite of all the praise, just a shade of bewilderment in the modest splendour of my mind. I recognise the fact that I have behaved magnificently, but I can't, at the moment, see just what the alternative to my magnificent behaviour would have been. Suppose that my heart had not rung true. Suppose that I had not been steadfast, forbearing, cool, dignified, wise, restrained and full of political instinct. Suppose that the deep tide had not flowed beneath the surface eddies. Suppose that I had not moved steadily and soberly, with reluctance and searching of heart, but without sentimentality and tumult. Suppose that in a sudden emergency I had not proved again my native greatness. Suppose, in short, that I had not been just the wonderful person that I have been. Exactly how would the deficiency have revealed itself? Of all the things that I did, what would I have omitted? Of all I left undone, what would I have done?

After all, I did not decide on the Abdication, and I could not have stopped it. I might, of course, have sent the wrong sort of letter to the papers. But if I had, they would not have printed it. I might, I am told, have formed a "King's Party." But if you were here and now to order me to form a "King's Party," I simply should not know how to set about it. One useful hint, indeed, is given me by *The Times*, which points out that I could have broken windows by throwing stones. That is very true, but the stone-throwing would have been followed by a night spent in a police cell, which would have been uncomfortable. And apart from that, a deep instinct whispers to me that merely to refrain from throwing stones is not in itself native greatness. It is undoubtedly puzzling. And sometimes, when I am slightly off colour, I become really worried, trying to make out what a man less wise, less cool, less amazing, less wonderful, less restrained and less full of deep instincts and running more to surface eddies myself—what would such a man have done that I did not do

Of course, if this were a foreign country the solution would be simple. I should say at once that the talk about my being so fine was all make-believe and eyewash, which are much in use abroad. But that theory will not work in it together. Those names in themselves are a guarantee temporal and spiritual, to the only possible conclusion—I am splendid.

NOTES OF THE WEEK

Men and Measures.—Just as last year's autumn session ended with the bizarre affair of the Hoare-Laval Plan, this year's ended with the even more bizarre affair of King Edward's Abdication. Naturally, the Abdication must overshadow all other topics in the minds of members of the public looking back over the session; but profoundly unsatisfactory as was the issue of the crisis in some ways, Parliament emerged from it with enhanced credit. Mr Baldwin's reputation appears to have been enhanced most of all. Indeed, the Prime Minister, who seemed on the verge of retirement at the beginning of the session, now seems to have taken on a new lease of political life; and Mr Churchill, who was gaining in reputation at the beginning of the Session, has suffered at the end for his championing of an unpopular cause during the Abdication crisis. Despite the irruption of that crisis, however, some important legislation has been passed during the autumn, including the Public Order Bill and the Trunk Roads Bill. The Marriage Bill, inspired by Mr A. P. Herbert, has also progressed fairly smoothly, and a Bill for establishing compulsory holidays with pay obtained a second reading. The Public Order Bill is certainly the main achievement of the Session, even if it was far from the public's mind on the gloomy December afternoon when King Edward's Abdication was announced.

* * *

Help for the Special Areas.—The problem of the Special Areas is very far from being solved, but the help that is being given by one means and another deserves the warmest encouragement. No remedy has better chance of success than the Government-financed trading estate; and it is good news that, following on the initial success of the Tyne Estate, work has actually been begun on the new Estate in South Wales. Work on this Estate—which is situated between Cardiff and Pontypridd, and is to be known as the Treforest Trading Estate—was begun on Monday. The first building is to be a paper mill; and the contract, which states that local labour shall be used whenever possible, has already been placed. The second series of contracts—for the provision of Estate roads and drainage, for the filling and levelling of the site, and for the provision of railway sidings—are now advertised, and tenders are returnable by January 5. Gardens, recreation grounds, canteens, a restaurant and a bank will be included in the Estate; and the railway will be led right into it and will give access to sidings, etc. Applications for sites have already been received from 24 firms in many industries, and six factories are to be erected immediately in addition to the paper mill. The Estate clearly offers substantial advantages to industrialists; and it may well prove a nucleus for economic as well as social revival in South Wales. Almost simultaneously with its initiation comes the news that Lord Nuffield has made a munificent gift of £2,000,000 to the Special Areas. The money has been placed at the disposal of three trustees (Mr Nigel L. Campbell, Lord Portal and Mr B. Seeborn Rowntree), and they will have full discretion to use it for the initiation or support of measures likely to give employment to those living in the Areas as well as measures designed for social betterment. There will obviously be plenty of scope for the trust's operations. The problem of the Special Areas as a whole, however, is still very far from any final solution.

* * *

The Marxist Front.—In view of the persistence of the incipient Popular Front movement in this country, the proposed "united front" (a "united front" seems to be one that excludes Liberals) between the Socialist League, the Independent Labour Party and the Communists is of some interest. It is not at all certain, however, that the united front—even if it came off—would assist the Popular Front movement. The Communist Party has never had any connection with the Labour Party; and the recent

Labour Party Conference at Edinburgh decided by an overwhelming majority against Communist affiliation. The I.L.P. split from the Labour Party after 1931, and put up candidates in opposition to Labour candidates at the last General Election. The Socialist League, on the other hand, now led by Sir Stafford Cripps and Mr William Mellor, is affiliated to the Labour Party; and since the Labour Party has rejected both Communist affiliation and open co-operation with the Communists, it is extremely doubtful whether the Socialist League could pursue these policies and remain within the Labour Party. It is also one of the ironies of the situation that the Communists are officially in favour of a Popular Front, while the Socialist League and the I.L.P. are not. The central idea of the proposed alliance between the three extreme Left factions would, of course, be to organise a campaign on Marxist, class-war lines. So small, however, is the influence of the three factions, even combined, both in the country and in Parliament, that the Labour Party would clearly not be willing to abandon for the sake of their support one iota of the democratic and gradualist principles to which it is committed. And it now appears that Sir Stafford Cripps cannot even carry his own Socialist League supporters. It may be that an eventual union of Left-wing parties will appear in this country; but the proposed Marxist Front has not brought it perceptibly nearer.

* * *

Britain and Italy.—The decision of the French and British Governments to convert their Legations at Addis Ababa into consulates was announced at Rome on Monday. The news had been foreshadowed in a statement of Mr Eden's in the House of Commons on December 16th. In the same statement, however, the Foreign Secretary declared that "in any case it is not the intention of His Majesty's Government to accord *de jure* recognition of the annexation of Abyssinia." This last assurance, of course, is not an earnest of an intention to do anything effective for the vindication of international justice in execution of British obligations under the Covenant. The British and French Governments, if they are to be judged by their records up to date, are likely to recognise the Italian "Empire of Ethiopia" with alacrity if and when they can induce the Assembly of the League of Nations to pave the way for this by declaring that Abyssinia has ceased to be a State member. Such formalities do not touch the heart of the matter. The British people will remain deeply humiliated by our failure to fulfil our own international obligations to prevent the commission of what we regard as a monstrous international crime. In his latest speech, Signor Mussolini declared that Italy's accounts in Africa had now been settled to the last centesimo, but that other accounts still remained open in other quarters. This is no very strong basis for the Anglo-Italian conversations which are now reported to have ended in a joint declaration on the respective interests of the two countries in the Mediterranean. A genuine Anglo-Italian agreement in a region vital to both parties might enable Italy to withdraw her perilous intervention in Spain, to leave the Western Mediterranean to Britain and France, and to leave Germany high and dry in Spain—an uncomfortable position. But we can scarcely trust Signor Mussolini's word after his triple breach of it in violating the Covenant of the League, the Kellogg Pact, and the Italo-Abyssinian Non-aggression Treaty of 1928. How are we to assess his assurances—reported in the House of Commons by Mr Eden last week—that the Italian Government has not engaged, and will not engage, in any negotiations with General Franco whereby the *status quo* in the Western Mediterranean will be altered? Have these assurances any more value than those which were still being given by the Duce to the Emperor of Abyssinia at a time when—as we now know from Marshal de Bono's book—the Italian preparations for attacking Abyssinia were already in full swing?

Spain and Europe.—The European wire-pullers behind the scenes of the Spanish conflict are still hard at work. This week it is reported that 30,000 German troops are already in General Franco's forces, and that they are manning tanks and artillery for the final drive on Madrid, the prelude to which seems to have begun. On the Government side considerable successes are still claimed in the north; and Oviedo and Burgos are suffering for the concentration of Franco's forces round the capital. The rebel leader's strategy seems to depend now on his ability entirely to surround Madrid with the aid of the divisions supplied by his Fascist backers. Then simultaneous advances from the Talavera road, from Guadarrama, and Sigüenza would, if successful, force Señor Caballero's forces either to surrender with the capital, or to run the gauntlet towards Valencia. Three events during the past week have rendered the European conflict of interests over Spain more acute. First, the Russian Government announce that a Russian ship, the "Komsomol," has been fired on and sunk by Spanish rebels or their foreign supporters; and it is reported that Russian warships and submarines have been ordered to convoy Russian ships in the Mediterranean. This opens up alarming possibilities of a European war in all but name. Secondly, the still continuing hasty despatch of many thousands of "blond Moors" to Spain from Germany, under German generals, has led the French Government to intimate to the German Government that France will consider herself free to take any suitable action if "volunteers" are sent from Germany in such volume. Thirdly, the definite understanding between Britain and Italy is reported to embody an Italian assurance to withdraw from supporting the Spanish rebels. If Italy does this, Germany may find herself in an awkward international predicament; and if, then, Germany and Russia withdraw from Spain together, Franco-British mediation will stand a real chance of success. For one thing is now evident beyond a peradventure; if Italy and Germany left off aiding and abetting Franco, and if Russia left off assisting the Spanish Government, General Franco's dastardly attempt at a *coup de main* would ignominiously collapse for lack of support among the Spanish people.

Rumblings in Germany.—Since the signature of the German-Japanese convention a few weeks ago Germany's diplomatic prestige has swiftly fallen; and today she seems more isolated than ever. Despite French and British official invitations to hasten her participation in discussions on a general European settlement, the directors of Nazi foreign policy unremittently cling to an isolation which their own acts, month by month, do most to crystallise. The reported Anglo-Italian understanding this week accentuates Germany's isolation, and may well involve Herr Hitler and the Reichswehr leaders in acute difficulties, both in Spain and Europe as a whole. Last week-end, so it is said, General von Blomberg deprecated the despatch of so many "blond Moors" to Spain as it might involve Germany with the Great Powers of Europe. But Herr Hitler and his Nazi politicians successfully defied the Reichswehr leaders when the Rhineland was invaded last March; and they may do so again, before long. Indeed, the manifest hardships of the present German winter are obviously forcing the chief actors in the drama—General Goering, Dr. Schacht and, strange as it may seem, the German Ambassador in this country, Herr von Ribbentrop—to exhort the German people to look elsewhere than on their own material deficiencies. These deficiencies are partly the outcome of world-wide hindrances to foreign trade, partly the result of Germany's monetary and exchange policy, but mainly the result of the Nazis' frantic self-sufficiency and re-armament programme. This has imposed rationing of food imports, and of all civil industries working for normal export trade, in favour of imports of raw materials for the Nazi war economy. This winter the deficiencies and poor quality of food, clothing, etc., have become painfully apparent in the lower income-earning classes. Accordingly, the propaganda campaign for external circumses—notably the demand for colonies in which German currency must be valid—has broken out with redoubled vigour in the last three weeks, after it had

become apparent that Herr Hitler's recent dissolution of the Colonial League had failed to bring the British Government round to the Nazi way of thinking. In this country, France, Belgium and all other European countries save Italy, the overwhelming sense of the people is that the "colonial question" can only be opened as an integral part of a general European settlement in which Germany will agree, fully and whole-heartedly, to collaborate in the political and economic redressment of Europe. Meanwhile, there is no longer any disguising the straits to which Germany has been reduced by the dictates of a frenetic militaristic preparation; and the months ahead must be clouded by fears lest desperate counsels sway desperate men.

France's Budget and the Franc.—An unnecessarily pessimistic view is being taken of France's financial position at the present moment. It is true that M. Vincent Auriol's Budget, passed by the Chamber on Friday, showed a deficit of 4,000 millions (over £40 millions); and there is, of course, a much larger additional total of loan expenditure on armaments, public works, etc. The deficit, however, is a legacy from the deflationary period of MM. Doumergue and Laval. When deflation fails and reflation and devaluation are adopted instead, the persistence of a large deficit is inevitable for a time, particularly if huge armament expenditure has to be undertaken as well. The solution can only come from increasing revenues, resulting from business revival; and business revival is steadily proceeding in France, despite the failure of the long-term interest rate as yet to fall. Moreover, recovery is likely in itself to tempt capital back, and the Government's new loan has been offered in terms which permit those who have made a profit on devaluation to retain at least 90 per cent. of their profits. Time is on the side of the French financial authorities once more. It may be that a bigger devaluation would have brought quicker relief, and that the rise in costs has offset some of the advantages. But a 30 per cent. devaluation is no trifle; and, more important still, prices and costs in the outside world are now rising rapidly, whereas in the case of most of the other devaluations they were falling. This fact is strongly in France's favour. It may be, again, that a slight lowering of the present pegged rate would be desirable—and it would be a pity to treat that rate as sacrosanct—but the remaining disequilibrium, if it exists, must be relatively small. It is on industrial revival, rather than on exchange or gold movements, that France's economic recovery now depends.

President Chiang Kai-shek's Fate.—In the course of a week, the facts of the Chinese situation have become clearer, while the outcome is still impossible to predict. It is now evident that the young Marshal's *coup* is essentially a piece of gangster's work and not a subtle move in high politics. His illustrious prisoner is not his confederate; and this means, unhappily, that the President's life is genuinely in danger. The position at Sianfu, in fact, is not unlike that at Vienna on the tragic day on which Dr. Dollfuss was a prisoner in his own Chancellery in the hands of a Nazi gang. The Chinese Government which has now of kidnapping is showing the same energy and resolution as were shown in Austria by Dr. Dollfuss' colleagues. Overwhelming Government forces are closing upon Sianfu, while their aeroplanes are circling over the city. Chang Hsueh-liang has not a chance if he decides to fight it out. His choice lies between surrendering at discretion without touching a hair of the President's head, or wreaking his revenge on his prisoner at the cost of condemning himself to death when he falls into the Government's hands. At the moment, everything is still in suspense. President Chiang himself is still alive, though one member of his suite has already met his death by "suicide" as a hint to the President of what the young Marshal can do if he chooses. On the other hand, Chiang Kai-shek's brother-in-law, Mr T. V. Soong, has flown to Sianfu, and has been allowed to land there; and he would hardly have put his head into the lion's den if he did not believe that

there was some hope of negotiating a happy ending to the story. One of the most interesting symptoms is the undisguised perturbation of the Japanese, who dread the possible permutations and combinations of Chinese politics if the strong ordering hand of Chiang-Kai-shek is removed. Evidently the Japanese do not believe that they can fish advantageously in Chinese waters that are troubled beyond a certain degree. This Japanese reaction will not be lost upon the President of the Chinese Republic if he returns safe and sound to Nanking.

A Franco-Turkish Dispute.—A dispute has arisen between France and Turkey over the future status of the Syrian district of Antioch and Alexandretta. The reason why this year's Franco-Syrian negotiations were a success, in contrast to the abortiveness of the Franco-Syrian treaty of 1933, was that the French negotiators this time conceded the inclusion of the whole of the French mandated territory outside the boundaries of the Greater Lebanon in the boundaries of the Syrian Republic. This meant the inclusion of considerable non-Sunni Arab minorities: for example, the Ansariyah of the Ladiqiyah district and the Turks in the district of Alexandretta and Antioch. As a matter of fact, this latter district has never been detached from the rest of Syria under the French mandatory regime; but, in virtue of decrees made by the French High Commissioner in 1921 and 1923, it has enjoyed a special local regime which has included a certain measure of financial as well as linguistic autonomy. This arrangement was made in fulfilment of a French pledge that had been included in the Franco-Turkish agreement of October 20, 1921. This latter agreement settled the frontier between Turkey and Syria, and settled it on lines that coincided with the linguistic boundary between the Turkish and Arabic languages—with the one exception that it left the Turkish population of Alexandretta and Antioch on the Syrian side. The French insisted upon this for the good reason that the assignment of this district to Turkey would have cut off Aleppo from the sea and have made the new Syrian State territorially halt and maimed. The concession of the special local regime was the *quid pro quo* for the Turkish Government's acquiescence in this French demand. There has been no suggestion that the rights guaranteed to this local Turkish minority in Syria have not been scrupulously respected under the mandatory regime; and the Franco-Syrian treaty provides for their maintenance under the sovereignty of the Syrian Republic. The Turkish Government's grounds for raising the question of the status of the Antioch and Alexandretta district now are twofold. They say that the agreement was between themselves and the French, and that, with the liquidation of the French mandate, they will lose their present guarantee for the well-being of their Turkish fellow-countrymen within the Syrian frontiers. In the second place, they argue that, if Syria is to receive her complete independence, the Antioch and Alexandretta district has an equal right to the same boon. The answer is that the geographical arguments for the inclusion of the district in Syria remain unaffected, and that the Turkish element in the district is by no means the whole population, nor even perhaps an absolute majority of it. The dispute has now come before the Council of the League, and the two parties have stated their cases in terms which do not hold out much promise of agreement by compromise. Both Turkey and France have, however, declared that they will not seek a settlement by other than peaceful means, and they have also agreed upon an interim regime. France is withdrawing the additional troops that were recently quartered in the disputed territory, while Turkey has agreed to the posting of neutral observers along the international frontier.

Britain's Invisible Income.—It is a necessary consequence of the way in which Sir Robert Kindersley's invaluable statistics of British capital abroad are derived that their interest is at first glance historical rather than topical. Those just published in the *Economic Journal*

refer to capital outstanding at the end of 1934 and the income obtained from it in 1935. The total of British investments in overseas Government and municipal loans, in British companies operating abroad, and in securities of overseas companies quoted in London, is estimated at £3,414 millions at that date, an increase of £28 millions in 1934. To this is added an estimate (admittedly less reliable) of £300 millions for other forms of British capital abroad, including securities not quoted in London and "direct investment." This estimate has been raised by as much as £20 millions compared with the end of 1933, and a still larger increase will undoubtedly be recorded for 1935, and again for 1936, in view of the enlarged flow of funds to Wall Street. Sir Robert Kindersley calculates the total income on the £3,716 millions of British capital abroad at £167,900,000 in 1935. The increase of £8,700,000 shown in this figure by comparison with 1934 is mainly accounted for by the larger dividends of British companies operating abroad, which of course include a large proportion of mining and plantation concerns; this trend also is therefore likely to be continued in 1936. The same group provides a further credit for the national balance of payments in the shape of sums placed to reserve and remitted to the United Kingdom. These allocations, exclusive of reserves for depreciation and obsolescence, are estimated at £5,900,000 for 1935. Still another credit item is loan repayments, which in 1934 totalled no less than £42 millions. These figures help to explain why the gross increase of British investments abroad, through new issues, British repurchases of investments formerly sold to foreigners, etc., sometimes seems out of relation to the sum apparently available for capital export. After allowing for larger dividends from "commodity" investment and for a much higher shipping income, Sir Robert Kindersley's calculations suggest that there can have been very little net surplus on the balance of payments in 1936, and that most of the capital newly sent abroad, to the United States and elsewhere, must have been counter-balanced by imports of capital, long-term or short-term.

Peace in Lancashire.—After having caused the country some anxious moments, the dispute in the spinning section of the Lancashire cotton industry was settled at the last moment. The notices to cease work, involving about 100,000 operatives, took effect at midday last Saturday. A few minutes before midnight the trade unions and the employers agreed on a compromise. A disastrous strike, which would have involved the whole industry at a moment of long-delayed improvement, has thus fortunately been averted. Since July, 1921, the wages of operatives have been steadily reduced without any whole-hearted effort to raise the efficiency of the industry by reorganisation. The last two reductions in wages were made in September, 1927, and in November, 1932, involving cuts of 12½ per cent. and 14 per cent., respectively, on standard piece price-list rates. The unions, it will be remembered, demanded a restoration of the 1932 cuts. The agreement reached last Saturday provides for an increase of 9½ per cent. on the standard piece price-list rates, equal to 1s. 1½d. in the pound. In addition, "big" piecers in the mule-room and adult male workers in the ringroom are to receive a rise of 2s. each. Actually, spinners and winders, who hitherto earned from £3 to £3 10s. per week, now receive 3s. to 4s. more, while the earnings of "big" piecers, receiving about 30s. per week, are raised by 3s. 9d. or 3s. 10d., and those of cardroom workers by 1s. 6d. to 2s. per week. Perhaps the most important feature of the settlement is the belated realisation by both parties that Lancashire's fortunes cannot be restored without a measure of co-operation. The trade unions have furnished proof of their goodwill by giving a promise of co-operation in the long-delayed internal reorganisation of the cotton industry. The sole criticism which can be made of the agreement is that it includes no provision for restoring adequate conciliation machinery. How useful a conciliation committee can be has recently been demonstrated by the prompt settlement of the dispute in the weaving section of the industry.

Pig Marketing Breakdown.—After creaking and groaning for three years, the machinery of the Pigs and Bacon Marketing Schemes has broken down altogether. The trouble has arisen because the farmers have not contracted to supply the curers with sufficient pigs to keep the bacon factories working economically throughout the coming year. The schemes provide that bacon pigs shall be sold on contract between feeder and curer, contracts being signed towards the close of the year to cover supplies during the ensuing twelve months. The approximate volume of home bacon supplies is thus known, and the Board of Trade can proceed to allocate import quotas to overseas suppliers. If the farmer defaults, however, the curer is entitled to purchase pigs on the open market, where—unfortunately for the success of the Schemes—the price paid has frequently exceeded the contract price. Partly owing to this price differential, the number of pigs offered on contract for 1937 is 314,000 short of the minimum of 2,200,000 required by the curers, although the terms are the most favourable yet granted to the farmers. Last week-end, therefore, the Bacon Board (representing the curers) availed themselves of their right to declare null and void the contracts already signed. This breakdown of the Marketing Schemes is the more serious for the British producer, since import restriction is contingent upon the existence of a marketing scheme at home. Although it is officially stated that the import quotas already fixed for the first six weeks of the New Year are to come into force, the legality of the regulation will thus be open to question. Efforts are being made to save something from the wreck as we go to Press. But it is clear that if the farmers will not play their part the curers must be allowed to obtain their pigs on the open market. This would mean an end to the schemes in their present form, and would render import regulation under the Agricultural Marketing Acts illegal. It is possible, therefore, that the consumer of bacon will benefit from this week's débâcle.

* * *

New Industries and Coal Supplies.—One of the chief paradoxes of the present system of control in the British coal-mining industry is its combined elasticity in some sections, and excessive rigidity in others. Colonel W. A. Bristow, chairman of Low Temperature Carbonisation, Limited, drew attention to this feature of the centralised selling system in the course of his speech at the annual meeting of that company on Monday. One of the statutory functions of the Central Council under the 1930 Coal Mines Act is to co-ordinate the operation of the district schemes. After these were introduced last August the Council, presumably in the exercise of this function, passed a resolution prohibiting the duration of long-period contracts for the supply of coal beyond December, 1937. A month or two later it so amended this instruction as to permit colliery companies to contract as far ahead as March, 1938. Meanwhile, the Executive Board of the South Wales District (Coal Mines) Scheme received inquiries from the National Oil Refinery, the Skewen subsidiary of the Anglo-Iranian Oil Company, Ltd., for the supply of anthracite duff for the service of a special equipment on which they proposed to spend £24,000; and from the Low Temperature Carbonisation Company, Ltd., for 150,000 tons of small coals, to be subsequently increased to approximately 400,000 tons per annum, for the service of one of its coalite and distillation plants. The Skewen concern asked for a seven-year contract, and Low Temperature Carbonisation for a twenty-five-year contract, subject not only to the usual rise and fall clause, but also to arbitration provisions. In principle, the Executive Board were agreeable to both applications. They regarded the two projects as particularly desirable in a district which has suffered so much from depression. They accordingly appealed to the Central Council to suspend its ban, and, when the Council refused, evoked the arbitration clauses of the central scheme. The case was considered by the three independent arbitrators on December 8th, and in the course of the hearing the representatives of the South Wales Executive Board suggested a compromise. The appeal, however, was dismissed, and these were the grounds on which Colonel Bristow on Monday condemned the pre-

sent methods of regulation and urged drastic changes. The defence of the Central Council, as explained by one of its officials on Monday night, is that "it is its duty to secure an economic price for coal," that "this duty could not be carried out if there were to be freedom to make contracts of unlimited duration," and that "the last thing the Council would desire is to prejudice the demand for coal." The ban of the Central Council applies uniformly to all mining areas in the country, and the "explanation" issued on Monday night would be weighty if the Central Council had been equally strong in the application of its other co-ordinating functions. It is too well known, however, that so far the Council has been almost impotent in the exercise of its statutory duty effectively to co-ordinate district minimum prices, and that its failure in this important task has contributed materially to the changed direction of inland and export demand in recent years. There is no inherent incompatibility between achieving "an economic price for coal" and giving exceptional consideration to special cases such as those brought to the notice of the Council by South Wales. It is to be hoped that further Government intervention may be made unnecessary through review of the whole matter by the Council.

The "Girl Pat."—The long drama of the runaway trawler, the "Girl Pat," ended this week in the dry-dust atmosphere of the Commercial Court. But somehow there was a dramatic touch. When the skipper disappeared with the boat, her owners claimed from the underwriters a total loss by barratry, and a most unusual thing happened. Though most of the underwriters after discussion settled the loss, two syndicates held out and fought the case for themselves; so that although the claim in Court was for a total loss, it is not improbable that the owners, before they went into Court, had received from underwriters more than the boat's market value. It is not easy to remember a similar situation. The case was fought on whether the boat was a constructive total loss while she was sailing the Atlantic. Barratry was not denied. But was she a constructive total loss? Mr Justice Porter held that she was not and gave judgment for the underwriters. A boat is a constructive total loss when the owner is deprived of possession and it is unlikely that he can recover it. Was that at a given moment unlikely in the case of the "Girl Pat"? The judge met the question frankly and said: "If I had been asked to say whether she was more likely to be lost or recovered, I should have had to say that I did not know." That is a very fair comment and the judgment emphasises the fact that mere uncertainty and anxiety about the ultimate fate of a boat is not enough to substantiate a claim for constructive total loss. All the same it seems hard lines on the owners to insure a boat that is useless to them except for home fishing, have it stolen and sailed to Central America, and then to be told that there is no loss. It is, all things considered, easy to understand the attitude of those underwriters who settled instead of fighting.

* * *

London's Fur Trade.—Since 1931—as we pointed out in an article in *The Economist* dated September 1, 1934—London has been gradually displacing Leipzig from the premier position in the international fur trade. While Britain's overseas trade in raw furs has recently enjoyed a progressive expansion, Leipzig's turnover has sunk to insignificant dimensions, as the following table shows:—

	OVERSEAS TRADE IN UNDRESSED FURS			
	United Kingdom (£ Millions)		Germany (Million marks)	
	Imports	Exports*	Imports	Exports*
1913	4.6	3.6	124.6	54.4
1931	5.4	6.7	134.9	55.2
1932	6.5	5.6	86.1	26.9
1933	7.5	5.9	69.1	28.2
1934	8.3	5.9	61.1	15.9
1935	7.6	7.4	38.9	13.1
10 months, 1935...	5.8	6.2	32.3	11.2
10 months, 1936...	8.0	7.1	31.6	4.7

* Including re-exports.

In dressed and undressed furs together, Leipzig's export balance (which amounted to 37.1 million marks in 1929) was actually transformed into an import balance of 3.8 million marks in 1935.

UNITED STATES

REFLATION AND RECOVERY

As the year ends everyone, from his own viewpoint, is endeavouring to project the trends of the past into the future. The conspicuous facts of the immediate past are: (1) The reflation programme, which is based on the Federal deficit, credit expansion and low money rates; (2) a steep and continuous increase in production since the fourth quarter of 1934, which has lifted activity near to a statistically conjectured normal; (3) a rise in commodity prices which has gained momentum in the last six months. Moody's index of primary commodities, which was as low as 78 just before the Administration took office, now stands at 200, at which figure it is almost 25 per cent. above a year ago; and (4) a definite sellers' market in labour.

Nevertheless, these qualifications should simultaneously be made: (1) While the Treasury has actually established its capacity to sell long-term issues on a 2½ per cent. basis or below, the American economy in general has by no means adjusted itself yet to any such low figure; (2) while the index of production at, say, 110 is near a conjectural normal, (a) certain sections of our economy (e.g. non-residential building and even residential building) are far below the average of the '20's and (b) it is apparently still impossible to single out any section that seems *prima facie* superheated; (3) while primary commodities have risen spectacularly, the official indices (including the cost-of-living index) show no corresponding movement. As with the low money rate, the effects of higher primary commodity prices do not yet seem to have permeated the economic structure; and (4) while there is a sellers' market in labour, there are still millions on the relief rolls, and hypothetical millions of unemployed not on the relief rolls.

APPREHENSIONS IN WASHINGTON

Washington seems to be filled with apprehensions. It is clearly concerned with the fear that prosperity will evolve into boom, and boom into collapse. So far, these apprehensions have expressed themselves in three directions: (1) Uneasiness over the influx of foreign capital (hot money) into our market; (2) intimations that further and perhaps drastic action will be taken to reduce the volume of excess reserves and regain control of the credit system and of the money market; (3) suggestions that the Securities Exchange Commission will take further action to control stock market trading.

The financial community is variously influenced by these apprehensions. Action taken to control the international flow of capital, as well as action taken to alter the mechanical operation of the stock markets are matters of vital concern to Wall Street; and it must adjust itself to the decisions taken, without necessarily having much voice in those decisions. Since little credit is now employed in the stock market, proposals for limiting or reducing bank reserves apply more directly to the banking community; and perhaps one can do no better than point to the reception of the last Treasury issue, and to the present prices of Government securities, to find evidence that the banking community is confident that whatever measures of credit control are imposed, they will not be so severe as to affect the long-term rate of interest. But Wall Street in the sense of the stock market interest as well as Wall Street in the sense of the banking fraternity, are persuaded that the implications of such a long-term rate, maintained over a period, have not been fully realised. Both Wall Streets are more than a little uneasy over the protraction of the credit expansion policy, and remember that more than a year has elapsed since the Federal Advisory Council recommended action on excess reserves, and that, although action was taken, excess reserves are nearly as high as they were when the recommendations were first made.

BUSINESS ADVANCE AND LABOUR

Industry seems less infected with misgivings than finance. Business is doing better than well; prices are rising all along the line; and the expectancy of higher prices is primarily responsible for the forward buying that has become so characteristic of recent weeks. On the industrialist's horizon, the principal cloud is his relations with labour; and this takes more forms than the well-known cloud that Hamlet observed from the battlements of Elsinore. There is the fact of the sellers' market in labour, which alone would occasion a rising trend of wages. Beyond this, there is the imposition of the Social Security taxes, which began in 1936, and became substantially heavier in 1937—combined with a strong probability that these taxes will be changed in the forthcoming session. Perhaps still more a source of anxiety is the intense rivalry for control of labour organisation between groups, as exemplified by the maritime strike on the Eastern Seaboard; and as elsewhere illustrated by the feud of the American Federation of Labour (Mr Green) and the Committee for Industrial Organisation (Mr Lewis).

Beyond these generalities, there are innumerable strikes, sometimes by a few men in key processes, sometimes affecting an entire plant. Frequently the contention is for the time basis rather than piece-work basis in computing wages. In a great variety of forms, piece-work had become the prevalent practice in American industry; adopted, of course, on the theory that it increases output per man-hour. *Per contra*, it might be expected that a general transposition of the wage base would reduce output per man-hour; and this, in conjunction with the present wide adoption of the 40-hour week, becomes one of the imponderables of the relations between management and labour in the coming months. At the present time, however, these considerations, which essentially focus on the question of labour costs, are dismissed with the assumption that demand is strong enough to absorb them in higher prices.

1938 BUDGET TO BE BALANCED

In recent years, at this period, a good deal of concern has been felt about the Budget. It is now widely supposed that the deficit as a reflationary mechanism has outlived its usefulness, and that, while supplementary relief appropriations will be introduced to cover the period to the end of current fiscal year (June), the Budget to be introduced in January will propose a virtual balance for the 1938 fiscal year.

It cannot be too strongly urged that the tone of the reports from Washington has completely changed. These reports emphasise three facts: (a) That the phase of reflation through deficits as a mechanism of recovery is ended; (b) that while a tentative start toward quantitative credit control was initiated in 1936, more active measures will presently be taken, probably in the form of higher reserve requirements plus some action in the direction of "hot money"; (c) that the contemplated controls, while in some measure quantitative, are what are called qualitative—i.e. exclude

the historic mechanisms of the restrictive or punitive money rate. The nature of these controls has not yet been indicated, except in so far as the very limited application of the principle in the form of S.E.C. control of margin requirements is taken as significant.

NEW YORK, December 14.

FRANCE

THE DEFICIT AND BUSINESS

AFTER a general discussion on the financial policy of the Government, which was severely criticised by the Conservatives, the Budget for 1937 was passed by 489 votes against 106, i.e. by a majority much larger than that of the Popular Front. The final Budget is as follows:—

	Millions of francs
Expenditure	48,047
Revenue	43,681
Deficit	4,366

This deficit arises only from the Ordinary Budget. There is still the Extraordinary Budget, yet to be covered by loans, the total of which is about Frs. 15,000 millions for defence and State public works. Even this does not represent the total sum to be borrowed. One must add the Frs. 7,000 millions deficit of the railways and loans for the Pensions Fund. M. Vincent Auriol pointed out that expenditure since the devaluation of 1928 had always been 50,000 or 55,000 millions, out of which 48 per cent. has been for public debt, 18 per cent. for defence and 34 per cent. only for State administrative expenses. Thus, 66 per cent. of the total cannot be reduced.

The last 1935 Budget, M. Auriol added, had proved the vanity of formal Budgetary equilibrium not associated with economic recovery. The final figures of the 1935 accounts are as follows:—

1935 BUDGET			
Millions of francs			
	Estimates	Excluded	Verified accounts Cost of new social laws Included
Expenditure	40,438	44,500	48,022
Receipts	40,450	38,000	38,000
	+ 12	- 6,500	- 10,022
Extraordinary defence expenditure	6,265 millions.		

M. Vincent Auriol said there was no hope of Budgetary equilibrium, save in the revival of business. But this revival had begun. He contended that the estimated increase of revenue by 4,500 millions would prove too high. Wholesale prices had risen by 35 per cent. and retail prices by 15 per cent. only since devaluation; and the re-established margin of profitability heralded favourable developments. Finally, M. Auriol pointed out that savings, which brought Frs. 30,000 millions every year to the State in a time of acute economic crisis, would not fail when a revival in business was obvious.

FOREIGN TRADE IMPROVING

Foreign trade in November was as follows:—

	November, 1935	October, 1936	November, 1936
(000's omitted)			
Imports:—			
Foodstuffs	543,710	763,440	846,703
Raw materials	898,124	1,143,225	1,476,630
Manufactured goods	294,478	340,475	383,787
Total	1,736,312	2,247,140	2,707,120
Exports:—			
Foodstuffs	251,173	259,502	297,183
Raw materials	393,330	397,968	534,166
Manufactured goods	776,704	802,459	888,367
Total	1,421,207	1,459,929	1,719,716
Import surplus	315,105	787,211	937,404

Total trade shows an increase of 720 millions and 1,270 millions if compared, respectively with October, 1936, and November, 1935. This is principally due to the increase of imports, provoked by fear of higher prices in foreign

markets. In volume, exports were 243,000 tons less, while imports were 575,000 tons more than in October.

GOLD HOARDERS AND THE NEW LOAN

The main question now is whether the gold hoarders will answer the last appeal of M. Auriol and exchange their gold against the new 1936 debentures repayable in three years. No doubt, immediate acceptance of these bonds in payment of death duties, and the introduction on the Stock Exchange of the subscription right attached to the gold certificates, are astute measures which will persuade many hoarders to sell to the bank gold which is becoming more and more devaloured by the rise in all prices.

It is to be feared, however, that certain gold hoarders not convinced by M. Poincaré will not respond to the appeal of M. Auriol. Moreover, the capital hoarded abroad will—at least for a time—not be encouraged to return by the new campaign of M. Jouhaux, General Secretary of Trade Unions, in favour of the nationalisation of all key industries (banks, insurance, coal mines, metallurgy, etc.). Its owners will also be disquieted by the almost unanimous refusal of the Senate to vote the compulsory arbitration system of M. Léon Blum, which the Chamber has adopted.

PARIS, December 23.

GERMANY

FOOD CARDS RE-INTRODUCED

THE conditions of the new food-card system, which comes into force on January 1st, have now been revealed. Having unpleasant associations, the term "food cards" is not used officially. Instead references are made to "customer lists," which are to be kept by retailers. But the householder may be entered upon a customer list only on presentation of a municipal card, issued on the basis of the number of persons in his family and their ages. Only butter and fats are for the present on the card system. In principle a household will be entitled to purchase a quantity equal to 80 per cent. of its normal (October, 1936) consumption, but no guarantee is given. The retailer will himself be limited to a ration, which may be too much, but may be too small for the supply of those customers who present cards; and if it is too small householders will have to change their retailers.

The meat situation has improved. About the grain shortage nothing from authoritative quarters has appeared. Official utterances made between October and early December about the combined bread and fodder outlook seem to have been too optimistic. It was not admitted that there would be any shortage of either, and it was only urged that farmers must deliver their full grain quotas and must not feed livestock with bread cereals fit for human consumption.

REASONS FOR CEREAL SHORTAGE

In October—that is, after the 1936 crops result was known—it was officially stated, on the basis of a Reich Nutrition Estate inquiry, that the bread cereal stock for the new crops year would be 12,400,000 tons, and the consumption, including that for seed and industrial purposes, only 10,150,000 tons. It was added that the very good fodder crops would relieve farmers from feeding wheat and rye to livestock, as they did to a great extent in the past crop year. The potato crop was returned at nearly 46 million tons, as against 41 million tons in 1935; sugar beet, at 11½ million tons, or 8 per cent. more than in 1935; and hay at 40½ million tons, as against 33 million tons. Other fodder crops were reported as very good. According to the *Frankfurter Zeitung*, which first divulged the impending wheat shortage and the need for resuming imports, 2,800,000 tons of rye, which is about 800,000 tons above the normal quantity, and 500 to 600 thousand tons of wheat were consumed for fodder in the crop year 1935-36. Formerly very little wheat was so consumed.

Unsatisfactory crops in 1934-36 had much less to do with the present shortage than the contraction of imports of both bread and fodder cereals. Only if the crops of 1934-36 are compared with those of the exceptionally good year 1933

could they be called unsatisfactory. The wheat crops of the three years were much larger than the pre-war and very much larger than those of many post-war years preceding the self-sufficiency campaign. In 1913 (in the present Reich area) the wheat crop was 4,040,000 tons; in 1926 (lowest recent year), 2,600,000 tons; in 1933, 5,604,000 tons; and in 1934-36 the crop was almost stable at around 4,700,000 tons. Rye cultivation was for a time intentionally reduced. Production in 1913 was 10,100,000 tons (an exceptionally high figure, however); in 1926, 6,406,000 tons; in 1933, 8,700,000 tons; since when the average has been about 7½ million tons. Even these considerable fluctuations are insignificant compared with the reduction of imports. The following figures (in tons) are of net imports:—

	1927	1935	1936 (11 months)
Wheat	2,530,000	145,000	23,000
Maize	2,105,000	282,000	166,000
Barley	1,996,000	158,000	47,000

The grounds on which the Government thought that it could permanently dispense with imports of fodder cereals are not clear. Those who were optimistic about the wheat situation seem to have expected that the very good harvests of 1933 would be repeated; and also to have ignored the bad quality of the 1935 and 1936 crops, which resulted in wheat being used for feeding livestock.

The prices of colonial goods rose this week by 5 per cent. Their prices were already prohibitive, and certain kinds had disappeared from the market. In connection with the Four-Year Plan, it is stated that Germany in 1936 produced 31.4 per cent. of her consumption of textiles raw materials, natural and substitute, as against 16.81 per cent. in 1932. The retail turnover in October was 18 per cent. higher than in October, 1935. Pig-iron output in November was 1,256,700 tons, against 1,379,000 tons in October.

LOSSES ON COAL EXPORTS

In an analysis of coal industry finance, an economic journal attributes the unexpectedly low dividends declared this year by mixed iron and coal companies to the losses suffered on coal export. In very few cases did the profit on all coal business, home and foreign, provide even for writing-off. The volume of exports of Ruhr coal has been relatively stable lately at a little below the figure of pre-crisis years. The volume and value of Ruhr exports, as well as average export and home (wholesale) prices, are given as follows:—

	Exports Volume 1,000 tons	Value Mill. M.	Average Export Price Marks per ton	Average Home Price
1928	20,679	408.8	19.07	20.11
1932	15,081	194.5	12.90	17.04
1935	21,022	198.2	9.43	17.00

The November foreign trade returns show an export surplus of Rm. 64 millions, against a surplus of Rm. 76 millions in October and of Rm. 54 millions in November, 1935. This result is only moderately satisfactory. In 1935 the November export surplus suffered practically no decline; and total exports as well as exports of manufactured goods increased, whereas this year both fell. Imports in November this year increased very little, last year considerably. The decline in exports was entirely in exports to Europe; and is officially attributed in part to the gold *bloc* devaluations. The export surplus in the first eleven months of 1935 was Rm. 459 millions:—

	Oct.	Nov.	Jan.-Nov.
Millions of Rm.			
Imports			
I. Foodstuffs	126.9	140.3	1,369.7
(a) Livestock	8.4	11.6	87.2
(b) Animal foodstuffs	38.4	41.6	409.7
(c) Vegetable foodstuffs	80.1	87.1	872.8
II. Industrial goods	229.1	217.6	2,483.2
(a) Raw materials	123.5	120.5	1,402.5
(b) Semi-manufactured	64.1	62.6	718.5
(c) Manufactured	41.5	34.5	362.2
Total	356.0	357.9	3,852.9

	Oct.	Nov.	Jan.-Nov.
Millions of Rm.			
Exports			
I. Foodstuffs	6.3	7.4	78.3
(a) Livestock	0.1	0.2	2.2
(b) Animal foodstuffs	1.3	0.8	8.7
(c) Vegetable foodstuffs	4.9	6.4	67.4
II. Industrial goods	425.2	414.3	4,233.4
(a) Raw materials	39.0	34.5	372.3
(b) Semi-manufactured	40.6	38.4	423.3
(c) Manufactured	345.6	341.4	3,437.8
Total	431.5	421.7	4,311.7

The Prussian Government announces the issue of a Rm. 200 millions 4½ per cent. loan, the main purpose of which is to convert Rm. 150 millions of 4½ per cent. Treasury bonds maturing on February 1, 1937. The new loan is to be repayable within twenty years at the annual rate of 3.2 per cent. In the first instance, the loan will be offered to holders of Treasury bonds at 97½. The price to cash subscribers is 97½.

Money last week was temporarily plentiful owing to repayment of Reich Treasury bonds and Treasury bills. On Friday and Saturday the day-loan rate declined. This week's market opened liquid, with the day-loan rate still lower at 2¼-3 per cent.

BERLIN, December 21.

ARGENTINA

FURTHER ECONOMIC RECOVERY

THE economic improvement in Argentina has become more marked during the past month. Prices of the three chief crops—wheat, maize and linseed—were 10.70 pesos, 5.60 pesos and 13.70 pesos per 100 kilos, yesterday, against 10.60 pesos, 5.55 pesos and 14 pesos a month ago. The decline in the price of linseed is due to the abolition of the basic price and the expectation of an excellent linseed crop in Argentina. On December 2nd the Government suppressed the minimum prices of wheat and linseed, while retaining that of maize. The accompanying decree stated that the reasons for authorising the Grain Regulating Board to buy wheat and linseed at a basic price had disappeared.

It has now become apparent that the export surplus for the current year will be substantially greater than in 1935. Figures of foreign trade for the first ten months of 1936 compared with 1935 are as follows:—

	1935	1936
(Market values in pesos)		
Imports	986,816,138	921,360,073
Exports	1,331,700,139	1,287,746,571
Export surplus ...	344,884,001	366,386,498

On December 2nd the value of the Argentine peso in the free market, which had remained for some time about 17.60 to the £, suddenly jumped to 17.16. The free market quotation continued to rise, and on December 9th reached 17 to the £—exactly equal to the official import rate. On the same evening the Government instructed the Central Bank to reduce the official import rate from 17 to 16 pesos to the £. The accompanying statement observed that the revalorisation of the peso was not artificial, but was the logical result of the improvement in the Argentine balance of payments. The Government, it was said, was gradually removing the emergency measures imposed during the depression, and this process would be hastened as soon as the principal countries approached the problem of definite currency stabilisation.

Argentine exports in November were in volume 1,484,047 tons (against 1,133,964 tons in November, 1935) and in

BRITANNIC

ASSURANCE COMPANY LIMITED

(Established 1866)
Annual Income : : : £6,200,000
Funds : : : £26,000,000

All classes of Life, Fire, Accident,
Motor and General Insurances transacted

Chief Office: BROAD STREET CORNER, BIRMINGHAM

value 159,047,079 pesos (against 111,578,403 pesos). The totals for the first eleven months of 1936, together with the corresponding figures for the same period of the two previous years, were as follows:—

FIRST ELEVEN MONTHS OF EACH YEAR		
	Volume in Tons	Market Value in pesos
1934	14,160,133	1,318,572,542
1935	15,090,804	1,443,278,542
1936	12,855,156	1,447,718,126

Exports in value were made up as follows in the first eleven months of the two years:—

(Market value in pesos)		
Products	1935	1936
Pastoral	482,085,039	538,165,193
Agricultural	890,699,798	839,445,253
Forestral	38,877,071	32,966,926
Mining	6,862,035	8,707,448
Hunting and fishing	6,517,601	8,155,743
Miscellaneous	18,236,998	20,277,563

Average prices for the first eleven months of 1936 were 48.7 per cent. higher in the case of wheat, 18 per cent. of linseed, 15.6 per cent. of maize, and 27.1 per cent. of unwashed wool. The value of dry and salted sheepskins was actually 99.1 per cent. higher.

The decline in the value of imports during the eleven months as compared with 1935 was the inevitable result of the decline in exports which was so marked in the first half of the year. Now that the fall in exports has been completely reversed, it is reasonable to expect an increase in imports in the near future. The import items which show the biggest declines are textiles, tobaccos and wood.

The third official estimate of cereal and linseed sowings, together with the percentage of increase over last year, is as follows:—

Crop	Hectares	Difference per cent.
Wheat	7,083,000	+ 23.2
Linseed	3,010,000	+ 13.2
Oats	1,278,000	+ 6.9
Rye	892,000	+ 26.0
Birdseed	44,500	+ 4.5
Barley	779,000	- 0.8

The weather for the new crops has been very favourable, and harvesting is in progress in Northern and Central Argentina.

THE NEW ANGLO-ARGENTINE TREATY

The new Anglo-Argentine Trade Treaty, which was signed in London on December 1st, was received here with mixed feelings. The Argentine stockbreeders, as was expected, were particularly disappointed. The meat clauses were generally regretted as calculated to reduce mutual trade between the two countries. A tax on the entry of Argentine chilled beef into Great Britain and a reduced quota have, however, been regarded as inevitable ever since the British Government announced its intention to subsidise domestic agriculture and give preference to the Dominions. The Treaty, while far from giving universal satisfaction, is felt to be much less unfavourable to Argentina than was expected. Had the Treaty been published six months ago when the Argentine economic outlook was dark and depressing, more complaints would probably have been heard. But to-day the world, and especially Great Britain, needs Argentine products, and with the high prices now ruling, it is felt that it would require more than the meat clauses to effect a substantial reduction in the value of trade between the two countries.

BUENOS AIRES, December 12.

CANADA

SYMPATHY WITH KING EDWARD

THE bewildering crisis over the Abdication of King Edward VIII has absorbed the attention of the whole Canadian people for the past ten days. Now that it is ended, there is widespread sympathy for the unhappy fate of a monarch who had won personal popularity in Canada

during successive visits; but, while he has his partisans who hold that he has been harshly treated, the great preponderance of intelligent opinion in Canada feels that his transference of the Crown to King George is all for the best.

THE DOMINION-PROVINCIAL CONFERENCE

Meanwhile there took place last week in Ottawa another Dominion-Provincial conference on finance, taxation and correlated problems; representative delegations from all the Provinces, including eight out of the nine Premiers, were present, and Mr Dunning and other Ministers attended for the Federal Cabinet. The practical reforms, which received the endorsement of the National Finance Committee set up by the Conference and are likely to come into effect soon, are three in number. After a discussion of the possible effects of the recent "gold clause" decision by the British Court of Appeal, the provincial delegates unanimously urged the Federal Government to enact legislation nullifying the effect of the gold clause in contracts relating to Federal, Provincial and private bond obligations in Canada, and to legalise payment of them, dollar for dollar, in any coin or currency which is valid legal tender. Another resolution called for the attainment of uniformity in the compilation of both Federal and Provincial statistics. Thirdly, it was agreed that the Dominion and the Provinces should, by co-operation with the Bank of Canada, attempt to achieve co-ordination in the timing of their several bond issues.

The King Cabinet has been continuing through Sir F. Floud, the British High Commissioner, its negotiations for the completion of the revision of the Anglo-Canadian fiscal agreement; and while apparently the basic principles have been settled, difficulties about details have arisen. Certain Ministers are resisting particular concessions to Britain, and a few days ago Mr Mackenzie King declared that he could not predict when a final bargain would be achieved or even say whether the revised pact would be ready for presentation to Parliament in the coming session.

BUSINESS WELL MAINTAINED

Business is being maintained at a remarkably satisfactory level; although the business index of the Bureau of Statistics has fallen slightly:—

Week ending	Car-loadings	Wholesale Prices	Bank Clearings	General Index
Dec. 7, 1935	67.0	72.7	94.7	98.8
Nov. 5, 1936	71.0	77.4	95.4	112.1
Nov. 21, 1936	75.0	77.3	99.2	113.6
Dec. 8, 1936	71.3	77.2	94.4	112.9

The chief business stimulant continues to be the boom in progress in most of the mining districts. This boom is creating a tremendous demand for supplies of all kinds. Purchasing power has also been increased by increases in dividends and wages; in one fortnight alone recently the aggregate value of the wage increases announced was about \$2,000,000. Retail merchants report that, except in special areas, their sales at the end of the year promise to be the highest since 1930 and that their prospects for winter business are good.

The Federal revenues continue month by month to show encouraging gains, and the yield for November, placed at \$37,120,277, was roughly \$6,000,000 above the figure for November, 1935. Expenditures, however, in November, 1936, amounted to \$49,550,755, an increase of \$1,750,000 over November, 1935.

The Western grain crop is being rapidly sold, and prices are tending to rise. On December 4th visible stocks of Canadian wheat were reduced to 120,113,569 bushels, compared with 266,546,382 bushels on the parallel date of 1935.

OTTAWA, December 12.

SOCIAL CREDIT IN DIFFICULTIES

THE failure of the Social Credit candidates at the recent civic elections—complete failure at Edmonton, relative failure at Calgary—may mark the turning point in that party's fortunes. These defeats occurred in spite of active participation in the campaigns by Mr Aberhart and many provincial ministers and members, and in spite of an appeal

LETTERS TO THE EDITOR

RECOVERY IN HOLLAND

TO THE EDITOR OF THE ECONOMIST

SIR,—Allow me to make a few remarks concerning your "Overseas Correspondence" about Holland in *The Economist* of December 12th, page 521. Your correspondent shows a great deal of optimism in beginning his letter with the assertion that "the consequences of the devaluation of the guilder are all favourable."

Having regard to the rather complicated structure of the Dutch economic organism, and the course of affairs in the months immediately preceding the depreciation, it seems to be premature to make up a balance so soon. My daily contact with leading men in industrial and commercial circles supports me in my opinion that most of them are still awaiting the development of events before pronouncing a definite judgment upon the effect of depreciation. The only conclusion we can come to for the present is that the depreciation, combined with the Tripartite Agreement of September 26th, has aroused an optimism which may be welcomed as a good thing in itself, but from which we cannot yet draw any conclusion about the final economic results. Orders that hitherto have been held back under the deadening influence of the depression are being placed. I have, however, a feeling that in the last few weeks in some circles a reaction is growing.

The conclusions of your correspondent concerning the influence of the depreciation on the port-traffic are a little one-sided. The following causes and figures show that other factors must be taken into consideration in accounting for the amelioration in the port-traffic of Rotterdam. In the first place, there was the increase of the port-traffic via Rotterdam resulting from the increasing costs at Antwerp following the strike there. In the second place, there was the considerable augmentation of the German traffic via Rotterdam during the third quarter of this year, which preceded the depreciation of the guilder. This increase is evident from the greater number of shifts worked by the Rotterdam dock labourers. The figures below speak for themselves. Another stimulus to the increasing activity in the port of Rotterdam was the reduction of the rents for quays, sheds and wharfs granted by the municipality, which came into force on June 15, 1936. The effect of these measures is clearly demonstrated in the following figures, giving the comparison between the numbers of shifts (half-day working time) worked by the Rotterdam dock labourers in the third and fourth quarter of 1935 and 1936:—

	1935	1936
Third quarter	549,775	583,274
Fourth quarter without December	378,283	400,234

The depreciation will most probably have the effect of an increase of port-traffic in this country.

Your correspondent also concludes from the following figures, mentioned by him, that "it is obvious that there has been a decided change for the better":—

UNEMPLOYMENT IN HOLLAND

	1934	1935	1936
End August	302,100	353,100	381,427
End September	309,600	366,000	390,091
End October	328,900	381,900	394,444

We all in Holland hope the change in the near future may indeed be in a good direction, but to infer already a decided change for the better from the above-mentioned figures is too optimistic.

Yours faithfully,
A. PLATE,
President of the Netherland Society
for Industry and Commerce and of
the Shipping Association South.

P.R. AND EUROPEAN DEMOCRACY

TO THE EDITOR OF THE ECONOMIST

SIR,—While not intending to enter the lists for or against Proportional Representation, as advocated by Mr Humphreys in your issue of November 7th, I would like to draw your attention to a significant fact attendant on the multiplicity of parties which has been evident in the post-war democracies.

The House of Commons is constructed so that Government supporters sit on one side of the House while the Opposition parties directly face them. In all other countries, to the best of my belief, where democracy has existed since the War, the Parliaments are constructed in a round or crescent-shaped manner, so that all political parties are adjacent to one another. Great Britain, with its rectangular Parliament, is the only country which has managed to confine itself to a reasonable number of parties.

Is it too far-fetched to suggest that the multiple party system is at least encouraged by the Continental system of adjacent benches? Is it not reasonable to suppose that proximity to one's neighbour induces an approximation of views, and that, in order to maintain the differing viewpoints of political parties, it is necessary that they should be separated by a symbolical chasm emphasising their opposing outlooks?

In all seriousness I venture to suggest that if the French Parliament were reconstructed on British lines, within 50 years—if democracy can hold out so long—the number of parties in the French Chamber would be reduced to manageable proportions.

Yours faithfully,
RICHARD M. HALDANE.

Cape Town.

to the Social Credit "covenants," which entitle the covenantor to "social dividends."

Each applicant for the dividends must sign a covenant, one provision of which reads, "I hereby covenant, promise and agree: (1) To co-operate most heartily with the Alberta Government and with my fellow citizens of the Province of Alberta in providing food, clothing and shelter for everyone of us." When this was criticised as an attempt to build up a huge party machine by means of wholesale bribery of the electors by payment of dividends only to the faithful, Mr Aberhart was most indignant and explained the clause as meaning that the recipient of dividends must co-operate in the new Social Credit economics of using Alberta credit. If he could ever be got to reconcile his statements with the facts or with his own subsequent statements, he might now be asked to explain the signed appeals issued by the Calgary campaign committee in the following terms: "Remember that when you signed the covenant with the Provincial Government you agreed to give them your full co-operation. This is the first opportunity you have had to show your sincerity of purpose. Vote, and vote a full Social Credit slate." In the result, some 38,000 Calgary covenantors produced less than 13,000 first choice votes for their defeated candidate for the commissionership—a sort of city manager elected annually.

The stamped scrip scheme—with its "Prosperity Certificates"—and the attempt at a province-wide co-operative enterprise, with banking functions—which is "Alberta Credit"—are the main sections of the programme. Prosperity Certificates have failed completely. They will not run their course and pay for themselves with the weekly stamps, but have been largely presented for redemption each month. The Government is now attempting to secure a partial re-issue of them as part of the salary of civil servants and to the recipients of relief—both on a "voluntary" basis. The original authority was for \$2,000,000 of these Prosperity Certificates. A remnant, probably \$30,000 to \$40,000, of these poor paper imitations of real money is now being passed out to civil servants, who have the humiliation of getting rid of an unwelcome and possibly illegal medium of exchange. The Prosperity Certificate is definitely moribund.

THE "ALBERTA CREDIT HOUSE"

The Alberta Credit House Act has been proclaimed, the Credit House Board appointed and some sites for branch houses secured. For some weeks now, however, there has been rather a suspicious lull in the flood of announcements about the details of organisation. Individual covenantors with a claim to dividends are asserted to number some 380,000, or over 85 per cent. of all the adults in Alberta. The hitch apparently is in getting covenantors to give manufactured goods and farm products in exchange for Alberta Credit. So far as the farmers are concerned, this is quite immaterial, because the scheme has been so long delayed that this year's crop has, in large part, been already marketed for good old-fashioned money and, fortunately, for more of it than last year. So Mr Aberhart has already lost the great bulk of this year's "foreign exchange."

If it be true that Social Credit proper is doomed to early failure, the rather anxious question remains, what use will be made of the undoubted powers of even a Provincial Government in being? What further measures will the Aberhart Government adopt at the next session, probably in February, to appease the wrath of disillusioned devotees? If it collapses, what form will its collapse take, and what will succeed it? Will it be physical collapse? Already poor Mr Manning (one of Mr Aberhart's chief assistants) has been ordered to rest so indefinitely that his portfolios have been parcelled out to other Ministers. Incidentally, this deprives the Government of about half of its religious activity; and either Calgary or Edmonton, but not both, will have its full weekly measure of Bible prophecies and politics. Mr Aberhart, too, speaks often of feeling the strain of his seven-day week.

EDMONTON, December 10.

BOOKS AND PUBLICATIONS

JAPAN AND WAR

Of these five books on Japan the two from Japanese sources confine themselves mainly to objective statistical surveys of Japanese economics, while the others are almost inevitably directed to one set of questions: will there be war in the East, and what will be the cost to Japan? Mitsubishi's analysis of the growth of Japanese trade and industry is an indispensable book of reference, whose usefulness is limited only by the fact that in Japan a very important part of economic activity slips through the statistical sieve, and is not measured.

Messrs Yano and Shirasaki's book is the English translation of a Japanese school text-book, and is therefore doubly interesting. The substance of the book consists in its statistical review of products and industries, illustrated by charts and pictures. Its comments on social and political matters are of a nature acceptable to the authorities, as is customary with text-books in all countries. We expect to be told that there is no country with a body politic so solid and sound as that of Japan. It is more interesting to read that there is cause "for fearing that the sense of loyalty to the Throne when carried to extremes, as is seen on occasions, might ruin the affection through which the people turn to the Throne." Is this the cloven hoof of criticism appearing in a text-book? At any rate, the student must find it encouraging to read that the country swarms with unemployed graduates, and the trouble is "that there are too many schools and universities."

Messrs Tanin and Yohan have tried to estimate the strain that would be put on Japan by a prolonged war, on the lines of the Great War. A schedule of military requirements is compared with industrial capacity and financial resources. Inevitably such calculations must be very approximate, and cannot justify the pretence of accuracy in the estimate that in the first half-year of war Japan will need 1,022,337 horses. The authors' sources for this calculation are not too relevant to the actual problem; it is more important to compare the industrial resources of Japan and her stipulated enemy, Russia, than to demonstrate that Japan could or could not sustain the burden of a war on the lines of the Great War. But granted their assumptions, the authors work through the problem in exhaustive detail, and most observers confirm their conclusion that Japan can bear the burden of a great war for only a limited period, and at the cost of "shattering the class basis of Japanese Imperialism" in the event of defeat.

To Miss Freda Utley facts are ammunition with which to mow down her target: Japan's bluff. Her attack is that of the idealist who hates the social injustices of Japan, "the acute social antagonisms, the stored resentment and fury of the millions of underclothed and underfed workers, peasants and artisans and of the desperately struggling petty bourgeoisie." Japan, she maintains, is actually as politically and socially unstable and as near to revolution as was the old Russia, from which Japan differs mainly in that she has not yet experienced her 1905. Miss Utley's book should be read for its comprehensive knowledge of Japan and for its passionate faith in a cause. But her zeal of phrase tends to oversimplify, and her eye to select what fits her mental framework. There are, despite oppression, many Japanese who are as critical of their own affairs as is Miss Utley, and social revolution may not be as imminent as she suggests.

As a journalist Mr Guenther Stein is concerned to show what is, and leave what ought to be to look after itself. His interesting book surveys the position in Japan, Russia

and China. Under an ever-increasing economic strain Japan pushes on in the arms race. Russia has turned the corner, and the Japanese Army has recognised that the day to strike alone is gone. There are signs of growing unity in China in opposition to Japan. War, if it came, would solve nothing for Japan, even in victory, and would inevitably spread from the East to the West. Yet reason is a thin barrier with which to hold back war, and Mr Stein feels almost inclined to close his account on a note of undisguised pessimism. As in the West, so in the East, the chances to build a system of peace with justice have been missed, thanks to too narrow a sense of international justice and the absence of courage with which to defend conviction. With this book Mr Stein meets a real need.

SHORTER NOTICE

"Coal: Its Constitution and Uses." By William A. Bone and Godfrey W. Himus. With a supplementary Chapter upon Fuel Economy and Heat Transmission in Industrial Furnaces, by Reginald J. Sarjant. Longmans. 631 pages. 25s. net.

This huge volume takes the place of Professor Bone's "Coal and Its Scientific Uses" (1918), and is likely to remain a standard work for just as long. It is an exhaustive treatise on the chemical constitution of coal and methods of utilising this greatest of our raw material assets, to which are prefixed certain economic remarks, few in number but thoroughly judicious. The cost of getting coal, the authors urge (to give one example), is largely a question of miners' wages, which chiefly depend on the cost of food, clothing and housing. Hence, any policy which aims either at restricting British overseas trade or at higher food prices, in the supposed interests of agriculture, will undermine, and probably in the long run ruin, our industrial and commercial system. Notwithstanding some opinions to the contrary, the authors hold fast to the dictum, which W. S. Jevons emphasised, that the more economy is practised in the use of coal, the more will its consumption increase. An impartial examination of the facts, e.g. of the electricity industry's consumption of coal, certainly bears this out. So does a brilliant series of chapters on fuel economy in the manufacture of iron and steel from the time of the Industrial Revolution.

But that is to anticipate. The book opens with the origin, formation and classification of coals, and the authors give general support to the peat-coal-anthracite theory. They study the geographical distribution of the world's coalfields, and then devote a long section to the chemical constitution of coal. Combustion next receives their attention, with chapters on the smoke nuisance and smoke abatement. In considering the utilisation of coal, they give special attention to the carbonising industries. Pulverised coal, boiler design, coal-and-oil mixtures, hydrogenation and the production of electricity are all studied, and there is a chapter on a subject in which Professor Bone has no rival—incandescent surface combustion. This is a monumental work, entirely worthy of its distinguished authors, and must necessarily hold the field for many years to come.

MONEY AND BANKING

ARGENTINE EXCHANGE

THE present position of the Argentine exchange lends additional interest to the modernisation of the Republic's monetary structure, which has been successfully achieved within the last year and a-half. Before the promulgation of financial reforms in March, 1935, there had been no fundamental change in the Argentine monetary system since the end of 1899. The reform laws were five in number, and all dealt with the formation and powers of the new Central Bank. They gave unity to certain functions, previously scattered, such as the care of the circulating medium, rediscount operations, and the regulation of the foreign exchange value of the national currency. Emphasis was laid upon the functions of a Central Bank in adjusting the international balance of payments—a vital necessity in developing an agrarian economy exposed to violent fluctuations in exports.

The Decree promulgating the financial reform laws was signed on March 28, 1935, and on the 13th of the next month a Decree was issued which in effect placed a surcharge of 20 per cent. on the official rate of exchange payable by importers of goods from countries which did not show a trade balance in favour of Argentina. The exchange control regime then in operation had been adopted at the end of November, 1933, when the world grain market was depressed and Argentina was faced with the unusual and disturbing feature of an adverse trade balance. The measures undertaken at that time included the formation of a Grain Regulating Board, in order to guarantee minimum basic prices at which the authorities were prepared to purchase grain from native growers. The necessary funds to repay the Board for any losses were to be obtained from the margin between the rates at which the Government bought and sold export bills, practically all of which became deliverable to the authorities. The Government's buying rate (paid to Argentine exporters) was fixed at 15 pesos per £, while the selling rate (payable by importers with priority permits) was, until recently, 17 pesos or over. Meanwhile, there was also the "free" exchange rate. This applied only to such foreign exchange as had not to be sold to the authorities. It was subject to the normal market influences, and until recently stood consistently higher than the Government's selling rate.

The Government's profit has thus been substantial, though its extent has been only occasionally revealed. Thanks, however, to the recovery in world grain markets since 1933, no considerable amounts have been required to compensate the grain board and other boards. The Minister of Finance's report, covering the year 1935, stated that receipts in the Government's Exchange Profits Account amounted in 1934 to 119.2 million pesos, and in 1935 to 118.1 millions. The exchange loss on the public debt service and other payments accounted for 24.3 million pesos in 1934 and 31.8 millions in 1935—a total of 56.1 millions. The financing of the various regulating boards which obtained their resources from the Exchange Fund required the sum of 10.7 million pesos in 1934 and 25.2 millions in 1935, or a total of 35.9 millions. There was thus at the end of 1934 an unutilised balance of over 80 million pesos, and at the end of 1935 a balance of over 60 million pesos. At that date, the Exchange Profits Fund totalled 144.9 million pesos (say £8½ millions sterling), distributed as follows: gold, foreign currencies and values realisable in foreign currencies, 82.6 million pesos; deposited in the Banco Central, 62.3 million pesos.

Recent unofficial reports have suggested that Argentina may restore freedom to the exchange market. How far do existing conditions lend colour to this suggestion? There can be no doubt that the economic situation has been largely consolidated. Mainly owing to the devaluation of the large gold holdings of the old Conversion Office, a heavy floating debt has been virtually eliminated. Major conversion and redemption schemes for the external

debt have effected, or will effect, considerable reduction in debt services, and will lessen the demand upon available exchange. The position of the Central Bank is exceptionally strong, the latest statement showing a ratio of gold and foreign exchange to note circulation and sight liabilities of over 88 per cent. The Bank is now exercising its orthodox functions by regulating the basis of internal credit and intervening when necessary to control the external value of the peso.

Further, the reasons for maintaining large Government exchange profits have virtually disappeared. Export trade is booming, and prevailing sentiment is optimistic. On December 2nd the Government suspended the guaranteed minimum prices for wheat and linseed, and thereby restored liberty of movement to the grain market, although for the time being the basic price of maize is being maintained. The decision was followed on December 10th by a reduction in the selling rate for official exchange from 17 to 16 pesos, which halved the Government's profits and gave a corresponding benefit to importers and other remitters through the official exchange market, who need to purchase foreign exchange.

Already the "free" exchange rate is practically at the new level of the official selling rate. As heavy maize shipments and good wheat and linseed crops are expected, the superabundance of export exchange will make it difficult to avoid a general lowering of exchange rates. Full relaxation, however, is most likely to take place in stages, as circumstances permit—or compel. The Grain Regulating Board is still in existence, and official opinion believes that if unforeseen circumstances arise, it may again have to support wheat and linseed prices. This implies that some margin between the buying and selling rates of official exchange will be maintained as long as possible. An alternative to a further lowering of the selling rate would be the raising of the official purchasing price from 15 pesos. This would benefit grain exporters, but, in view, of present world prices, it is hardly likely to come about.

The omens, generally, suggest that the authorities will follow a middle course between raising the buying rate and lowering the selling rate for official exchange. So long as any system of exchange control remains, the priority terms of the new Anglo-Argentine Trade Agreement continue to apply to the provision of sterling exchange to cover remittances from Argentina to this country. The wording of the relevant clause appears loose enough to enable this priority to be retained so long as there is the slightest vestige of control. From the general point of view of all remitters, full freedom in the exchange market would naturally be welcomed. But from the British exporters' viewpoint, importance attaches to the apparent absence of any intention, so far, to suppress the system of priority permits which implies the payment by many competitors of a surcharge up to 20 per cent. From the Argentine standpoint, also, this surcharge is the most important feature of the exchange control. The priority permit system, which gave importers exchange at the official selling rate and relieved them from the 20 per cent. surcharge, has enabled the country to direct the course of trade so as to fulfil its trade agreements, under which imports have been stimulated from various countries which have purchased Argentine products. In a recent official report, indeed, the Argentine Minister of Finance emphasised the importance of this control so long as international trade remains fettered by high tariffs, quotas and other obstacles.

The upshot is that so far as her foreign exchange reserves are concerned, Argentina could safely abolish all her exchange controls to-morrow. The difficulty lies rather in the way in which her control system has become involved

in her commercial treaties with certain countries, including ourselves. Furthermore, there is her desire to balance imports and exports bilaterally—that is, country by country—and while we must condemn this attitude from the broad standpoint of economic theory, we must equally concede that, if she were to abandon it, she might in practice find that she had exposed herself to an indiscriminate flood of imports, which in time might swallow up her foreign exchange reserves. One of the penalties of restriction and canalisation of trade is that freedom can only be recovered gradually and with care. In Argentina's case, the transformation of her present surcharge into a straight 20 per cent. discriminatory tariff against countries with whom she has an adverse trade balance might, in conjunction with the restoration of exchange freedom, be a practical first step. This, however, brings us from the realms of foreign exchange to those of international trade, and so falls beyond the scope of our present article.

FINANCIAL NOTES

American Exchange Control.—Mr Morgenthau announced only this week an alteration in the methods of the American Exchange Stabilisation Fund, which in effect will make it similar to the British Exchange Equalisation Account. So far the difference has been that when the British Exchange Account was formed its original assets consisted of Treasury bills specially issued for the purpose. The original assets of the American Stabilisation Fund, on the other hand, consisted of gold derived from the 1934 devaluation of the dollar. The distinction was that when the British Account buys gold it turns Treasury bills over to the money market; which in reality means that the British Account has continual powers to borrow sterling at short-term, up to the statutory limit of the Account, in order to pay for any fresh acquisitions of gold. So far the American Exchange Account has had no such borrowing powers, for it never had any American Government securities placed originally at its disposal and available for sale. All gold coming into the United States has, therefore, had to be re-sold to the Reserve Banks, with a consequent expansion of the internal credit basis, for the simple reason that the banking system alone had dollars with which to pay for the gold. Hence the stupendous increase in member banks' excess reserves, only partially mitigated by a lesser expansion in the note circulation and in Government deposits at the Reserve Banks. The Administration is now seeking power to follow the British example and to issue Treasury bills for the purpose of enabling the Stabilisation Fund to buy and hold gold. This fundamental change in procedure suggests several interesting possibilities, if we can draw upon our own past experience. If these Treasury bills are taken up by the member banks, then any increase in their deposits due to the inflow of foreign funds will be off-set by an increase in their securities. This will mean a fall in their ratio of cash to deposits, and a reduction in their excess reserves. On the other hand, if the Reserve Banks take up the new Treasury bills, the only change from the recent experience will be an expansion in the Reserve Banks' "governments" instead of in their gold certificates; and member banks' excess reserves will continue to grow, as in the past. These are matters of practical operation with which the American authorities are doubtless conversant. In the meantime, we are glad that the United States is following the British precedent, for our methods are the only way in which an Exchange Fund can be made to serve as an efficient insulator of the internal credit basis from the sudden pressure of international capital movements.

The Foreign Exchanges.—The London market has been very quiet. Dollars have been weak at \$4.91½, partly because the market over-bought dollars earlier in the month. With the approach of the end of the year there has been a temporary demand for sterling, for lending in

the London money market. Some American banks have therefore been selling dollars spot and buying them forward, and while they incur a small loss on the swap, the return on loans in London into the New Year leaves them with a margin of profit. There have also been sales of dollars against gold shipments to New York, while there has been further covering of previous forward sales of guilders and Swiss francs. The feeling in London is that ultimately dollars will appreciate, but no one wishes to buy spot dollars before the end of the year. Spot guilders have been very strong at Fl. 8.97½. This week the last of the forward guilder sales made before the guilder went off gold on September 28th have been falling due, and there has been heavy covering. Next week this special demand for spot guilders will have subsided, and so the rate may weaken. Forward guilders have now strengthened to either side of par. The franc is still held at Frs. 105.15. The new loan offered to gold hoarders has met with a very partial success, and there has been little new repatriation. Its current market price is 124-126. Frenchmen who "surrendered" gold at the old parity immediately after devaluation are able by presenting their surrender certificates to subscribe for the new loan at par, and they will probably all do so. These subscriptions are estimated roughly at Frs. 2,000 millions.

The Money Market.—We go to press before this week's Bank return is issued, but there is no doubt that the note circulation has risen to a new high record. There has been a fair demand for money this week, and while some of the clearing banks have been lending at the normal rates, others have been asking rates of ½ and 1 per cent. for loans against bills. Loans into the New Year now cost 1½ and 2 per cent. Borrowing at the Bank was expected to begin on December 24th. On that day there were three days' Treasury bills to pay for, while maturities are now mainly on December 20th and 30th, immediately before the end of the year. Still, loans from the Bank should make money easier until the 31st, especially as next week's Treasury bill payments will be dated January 1st and 2nd. It is more than likely that the Treasury will have to borrow on Ways and Means over the turn of the year:—

	Dec. 3, 1936	Dec. 10, 1936	Dec. 17, 1936	Dec. 23, 1936
Bank rate.....	2	2	2	2
Clearing banks' deposit rate ...	½	½	½	½
Short loan rate:—				
Clearing banks	1-1½*	1-1½†	1-1½*	1-1½*
Others	½	½	½	½
Discount rates:—				
Treasury bills	½	½	½	½
Three months' bank bills	1½	1½	1½	1½
* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.				
† This week's rates were 1-1½; 1-1½; and 1-1½ per cent., for the three classes of loans, respectively.				

The Bank's gold purchase has caused an easing of discount rates. Last week the Treasury bill tender rate dropped from £1 os. 7.4½d. to 18s. 1.36d. per cent., with the result that market discount rates have also fallen.

Coronation Insurances.—It is impossible to arrive at an exact figure of the amount insured against the postponement of the Coronation, but it is probably somewhere between £100,000 and £200,000. The insurances took various forms. Most policies mention specifically the Coronation of Edward VIII, and on these there can be no risk of postponement of the Coronation, and it seems probable that if the Coronation of George VI duly occurs on May 12th these policies will bring no claim. It might be possible to argue that the word "the" in front of Coronation denotes the particular Coronation which was in mind at the time the risk was placed, but the value of this argument must be doubtful. Most policies entitle the assured to an agreed sum if a loss occurs, while others are indemnity policies to pay only the ascertained loss. What the aggregate loss will be on them it is impossible as yet to say.

THE STOCK EXCHANGE

WHAT ARE EARNINGS?

THE Christmas season is not, by tradition, a time for intense investment activity. Shareholders are concerned with the spending rather than the receipt of income. The autumn dividend warrants have mostly been cashed. The banks' statements will be upon the investor before the twelve days of Christmas have run their course, but he must wait another month for the railway announcements and at least a couple of months for the reports of the host of companies which make up their accounts to December 31st.

The end of the year is an appropriate time for balancing gains and losses, reviewing opportunities accepted and forgone, and calculating earnings, individual and corporate. The rise in investment portfolio values during the past year has been based, directly or indirectly, on increased industrial earning power. But what are company earnings? How is earning power measured? And how should it be translated into capital values?

When a company is first formed, investors supply capital (let us assume ordinary shares) in the expectation of a return of x per cent., which will be low if prospects of profits are good and high if they are not. If the subscribers enjoyed Methuselah's expectation of life they would seek this return in perpetuity. In order to secure that return it would be necessary for the company, through all changes of economic circumstances, to maintain its assets "intact" and to keep their earning power undiminished.

This theoretical idea of the maintenance of assets values goes farther than the provision of formal depreciation, and, indeed, beyond the categories of "fixity" in any physical sense. It involves the consideration of fundamental risks of economic change which, for mere mortals, are more easily subsumed in a "higher than average" yield during prosperity and a prompt sale if sudden technical change occurs. To the layman, however, the adequacy of depreciation allowances is itself difficult enough to judge, for it depends on two factors—the rate employed, which is a technical matter, and the basic value of the assets, which is even more mysterious. Occasionally, there may be obvious anomalies of practice. Suppose that two companies each value their fixed assets, which possess similar earnings capacities, in the one case at £1 million and in the second at £2 millions. If the conventional rate of depreciation were, say, 5 per cent., investors would accept annual depreciation charges of £50,000 and £100,000, respectively, without comment. Yet, when the time came for replacing these assets, Company A's shareholders, despite their ostensibly more favourable balance-sheet position, might be much the worse off.

It is usual to consider "free" reserves as earnings, which, but for the board's caution, could have been distributed in dividends. But if they are really "true" earnings, can they be hypothecated in later years for dealing with special circumstances—an exceptional fall in stock values, for example? Shareholders are taught to regard a conservative distribution policy as a contribution to their equity and a portent of rising earnings to come. But if reserves are snatched back in later years to cover what are really working expenses, does the point still hold? Between 1901 and 1930 the profits available for the common stock of the United States Steel Corporation amounted to \$2,344 millions. Cash and stock dividends distributed totalled \$1,094 millions and \$1,250 millions were "ploughed back" into the business. But when depression came, considerable drafts were made, in effect, on this accumulation to meet current depreciation charges. To that extent, the "free" reserves were not free, but represented advance provision for future depreciation, and the "true" earnings of earlier years were, *pro tanto*, overstated.

To measure "true" earning power, therefore, it may sometimes be necessary to question the adequacy of depre-

ciation provisions over a term of years, or the perpetual "freedom" of free reserves. But the shortcomings of the majority of reports involve more immediate practical difficulties. The number of concerns which specifically disclose the amounts charged for depreciation is not large, and the point at which "profits" are disclosed is wholly irregular. There are some holding companies which disclose merely sufficient profits to cover formal expenses and the cost of a dividend decided round the board-room table. Until holding companies disclose the full earnings of all their subsidiary companies (following the excellent examples of Dunlop, Wiggins Teape, Richard Thomas, Turner and Newall and others), investors can have no real notion of their true profits. And the same generalisation applies to companies which make undisclosed transfers to contingencies before striking their profits—a practice which enabled one concern to report identical "earnings" for three successive years—and to those which credit undisclosed amounts from capital profits to revenue. The number of companies which thus clothe their earnings in the cloak of semi-invisibility is legion. If companies were as willing to disclose their essential earnings position as they are to publish such trivial details as transfer fees received, or to separate small charges for bank interest, professional fees and the like, the investor's lot would be happier.

But even if obscurantism were eliminated from the published accounts of British companies, the investor would still have to consider the implications of the fact that he shares his equity, to the extent of nearly one-quarter, with the Exchequer. Clearly, the treatment of income tax is a very relevant factor in the calculation of true earnings. Investors occasionally write to the financial Press, urging that all company reports should be produced in an identical format. But no shareholder appears ever to have inquired why income tax is treated in so many different ways in company accounts. There are many variations on a single income-tax theme, all depending on the answer to the question: Have disclosed profits been struck after providing for the company's full liability for income tax for the year, or has the company's charge for tax been reduced to the extent of the tax recoverable from its shareholders? Companies such as F. W. Woolworth show a charge for income tax which clearly represents the full liability, and in consequence the dividends provided in the accounts are calculated at the *net* total which shareholders will receive, after income tax has been deducted at the standard rate from the dividend warrants. Others, like Imperial Chemical Industries, charge a relatively small proportion of the total tax liability, and consequently show the dividends at their *gross* total, before income tax has been deducted. In this second case, therefore, the total assessment is made up of two parts: the company's share, which represents tax on the profits which are not distributed, and the shareholders' proportion, which is deducted at source from their dividends. Two consequences immediately arise, which have great significance where a substantial proportion of earnings is ploughed back.

For "Woolworth" companies the accounts are on a net basis throughout; preference dividends are shown after deducting tax, and the resultant earnings for the equity, therefore, need only be divided by the total (net) cost of the dividend and multiplied by the (gross) rate per cent. declared. The resultant figure is the percentage rate of earnings for the equity, available if the directors wished to distribute profits up to the hilt. But for "Imperial Chemical" companies, the amount shown as earned for the ordinary shares is a composite total, made up of two distinct parts. The first consists of profits which the directors have decided to place to reserve. The company's liability for income tax on this sum has necessarily been provided, and consequently the sum is included in the

published earnings on a net basis. But the second part, which is to be distributed in dividends, is, *ex hypothesi*, on a gross basis. To ascertain the "true" earnings, therefore, it is necessary to deduct the (gross) cost of the dividend from the apparent amount earned to pay it. The residue, representing the net amount of reserved earnings, must then be multiplied by a factor to raise it to a gross basis. With the standard rate of income tax at 4s. 9d. in the £, this factor is 20s. ÷ 15.25s., or 1.3115. This gross amount, added back to the dividend, shows the approximate "true" earnings, i.e. the earnings which would have been shown in the accounts if the company had intended to divide all the available profits. A simple comparison between this sum and the amount of ordinary capital reveals the effective rate of earnings. Some companies show both earnings and dividends free of (i.e. after deduction of) income tax. This method is really another way of representing the accounting position of "Woolworth" companies. A gross dividend of 13.115 per cent. (at the present rate of tax) would, in this case, be declared as 10 per cent., tax free, and a 10 per cent. gross dividend would be declared as 7.625 per cent., tax free. The effective amounts earned are similarly set out on a "tax-free" basis, and can be converted to a gross rate, for comparison with those of other concerns, by simple application of the tax factor.

The treatment of the tax problem, altogether, is troublesome rather than obscure. Its difficulty is enhanced by non-disclosure of the actual amounts provided for tax in many company accounts. But the method adopted for setting out the dividend serves as a thread to guide the investor through the labyrinth, even where the amount provided is itself undisclosed. Finally, adjustments are necessary for companies which obtain Dominion income tax relief—the South African gold mines, for example. This is a factor which some investors are apt to overlook in calculating relative yields.

It is clear that the measurement of earning power is a problem worthy of the mathematical skill of a Dr. Rhodes and the deductive flair of a Sherlock Holmes. And it is equally clear that so long as the investor must work, willy nilly, on the imperfect raw material to which alone, in the present state of British company law, he is entitled, the value of the results will be relative rather than absolute. And mathematics have no relation whatever to the mixture of conventional regard, sentiment and enthusiasm with which the market converts earnings percentages into capital values. We are still far from scientific investment in any but a Pickwickian sense. But Christmas is not, perhaps, the most appropriate of seasons for philosophical musing on a problem which has regularly perplexed the mind of uneconomic man since the South Sea Bubble.

INVESTMENT AND COMPANY NOTES

Rising Costs and Profits.—How is the investor to view the effect of rising costs and prices on the various enterprises in which he may be interested? Emphatic warnings have been given to him by the spokesmen of companies as widely different as J. Lyons and Company, Tube Investments and Dorman Long. The possible effects, although they are dependent upon identifiable factors, cannot be simply expressed for any one company. For those industries whose prime costs form a large proportion of the total, the effect of rising prices and expenses might be expected to show itself at an early stage. These conditions apply to many processing concerns, working on materials which are already in a fairly advanced stage of manufacture. Much depends also on what the consumer will bear; where a small rise in selling prices would cause a large falling-off in demand, it may be worth a manufacturer's while to carry most of the burden himself. Inability to pass on the whole rise in costs is plainly evident among provision and catering concerns, of which International Tea Company's Stores and J. Lyons and Company may be taken as typical. For concerns in specialised branches of manufacture—which we may illustrate by

W. and T. Avery, Craven Bros. (Manchester), Westinghouse and General Electric—there should be less difficulty in passing on rising costs owing to the urgent demand for mechanical equipment. And where manufacturing concerns can immediately adjust selling prices and hold substantial stocks of raw materials, like woollen textile concerns, a rising trend of material prices is of positive advantage. The reverse case, however, is presented by a company whose sales must be effected some time ahead at firm prices, for seasonal reasons. Unless raw materials can be fully "covered" in the market, the risk of a subsequent rise is important. Past reports of Dunlop Rubber have frequently called attention to this factor. In the present phase, indeed, market initiative is passing steadily to commodity and mining shares, and to the bonds of the producing countries. Even if labour unrest is avoided, the effects of rising costs are bound to assume increasing market importance next year.

U.S. Rail Surcharges Expire.—Wall Street's optimism was deflated by the week-end news that the Interstate Commerce Commission had refused to extend the emergency freight surcharges. As recently as November 14th attention was drawn, in a Stock Exchange leading article, to their expiration on December 31st, after six months' extension. Recently, the Class I Railroads asked for a temporary extension of sixty days, to give time for general readjustment of freight charges, but it has been refused. Although Wall Street affected surprise at this verdict, it was suggested by the Commerce Commission's recent decisions. Certainly informed railroad opinion and those in touch with Washington did not anticipate a "favourable" decision. Various references which have been made to the "serious" effect of the decision for the coal-carrying lines seem equally misplaced. When the emergency charges were renewed, coal traffic was specifically relieved of certain of these higher rates. In actual practice, such coal-carrying lines as the Chesapeake and Ohio and the Norfolk and Western have recently shown a sharp expansion of net revenue, and have overtaken considerable arrears of maintenance. Railroads serving the Pennsylvania coalfields have been severely hit by the "boot-leg coal getters." As much as 6,000,000 tons of coal is estimated to have been trucked away from the anthracite coalfield in 1935, and it is doubtful if lower rates would divert much of this traffic to the railroads. Broadly, the Interstate Commerce Commission's view, both on fares and rates, is that, under prevailing conditions, a reasonable reduction of charges will stimulate traffics and net revenues. The Eastern passenger fares case was typical, and it is generally agreed that the Commission was right in this forecast. It was hardly to be assumed that they would take, within a few months, a diametrically opposed viewpoint, and for this reason alone our previous article did not even envisage the possibility of an extension of the higher charges. The case is not of considerable importance for itself, but for British investors it suggests that Wall Street's optimism regarding the recovery of rail stocks has, for the time being, lost some touch with quite simple realities.

Textile Machinery Shares.—The investment possibilities of a Lancashire cotton revival were examined at length in *The Economist* last week. It may be expected, in that event, that a considerable re-equipment movement would make itself felt. In recent articles on the general prospect for Lancashire, we showed that a large proportion of Lancashire's machinery could now be renewed with advantage. The three concerns most interesting to the investor in that event would be Platt Brothers (Holdings), Smalley. The first two are the dominant members in the Textile Machinery Makers group, and have apparently been in the group during recent years. The finances of both are reasonably strong, and a revival of profits would imply an important increase in dividends. Tweedales and Smalley is outside the group, but is a well-established concern on

a smaller scale. Its interim dividend declared in October was only 2½ per cent. against 4 per cent. last year. That reduction presumably reflects current difficulties in export markets. It is not, however, relevant to the possibilities which would open if Lancashire were itself to appear as a promising market for the machinists. The following table of recent earnings shows that the yields now obtainable on Howard and Bullough and Tweedales and Smalley ordinary shares (though their maintenance is not assured in the immediate future) should pay for the keep of the securities till more profitable conditions are experienced:—

Company	Total Profits	Earned for divs.	Ordinary Shares			
			Earned	Paid	Price and Denom.	Yield %
Howard & Bullough Secs. (Mar. 31) ...	1934 18,272 1935 25,819 1936 36,832	7,772 16,124 29,774	% Nil 1-9	% Nil 2½	s. d. 15 0 (£1)	£ s. d. 5 0 0
Platt Bros. & Co. (Hlids.) (Mar. 31) ...	1934 73,648† 1935 118,595† 1936 127,178†	45,211 86,470 95,083	Nil • •	Nil Nil Nil	9 0 (£1)	Nil
Tweedales & Smalley (Apr. 30) ...	1934 24,365 1935 52,456 1936 57,676	22,250 50,198 55,418	4-9 11-5 12-4	6 10 12½	17 6 (10s.)	6 17 0‡

† Includes undisclosed income tax repayments, and reserves not required. * Assuming normal preference dividends, earnings were 0-7 per cent. and 1-3 per cent., respectively. Arrears of 9s. 1d. gross still due on 7 per cent. 2nd preference. ‡ Interim 1936-37 reduced from 4 per cent. to 2½ per cent.; not allowed for in yield.

It would appear, however, that prosperity for the textile machinery makers in general would need to await the second wave of Lancashire's recovery. To forecast the date of that recovery is difficult, but it is conceivable that the market would already be discounting the second wave by the time the first wave had established itself.

Property Company Results.—Outstanding among recent property company reports, *Second Covent Garden Property* shows an increase of £53,400 in profits. In their report, the directors state that more capital will be needed if certain plans mature. In these circumstances it is difficult to frame an estimate of future earnings, but the company has the benefit of experienced management and the accounts since its incorporation make the following satisfactory showing:—

	Years ended November 30th		
	1934†	1935	1936
Total profits	63,590*	111,199	164,599
Taxation	8,404	11,645	20,411
Other expenses.....	4,735	6,822	9,591
Debtenture and other interest	20,523	45,998	65,460
Preference shares	9,682	19,375	26,687
Ordinary shares—			
Earned	20,246	27,359	42,450
Paid	9,823	21,390§	35,456
Earned %	10-3 p.a.	7-7	9-0
Paid %	5 p.a.	6§	7½
Carry forward†	9,947	16,300	23,118

† Period from July 28, 1933, to November 30, 1934.
* Including £8,909 profit on sale of property.
‡ After adjustments. § 6 per cent. actual on £300,000, plus 3 per cent. actual on £320,000 for 6 months.

The balance-sheet shows that £40,000 has been spent on further properties, while investments have increased from £14,647 to £153,228. In accordance with a note to the balance-sheet of November 30, 1935, mortgages have been reduced by over £119,000 to £16,104, and the bank loan has increased to £64,392, against £31,020, while creditors amount to £64,392 against £28,175. The position generally suggests that any extensive developments will certainly require new money. Any property company, indeed, can only progress if opportunities arise for expansion. Buildings can be no more than fully let, and wholesale adjustments in rent cannot frequently be made, although profits are undoubtedly subject to the trend of rents, particularly where "lets" are short. These factors have again become

topical in view of recent prospectuses. Results lately available include those of another large company, *Town Investments*. The form of the profit and loss account has been changed, but it seems that profits of £98,886 after expenses and tax compare with £88,522. The 14 per cent. dividend is only maintained, but is payable on a larger capital. A new concern, *Capital and Provincial Trust*, shows a full year's profits of £44,033 compared with £53,588 for the initial 16-month period. A much smaller company, *Properties Selection*, shows practically unchanged profits of £18,469, and though a higher dividend of 5½ per cent. is paid, the percentage earned for the equity remains at about 8.8 per cent. The long-established *Metropolitan Industrial Dwellings* is in a somewhat different category, for profits over recent years have been unusually steady. An increase of 2 per cent. in the dividend to 8 per cent. marked the company's fiftieth year. There is no clear inference from these mixed results, but the invitation they extend to new property investments at a time when rents appear to be falling rather than rising in contrast to building costs, is not outstandingly warm.

Brick and Housing Estate Companies.—An opportunity to study the present state of housing development has been afforded by recent reports from a brick company and two housing estate concerns. No immediate recession in building activity is suggested by the results of *Sussex Brick Company*, whose profits have advanced from £56,622 to £83,314. These earnings are again distributed up to the hilt, although the dividend remains at 18 per cent., since both the preferred ordinary and deferred capitals have been increased. The position of the brick-making companies has been well summed up by the chairman of *London Brick*. The inevitable down-turn in building activity will probably not be sudden, for demand can hardly fall simultaneously in every district. For this major concern the surpassing of three output records suggests no imminent setback. The position of smaller companies, compelled to follow the lead of London Brick Company in reducing prices, may be less favourable, for they cannot spread their geographical risks so easily. The few housing estate companies known to the investor, however, reveal certain signs of strain in the residential building industry. *Morrell Estates and Development*, a holding company, has published a first report for the period to June 30th, showing total profits of £110,845 and £82,219 for the equity. The latter figure represents no less than 47.9 per cent. on the ordinary capital, but not a penny is distributed in dividend. The balance sheet, indeed, indicates how inconvenient any large payment would be. Cash stands at only £45, while current liabilities amount to about £6,000 (including preference dividend), and £242,000 out of the £522,000 interests in subsidiaries is on loan account. A similar policy is followed by *Davis Estates*, whose income of £92,834 shows a substantial increase of £24,665 over the previous year. For the second year, however, no ordinary dividend is paid, although 18.7 per cent. and 19.9 per cent. respectively was earned for the equity in the past two years. Is this determination to continue development out of profits consonant with the general belief that some slackening in housing expansion is imminent? Or may shareholders feel that the dividend policy of these companies must be governed by the rate of disposal of new houses as they are built?

The Problem of the Foreign Exchanges

by L. L. B. ANGAS

This book goes right to the heart of one of the most crucial economic questions confronting the business-men and statesmen of our day.

Financial News: "Mr. Angas has written the most clear and searching criticism of the gold standard which I have ever read."
Journal of the British Institute of Bankers: "His summing up of the prerequisites of a successful functioning of a free gold standard is masterly."

Macmillan & Co., St. Martin's Street, W.C.2. Price 61 net.

Brazil Bond Outlook.—A recent feature in the foreign bond market has been a sharp rise in Brazilian bonds. Brazil's trade returns for the past few months have shown decided improvement, but the slowness of the market to respond may have been due to uncertainty caused by local agitation for default on the foreign debt when the Aranha scheme ends in 1938. The export trade figures up to September, however, were so good that the bonds immediately moved up sharply. The favourable balance of trade for the nine months, £6,139,000 (gold), compares with only £4,223,000 (gold) at end-September, 1935. Owing to the recent rise in coffee prices, total exports of coffee increased slightly this year to £12,662,000 (gold), against £12,508,000 (gold), while cotton shipments have risen sharply to an aggregate value of £5,612,000 (gold)—a rise of £1,456,000 (gold) over last year's value. There seems no statistical reason for the rise in coffee prices, which is due rather to hopes of a definite scheme between the producing countries for raising prices as a result of the Bogotá Conference. But even if the promised quota system were also achieved, Brazil's problem of coffee over-production would still be unsolved. Other signs of economic improvement may be found in the steady increase in revenue this year over Budget estimates. Meanwhile, the President has refused to pass the 1937 Budget unless public expenditure is drastically reduced. These signs, together with the check to currency inflation and the creation of a gold reserve, are propitious. From the end of March, the proportions of debt service under the 1934 Debt Plan are increased, for loans in Grade III to Grade VII, by a flat 10 per cent. This will increase the basic rates to 50 per cent. for Grade III issues, and to 32½ per cent. for Grade VII issues. In view of the improvement in Brazil's finances, it is reasonable to expect the full satisfaction of the 1934 undertaking. In framing yield calculations, investors must consider the prospects of revision of the scheme from 1938 onwards. But assuming that the final rates are maintained, yields of 7½ per cent. are obtainable on Grade IV bonds, while among the State and municipal loans in Grades VI and VII current yields range from 9 to 10 per cent. These valuations are plain enough warning for the investor. But there is evidence that speculative operators, impressed by rising commodity prices, are turning to the bonds of primary producing countries. The claims of Brazil for this strictly specialised purpose cannot be overlooked.

British-American Tobacco Report.—The disclosed profits of this holding company show further progress in the slow climb towards the pre-depression level of over £6,000,000. Profits and dividends amount to £5,541,756, against £5,469,171, and the dividend is maintained at 20 per cent., tax free. Of the real changes in the trading position it is impossible to judge, as the accounts are still presented in the usual form, without consolidated statements of earnings or assets. Thus, the profit and loss account is merely an appropriation account of disclosed earnings. There is reason to presume that a favourable change has occurred in the company's trading prospects, as discussed by Sir H. Cunliffe-Owen's address last January. Sales at that time continued to increase above the record year, 1929, but the ratio of profit was less, and the rise in total earnings was in smaller proportion. But the company, as the market recognised on the collapse of the gold bloc, is an international trade equity, *par excellence*, and has a striking interest in a recovery of world trade. The balance sheet discloses no important changes. A rising trend in tobacco profits is perhaps indicated by the dividend of one of the associated companies, United Tobacco Company (South), whose final distribution of 2s. per share plus a 3s. bonus, free of South African tax, makes 40 per cent. for the year, compared with 30 per cent. But if any opinion is formed of British-American Tobacco's prospects, it must be judged on general considerations, and not from a study of the accounts. At the present price of £6½, the ordinary stock yields £3 18s. 6d. per cent.—a figure in keeping with its stable dividend record.

United Molasses Position.—The diversification of United Molasses industrial interests was the theme of Mr F. K. Kielberg's address last Friday. Already, the company's tanker tonnage has been largely employed for the transport of oil, and recently it has acquired an interest in the sugar-refining industry. These developments differ markedly in their significance. The full benefit of the investment in Macfie and Sons has yet to be realised, for the due proportion of earnings for the past year, before the share purchase, has been placed direct to investment reserve. This Liverpool refinery was acquired with the proceeds of part of the United Molasses' holding in British Sugar Corporation shares, which was received in exchange for investments in various East Anglian beet sugar companies acquired only two years ago. Like Sir Leonard Lyle, the directors felt that the holding in British Sugar Corporation was unnecessarily large, in view of its limited dividend prospects. The chairman pointed out, not for the first time, that two-thirds of the company's capital is represented by transport equipment. Increased oil carrying, although opportune in view of the short supplies of molasses, is nevertheless something of a *pis aller* for a company formed to concentrate the great part of world trade in molasses into its hands. And it is significant that although the production of Cuban high-test molasses relieved any actual market shortage, it involved the acceptance of a lower trading margin, and required sub-normal transport facilities. Two tankers, constantly employed between Cuba and England could carry the equivalent of eight handling the ordinary "Blackstrap" molasses from the East. The chairman confirmed our suggestion that the directors would continue their cautious depreciation policy while earnings remained favourable. At 25s. 3d., the 6s. 8d. stock units are a progressive but not highly-gearred recovery holding.

Gaumont Group Position.—By wielding the heavy weight of the poll, the directors of Gaumont-British succeeded in obtaining the adoption of the accounts and the re-election of Mr S. R. Kent to the board by overwhelming majorities on Thursday of last week. The meeting, however, produced some pointed criticism from the floor and some significant disclosures from the chairman's table. Since shareholders, once seized of the facts, can usually interpret their full significance, it may be sufficient merely to add the new information to our recent discussion (see *The Economist* of December 12th, page 534) of the consolidated balance sheet. It was disclosed that the group's gross profits amounted to £1,296,906 for the year to March last. Depreciation and sinking fund took £372,763 (equivalent to only 2.3 per cent. of the valuation of the group's property assets), and debenture interest and outside holdings required £526,411. After providing £178,750 for the corporation's preference dividend, the balance available for the equity was £218,982—some £20,000 more than the amount brought into the parent's accounts. Analysis of the book value of film production (£1,578,908, before deducting the newly-created special reserve) revealed that released films stood at £871,619, unreleased films at £101,350, and productions in progress, including "expenditure in respect of future productions" at £605,939. Information of great moment was also given on the valuing of properties. The figure of £16,145,233 for properties taken at valuation included an excess over book values. In earlier years, book values had been written down, and such amounts were being reinstated "to a certain extent." In other instances, properties were apparently valued in excess of book values where no depreciation had been provided. A request for disclosure of the extent of writing-up was rejected on the grounds that the figure would be misleading. The 10s. ordinary shares still stand around 9s. 4½d.

London Tin Merger Approved.—Shareholders of London Tin and Anglo-Oriental this week approved, though not without some criticism, the merger scheme outlined in *The Economist* of November 28th. The scheme was

amended, at the last moment, to allocate a further 200,000 shares from the ordinary shareholders of Anglo-Oriental to the preference holders, and the final share of the two classes in the company's allotment of London Tin shares will therefore be 28.9 and 71.1 per cent. respectively. This modification, which was made possible by a change of ownership in a substantial block of ordinary shares, goes some way to meet the comment, expressed in our earlier Note, that Anglo-Oriental preference shareholders were required to pay a stiff price for the support of the ordinary shareholders to the scheme. Proposals, however, to increase their participation from 3,000,000 to 4,000,000 shares, leaving the ordinary holders with a mere 500,000 shares, were plainly unacceptable. In the course of the proceedings, it was disclosed that the Association of Investment Trusts, whose approval was given to the first proposals, represented 36 members holding 13½ per cent. of the Anglo-Oriental preference capital. But the sense of the two meetings suggests that most shareholders accepted the view put forward in these columns—that some inequities were created and perhaps were inevitable in a scheme of this sort, but that the principle of the merger was fully deserving of support. Such considerations, presumably, explained the relatively quiet endorsement of the scheme by London Tin ordinary shareholders. Mr Ivan Spens made no attempt to forecast the London Tin profits for the year to April next, but he expressed the hope that shareholders would receive a modest distribution.

Apex (Trinidad) Profits.—The preliminary profits statement from Apex (Trinidad) has provided excellent Christmas news, and justified recent activity in the 5s. shares. Oil profits have jumped from £300,468 to £369,700—the highest level since 1929, and the 35 per cent. dividend is equal to the best expectations. After a substantial increase in tax provision, equity earnings show an increase from £122,454 to £179,555. As the following table shows, the 1933-34 level of profits has been restored:—

	YEARS TO SEPTEMBER 30TH		
	1934	1935	1936
	£	£	£
Oil profits	348,700	300,468	369,700
Amortisation of wells	130,973	146,114†	132,378
Head Office expenses (net)	7,433	4,011	8,030
Taxation	21,443	21,013	40,987
Directors' remuneration	8,750	6,875	8,750
Ordinary shares:—

Paid (%)	35½	27½	35½
Carried forward	115,611	100,565	105,120

† Includes £19,693 special depreciation.
‡ Subject to deduction of tax, after Dominion Income Tax relief, of 2s. 1-9d., 2s. 3-4d. and 2s. 5-5d. in the £ in respective years.

The company is the largest producer working in the British Empire, and its costs are among the lowest. It is to finance a programme of expansion, by issuing 200,000 5s. shares to shareholders at 20s., in the proportion of one in ten. At the present price of 33s., these rights are worth approximately 1s. 2d. per share, and the "ex all" price is approximately 30s. 6d. Around this level, the shares offer the satisfactory yield of £6 11s. per cent., after adjustment for Dominion income tax relief. Deliveries have lately increased, and pending the publication of the full report early in 1937, the outlook seems good.

Other Company Results.—Our summary on page 658 of the profit and loss accounts of 22 companies is of seasonally short dimensions. *Adelaide Electric Supply* continues to display rising gross revenues, and the net profits have recovered from their previous small setback, to £351,193, against £347,739. The trading profits of *Cannon Iron*

REDUCE PRODUCTION COSTS
—USE ELECTRICAL POWER FOR ALL INDUSTRIAL PURPOSES
NORTH-EASTERN ELECTRIC SUPPLY Co. Ltd.
Carlisle House, NEWCASTLE-UPON-TYNE
Apply to above address for particulars of Sites for Works

Foundries are over £3,000 higher at £76,946, and the company pays 15 per cent. compared with 7½ per cent. paid for the period March 20 to September 30, 1935. The *Triumph Company* reports an increase in the previous year's loss of £89,785 to £115,236 for a fifteen-month period. An independent valuation of assets has, however, been made, and a definite scheme of financial reconstruction is expected in the New Year. *W. Abbott and Sons* have experienced a severe setback, with a loss of £94,969 against £2,897. Most of the loss was due to the disposal of over-valued stocks at the best prices available. A capital re-organisation is proposed. *Chappell and Company* have earned no less than £24,794, compared with £7,246, but the increase is being used to provide for repairs and dilapidations of properties.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Mexican Railway, Stoll Theatres Corporation, Carreras, United Molasses, Low Temperature Carbonisation, Raphael Tuck, Agar Cross, Industrial Credit Company, Gold Options Syndicate, Scottish Australian Company, Kwahu Mining (1925), Thistle-Etna Gold Mines, Arston Gold Mines, Akim (1928), Wiluna Gold Corporation, and South-West Africa Company. At the Stoll Theatres Corporation meeting, Sir Oswald Stoll described the sale of the Alhambra Theatre and pointed out that the Alhambra capital would be returned in full plus a substantial premium. Colonel W. A. Bristow, at the Low Temperature Carbonisation meeting, criticised the policy of control adopted in certain instances by some of the coal sales committees. Points discussed by Mr F. K. Kielberg at the United Molasses meeting are discussed in a note on page 643. Mr Henry S. F. Alexander, at the Agar Cross and Company meeting, referred to the company's shortage of working capital. At the Carreras meeting, Mr Harry W. Danbury said it was felt that the time had arrived for another step to be taken in making the capital more commensurate with profits. The chairman at the Industrial Credit meeting gave some figures of the capital issues carried through by the company. Mr Gustave Tuck, at the Raphael Tuck and Sons meeting, said that the Christmas and greeting card departments continued to make progress. At the Kwahu Mining Company (1925) meeting, the chairman ventured to predict that the Marlu Gold Mining Areas was destined to be added to the world's important gold mines. Sir Godfrey Fell, at the Thistle-Etna Mines meeting, discussed the progress made in the company's mines. At the Arston Gold Mines (1929) meeting, the chairman referred to the proposal to increase the company's capital. Mr J. Campbell Inglis, at the Scottish Australian meeting, attributed the greatly improved results to a favourable rainfall at practically all stations and to the recovery in the world price of wool. At the Akim (1928) meeting, the chairman discussed the company's holding in Arston Gold Mines. Sir Edmund Davis, at the South-West Africa Company meeting, expressed satisfaction that the prediction of a substantial increase in profits had been fulfilled on the re-opening of the Abenab mine. At the Wiluna Gold Corporation meeting the chairman said the chief reason for the fall in monthly profits was the decrease in the grade of ore opened up on the East Lode. Mr Vincent Yorker, at the Mexican Railway Company meeting, in remarking that the increase in traffics had been contributed equally by goods and passenger traffic, reported that the rise in expenses was more than double that in receipts. At the Gold Options Syndicate meeting, the chairman gave the reasons for the proposed return of 2s. 6d. per share.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET
JANUARY 5

ACCOUNT
JANUARY 7

THE markets of chief interest to investors this week deal in something more appetising than mere *choses en action*. The Stock Exchange has displayed a firm tone, relatively to the approach of the Christmas holiday, and fair business has been reported in the week's "features." In the investment markets, gilt-edged have been dull and neglected, as befits the year-end, but buying of the Railway Rebates Loan was well sustained and took the scrip to a new high. Brazilian bonds lost something of their recent tone, and there was little afoot among Far Eastern issues. European issues remained nervous, with German bonds lower.

Home rails have shown small movements, although L.M.S. ordinary enjoyed some following. Prior charges were featureless. A firmer front, however, was displayed by London Transport "C." Among foreign rails, Cordoba provided the greatest interest, for the market was still busy with persistent rumour, though no firm fact, regarding the possibility of purchase by the Argentine Government. In other Argentine stocks, a steadier tone was apparent, with a number of fractional advances.

In quiet industrial markets, a few features made an immediate impression. Cable and Wireless stocks, for example, improved on the better traffic return, and Triplex Glass were stimulated by an impressive output statement, and by hopes of a bonus to come. Standard provided the principal feature in the motor group. Reduced business was done in iron and steel shares, and the aircraft group continued deflated, apart from Fairey. Tobacco shares enjoyed moderate support, and British American Tobacco improved fractionally on consideration of the results. Unilever were supported on rising soap prices. The miscellaneous leaders, like Murex, Turner and Newall and Imperial Chemical, made a few pence, and several of the small engineering concerns improved.

The oil shares market has seen satisfactory business for the eve of the Christmas holiday. Attention has been directed mainly to Trinidad issues, particularly Leaseholds. Apex (Trinidad) were strong on the dividend and new share offer discussed on page 644. Rubber shares closed last week on their best form, with prices reaching their highest, and spot rubber touching 10d. a pound. This week conditions were less active, and some prices fell back slightly on profit-taking. Interest in the tea shares market was naturally greatest in Ceylon tea-cum-rubber issues; dealings in Indian issues were on a very restrained scale.

The Kaffir market has been quietening down for the holiday, and there have been no movements of great importance. Prices have remained very firm, and in mid-week there was a substantial demand for Gold Fields, and other finance descriptions. The West African section was nearly stagnant. Rhodesian copper issues saw some profit-taking at the end of last week, but this gave way to renewed support later as the commodity price improved. Rhokana were in the lead. Tin shares have been supported on the rising commodity price.

Business on the Paris bourse has been very quiet, but the tone was fairly satisfactory. At Berlin, the week opened with an all-round improvement, which was maintained in mid-week.

NEW YORK STOCK EXCHANGE

THE decision, at the end of last week, of the Interstate Commerce Commission not to permit renewal of the emergency freight rate surcharges introduced early in 1935 produced a sharp fall in railroad issues. This spread over the market, which was inclined to be watchful for depressing influences. The Eastern coal-carrying lines were the hardest hit by the change, but they also serve areas where recovery is most pronounced. The Commission's opinion that the more encouraging than otherwise. Government issues on the bond market were also depressed at the end of last week on selling by banks, which anticipate an increase in gold reserve requirements at the beginning of next year. The weakness continued this week, but there was an improvement on Tuesday after the plan was announced to isolate gold imports from the Treasury Bills, on the precedent of the British Exchange Equalisation Account. Recovery in prices on Tuesday was fairly general. Copper issues were put higher on the rise in the commodity price; oil, steel and railroad issues recovered and motor issues were less affected by the fear of labour troubles.

CAPITAL ISSUES

THIS week's new issues are seasonably few. The 3½ per cent. sterling bonds of *The Mortgage Bank of the Kingdom of Denmark* are of chief investment interest, although the issue was not accorded a spectacular reception. The issue will provide for the repurchase of building loan bonds issued to the Danish Treasury, and appears under excellent auspices. It may attract long-term investors who seek a sizable redemption premium. *Kinemas Limited*, a leading concern in the South African entertainments industry, has issued 5½ per cent. debenture stock at par, a rate evidently higher than would normally apply to comparable British issues. Although the earnings cover is satisfactory and rising profits are disclosed, the stock must be accorded a rating which, although fair of its debentures in this country. *Vab Products*, whose £50,000 shares and £40,000 in 2s. ordinary shares, offers part of the £10,000 consists of patents and designs), and are acquired for facts, and an issue price showing an estimated earnings yield appears to have been arranged on a somewhat generous basis. Statements for information only have been published by *Zletovo Mines*, *Bremang Gold Dredging*, *Yukon Consolidated* and *Graham's Trading Company*.

Makes and sells patented metal curtain rail and other products; owns also electroplating plant. Profits, after depreciation: 1933, £6,828; 1934, £7,832; 1935, £7,811; nine months to September 30, 1936, £6,265. Net assets £20,150 (patents and designs £10,000), purchased for £41,000 (goodwill, £20,850) payable in 10,000 £1 preference and 310,000 2s. ordinary shares. Crews and Co. take issue from Barton and Sons (1935) at 2s. 9d., or 3s. with part of expenses. List closed 9.5 a.m., December 22nd.

BY STOCK EXCHANGE INTRODUCTION

Bremang Gold Dredging Company, Ltd.—Issue of 1,750,000 5s. shares at 6s. (of which preferential allotment of 1,500,000 shares to Gold Coast Selection Trust shareholders; Trust takes balance). Acquires properties and mining rights in West Africa with area 20 square miles, near Ariston gold mine. Working costs estimated not to exceed 4d. per cubic yard with two dredges, or maximum working costs 3.5d. per cubic yard with four dredges. Operating profit estimated at £2,953,363, or annual profit on a 12.2 years' life, treating 7,680,000 cubic yards annually, £242,079. Purchase prices: £432,500 in 1,730,000 5s. shares to Gold Coast Selection Trust (the promoter); £25,000 cash to Ariston Gold Mines; and £10,000 (£5,000 cash and 20,000 shares) to Tintin Exploration. Company pay expenses (say £10,000).

Grahams Trading Company, Ltd.—Particulars of issue of £176,357 ordinary stock and £145,000 5½ per cent. first debenture stock, redeemable at par by drawings from 1937, in 1965, or on notice. A holding company, owning capital of West European Industries, Ltd., manufacturers through subsidiaries of textiles and paper in Portugal. Net assets, £176,357. Guarantee up to £30,000 on trade bills to W.E.I., Ltd. (£14,000 used); auditors' certificate "subject to value placed on the investments" (£337,767 in subsidiaries). Profits, before interest, 20 months ended March 31, 1934, £13,772; year to March 31, 1935, £12,741; 14 months to May 31, 1936, £13,672. Debenture stock was issued against like amount of 5½ per cent. unsecured notes.

Herts and Essex Waterworks, Ltd.—Particulars of issue of £44,000 3½ per cent. redeemable mortgage debentures placed through James Capel and Company at 100½ for ¼ per cent. commission. Redeemable at par 1971, or from 1961 on notice.

Round Oak Steel Works, Ltd.—Issued capital: £500,000 ordinary stock, £100,000 6 per cent. cumulative preference stock, and £388,130 debenture stock, 1965. Robert Benson and Company and Messrs Cohen, Laming, Hoare take preference stock at par or at total 100½ with certain expenses. Company formerly "Earl of Dudley's Round Oak Works."

Yukon Consolidated Gold Corporation.—Issued share capital \$4,533,018. Loan capital issued \$1,500,000. Debentures redeemable by drawings from 1939 or in 1945 at par; they carry right to convert each \$500 debenture into 500 \$1 shares. Incorporated in Canada April 14, 1923. Owns 1,607 placer mining claims, 156 under option and six leases, all in Yukon territory. Gold reserves: 1933, \$857,984; 1934, \$959,464; 1935, \$912,566; 1936, \$1,435,000. Profits, years: 1934, \$171,933; 1935, Dr. \$104,283.

Zletovo Mines, Ltd.—Issued capital 1,430,560 5s. shares. Incorporated in England 1929. Owns mining concession and prospecting rights in Southern Yugoslavia. Work has been mainly confined to Dobrovo mine (lead-silver ore); steps being taken to prepare mine for production. Estimated revenue 29s. 6d. per ton (with lead at £16 and silver at 21d.), or 12s. 6d. surplus; on basis of 110,000 tons ore, surplus would be £68,500. Total assets £239,126. Total expenditure, year to September 30, 1936, £17,818.

ISSUES TO SHAREHOLDERS ONLY

Hepworth and Grandage.—Issue of 50,000 ordinary shares 10s. at 22s. 6d. per share to ordinary shareholders registered on November 26th in the proportion of one new ordinary share for every complete seven ordinary shares held.

Ismay Industries.—In order to finance the company's expanding interests, the directors have decided to issue a further 408,000 ordinary shares 5s. at 7s. 6d. per share to ordinary shareholders on the register on December 4th in the ratio of one new share for every five held.

O.K. Bazaars.—Issue of 240,000 new "B" ordinary shares 5s. to the ordinary, "A" ordinary and "B" ordinary shareholders registered on November 30th, in the proportion of one new "B" ordinary share for every complete five ordinary or five "A" ordinary or five "B" ordinary shares held at 41s.

OTHER RESULTS OF ISSUES

Atlantic and North-West Railway.—The offer made to holders of £1,300,000 5 per cent. guaranteed first mortgage bonds to convert into 4 per cent. first mortgage redeemable debenture stock was accepted by holders of something over 70 per cent. of the bonds. The balance will be taken up by an underwriting syndicate. List opened at noon December 21st, and closed one minute later.

George Ward (Barwell).—The lists for offer for sale of 200,000 ordinary shares of 10s. at 26s. per share were closed at 9.5 a.m., December 18th. Oversubscribed.

K. and L. Timbers.—Lists for offer for sale of 350,000 shares 5s. at 8s. 3d. per share were closed at 9.5 a.m., December 18th.

Pease and Partners.—Lists for issue of 1,250,000 5 per cent. cumulative preference shares of £1 at 21s. per share were closed at 9.5 a.m., December 18th. Heavily oversubscribed.

COMPANY MEETINGS

STOLL THEATRES CORPORATION, LIMITED

EFFECT OF ENTERTAINMENTS DUTY

SALE OF ALHAMBRA THEATRE

SIR OSWALD STOLL'S ADDRESS

The eighth ordinary general meeting of the Stoll Theatres Corporation, Limited, was held, on December 22nd, at the London Coliseum, St. Martin's Lane, London, W.C.

Sir Oswald Stoll (chairman and managing director) presided. The Chairman apologised for the absence from the board of Mr J. Christie owing to illness.

The Secretary (Mr Rowland J. Bentley) having read the notice convening the meeting and the auditors' report,

The Chairman said:—Ladies and gentlemen, I rise to move the adoption of the report and accounts, which I assume may be taken as read.

I will compare the items of this balance sheet with those of the balance sheet of last year.

BALANCE-SHEET ITEMS—LIABILITIES

Taking the liabilities side first:—
The ordinary share capital is the same.
The management share capital is the same.
Loans secured by sub-mortgage of mortgages and interest thereon is down by £165,211.
Bank overdraft is up by £6,493.
Creditors are down by £1,915.
Subsidiary companies are up by £5,442.
Profit and loss account is up by £9,529.

ASSETS

I now come to the assets side:—
Investments in and advances to subsidiary companies are down by £188,139.
Lease of Tyne Theatre and interest in Liverpool site are up by £43,431.
Sound projector apparatus is down by £395.
Sundry stocks on hand are up by £16.
Debtors are down by £109.
Cash is down by £465.
Since the end of this company's financial year one of our subsidiaries, the Alhambra Company, Limited, has sold the Alhambra Theatre and the adjoining property, Charing Cross House. A substantial amount of cash will come into the coffers of this company on the liquidation of the Alhambra Company, Limited.

The Alhambra was a losing property in respect of stage productions. As a theatre it has been taxed out of existence by entertainments duty. Now it can become a cinema, because cinemas use celluloid instead of human artistes.

ALHAMBRA'S DIVIDEND RECORD

You might like to know my record there. Over the whole period during which I was chairman and managing director of the Alhambra, 151 per cent. in dividends was paid on its share capital. This represents an average of nearly 8 per cent. per annum during that whole period. These dividends were paid in spite of gaps; one of the gaps was for three years, when no dividend was paid—for instance—through the trade slump in 1921, '22 and '23.

The Alhambra capital will now be returned in full with a substantial premium. The intrinsic value of the Alhambra property is the reason why we have come well out of a fine theatre brought to ruin by entertainments duty.

As a first-class up-to-date cinema the Alhambra should, in my opinion, do remarkably well. I understand it will have an excellent supply of feature pictures and many thousands of people from all over Europe and America will come to see where the famous Alhambra was. Like the Empire, the place has a goodwill in retrospect which taxation can never close down.

So far as this company is concerned, it will be better off without the Alhambra. The Coliseum as a stage theatre will have a better chance of obtaining profitable attractions.

Incidentally, it is worthy of note that the Coliseum is capable of being converted into a superb cinema accommodating 5,000 people. If this should ever become necessary or desirable, the

work could be done at a moderate cost. Demolition would not be necessary and the great outlay always attendant upon demolition would not have to be incurred.

The Alhambra Company, Limited, will in due course go into voluntary liquidation because it has sold the property essential to its business. I should like to stress that in the course of such liquidation the whole of the share capital of the Alhambra Company will be repaid to its shareholders plus a substantial bonus.

ADVANTAGES OF A FILM REEL TAX

In conclusion, I may say that before the formation of the Stoll Theatres Corporation, Limited, I had foreseen trouble in the entertainment world. In regard to the picture industry, I opposed the Quota Act and proposed a selective Film Reel Tax instead. This would have made the picture industry not only sound, but also a friend of the stage industry. It would have made the cinema realise that so long as the principle of entertainments duty existed the cinemas and picture studios should for their own sakes join hands for the exemption of the stage.

On another point I might add that many balance sheets have treated films as assets when in fact the films were liabilities. Such a system must obviously be unsound because it can and does lead to the treatment of losses as profits.

ADHERENCE TO SOUND FINANCIAL PRINCIPLES

These unsound principles which were being followed by finance on a great scale warned me of the trouble that lay ahead in the entertainment world. I could have practised those principles myself, made a million or so and cleared out. I preferred instead to operate by means of this company which was formed entirely through my initiative.

Now that sound principles are being reverted to and that trade is improving, this is not the time to lose patience. Pictures, cinemas and the stage, given fair conditions, are bound to prosper. Entertainment must always be a playing industry. But losses must not be called profits, raw material must not be taxed out of existence, and products must fit natural markets. In that way the vast sums now sunk in the entertainments industry will be rendered safe and remunerative.

I now beg to move: "That the directors' report and balance sheet at September 30, 1936, and profit and loss account for year ending that date, be approved and adopted and that the balance of £109,344 17s. 2d. at credit of profit and loss account be carried forward to the current year's accounts."

Mr Douglas McCraith seconded the resolution, which was put to the meeting by the chairman, and carried by a large majority. The retiring directors were re-elected and the auditors were reappointed.

SOUTH WEST AFRICA COMPANY, LIMITED

SATISFACTORY RESULTS

The annual general meeting of this company was held, on the 21st instant, in London, Sir Edmund Davis, J.P. (chairman and managing director) presiding.

The Chairman, in the course of his speech, after dealing with the balance sheet and having explained their new German investments, said:—Turning to the profit and loss account, there remains a balance profit of £123,138, to which we have added "Reserve for income tax not required, £5,948," and deducted the percentage of profit due to members of the board, £5,556, which leaves a net balance of £123,530, which has been carried to the balance sheet.

At our last general meeting I referred to the reopening of the Abenab mine, and stated that I looked forward to a substantial increase in our profits; and it is a matter of great satisfaction to my colleagues and myself that this prediction has been fulfilled.

I am not able, at this meeting, to express such a strong opinion as to profits in our current financial year, as a large tonnage of the Abenab output disposed of during the period covered by the accounts we now present was due to development previous to the closing down of the mine on September 1, 1932.

Though development was resumed early in 1936, it was only in July that the ore-body was cut on the sixth level. Driving and crosscutting on this level is still proceeding and it is impossible at the moment to express any opinion as to its extent.

I now beg to move:—"That the report of the directors, together with the statement of the company's accounts at June 30, 1936, duly audited, be now received, approved and adopted, and that a dividend of 5 per cent. and a bonus of 10 per cent., together 3s. per share, be declared, such dividend and bonus to be payable, less income tax, on and after the 23rd instant."

The report and accounts were unanimously adopted.

MEXICAN RAILWAY COMPANY, LIMITED

UNSATISFACTORY WORKING CONDITIONS

MR VINCENT YORKE'S ADDRESS

The one hundred and forty-third ordinary general meeting of the Mexican Railway Company, Limited, was held, on the 23rd instant, at Winchester House, London, E.C.

Mr Vincent W. Yorke, the chairman, in the course of his speech, said: I regret to have to say that there has been little if any change for the better in our affairs during the last six months, and that there is very little of a reassuring or encouraging nature that I shall be able to say to you to-day.

There can be no doubt as to the period of prosperity which Mexico is enjoying. Every indication points in that direction. She has a favourable trade balance of approximately £20,000,000, to which can be added a considerable sum in invisible imports derived from a constantly expanding tourist traffic; her Budget has been more than balanced for the last three years, and the output of oil, a very important source of revenue, is increasing. Added to all this she has the advantage of a steady exchange, which for the last three years has been stabilised with the United States dollar. Complete political tranquillity appears to prevail, and the mining industry is being encouraged by the rising prices of all metals, while the cotton mills are working more than full time to keep pace with the increased spending powers of the people.

ATTITUDE OF THE GOVERNMENT

In fact the time would seem to have arrived when she could commence to put her affairs in order and show some consideration to her long-suffering creditors, who have received next to nothing for very nearly 25 years. The re-establishment of public credit would be to the immediate advantage of a country which is backward in many material respects and badly needs foreign capital for development in many directions. Similarly, a more conciliatory attitude towards public service companies, such as ourselves, who have had to struggle on for many years under appalling difficulties, and some consideration for our constituents who have shown exemplary patience throughout, would go some considerable distance towards the re-establishment, first of all of confidence and then of credit. Unfortunately, however, there is little evidence of the awakening of a public conscience in these matters in Mexico, and though words of encouragement are sometimes spoken to us, practical assistance is entirely withheld.

The problem is only one more of the many with which the world is faced to-day—on the one side a country like ourselves seeking in vain for outlets of money which is eating its head off at home, and on the other side a country by all standards of political economy worthy of credit and yet unwilling to show that disposition towards the would-be lender which he naturally requires. If a bridge can be found to span the gulf between the two so much the better, but I do not see at the moment any possibility of finding it, and I must content myself with throwing out the hints that I have already done.

GROWTH OF TRAFFICS

The prosperity of which I have spoken is very clearly reflected in our gross traffics during the half-year under review. The increase of \$520,000 is almost equally divided between passenger and goods traffic. Passenger traffic, however, shows the more remarkable increase of the two, namely, 14.84 per cent., as compared with only 5.9 for goods. This is accounted for by a satisfactory accession of tourist traffic from the United States and by a big movement of native second-class traffic. The general public seem to be becoming more travel-minded and more anxious to see their own country than ever before.

The tonnage of foreign goods carried shows an actual decrease of 9,300 tons, though the increase in revenue is nearly \$29,000. This is due to our having carried nearly 15,000 tons of cast-iron pipe in the first half of the year 1935, for which specially low rates had been quoted. The pipes were for the Mexico City Water Works. The increase of \$236,000 in national goods traffic is fairly well distributed over different classes of products; the only increases to which I need draw attention being in bananas, which have moved in larger quantities all rail to the United States, and in pineapples, which are being grown on a larger scale than previously in the country to the south of Cordoba.

A LAMENTABLE RESULT

Unfortunately, the increase in expenses shown in the accounts at \$1,051,000 is more than double the increase in receipts, though for purposes of strict comparison a deduction of \$308,000 should

be made from this figure. In the first half of 1935 an allocation of 6 per cent. on gross receipts was made to the credit of special renewals, which was increased in this half-year to 10 per cent. Still, even after this deduction has been made, it will be clear that it has cost us \$743,000 to earn an additional \$520,000, which can only be described as a most lamentable result. The same causes of which I spoke at length at our last two meetings have again been at work, and the payment for the seventh day and other privileges we have had to grant our employees, are almost entirely responsible for this very regrettable showing.

As regards the current half-year as shown in the report the gross receipts have again shown a satisfactory tendency and reach an increase of \$225,000 over the corresponding half-year, or rather more than 5 per cent. Expenses, however, which have been prepared on a strictly comparable basis, show an increase of \$407,000, or more than 9 per cent., and I fear that there is no doubt that we shall be faced with an actual operating loss at the end of this half-year.

The increase in receipts which has been the most notable feature of our reports for the last few half-years has necessarily involved more work and thrown an increasing strain on all branches of our equipment. Though not much fault can be found with our permanent way, our locomotives and both freight and passenger vehicles are not now equal to the demands that the increased traffic is making upon them. A minimum programme submitted to us by our officials calls for the expenditure in the near future of not less than £300,000.

SOME BRIGHT SPOTS

To relieve, to a slight extent at any rate, the blackness of the picture which I have hitherto painted for you to-day, there are, I am glad to say, a few bright spots to which I can draw your attention. At our last meeting I spoke with some alarm about a case brought against us in the Mexican Courts by some fruit companies for the refund of alleged excess charges for carriage of their produce. This case was decided in our favour in the Supreme Court last October, and we are now, I believe, finally relieved of a liability which might have amounted to some £50,000 or even £60,000.

Then we have been successful for the third time in cashing the annual coupons attached to the 40-year bonds and falling due on January 1st next at a very small discount, and the amount received, some £19,000, will be credited to net revenue in the accounts of the current half-year. Then, finally, we have at last agreed our claims for rolling stock and freight destroyed by fire in the accident in April last at Paso Grande with the insurance companies for the sum of U.S. \$40,000.

The report and accounts were unanimously adopted.

KWAHU MINING COMPANY (1925), LIMITED

IMPORTANT INTERESTS

The ordinary general meeting of the Kwahu Mining Company (1925), Limited, was held, on the 22nd instant, in London.

Lieutenant-Colonel Frank Johnson, D.S.O. (the Chairman), said that probably the most interesting and important item was "Shares in mining companies at cost, £37,387." At the date of the balance sheet these shareholdings had a market value of no less than £448,893, a figure which at to-day's market values would amount to £560,000. It was well to emphasise the fact that this very large sum had its sole genesis in mining concessions in West Africa, similar—so far as original appearance went—to those the company still held and to which he had just referred.

The directors proposed to follow an active policy, firstly as regarded the realisation—or at least examination—of the more or less dormant mining properties or mineral areas; and, secondly, by acquiring a participation in the development of any other properties recommended by the technical staff.

In this latter connection, within the last few days they had been able to acquire a 25 per cent. participation in an option to purchase a gold-mining proposition known as the Tokosea on which extensive development was carried out from 1911 to 1914, but was closed down on the outbreak of the War. The 100-ft. level, driven for 500 ft. in the oxidised ore, was reported to have exposed a lode, averaging for that distance 5 ft. in width for 16 dwt. In addition to this one mine, the area was said to contain at least two other occurrences of promise. It was hoped that work would be commenced on this property within the next few months.

Their principal shareholding consisted of their very large interest in the Marlu Gold Mining Areas, Limited. At the

1936 — OUR CENTENARY YEAR

*"The best pledge of the future
is from the past"*

THE

AND
LONDON
AND
GLOBE
INSURANCE CO., LTD.

Head Office: 1 Dale Street, Liverpool, 2 | London: (Chief Office): 1 Cornhill, E.C.3

second annual meeting of that company held only ten days ago very full information of the progress made in bringing the mine to production was laid before the shareholders. He ventured to predict that the Marlu Gold Mining Areas was destined to be added to that very small list of the world's great mines.

Of equal importance was their holding in Gold Coast Main Reef, Limited. This company was at present developing its Bondaye mine in the Prestea district of the Gold Coast with distinctly encouraging results. The most recent information showed that development had already reached the third level, and was being continued to the fourth. The results obtained from the driving at the second level showed an average value of over 8 dwt. for a width of 5 ft. Should equally satisfactory results follow the completion of third and fourth levels development, steps would have to be taken to equip the mine for production.

The report was unanimously adopted.

SCOTTISH AUSTRALIAN COMPANY, LIMITED

SUCCESSFUL YEAR — GOOD PROSPECTS

The annual general meeting of the Scottish Australian Company, Limited, was held, on the 18th instant, at Winchester House, London.

Mr J. Campbell Inglis (chairman and managing director), who presided, said: When I addressed you just a year ago the statement of accounts which I then laid before you was not a very happy one, the company's operations during the year then under review having been adversely affected, not only by a fall in the price of wool, but also by a very serious drought. As the inevitable result of those adverse circumstances there was a loss for the year of £62,030 14s. 1d.

Of the year now under review quite a different picture can be presented, for the loss of £62,030 14s. 1d. has been transformed into a profit, after paying debenture interest and meeting all revenue charges, of £25,451 9s., an improvement of £87,482 3s. 1d.

For this pleasing turnover two factors are mainly responsible—first, that instead of a drought we had, on the whole, a favourable rainfall over practically every one of our stations, while the world price of wool showed a marked recovery.

As against this the clip of wool which we had to offer for sale was reduced by some 28 per cent.—a shortage which, however, was to a large extent offset by the prices realised.

To the net profit of £25,451 9s. there falls to be added the amount brought forward from the previous year, namely, £10,975 os. 4d., making a total of £36,426 9s. 4d. This amount we have been able to augment by a transfer from taxation reserves no longer required of £20,000, thus enabling us, without encroaching on the general reserve, to recommend the payment, in addition to the full dividends on the preference stocks, of a dividend of 4 per cent. on the consolidated ordinary stock, while leaving a balance of £4,426 9s. 4d. to be carried forward.

For the future, all I can tell you is that at the moment the world prices of wool remain firm, and that our wool clip for the current year is some 15 per cent. larger than that for the previous year.

If climatic conditions continue favourable and the present firmness of the wool market is maintained, the results for the current year should show a marked improvement.

The report and accounts were unanimously adopted.

CARRERAS, LIMITED

ANOTHER SUCCESSFUL YEAR

The thirty-third annual general meeting of Carreras, Limited, was held, on the 18th instant, in London, Mr Harry W. Danbury, chairman of the company, presiding.

The Chairman, in the course of his speech, said: The past year's trading has resulted in a net profit of £1,234,833. Your directors feel justified in making a larger cash distribution on all classes of ordinary shares.

For some years past the dividend has been at the rate of 35 per cent., and last year a cash bonus of 1s. per share on the ordinary and A ordinary, and 1½d. per share on the B ordinary shares was paid. This year it is proposed that in addition to the dividend of 35 per cent. a cash bonus of 2s. per share on the ordinary and A ordinary shares and 3d. per share on the B ordinary shares should be distributed. Your directors have also given very careful consideration to the capital structure of the company in the light of the policy indicated at earlier general meetings. They to-day feel that the time has arrived for a further step to be taken in adjusting the capital of the company so as to make it more commensurate with the profits earned.

There remains an amount of £1,517,472, and the directors propose that out of this amount a sum of £708,626 shall be capitalised and B ordinary shares distributed by way of bonus in the proportion of 16 B ordinary for every five ordinary and/or A ordinary shares and two B ordinary for every five B ordinary shares held by shareholders on January 4, 1937.

A notice calling an extraordinary general meeting for January 4th next and setting out the necessary resolutions for increasing the capital and authorising the bonus distribution has been sent to you.

You will agree, I think, that the balance sheet before you discloses a very sound position, and there is little which requires special comment.

I think we may claim that our reserves are adequate. Including this year's appropriation, the specific and general reserves will total £1,245,937, and after the proposed capitalisation of part of the undivided profits has been effected the carry-forward will be £808,846. This sum added to the reserves already mentioned makes a total of £2,054,783 available to meet contingencies and reflects the very strong position in which your company stands.

HIGH QUALITY OF PRODUCTIONS

The general consumption of cigarettes and tobacco, in common with that of many other commodities, has shown an increase during the past year, and we have obtained a fair share of the additional trade. It may not be out of place to remind you that such results as those submitted would not be possible without a very large volume of turnover, and your directors are quite alive to the fact that to ensure continuance of the prosperity which the company has enjoyed over a period of years they must use every means in their power to extend the popularity of our tobacco.

In this connection I may say that in our endeavours to make permanent the widespread appreciation of the company's brands we shall continue to rely on those factors which have had so much to do with the building up of this business—namely, the high quality of our productions, which is very jealously guarded, and the fullest possible value to the consumer.

Our machinery and factory equipment are maintained at a high standard of efficiency, and unremitting efforts are directed to the improvement of our manufacturing facilities and the application of every modern development to our machinery.

Our overseas business is being well maintained, and in some past year your directors turned their attention to Canada with a view to securing a larger share of the trade in that Dominion, and I am glad to tell you that we have obtained control of an established manufacturing business in Quebec with a very good organisation for marketing our products throughout the territory. We have every hope that the new arrangements will enable us steadily to improve our volume of trade in that part of the Empire.

I am pleased to inform you that in the short period of the current financial year which has elapsed our trade shows every sign of being maintained, and if the present favourable conditions company will be able to maintain the favourable position in which it finds itself to-day.

The report and accounts were unanimously adopted.

RAPHAEL TUCK AND SONS, LIMITED

POPULARITY OF PRODUCTS MAINTAINED

The thirty-fifth annual ordinary general meeting of Raphael Tuck and Sons, Limited, was held, on the 22nd instant, in London. Mr Gustave Tuck (the chairman), in the course of his speech, said: Ladies and gentlemen, as a firm of 70 years' standing, we enjoy a reputation built up in the course of time which we have more than maintained. You will agree that the name of Tuck stands as high as ever in the world of artistic production.

In dealing, as is my custom, with the various departments of your company, I would say that the Christmas and greeting card department, the largest section of our activities, continues to make progress, the popularity of these productions being unabated. Tuck's books continue to appeal to the imagination of the young generation, "Tuck's Annual" and "Father Tuck's Annual for Little People" holding their place in the affections of the young. Our calendars bring their full measure of joy for twelve months of the year, only to be replaced by new productions of equal and comparable beauty.

Tuck's postcards—the pioneers of picture postcards in this country—are being constantly added to with designs of an artistic and topical nature, the local view section being responsible for a large increase in the circulation of these world-famous missives.

The accession of H.M. King George VI to the throne evoked an immediate and natural desire for authentic portraits of their Majesties and of T.R.H. the Princess Elizabeth and the Princess Margaret Rose. Your company has been in the gratifying position of at once being able to meet this demand with reproductions, issued by gracious permission, of the charming paintings of their Majesties and H.R.H. the Princess Elizabeth by Philip de Laszlo, and of the Princess Margaret Rose by Edmond Brock.

I have, moreover, pleasure in announcing that we have just acquired the copyrights of two magnificent Royal paintings of the King and Queen by Mr Simon Elwes, from sittings graciously accorded the artist, exhibited at the Royal Academy. Reproductions of these two Royal pictures, for which we anticipate a heavy demand, not only at home but in our Dominions and Colonies overseas, will be ready next month.

I can only conclude with the hope that when next we meet for our annual meeting we shall have a happier and a brighter report to set before you.

The report and accounts were adopted.

UNITED MOLASSES COMPANY, LIMITED

CONTROL OF MACFIE AND SONS ACQUIRED

The eleventh annual general meeting of the United Molasses Company, Limited, was held, on the 18th instant, in London.

Mr F. K. Keilberg (chairman and managing director), in the course of his speech, said: Two years ago we acquired a substantial share interest in the Ely, Ipswich, and King's Lynn beet sugar factories, but under the Sugar Industry (Reorganisation) Act, passed this year, these three factories, together with all other British beet sugar factories, were amalgamated into the British Sugar Corporation, Limited. In exchange for the company's shareholding in the three companies referred to we received shares in the new corporation, of which I am a director. There was no special reason why your company should continue to hold so large an investment in what is virtually a Government-controlled corporation, permitted to earn only a small, although practically guaranteed, dividend. Your directors, therefore, disposed of a portion of this investment and utilised the proceeds towards the cost of acquiring the controlling interest in Macfie and Sons, Limited, sugar refiners, Liverpool. We have reason to believe that the return on the investment will prove more than satisfactory, but I should like to make it clear that, apart from this, there are substantial advantages connected with our owning the controlling interest in Macfie's.

The Sugar Industry (Reorganisation) Act, in conjunction with the industrial agreement which is being entered into between the sugar refiners and the British Sugar Corporation, Limited, should for some years to come ensure friendly and harmonious collaboration amongst the various sugar interests in the country. The agreement will run until the end of March, 1941, and we should at the very least be able to look forward to reasonably stabilised conditions until then.

Your company is essentially a storage and transportation company, and it follows as a matter of course that earnings must be larger when rates of freight are remunerative than in times of

depression in the tanker market. The c.i.f. selling price of molasses is largely influenced by prevailing freight rates, and high tanker freights, therefore, affect not only the earnings of those of the company's tankers employed in carrying oil but also those employed exclusively in the molasses trade.

During the past year the company had an unusually large percentage of its tankers employed in carrying oil, and this condition would most likely continue for the greater part of the current financial year. These exceptional conditions were brought about by last year's short supplies of molasses in the Far East and the consequent introduction of Cuban high-test molasses. Two of our tankers continuously employed would have been sufficient to carry the quantity of high-test molasses we imported from Cuba to the United Kingdom last year, as against eight vessels which would have been necessary to carry the equivalent quantity of blackstrap from the Far East.

Fortunately the advent of high test took place at a time when there was no difficulty in obtaining remunerative employment in the oil market, and tanker freights continue at satisfactory rates and present prospects are encouraging. By the end of the company's current financial year we hope once again to have large Eastern supplies available for shipment to Europe. Java will in 1937 produce approximately a quarter of a million tons more molasses than in each of the two previous years. In addition to this, there will next year be considerable quantities available for shipment from India. These two factors combined make it reasonable to assume that if the demand keeps up we shall from the autumn of 1937 onwards be able to employ the greater part of our fleet in the Far Eastern trade.

The report and accounts were unanimously adopted.

LOW TEMPERATURE CARBONISATION LIMITED

ANNUAL GENERAL MEETING, DECEMBER 21, 1936

POINTS FROM THE SPEECH OF THE CHAIRMAN,
COLONEL W. A. BRISTOW

1. The profit on trading with dividends from subsidiary companies total £97,686 as compared with £78,480 last year.

2. After providing for debenture interest, depreciation, etc., there remains £61,232, which, with the amount brought forward, produces £70,328.

3. Directors recommend dividend of 6 per cent., less tax, absorbing £58,331 and leaving £11,997.

4. Directors have no hesitation in recommending increased dividend as no revenue received yet from new Bolsover Works and only a few months' revenue from new chemical plant.

5. Cash in hand amounts to £126,945, and this, together with Government and other securities held by company, now totals £712,205.

6. Further "Coalite" plant has been erected during the year, drawing coal from the Bolsover Colliery Company, Limited. Negotiations are proceeding in connection with further works and erection will commence in January of a coal-oil distillation plant five times the capacity of the plant at Barugh.

7. Demand for "Coalite" continues to increase faster than company can build the plants.

8. Home defence squadrons of Royal Air Force for the fourth year in succession continue to ply on "Carless-Coalene," the company's coal petrol, refined and distributed by Carless, Capel and Leonard. This fuel can now be bought at a large number of pumps in London and Home Counties.

9. The company has already carbonised over two million tons of coal. The demand for the coal petrol and coal-oils continues to expand, and considerable tonnages are being exported to the Continent and America.

10. Great difficulties are being introduced into the coal trade by some of the committees of coalowners set up under Coal Mines Act, 1930. It is difficult to believe that the Government, the miners or the people will stand for this policy. Sooner or later the coalowners will have to realise that they hold their coal in trust for the nation, whose lifeblood it is, and if it is not made freely available on proper terms to those who need it then drastic changes must inevitably follow. The coalowners cannot expect to retain their powers if they are misused, and the company consider that the recent case in South Wales, and other steps which the owners are proposing to take in South Yorkshire and elsewhere, as a gross misuse of these powers. The company will continue to press for Government action to remedy the defects in the present system.

A print of the chairman's full speech will be sent on application to Low Temperature Carbonisation Limited, 28 Grosvenor Place, London, S.W.1.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

SUCCESSFUL RESULTS

The third annual general meeting of this company was held, on the 15th instant, at 9 Leinster Street, Dublin, Mr J. P. Colbert (chairman and managing director) presiding.

The Chairman said: Taking first the balance sheet, you will note that there are considerable changes as compared with the balance sheet which we presented at last year's meeting. I mentioned last year that it was probable that we should have to raise fresh capital in order to enable the company to take up new commitments. In July last we issued a further 500,000 shares of £1 each at par. On these 12s. 6d. per share has been paid up, leaving a balance of 7s. 6d. per share subject to calls. This issue has raised our subscribed capital to £1,000,000 and our paid up capital to £812,500. The additional funds have found ready employment, our investments being £215,000 above last year's figure and our loans and advances £78,000 higher.

The books have now been cleared of the item of £11,250 preliminary expenses which appeared in the last statement.

Our profits show a moderate increase as compared with last year. The gross profit (£46,478) is £3,836 higher, and the net profit is £2,637 up, at £38,927.

Deducting provision for income tax and Corporation profits tax (£9,562), and adding in the balance of £2,213 brought forward from last year, we have to deal with a total of £31,330. Last year we made a beginning with a general reserve fund by an allocation of £10,000 for that purpose. This year we propose to make a similar allocation. We propose to transfer a like amount (£10,000) to investment reserve.

Since the date of our last report the company has carried through six capital issues, the net cash total involved being £1,150,000. This brings our total since the commencement of business to £3,968,400. Apart from the issues carried through by us there have been other issues by companies in the Dublin market since we were established, amounting to a net cash total of £2,308,642, which brings the total of capital issues by companies in the three years to £6,277,042. In the three years preceding the establishment of the Industrial Credit Company public issues by companies amounted to only £160,750.

The report and accounts were unanimously adopted.

AGAR CROSS AND COMPANY, LIMITED

IMPROVED OUTLOOK

The thirtieth ordinary general meeting of Agar Cross and Company, Limited, was held, on the 21st instant, at Dorland House, 14-16 Regent Street, S.W.1, when, in the absence of the chairman—Mr William A. Agar—who is at present in the Argentine, Mr Henry S. F. Alexander, managing director, presided.

He said that once again the directors had to present accounts showing a loss, although one substantially reduced in amount over what had been ruling of late years.

The year to June, 1936, had been, in many ways, particularly difficult and worrying. The action of the Argentine Government in fixing higher minimum prices at which they were prepared to buy wheat and linseed (December, 1935) and maize (March, 1936) gave new hope to the agriculturists, coupled with the fact that owing to the maize crop having been late, the latter increase went, very largely, direct to the producer.

Sales from January, 1936, onwards continued more or less to show, month by month, increases over the figures for the corresponding month of the preceding year. Unfortunately the agricultural machinery sales department of the company was one which gave the better percentage of profit, and the effect of the loss of harvest sales in this department was never made good.

With regard to the current year's prospects, sales to date showed a considerable expansion over those of the corresponding period of last year. If, by any chance, more favourable exchange rates than had been ruling were obtainable it would be an added advantageous factor, and the assumption was that the Argentine Government expected grain prices to keep up.

Mr Alexander concluded with a reference to the financial position; losses sustained over the past six years, as shown by the balance sheet, having left the company very short indeed of the necessary working capital; reasonable profits being obtainable only by an adequate turnover, which, in turn, necessitated carrying considerable stocks of merchandise. The directors were fully alive to the importance of having the whole financial position dealt with satisfactorily as soon as it was found possible, and they proposed to deal with the matter at the earliest date they found most favourable.

The report was unanimously adopted.

GOLD OPTIONS SYNDICATE, LIMITED

SUGGESTED DISTRIBUTION OF 2s. 6d. PER SHARE

The annual ordinary general meeting of this company was held, on the 22nd instant, in London.

Major W. A. Wills (chairman and managing director) who presided, said that the issued capital of the company stood at £73,522 10s. and the paid-up capital was almost identical—£73,094 1s. 3d. On December 7th last the liquid assets of the company totalled £76,590 10s. 7d., so that the break-up value of the shares was much over par. The balance of profit and loss account was £4,083 1s. 8d., in addition to the replacement of £8,000 transferred from general reserve and depreciation reserve accounts. That was sufficient to pay a 5 per cent. dividend, but they thought, in view of the position he would explain later it would be wiser to keep this money for a future dividend. The reserve fund now amounted to approximately 10 per cent. of the paid-up capital. In last year's accounts £8,000 was transferred from share premium account to reserve for depreciation on shares and general reserve accounts. This amount had now been put back into share premium account, and the amount necessary this year for depreciation and general reserves—£5,500—had been taken out of the profit and loss account.

With regard to the company's various assets, the Pluto Publishing Company, owning *The Gold Mining Record*, in which they held the whole of the ordinary shares, was doing exceedingly well. The Nigel van Ryn Reefs, which was reconstructed by their syndicate in 1934, was doing brilliantly. Last year they earned a realised profit of 30 per cent., but thought it wiser to declare 10 per cent. and carry forward 20 per cent. The present year would, he believed, be equally satisfactory.

They had failed in their endeavour some two years ago to find a sufficient amount of capital to become an investment company on a large scale. Their present capital was not sufficiently large to warrant their making an application for permission to deal on the Stock Exchange with any prospects of success, and as their business was now more or less confined to agency and secretarial administrations, they could do with less capital without reducing their earning capacity for dividend purposes. If fresh reconstructions or company formations came along, which had in the past proved most payable (they had paid since the company's formation 45 per cent. in dividends) they would not require excessive capital for doing that work. Their business was chiefly dependent not on their cash but on their credit, and the connections of the board and their knowledge of the gold mining finance business. They could, he was quite sure, do this business and pay out the same amount in dividend on a reduced capital.

In the meantime he was deluged every day with applications to take over shares at various prices, some as high as 10s. He had done so as far as possible, but as he was not a Rothschild this could not go on for ever. In these circumstances he thought they could safely return to the shareholders, if they approved, somewhere about 2s. 6d. per share from the capital. He was sure every shareholder would be glad to get back 2s. 6d. per share with a reasonable prospect of receiving an undiminished amount in dividends. This was equal to a 50 per cent. bonus in the shape of a reduction of capital. This, of course, would have to be approved by the court. He was glad to say that even while the present report was being drawn up they had successfully concluded a large and most important business. He could not, however, disclose the details until the transaction had been through the usual formal and initiatory stages.

During the year, he was sorry to say, Dr. Cullen had resigned. His place had been taken by Major P. R. Peters, who he understood was a remarkably good judge of the value of gold mining shares.

The chairman concluded by moving the adoption of the report and accounts, which was seconded by Lieut.-Colonel H. Marshall Hole, C.M.G.

A long discussion ensued, during which shareholders expressed their approval of the proposed distribution of 2s. 6d. per share. On the resolution being put to the meeting it was declared carried on a show of hands. A poll was demanded, which was subsequently taken and resulted as follows:—Against the resolution, 18,898 votes; in favour of the resolution, 119,225 votes. The chairman thereupon declared the resolution carried.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bowyer Street, Fleet Street, London, E.C.4.

ARISTON GOLD MINES (1929), LIMITED

INCREASE OF CAPITAL

The seventh ordinary general meeting of the Ariston Gold Mines (1929), Limited, was held, on the 21st instant, at River Plate House, London.

Mr Francis Allen (the chairman) said that the new capital issue would increase their share premium account by £140,000, so that in the future they could further reduce either their property account or their development account. They had spent a very large sum on reconditioning and increasing their plant with a view to bringing their production up to 12,000 tons per month, towards which figure their monthly crushings were steadily growing. The development account had been increased by over £116,000 and £102,500 had been spent on buildings, machinery and plant during the year.

He did not think they would be long before they were crushing 12,000 tons per month, but they were not likely to exceed that figure by much until the new shaft was finished.

Last year, speaking of Anfargah, he had said that development on that section was proceeding, but that no Anfargah reserves were included in their reserves, and that position still continued.

It was proposed to increase the capital by £100,000, making a total of £800,000, upon which sum they would have no difficulty in paying substantial dividends. It had taken them a long time to arrive at their present satisfactory position, but there was a far greater future ahead of them when the new shaft was finished, say in two years' time. Their underground work was being pushed on so that when once the shaft was down and equipped there would be no delay in crushing a large monthly tonnage, which would assure very large dividends to the shareholders if the price of gold remained anywhere near its present level.

At the recent meeting of the Gold Coast Selection Trust, Mr Agnew had stated that the position at the Ariston mine was improving rapidly, and there was no doubt that the new ore-body would add very materially to the reserve of ore. At September 30th last those reserves were 799,000 tons. If they took gold at £7 an ounce and an extraction of 88 per cent., that showed a realisable value of about 2½ million pounds.

The report was unanimously adopted and the increase of capital approved.

THISTLE-ETNA GOLD MINES, LIMITED

ENCOURAGING DEVELOPMENTS

The second ordinary general meeting of Thistle-Etna Gold Mines, Limited, was held, on the 21st instant, in London.

Sir Godfrey B. H. Fell, K.C.I.E., C.S.I. (the chairman), said that at the date of their last annual meeting the position was in some respects disappointing, but there were encouraging features, the most important of which was the fact that drilling operations had established beyond doubt the existence of the reef beyond the dyke both on the Etna and Thistle mines. The values disclosed on the Etna mine warranted the sinking of a vertical shaft, which shaft intersected the reef in June last at 373 feet. The values disclosed were exceptionally high. Steps were taken to drive on that reef both north and south. 393 feet had been driven on that level by the end of September, and 385 feet sampled averaged 12.4 dwts. over 29 inches. In addition, a rise on the north drive assayed, for 100 feet sampled, 8.5 dwts. over 29 inches, and a winz sunk on the south drive averaged, for 20 feet sampled, 17 dwts. over 40 inches.

It was decided to suspend work on the new Etna incline shaft and to concentrate on the reclamation and further sinking of the Hooper shaft. By the end of the year the latter had reached an incline depth of 919 feet. Since the close of the period under review that shaft had intersected at 1,020 feet what was undoubtedly a section of the reef which had been exposed at the bottom of the vertical shaft. Although the full width had not been disclosed the values were most gratifying, assaying 21.7 dwts. The new incline shaft on the Thistle mine had reached a depth of 423 feet by the end of the period and was connected at 356 feet by a short cross-cut to a ventilating shaft. On the incline shaft a cross-cut west at 400 feet advanced 70 feet, and drives north and south proved a strike of 96 feet, of which 66 feet were sampled and assayed 21.2 dwts. over 17 inches.

Good progress has been made in the equipment of the property with power plant, compressors, etc. The first mill unit was in erection and was expected to be in operation early in 1937.

A cable has just been received from the property which would be published in the Press, stating that recent developments were very satisfactory.

The report and accounts were unanimously adopted.

AKIM (1928); LIMITED

MUCH IMPROVED POSITION

The seventh ordinary general meeting of this company was held, on the 22nd instant, in London, E.C., Mr Francis Allen, J.P., the chairman of the company, presiding.

The Chairman said: We stated in our report that the year under review had not been a very favourable one for business, and we were quite right in making that statement; but this new year shows us to be in a very different position. Our main holding has always been the Ariston Gold Mines, in which we have always held over a quarter of a million shares. Ariston Gold Mines held their meeting yesterday, and, in addition to the dividend of 7½ per cent. which will come to this company, they are making an issue of capital at 6s. per share. The market value of their shares is now in the neighbourhood of 11s., and we shall receive quite a large number of the new shares as our right at 6s. a share.

So much has the position improved that our assets, which showed a market valuation on September 30th last of £235,845, stood on December 17th at £289,551. That is a very strong position to be in. We continue to hold a very large block of Aristons and intend to hold them as a permanent investment, while as regards the rest of our holdings, our share interests fluctuate very much. At times we think it wise to buy and at other times we consider it wise to sell. Our smaller interests, therefore, are fluctuating interests, and I think no good purpose could be served by going into details. If we hold our Ariston shares for another two or three years—which we shall certainly do—this company, from that source alone, should enjoy very large dividends. The Ariston Company are sinking a new deep shaft to the 3,000-foot level, through which they will be able to hoist large bodies of ore, and when that shaft is completed our dividends from Ariston will certainly mount up to a very large figure.

We have declared an interim dividend of 7½ per cent. on account of the current year, and I think you can take it for granted that that will not be the last of the dividends for this year, for our position is now such a good one that I think you will see it increased during the current year.

The report and accounts were unanimously adopted.

WILUNA GOLD CORPORATION, LIMITED

ENCOURAGING DEVELOPMENTS

Presiding at the ordinary general meeting of Wiluna Gold Corporation, Limited, held, on the 18th instant, in London, Mr John A. Agnew (the chairman), in moving the adoption of the report and accounts, said that the accounts of the Corporation showed a profit for the year of £159,511, to which was added the balance of £12,532 brought forward from the previous year, making an available total of £172,043. Out of this an interim dividend was declared, which was paid in June last, amounting to £155,901, leaving a balance of £16,142, which it was proposed to carry forward. Shareholders had been advised of the reasons for the falling off in monthly profits since the beginning of this year and of the steps which had been taken to counteract this as far as possible. The principal reason accounting for this fall had been the continued decrease in the grade of ore opened up on the East lode in the main workings.

The encouraging results obtained recently in developing the East lode on the 1,600 ft. level and in diamond drilling below that level seemed to indicate that the ore body might again be entering a zone of much better value.

Diamond drilling had been carried out in the last few months below the 1,600 ft. level, and they regarded the results as being extremely important and encouraging.

In the Bulletin section the ore reserves amounted to 286,400 tons of an average grade of 22s., all above the 625 ft. horizon. At the Happy Jack Leases the shaft had now reached the 275 ft. horizon, and a cross-cut from the shaft exposed 25 ft. width of ore averaging 48s. per ton. Ore reserves at March 31st last were estimated at 2,413,700 tons of an average grade of 23s. 2d. per ton.

Not for the first time in their history were they passing through a period of some anxiety, but the confidence they had in the mine itself and their knowledge that everyone connected with the business was doing everything possible to put matters on a more satisfactory footing encouraged them in the belief that before very long they would have emerged from the troubles that they had recently been experiencing and would be able to look forward to a real improvement in developments on the property and a satisfactory result from the smelter.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended December 19, 1936, amounted to £11,539,000, against ordinary expenditure of £15,800,000. After allowing for a decrease in Exchequer Balances of £368,271, the operations for the week, as shown below, decreased the gross National Debt by £1,077,000 to approximately £8,041 millions.†

THE BANK OF LONDON AND SOUTH AMERICA, LTD., has received telegraphic advice from the Valencia Branch that the gold surcharge for payment of Spanish customs duties has been fixed for the period from December 21st to 31st at 143-07 per cent. The previous rate was fixed as from December 11th at 143-25 per cent.

Central and South American Exchange Rates appeared in the issues of December 5th and 12th. South African and Australasian Exchange Rates were given in the issue of December 5th.

The Norwegian Bank Rate is now 4 per cent. For other Overseas Bank Rates see page 497 of December 5th issue.

REPORTS AND NOTICES

Sir Abe Bailey, Bart., K.C.M.G., Mr John A. Agnew, M.Inst.M.M., and Mr Carl R. Davis, M.Inst.M.M., have been elected to the board of Amalgamated Bank Areas, Ltd.

The directors of Peter Walker (Warrington) and Robert Cain & Sons, Ltd., announce that their General Manager, Mr Thomas Walker, has been elected a director of the company and its subsidiary and associated companies.

Mr. Algernon Denham, J.P., a director of the Halifax Building Society, has been appointed a director of the Yorkshire Board of the Union Bank of Manchester, Ltd.

BANKS

THE CANADIAN BANK OF COMMERCIAL.—The Bank's seventieth annual statement to November 30, 1936, shows: total assets \$637,737,903, of which quick assets are \$394,791,367. Cash, including deposits with Bank of Canada, \$87,671,968. Cash items, including cheques of and balances with other banks, \$51,357,883. Total security holdings \$222,295,127. Total call loans \$52,141,387. Of liabilities, note circulation \$24,559,751; total deposits and bank balances \$542,808,271; non-interest deposits increased \$39,585,000; but decrease in Government balances of \$18,000,000, interest-bearing deposits of public of \$15,234,000, and balances due to other banks of \$2,897,000. Net profit, after appropriation to contingent fund and after deductions for taxes, \$2,909,124; from which dividends \$2,400,000, transfer to pension fund \$259,003, and written off bank premises \$200,000. Balance forward \$715,516. Net profits shown this year after deducting Government taxes of \$823,919. For comparative purposes with last year's statement, taxes \$800,000 should be deducted from amount shown as net profit.

THE UNION BANK OF MANCHESTER, LTD.—Mr Allan Heywood Bright has resigned his seat on the board of the bank. He has been a director over 32 years, and for over 11 years he was deputy chairman.

MISCELLANEOUS

VACTRIC, LTD.—Report for year to September 30, 1936, shows profit of £44,009, compared with £44,368 for previous year. The ordinary dividend is 25 per cent., compared with 22½ per cent. Transferred to reserve accounts £7,868, against £10,028. Carry-forward increased from £3,221 to £3,512. Total assets increased from £249,684 to £262,184. Cash stands at £21,738, against £54,521. Debtors, £48,245, against £37,758. Stocks at £58,508, against £25,004. The number of Vactric Vacuum Cleaners sold during the year constituted a further record. A new model will be introduced early in the New Year.

FORD PAPER MILLS, LTD. (Offer for Control by Wiggins, Teape).—The directors of Ford Paper Mills, Ltd., in a circular to shareholders, state that a conditional offer has been received from Wiggins, Teape and Company (1919), Ltd., the paper makers, to acquire a controlling interest in the company. The terms of the offer are 13s. 4d. in cash in

respect of each £1 share held, or, at the shareholder's option, one £1 ordinary share in Wiggins, Teape (to be allotted at a premium of £1) credited as fully paid both as to nominal value and premium in respect of every three £1 shares held, odd shares to be paid for in cash on the basis of 13s. 4d. per share.

LOW TEMPERATURE CARBONISATION, LTD.—The profit on trading 1936, as compared with £78,480 last year. After providing for debenture interest, depreciation and other charges there remains the sum of £61,232 dividend 6 per cent. less tax, absorbing £58,331, leaving £11,997 to be carried forward. No revenue has been received in the year under review from the months' trading in connection with the new oil and chemical plant at Barugh. and other securities and investments held by the company now amounts November 12th and 14th returns are already in operation. The new coal oil has been most successful.

CAMBUHY COFFEE AND COTTON ESTATES, LTD. (Scheme of Arrangement).—The scheme provides for: (1) The reduction of capital by £430,000, capital of £420,000. (2) The cancellation of all arrears of preference dividend. (3) The conversion of all shares into one class of ordinary shares of £1 each. (4) The surrender of 28,000 ordinary shares to the preference shareholders all the ordinary capital, which will permit of the distribution among the shareholders of eight ordinary shares for every 100 preference shares now held.

COW AND GATE, LTD.—For year to September 30, 1936, profits were £90,785, an increase of £26,994. Present figure is after reserving £19,500 for losses of subsidiary and associated companies not covered by previous year. For year to June 30, 1936, £69,305 for additional provision has been made on balance sheet for difference in exchange arising from the losses on realisation of investments, making total loss £51,864, against total loss last year £90,936.

AGAR, CROSS AND COMPANY, LTD.—Profit for year to June 30, 1936, amounted to £21,590, compared with a loss of £95,407 for preceding year. For year to June 30, 1936, £69,305 for additional provision has been made on balance sheet for difference in exchange arising from the losses on realisation of investments, making total loss £51,864, against total loss last year £90,936.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LTD. (INTERIM BONUS DECLARATION).—The directors declare the become claims by death or maturity in the year 1937—45s. per annum for whole life and limited payment policies; 40s. per annum for endowment assurances.

Agencies in: New York, Manchester, Bradford

CABLE AND WIRELESS, LTD.—Traffic index for November, 1936, is 80.5 compared with 75.9 for October, 1936; November, 1935, 72.7. For particulars of index since 1930 and method of construction, see *The Economist*, July 25, 1936, page 203.

R. E. JONES, LTD.—R. E. Jones' accounts show a profit of £47,638, against £44,823 for the year to October 31, 1936. Adding £1,560 brought in from the last accounts, there is a total of £49,198, from which £2,193 is deducted for tax and £10,000 transferred to property reserve. The dividend for the year is again 5 per cent. on ordinary shares, less tax, the balance of £29,470 being carried forward.

JOHN CROSSLEY AND SONS.—A preliminary statement shows profits (subject to audit) of £86,615, compared with £56,587, for the year to December 5, 1936. The balance brought in was £3,389, making a total of £90,004, and the usual amounts have been allowed for depreciation. The directors recommend a final dividend of 5 per cent., making, with the interim, 7½ per cent., less tax, for the year, against 6½ per cent. It is also proposed to raise the allocation to reserve by £20,000, to £30,000.

BRITISH OXYGEN DEAL (Purchase of Turner and Newall Subsidiary).—The whole of the shares in the Quasi-Arc Company, Ltd., previously held by Turner and Newall, have been acquired by British Oxygen, in exchange for shares in that company issued to Turner and Newall.

OIL OUTPUTS

ANGLO-IRANIAN OIL COMPANY, LTD.—Production in Iran for the month of October amounted to 672,000 tons, making a total of 6,829,000 tons for the first ten months of 1936.

THE MEXICAN EAGLE OIL COMPANY, LTD.—Production for the week ended December 12, 1936, was 615,000 barrels.

BRITISH CONTROLLED OILFIELDS, LTD.—Production for week ended December 19th: Venezuela, 6,710 barrels; Trinidad, 27,813 barrels. *Office Note.*—Decrease in production due to general strike of oilfield workers in Venezuela from Monday last, December 14th.

A SELF-BINDER for The Economist

Week by week you keep your copies of "The Economist," and ultimately you either file them or bind them. Doubtless you are accustomed to the annoyance which attaches to the ordinary binder—the difficulty of reading half the left-hand page and the unwieldiness of the device generally.

We are able to offer our readers a binder which overcomes these irksome difficulties and is, in our opinion, the most efficient contrivance for the purpose we have yet seen.

It holds three months' issues and index, it has no wires, clips or metal contrivances, and each issue can be bound up in an instant in such a way that it can be read as easily as a well-bound book.

INTRODUCTION

ON November 3rd President Franklin Roosevelt faces the electors of the United States. It will then be four years since he defeated President Hoover by the largest majority ever accorded to any President. It will be three years and eight months since, in the middle of a banking panic, he took over the government of the largest and richest democracy in the world. In the interim period there has been one opportunity for the electorate to pronounce a provisional verdict at the election of 1934, when the House of Representatives and a third of the Senate were chosen. That verdict was overwhelmingly favourable. But this time it is the President himself who submits himself for judgment; this time it is the future of the whole New Deal that is at stake.

The campaign has been vigorous and the contest is expected to be close. All sorts of issues have played their part in the speeches of candidates and partisans, but the dominant ones are economic and social. Has the policy pursued by the President succeeded in its dual aim of restoring the activity of the economic system and of correcting some of its abuses? Has there been enough Recovery? Has there been enough (or perhaps too much) Reform? Beneath the glossy surface of the slogans and platitudes, these are the questions that electors will have to answer next month.

No one can anticipate the answer they will give. But it may be of assistance, especially to observers who have

watched the New Deal from afar, to summarise what has been done and to point the morals which appear to emerge from the record. This is what has been attempted in the following pages. In each chapter an attempt is made to sketch the situation at the pit of the depression; to outline the remedy adopted; to record the results, in so far as they emerge in a form susceptible of record; and to suggest a conclusion on the merits of the experiment.

This attempt has been subject to two difficulties in particular. The first is space. An encyclopædia is needed for an adequate description of the gigantic experiment that has been proceeding in America under President Roosevelt, and many endeavours which have occupied the minds and employed the bodies of many thousands of men have had to be dismissed here in a line or two, or left entirely unmentioned. The second difficulty is subjective. Only to a very limited extent is it possible to judge the actions of a whole nation by any absolute criterion. For the rest, he who expresses a judgment merely exposes his own preconceptions. This risk has been recognised and faced. Judgments will be found in the succeeding pages, and in a leading article in the accompanying issue of the *Economist*, which should be read as a synthesis of the whole survey. An effort has been made to make these judgments consistent with each other. Beyond that they claim no absolute authority.

UNEMPLOYMENT AND RELIEF

UNTIL the onset of the Great Depression, America prided itself on giving no thought to unemployment. Even in periods of abnormal activity there was always a body of unemployed workers who may well have been numbered in millions. Indeed, unemployment is an inevitable concomitant of any dynamic community, and in a country where conditions change so rapidly and so ruthlessly, and where "labour turnover," voluntary and involuntary, is so high, the normal minimum of unemployment must necessarily be considerable. But it was contrary to the established social philosophy of the country to admit that any able-bodied and efficient workman could remain out of work for more than a temporary transitional period, or that he should be assisted by the community if in want. The older and more settled States on the Atlantic seaboard had

inherited from England a rudimentary Poor Law of an Elizabethan character, but these institutions were not intended for the able-bodied poor and made little contribution to the relief of destitution arising out of unemployment. Broadly speaking, the only recourse of the indigent working man was to charity, and previous visitations of depression had always been surmounted, not without great suffering, by special efforts on the part of private and semi-official charitable institutions.

The emergency of the present depression was at first tackled on the same lines. But its dimensions soon overwhelmed the private organisations. Figures which are available for 70 of the largest cities show that the number of families receiving charitable assistance, which had been no more than 40,000 in the winter of 1928-29, had risen to

70,000 by the winter of 1929-30, to 185,000 by the winter of 1930-31, and to nearly half a million by the next winter. The agencies dispensing charity, accustomed to finding less than \$1,000,000 a month in the normal winter, were called upon to find more than \$10 millions a month by the time the depression was two years old. Private funds obviously would not bear a strain such as this, and one by one the Treasuries of the 48 States had to shoulder some of the burden. Even so, only four States made specific appropriations for relief before 1932, so hard did the tradition of "rugged individualism" die. When the full measure of the need came to be taken, however, it was found that the finances of the States were also inadequate to meet it. Their basis of taxation is narrow, and their borrowing powers, in most cases, are strictly limited both by law and by circumstances. Pressure was therefore inevitably directed on to the Federal Treasury. But Mr Hoover did not yield. In 1932, he went so far as to approve the loan to the States of \$300 millions (enough for less than two months at the rate of spending reached three years later). Until Mr Roosevelt's inauguration this was the sum total of the Federal Government's relief measures.

The Federal Emergency Relief Act was one of the first enactments of the new Congress. It became law on May 12, 1933, and authorised the immediate expenditure of Federal funds for relief purposes. The burden was not entirely lifted from the States or from subsidiary local authorities, which have continued to spend heavily for relief. But since May, 1933, the main cost has fallen on the Federal Treasury. These expenditures have been outright grants, not loans, and the liability of the States for the \$300 millions lent in 1932 has been cancelled. Relief has been accepted as a Federal obligation.

THE VOLUME OF UNEMPLOYMENT

One of the most puzzling features of the American relief problem is to determine its size. No trustworthy statistics of unemployment exist and, strangely enough, little effort is being made to collect them. In the absence of accurate figures, conjecture has a wide range. The American Federation of Labour regularly publishes a figure which has ranged as high as 13,689,000 in March, 1933, and was still 11,259,000 in May last. To represent the other extreme, estimates made by *The Sun*, a New York newspaper, may be cited. These resulted in a figure of almost 4,000,000 unemployed in 1935, omitting agriculture, domestic service or the professions. An approach to the true figure may be secured by means of a comparison with the United Kingdom. According to the Census of 1930, the occupied population of the United States, omitting agriculture and domestic service (i.e. the two great manual occupations exempted at that time from British Unemployment Insurance) was almost exactly double the corresponding figure for the United Kingdom, as shown by the Census of 1931. British unemployment (as defined by the various Unemployment Acts) has been as high as 2,800,000, and is now about 1,650,000. It is probable that American "normal" unemployment is higher than British (owing to the greater mobility of labour) and that the depression has been more severe in the United States, both at its worst point and later, than in this country. This would lead to the expectation that American unemployment (still on the British definition) would be somewhat more than twice that of Great Britain. This gives a range between, say, 4½ and 7 millions. It is unlikely, until further information is available, that any closer approach to accuracy can be made.

The measure of unemployment, however, is not the measure of the need for relief. The following table shows, by quarters since the beginning of 1933, how many relief "cases" have been assisted either by the Federal Government or by States or by local authorities. The total has been divided to show the numbers assisted by "direct" relief (i.e. cash or payments in kind) and those relieved by the provision of work of any variety†:—

RELIEF CASES, 1933-36
(Figures are monthly averages, in thousands)

	Direct relief	Work relief and special schemes (b)	Total
1933—First Quarter (a) ...	2,736	1,824	4,560
Second Quarter.....	2,724	1,952	4,676
Third Quarter.....	2,097	1,815	3,912
Fourth Quarter.....	2,385	2,469	4,854
1934—First Quarter	3,031	3,961	6,992
Second Quarter	2,885	1,778	4,663
Third Quarter.....	2,373	2,366	4,739
Fourth Quarter	2,530	2,794	5,324
1935—First Quarter	2,617	3,147	5,764
Second Quarter	2,438	2,942	5,380
Third Quarter.....	2,508	2,537	5,045
Fourth Quarter	2,789	3,254	6,053

(a) Estimated. (b) Includes Civil Works Administration November, 1933–July, 1934; Works Progress Administration from July, 1935; Civilian Conservation Corps, Work Relief, Rural Resettlement, Education and Transient programmes from the inception of each.

These figures are both more and less than figures of unemployment, as understood in England. They underestimate unemployment, in so far as each family is counted only once, however many unemployed persons there may be in it. But they overestimate the degree of industrial unemployment by the inclusion of a number, varying between one and two millions, of agricultural workers. The problem of rural destitution, so far from being ignored, as is tacitly done in Europe, is actually worse than that of industrial unemployment. Taking January, 1935, as a typical month of heavy relief expenditures, the eight States with the highest ratio of relief "cases" to total population were all of them farming States west of the Mississippi. The eight States with the lowest ratio were all States east of the river, many of them manufacturing communities. The need for relief has clearly been caused by the vagaries of climate as much as by those of economics.

ADMINISTRATIVE POLICIES

In dealing with this vast and inchoate problem, the approach of the Government has been both experimental and elastic. Both qualities deserve brief exposition.

The experimental character of the programme can best be illustrated by the many changes of policy and of nomenclature. The first agency to be set up was the Federal Emergency Relief Administration (F.E.R.A.), which lasted from May, 1933, until December, 1935. The F.E.R.A. worked entirely through the States, although its control of the limitless Federal funds gave it a very definite influence over the policies of the Relief Administrations that were set up in every State. A large proportion of F.E.R.A.'s disbursements went for direct relief, and in the early months considerable effort was devoted to increasing the average rate of relief, which rose from \$15.15 per family per month in May, 1933, to a peak of \$30.45 in January, 1935. From the first, however, the Federal authorities showed a strong predilection for giving relief by way of work. This side of the programme has been organised under no less than three successive agencies and known by four different titles, but its development can be traced fairly consistently throughout these vicissitudes.

At the beginning the "work relief" was little more than leaf-raking and similar forms of "made work." The usual difficulties of providing work for the unemployed were encountered. For example, nothing could be undertaken that would either, on the one hand, enhance the value of private property or, on the other hand, compete with private industry. Moreover, jobs had to be fitted to the men available, rather than men to the jobs.

These difficulties have not, however, deflected the Administration from its preference for work as compared with the dole, but have served to change the basis of relief. During 1935 a gradual change was made to an entirely different organisation. Since December 15, 1935, the F.E.R.A. has ceased to exist and the Federal Government has ceased to make any payments to the States for relief purposes. It has, however, taken over full and direct responsibility for finding work for the 3½ million destitute

persons deemed to be "employable." The remainder are now the sole responsibility of the States.

The organisation in charge of these work projects has been re-christened the Works Progress Administration (W.P.A.), and its policy may be regarded as a halfway house between pure "made work" and a public works programme as usually understood. Men are employed at standard rates of wages, which vary from locality to locality and according to skill (the lowest rate is \$19 per month for unskilled workers in villages in the South-Eastern States; the highest is \$94 per month for professional and technical workers in the North-East and Far West). Ninety per cent. of all persons employed must be taken from the relief rolls, but no attempt is now made to vary payments between different workers according to any assessment of need. On the other hand, the total expenditure per man employed has been kept to such a low figure that "remunerative public works" can only rarely be undertaken. The bulk of the work done is undoubtedly useful, but it will return dividends in social benefit and æsthetic pleasure rather than in cash or even in taxable capacity. The compromise nature of the programme can be illustrated by figures of cost. Direct relief costs \$33.66 per family per month. The Public Works programme (discussed in the next section of this survey) has cost \$206 per month per man directly employed. The work being done by the W.P.A. costs about \$80 per man per month.

Some of the details mentioned above—such, for example, as the considerable variation in rates of wages paid—illustrate the elasticity with which relief has been administered, contrasting strongly with the rigid uniformity of the British system. But this elasticity is most strikingly exemplified by the various special programmes which have been devised to meet the needs, and to exploit the skills, of particular varieties of unemployed persons.

Two of these special schemes may be singled out for specific mention. The first is the well-known Civilian Conservation Corps, which has taken half a million youths from the cities and put them to work in the forests and National Parks. This is the one section of the whole relief programme of which there has been virtually no criticism; it has done incomparable good to the health and morale of the young men enrolled, as well as accomplishing much valuable conservation work on the natural resources of the country. The second special scheme selected for mention is the work done by the Federal Surplus Relief Corporation, which has made a direct assault upon the paradox of "starvation amid plenty." In two years the Corporation bought \$270 millions of agricultural products from the distressed farming regions, processed them and distributed them to the needy of the cities.

Relief on this scale is necessarily expensive. During the three years 1933-34-35, the total spent on relief (omitting some of the special schemes) by the United States, the separate States and by local authorities, was \$4,353 millions, or about £871 millions. This gives a monthly average rate of expenditure of about \$121 millions. Of this total sum, the Federal Government found 70.9 per cent., the States 12.8 per cent., and local authorities 16.3 per cent. The Federal Government's contribution was much less than the aggregate Federal deficit during these years, so that it can all be considered as having been borrowed. Of the State's contributions, 61 per cent., and of the local authorities' contribution 35 per cent., was raised by borrowing. Of the total expenditure, therefore, only some 16 per cent. has been financed by taxation. Even for this comparatively small amount the existing taxes have frequently proved insufficient and many States have imposed special Sales Taxes (i.e., excise taxes on retail sales) to raise funds for relief. Neither Federally nor in the States have the funds been raised to any significant extent by progressive taxation.

CRITICISMS

The relief programme has been subjected to a very great deal of criticism. Any summary account of a great charitable venture must necessarily read favourably, and it must

be admitted that behind the admirable elasticity, the praiseworthy willingness to experiment and the worthy humanitarian impulse which has inspired the programme, there has been a great deal of sheer waste and inefficiency. Most of this, and most of the criticism, arise out of the decision to concentrate on work relief rather than direct relief. The very desire to accommodate the nature of the work provided to the capabilities of those available for work, unexceptionable in principle, has led to a great deal of purely unnecessary endeavour—projects such as the cataloguing of foraminifera fossils, the construction of arboreta, the measurement of the cubic content of buildings and others for which the term "boondoggles" has been invented. It can be urged in defence, however, that in most of these cases the provision of work has cost no more than cash relief. Greater objection could, indeed, be taken to the more usual run of work projects, which are costing much more than cash doles, but producing little to enrich the country in any financial sense. It is only a rich country that can afford to deal with its unemployment in this expensive, unremunerative way.

A parallel criticism which is very frequently heard is that the Federal Government has made it far too easy to get on to relief and that the attractive rates which the authorities are prepared to pay have conjured up unemployed where there never were any. This may be true in some agricultural States, where employment on the land for those not owners has always been sporadic and poorly paid. But it is difficult to disentangle this form of economic malingering from the genuine distress left behind by the drought. In any case, it is an inevitable defect of any hastily improvised system of relief that the appearance of distress must be taken at its face value. The critics of the Administration usually clinch their argument on this point by emphasising that when direct relief was handed over to the States and local authorities in December, 1935, the relief rolls rapidly shrank in many areas. But there is reason to believe that this was due to the local authorities' severity as much as to the Federal Government's generosity. Indeed, one of the chief objections that can be lodged to the new scheme of relief is that those unemployed who do not succeed in finding employment under the W.P.A. have been deserted by the Government. In at least one Eastern State the local relief administration was "closed for the summer" in 1936, and many other States have failed to make adequate financial provision.

Another criticism which has some justice (though, possibly, not nearly as much as its originators believe) is the accusation that relief funds are being used to buy votes for the Democratic Party. Over the country as a whole there is no reason to doubt the protestations of the Administrator that "politics" have been banned from the dispensation of relief, except, of course, to the extent that the Democratic Party anticipates a certain sense of gratitude from the beneficiaries of relief. But in some areas, especially where the local Democratic "machine" has been weak, more dubious methods have been used to ensure that relief dollars were transmuted into Democratic votes.

These are the criticisms. Against them must be set admiration for the amazing rapidity with which a vast organisation was improvised and for the imaginative humanity with which it has been administered. It is natural for the critics to compare the actuality of relief in a nation which had not admitted the possibility of such a thing five years ago with some theoretical ideal. It is, perhaps, more pertinent to make the comparison with the chaotic misery of Mr Hoover's last two years. And the argument can fairly be turned against the critics. Those who most strongly inveigh against waste and extravagance to-day, are, by and large, those who proclaimed most loudly that the "dole" was "un-American." Moreover, it is noticeable that though no department of the New Deal is more frequently criticised in detail, none is more rarely attacked in principle. The Republican "platform," for example, though it would return the "responsibility" for relief to "non-political local agencies," would lay no more than a "fair proportion" of the cost on the States. This is a very considerable advance on the Hoover policy.

* A "case" is a family or an individual if he has no family.

† It is possible that there is a small degree of duplication in the figures, but it does not, in any case, exceed 200,000.

PUBLIC WORKS

PUBLIC works were executed on a considerable scale in the United States in the 1920's. So much can be stated on the evidence of the traveller's eyes, for there is hardly a town in the country which has not had at least one new city hall, courthouse, high school or post office since the end of the war, and large sums have been spent on improving the network of motor roads. The following table gives estimates of the amounts spent in public construction of all kinds in the years before the depression, together with the proportion of public construction to total construction*:

	1923	1924	1925	1926	1927	1928	1929
Public construction (\$ millions)	2,123	2,652	2,812	2,974	3,706	3,631	3,555
Percentage of total ...	22.1	24.6	22.9	23.6	28.7	27.9	29.0

The average expenditure during these years was \$3,065 millions, or £613 millions—a substantial sum even for a country with nearly three times the population of the United Kingdom. On the average of these seven years, about 47 per cent. of the total went for roads, streets and bridges.

This considerable volume of public works, however, was "unplanned" in two separate ways. In the first place, it was undertaken by the Federal Government, 48 separate State Governments and a very large number of cities, all on their own separate initiative. Secondly, there was no attempt to adapt the volume of public works to any form of plan for economic stabilisation. A partial exception to both statements must be made in the case of roads. Since 1921 the Federal Government has been making grants to the States for the construction and maintenance of the trunk road system of the country, and some degree of forward planning has been necessary for the purpose. But these grants never exceeded \$95 millions per annum until after 1929, and the planning involved was more technical than economic.

Efforts to expand the volume of public construction were made by President Hoover early in the depression. The Federal Government's own works were increased in volume and the appropriation for grants-in-aid for road construction was considerably enlarged. These measures resulted in an increase in Federal public works in each of the years 1930, 1931 and 1932. But State and city administrations, without either the national responsibility or the elastic fiscal resources of Washington, severely reduced their expenditures after 1930. In an effort to remedy this state of affairs the Emergency Relief and Construction Act was passed in July, 1932, authorising the Reconstruction Finance Corporation to lend up to \$1,500 millions to States and cities for public works. But the Act also provided that all projects to be undertaken should be self-liquidating without the imposition of special taxes or assessments, and the rates of interest demanded by the R.F.C. were high. As a result, by December, 1933, only \$60 millions had actually been spent. The figures for these years are as follows:

	1930	1931	1932	1933
Construction by				
Federal Govt.	390	510	580	500
States	706	786	551	300
Counties	709	329	137	100
Cities	1,495	1,302	797	400
Total public construction	3,300	2,927	2,065	1,300
Percentage of total construction ...	35.6	40.4	49.3	45.4

It will be seen that, in spite of the rapid decline in total public construction, its proportion of total construction increased very substantially.

The Roosevelt Administration, coming into office in March, 1933, put in the forefront of its programme a large programme of public works expenditure. The National Industrial Recovery Act, passed in May, which was the parent of the N.R.A., also authorised an appropriation of \$3,300 millions for public works and set up the Federal Emergency Administration of Public Works, better known as P.W.A. Not all of this sum, however, was spent on public works, and still less was available to P.W.A. The Act provided that \$621 millions was to go to various specific

agencies. At later dates the President transferred various sums for purposes, such as the Civil Works Administration, which were more relief than public works. Moreover, the enlarged construction programmes of Departments of the Federal Government, though they were financed out of the \$3,300 millions fund, were under the control of the Departments concerned. In short, only \$711 millions was actually available to P.W.A. out of this first appropriation. Later appropriations increased the total of Federal money available to P.W.A. to \$1,291 millions.

The Act of 1933 laid down that these funds were to be distributed by P.W.A. to States and smaller local authorities to finance public works. Thirty per cent. of the cost of labour and materials (amounting in practice to about 25 per cent. of total cost) could be given as an outright grant. The remaining 70 per cent. could be loaned; the rate of interest was later established at 4 per cent. In addition loans, but not grants, could be made to private corporations. In 1935 these arrangements were modified, and from the additional appropriations then made available to P.W.A. it could make grants of as much as 45 per cent. The loans to States and municipalities were made by purchasing their bonds. P.W.A. was empowered to sell these bonds on the open market and to use the funds thus obtained for making further loans. By means of this "revolving fund" a further sum of \$395 millions had been obtained by April 30, 1936.

The change of policy in 1935 approximated the character of public works much more to that of relief. At the same time, direct cash relief was abandoned in favour of work relief. This compromise of work which is neither remunerative nor wholly "created" is now the established policy of the Federal Government. Public works, in the proper sense of the term, have been almost abandoned. There are several reasons for this. Ever since 1933 there has been some disappointment at the slowness with which public works expenditures were developed. In addition, public works are deemed to be an unduly "expensive" form of increasing employment. This view is based upon the fact that the cost per man directly employed has worked out at \$2,470 per annum. Indirect employment and the value of the works themselves tend to be ignored. Finally, in the interplay of personalities in Washington, Mr. Ickes, the Public Works Administrator, has lost in influence at the White House as Mr. Hopkins, the Relief Administrator, has gained. The Appropriation Act of 1936, as originally proposed, contained no provision at all for P.W.A., which would have lapsed. Amendments in Congress gave it a reprieve, by authorising it to make grants as well as loans out of its revolving fund. But this revolving fund is now its sole source of funds, and public works will be on the decline in the remainder of 1936 and in 1937.

The total amount spent in the public works programme from July 1, 1933, to April 30, 1936, was \$3,977 millions. Of this total, \$1,291 millions, as stated above, was appropriated to P.W.A., \$1,567 millions was spent on construction projects of the Federal Departments, \$395 millions came from the revolving fund, and \$723 millions was put up by the States and municipalities. The total was spent on the following forms of construction:

	Amount (\$ millions)	Per cent. of Total
Public buildings	929	23.8
Roads	620	15.9
Dams, etc.	387	9.9
Sewage systems	336	8.6
Bridges, etc.	314	7.8
Ships (including naval vessels)	265	6.8
Aids to navigation	257	6.6
Railroads	201	5.1
Waterworks	194	5.0
Housing	133	3.4
Power (other than water power)	42	1.1
Aviation	30	0.8
Miscellaneous	192	5.0
	3,900*	100.0

* The discrepancy between this figure and that given in the text is explained partly by the omission of administrative expenses, partly by a difference of two months between the dates to which the figures refer.

Figures are not available for the construction expenditures of States and municipalities, other than those included in P.W.A., since the end of 1933. But they have almost certainly been very small, both because the financial position of most local authorities has been difficult and also because the attraction of a Federal grant has tended to bring most projects into the P.W.A. programme. In view of this, the expenditure of a little less than \$4,000 millions in 32 months does not look large. Even if allowance is made for the fact that the programme did not get under way until the beginning of 1934, the monthly rate of expenditure is only \$150 millions. A figure for the United Kingdom in roughly the same proportion to national income would be £7½ millions to £10 millions per month, or £90 millions to £120 millions per annum. Though considerable, these figures are by no means gigantic.

The size of the public works programme, as such, has

been exaggerated. Its net result has been to restore the average expenditure on public construction to about 60 per cent. of its pre-depression level. In these circumstances, it would be idle to look for the effects which have been theoretically predicted for a policy of increasing public works expenditures in times of depression. The plain truth is that in the United States public works have not been increased; they have merely been prevented from fading altogether away. Public works, as such, in fact, have played only a relatively small part in the experiment of "deficit financing" by which it was hoped to "prime the pump" of recovery. Discussion of this theory must therefore be deferred to our article on the Budget, in which it will be possible to bring together the figures not only for public works but for the various other activities which have been financed by borrowing.

HOUSING

THE provision of houses in the United States has always been an erratic and speculative business. The period of the '20's in house-building was certainly no less erratic and considerably more speculative than earlier periods. The advent of the automobile opened up whole new areas for development round the cities, which were growing fast both in area and in population. There was a boom in urban apartment buildings, and although this particular form of activity receded considerably before the Stock Exchange crashed, every large American city in 1929 was over-supplied with apartments, especially of the newer and more expensive varieties. The unsoundness of the real estate position in 1929 did not rest solely on the over-supply of apartments. For many years the financial practices of speculative builders and individual home-owners had been getting progressively more foolhardy. Buildings were constructed with the slenderest of equities, the service of first and second mortgages requiring a proportion of the prospective income which could only be justified on the most optimistic view of the future. Mortgage debt increased very rapidly. It has been estimated* that while the total value of urban real estate increased from \$64,600 millions in 1921 to \$73,700 millions in 1929 (a 14 per cent. increase) the volume of long-term urban mortgage debt increased from \$8,968 millions to \$27,616 millions, or by 208 per cent. The ratio of total value to debt fell from 7.2 : 1 to 3.7 : 1. Moreover, it was not only the mortgagors who were imprudent. Banks invested in real estate loans with more faith than wisdom, and in many cities it was their real estate holdings rather than their industrial and commercial loans which ultimately compelled the banks to close. In the later years of the boom there was an almost incredible degree of recklessness among some of the financial institutions specialising in mortgage business.

Amid all this activity, however, one problem was untouched. There was very little building in the Golden Decade for the benefit of the really poor. The housing standards of the middle and upper classes in America are considerably higher (except as regards the amount of cubic space deemed necessary) than in Europe. But the slums of America are among the worst in the world. They are bad in the large cities where the recent immigrants are herded together. They are, if anything, worse in the small towns, and they reach their nadir in the coloured quarters of every town, large or small.

The position of the real estate market when the depression appeared was thus one of peculiar difficulty. A fall in incomes, coming on top of an already existing over-supply of dwellings, led to a rapid fall in both rents and values. Average rents, according to the National Industrial Conference Board, fell by 14 per cent. between January, 1929, and December, 1931, while the total value of urban property declined by 17 per cent. in two years. Foreclosures in the first two years of depression were not unduly

numerous. The estimated total debt declined only by 0.5 per cent., in spite of the rapid fall in values. But the activity of the building industry vanished very rapidly, as the following chart of contracts awarded shows:—

INDEX OF CONSTRUCTION CONTRACTS AWARDED
(1923-25=100)

Beginning in 1931, the deflation of debt was intense. The total of urban mortgages declined between 1931 and 1933 by \$8,245 millions, or 22 per cent.† But foreclosure was of little use to mortgagees, for houses could not be sold or let, except at ruinous loss. The financial institutions involved, especially those that had demand liabilities to the public, were accordingly affected. Their depositors grew anxious, and the pressure on the debtor was increased. Liquidation was the order of the day in all sections of American economic life in the years 1930 to 1933, but nowhere was the pressure more severe or the havoc caused more painful than in the field of urban real estate. The collapse of values was, perhaps, rather greater in commercial than in residential buildings, but the individual hardship caused was infinitely greater in the latter category.

There were thus four separate problems in connection with housing which forced themselves on the attention of the Administration long before the advent of President Roosevelt. The first was to prevent the eviction of many thousands of home owners. The second was to rescue the financial institutions involved in the real estate market from complete collapse. The third was to make possible some

* Evans Clark. "The Internal Debts of the United States," page 66.

† These are the estimates of the Federal Home Loan Bank Board and cover a rather wider field than those cited above.

* Figures taken from A. D. Gayer "Public Works in Prosperity and Depression," pages 51 and 62. Published by the National Bureau of Economic Research.

revival in the building trades. And the fourth was to clear the slums.

Characteristically, President Hoover selected the financial problem for prior treatment. His solution was the Federal Home Loan Bank Bill, which was passed in the Congressional session of 1932. Legislation on the lines of this Act had long been advocated by the building and loan societies (the nearest American equivalent to the English building societies). Broadly speaking, the Act set up for these societies, and for any other financial institutions engaged in similar business, a mechanism very similar to that provided for commercial banks by the Federal Reserve system. Twelve regional Home Loan Banks were created, with capital provided partly by the Treasury, partly by the member institutions. These banks can extend to their members either short-term accommodation or long-term loans on the security of the mortgages pledged as collateral by the member institutions. The twelve Home Loan Banks are co-ordinated and, in part, directed by a Federal Home Loan Bank Board at Washington. The system is rounded out by a Federal Savings and Loan Insurance Corporation, which insures all deposits up to \$5,000 in member institutions in return for an annual premium of $\frac{1}{8}$ of 1 per cent. of aggregate deposits.

This structure, though possibly a little top-heavy for the purposes it was intended to serve, is undoubtedly necessary and beneficial. Loans and advances to member institutions amounted to \$119 millions on June 30, 1936, and there is no doubt that this additional source of credit has enabled the mortgage institutions of the country to maintain greater liquidity and to extend more ample and easier credit to individual mortgagors. But it is clear that a system whose guiding principle is the extension of credit against sound assets only could do very little to solve the pressing emergency of 1932-33. Its undoubted merits are of the permanent rather than the emergency variety, and it is surprising only that it was ever thought to be a solution for the more urgent problem.

RESCUING THE HOMEOWNER

The first action of the Roosevelt Administration was as characteristic of its philosophy as the Home Loan Bank system was of Mr Hoover's. Instead of pumping in credit at the top against sound assets, the new method was the provision of immediate relief at the bottom, to individual home-owners, against assets whose soundness was frequently dubious. This policy was accomplished by the Home Owners' Loan Corporation, which was administered by the F.H.L.B. Board. The H.O.L.C. was quite definitely an emergency institution, and one of the conditions under which it operated was that the beneficiary must be in distress and unable to obtain accommodation from any other source. These conditions satisfied, the Corporation would take over the mortgage, giving a three-year moratorium on repayment instalments and reducing the rate of interest to 5 per cent. The term of these new mortgages was not more than 15 years. The mortgagee was to be paid off not in cash (except in a minority of cases) but by H.O.L.C. Bonds. These bonds were at first guaranteed by the Government in respect of interest only, but in order to make them acceptable, it was found necessary to guarantee principal also. Lending ceased on June 13, 1936, and on June 30th, the H.O.L.C. had made over a million loans amounting in all to \$3,093 millions. Its existence will terminate on June 13, 1951.

The H.O.L.C. has carried out, with expedition and efficiency, a very large and necessary rescue job. In theory, the task has been carried out at no cost, since there are assets against all the Corporation's liabilities. These assets, however, consist of many of the most doubtful mortgages in the country, and it remains to be seen what success the Corporation will have in collecting the interest and repayment instalments due to it. It may be argued with some force, however, that an ultimate loss to the public Treasury, provided it is kept within moderate limits, will have been worth while if it has prevented a million evictions.

Simultaneously with these successful attempts to prevent further liquidation in the real estate market, an assault was made on the problem of providing homes for the very

poorest sections of the community. Some rehousing activities have been carried on by the Resettlement Administration, mainly in connection with self-subsistence projects of one kind or another. But the major part of the "low-cost" housing campaign has been carried out by the Housing Division of the Public Works Administration. This division was originally set up to make loans to "Limited Dividend Corporations." These corporations were envisaged as something analogous to the Public Utility Housing Societies in Great Britain. But they were very slow in putting in an appearance. In most projects submitted, the dividend was virtually unlimited, and in the event only seven projects were approved, housing only 11,000 persons. As a result of the failure of this scheme, the Housing Division decided to construct its own buildings and operate them as Federal property. This second programme has achieved rather more success. Forty-nine projects are built or building, housing nearly 30,000 people. These houses are being built with P.W.A. money, and accordingly 45 per cent. of the cost is counted as a free grant. Rents are calculated to pay interest only on the remaining 55 per cent., but even so the average rental will work out at about \$7 per room per month, including services. A rough equivalent in Great Britain would be 28s. a week for a four-room dwelling, inclusive of light, heat and hot water. Even allowing for the difference in wage-levels, it can be seen that this is very far from being "low-cost" housing. The Housing Division, together with the rest of P.W.A., has lately fallen into disfavour, and its activities are to be wound up.

To have provided accommodation for 40,000 people at rents which the really poor cannot pay is no sort of solution of the slum problem. Indeed, it may be said that the chief purpose served by the Housing Division has been to demonstrate that housing cannot be provided for the slum dwellers except with a very large subsidy from public funds. This is partly due to the coincidence in America of very ambitious housing standards with a cost of construction which is very high even in relation to American wage standards. So long as these conditions remain, America will be even further from a solution of the slum problem than European countries.

MOBILISING CREDIT

The Home Loan Bank system started operations in October, 1932. The H.O.L.C. made its first loans in September, 1933. The first expenditures of the Housing Division were made early in 1934. But still there was no substantial recovery in the activity of the building trades. A fourth agency was accordingly called into existence by the National Housing Act of July, 1934. This was the Federal Housing Administration. The theory which gave birth to the F.H.A. emanated from Federal Reserve Board circles, and it ascribed the continued stagnation of building to a lack of credit. It was easy to show that there was a very large potential need for houses. The number of families had been increasing since 1930 by 500,000 per annum (a very moderate rate for a country with the housing habits of the United States), would require a further 320,000 houses per annum. The total annual "requirement," allowing nothing for slum clearance, etc., was therefore in excess of 800,000, or 4,000,000 for the five years 1930-34. In those five years about 500,000 houses had been built and 200,000 demolished. Thus there was, and is, an undoubted "accumulated deficiency" greatly exceeding the estimated surplus of 650,000 dwellings existing in 1930, and this will sooner or later stimulate a very active period of construction.

The theory responsible for the F.H.A. assumed that since there was a clearly demonstrable need, but no building to meet it, the absence of building must be due to the unavailability of credit. On the other hand, in the commercial banks of the nation a great over-supply of credit was accumulating owing to the cheap money policy. Investments in, and loans on, real estate had proved very dangerous for commercial banks, and they could not be expected to go back into this market on the old terms. But the danger of real estate assets, from the banking point of

view, is that they are illiquid. Accordingly, the F.H.A. is authorised to set up a system of mutual insurance of approved mortgages, and duly insured mortgages are made eligible as collateral for loans from the Federal Reserve Banks. The F.H.A. is, however, more than a mere insuring institution. It is charged with the duty of standardising both methods of construction and methods of financing. It is empowered to guarantee mortgages of up to 80 per cent. of the appraised value of a house at rates of interest not above $5\frac{1}{2}$ per cent., of which $\frac{1}{2}$ per cent. is the insurance premium payable to F.H.A. itself. In addition to these permanent powers, the F.H.A. was also temporarily authorised to insure loans made for the modernisation of existing houses.

Since the establishment of the F.H.A., the volume of building has increased very rapidly, as can be seen from the chart on page 5. But it does not necessarily follow that the increase in activity can fairly be ascribed to F.H.A. In the seventeen months January, 1935, to May, 1936, inclusive, the F.H.A. insured \$296 millions of mortgages for new construction. The total of residential contracts awarded in these 17 months in 43 States was \$740 millions. In view of these facts it appears that the F.H.A. has played a limited part in bringing about the present building recovery.

Moreover, the same chart (page 5) shows how far the activity of building is still behind the pre-depression level. The facts are such as to suggest that the provision of ample credit on easy terms is at best a very partial solution of the problem. What, then, is still holding up American building? To some extent the explanation may be found in the current emphasis on building small houses for sale to the occupier. The F.H.A. will insure mortgages up to 80 per cent. of the appraised value, and this is the extreme upper limit of prudence in a volatile market such as the American real estate market always has been and still is. But even as little as 20 per cent. is a substantial sum to expect hundreds of thousands of families to find in cash. Yet of building to let, either of single-family houses or of larger apartment blocks, there is very little.

The major explanation is undoubtedly to be found in the fact that it is not yet profitable to build houses in the United States. Rents fell at least as much as building costs, even in the years of severest deflation. Since 1933, both building wages and the costs of materials have been raised by N.R.A. One effect of this has already been mentioned in connection with "low-cost" housing—namely, the surprising fact that with a 45 per cent. free grant and interest on the remainder at only 4 per cent., P.W.A. cannot reduce its rents below \$7 per room per month. The movement of rents, hourly wages and material costs, in the shape of indices based on 1929, is represented in the following chart:—

(1929 = 100)

BANKERS TRUST COMPANY

NEW YORK

All types of International Banking transactions handled.

Special attention given to the development of Anglo-American trade.

Complete executor and trustee facilities.

London Office:

26 OLD BROAD STREET, E.C.2

(Incorporated with Limited Liability in U.S.A.)

Until the rent curve crosses, or more nearly approaches, the other two curves, it is most unlikely that the building industry will find a normal volume of activity. It should be remembered, however, that building is an essentially local activity and that rents and costs are much closer to equilibrium in some communities than in others. This is conspicuously true of Washington, whose major industry, the Civil Service, is booming as never before.

Attention should therefore be concentrated, it may be suggested, on the relation between costs and rents rather than on the provision of credit, which is now available for all who seek it. Unless the Government is prepared to subsidise on a very large scale, there is little to do but wait until the revival of individual incomes and the growing shortage of house room pushes rents up to the point

where building once again becomes profitable. When that point is reached the accumulated deficiency is sufficient to guarantee a building boom.

In the meantime, the Government has solved, or at least made substantial contributions to the solution of, two of its problems. The widespread misery of wholesale foreclosures has been averted. The collapse of the financial institutions engaged in the mortgage market has been prevented. In addition, a valuable permanent service has been done by improving the terms on which mortgage money has been generally available in the past. But the problem of the slums remains and the building industry is still very depressed. Moreover, there is every indication that its course in the future, as in the past, is to be an erratic progress from boom to slump.

INDUSTRY AND LABOUR

THERE are few aspects of the New Deal which do not have a direct bearing on industry and labour. The whole programme was designed to increase the profitability of industry, the amount of employment it provided and the well-being of its employees. Even the agricultural programme, which at first sight might seem to be distinct from, if not actually antithetical to, the industrial measures, was advocated as providing an enhanced demand from the rural areas for the products of industry. Wherever a separate line of approach to the general problem appeared, it is discussed in other chapters. The present chapter is concerned with the direct approach to industry and labour as such. This is mainly contained in that extraordinary catch-all, the National Industrial Recovery Act.

The N.I.R.A., passed in May, 1933, probably collects more divergent economic and social theories under the roof of a single enactment than any other piece of legislation ever known. If an attempt be made to reduce its chaos of principles to order, it may be said to have had two main purposes. One was industrial recovery; the other was justice to the worker. When it came to methods, however, these two objectives were almost inextricably intertwined, and several methods were propounded for achieving each objective. Perhaps the dominant theory in the genesis of the Act was the belief that industrial depression could be reduced by getting rid of "wasteful, cut-throat competition." In each industry there were those who argued that if only the industry could be relieved of the pains and penalties of the anti-trust laws, if only it could set up its own by-laws and regulate its own production, if only it could "co-ordinate" (*anglice* raise) prices, all would be well. This was the germ of the idea of "codes of fair competition," or basic charters for each industry. The pressure for this part of the Act came from trade associations. Its purpose, quite plainly, was purely recovery, but recovery envisaged more as a rise in profits than as an increase in the volume of employment.

There are contrasting elements of the Act intended to serve social justice without much reference to recovery. The ban on child labour is an excellent example, although even here it was thought that the removal of children from the labour market would increase the demand for adult labour. The most important provision of the Act without direct bearing on recovery, however, was the encouragement it gave to collective bargaining and to trade union organisation. This part of the Act—to be discussed below—was due to pressure in Congress from organised Labour.

These provisions can, without distortion, be allotted either to recovery or to social justice. The central part of the N.I.R.A. programme, however, its provisions for shorter hours and higher wages, were an amalgam of the two aspirations. It was hoped to benefit the worker by giving him more leisure, or more income, or even both. At the same time it was believed that the reduction of hours would increase the total number of men in employment, while higher wages would increase purchasing power. The magic formula had been devised for advancing both recovery and reform at one and the same time.

The N.I.R.A. was an enabling Act. Everything, there-

fore, turned on the policies adopted by the administrative body, the N.R.A.* There is reason to believe that when the Act was passed it was not expected to be of universal application, but was to be confined to a handful of the largest industries. Within a few weeks, however, the programme grew more ambitious. Every industry was to have its code, and have it as soon as possible. In the interim period a "blanket code," known as the President's Re-employment Agreement (the famous Blue Eagle), was to be forced on industry by the pressure of public opinion.

The N.R.A. lasted less than two years, but in that time no less than 546 codes and 185 supplemental codes were approved. Most of these were forced through at a break-neck pace, without opportunity for proper investigation of the specific problems of the industry, or for correlation of codes with one another. In the process of code-making, the employers predominated. Where there were strong labour organisations already in existence in the industry, labour exercised a considerable influence, but not elsewhere. The interest of the consumer, or the public interest in general, received very little attention. The mass of supplementary law which was thus created in a few months was, accordingly, in the main, written by the industrialists themselves. Moreover, the Code Authorities, the administrative bodies set up under each code, were also almost exclusively composed of employers drawn from the industry in question. The N.R.A. thus resolved itself into a gigantic, if somewhat incoherent, experiment in the self-government of industry. Its motto might have been "Cartels for All, and no questions asked." This, at least, was the theory, but practice lagged far behind. Many of the codes merely remained on paper, and even in the minority that were well administered, enforcement was never universal. This was due partly to the fact that the business men were expected to police themselves, partly to a well-founded reluctance of the Administration to carry enforcement into the Courts.

N.R.A. AS A RECOVERY MEASURE

It is difficult to assess the effects of this universal cartelisation on the progress of recovery. Where "co-ordination" was successful, the inevitable effect was to raise prices and *pro tanto* discourage demand. This can be observed at its most extreme in the case of the construction trades, where a steep rise of prices effectively delayed the recovery of the building industry for many months (see the chart on page 7). But throughout industry in general the cartelisation was hardly effective. Had every trade become a virtual monopoly, industrial production must inevitably have been still further restricted. In the event, there was little effect of this sort. Under this heading, then, the N.R.A. can be acquitted of any widespread and serious hampering effect on recovery; but it secures its acquittal only by virtue of its ineffectiveness.

The effect of the wages and hours provisions is harder to assess. The immediate results of the codes can be seen

* N.I.R.A. stands for National Industrial Recovery Act, N.R.A. for National Recovery Administration.

from the following chart, which gives numbers of average hours worked in industry, average hourly wages and average weekly earnings:—

HOURS AND WAGES IN INDUSTRY (1929=100)

It will be noticed that average weekly earnings had been increasing rapidly for some months before N.R.A. was born in June, 1933, but this increase was due entirely to an increase in average hours worked. The effect of N.R.A. was to reduce hours of work again to the lowest level previously reached, but to increase hourly wages, so that weekly earnings remained constant. The subsequent effect has been to increase hourly wages to above the 1929 level, but to leave average hours at 80 and weekly earnings at 85 per cent. of that level. It is unfortunately impossible to say with any precision what the effect was on the numbers employed. The Federal Reserve index number of employment in manufacturing industries, however, rose from about 57 per cent. of the 1929 level in March, 1933, to about 77 in the last quarter, and remained close to that level throughout most of 1934 and 1935. Not all of this increase, of course (and perhaps not any of it), is to be ascribed to N.R.A.

Since 1933 the total purchasing power of American wage-earners has undoubtedly increased; the increase has been at once the cause and the symptom of recovery. But it is impossible to isolate the effect of N.R.A. on this recovery from the effects of all the other causes operative—cheap money, credit expansion, currency depreciation, agricultural reconstruction, Government spending, etc., etc. There is, however, one element in the situation, clearly visible from the chart above, which is directly traceable to N.R.A. This is the fact that whereas labour cost (as measured by hourly wages) is now higher than the 1929 level, the money income of the wage-earner is only 85 per cent. of the 1929 amount. It is hard to resist the conclusion that this discrepancy has been a drag on recovery. The American worker has gained in leisure; but it may be that he has paid a heavy price for his leisure either in unemployment or in lower real income. As a recovery measure it is very doubtful whether N.R.A. was more help than hindrance.

N.R.A. AS A LABOUR CHARTER

The chief concession to Labour in the N.I.R.A., other than the wages and hours provisions, was the famous Section 7 (a). This provided that every code must include the following conditions:—

- (1) That employees shall have the right to organise and bargain collectively through representatives of their own choosing, and shall be free from the interference, restraint, or coercion of employers of labour, or their agents, in the designation of such representatives or in self-organisation or in other concerted activities for the purpose of collective bargaining or other mutual aid or protection; (2) that no employee and no one seeking employment shall be required as a condition of employment to join any company union or to refrain from joining, organising or assisting a labour organisation of his own choosing; and (3) that employers shall comply with the maximum hours of labour, minimum rates of pay, and other conditions of employment, approved or prescribed by the President.

Over the precise meaning of these words a battle has raged ever since. It seems probable that the Administration originally intended to make a legislative declaration of the right of collective bargaining and then to preserve neutrality between employers and unions. But events forced it into a more positive attitude. In the first place, it had not been foreseen that the employers, after the passage of N.R.A., would have more success in enrolling workers in company unions than the American Federation of Labour would have in organising "genuine" unions. And secondly, the political pressure of organised Labour was relentless. Accordingly, two modifications have been added to the original doctrine of Section 7 (a). The first of these is the prohibition of employers from giving any financial aid to company unions. The second is the doctrine that the representatives selected by the majority of workers shall be entitled to represent all the workers in collective bargaining. These two modifications (which, after the outlawry of N.R.A., were embodied in the National Labour Relations Act) were interpreted as substantial concessions to organised Labour, and they definitely ranged the Administration on Labour's side of the fence.

European observers, in approaching this controversy, should beware of identifying the principle of collective bargaining in the abstract with its practice in the United States. The American trade union movement is not similar to trade unions in other countries. The total membership of the American Federation of Labour was only 2,127,000 in 1933. Moreover, even this small membership was split into a large number of "horizontal" or "craft" unions—that is, organisations of skilled artisans plying their craft in a score or more of industries, and concerned to defend themselves against the unskilled workers as much as against the employers. Only the minority of "industrial" unions (now expelled from the A.F.L.) deliberately cater for the unskilled worker. Moreover, the methods of unionism in America are not always such as to appeal to democrats. Unions which control only a minority of workers in an industry and are effectively debarred from peaceful recruitment, can advance their objects only by violence, and American strikes are notorious for the violence and bloodshed they cause.

Conclusions on the matter will almost inevitably vary with the political preconceptions of the observer. With this qualification in mind, it may be suggested that the original purpose of the Administration—to remove the legal and practical disabilities of the unions—was fully justified. Furthermore, it may be that, in the circumstances of American industry, trade unionism could not find full freedom for growth without some positive discouragement of company unions.

THE AFTERMATH OF N.R.A.

The N.I.R.A. was judged to be unconstitutional in its entirety by a unanimous decision of the Supreme Court in May, 1935. All codes thereupon lost their validity and the administrative machinery of N.R.A. vanished. The disappearance of N.R.A. made surprisingly little difference. Such of the new regulations as were approved by public opinion or the opinion of the trades concerned were continued by tacit agreement. The unpopular or impracticable proposals had never been enforced.

A few remnants were salvaged from the wreck. The National Labour Relations Act has already been mentioned. This Act is before the Courts now, and, in view of previous pronouncements of the Supreme Court, it is very doubtful whether it will survive. Two industries which had indubitably been benefited by N.R.A. were coal and oil. In coal, the Guffey Act was passed setting up a cartel structure very similar to the N.R.A. but using the taxing power rather than direct compulsion as the sanction. But this, too, was forbidden by the Supreme Court. In oil the Federal Government could do no more than prohibit the movement in inter-State commerce of oil produced in defiance of the "proration" laws of the separate States.

These crumbs are all that is left of the N.R.A. What conclusion are we to come to about the N.R.A. as a whole—if, indeed, any one conclusion is possible about such a heterogeneous enactment? In retrospect, it seems to have

been more of a muddle than a policy. Its theory was, to say the least, dubious. Few economists would advocate the cure of industrial depression by further restriction of production, the remedying of the disparity of price between raw materials and finished goods by increasing the cost of production, the stimulation of the demand for labour by an artificial increase in its supply price. But in practical administration the N.R.A. was even more muddled, incoherent, unprincipled than in its basic theory. It may perhaps be concluded that the N.R.A. brought some benefit (chiefly in the shape of shorter hours) to the worker in employment, but this benefit would be cancelled out if it could be shown that N.R.A. hindered the reduction of

unemployment. It brought benefits without doubt to labour organisations; but in the present state of affairs it is doubtful how far this is synonymous with benefits to the working man. To the movement of recovery as a whole, N.R.A. was almost certainly a definite hindrance. The argument from time coincidences is not always convincing, but it is significant that the imposition of N.R.A. was accompanied by a recession in industrial production, and that its two years of life coincided with the long stagnation which separated the two periods of rapid recovery at the beginning and end of Mr Roosevelt's term of office.

AGRICULTURE

AMERICAN agriculture has considered itself to be a depressed industry ever since the war. The four war years, with their rising prices and their insatiable demand from Europe, were the Golden Age of the American farmer. His income and the value of his land shot up, and the area under the plough was rapidly extended. The reaction in 1920-21 was all the more severe. Gross farm income, which had been nearly \$17,000 millions in 1919, fell to less than \$9,000 millions in 1921. But this acute depression was short-lived and income soon started mounting again. Agriculture did not, however, share the swelling prosperity of the 'twenties. Gross farm income was over \$11,000 millions in 1923 and it never exceeded \$12,000 millions in the next six years. Agriculture's share in the total national income slowly declined from 11 per cent. to 9 per cent. There was a constant disparity between the prices received by farmers and those paid by them. The average income *per capita* on farms was consistently less than half the average *per capita* income of the whole nation.

Whatever may have been its absolute condition, agriculture was thus relatively depressed throughout this period. The chorus of complaint was so loud that Mr Hoover, in his campaign for the Presidency as early as 1928, was constrained to promise that he would summon a special session of Congress to consider measures of relief. Unfortunately, the special session, after passing an agricultural measure which proved wholly ineffective, proceeded to perpetrate the Hawley-Smoot Tariff, which was calculated severely to injure the farmer. Mr Hoover's remedy for the farmer's troubles was the Federal Farm Board, equipped with a revolving fund of \$500 millions and given the mandate to stabilise prices. No worse time could possibly have been picked for the venture than 1929. The Farm Board spent its money in acquiring vast stocks of agricultural products which had later to be dumped at enormous losses. Its net effect on the course of prices was nil.

The farmer's relative depression in the 'twenties did not save him from severe deflation in the crisis years. On the contrary, he suffered more than anybody else. Gross farm income, which had been steady between \$11,000 and \$12,000 millions for seven years, fell to \$9,454 millions in 1930, \$6,968 millions in 1931 and \$5,331 millions in 1932. Moreover, the farmer's cash expenses did not fall in equal proportion. Interest was fixed; taxes actually increased. Other cash expenses were relatively inelastic. In consequence the net income of farmers, after paying their outgoings, declined from an average of \$6,828 millions in 1923-29 to \$2,573 millions in 1932. Agricultural prices fell far more rapidly than other prices, and the purchasing power, in terms of non-agricultural products, of the things farmers sell, which already stood at as little as 79 per cent. of the pre-war relationship in 1929, had declined to 41 per cent. in 1932. Such was the appalling effect upon American agriculture of the coincidence of a fall in the purchasing power of the American urban population with a catastrophic decline in the value of exports.

This calamitous state of affairs inevitably took first rank among the incoming Administration's problems. The farmers are a very large proportion of the total population of the United States. Owing to the equal representation

of the States in the Senate, they have a political power greater than their proportion of the population. And finally the agricultural States were, and are, the backbone of Mr Roosevelt's support. Moreover, the problem was more than a purely agricultural one. For the typical American farmer relies very largely on one crop. If he cannot sell that one crop he cannot even feed his family. Agricultural depression in the United States, unlike other countries, can easily become actual starvation on the farms.

The major instrument of the New Deal's agricultural programme is the Agricultural Adjustment Act. The main objective of that Act was to restore agricultural prices, separately and collectively, to "parity," which was defined as the relationship they bore to non-agricultural prices in 1909-14. Several methods were laid down for attaining this objective. "Processing taxes" were to be levied equal to the difference between the actual prices and the "parity prices." The funds thus raised were to be employed in financing the restriction of production, either by renting land and keeping it out of cultivation or by paying benefits to farmers in return for the contractual obligation to reduce production. In two branches of agriculture—cotton and tobacco—this voluntary scheme was reinforced by a compulsory quota scheme. In still other branches, such as milk, the increase in prices was secured by marketing agreements similar to those which have been set up in Great Britain under the Agricultural Marketing Acts.

This ingenious scheme has been subject to a number of objections in principle. It has been urged, for example, that the "parity" arrived at is an impracticable ideal. The years 1909-14 were the most prosperous period the American farmer has ever known, save only the war years, while there is evidence that the index numbers used to calculate the "parity" (which are given official sanction in the Act) tend to understate the level of agricultural prices and to overstate the prices of the things the farmer buys. Apart from this technical question, there are many people who condemn the restriction of food production on economic, social and even religious grounds. Finally, the method of financing the scheme, by a tax which is inevitably passed on to the consumer, is objectionable to many. All these are serious criticisms, but it may be urged that the problem of restoring the income of an industry of 30 million heterogeneous and uncontrollable units is so difficult that considerations of ideal justice cannot be decisive. Restriction of production was only to be imposed in so far as it was necessary to counteract the decline in the export markets, and if foreign countries are so insane as to reject the proffered supplies of cheap food, the exporting countries can be excused if they too depart from strict logic. Moreover, both restriction of production and the taxation of food were permitted by the Act only so long as agricultural prices were below "parity."

Much satire has naturally been directed at the philosophy of granting subsidies "for not raising hogs." But on balance it may be concluded that the theoretical absurdities of the plan could be excused if it could be shown to have worked. Its practical effects, consequently, become the central question. There is no room for doubt that the position of the American farmer has improved

very greatly, and much more rapidly than the position of the country as a whole, since 1932. The average of farm prices was 66 per cent. higher in 1935 than in 1932. Total cash income of the farmers (a conception somewhat different from the gross farm income discussed above), which had been \$10,417 millions in 1929 and had fallen to \$4,377 millions in 1932, had recovered to \$6,900 millions in 1932. Of this latter sum, \$480 millions represents direct benefit and rental payments from A.A.A. Even without these, however, the recovery in income in three years was 47 per cent. of the total 1932 income and nearly 20 per cent. of the peak income of 1929. Net cash income after paying the cash expenses of production shows an even more striking recovery, from \$1,473 millions in 1932 to \$3,575 millions in 1935. Agriculture's share in the national income, which had fallen to 7½ per cent. in 1932, has risen to about 10½ per cent. If agricultural incomes be compared with non-agricultural incomes, or prices with prices, agriculture has got back to the same relative position as it occupied in the 'twenties. This increased income does not seem to have been very equally distributed among the different classes of people dependent upon it. Thus, while the net cash income of the industry increased between 1933 and 1935 by about 40 per cent., the total amount paid in wages to agricultural labourers increased only by about 14 per cent. Tenant farmers, especially the share-croppers of the Cotton Belt, also do not seem to have received their fair share.

To demonstrate the degree of improvement, however, does not prove that all of it was due to the A.A.A. The \$480 millions of increased income that comes from benefit and rental payments is obviously due to the A.A.A. But this is less than one-fifth of the increase in gross income. For how much of the remaining four-fifths can the A.A.A. take credit?

To answer this question precisely would involve an estimate of the indistinguishable parts played in recovery by a large number of factors. A decline in the volume of agricultural production has undoubtedly played a large part,

perhaps the dominant part, in raising prices and incomes. But drought has been a very much more potent restrictor of production than the A.A.A. The voluntary schemes never enrolled all the producers, and there is evidence that farmers who did not sign restriction contracts increased their production to offset the reductions by the contract-signers. In cotton and tobacco, restriction was compulsory. Moreover, the drought of 1934 did not affect these crops nearly as severely as it affected the cereals. The judgment may therefore be hazarded that a larger proportion of the increased income from cotton and tobacco should be ascribed to A.A.A. than in the case of grain crops. In the case of wheat an independent expert estimate* is inclined to assess the effect of A.A.A. as being very much less than that of the drought. In the nature of the case, it is a matter of extreme difficulty to place quantitative estimates upon the various factors at work. But if it be borne in mind that A.A.A. affected the prices of some products more than others, and that on still others it had no effect at all, since no restriction schemes were promulgated for these commodities, it may be guessed that about a quarter of the rise in prices can fairly be ascribed to A.A.A. Add on the direct gain from cash benefit and rental payments, and a final approximation of 40 per cent. is reached, as the proportion of the increase in farmers' incomes directly or indirectly attributable to the A.A.A. If this estimate is badly wrong, it probably errs on the side of flattering the A.A.A. The experiment can thus be said to have been at least a partial success. But Nature has done far more for the farmer than Mr Wallace.

The processing taxes were declared by the Supreme Court to be unconstitutional in January, 1936. With that decision the financial basis of the A.A.A. was disrupted. When a similar sentence was pronounced upon the N.R.A., that experiment was brought to an immediate end. But the A.A.A. was both more successful and more popular

than the N.R.A. and methods have been devised for continuing its essential parts. The primary purpose of the new legislation is declared to be the conservation of the soil of the country. To attain this end, farmers are to be financially encouraged to take their land out of arable cultivation and to put it down to pasture and soil-conserving grasses. There is undoubted need for soil conservation in most parts of the country and it is a lucky accident that the crops which should be discouraged for the sake of soil conservation are also those which should be restricted in the interests of the farmers' income. Moreover, it is declared in the Act that proper husbandry demands that the farmer shall receive an adequate income, defined as being one bearing the same relation to the average urban income as existed in 1909-14. The framers of the new Act need not be accused of insincerity, or of anything save a certain conscious distortion of motives. But the net effect is to side-step the judicial decision, and it remains to be seen whether the new façade will satisfy the Supreme Court. From the constitutional point of view, the new scheme is improved by the provision that, from 1938 onwards, it shall be administered by the States, the Federal Government providing the funds. These funds are to be raised by general taxation, which does away with the objection to the regressive nature of the processing taxes. It is also an improvement to have an "income parity" substituted for a "price parity" as the objective of the scheme.

The Government's agricultural policy has not been confined to the A.A.A. The provision of cheap and abundant credit has also played a large part. A great deal had already been done in this direction before 1933, and the present Administration's contribution has been largely one

of extension and co-ordination. All Government agencies making loans to farmers have now been grouped under the Farm Credit Administration. In each of the twelve regions into which the country is divided, the F.C.A. supervises (1) a Land Bank, making and refinancing long-term mortgage loans; (2) an Intermediate Credit Bank, which extends credit for medium-term purposes; (3) a Production Credit Corporation which, through local associations, makes seasonal loans on crops or livestock; and (4) a Bank for Co-operatives, which finances farmers' co-operative associations. This remarkably comprehensive system had total loans outstanding on June 30th last of \$3,981 millions, a substantial sum in comparison with the gross cash income of the industry last year of less than \$7,000 millions.

Two other financial measures deserve mention. One is the creation of the Federal Farm Mortgage Corporation (also included in the F.C.A.), with the object of re-financing farm mortgages. The debtor is given a new mortgage at favourable rates, the creditor being paid off with Treasury-guaranteed bonds. This institution is the counterpart in the rural field of the Home Owners' Loan Corporation (see page 6). The other measure worthy of mention is the Farmers' Bankruptcy Act, which entitles a bankrupt farmer to retain possession of his land and to pay off his creditors by paying them, in easy instalments, the appraised "fair and reasonable value" of his assets. These two measures between them have given the farmer a very substantial degree of protection against eviction. Indeed, it is questionable whether there is not some need for a Farm Creditors' Relief Act. But the United States, in its political aspect, is almost an agrarian state, and such states have never been solicitous of the money lender.

BANKS AND BANKERS

BANK failures were no depression novelty in the United States. All through the prosperous decade of the '20's there was a continuous epidemic of bank failures. Starting with 1921, there was no year in which less than 354 banks failed, or less than \$110 millions in deposits were impounded. The average annual rate throughout the nine years to 1929 was 627 bank failures, involving \$169 millions of deposits. The figures reveal, however, what manner of banks they were that failed in such numbers. The average total of deposits per failed bank was only \$270,000, or £54,000. They were, in short, the smallest variety of rural bank and the cause was, in the main, the collapse of land values in and after 1921 and the slow deflation of agricultural pipe-dreams which occupied the whole of the '20's. The total number of banks in the country, which had been 30,812 in June, 1921, had fallen to 23,696 by June, 1930, but the banking facilities of the country had not been reduced in anything like the proportion that a bare comparison of these figures would suggest.

The fact that failures were largely confined to small banks in outlying districts does not, however, mean that all was well with the American banking system. On the contrary, there were many grievous defects which the depression successively uncovered. This is not the place for discussion of the weaknesses left in the American banking system by the period of prosperity. It must suffice to say that the real run on the American banks can be dated from the failure of the Bank of United States in New York in December, 1930. This was the first time a large bank in a large city had closed its doors. From that time the tide of public suspicion mounted. Failures continued at an increasing rate and the size of bank affected was growing. Public uneasiness was reflected in the hoarding of currency; money in circulation increased from an average of \$4,546 millions in 1930 to \$4,957 millions in 1931 and to \$5,699 millions by the end of 1932. President Hoover attempted to stem the flow. In October, 1931, he persuaded the banks to organise themselves for mutual defence in the National Credit Corporation, which was to derive funds by assessment on the sound banks and lend them, against sound security, to banks in difficulty. This failing, the Reconstruction Finance Corporation was set up in January, 1932, to lend Government funds, though still with the require-

ment of adequate security, to hard-pressed banks. The R.F.C. succeeded in slackening the pace of failures, though they continued throughout 1932 at the average rate of 40 banks and \$2 millions of deposits every day. Towards the end of the year the final collapse began. The first State moratorium was declared on October 31st; the Detroit banks closed on February 14, 1933, and within three weeks the bank "holiday" had spread to every State in the Union.

It is impossible to exaggerate the effect of this banking trouble in intensifying the depression. If reasons be sought for the greater severity of the depression in the United States than in Great Britain, this is undoubtedly the chief. A run by the public on the banks not merely reduces directly the circulating medium of the country, it also compels the banks to put every conceivable pressure on their debtors for repayment of loans and to dump securities on the Stock Exchanges. While such a deflation of credit is proceeding, the Government is powerless to reverse the downward sweep of all the economic indices. In the fiscal year 1931-32, the Federal deficit amounted to \$2,473 millions and to that extent fresh funds were pumped into the system. But in the same period the total loans and investments of the banks of the country declined by \$8,951 millions. Deflation of this nature imposes a creeping paralysis on the whole economic structure of a nation. Some idea of the baleful effects of banking instability can be gained from the fact that the total value of cheques drawn (excluding New York City) was in 1933 only 44 per cent. of the 1929 level. The total of the British Metropolitan, County and Provincial clearings, in 1931, the worst year, was 95 per cent. of the 1929 total.

REOPENING THE BANKS

The utter collapse of the whole banking system of the country forced itself on President Roosevelt as his first and most urgent problem. His handling of this emergency, in his first days in office, has won universal praise. It is no detraction from this praise to say that his approach was purely psychological. He contrived to convince the public that only "sound" banks would be allowed to re-open, although, had the panic continued, there would not have been a sound bank in the country. Moreover, he induced

the man in the street to believe that the Government was now behind the banks, although in fact no sort of guarantee was given. It is probably the case that a collapse so complete would in any case have been followed by a return of confidence. The obvious lunacy of attempting to convert all deposits into cash is apparent if once the public is given time to see it, and in economic fevers, as in physiological distempers, improvement follows on the crisis. Be that as it may, when the banks re-opened, deposits returned and the strain was lifted.

The Roosevelt Administration has taken measures to buttress the banking system other than the reversal of psychology which the President achieved at the time of the crisis. One of these was the creation, in June, 1933, of the Federal Deposit Insurance Corporation. Apart from a preliminary investment of capital by the Treasury, the F.D.I.C. is a purely mutual institution. Membership is obligatory for all members of the Federal Reserve system and optional for other banks. Funds are raised by assessment from all member banks, and are available to insure deposits—small deposits in full, larger deposits in part. Another buttressing measure has been the purchase by the Reconstruction Finance Corporation of preferred stock in a number of banks. The amount of money placed at the disposal of banks in this way amounted at the peak to \$1,265 millions. This device had the virtue that it did not compel the banks to mortgage their soundest assets in order to get Federal help. Whether as a result of these measures, or for other reasons, bank failures have been very much reduced. From March 16, 1933 (the end of the "holiday") until the end of the year, there were 179 suspensions, involving \$146 millions in deposits (approximately the monthly average in 1931); in 1934, the figures are 57 and \$37 millions respectively; in 1935, 34 and \$10 millions respectively.

It would be an exaggeration to ascribe this improvement entirely to the measures which have been mentioned. It was undoubtedly due in the main to the change in trend from deflation to inflation in 1933, and, in particular, to the policy of cheap money discussed below. But in politics *post hoc* is always *propter hoc*, and one of the chief arguments of the President's supporters is the claim that he has put an end to banking trouble. The policy has, indeed, been amazingly successful. It may be that the future will show it to have been too successful, as the very liquidity of the banks and ease of the money market are an invitation to a repetition of just such unsound expansion as occurred in the '20s. There are serious doubts, moreover, about the wisdom of a permanent system of mutual deposit insurance. It amounts to a penalisation of sound banks for the benefit of unsound banks, and an endowment of imprudent banking. On the other hand, this history of the past six years would tend to show that it is in the interest of the sound banks to keep their less wary brethren afloat, however unsound their practices may have been.

The Government's attentions were not, however, solely directed towards the underpinning of the banking structure. The long period of deflation had revealed a number of abuses, real or imagined, in American banking practice. A whole folk-lore of anecdote had grown up around the unpopularity of the banker, and the President himself, in his Inaugural Address, spoke of money-changers fleeing from the Temple. In the circumstances, reform was inevitable, and it was no less inevitable that the reform programme should take little account of the wishes of bankers themselves. Much of it, in fact, amounted to penal legislation. Thus, the Banking Act of 1933 enforced an immediate and complete divorce between banking functions and any form of security trading, whether the issue of new securities or dealing in existing issues. Plural bank directorships were prohibited, and many of the activities of banks were made subject to the control of the Federal Reserve (e.g. rate of interest payable on time deposits, volume of collateral loans).

Nobody would deny the need for a reform of some American banking practices. The actual measures adopted, however, have been disappointingly negative. They amount almost entirely to prohibitions of practices deemed unsound, and even then there has been a strong tendency to penalise the whole race of bankers for the sins of a few. Of encouragements to sound banking, there have been few indeed. This applies more especially, in foreign

eyes, to the failure to provide even the legal framework for a system of branch banking. The Act of 1933 went no further than to permit national banks to open branches in States where the State law permits. Conditions in 1933 were such that the President could have carried any measure he proposed for banking reform, and it must be one of the severest indictments of his financial policy that he allowed prejudice against bankers, especially big bankers, to blind him to the needs of American banking.

FEDERAL RESERVE POLICY

In the years before 1929, high claims were made for the Federal Reserve system. It was generally believed that the secret of credit stability had been discovered; and, indeed, the long period of comparatively stable prices, combined with steadily mounting production, appeared to offer strong testimony to the success of the system. This complacency was not seriously shaken by the events of the autumn of 1929, for though it was apparent that the period of steady prices and constant expansion of industry was over, a Stock Exchange panic had been overcome without the banking crisis which in pre-Federal Reserve days would have been almost inevitable. Accordingly, the policy pursued by the Reserve authorities throughout 1930 was a negative one. They had eased credit late in 1929, and were content to leave the volume of credit provided for the market at the level then attained. Member bank borrowings from the Reserve had fallen to a low level by March, 1930.

This Fabian policy was continued in the first half of 1931, although assistance was given to the market temporarily in the Bank of United States crisis in December, 1930. But in the second half of 1931 more drastic measures became necessary. The rising tide of bank failures was inducing a steady flow of currency into hoards. Moreover, after September, 1931, the flow of gold, which had been steadily inwards, was sharply reversed, and the imports of thirty-two months departed in nine months. These influences greatly increased member bank borrowings and restricted the money market. Between July and October, the Reserve bought some \$650 millions of securities to ease the market, but in the last two months of the year the Reserve system itself began to feel the pressure of gold exports. As the law then stood, Federal Reserve notes could be backed by gold or "eligible collateral." But since the supply of eligible paper meeting the requirements of the law was limited, most of the backing was, perforce, composed of gold, and the minimum gold reserve percentage was, in practice, far above the 40 per cent. specified by the law. Consequently, from November onwards, the Federal Reserve, far from being able to expand the credit structure still further, was compelled to sell the securities it had bought since July. These four months, from November, 1931, to February, 1932, were the period of severest deflation during the whole depression.

The restrictions on the Federal Reserve were removed by the Glass-Steagall Amendment to the Federal Reserve Act, approved on February 27, 1932, which, for a period of three years (since made permanent), permitted United States Government bonds to serve as collateral for notes. The Reserve immediately started buying securities. About \$1,000 millions were bought between February and June, when the total was stabilised until the end of the year. There was plenty of banking trouble still to come, but (with the temporary exception of the final crisis of February and March, 1933) the basis of the credit structure was steadily expanded from this time onward.

The Roosevelt Administration has considerably altered the structure of the Federal Reserve system without changing the fundamental policy adopted by President Hoover in February, 1932. The chief changes in structure are contained within the Banking Act of 1935, although several other enactments have contributed. Two tendencies are clearly visible. In the first place, the Reserve system as a whole has been given greatly enhanced powers over the member banks and over the credit market generally. It can substantially regulate the interest rates paid by banks; it can restrict credit to banks which it believes to be financing speculation; it has increased powers over brokers' loans, both by regulating their source and by specifying

the minimum cash margin to be demanded; finally, it can vary the minimum legal reserves required of members. But the second tendency is to concentrate these new powers in the Federal Reserve Board at Washington rather than in the twelve regional Federal Reserve banks. The officers of the regional Reserve Banks are now virtually appointed by the Board, while the open market operations of the whole system are regulated by an Open Market Committee on which the Board has a majority. Rediscount rates have always been more the concern of the Board than of the banks. The Board itself has been reconstructed. The two former political ex-officio members, the Secretary of the Treasury and the Comptroller of the Currency, have gone. The Board, now rechristened the Board of Governors, consists entirely of whole-time specialists appointed for fourteen-year terms. President Roosevelt has appointed the whole Board, which can therefore be taken as reflecting his views. But future Presidents will only be able to fill vacancies as they occur and to nominate one of the Governors as chairman.

Within the Federal Reserve system there has thus been a distinct centralisation of authority. But it should not be assumed that the Board of Governors is now the supreme authority in American banking. It has at least three rivals. First there is the Federal Deposit Insurance Corporation, with its own powers of inspecting and coercing banks. Second, there is the Reconstruction Finance Corporation, with its large advances to, and investments in the preferred stock of, banks. These two bodies, if they chose to exert their influence in a sense contrary to Federal Reserve policy, might nullify all the efforts of the Board of Governors. Last, and perhaps most potent of all, there is the Treasury, at once the largest debtor and the largest creditor of the banks, which controls a whole string of Government institutions granting credit to mortgage institutions, house owners, farmers, etc. It is impossible to say exactly where the balance of power in American banking now lies. The only certainty is that it does not lie with the individual member bank.

The Federal Reserve system, thus reconstructed, has consistently pursued a cheap money policy. For most of the time, however, its policy has been negative and acquiescent rather than positive and initiating. In the second half of 1933, when gold was flowing out, the Reserve made further purchases of Government securities, with the result that member banks' reserves were swollen, borrowings vanished and the phenomenon of "excess reserves" (i.e. reserves of member banks held at the Federal Reserve banks in excess of the legally-required proportions) began to appear. But from the beginning of 1934 Reserve holdings of securities have been stabilised. It can be seen from the accompanying diagram that the rise in member bank reserves (and hence in excess reserves) was due to Reserve purchases in the open market in 1932 and 1933, but that for the last two-and-a-half years it has been almost entirely due to the inflow of gold.*

These excess reserves have lately increased to such an unprecedented extent that the question has been raised whether the credit structure is not entirely beyond the control of the Reserve authorities. The increase in minimum reserve requirements for member banks, which took effect on August 15, 1936, has left a very considerable volume of excess reserves remaining. The authorities have a formidable armoury of weapons at their disposal. The Reserve Board could increase reserve requirements by a further 50 per cent. (33½ per cent. of the present reserves); it could sell its holdings of securities; it could raise the margin requirement for Stock Exchange dealings; if it forced the member banks to borrow, it could raise the re-discount rate. The Reconstruction Finance Corporation could call or sell its \$452 millions of advances to and investments in banks and other financial institutions; it could

* The two factors shown on the diagram, Federal Reserve open-market purchases and gold imports, are the most important, but not the only influences on the level of member bank reserves. The flow of currency into or out of circulation, the size of Government balances and their movement between the member banks and the Reserve banks are other influences. The increase in excess reserves in July and August, 1936, has been due to a reduction in Treasury balances which in its turn is to be ascribed to the disbursement of the "veterans' bonus."

sell part at least of its \$930 millions of other negotiable securities, and the payments made for these assets by their purchasers would, of course, *pari passu* lower member bank reserves. If on top of all this the Treasury started to build up its cash balance and to transfer it from member banks to Reserve banks, the combined deflationary effect would undoubtedly be sufficient to reduce even the present abnormally swollen mass of bank cash to manageable proportions.

The credit structure undoubtedly *can* be controlled; whether it *will* be controlled is, however, an entirely different matter. There seem to be two main reasons for believing that the weapons of deflation will not be drawn out of the armoury. The first is the state of the Budget and of the National Debt, both of which will be discussed in a later chapter of this survey. But so long as the Treasury is under the necessity of making frequent issues to finance the deficit or to fund the Debt, it will not look kindly on credit deflation, which, if it were at all effective, would very seriously affect the bond market. The second reason is to be found partly in the historical reflection that deflation at the proper time has always in the past been politically impossible, and partly in the philosophy of those in control of the Federal Reserve system, which is pro-

nouncedly expansionary. The conclusion may be hazarded that these factors will be sufficient to delay restrictive action, if it should become necessary, until long after the psychological moment. If, when that time comes, the Federal Budget is still in deficit, it is hard to see how a really effective restriction could be imposed even if the Board so desired.

THE EFFECTS OF CHEAP MONEY

We must now return to the member banks. Until March, 1933, they were on the defensive, fighting a desperate rearguard action against deflation and panic. Since 1933, their fear of insolvency has been largely removed, and they have had an ever-increasing volume of cash reserves placed at their disposal. It is safe to say that the theory of recovery by credit creation has nowhere else during the last three years. In that period, member bank reserves have been increased from \$2,160 millions (end of June, 1933) to \$5,633 millions (end of June, 1936). If the base of the credit pyramid has been expanded, what has happened to the upper layers and to the stream of money coming on to the market?

The effects of the policy of credit creation are shown, in broad outline, in the next diagram, which is drawn on a

logarithmic scale, so that equal proportionate changes are shown equally:—

The total amount of deposits in member banks has increased quite substantially, though by no means in the same proportion as reserves. The policy has thus undoubtedly succeeded in increasing the available volume of purchasing power. The method by which this additional purchasing power has been brought into existence, however,

has not been in accordance with theoretical expectation. The availability of greatly increased cash reserves has stimulated hardly any noticeable increase in loans to, or investments in, industry and commerce (shown on the diagram by the line "Other Loans and Securities"). The increase in deposits, in so far as it is not the direct reflection of the increased reserves themselves, is almost entirely due to the increased holdings of Government securities. This can be shown by the following figures of changes in the chief balance-sheet items of the member banks during the three years June, 1933, to March, 1936:—

	(\$ millions)
Deposits	+ 9,053
Government securities	+ 5,557
All other loans and securities	— 55
Reserves	+ 3,549

It is possible that the member banks would have increased their holdings of Government securities even if there had been no Budget deficit, just as the English banks have done. But the analogy between Great Britain and America is not just. American banks do not adhere so rigidly as the English banks to a reserve proportion which is both minimum and maximum. The minimum is specified by law, but they are content to allow large amounts of excess reserves to accumulate. Secondly, the available supply of Government securities, before the deficits of recent years, was very much smaller, relatively to the size of the banking system, than in Great Britain. Without a constant flow of new issues to finance the deficit, it is doubtful whether the banks could have purchased nearly as many securities as they in fact did buy. In the event, as is notorious, the financing of the deficit has been largely arranged to meet the convenience of the banks, as regards both the timing of the issues and the nature of the securities issued. We are justified in concluding that without the deficit there would have been no substantial increase in the banks' investment portfolio and, consequently, no considerable increase in the total of deposits.

The theory of credit creation has still a third link.

Guaranty Trust Company of New York

Incorporated with limited liability in the State of New York, U.S.A.

AN international bank handling every phase of modern banking business, and by means of its offices in the United States and the principal cities of Europe, offering unusually complete services and facilities to firms developing foreign trade.

The Bank issues each month a survey of business and economic conditions in the United States and various parts of the world.

A copy of the current issue of the "Guaranty Survey" will be sent post free on request.

Increased reserves having led to increased deposits, the final stage is that increased deposits lead to increased spending. Here the actual results have been more in accordance with theoretical expectation. The flow of expenditure has increased in, roughly, the same proportions as the total of deposits. It is a little disappointing, nevertheless, that it has not risen any faster than deposits. Recovery from a depression would normally be accompanied by some revival in the activity of bank deposits, especially when, as in the United States, the fall in the volume of expenditure had been proportionately much greater than the fall in the total of deposits. The proportionate movements of bank reserves, bank deposits and cheque payments are shown in the following table, which gives quarterly index numbers (second quarter of 1933 = 100) of the reserves and deposits of member banks and of the total of bank debits. The reserve and deposit figures refer to member banks all over the country and the debit figures to 140 cities (excluding New York), but in spite of this discrepancy the proportionate changes can be regarded as comparable:—

	Reserves	Deposits	Debits
1933—2nd quarter.....	100	100	100
3rd "	118	102	114
4th "	120	104	106
1934—1st "	141	107	116
2nd "	171	116	125
3rd "	178	122	119
4th "	183	124	117
1935—1st "	203	126	128
2nd "	221	136	136
3rd "	254	142	142
4th "	249	143	145
1936—1st "	259	146	148
2nd "	251	154	150

In view of these facts, what are we to conclude about the efficacy of credit creation as a means of attaining recovery? All conclusions must necessarily be tentative, but it seems to be clear that the effects have been smaller and slower in appearing than was claimed by the advocates of the theory. It seems to require a very great expansion of the base of the structure, continued for a considerable time, before the appearance of an adequate rise in the stream of money, which alone can affect the size of individual incomes.

Secondly, we have found reason for believing that, in the United States at least, it was the deficit rather than the creation of excess reserves which expanded the total of bank

deposits. Additional reserves would be needed, it is true, before deposits could be expanded at all, but the additional reserves required for this purpose would be vastly smaller than those actually created. In so far as deficit financing expanded the stream of purchasing power, the palm must go to a rival theory, that of public expenditure (which is discussed below in the section on "Public Finance"), rather than to the theory of credit creation.

It may, however, be pleaded in defence that the cheap money policy succeeded in lowering interest rates. It is undoubtedly true that interest rates have fallen substantially. The yield on U.S. Government bonds, for example, which was 3.65 per cent. in the second quarter of 1929, and 3.30 per cent. in the first quarter of 1933, had fallen to 2.50 per cent. in the second quarter of 1936. The yield of highest-grade industrial bonds was 4.72 per cent., 4.53 per cent., and 3.55 per cent. respectively at these three dates. Even the rates charged by banks to their customers in twenty-seven Southern and Western cities have fallen from 6.11 per cent. and 5.61 per cent. to 4.39 per cent. The effect of lower interest rates cannot be overlooked; it has undoubtedly been one of the most potent causes of recovery. But there would have been some fall in any case—as is shown by the reductions between 1929 and 1933, a period of growing stringency of credit—and it may be doubted whether more than a relatively moderate expansion of credit (as, for example, in Great Britain) was needed to bring about the full benefits of lower interest rates.

It may also be urged that the United States in 1933 presented the worst possible case for an experiment in credit creation. Banks which have only escaped insolvency by the proclamation of a "holiday" are not likely to prove particularly susceptible to expansionary stimuli. But if the American banking system was a poor subject for the experiment, it is also true that the experiment was carried to quite unprecedented lengths. If it has succeeded, it may have done so only at the cost of storing up financial dynamite for the future.

It is perhaps permissible to conclude that, in the peculiar circumstances of the United States, the theory of credit creation and cheap money has hardly performed all that was expected of it by its advocates. It has undoubtedly stimulated some expansion, but it would seem doubtful whether more than a portion of the recovery of the last few years can be ascribed to it.

THE BUDGET

A BUDGET, in American parlance, is something rather different from its British counterpart. There is no person or body in the United States charged both with a comprehensive oversight of the whole of the national finances and also with the power to formulate and execute any plan for dealing with them. In these circumstances the result of a year's working is completely at the mercy of the whims both of Congress and the trade cycle. Balancing the Budget, in the precise sense in which it is understood in Great Britain, is quite unknown. The surplus or deficit on the Budget has been less than \$100 millions in only one year since 1916.

These considerations should be borne in mind in studying the following summary figures for the last seven completed financial years (which end on June 30th):—

UNITED STATES BUDGET, 1929-36
(\$ Millions)

	Receipts	Expenditure				Deficit (less Debt Retirement)
		Ordinary	Recovery and Relief	Debt Retire- ment	Total	
1929-1930.....	4,178	3,440	---	554	3,994	738*
1930-1931.....	3,317	3,780	---	440	4,220	462
1931-1932.....	2,121	3,826	768	413	5,007	2,473
1932-1933.....	2,080	3,405	1,277	461	5,143	2,602
1933-1934.....	3,116	2,741	4,044	360	7,105	3,630
1934-1935.....	3,800	3,145	3,657	574	7,376	3,002
1935-1936.....	4,116	5,186	3,291	403	8,880	4,361

* Surplus

The most striking fact to be derived from this table is the extraordinary variability in revenue. This is very largely

due to the provision of the income tax law which taxes capital profits and allows capital losses to be deducted from income. But it must also be remembered that the estimated national income fell to half its peak figure, which would naturally affect the yield of taxation, irrespective of the method of assessment. The largest fall, as might be expected, was in the income tax, which yielded \$2,411 millions in 1929-30 and only \$746 millions in 1932-33. The second fact that emerges is the comparative stability of the ordinary expenses of the Government. The large increase in the last year is due to the payment of the "veterans' bonus." When this is allowed for, the only substantial variation is in 1933-34, which shows the temporary effect of the Economy Act. The deficits have therefore been entirely due to shortfall of revenue and to expenditures for relief and recovery.

It should be noticed that the deficits are not entirely a creation of the Roosevelt Administration. On the contrary, Mr Hoover's last two years showed a combined deficit of \$5,075 millions. The unbalanced Budget was hardly welcome to Mr Hoover. Indeed, in his last year he attempted, vainly, to reduce it by economies and salary reductions. But his dislike of unbalanced Budgets did not go so far as to lead him to advocate an increase of taxation. He may therefore be said to have had a negative belief in the virtues of unbalanced Budgets in time of depression.

During his election campaign, Mr Roosevelt criticised severely the unbalanced Budget which Mr Hoover permitted, and one of his first moves in office was to cut down expenditures by further economies. For some time there

was an attempt to maintain that there was economic merit both in curtailing ordinary and in expanding extraordinary expenditures, but it proved too great a strain on logic and consistency. Mr Roosevelt's second mood was one of glorying in the deficit and even of attempting to increase it; this was the mood of the Budget Message of January, 1934. It soon became apparent, however, that extravagance on a monumental scale was not a popular policy and from that time onwards gestures have been made towards a balanced Budget. If the deficit in the last completed year was the largest of the series, the President could with justice claim that it had been forced upon him by the action of the Supreme Court in invalidating the processing taxes and by the action of Congress in passing, over his veto, the immediate payment of the "veterans' bonus." Both last year and this, taxes have been raised, but it is more than probable that the bulk of the increased revenues should properly be ascribed to returning prosperity rather than to these increases. Indeed, the impression has been given that the increases were proposed in order to advance theories which had little to do with the Budget (such as "soaking the rich" or preventing large corporations from extending their sway) rather than to collect revenue.

The continuance of such large deficits inevitably gives rise to two questions. How much has deficit financing contributed to recovery? Does the continuance of deficits threaten the soundness of the national finances? It may be pointed out, before these questions are discussed, that the last column of the table above is not an accurate guide to the movements of the National Debt. In the first place, \$4,718 millions of securities have been issued with the guarantee of the United States and these are at least contingently part of the Debt, although they do not enter into the Budget. But secondly, assets have been acquired against the National Debt in the form of claims on local authorities, corporations and individuals. On May 31, 1936, the Government's estimated net equity in the assets of the various New Deal agencies was \$4,295 millions (in addition to assets held against the contingent liabilities), compared with a gross National Debt of \$33,779 millions. And thirdly, the cash balance in the Treasury has been swollen by, among other things, the profit on the revaluation of the dollar.

The net Debt of the United States, after including the contingent liabilities, but deducting the assets and the Treasury balance, was in the neighbourhood of \$26,250 millions on June 30th last. This is roughly equivalent to £5,250 millions, and the British National Debt, calculated on roughly the same principles, was £7,490 millions on March 31st last. In view of the very much greater wealth of the United States, the burden would not seem to be disproportionately heavy. In relation to "normal" National Income (if that concept could be defined and calculated) the American debt is only about a quarter or a fifth of the British. This calculation is not seriously disturbed by a consideration of the debts of governmental units other than the national Treasury, which amount to about \$19,000 millions, or £3,800 millions. The total *per capita* debt of the United States and subsidiary units is about \$360, or £72, compared with a *per capita* burden of £166 for the British National Debt alone. The conclusion may be hazarded that a further increase in the American debt, though doubtless unwelcome, will not impose an intolerable burden on the taxpayer. Nor does there seem to be any risk of the Treasury's having to pay an excessive rate for accommodation. Reference to the rates of yield on Government bonds quoted on page 16 will show that the Treasury's credit has risen in proportion to the deficit.

The methods of financing the deficit are, perhaps, more fertile ground for alarm than its gross amount. The following table shows how the different forms of obligation have varied in recent years:—

	(\$ Millions)		
	June 30, 1932	June 30, 1933	June 30, 1936
Bonds	14,250	14,223	18,628
Notes	1,465	4,780	11,861
Certificates and Bills	3,447	3,154	2,500
Non-interest bearing	326	381	790
Total	19,488	22,538	33,779

It will be noticed that the greatest increase is in the comparatively short-dated securities. On June 30th last, of the total of interest-bearing debt, 12.6 per cent. was due in less than a year, 21.0 per cent. in less than 2½ years, 44.1 per cent. in less than 5½ years and 55.7 per cent. in less than 10½ years. Even after the Budget has been balanced, the necessity for constant conversion will impose a severe task upon the Treasury. As has been remarked on a previous page, this fact has an important bearing upon the prospect of adequate credit control being exercised.

The contribution of the deficit to recovery is not easy to assess. As was indicated in the article on Banking (page 15), the issue of a steady stream of new Government securities has been an essential part of the mechanism by which credit has expanded. Furthermore, it stands to reason that the creation of substantial amounts of new money (for that is what it has amounted to) and its disbursement to individuals has increased the total national income by more than the amount of the original disbursements. This could only *not* be so if the recipients of Government expenditure failed in their turn to spend it. Since these recipients were mainly destitute persons, the money was obviously handed on at least once after its receipt by them. Exactly how great this cumulative effect has been it is, unfortunately, very difficult to say.

Attention may, however, be called to a calculation which has been made by Professors Cohn and Lehmann of the New School for Social Research.* These authors have divided the deficit under three heads. The first they call the "maintenance deficit." This is the deficit which arises out of the decline in revenue and not out of increasing expenditures. The failure to increase taxes means that the national income is not further depressed, but it has no positive stimulating effect. Second are "liquidating expenditures," i.e. those expenditures which are used merely to repay debts, such as refinancing activities, etc. These also are presumed to have no stimulating effect.

Only the remainder of the deficit, the "stimulating expenditures," are taken into account. In calculating the effects of these "stimulating expenditures" the authors make two quite arbitrary but not inherently unreasonable assumptions. The first is that money thus spent by the Government reappears as income in its further course every two months (i.e. that the income-velocity of circulation is 6 per annum). The second is that at each reappearance there is a "leakage" of 50 per cent., in other words, that the "multiplier" is 2. The sum of the primary and secondary effects of the "stimulating expenditures" of the deficit, calculated in this way, is shown (in millions of dollars per two-monthly period) in the accompanying diagram.

The other curve in the diagram represents the excess of the national income over the minimum rate of \$3,500 millions per month recorded in the spring of 1933. The figures used

* Published in "Social Research," May, 1936.

in drawing this curve are those of the Cleveland Trust Company, which distributes the official estimates of annual national income over the different months.

This comparison must not be burdened with greater weight than it can bear. The one curve depends entirely upon certain arbitrary assumptions. The other depends as completely upon estimates of the national income which are necessarily approximate. But the diagram does supply a certain measure of experimental verification of the judgment which could be given by general observation—namely, that Government expenditures were almost the sole support of recovery in the long hesitant period of 1934, but that early in 1935 the pump was successfully primed and recovery began to make independent headway. Even this conclusion, however, does not enable us to assume that the "spontaneous" recovery of 1935 was the result of the deficit. The statistics provide no answer to the argument that this spontaneous recovery would have come

earlier and in greater force if it had not been for the disturbing effect on business confidence of the mounting deficit. It can only be said that the course of bond prices and other phenomena during 1934 gave no warrant for the belief that anxiety over the deficit was any greater than it was in 1935.

It would be prudent and, perhaps, on balance, judicious to conclude that the deficit expenditures neither delayed "spontaneous" recovery nor created it. But they nevertheless filled the gap until spontaneous recovery appeared. On the assumptions set out above, the deficit added almost \$7,000 millions in the financial year 1934-35 to a national income which without it would only have been some \$44,000 millions. The proportion of about 16 per cent. may be considered small, but in an economy where the margin is of paramount importance an addition of 16 per cent. to the national income may well be considered worth the addition of \$3,000 millions to the national debt.

THE DOLLAR

THE gold standard was one principle with which President Hoover never admitted the slightest compromise. Throughout the four years of his Presidency gold was freely bought and sold at the standard price of \$20.67 an ounce. There was never any hint, even in the darkest days of 1932, that the free convertibility of the dollar into gold would be suspended. Indeed, Mr Hoover constantly referred to such a suspension as a calamity which should be avoided at all costs, and he took steps, in the Glass-Steagall Act of 1932, to free more of the Federal Reserve's gold for export.

Mr Roosevelt's attitude, before his election and during his first weeks of office, was the same. The Democratic Party platform of 1932 was uncompromising on "hard money," and Mr Roosevelt's declarations in the early days of the banking crisis of March, 1933, seemed to show a determination to adhere to this policy. But on April 19th the policy was bluntly reversed and the export of gold prohibited. Not only was the dollar thus permitted to depreciate, it was encouraged to fall, and for several months official and unofficial opinion considered the prospects of recovery to be bound up with the decline of the dollar.

So many misconceptions have arisen about the depreciation of the dollar that it is advisable to recite some of the relevant facts. The American balance of payments was favourable to the United States on current account both in 1932 and in 1933, while the combined net outflow of capital in the two years together was less than 12 per cent. of the monetary gold stock of the country at the beginning of 1932. Moreover, most of the outflow of capital in 1933 was the consequence, rather than the cause, of the depreciation. There can be no question of any external compulsion having forced the fall of the dollar.

This is generally admitted even by the Administration's defenders, but they allege that the depreciation was nevertheless forced upon the country by internal factors. It is true that throughout 1932 there had been a growing volume of hoarding of currency and even of gold. But this had stopped before April, 1933. The total of currency in circulation was falling very rapidly in the weeks between the reopening of the banks and the suspension of gold exports. The monetary gold stock was rising steadily week by week and the deposits of the reporting member banks were increasing. There was every sign to indicate that the internal run on the currency, and *a fortiori* the internal run on gold, was at an end.

Those who argue that the depreciation was compulsory take their stand, however, on a different ground. They maintain that, in spite of the technical possibility of maintaining the free convertibility of the dollar into gold, depreciation would sooner or later have been inevitable, because so long as the United States stayed on the gold standard so long would the American economy be subject to the paralysing deflation which had just wrecked the banking system. The argument is not one that can ever be decided. But it is probably the conclusion of most observers outside America, and of many Americans, that it was fully possible

for the United States to have remained on the gold standard in 1933 and thereafter without preventing recovery. If this view is correct, the departure from the gold standard was in no sense forced; it was a purely voluntary act. This does not mean to say, of course, that the depreciation produced no benefits for America, or, indeed, for other countries. It is almost certain that "recovery on gold" would not have been as rapid as "recovery off gold." There were, however, certain disadvantages. The American Government had to break its contracts in order to carry through the depreciation, and the judgment of the Supreme Court in the "gold clause" cases stigmatised it as a defaulter, though effectively blocking the way to any private individual seeking redress. There were also disadvantages to the gold bloc countries, although it can be argued that they could have escaped these disadvantages if it had not been for their own stubborn clinging to their existing gold parities. There is also the question of the ultimate morality of such depreciations. The definition of currency honesty is no longer so rigidly drawn as to exclude all readjustments of currencies. But when a rich country, with a strong currency, voluntarily devalues by a very large percentage solely in order to facilitate its internal economic policy, it might be considered a very dangerous precedent and an incitement to the insanity of competitive depreciation.

The advantageous results that have flowed from the depreciation must, therefore, not be allowed to exclude entirely from consideration its more disturbing aspects. Before we can attempt to assess the balance of good and evil, however, we must see what benefits can properly be ascribed to the American currency policy.

The dollar was encouraged to depreciate throughout the summer and autumn of 1933. At first this was done merely by pronouncements of policy, the most famous of these being the celebrated telegram to the World Economic Conference, which bade the assembled statesmen of the world turn their attention to more important matters than currency stabilisation. In the last quarter of the year, however, depreciation was secured by the curious device of buying gold at steadily rising prices. Towards the end of the year it was apparently considered that a low enough level had been reached, and at the end of January, 1934, the dollar was restabilised at a fraction above 59 per cent. of its previous gold parity. The President retained the power to devalue further to 50 per cent. of the old parity, but this power has not been used. The United States is not allowed freely to exchange dollars for gold. But the currency has been kept close to its new gold parity, and gold transactions with the central banks of countries on the gold standard have been undertaken when necessary.

The first place to look for effects of the depreciation is in the movement of prices. The relevant facts are presented in the accompanying chart, in which an index of the dollar price of gold (the reciprocal of the depreciation of the

dollar) is compared with four price indices, all five being based, for the sake of convenience, on March, 1933:—

EFFECT OF DEPRECIATION ON PRICES
(March, 1933=100)

The juxtaposition of series of figures in this way has the disadvantage that it excludes all other factors from consideration. In the case of this chart, however, it is immediately apparent that it proves too much. The depreciation of the currency could not possibly have induced such a large rise in farm prices. Moreover, there is little temporal coincidence. Farm prices were falling during part of the period of most rapid currency depreciation, and they accomplished the greater part of their rise after the dollar had been restabilised. The drought of 1934, coupled with the crop limitation projects of the Administration, have undoubtedly done more to raise farm prices than the fall of the dollar, though it should not be denied its share in the merit for the combined result. The raw materials curve behaves very approximately as a price curve should if the theories which inspired the gold-buying programme were correct. But a close inspection of the whole chart, and particularly of the relations between the month-to-month movements of the different curves, suggests that the position of this curve is due more to the "attraction" of the farm price curve working against the "drag" of the more stable industrial indices than to the depreciation of the currency. As for the two remaining curves, when allowance has been made for the effects of expanding credit, reviving employment, public works and deficit financing, the influence of a falling dollar appears to have been slight.

The movement of the price curves in relation to the exchange curve would tend to suggest that the exchange value of the dollar which has prevailed since the beginning of 1934 is not yet in equilibrium with prices—in other words, that the dollar is still undervalued. This depends, however, on the movement of prices in other countries. In the chart in the next column an attempt is made to compute "equilibrium rates of exchange" between the dollar and the pound. In each case the assumption has been made that the two currencies would have been in equilibrium in 1929 if the value of the pound had been lower by 10 per cent. than the old pre-war parity adopted in 1925. Equilibrium rates have then been calculated by adjusting this basic rate of \$4.38 by the relative movement of prices in the two countries. The wholesale price indices of the Bureau of Labour Statistics and of the Board of Trade have been compared to give one curve, and the indices of wage rates calculated

by the National Industrial Conference Board and by Professor Bowley to give the other. The limitations, theoretical and practical, of this type of calculation have been frequently pointed out in the *Economist*, and the curves cannot be regarded as doing more than indicate the probable range within which the true equilibrium rate lies:—

DOLLAR-STERLING EQUILIBRIUM RATES
(In \$ per £)

It will be observed that the dollar appears to have been close to an equilibrium with the pound at the end of 1934 and throughout most of 1935, but that, both before and since, it has been undervalued.

The positive effects of depreciation thus appear to have been very considerably less than was expected by the authors of the policy. The connection between the exchange rates and the level of prices is evidently neither exact nor immediate. There have been, however, certain indirect benefits from depreciation. Without it money could not have been quite so cheap nor credit quite so plentiful, although they could undoubtedly have been made considerably cheaper and more plentiful than they were in March, 1933. It is possible, too, that the initial announcement of the policy of depreciation had a considerable effect in imparting impetus to the recovery, though it is doubtful how far the impetus was given by the depreciation or by the prospect of inflation, which is not quite the same thing. It is noteworthy that in the autumn of 1933 depreciation without inflation had almost no stimulating effect at all.

There are very few departments of the Administration's economic policy on which it is harder to pronounce a final judgment than this. On the one hand, there was a patent breach of contract without any excuse of *force majeure*, and a considerable amount of economic damage inflicted on foreign countries. On the other hand, there was a certain amount of economic benefit to the United States in stimulating recovery, though the guess may be hazarded that the stimulus was smaller than is sometimes claimed. The balance may be struck by attempting to imagine how much of the recovery programme would have been possible without depreciation. The strong probability is that there would have been some recovery, but that it would have been somewhat slower and more timid. And it may very well be that the other nations of the world, taking them as a whole, have gained rather more from the greater *élan* of America's recovery than they have lost from the undoubted currency aggression with which it began. The end seems to outweigh the means. Whether the means are also justified by the end they served is too difficult a question of economic ethics to be settled here.

FOREIGN TRADE

THE two tables* at the foot of the page tell the story of American foreign trade in the depression. The left-hand table gives the dollar values of exports and imports, classified both as to geographical distribution and also as to nature of trade. In this table each set of figures has also been calculated as an index number, the figure for 1933 being taken as 100. In the right-hand table figures are presented for the chief individual items of trade, giving quantity figures whenever possible; and also a series of indices of the volume of trade.

The declines revealed by these figures are astonishing, particularly when it is recalled that the volume of world trade, as a whole, never fell below 74½ per cent. of its 1929 amount. It is clear at a glance that the foreign trade of the United States has been peculiarly susceptible to the effects of depression. In large part, this is due precisely to the fact that for America foreign trade is marginal. Some of her products are absolutely dependent upon the export market; and some raw materials she can only get from abroad. But neither is typical; for the most part foreign trade is not vital to the existence of the American economy, though it may very well be essential for its profitability.

American imports consist predominantly of industrial raw materials and of two foodstuffs, coffee and sugar. With industry in headlong retreat, and the consumption of the people seriously restricted, it was only natural that imports of these goods should fall off very sharply. The smallest declines are those of the categories which include coffee, sugar and newsprint, all three of them virtually articles of popular consumption, but even here the declines from 1929 to 1933 (which was not the worst year) are very large in value and quite considerable (save for coffee) in volume. In the geographical distribution of imports, however, it is interesting to notice that Europe shows the smallest decline.

American exports consist, in the main, of agricultural and mineral products on the one hand and of highly-finished manufacturing products on the other. Both categories have suffered very severely. Manufactures lost through the disappearance of foreign demand for motor-

cars, typewriters, machine tools, etc. Agricultural products lost through the decline in foreign demand, through the fall in prices and, also, at a later stage of the depression, through the short supply of crops in drought-ridden America. The combination of these factors was sufficient to bring about a greater decline, both by volume and by value, in American exports than in imports.

Compared with the low level to which American foreign trade had fallen, the recovery has been rapid. Compared with the level existing before the depression, it is less impressive. In one respect, there has been no recovery at all. This is in the volume of exports of agricultural produce. Cotton, which is the largest item, held up better in volume during the earlier years of the depression, and has also lost ground rather more slowly since 1932. But the total of agricultural exports in 1935 was only 65 per cent. of the 1932 volume and 57 per cent. of the 1929 volume. For all products except cotton, the figures are 58 per cent. and 33½ per cent. respectively. To what extent these declines can be blamed on Man and Nature, and how far they are permanent, are questions which are more appropriately discussed in the chapter on Agriculture.

In other categories, however, there has been a substantial recovery in trade. Imports have increased by more than a third in volume, and by more than a half in value, since 1932, the recovery being entirely due to the revival in the demand of American industry for raw materials and in the consuming power of the American public. The export totals are unduly depressed by the decline in agricultural exports, but even so, there has been an increase of nearly 14 per cent. by volume and of over 40 per cent. by value. Exports of semi-manufactures and of finished manufactures were 64 per cent. higher by value. Even in these categories, however, the 1935 figure was only 48 per cent. of the average for the years 1926-30.

Foreign trade thus presents the same general picture (if the special case of agricultural exports be excluded) as American business in general, a precipitous decline between 1929 and 1932, and a substantial but far from complete recovery between 1933 and the present. It remains to inquire how far the recovery can be attributed to the conscious planning of the Roosevelt Administration. Most of it has been the by-product of general recovery, and the answer to this specific question must to that extent wait upon the answer to the more general question of the responsibility of the New Deal for recovery as a whole. The

UNITED STATES FOREIGN TRADE*

New Deal has, however, included a specific policy for stimulating foreign trade, and to this we must now turn.

TRADE AGREEMENTS

The Democratic Party is, by long tradition, the low-tariff party, and the last Democratic President before Franklin Roosevelt, Woodrow Wilson, was also the last President to accomplish a reduction in the American tariff. The times were not propitious in 1933 for an all-round reduction of the tariff on the lines of the Underwood Act of 1913, but Mr Roosevelt, in earnest of his good intentions, appointed as his Secretary of State one of the most consistent and persistent low-tariff advocates in the country, Senator Cordell Hull. Unfortunately, the policies of some other members of the Administration, notably those responsible for the N.R.A. and the A.A.A., involved higher tariffs to protect their experiments in wage and price raising. But Secretary Hull has also been allowed to pursue his patient course. His method has been by the negotiation of bilateral trade agreements with one country after another. Provided that no tariff duty is reduced by more than 50 per cent., these agreements are exempt from the necessity of running the gauntlet of Senatorial approval. So far, thirteen of these agreements have been concluded, the most important being those with Canada, Cuba, Belgium, France, the Netherlands (and Netherlands Indies), Brazil, Sweden and Colombia. It is a condition of the Act under which the agreements are negotiated that concessions shall be reciprocal, and it has also been the uniform practice of the United States to generalise its concessions to all countries enjoying the benefit of the most-favoured-nation clause.

No praise can be too high for the spirit that has animated this policy. In this tariff-ridden world the sight of any nation deliberately seeking to lower its tariffs is both rare and refreshing, and not less so when the nation concerned has for many years been one of the world's most hardened tariff sinners. The countries with which these agreements have been concluded account for nearly a third of America's exports and well over a third of her imports. The agreements do not affect the whole of the trade between the countries concluding them, but even so a substantial fraction of the foreign trade of the country is benefited in greater or less degree. Moreover, the generalisation of the concessions extends the benefits, such as they may be, to third parties. It is fully possible, for example, that Great Britain has already gained more from the concessions given by the United States in her treaties with other countries than could be obtained in a direct Anglo-American treaty. British trade has gained in particular from the concessions on whisky in the Canadian agreement, on linen in the Belgian, on special steels in the Swedish and on lace and similar goods in the French agreement.

While praising without reserve the principle embodied in these agreements, and the spirit inspiring their negotiation, it is permissible to express a certain scepticism about the quantitative degree of the results achieved. In the first place, many of the countries with which agreements have

been concluded sell more to the United States than they buy. This is true of Cuba, Belgium, the Netherlands and Netherlands Indies regarded as a unit, Brazil, Sweden, Colombia, Switzerland and Honduras, or eight out of the first ten agreements concluded. It is clearly in the interests of these countries to conclude agreements with the United States. But negotiations are proceeding, and inevitably must proceed, much more slowly with countries who buy more than they sell, and these latter are much more typical of the normal state of American trade.

Secondly, there is very little sign that the agreements have brought very large quantitative benefits. Benefits, as has been explained, are shared by all countries, but it would be remarkable if the proportionate benefit to a non-signatory were actually as great as to a signatory. Other glass producers will benefit from the concession made to Belgium, but the item was picked to be of special benefit to Belgium. Nevertheless, the following figures show no tendency for trade with the signatory countries to outstrip trade with other countries. The first five months of the last three years have been compared; none of the ten agreements selected was in force in 1933 or 1934 and all were in force for part at least of the first five months of 1936:—

		Ten countries with agreements	All other countries
Imports: 1933.....	(\$ million)	235.9	491.8
1934.....	(\$ million)	295.8	541.9
Change	%	+25	+10
1935.....	(\$ million)	349.4	623.4
Change	%	+18	+15
Exports: 1933.....	(\$ million)	233.3	632.2
1934.....	(\$ million)	248.8	605.1
Change	%	+7	-4
1935.....	(\$ million)	280.6	688.6
Change	%	+13	+14

It will be noticed that trade with these ten countries was increasing more rapidly than trade with other countries in the year *before* the agreements came into force. But in the last year, with the agreements in force, the difference between the two categories has been narrowed, and in the case of American exports trade with other countries has actually increased faster than with the ten countries. These figures suggest either that the concessions made have benefited third parties more than the signatories (more proportionately to total trade, not merely absolutely more), which is absurd, or else that the concessions made on either side have been too small to have any perceptible effect on the total of trade.

The agreements have not lacked critics in the United States. The platform adopted by the Republican Party at Cleveland calls for the repeal of the Trade Agreements Act of 1934. It does not specifically promise the abrogation of the agreements already concluded, but if the Republicans win the election it is not impossible that this will be their fate. Indeed, there are Republican voices crying in what may turn out to be less of a wilderness than it now appears for a general increase in the tariff on the lines laid down by Mr Hawley and Senator Smoot in 1930. Even if Mr Roosevelt is re-elected, it is doubtful whether any considerable further advance will prove to be possible.

SECURITY MARKETS

THE insistent demand for a change which swept Mr Roosevelt into office four years ago related to Reform as much as to Recovery. The most fervent desire of the American people was for work and wages, and the primary task of the incoming Administration was undoubtedly to hasten recovery. But there was also a nation-wide spirit of anger which clamoured for reform of the abuses of the system which had permitted the depression to happen. Those abuses centred in the securities exchanges of the country. It is true that the sternest disfavour was reserved for the bankers, but the link between the banks and the Stock Exchange is a close one in the United States, and it was for his misdeeds in the stock market far more than for his mistakes in the field of commercial

banking that the name of banker was made a byword. It may be urged that the public, in large part, had only itself to blame. It had yielded to the temptation of speculation, had "plunged" on a gigantic scale, had proved itself only too ready to listen to the siren songs of the chart-readers and the economic prophets. All that is true, but it did not lessen the anger of the many thousands who had lost their life savings in the market to see the market professionals still, to all appearance, wealthy or to hear them blandly confess before the Congressional investigating committees to practices which far outstepped the limits of ethics, even if they remained within the somewhat more obliging boundaries of the law.

There were, indeed, very grave abuses in the security

markets in the years before the depression. There was, first of all, the close connection between the banks and speculation. The banks not only invested their own funds in securities, they not only poured money into the markets for the use of speculators, but, through their "security affiliates," they took the lead in peddling securities, often of doubtful merits, up and down the country. Secondly, there was far more profit being made by "those in the know" at the expense of the innocent investor than could be reconciled with a healthy state of the markets. And thirdly, all forms and varieties of rigging the market were rampant. In addition to the insistent clamour that arose after the crash for the reform of these abuses and the punishment of the guilty, the belief was also widespread that the depression had been caused by excessive security speculation, and that prevention of speculation would prevent future depressions.

For all these reasons, reform of the security markets was placed in the forefront of the new Administration's programme in 1933. No department of its programme has been more persistently pursued or more generally supported. The enactments bearing on the subject are several and their methods various, but for convenience of discussion the remedies adopted can be considered as falling under three heads: the relations of the banks to the security markets; the regulation of new issues; and the control of exchanges.

THE BANKS AND THE MARKETS

The Banking Act of 1933 imposed upon the banks a complete divorce from their security affiliates. Every financial institution which had hitherto been doing a combined banking and investment business had to choose one of the two and abandon the other. There is a great deal to be said in theory for a connecting link between the banking system of a country and the system by which capital is invested in industry. Historically it can be established beyond much question that the American banks were almost forced into the security business by the declining use being made by industry of banking accommodation, by the terrific demand from industry for capital and from the public for investments, and, finally, by the absence of a sufficient number of other financial institutions to serve the needs of the new issue market. There is thus quite a weighty academic case to be made out for security affiliates. But the abuses which had crept in during the later years of the boom swept away all these arguments. If security affiliates behaved as only too many of them did behave in these years, then it was both inevitable and proper that they should be suppressed. The effect on the market of their disappearance was regarded with apprehension in some quarters. It is true that if a very large demand for the services of the new issues market had arisen immediately after the Banking Act of 1933 was passed, the machinery of the market, stripped of its most important members, would have been unable to cope with it. It may still prove that the market is too narrow or too inadequately supplied with capital to deal with a period of real activity, but in the intervening years several new agencies for the origination of securities have been able to develop.

Congress has imposed further limitations on the use of banking funds in financing speculation. The most important of these provisions is that giving the Board of Governors of the Federal Reserve system the power to specify a minimum cash margin which must be put down for every security transaction. At present this margin is fixed at 55 per cent., i.e. no investor or speculator can borrow more than \$45 for every \$55 of his own money that he puts down. In boom days, margins of as little as 20 per cent. or even 10 per cent. were common, and it is clear that this new rule very considerably increases the ability of the banking authorities to control a speculative movement. It has also had the effect of narrowing the market, especially since accounts in which a fall in the value of securities brings the margin below 55 per cent. are "restricted." The result seems to be to accentuate the movements of prices. In particular, sharp falls in the market appear to be more frequent than formerly.

NEW ISSUES

The new issue market is regulated (apart from the exclusion from it of the banks) by the Securities Act of 1933. The regulation of new issues had previously been very complaisant, and practices had been of everyday occurrence which would certainly have led in England to proceedings under the Companies Acts. The Act of 1933 imposed upon an almost completely *laissez-faire* market a strait-jacket of very rigorous regulation. The immediate shock was naturally considerable. The Act calls for the disclosure in prospectuses of a great mass of information, relevant and, frequently, irrelevant. Directors are made liable not only for misstatements, but also for the omission of material facts. But the new American Company Law does not rely, like its English prototype, purely upon the compulsory disclosure of information, with the negative sanction of a possible prosecution. A regulatory body, the Securities and Exchange Commission, is set up,* whose positive assent is required before an issue can be made.

When these provisions were first imposed, they were universally condemned in Wall Street as unworkable. The S.E.C. is charged with much detailed amplification of the Act's general principles, and its first set of regulations certainly seemed to add to the complications. Since 1933, however, the position has considerably improved. The S.E.C. has shown a very accommodating spirit in modifying its regulations and in reducing the bulk of prospectuses to manageable size. On the other hand, directors have recovered from their first fright and have begun to shoulder cheerfully the responsibility for the truth of their statements.

The volume of new issues is shown in the following table (the figures are those of the *Commercial and Financial Chronicle*):—

	New Issues (\$ millions)			
	Foreign	Municipal, State and Federal agencies*	All others	Total
1928	1,574	1,485	6,933	9,992
1929	780	1,436	9,377	11,592
1930	1,136	1,584	4,957	7,677
1931	286	1,476	2,253	4,016
1932	60	1,004	650	1,714
1933	67	605	375	1,047
1934	62	1,646	489	2,197
1935	116	2,362	2,253	4,731
1935—1st six months.	0	1,444	1,870	3,314
1936—1st six months.	111	855	2,679	3,645

*Excluding direct obligations of the U.S. Government.

It will be seen that though there has been a substantial recovery, the volume of new issues is still a long way below that of the years preceding the depression. The effect of the Securities Act cannot, however, be deduced from the figures. The opinion of Wall Street is that the Act has seriously hampered the development of new issues. Indeed, the argument is frequently carried further, and it is alleged that the Securities Act, by cramping the revival of the capital industries, is the chief drag on recovery. This is undoubtedly a wild exaggeration. It is probable that the Act has had some retarding, and perhaps diminishing, effect upon the volume of new issues. It has certainly affected the quality of new issues. But there seems to be very little evidence that any corporation in need of new capital has been prevented from obtaining it.

CONTROL OF MARKETS

The Securities Act of 1933 could be represented as doing no more than bring the United States into line with other countries. The Securities Exchange Act of 1934, however, broke entirely new ground. The Securities and Exchange Commission created by the Act is given the very widest powers of control over all stock exchanges in the country. Furthermore, the Act prohibits a long list of manipulative transactions and speculative devices, including such sales "and" "straddles." The borrowing of funds for speculation by brokers is regulated as closely as the lending of funds by banks, and short selling is subjected to close

* The S.E.C. was created by the Act of 1934, the original Act of 1933 conferred these powers on the Federal Trade Commission.

control. This section of the Act is far too detailed for convenient summary, but it is broadly true that every transaction except a straight purchase or sale of a security for cash is now regulated, and even with these exceptions, the exchange on which the transaction is performed is controlled, and the security which is bought or sold has to be approved before it can be listed.

The enforcement of these prohibitions is entrusted to the S.E.C. The Commission watches the market very closely in the attempt to detect infractions and has instituted a few inquiries and prosecutions. But from the nature of the case, this part of the Act is unenforceable. It remains to be seen in a period of widespread speculation whether it will succeed in limiting the amount of manipulation.

Prohibition is only one of the weapons placed in the hands of the S.E.C. The other is Publicity. To secure registration of its securities on an exchange, a corporation must file with the S.E.C. a great volume of information about its finances, all of which is published. Moreover, the obligation to publish information is a continuing one; the S.E.C. is extending the excellent work done for many years past by the New York Stock Exchange in compelling the disclosure of vastly more information for the benefit of the investor than he is vouchsafed in any other country. Publicity is not extended merely to the corporate operations of the firm. The salaries paid to the chief executives are also made public, and directors, officers and principal shareholders are compelled to publish all changes in their holdings. An even more drastic provision is that which enables a corporation to recover any profits made by its officers, directors and principal shareholders by buying and selling its securities in breach of the regulations. Short sales by these persons are entirely prohibited. Difficulties of enforcement obviously arise here too, but publicity alone is a powerful sanction, and even if the prohibitions can be only partially enforced, much will have been done to convert the office of director from an opportunity for private gain to one of public trust.

EFFECTS OF CONTROL

Judgment on the effects of this mass of legislation depends peculiarly upon the viewpoint of the judge. There are many people who sincerely hold that the dangers of completely free markets are far less than their advantages. To these people any regulation, however laudable its objects, is deplorable. The degree of regulation imposed since 1933 is certainly most onerous to the persons and institutions engaged in the market; Wall Street is tightly restricted by red tape. But the majority of people not directly interested in security trading would probably take

a different attitude. The business of dealing in capital is manifestly affected with the public interest. Moreover, the first requisite of a free market, the approximate equality of bargaining power of all concerned, has never been realised; the shrewd insider has always had better information and greater acquaintance with manipulative technique than the private investor. This majority opinion would undoubtedly consider that some check on these abuses was worth a considerable interference with the freedom of the market.

Whether the degree of protection which has been accorded to the investing public by the New Deal legislation is at all commensurate with the restriction forced upon the markets is, however, rather a different question. As has been indicated above, the prohibitions have rather outrun the possibilities of enforcement, as is typical of American legislation. But even if offences cannot in all cases be detected and punished, the presence of these prohibitions on the statute book must be some deterrent to the abuses which they were intended to check.

Publicity is perhaps a more profitable field for activity. It is true that the mass of information now published is far more than can be digested by anybody save the very largest private investor or the large financial institution. But the obligation to provide it is very salutary for the business man. It is pure gain that the searchlight has been turned on the activities of directors as well as on those of the corporations they control. The cost to the market of these gains to the public is, as yet, difficult to assess. But there seems to be little room for doubt that it has been greatly exaggerated. Some new issues may have been prevented; others may have had their form changed. But the mechanism of the market seems now to be working smoothly. The limitation of purely professional buying and selling appears to have made the course of prices somewhat more erratic, but there is no reason to believe that genuine investment or liquidation has been impeded. Finally, something has been done to remove the banking system from dependence upon a highly speculative market, and this can hardly be other than a gain.

On the whole, therefore, this may be considered one of the more successful departments of the New Deal. One can sympathise with the attitude of the Wall Street brokers who see part of their livelihood taken away as retribution for practices which they did not consider to be sins and were, in any case, largely perpetrated by others. But regulation of their activity was long overdue, and if it has now come all in one crushing instalment the shock must be set against the freedom which they enjoyed throughout the years of booming markets.

THE POWER CONTROVERSY

ANY discussion of the American power industry must distinguish carefully between its technical and its financial aspects. Technically, the American industry leads the world. It is efficient, both in generation and in distribution; it has standardised its methods and equipment and is co-ordinated and interconnected over large areas of the country. Many of the principles which have been applied under State guidance in Great Britain in the last nine years were derived from American practice. For a new industry, the development of the supply of electricity and gas in the United States has been astonishingly rapid and sound, so far as its technical accomplishments are concerned.

The financial history of the industry is rather more dubious. A further distinction can usefully be drawn here between the rate policy of the utility and the "high finance" of their corporate structure. For many years now, rates have been controlled in the several States by the State utility commissions. But the control has been lax for a variety of reasons. The State commissions have been subject both to political pressure manipulated by the utilities and to the rulings of both State and Federal courts on such matters as "confiscation." Moreover, State commissions have no control over energy transmitted across the borders of States. The result has been that in spite of regulation,

the utility companies have been highly prosperous. True, some relationship has been kept between their income and the conception of a "fair return" on capital invested, but the definition of capital invested has never been very strict, and there has undoubtedly been a great deal of "water" in the capitalisation of the companies.

The severest criticisms of the industry, however, relate to its corporate structure. The device of the holding company has been used more consistently and carried further towards its logical conclusion in the American electrical industry than in any other. There is some virtue in the device. It may serve to integrate a number of small companies and to secure for them operating and financial economies. But in the 1920's it was carried far beyond this and made to serve far wider purposes. Different utility magnates used holding companies to build up their rival utility "empires." They were ready to purchase any utility that was in the market, however remote it might be from their existing interests. Pyramiding was carried to fantastic lengths, and in many of these pyramids the operating companies were "milked" for the benefit of the holding companies. When carried to these extremes, holding companies contribute nothing to the efficiency of the industry, but positively endanger it.

The depression years brought many of these structures to

collapse. There was no catastrophic decline in the income of the industry; its revenues were less than 11 per cent. below the best known year even in 1933, which was the worst of the depression. But even this minor setback was sufficient to prick many insubstantial bubbles, and the attendant losses to investors raised a storm of hostility to the industry. Mr. Roosevelt had long been a foe of the utilities, and his beliefs had already been demonstrated during his two terms as Governor of New York. His attitude seems to be inspired partly by indignation at the policies—financial and political—which had been pursued by a considerable part of the industry, partly by a strong belief that a general reduction in rates would tap an enormous demand for electricity and set the country on the highway to the "power age."

The Administration's policy has moved along several lines. In the first place, a Federal tax of 3 per cent. was levied on domestic and commercial sales of power. Regulation of rates prevents this from being passed on to consumers. Secondly, the conception of "yardsticks" has been evolved. The Federal Government is constructing in many parts of the country hydro-electric developments where the cost of generation will serve as a check upon the reasonableness of the rates charged by private utilities. This idea has given rise to an apparently endless controversy on the fairness of the accounting methods to be employed in calculating cost of production at plants which are tax free and financed by the Treasury. The best known of these projects are those associated with the Tennessee Valley Authority. The T.V.A. is, of course, much more than a power project. On paper, it is a plan of regeneration for the whole of a backward area; in law, both rural reconstruction and the generation of power are merely by-products of the Federal Government's undoubted constitutional right to control and develop navigation. But in practice the power activities of the T.V.A. have taken the front of the stage. The constitutionality of the plan, in all its aspects, is still undecided.

Another method of attack on the "power trust" has been the loan of money, on the very favourable P.W.A. terms (see "Public Works") to municipalities for the construction of municipal power plants. P.W.A. has approved 244 projects of this nature, most of them small; many of them are held up by legal action.

The more direct attack on the utilities, however, is contained in the Public Utilities Act of 1935. That Act consists of two parts. The second greatly enlarges the scope of the Federal Power Commission, which is given authority to control all utilities transmitting electricity across State lines (18 per cent. of all power generated is so transmitted). The F.P.C. is also empowered to conduct a continuous investigation of rate schedules.

THE "DEATH SENTENCE"

Part One of the Act is the famous Public Utility Holding Company Act. The holding company, whether in the utility field or not, had already been under fire and a tax of 10 per cent., later raised to 15 per cent., had been imposed on dividends received by corporations, with the object of discouraging needlessly complicated corporate structures. On specifically utility holding companies, however, the sentence was far more severe. A holding company is defined as one directly or indirectly holding more than 10 per cent. of the voting stock of a gas or electric company. All such companies are required to register with the Securities and Exchange Commission, unless their properties are substantially confined to a single State. On registered companies the Act imposes a variety of prohibitions and a very strict control. No securities are to be issued in future except equity stocks; no fresh properties are to be acquired without permission; contracts with subsidiaries for the supply of services of various kinds (a favourite form of "milking") are subject to control; holding companies may not borrow from their subsidiaries; they must keep accounts in specified forms, etc., etc. This is not all. The S.E.C. is directed "as soon as practicable after January 1, 1938," to bring about a simplification of corporate structures by eliminating all holding companies

beyond the second degree and by dissolving all holding companies except those whose properties form a "geographically and economically integrated" system. This is the famous "death sentence" clause which led to such prolonged and acrimonious debate in Congress.

The abuses of the holding company device during the last decade had rendered some form of control inevitable. Whether the actual terms of the Act are unnecessarily severe is a question which can be answered according to taste. It may be urged in its defence that there is ample precedent in the anti-Trust laws for the forcible dissolution of companies which are considered anti-social. Moreover, it has been argued that the "death sentence" will apply only to the more extreme cases, since the majority of holding companies are confined, or can be reorganised so as to be confined to "geographically and economically integrated systems." On the other hand, the universal opinion in the industry, even among those who never indulged in frenzied finance, is that the efficiency of the operating companies will be seriously interfered with if they are compelled to isolate themselves from the direction under which they have flourished. It is further urged that to compel the holding companies to dispose of their holdings at or near the bottom of the market amounts to unjustifiable confiscation of property. In any case, the whole Act is before the courts, and the utility companies are confident that it will be found unconstitutional by the Supreme Court.

The reply of the utilities to this adverse campaign has been varied. The best reply would be to lower rates and simplify corporate structures. Both have been done. A comparison of the figures of energy generated and revenue received shows that the average charge has been reduced between 1929 and 1935 by 21 per cent. to domestic consumers, 7 per cent. to wholesale and 11 per cent. to retail commercial consumers. The industry has also carried the war into the enemy's camp. It has fought the Administration at every turn in the courts and carried on an intensive campaign both of lobbying at Washington and of political propaganda throughout the nation. It is safe to say that Mr. Roosevelt has no more determined opponents than the utility companies, and if their aid and counsel can assist in electing Mr. Landon they will be given unsparingly.

Simple conclusions about this whole controversy are hardly possible. It is true that the industry has been guilty of many malpractices; and it is true that in seeking to meet the resentment which these have occasioned, many people in the industry have been stubborn and unwise. But it is also true that the industry has been harried and harassed in many ways which at times have seemed unfair and purely spiteful; and it is true that in some cases some of the Government projects would apparently be difficult to justify either on economic or accounting grounds.

As in most controversies, the reasonable position probably lies somewhere between the extremes. Several things can be said for the industry. First, the malpractices and short-sighted policies of the industry in earlier years are certainly in large part corrected (though whether they might not reappear in another boom period is more doubtful). In point of financial, structural and operating bases the power industry is now in a better position than it has probably ever been since its birth. Secondly, rates have been substantially reduced and *pro tanto* whatever reality there is in the dream of a "power age" brought nearer. This applies not only to the cost, but also to the availability of electric power, and to the cost of appliances.

On the other hand, it is said that these improvements have been forced upon the industry by the weight of depression and the threat of legislation, that the industry is unrepentant and unregenerate and would return to its old abuses as soon as recovery proceeds far enough. It is not necessary to reach a precise conclusion; disinterested opinions. This much at least can be said for the Administration's case, that after the lessons of the 1920's a complete degree of control that will satisfy the public and be acceptable to the industry is not defined for all time in the Acts of the last few years. It will, in any case, have to be slowly evolved by the combined efforts of Congress and the courts.

THE BANKS AND RECOVERY

REFERENCE to recent issues of the *Economist Monthly Trade Supplement* shows that there is no doubt about the continuance of the trade revival. The *Economist's* business activity index number rose at the end of August to a new high record of 108½, and recent trade reports show that recovery is becoming more general and widespread. What part has the banking system played in the recovery of the past four years? And what are the present and future functions of the banks, if recovery is to continue? These are the questions which we propose to discuss to-day, and while the technique may have to be altered to meet the new conditions created by the devaluation of the franc, the basic principles hold good.

The banking system, including both the Bank of England and the joint-stock banks, has two main functions. First it has to determine the total supply of credit; and second it is charged with the duty of the distribution of credit. The former falls within the province of the Bank of England acting largely in co-operation with the Treasury; while the latter is under the control of the joint-stock banks. The importance of these functions is that not only do they determine the total amount of credit available and how it is used, but indirectly they determine its cost, that is the short-term and long-term rates of interest.

In the May *Banking Supplement* we discussed some aspects of these questions, and we published four charts tracing the banking trend of the past four years. These charts have been brought up to date and are reproduced here. In brief, as we explained last May, the policy of the authorities—that is the Government, the Treasury and the Bank—has been to make the provision of cheap and plentiful credit their over-riding duty in the financial and monetary field. The Bank of England bought both gold and securities in sufficient quantities to bring about

Chart 1.

a considerable expansion in bankers' deposits—that is in joint-stock bank cash. This induced the banks to add proportionately to their earning assets, and initially they could only do so by making heavy purchases of Government securities. It was these purchases which made conversion possible and brought down the long-term rate of interest.

This is a bare summary of what we said last May. Since then the summer has created new monetary and banking problems, which the authorities have had to solve. The weakness of the franc occasioned a fresh influx of French money into London, and unlike the experience of former panics much of this money was hoarded in British currency. This hoarding depleted both the reserve of the Bank of England and the cash holdings of the joint-stock banks, and at the end of May the resulting stringency had developed to the point

where it was beginning to drive up short-term interest rates. Had this movement been allowed to continue, the long-term rate would eventually have been affected, and the whole of the Government's cheap money policy would have been upset. A new remedy therefore had to be found.

This remedy took the form of gold purchases by the Bank of England, mainly from the Exchange Equalisation Account. To appreciate its operation it is simplest to study the first two charts (on this page), which show respectively changes in the condition of the Bank of England and in the composition of the Treasury bill issue:—

Chart 2.

Broadly speaking, and apart from temporary transfers of funds to public deposits, such as occurred for technical reasons at the end of July and September, bankers' deposits rise with each increase in the Bank's holding of either gold or securities (including those behind the fiduciary note issue), and it is simplest to consider only the fiduciary issue plus Government securities in the banking department. Conversely, bankers' deposits fall with each increase in the note circulation. Thus in the event of an expansion in the circulation, particularly if due to foreign hoarding, the simplest remedy is for the Bank to buy an equivalent amount of gold. If the gold is bought in the market bankers' deposits are replenished directly. If the gold is bought from the Exchange Equalisation Account, then the Account can take up more Treasury bills, and so less Treasury bills have to be issued by tender to the banks and the money market than would otherwise have been the case. Thus bank cash is replenished out of current Government disbursements and maturities of outstanding Treasury bills.

The whole object of the Bank's recent policy has been to keep bankers' deposits at a constant level of about £100 millions. To do this, while the note circulation was expanding, it bought gold and enabled the Exchange Account to take up more bills. This is reflected on Chart (2) in the recent rise in the tap issue and fall in the tender issue. It also appears in the August drop in the clearing banks' discounts, shown in Chart (3). When the notes returned from circulation for it has retained its gold in anticipation of the Christmas currency demand. Instead it has sold

If the devaluation of the franc is followed by a repatriation of French funds, then the conditions of last summer will be reversed. Ease, not stringency, may develop, and may call for appropriate action.

We come now to the function of the joint-stock banks as distributors of the total volume of credit, as determined by the volume of bank cash. To some extent the banks have to fulfil a passive rôle. First and

foremost, the cash at their disposal is fixed for them by the authorities; and so too is the total supply of Treasury bills issued by tender. Next, they cannot force customers to borrow, and the authorities have raised bank cash to the point where there is not the slightest need for the banks to reject any reasonable application for a loan, on the score that they have lent up to the limit of their resources. On the other hand, the banks, through their purchases of bills and securities, can exercise a dominant influence over both short-term and long-term interest rates. Here their rôle becomes definitely active.

The distribution of the banks' resources is illustrated in Chart (3), while Chart (4) shows the course of interest and discount rates.

Chart 3.

The banks have at least three objectives before them. First they must buy enough bills to prevent a rise in short-term interest rates. The fact that discount rates are barely over ½ per cent. shows how completely they have reached this objective, and indeed, if necessary, they could reduce their purchases and allow discount rates to rise a little without in any way checking the progress of the trade recovery. Next, they must purchase and hold a sufficient quantity of gilt-edged securities, including short-, medium-, and long-term stock, to ensure that there is no serious set-back in the gilt-edged market. This is essential, not only in the narrower interests of the banks themselves, as large holders of gilt-edged stock, but in the wider interest of the country. There is no doubt that the fall in long-term rates of interest during the past five years is a leading cause of the trade recovery, and any tendency for a rise might easily check the revival. To-day, the ratio of advances to deposits has fallen to 39 per cent., while that of investments to deposits has risen to 28 per cent.; whereas prior to 1929 an advance ratio of 55 per cent. and an investment ratio of less than 10 per cent. was common. It is important to realise that it would be definitely against the national interest for the banks to seek to restore too precipitately the ratios of eight years ago, for an immediate and disastrous consequence would be a relapse in the gilt-edged market.

This emphasises the need of the authorities to maintain the total supply of credit, for the banks must be in a position to meet all legitimate demands for advances without reducing their investments. So far they have been able to do so, for Chart (3) shows that advances have risen this year without any contraction in investments. These movements, however, have only been rendered possible by a rise in deposits to a new high record, and this last increase was possible only because of an expansion in bank cash. Thus it is no exaggeration to say that the easy money policy of the authorities lies at the basis of the trade revival. Chart (4) shows that both short-term and long-term interest rates have remained low. Without the year's increase in bank cash and deposits, the banks could not have met the growing demand for advances without reducing their holdings

of bills and/or securities, with the inevitable consequence of a rise in interest rates. As matters stand, the rise in deposits and earning assets has outstripped the rise in cash, so that the banks' cash ratio has fallen since January from 10.9 to 10.4 per cent. This approach to the traditional bottom limit of 10 per cent. emphasises the need for maintaining, if not augmenting, the supply of bank cash.

In the distribution of advances, the banks' rôle again tends to become passive, for there is no need for rationing and each application can be treated on its merits. This means that the actual distribution reduces to a matter of trial and error, but there is no evidence of any serious maldistribution, judged by the over-riding test of the country's needs. On the contrary, as we pointed out last August, the banks are to-day faced with new competition from the accepting houses, insurance companies and even certain municipalities, and there is no reason to fear that any credit-worthy borrower is unsatisfied. Conversely there is probably less undesirable borrowing than in the boom of 1927-29, for the banks, the stock markets, and the public have learned a valuable lesson. Finally, a recent analysis by Barclays Bank shows that bank credit is well distributed between various classes of borrowers. To cite one

Chart 4.

prominent example, 35.7 per cent. of Barclays' loans were made to "professional and private individuals." This reveals the existence of a substantial mass of "consumers'" as distinguished from "producers' credit." The balance between producer and consumer is thus being well kept.

To sum up, the two problems before the banking world are (a) the creation and maintenance of an adequate total supply of bank cash and credit; and (b) its equitable distribution in such a way as to meet all legitimate demands for bank loans and also to maintain a low level of short-term and long-term rates for bills and securities respectively. The indications of the measure of success of current banking policy lie in the satisfaction of the demand for bank loans and more precisely in the level of discount rates and the firmness of the gilt-edged market. Another indication lies in the power of the new capital market to take up any new issues of a legitimate and productive character. These are the real tests, and notwithstanding the monetary disturbances of the summer they are being adequately fulfilled. In other words, the technique of the monetary and banking problems of to-day has been worked out and is being applied successfully. This is the banks' contribution to recovery, and the final proof is that recovery is continuing.

DEVALUATION IN RETROSPECT

THE devaluation of the gold *bloc* currencies is still so recent that it is impossible to say what its results will be. Indeed, a cynic might say that the answer to that question depends upon what the different Governments make it. But if we cannot foresee the future it is useful at the time of a major decision in world economic history to look backwards, for this helps us to see recent events in their true perspective.

Such a backward glance must start with the troubled years immediately succeeding the war. In the early 'twenties the major part of the world was plunged into economic disorder. They were years of widespread inflation, both monetary and psychological, and years during which former belligerents were vainly trying to collect war debts and reparations and were upsetting the whole world in the process. The number of countries which preserved their currencies within sight of the pre-war gold parity could then be counted almost on the fingers of one hand. Holland, Switzerland, Sweden and the United States almost complete the list. In these years the world generally and Europe in particular conceived a deep-rooted horror of inflation; for experience had proved the truth of the Bolshevik doctrine that you can disintegrate society if only you destroy all confidence in the currency. It looked almost as though any currency not linked to gold was bound sooner or later to depreciate; and all the various conferences that dealt with the matter—from Brussels to Geneva—insisted that a return to the gold standard was the only salvation.

The first attempt to put these ideas into practice began in 1923-25. Those were the years of the League loans to Central Europe, of the Dawes Report, of the revaluation of the Reichsmark and of Great Britain's return to gold. In one sense the last event set the seal on the old period of chaos, and ushered in the new period of six years' breathing space and attempted reconstruction. Great Britain's return to gold, in fact, was the major landmark of the middle 'twenties, for it gave a lead to the rest of the world to put their monetary affairs in order, and that lead was generally followed. Looking backwards, it is easy to criticise our return to gold, and in particular our reversion to the pre-war parity of 85s. per ounce and \$4.86 to the £. But it was almost universally believed—and this is the only legitimate excuse for returning to \$4.86 and for our debt settlement with America—that the disappearance of gold coins from circulation and the introduction of the gold exchange standard would so economise gold that a price level of 50 per cent. or even 100 per cent. above that of 1913 was to be expected; and at such a level current costs were reasonable, the debt charges were tolerable and the exchange rate a right and proper one. These expectations were falsified. In that event it appeared that the £ was over-valued, and many troubles arose therefrom. But this justification may be urged in defence of the policy then pursued, namely that it allowed the world six years in which to pause and store up some reserve of strength; and to that extent it may have made the world better equipped to survive the major depression which began in 1929.

Unfortunately the monetary stability introduced in 1923 was short-lived because certain of its foundations were fundamentally unsound. The most radical defect was that although something like an international monetary system was set up, obstacles were created against the free movement of goods, and it was therefore impossible for the economic system of the world to readjust itself and correct the extreme distortion of production and distribution which had been brought about by the war. No conscious attempt was made to plan in broad outline the world's production; while the free play of economic forces was so obstructed that it was not allowed to adjust itself automatically to world demand. Hence arose a growing lack of balance in physical trade and between costs and prices. Secondly, the return to gold took place in a very haphazard way so far as the cur-

rency levels of various countries were concerned. The pound and the lira were overvalued, partly for prestige reasons, while the French and Belgian franc proved to be undervalued. There was no easy method of allowing these maladjustments to correct themselves. Finally, this economic and financial distortion led to international lending on a scale out of proportion to the capacity of the nations to make payments to one another. Prosperity lasted just so long as this top-heavy structure of unsound investment continued.

In 1929 the great depression developed and the fabric began to crack, and from 1931 practically to the present day the world has been passing through the second post-war period of monetary confusion. The pound itself went off gold and rapidly drew a number of the world's leading currencies behind it. The dollar held out until 1933, but was then taken off gold only to return to gold at a lower parity early the following year. Germany and the Central European countries preserved the nominal gold value of their currencies, but only by setting up an impenetrable hedge of exchange and import restrictions and exchange clearing systems. South America passed through many vicissitudes, during which several of the currencies gradually drifted across from gold to sterling. Only a few countries steadfastly adhered to gold, and these became the gold *bloc*, consisting of France, Holland, Belgium, Switzerland, Italy and Poland. Thus by 1934 the world was divided into four main parts: the gold *bloc*, the sterling area, the United States, and countries with restricted currencies.

These years of crisis taught the world some new lessons. The first was that a currency detached from gold does not necessarily involve wild inflation, but that a deliberately managed currency is not merely possible but may succeed in keeping the price level more steady than a gold currency. The world further learned that provided a currency is not being artificially inflated, the readjustment of its international value may facilitate the task of striking a proper balance between costs and prices, and thereby may make recovery possible. It moreover discovered that this route is an easier one by far than to make a large readjustment by the heroic method of deflation. The chief nations of Europe, however, were slow to learn from the experience of others and the prolonged resistance of the gold *bloc* to devaluation is to be attributed to memories of the panic inflation of the early 'twenties. Since 1931, however, the pressure on the countries of the gold *bloc* has steadily increased and one by one they have given up the struggle. Belgium devalued at the end of March, 1935, and six months later the Abyssinian war and the imposition of sanctions drove Italy into the ranks of the restricted countries. Poland gave up the struggle early this year, so that only France, Holland and Switzerland remained. These countries found themselves engaged in a losing battle of trying to bring down internal prices and costs to world level, while at the same time they convinced their own people that the burden inflicted on them did not surpass the bounds of toleration.

And so we come to the present day. The gold *bloc* has at last abandoned the struggle, but it has done so in the best possible way. Instead of devaluing arbitrarily, unilaterally and by "hit or miss" methods, France approached Great Britain and the United States, with the result that we have just had devaluation by co-operation. Switzerland, Holland, Italy and Czechoslovakia have followed France, while other countries have linked on to sterling. The exchange rates already we can see that gross over- and under-valuation world's currencies are within measurable distance of equilibrium with each other. Again, if France has abandoned her former gold parity, Great Britain and the United States have undertaken that they will seek to prevent any further depreciation of their currencies.

The leading countries of the world have also learned by now the technique of regulating exchange fluctuations by the proper use of Governmental exchange funds. Thus already we have achieved two great gains, namely, the establishment of international monetary co-operation,

and the approach towards world monetary equilibrium for the first time since the war. In Mr Chamberlain's words, we can now begin to hear the breaking of the ice. The nations have the chance to free world trade and finance, if only they have the will.

THE STERLING AREA

(BY A CORRESPONDENT)

THE minds of those dealing in the foreign exchange markets have, during the last few years, been so pre-occupied with future hopes and fears that the rates of exchange in the markets have reflected these rather than the day-to-day or month-to-month trading conditions between the different parts of the world. In consequence any examination of the foreign exchange position by means of a comparison of price levels in, for example, the United Kingdom, America and France, serves only to illustrate how important "capital" movements have become, and does not explain changes in underlying trading conditions. In this note, therefore, an attempt has been made to examine the monetary position of the sterling area as a whole by going behind the data of prices and examining instead the changes that have taken place in the trade balances of the sterling area and in its reserve position.

The area as a whole has been examined rather than that of the United Kingdom alone, because the close association of sterling area and imperial currencies with the pound sterling sets up an implied responsibility on the London Money Market for the maintenance of the financial stability, not only of the pound itself, but of its related currencies. For example, the weakness of the pound early in 1935 was not only due to the pepper crisis, but, as explained by the Annual Survey of Economic Conditions, 1934-35, published by the League of Nations, also arose from inflationary tendencies in outlying parts of the sterling area.*

* Page 196 f.

An attempt has therefore been made to depict, in the roughest of outline, changes in the monetary position of the sterling area as a whole in the recent past, but it must be emphasised as strongly as possible that the technical difficulties inherent in the task make it impossible to draw anything but the most general conclusions from the results that have been obtained. The gold holding, measured in present sterling values of gold, of the area as a whole has increased even when London is excluded, and the "foreign" assets have risen substantially as set out in Table I, which excludes the United Kingdom:—

Millions of £'s Sterling				
	1927-8	1933	1934	1935
<i>A. Gold Reserves</i>				
Empire Countries (a).....	95.2	107.8	108.7	114.8
Principal Sterling Countries (b)	32.0	58.0	56.0	73.5
TOTAL: Value	127.2	165.8	164.7	187.3
<i>Volume (million ozs.) ...</i>				
	30.0	23.7	23.5	26.8
<i>B. Foreign Assets of Central Banks</i>				
Empire Countries	94.7	119.2	151.8	149.9
Principal Sterling Countries	26.5	24.0	36.6	49.8

Lothbury, E.C.2

Established 1810

Taken as a whole these figures suggest an improvement in the technical monetary position of the sterling area. The increase in gold is, however, due to its revaluation and not to an increase in quantity, and foreign assets have only risen roughly in proportion to the decline in the gold value of the currency in which they are measured. As there has not, however, been a proportional increase in the note circulation or banking deposits of these countries, and as the majority of other currencies have already been devalued, there is a greater international liquidity in the sterling area as a whole than there was before the depression. But it appears that this has been the result more of a re-arrangement of assets than of any large increase in them. In Table II the gold holding of the Bank of England is added to that of other parts of the sterling area, and from this total is deducted the foreign assets held by the Central Banks of the sterling area, excluding the United Kingdom, so that on the assumption that all foreign assets in the sterling area are held in London, the final figures in Table II give the net international monetary reserve of the area as a whole:—

	Average of 1927-8	End of 1933	End of 1934	End of 1935
Gold Reserve of Sterling				
Area Countries	127.2	165.8	164.7	187.3
United Kingdom	152.9	315.0	317.0	330.0
	280.1	480.8	481.7	517.3
Less Foreign Assets.....	121.2	143.2	188.4	199.7
Net Reserve	158.9	337.6	293.3	317.6

These changes in the financial position of the area have been accompanied by shifts in its trading position which are very difficult to follow owing to the number of national trade returns to be analysed. The gross surplus or deficit on merchandise account of the principal countries of the sterling area is shown in Table III. The figures for Empire and non-Empire countries are given separately, and the figures for the United Kingdom have been excluded. From the gross figures have been deducted the value of the United Kingdom's import surpluses from sterling countries, calculated from the figures given in the Bank of England's Statistical Summary for February, 1936 (page 19). Changes as between two or more countries whose figures have been included must cancel out, so that the net result shows changes in the merchandise account of the sterling area and the rest of the world.

Millions of £'s Sterling.	Surpluses (+)	Deficits (-)	on	
	Merchandise Account			
	1927-8	1933	1934	1935
<i>Empire Countries :</i>				
1. Gross Balance of Trade	-37.0	+29.5	+ 9.1	-12.0
2. Less U.K. Import Surplus	...	40.8	37.8	29.8
3. Net Merchandise.....	...	-11.3	-28.7	-41.8
4. Net Gold Movements, India and Union of South Africa	+18.3	+110.0	+104.2	+110.8
5. Net Merchandise and Gold	-18.7	+99.7	+75.5	+59.0
<i>Sterling Area Countries:</i>				
6. Gross Balance of Trade	-10.9	+ 5.4	- 2.7	-18.6
7. Less U.K. Import Surplus	...	22.4	28.7	25.2
8. Net Merchandise.....	...	-17.0	-31.4	-43.8
Total 5 and 8.....	...	+82.7	+44.1	+14.2
Total, excluding 4	...	-27.3	-60.1	-96.6

The increased sterling value of the gold exports from South Africa and the release of gold hoarded in India have clearly played a large part in sustaining the financial equilibrium of the sterling area, and it is perhaps significant that during the period in which the export surplus of Empire countries as a whole has been falling, their balance with the United Kingdom itself has not been maintained. The figures as a whole suggest that the League of Nations Survey called attention to an important point when it emphasised the dangers to the pound that might arise from weakness in outlying parts of the sterling area.

It has not been possible to get the data necessary to change the figures for balances of trade into balances of payments. Those that are available suggest that there has been a fairly steady decline in the invisible imports of both British and non-British parts of the sterling area since 1931, particularly in interest and dividend payments. But for the most part these payments must be taken to be intra-area payments and cannot influence the financial relations of the area as a whole or the rest of the world. It would be in the highest degree unwise to attempt to draw from these figures any inference about the present or possible future technical position of the pound sterling *vis-à-vis* the rest of the world. The capital movements, both short and long term, of the past four years have been on a scale which must dwarf most of the changes on income account. It seems, however, safe to say that the influences of devaluation in anticipation of a mild inflation have followed in the sterling area their typical course, and that the relative economic ease that they have brought with them is proving to be a wasting asset. The position has, of course, now been radically changed by the devaluation of nearly all the principal currencies of the gold bloc, but the division of the world into sterling area and the rest is one which has lasted for five years, and the problems enumerated here will not immediately vanish.

THE PROSPECT FOR INFLATION IN THE UNITED STATES

(BY A CORRESPONDENT)

NEW YORK, September 15, 1936.

EVER since the great open-market operation of the spring of 1932, the prospect of inflation has been a theme of lively discussion in the United States. This article will consider three of the phenomena popularly associated with inflation: (1) The prospect for expansion of the quantity of money; (2) the prospect of the creation of some vulnerable area of debt whose collapse would produce the phenomena of deflation; and (3) the prospect of the appearance of a sellers' market.

Since the end of 1933, the demand deposits of the member banks have risen by above 50 per cent. To-day the Reserve authorities estimate that the combined total of bank deposits and currency is approximately at the figure of 1929. The level of production and trade is lower than in 1929 and the velocity of bank deposits

decidedly lower. The increase in currency is not readily explained, but one reason is certainly the reduction in the number of banks. The increase in bank deposits is mostly attributable to two factors—the financing of the deficit and the gold imports.

Beginning with the question of the deficit. Unless entirely new factors enter into the situation, it seems likely that the days of monumental deficits are past. While the revised Budget for the current fiscal year shows no decline in total Government expenditures (except the sum allocated to the Veterans' Bonus), it is expected that the amount to be covered by borrowing will be greatly reduced, thanks to an anticipated increase in tax revenues. While the Budget estimates are liable to disappointment, the prospect is for more taxes and less

borrowing, even if the hoped-for reduction of Emergency Expenditures should not materialise. Thus, the expansion of bank deposits against deficit financing should be substantially smaller in the future than in the past.

The prospect of a continued expansion of bank deposits through gold imports is much more problematical. Gold production is rising rapidly, and the demand for gold outside the United States uncertain. In the recent past, the United States has in effect bought the world output, less sums taken by the British Exchange Equalisation Account and individual hoarders. If this situation should continue, gold imports alone would increase the circulating medium of this country by a substantial amount in the future as in the past. The discontinuance of this trend obviously depends more upon developments outside the United States than within.

That the existing volume of bank deposits is redundant is strongly suggested by the remarkably low turnover of the present deposits, and this supplies at least a theoretical argument against the anticipation of a marked expansion of bank loans (as a source of deposits) within the visible future. On the other hand, allowance must be made for the intense desire of the banks for earnings; but the fact remains that our recent data show that when deposits increase more rapidly than the economy requires, their velocity distinctly diminishes in compensation.

Quite apart from the question of quantitative inflation, there are always possibilities of qualitative inflation—that is the development of weak loan-structures subject to collapse, with deflationary consequences. The two standard forms of credit inflation in the United States have arisen from speculation in real estate and speculation in the stock market. Speculation in real estate has been materially facilitated by various legislation of the past few years, and only one compensating safeguard has been erected against it or its consequences, namely, the substitution of the long-term amortised mortgage for the short-term, non-amortised mortgage. However, at the moment speculation in real estate is not active. As for the erection of a weak credit structure in the stock market, two effective safeguards have been provided—the prohibition of brokers' loans for others, and the stiff margin requirements prescribed by the Federal Reserve in co-operation with the S.E.C. In other words, we seem to have taken to our legislative hearts some lessons from the history of past inflations.

But another area requires consideration. Apart from the Federal deficit, the most active demand for credit since the bottom of the depression has come from municipalities and consumers. The magnitude of the volume of consumer credit, and how it is financed, are matters of guesswork, not statistics. Nor does anyone have a clearer idea of its danger point, than they had in 1929 of the danger point in brokers' loans. While every other phase of our credit system is regulated by law, subject to regular public report, and policed by vigilant supervisors, this area is a *terra incognita*, officially ignored, statistically non-existent. It is even impossible to tell whether it is now in a stage of inflation, or at what stage it would constitute a threat of deflation. All that can be said is that it is an area that lends itself to inflation; that it could reach the inflated stage without preliminary warning; and that once inflated, its deflation might produce important economic repercussions.

A rise in commodity prices is probably the most widely acknowledged phenomenon of inflation; although certainly many would argue that an advance in the price index to the level from which it tumbled so precipitately between 1929 and 1932 represented, not inflation, but recovery, or at most, "reflation." Be that as it may, the American price index has over the past two years exhibited remarkable stability at about 80 per cent. of the base year, 1926. In that period, bank deposits have risen enormously, and our production index has advanced by between 30 and 40 per cent. Although there have been in that time substantial fluctuations in the prices of annual crops whose supply is a function of weather and demand relatively inelastic, it would appear that supply and demand had risen about *pari passu*, and that the increase in demand could readily be met from existing

Security with Economy

The utmost safety is assured for valuables and documents placed in the Safe Deposit at the Head Office of the Midland Bank. Private persons and accredited officers of companies, corporations, firms and associations may become renters and derive the following advantages of this service:—

- SECURITY** A specially constructed strong room, protected by a circular door and frame weighing 35 tons, contains many thousands of private safes fitted with deed boxes. Each renter is supplied with the only two keys of his safe, to which he thus has sole access as often as desired.
- PRIVACY** Renters may examine the contents of their boxes, deal with correspondence and conduct interviews in private rooms equipped with telephone and stationery.
- LOW FEES** The inclusive annual fee ranges from 10s. to 60s., according to the size of safe selected.

INSPECTION IS CORDIALLY INVITED.

facilities without further impulse from price. Our production index has risen since 1934 from 75 to 105, and is now something less than 20 per cent. under the 1929 peak, and it is uncertain whether on an average our productive facilities are equal to those of 1929, owing to the fact that in the meantime there has been not only little general investment in additional facilities, but perhaps not even the replacement of equipment worn out and scrapped. To cite an unrelated example, but one providing suggestive data, our railroads have at present neither the tractive power nor the freight cars to haul the volume of traffic they handled easily in 1928-29. It is conceivable that this situation has parallels in industry.

In other words, for some months we have had buyers and sellers so evenly matched (always excepting, of course, in those commodities subject to the vagaries of annual weather), that neither had the advantage of the other. The prerequisite of a comprehensive price rise is the existence of a seller's market over a considerable proportion of the economy. A number of reasons may be advanced for supposing that we may be approaching a seller's market; among these are the general adoption of the forty-hour week and an increasing scarcity of labour in many fields. Opposing arguments would include the facility with which an uncartered economy can increase output, and our susceptibility to foreign competition. At the time the Hawley-Smoot tariff was passed in 1930, it was rated a highly protectionist measure. In comparison with the devices since adopted by other nations it is moderate indeed. In specific instances one hears evidence of the appearance of a seller's market, but neither strong enough nor general enough to be conclu-

sive. Whether the actual appearance of a seller's market with an attendant price rise would be rated as "inflationary" or not would depend mostly on a point of view.

In fact, under the circumstances it is doubtful if there are any criteria which would be accepted as warnings of inflation. Certainly not the movements of the foreign exchanges, for, the world over, depreciation of one's currency is signalled as a triumph of monetary management. Probably not a rise in prices, for this is still rated a consummation devoutly to be wished. Certainly not an advance in money rates, for this is almost out of the question. Nor would an outflow of gold be regarded as evidence, for this would be welcomed as a sign either of world recovery or of the necessity of another profitable devaluation. A decline in the reserve ratio would equally be rejected as evidence, for with our present system the reserve ratio has no particular significance. The old familiar beacons of monetary policy have been pretty thoroughly demolished; and no new ones have been erected. All that can be said is that credit expansion originating in deficit financing has passed its peak unless entirely new factors appear, that effective safeguards have been devised against inflation originating stock market speculation, and that in spite of a phenomenal increase in demand in the past two years, our price-level has been distinguished by its stability. Furthermore, although the facilities of inflation are at hand, the business community still holds too bitter a memory of the recent deflation to extend itself rashly—at least while those memories are vivid. All this suggests that the immediate question does not concern the prospect for inflation. It is the question of whether or not we are entering a seller's market.

THE OUTLOOK FOR BANK SHARES

THE shares of the great British banks have always attracted the most solid and influential class of investor. The concentration of joint-stock banking in the hands of a small number of powerful concerns, the prudence and conservatism which are the hallmark of British banking methods, and the progressive consistency of earnings during the twenties combined to give bank shares the character of gilt-edged equities. Although dividends were reduced with the onset of economic depression, it was argued that the banks' large and increasing gilt-edged holdings afforded an effective "safety buffer," pending a revival in the demand from industry for banking facilities.

To-day, however, when industrial revival has reached an advanced stage, the underlying soundness of bank shares, as investments, remains unquestioned, but considerably less stress is being laid on the "equity" element in their composition. Bank share values have certainly participated in the general recovery in share prices. The twelve bank and discount company shares included in the Actuaries' Index, for example, have risen in average value from a low point of 67.8 on December 22, 1931 (December 31, 1928 = 100), to 125.0 on October 6, 1936—a rise of no less than 84½ per cent. The percentage yield on bank shares, however, is higher to-day than that on the ordinary stocks of leading companies in such industries as iron and steel, engineering, electrical equipment, oil production, etc., which are believed still to have pronounced recovery potentialities. From these groups investors expect a further increase in dividends during coming months; from bank shares they look rather for certainty of income without any spectacular upward movement in earnings. The reasons for this attitude deserve detailed examination.

The following table shows the amounts of profit earned

for dividends by each member of the Big Five in every year from 1927 to 1935:—

DISCLOSED PROFITS OF BIG FIVE BANKS
(000's omitted)

	1927	1928	1929	1930	1931	1932	1933	1934	1935
Barclays.....	2,306	2,251	2,332	1,821	1,795	1,574	1,555	1,708	1,794
Lloyds.....	2,176	2,228	2,242	1,930	1,927	1,551	1,439	1,652	1,643
Midland.....	2,335	2,437	2,445	2,219	2,057	2,019	2,287	2,262	2,133
Nat. Prov. ...	1,983	2,009	2,060	1,831	1,647	1,493	1,503	1,544	1,565
Westminster	1,932	1,948	1,960	1,622	1,402	1,295	1,285	1,325	1,203
TOTAL ...	10,742	10,873	11,069	9,423	8,828	7,932	8,029	8,521	8,328
1927-29 = 100		100		86.5	81.1	72.8	73.7	78.3	76.5

Note.—Bank profits are struck after adjustments (e.g., for Contingencies), which may vary from year to year. The above figures show earnings after these adjustments and after deducting such items as Staff Pension Funds and Directors' Fees.

The figures are not wholly comparable owing to differences in individual treatment of taxation items, but the totals are sufficiently uniform to afford a representative picture of the recent trend. Banking profits, it will be seen, rose steadily to a peak in 1929. They fell sharply in 1930, declined further in 1931 and 1932, and have subsequently made a measurable but limited recovery. Last year the amounts earned after all charges and adjustments were still only a little more than three-fourths of the average for the three years 1927-29.

Bank profits, in short, have remained inelastic during the last three years, during which the *Economist's* Index of Business Activity rose by 19 per cent.

The reasons for the non-participation of bank shareholders in the fruits of economic recovery may best be indicated by setting the profits indices of the Big Five side by side with other figures showing the trend of their earning assets and certain of the more important means of employing those assets.

INDEX NUMBERS FOR BIG FIVE BANKS
(1927-29=100)

	1930	1931	1932	1933	1934	1935	Actual figures (£ millions)	
							1927-29*	1935
Profits	86.5	81.1	72.8	73.7	78.3	76.5	10.9	8.3
Capital and Reserves...	101.4	94.3	94.6	94.7	96.7	96.6	121.2	117.1
Deposits.....	104.0	95.9	108.7	106.7	108.8	115.0	1,632.0	1,874.6
Investments	116.0	115.1	187.4	224.0	235.0	241.4	226.7	547.3
Discounts ...	135.8	99.5	167.4	127.2	109.5	130.6	212.3	277.3
Advances ...	96.8	94.7	80.9	77.1	79.2	82.2	869.3	714.3

* Average.

Now, bank earnings represent a small percentage rate of profit on the turnover of large amounts of funds, in the shape of capital, reserves and deposits, which may be employed in a variety of ways. Since 1929 the volume of the banks' available resources—their "effective working capital"—has tended not to diminish, but to increase. The paid-up capital, disclosed reserves and undivided profits of the Big Five totalled £121.7 millions at the end of 1929 and £117.1 millions at the end of 1935, a decrease of 3.8 per cent. But amounts on deposit and current account are many times greater than capital and reserves. Between December 31, 1929, and December 31, 1935, the aggregate deposits of the Big Five rose by 15.3 per cent., from £1,626 millions to £1,875 millions.

Clearly, the rate of return on banking funds has fallen even more considerably than the total profits figures. Has there been any involuntary diversion from the more to the less profitable means of employing these resources? The banks are in a position not wholly dissimilar from that of the railways. They carry many kinds of "traffic," affording varying rates of return, and they charge what the traffic will bear. For the best part of a century British railways recouped themselves out of their receipts from the more valuable traffics for the low return on heavier classes which would otherwise have

been moved at a loss. Road competition, after the war, was formidable precisely because of its concentration on the best traffics.

Similarly, as we showed in a leading article in the *Economist* of August 1st last (page 224), British banking performs for the public the essential and complex service of transmitting money, in the form of cheques, all over the country. This service is performed free (except for an unremunerative charge on small accounts), and the cost falls to be deducted from general "traffic receipts." Of all earning assets, advances to customers are much the most remunerative. But these have fallen, between 1927-29 and the end of 1935, by 17.8 per cent. It is true that in the same period, investments have risen by 141.4 per cent. and discounts by 30.6 per cent., but these give a considerably lower return per £1,000,000 employed, and that return itself has fallen since the advent of low general interest rates. The banks, in fact, have been employing enhanced resources to a decreasing extent in the more remunerative and to an increasing extent in the less remunerative forms of "traffic." If allowance is made for abnormal factors which affected the level of disclosed profits in certain years, the correlation between the index numbers of profits and advances, shown in the table, is decidedly significant.

The reasons for the failure of bank advances to regain—much less to surpass—their pre-depression level, are varied. They include the increased liquidity of borrowers and the "unfreezing" of bad and doubtful loans, the abundance of money, the expansion in savings, the tendency of industrial companies to "plough back" more of their profits into their own businesses, and, last but not least, the appearance of certain "competitors." These include certain municipalities with surplus floating resources, the insurance companies, the accepting houses, and private individuals. Experience seems to have suggested, indeed, that it may be impossible long to maintain rates for bank advances at a higher rate than the yield on gilt-edged securities without setting up a tendency for borrowers to go to the Stock Exchange

rather than to the banks. Industrialists will prefer to sell gilt-edged holdings on a 3 per cent. yield basis rather than to pledge them as collateral for a bank loan at 4½ per cent. But the banks cannot indefinitely reduce their rates for "high-paying traffic" if they are to continue to carry the vast burden of unremunerative services, to which the public has grown accustomed, and on whose continuance it is likely strenuously to insist.

That is the dilemma which faces bank managements and bank shareholders to-day. Given a continuance of rising industrial activity, bank advances should maintain their present upward trend, but so long as interest rates

remain low and money is plentiful, their speedy return to the level of 1927-29 is unlikely. The banks may curtail some of their more unremunerative services for customers, but the greatest of them all—cheque clearance—is insusceptible to draconian treatment. The stability of the banks is as unquestioned and unquestionable as ever, and their credit stands four-square to every wind. But shareholders will not look for an early return of bank profits to the levels prevailing six or seven years ago. They will closely watch for any further growth of "competition" in lending, lest the banks' system of "traffic-rating" should demand future revision.

AUSTRALASIAN BANKING

(BY A CORRESPONDENT)

THE first half of 1936 was an encouraging period for Australia and New Zealand. After the somewhat disappointing export season which preceded that of 1935-36, higher wool values in particular and greater export receipts in general increased London balances and removed fears of strain upon the external balances of payments. The trade returns for the years ending June 30, 1935 and June 30, 1936, show substantial increases in the active balance of exports from each Dominion.

AUSTRALIAN IMPORTS AND EXPORTS, 1934-35 AND 1935-36 GENERAL TRADE (£A. millions)			
	Years ending June 30th		
	1935	1936	
Exports	102.5	122.0	
Imports	90.7	104.7	
Export surplus	11.8	17.3	
SPECIE AND BULLION (£A. millions)			
	Years ending June 30th		
	1935	1936	
Exports	10.4	13.0	
Imports	2.1	2.2	
Export surplus	8.3	10.8	
Total export surplus (merchandise and bullion)	20.1	28.1	

For New Zealand the figures of special trade (including specie and bullion) show an even greater proportionate increase.

NEW ZEALAND IMPORTS AND EXPORTS SPECIAL TRADE, INCLUDING SPECIE AND BULLION (£N.Z. millions)			
	Years ending June 30th		
	1935	1936	
Exports	42.4	53.2	
Imports	33.8	39.0	
Export balance	8.6	14.2	

The influence of higher raw material prices is clear in both sets of figures; but it will be seen that imports have also increased substantially. The relation between exports and imports in Australia and New Zealand is more than usually important, not only because of the substantial external debt service owed by each Dominion, but also because the monetary systems are managed on a sterling exchange standard. The accumulation of London balances due to an export surplus in excess of the external debt reserve, normally leads to an expansion of credit in the Dominions. This, in turn, leads to greater spending and an expansion in imports, and so the pendulum begins to swing the other way, and London balances contract.

During the depression years Australia not only developed the central banking functions of the Commonwealth Bank and used the Bank to expand the issues of Treasury Bills, but sacrificed part of its monetary reserves. The last annual report of the Bank for International Settlements points out that if the international reserves of the Commonwealth Bank and the commercial banks are combined, their total is now only about half what they had been before the depression. The evidence given before the Royal Commission on the Monetary and Banking Systems of Australia, by Mr L. G. Melville, the Economic Adviser of the Commonwealth Bank, contains repeated references to "the uncomfortably low level of London funds." At home,

the Commonwealth Bank is already loaded rather heavily with Treasury Bills and Mr Melville suggests the funding of part of those Bills as the first necessary reform of the Australian banking system. Abroad, its responsibilities in respect of the exchange rate are great, but "the sources from which the Central Bank can secure London funds are limited." There is no suggestion that any immediate urgency exists, but Mr Melville argues that the Commonwealth Bank needs to secure greater elasticity at home and more adequate exchange reserves in London in order to be prepared "for drought and other reverses before they overtake us." The effort, early this year, to unload some of the Bank's Treasury Bills upon the public was made partly to free the Bank and partly to test how far a market existed for such Bills. In the course of the experiment the latent conflict of interest between the Commonwealth Bank and the trading banks, especially the largest trading bank, came to the surface, and as a result short-term money rates were raised from 1½ to 2 per cent. This incident, while not perhaps of great intrinsic importance, reveals the rather slender monetary basis upon which Australian recovery has been built, and the difficulties of broadening that basis. If it is difficult in a time of high wool prices and relatively great prosperity for the Commonwealth Bank to take tentative steps to test the existence of a local market for bills, and to fund part of the existing issue, it seems obvious that in a period of greater strain relief by expanding central bank credit would run definite risks. Externally, London balances are not too great at present. If export receipts should suddenly shrink for any reason, the further depreciation of the Australian pound against which Mr Melville argues strenuously might be difficult to avoid. It is well that these questions should be publicly canvassed while they are still academic, rather than actual. The Report of the Royal Commission will be awaited with great interest.

In New Zealand there are definite and striking events to record. The Labour Government has nationalised the Reserve Bank but retained both the Governor and the existing board of directors. It has exercised its right of appointment to the directorate of the Bank of New Zealand by passing over two of the former directors in favour of two men new to banking, one of whom is Lecturer in Economics at the Massey Agricultural College. Considerable increases in public expenditure have been provided for by extra taxation, including a 20 per cent. increase in the income-tax, so that there is no intention of using the Reserve Bank to meet current expenses. On the other hand, the Reserve Bank will quite properly be used as the instrument through which the monetary side of the new marketing policies will be handled. Though details have yet to be worked out, the essential elements of the marketing policy are now clear. The Government becomes the owner, at a fixed price, of all dairy produce (and possibly later of other exports). It will endeavour to negotiate commercial treaties, primarily with the United Kingdom, to assure markets for this produce. It will then sell in those markets through the usual commercial channels at current prices. The price fixed for butter (117s. 3d. per cwt., New Zealand currency) is moderate, and seems

likely to lead in a rising market to an accumulation of reserves in London. If the dairy-farmers accept such a conservative policy in order to secure stability, the result may well be the accumulation of sufficient reserves to tide over a future depression. The Government has a strong position. With the support of fifty-five members in a House of eighty, and control both of the Reserve Bank and of the strongest trading bank, the only safeguard against rashness lies in the moderation and commonsense of the Government itself. Fortunately, the first steps taken, especially the fixing of such low guaranteed prices for dairy produce, offer substantial evidence that such moderation will be exercised. Meantime, there is ample evidence of returning prosperity, perhaps the clearest statistical proof being the increase of free deposits at the

trading banks from £26,374,859 to £31,583,672 in the year ending May 25, 1936. Fixed deposits increased in the same period from £35,885,504 to £36,675,282; but bank advances fell from £45,381,213 to £44,970,796. The sterling position of the New Zealand banking system is shown in the following table:—

(£N.Z. millions)			
	Trading Banks	Reserve Banks	Net Overseas
	Assets	Sterling Assets	Funds
May 27, 1935 ...	23.8	22.8	46.6
May 25, 1936 ...	21.6	23.4	45.0

On the whole, sterling assets have been well maintained, but there has been a small transfer from the trading banks to the Reserve Bank. Since last May, the total sterling assets have risen.

CANADIAN BANKING

(BY A CORRESPONDENT)

THE year in Canada has been marked by a revision of the constitution, and the completion of the first year's activities, of the Bank of Canada; the intensification of cheap money and continuance of business revival; the failure of the chartered banks to derive any substantial benefit from the business revival; the increasingly favourable balance of trade; and the failure to solve entirely the problem of local government debts.

The Liberal Government, in fulfilment of its election pledges, has strengthened Government control over the Bank of Canada by an Act recently passed. The Act provided for an increase in the capital of the bank, from \$5,000,000 to \$10,000,000, the new stock to be issued to the government. The Deputy Minister of Finance is now an ex-officio member of the Board of Directors, and also of the Executive Committee. The Government will also appoint six other directors, each of whom will have two votes.

The bank declared a net profit, for the period of about ten months ending December 31, 1935, of \$764,250. Of

this amount, only \$239,000 was required to pay the maximum dividend of 4½ per cent. The Dominion Government receives all surplus profits. The Governor of the Bank, at the first annual meeting, said that the functions of the bank were to try to regulate the volume of credit and defend the external value of the monetary unit; to be a ready source of skilful and impartial advice to the Government; and to afford timely co-operation to the banks of other countries. The passage of only a single year since the Bank of Canada's returns ceased to be distorted by its initial operations renders it difficult to see how the bank is developing its technique. The gold reserve has remained at about \$180 millions, being apparently valued at the current price from week to week. The variable part of the reserve is the bank's holding of sterling and United States funds, the former varying up to about \$5 millions, and the latter varying from about \$2½ to \$15 millions. The bank has thus apparently been prepared to operate in the exchange market (presumably in a stabilising way); but the

amounts involved are relatively small. The changes in the other items would appear to be mainly the result of Government financial operations. There is no indication of the bank's having made any determined effort to modify the general position of large surplus reserves. The returns issued at the end of each quarter are summarised below:—

BANK OF CANADA RETURNS
(\$'000)

	Sept. 30, 1935	Dec. 31, 1935	April 1, 1936	June 30, 1936
Note circulation	85,067	99,677	85,983	95,737

Loans and Advances:—				
Dominion Government	2,759	3,466	...	...
Provincial Government	...	...	...	3,000
Chartered Banks	...	...	...	...
Dominion Government secs. Total	104,198	114,283	108,046	111,687
Reserve ratio	63.9%	62.1%	65.04%	63.10%

The chartered banks further reduced their interest rates in the spring of this year. Since June 1, 1936, the rate paid on notice deposits and savings deposits has been reduced from 2 to 1½ per cent. Following this change, rates charged for current loans were also reduced by ½ per cent. Farmers are now charged 6 to 7 per cent., traders 5½ to 6½ per cent., and borrowers depositing collateral security are charged 5 to 6 per cent.

The revival in trade and the rise in security prices is reflected in an increase in the amount of currency in the hands of the public. Bank debits have, on the other hand, shown a slight fall, and (more ominous, perhaps, for the immediate future) the figures of contracts awarded have shown some falling off. The severe drought conditions in the wheat area will tend to check further recovery in the coming months. A notable feature of the trade recovery has been the complete failure of the chartered banks to find increased outlet for loans. While the volume of business has increased, the amount of current loans outstanding has continued to fall, the reduction being from \$823 millions in April, 1935, to \$725 millions in April, 1936. This failure of the demand for bank loans to expand with reviving trade has been the subject of remark in these columns in previous years. It was then parallel to the movement of English banking statistics—but whereas English bank advances are now expanding, the comparable Canadian figure has continued to fall. The enormous change during recent years in the portfolios of the chartered banks is portrayed in the following table:—

	Current Loans	Investments
	(Mill. dols.)	(Mill. dols.)
April 30, 1925	909	564
" 1929	1,321	526
" 1932	1,063	664
Feb. 1935	823	1,000
April 1936	725	1,314

INDIAN BANKING

(BY A CORRESPONDENT)

THE past year has been a period in which money has been exceptionally cheap in India and the Bank rate has averaged less than 3½ per cent., a low level reached last in the year 1890. With an almost complete lack of the seasonal demand for money which usually marks the beginning of the busy exporting season, lasting from November to March, the larger banks have found the employment of funds at remunerative rates extremely difficult, and banking profits generally have not been encouraging. The smaller and less important institutions operating chiefly in the mofussil districts have done perhaps better, as their profits are derived chiefly from sources outside the money markets. There can be little doubt that the funds available from the continued export

This radical change is probably due in part to the relative decline in agriculture, which had been more dependent on bank loans, and the great relative increase in certain other forms of economic activity, particularly mining, which are perhaps not so dependent on bank loans, but it must also be due in part to a change in the methods of financing business. Unless this steep downward trend in the demand for loans is reversed, the threat to the bank's profits will be serious. So long as cash reserves remain appreciably above the legal minimum the banks can recoup themselves, at least in part, by adding more to their investments than is needed to offset the contraction in current loans. In the past year the drop in current loans from \$823 to \$725 millions has been accompanied by an increase from \$1,000 to \$1,314 millions in investments. Deposits in Canada have risen from \$2,034 to \$2,158 millions, and foreign deposits from \$328 to \$392 millions.

One of the reactions of the banks to their reduced earning capacity has been the closing of unremunerative branches—sometimes by reciprocal arrangement with other banks. The total number of branches of the chartered banks in Canada has fallen from 4,083 at the end of 1930, to 3,527 at the end of 1934, and 3,431 at the end of 1935—a decline of 16 per cent. in five years. Their dividends remain at the reduced rates of the last two years.

The bankers' deposits at the Bank of Canada average about \$185 millions, ranging from \$171 to \$204 millions. These figures represent roughly 9, 8 and 10 per cent. respectively of the Canadian deposits. The legal minimum is 5 per cent. With such large substantial reserves here, and the Bank of Canada's own reserve proportion being almost 40 per cent. above the legal minimum, it is apparent that any automatic monetary check to inflationary developments is very remote. This adds to the importance of conscious banking policy. As a great exporter of primary products, Canada's balance of trade has naturally improved with the better markets for primary products. The active commodity balance in 1935 amounted to \$198 millions, as compared with \$153 millions in 1934. Exports of newly-mined gold remained practically unchanged at \$104 millions. Tourist traffic benefited from increasing prosperity in the United States, rising from \$69 to \$100 millions net in Canada's favour. Interest and dividend payments outwards, on the other side of the account, rose from \$195 to \$219 millions, probably because of the slightly lower average sterling value of the Canadian dollar in 1935 as compared with 1934, and the tendency of dividends to rise. The capital movement out of Canada, consisting largely of the retirement of old issues and repurchases by Canadians, rose from about \$80 to about \$140 millions. Canada thus appears to have settled down again to her post-war position as a predominantly creditor country. In terms of sterling, the Canadian dollar has, during the last eighteen months, hardly moved outside the range of 4.95 to 5 to the £. It has also remained practically at par with the United States dollar.

of treasure in recent years are now exercising a considerable influence in the Indian money markets, while other factors making for easy monetary conditions are the diminished volume of Treasury bills and the decline in the amounts formerly taken off the market annually by Government in the shape of loan flotations.

The Reserve Bank has also been a consistent buyer of sterling, offering to purchase up to £1,000,000 weekly by tender at its minimum rate of 1s. 6½d., with intermediates on tap at 1s. 6¾d., thus enabling banks to augment their local balances in India as need arose.

Since its inception in April, 1935, and in view of the prevailing conditions, the Reserve Bank has not found it necessary to pursue an active policy of attempting to

regulate credit. It gave some indication of its financial policy early in the exporting season by reducing the Bank rate from 3½ per cent. to 3 per cent. as from November 28th last, at which rate it has remained since; but with the call money rate throughout the winter months averaging about ¼ per cent. and with bank loans being freely granted at less than 2 per cent. for short periods, even a 3 per cent. Bank rate was out of touch with market conditions. Bankers' deposits with the Reserve Bank, which in August, 1935, averaged about Rs. 30 crores, rose under the influence of Government repayments of maturing loans in September, 1935, to Rs. 38 crores, and thereafter fluctuated largely in accordance with Treasury bill offerings. The present total is about Rs. 33 crores. As the sums lodged by the banks are nearly three times in excess of the compulsory minimum balances, the Reserve Bank has maintained a large proportion of these deposits in the form of notes held in its banking department, the increase in its sterling assets being derived from the substitution in its issue department of sterling securities in place of the Treasury bills run off in India. The note circulation throughout the year has fluctuated between Rs. 155 crores in August, 1935, and Rs. 172 crores in January, 1936, thereafter gradually falling away to the present level of about Rs. 160 crores. The intense speculative activity which developed in India in the late summer and autumn in connection with silver is probably the reason for a slightly wider variation between high and low levels as compared with previous years.

The figure of notes issued continues to record a steady increase, the total having risen from Rs. 186 crores in April, 1935, when the Reserve Bank took over the note issue, to over Rs. 200 crores at the present time. This is due largely to the provisions ensuring the convertibility of the silver rupee, the Reserve Bank's holding of rupee coins having risen from Rs. 49.95 crores to about Rs. 66 crores during the same period. While some part of the increased holding of silver rupees is due to the repatriation of rupee coins from places outside India, notably Iraq, Mauritius and the Seychelles, the bulk has undoubtedly come from the Indian people.

Though trading activity has been subdued, the past year's figures show on the whole some improvement in comparison with 1934-35, exports of merchandise at Rs. 164 crores being up about Rs. 10 crores and imports at Rs. 133 crores up about Rs. 2 crores. The exports of gold during 1935-36 are, however, some Rs. 15 crores lower than in 1934-35, and silver shows a net import on the year of Rs. 1¼ crores as compared with a net export of over Rs. 2 crores in 1934-35. Industrial production has been well maintained, and wholesale prices have remained steady.

In spite, however, of this sustained level of general economic activity, the aggregate deposits of the scheduled banks continue to increase and the figures of banks' advances to fall. The total deposits, which amounted to Rs. 208 crores in July, 1935, had risen by February, 1936, to about Rs. 224 crores, and are now about Rs. 228 crores, while the figures of advances and bills discounted in India, which were shown as Rs. 106 crores in July, 1935, fell to about Rs. 83 crores in November, 1935, and are now about Rs. 90 crores. Some of the factors contributing to the increase in deposits have already been noted, and the decline in advances can only be regarded as resulting from the easy monetary conditions which, while reducing the demands of the indigenous bankers for finance from the banking system, have also possibly allowed some long-standing credits to be liquidated.

The small proportion which bills discounted in India bear to the other advances should be noted. Banks in India have in the past preferred to make advances against produce by means of cash credits secured collaterally by the demand promissory note of the borrower, but it is to be hoped that the special discounting facilities now available from the central bank will tend to modify this practice. So long, however, as the difference between the *ad valorem* stamp duty on bills of exchange remains at its present rate of about 9 as. per cent. per annum, as compared with a maximum stamp charge of 4 as. for any amount on the demand

promissory note, the wider use of the inland bill must be handicapped.

Comparative figures relating to the Consolidated Return of Scheduled Banks are given below:—

CONSOLIDATED STATEMENT OF SCHEDULED BANKS

	(In lakhs of Rs.)			
	Aug. 2, 1935	Nov. 1, 1935	Feb. 9, 1936	July 31, 1936
Demand liabilities in India	110.11	124.89	122.18	126.92
Time liabilities in India	98.65	95.68	100.17	101.02
Cash in India:—				
(a) Notes	4.98	5.41	4.89	4.91
(b) Rupees	.51	.59	.58	.60
(c) Subsidiary coin	.25	.28	.22	.26
Balance with Reserve				
Bank in India	29.11	31.64	35.99	32.13
Advances in India	93.79	82.57	86.79	87.71
Bills discounted in India	2.86	2.72	4.58	2.82

In its relations with the Government the Reserve Bank has so far experienced no difficulty in supplying the Secretary of State with his sterling requirements, and on July 15th last provided sufficient to repay the outstanding balance of the 5½ per cent. Sterling Bonds, 1936-38, which was thought to amount to about £17 millions. As the Bank's returns subsequent to this date did not reveal a displacement of more than about £7,000,000, it is thought that the bulk of the Loan had been bought up beforehand on behalf of the Government. In India the Bank in May last, as agent for the Government, offered a 2½ per cent. 1948-52 Loan for Rs. 12 crores at par, which was immediately oversubscribed about 2½ times.

The inauguration of Provincial Autonomy on April 1st next will create new problems for the Bank consequent on the separation of Burma from India and the licence given to the Provincial Governments to regulate their own borrowings. So far as the first is concerned,

THE CHASE NATIONAL BANK

OF THE CITY OF NEW YORK

(Incorporated with Limited Liability under the Laws of the U.S.A.)

HEAD OFFICE:

PINE STREET CORNER OF NASSAU, NEW YORK

The Bank offers complete facilities for the provision of all banking services and the handling of Anglo-American and foreign business. Current and deposit accounts are invited and consultation with the management is welcomed.

the agreement entered into between the Governments of India and Burma will ensure no disturbance in the monetary relations of the two countries, which will continue as at present for three years, and, as regards the second, a conference has been held recently in India between the Central and Provincial Government authorities and the Governors of the Reserve Bank, whereby some clarification of the new position has been attained. Meanwhile, the more intricate problems indicated in Section 55 of the Bank Act relating to the incorporation of the indigenous banking community in the general banking system and the improvement of the

machinery for dealing with agricultural finance are engaging the attention of the Bank, which is not yet in a position to make public its proposals. The stimulus which has been imparted to rural reconstruction by the grants allocated by the Central Government of recent years and the progress made by the Provinces in passing legislation to protect the agriculturist from the extortionate practices of money-lenders are factors which will in time tend to bring joint-stock banking facilities closer to the ryot, but it is difficult to see how the Reserve Bank can render any effective assistance for some time.

IRISH BANKING

(BY A CORRESPONDENT)

THE Banking Commission has not yet issued its report although it has now been sitting for nearly two years. The terms of reference are so wide and many of the issues so contentious that a considerable time may still elapse before the report is ready for publication. While the strictest secrecy is being maintained regarding the Commission's proceedings, it is possible to surmise that one of the major problems with which it is concerned is that of the desirability of setting up a central bank in the Free State. There is unquestionably a feeling among the public that, in the absence of such an institution, the country's independence in monetary matters is not complete, and a strong argument in favour of establishing a central bank is that this feeling should be allayed and nationalist sentiment satisfied. On the technical side the establishment of such a bank presents many difficulties, which were dealt with in the report of the Banking Commission in 1926, on the recommendation of which the existing Currency Commission was founded.

The technical problem in relation to a central bank in the Free State may be thus summarised: some of the functions which such a bank is usually called upon to

perform are already performed quite satisfactorily by existing institutions, and others are incapable of being performed by any institution that could be established in the Free State. The note issue is in the hands of the Currency Commission, and the public accounts are admirably managed by the Bank of Ireland. The regulation of credit is in the hands of the commercial banks, whose rates are varied by the Banks' Standing Committee every time the Bank of England rate is changed. The demand for credit is so inelastic in Ireland that it would probably prove very insensitive to any independent variations in local rates which a central bank might make, even assuming that such variations could be made so as effectively to influence the commercial banks' rates.

This is but one of the consequences of the very close inter-relation between the banking systems of Great Britain and Ireland. There is not a single bank in the Free State which has not branches either in Northern Ireland or in England, and the head offices of some of the most important Irish banks are in London or Belfast. Enough has been said to indicate that the problems connected with a central bank in the Free State are unique,

and the report of the Commission should prove very interesting to students of monetary questions not only in Ireland.

The economic background of Irish banking showed signs of improvement about the middle of last year, since when agricultural prices have risen and the balance of trade has become less passive. The first national loan was converted in December, and several industrial issues have been successfully floated. A new equilibrium seems to have been attained, at a lower level than before the depression and the economic war. Much of the activity in the Free State is engendered by public expenditure financed by borrowing, and the annual burden of open and concealed taxation and the amount of dead-weight debt are growing at a rate that certainly cannot be indefinitely sustained. For the moment trade is active and business brisk. Bank debits in the first six months of this year increased to £328,701,000 from £307,055,000 in the same period last year.

The Irish banks' dividends were the same as last year, and their profits showed little change. Expenses have shown a rising tendency owing to the increase in the salaries of officials under the arbitration award, and the rate of interest on loans and investments has continued to remain at a low level. The slight increase in deposits shown in the consolidated balance sheet suggests that some saving has taken place in spite of the bad times, and that the money required for the new industrial flotations has been obtained by the sale of other investments rather than by the withdrawal of deposits. The slight reduction in advances in the Free State is likely to give a wrong impression unless properly interpreted, and the figures as given probably disguise a good deal of new borrowing, owing to the fact that a number of formerly frozen advances have been repaid, while local authorities have had to borrow less owing to the better collection of rates. Investments outside the Free State have increased, and it is the existence of this very large accumulation of external liquid assets that renders so difficult the problem of devising effective central bank control.

The excess of external assets over external liabilities would appear to have further declined, but changes in the method of segregation of certain items in the dividend balance sheet have introduced difficulties of comparison, and in fact the net sterling assets have increased by £1,368,000. Changes in this figure are useful indicators of movements of funds in and out of the Free State, and therefore of the balance of payments. While innumerable disturbing influences render

the interpretation of these statistics difficult, they serve as a rough means of corroborating other estimates of the balance of payments and they seem to bear out the suggestion that a new position of equilibrium has been established.

The issued capital of the Industrial Credit Company has been increased from £500,000 to £1,000,000. This company was incorporated in 1933 to act as capital underwriters and investment bankers, to carry on the business of an issuing house, and to engage in the financing of industrial undertakings in the Free State. Since it began business the company has underwritten or been associated in the underwriting of capital issues by companies to the total amount of £3,968,400, of which the underwriters were called upon to take up 12½ per cent. The majority of the shares of this company are held by the Minister for Finance, and it has played an important part in laying the foundations of a capital market in Dublin, where a long list of new local securities is now dealt in on the stock exchange.

The report of the Agricultural Credit Corporation for the year ended October 31, 1935, states that the aggregate of loans issued by the Corporation from the commencement of business in 1927 amounted to £1,305,903. The number of loans was 15,782, of which 15,549 were for sums under £500, 157 for sums between £500 and £1,000, and 76 for sums over £1,000. The average amount of the loans was £83. In spite of the difficulties of the agricultural industry the record of borrowers in regard to the payment of interest has been good. During the year the rate charged by the Corporation on advances was reduced from 6 to 5 per cent.

The Report of the Currency Commission for the year ended March 31, 1936, states that the volume of the legal tender note issue fluctuated between a minimum of £7,445,719 on July 27, 1935, and a maximum of £8,854,750 on December 23, 1935, the latter being the highest figure ever attained by this issue. Of the total assets of the legal tender note fund, amounting to £8,274,566 on March 31, 1936, the holdings of British Government securities of maturity exceeding twelve months amounted to £3,713,193. The surplus income of the Commission for the year amounted to £195,213, compared with £206,523 in the previous year, the decrease being the result of the diminished earnings of the legal tender note fund by reason of the substantial reduction of the proportion of investments of maturity exceeding twelve months held by that fund during the year. These diminished earnings were to some extent offset by income arising from an increase in the assets of the fund reflecting higher note circulation.

SOUTH AFRICAN BANKING

(BY A CORRESPONDENT)

THE year 1935-36 has again been one of increasing prosperity and business activity in the Union of South Africa. If, however, we look at the figures for separate industries, it becomes clear that, while the gold-mining industry and industries depending upon it are enjoying a very high level of prosperity, in other industries, especially those producing for export, recovery is less striking.

	1928-29	1931-32	1935-36
Value of—	(£ mill.)	(£ mill.)	(£ mill.)
Gold produced	44.3	47.6	77.3

NOTES.—(a) Not available.

(b) Including throughout balances with the South African Reserve Bank.

(c) Excluding Money at Call, which for this year is included with other assets.

The change in the figures between earlier years and 1926 is due to the incorporation of the National Bank of South Africa, Ltd., with Barclays Bank (Dominion, Colonial and Overseas).

The Wisdom of making a Will

The exceptional facilities of the Midland Bank Executor and Trustee Company, an affiliation of the Midland Bank, should strongly appeal to all who have not yet made a will or desire to revise existing plans for the care of their estates.

The Company acts in the following or similar capacities: ¶ executor or trustee under a will; ¶ trustee under a marriage or other settlement; ¶ trustee for any club, society, hospital or religious, charitable or other institution; ¶ manager of an estate; ¶ trustee for debentures or debenture stock. The use of its services ensures the following advantages:

- CONTINUITY The expense and trouble of appointing new trustees are avoided.
- SECURITY The Company is responsible for the acts of its officials.
- EFFICIENCY All officers have been specially trained for their duties.
- EASY ACCESS Co-trustees and beneficiaries may inspect their records at any time.
- LOW FEES The fees, fixed at date of appointment, are exceptionally low.
- SECRECY The staff are pledged to secrecy. Solicitors, accountants, stockbrokers and estate agents named by testators or settlors are employed whenever possible.

A book describing the services and quoting fees or a brochure entitled

"THE WISDOM OF MAKING A WILL"

may be obtained free on application to any branch of the Bank, the Head Office of the Executor and Trustee Company, Poultry, London, E.C.2, or its own branches in various provincial centres.

7 BISHOPSGATE, LONDON, E.C.2

H. KANO, Manager

The other most noticeable features in the combined accounts of the commercial banks for June 30th are a fall of over £5 millions in cash reserves in South Africa (mainly in deposits with the Reserve Bank) and a rise of a similar amount in South African investments. It seems probable that these movements reflect the recent Government borrowing in South Africa for the purpose of repaying maturing sterling debt, and it looks as if a part of the money required had been obtained from the banks and not from the public. The Reserve Bank's accounts also show a fall of about £5 millions during the year in its combined holdings of gold (at market price) and sterling bills. While, therefore, the cash reserves of the banking system show some decline in the direction of normal, deposits with the commercial banks are maintained at their inflated level.

In the light of the June figures it is clear that the present abnormal banking position, though essentially unstable, shows signs of only very slow adjustment.

Imports continue to rise, though somewhat less rapidly, and the total for 1935-36 (July to June) was about £9 millions higher than in 1934-35. Much of this expansion was, however, balanced by an expansion of exports. The true expansion in exports was, of course, much less than that shown in the trade figures, which are falsified by the fact that in 1934-35 the Reserve Bank was accumulating gold in Pretoria and liquidating its London stocks, while in 1935-36 the Reserve Bank was transferring part of its gold reserve to London, no doubt in preparation for the repayments of Government debt. Nevertheless, even when a guide to the real position is obtained by adding to exports of merchandise the value of the gold produced during the year, exports show an increase of about £6 millions:—

	1934-35	1935-36
	(£ mill.)	(£ mill.)
Exports of merchandise	27.3	30.6
Gold produced (at market price)	74.3	77.3

	1934-35	1935-36
	(£ mill.)	(£ mill.)
Imports	101.6	107.9
	71.9	80.8

Surplus of exports..... 29.7 27.1

The true export surplus thus declined during the year by between £2 and £3 millions, and is now probably very nearly identical with the net balance of "Invisible Imports" on income account. Thus in 1935-36 the South African balance of payments on income account was probably approximately in equilibrium.

In view of this, it is at first sight surprising that the net repayment by the South African Government of some £10 millions of overseas debt during 1935-6 should have been reflected in a decline of only £5 millions in the Reserve Bank's holdings of gold and foreign exchange. It is possible, of course, that part of the repayment had been provided for by the Government in the previous year; but it is much more likely that this year provision has been made for part of the still larger repayments which it is making in 1936-37. The most likely explanation of the way in which the banking system has financed the other £5 millions or more of the debt repayments is that a considerable amount of capital has been imported into South Africa during the year for investment in the gold mines and in general industry.

In 1936-37 the Government will effect a further net reduction of about £18½ millions in its overseas debt. It will be interesting to observe in the year's banking figures if this large transaction will at last have the effect of reducing the immense cash reserves of the banks to a more normal figure. If not, presumably interest rates will remain sufficiently low in South Africa for the Government to continue to raise conversion loans at home and to repay foreign debt as opportunity offers.

To sum up, it may now be said that there is a good chance that the peculiar factors in the present recovery, together with the careful policy followed by the banks and the Government, may enable the country to escape from the severe credit inflation which at one time seemed possible, and from its inevitable after-effects. Given the maintenance of the price and value of gold, the ultimate reaction from the present boom may be local and perhaps comparatively moderate.

BANK OF ENGLAND OPERATIONS, 1890-1914

By R. S. SAYERS

6s.

Bankers' Magazine: "... a most useful contribution to the story of English monetary history. While the author has not been able to draw on official sources for his data, he has relied upon some of the best possible contemporary sources, and his inferences and conclusions are, perhaps, thereby rendered all the more of interest. Those who regard monetary crises as belonging only to the post-War period will also be much interested in the evidence to the contrary which this book provides."

THE INDUSTRY AND TRADE OF JAPAN

By S. UYEHARA, M.Sc., with an Introduction by His Excellency BARON HAYASHI. New and revised edition.

The purpose of this book is, firstly, to survey the statistical development of Japan's industry and foreign trade, which have enormously increased since the Meiji Restoration, 1868; and, secondly, to examine closely the economic state of present-day Japan and also to elucidate the way to which she should be guided in the future.

THE RATIONALE OF CENTRAL BANKING

By VERA C. SMITH, Ph.D.

9s

This book examines the reasons why the system of Central Banking came to be adopted in preference to a "Free-banking" system with competition in the note-issue. It gives an account of the historical development of the main Central Banks and the circumstances in which they acquired their powers, and sets out the arguments advanced by the economists (on the Continent and in England and America) for and against "Free-banking" during the period 1840-1865 when the controversy was at its height.

P. S. King & Son, Ltd.
Westminster

MACMILLAN

Third Edition, completely revised, re-written and up to date
SCIENCE OF PUBLIC FINANCE

By PROFESSOR G. FINDLAY SHIRRAS.

Two vols. 24s.

Professor Shirras's work has been so largely extended, revised and brought up to date, that it has become virtually a new book. It now surveys the whole field with special reference to the results of recent speculations and the application of the principles to actual conditions. The two volumes are intended especially for students of finance, but will interest a much larger circle.

THE FUNDAMENTAL PRINCIPLES OF TAXATION

IN THE LIGHT OF MODERN DEVELOPMENTS

By SIR JOSIAH STAMP, G.C.B., G.B.E.

New and Revised Edition. 10s. 6d.

This edition has been thoroughly revised. The author has brought some of its statements to date by correcting footnotes, and introduced a good deal of new matter, illustrations from more recent events, and references to later problems, direct into the text, but clearly distinguished, for the guidance of the student.

AN ESSAY ON ECONOMY AND VALUE:
BEING AN ENQUIRY INTO THE REAL NATURE OF ECONOMYBy ALEC L. MACFIE (Author of *Theories of the Trade Cycle*).

7s. 6d.

This essay, the author states, has grown from a consideration of the definition of economics given by Professor Robbins in his "Nature and Significance of Economic Science." The definition is unusually important, he says, because it breaks new ground, in British economics at least.

BANCO DE CHILE

The report for the half-year ended June 30, 1936, shows that after writing off and providing for bad and doubtful debts the net profit is \$9,184,107, which, added to the shareholders' fund of \$9,325,511, gives an available total of \$18,509,618.

The board proposes to distribute this sum in the following form. To pay a dividend of \$9.00 per share, \$9,000,000, and to carry forward to shareholders' fund \$9,509,618.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

The profit for the year ended September 30, 1935, after deducting all expenses and charges, and after providing for bad and doubtful debts and legal reserves in South America, amounts to £209,913. To this sum has to be added £163,561 brought forward from last year, making a total of £373,474. From this

unappropriated balance the directors recommend the following distribution:—To dividend of 3 per cent., payable December 23, 1935, subject to income tax, £106,200; to contingency reserve, £100,000; to profit and loss carried forward, £167,274. A transfer of £500,000 has been made from contingency reserve to published reserve.

BANQUE BELGE POUR L'ETRANGER, S.A., BRUSSELS

At the end of last year the Eastern Branches of this bank were formed into a separate company, the Banque Belge pour l'Etranger (Extrême-Orient), S.A., while the then remaining assets, etc., of the Banque Belge pour l'Etranger were taken over by the Société Générale de Belgique. Profits for the year

1934-1935 amount to Frs. 8,670,842. Of the Frs. 9,051,947 carried forward from last year, Frs. 4,730,592 were utilised for writing down assets, and the remainder brings the total of profit and loss to Frs. 12,992,197

BRITISH AND CONTINENTAL BANKING COMPANY LIMITED

The report of the directors for the year ended September 30, 1935, shows a net profit of £13,587, of which, however, an amount of £1,577, representing income tax retained at source, in excess of tax due this year, must be deducted, thus leaving £12,010, to which must be added the balance brought forward

from last year £1,476, making an available total of £13,486. The directors propose to appropriate this balance as follows: Payment of a dividend of 4 per cent., free of tax, on December 31, 1935, £4,000; to be placed to reserve (thus increased to £92,500), £7,500; to be carried forward, £1,986—£13,486.

THE BRITISH BANK OF SOUTH AMERICA, LIMITED

The directors' report for the financial year ended December 31, 1935, states that the gross profits, after allowing for rebate of interest on current bills and drafts, for interest on deposits, and after making provision for bad and doubtful debts, amount to £123,106; this, with the balance of £119,744 brought forward from the previous year, makes £242,850. After deducting all charges at the head office and branches, including directors' remuneration, Government taxes in Brazil, etc., amounting to

£91,956, there remains available the sum of £150,894. The directors now recommend that a dividend of 2 per cent., amounting to £20,000, be now declared, payable on May 28, 1936, subject to income tax, on the paid-up capital of the bank of £1,000,000. After paying this dividend, there will remain the sum of £130,894, of which the directors propose to transfer the sum of £11,000 to contingencies account and to carry forward the balance of £119,894.

COMPTOIR NATIONAL D'ESCOMPTE DE PARIS

The report of the directors for the year ended December 31, 1935, shows that net profit, after the necessary reductions for expenses, taxes, and other charges, amounts to Fr. 44,213,301. A dividend was announced of Frs. 50 for each share, and Frs. 10-45 for each founders' share. This leaves Frs. 275,429, which increases the amount carried forward into the shareholders' account to Frs. 6,515,371.

COMMERCIAL BANK OF THE NEAR EAST, LIMITED

The following is a statement of the results for the year 1935: Profit for the year after making provision for bad and doubtful debts, rebate and directors' fees, £3,569; less balance of provision for depreciation of investments, £2,221—£1,348. Add balance brought forward from the year ended December 31, 1934, £1,628—£2,976. As well as the amount mentioned above, the sum of £5,000, transferred last year to contingency account to provide for any subsequent depreciation in investments, has had to be appropriated for the investment reserve in order to reduce the value of the securities to market value as at the date of the balance sheet. In view of the unsettled inter-decided to carry forward the above balance of profit and loss account of £2,976 to the current year.

HAMBROS BANK, LIMITED

The directors' report for the year ending March 31, 1936, shows that after payment of all expenses, making provision for rebate on bills discounted, bad and doubtful debts, and income tax, the accounts show a profit of £339,784. Deducting the directors' remuneration of £14,961, and adding the balance brought forward from last year of £94,192, there remains an available total of £419,014. After transferring £170,000 to contingency reserve account and allowing the sum of £50,375 for interim dividend

on the £10 shares and £9,390 for interim dividend on the £1 "A" shares paid on October 31, 1935, the directors now recommend the payment of a further dividend of 11½ per cent., less income tax, on the £10 shares, making a total of 18 per cent. for the year, less income tax, and a further dividend of 3 per cent., less income tax, on the £1 "A" shares, making a total of 6 per cent. for the year, less income tax, and that the balance of £92,502 be carried forward.

THE HONGKONG AND SHANGHAI BANKING CORPORATION, LIMITED

The directors report that the net profits for the year ending December 31, 1935, together with \$3,294,701 balance brought forward from last account, after paying all charges, deducting interest paid and due, and making provision for bad and doubtful accounts and contingencies, amount to \$15,383,543. They recommend writing off bank premises account the sum of \$1,000,000, in addition to a transfer already made from allocations accumulated in previous years for a contingency which

has now become non-existent. After deducting \$1,000,000, the interim dividend of £2 10s. per share, paid on August 12th last, viz.: £400,000 at 2s. 2½d.—\$3,622,641, and remuneration to directors, there remains for appropriation \$10,699,860, out of which the directors recommend the payment of a final dividend of £3 per share, viz., £480,000 which, at 1s. 3½d., the rate of the day, will absorb \$7,372,800. The balance \$3,327,060 to be carried to new profit and loss account.

THE IMPERIAL BANK OF IRAN

The profits for the year ended March 20, 1936, after making provision for expenses of management, general charges in London and at chief office and branches, income tax, and bad and doubtful debts, amount to £75,786, to which has to be added £49,818 brought forward from last account, making a total of £125,604. The assets and liabilities of the branches in Iran have been converted at the rate of exchange of Rials 80 per £ sterling,

being the rate on March 20, 1936. The rate last year was Rials 66. The directors now recommend payment of a final dividend of 7s. per share, and a bonus of 2s. per share, making with the interim dividend of 4s. per share a total for the year of 13s., free of income tax. It is also proposed to add £10,000 to reserve, which is thereby increased to £740,000, and to carry forward £50,604.

Our New
Information Service

The Intelligence Branch of the *Economist* has now been enlarged to meet the growing demand for economic and statistical information. The Department has been able to secure the services of a number of experts, and is prepared to supply information and reports on any branch of industry and finance as well as on international relations at a fee proportionate to the work involved.

Enquiries should be addressed to the
Intelligence Branch
THE ECONOMIST
8 Bouverie Street, London, E.C.4

A SELF-BINDER
FOR
The Economist

Week by week you keep your copies of "The Economist," and ultimately you either file them or bind them. Doubtless you are accustomed to the annoyance which attaches to the ordinary binder—the difficulty of reading half the left-hand page and the unwieldiness of the device generally.

We are able to offer our readers a binder which overcomes these irksome difficulties and is, in our opinion, the most efficient contrivance for the purpose we have yet seen.

It holds three months' issues and index, it has no wires, clips or metal contrivances, and each issue can be bound up in an instant in such a way that it can be read as easily as a well-bound book.

Correspondents all over the commercial towns of Syria, Lebanon and Iraq, the Near East and the principal financial centres of the world.

Organised to act as Correspondents for Foreign Banks

IONIAN BANK, LIMITED

The directors' report for the year ended August 31, 1935, shows a net profit of £12,079, to which has to be added balance brought forward from last accounting year £14,567, leaving available for distribution £26,646. This, the directors propose,

should be disposed of as follows: Dividend for the year at 2s. per share, subject to income tax, £12,000; leaving a balance to be carried forward of £14,646.

THE NATIONAL BANK OF EGYPT

The report for the year ending December 31, 1935, shows the following statement: Gross profit for the year, after providing for depreciation on the bank's buildings and furniture, for rebate of discount, and for doubtful debts, amounts to £906,529. After deducting from this for directors' fees £15,223, and for

current expenses £464,621, the remainder is divided between the statutory dividend of 4 per cent., amounting to £120,000, and an additional dividend of 11 per cent., amounting to £330,000. By adding the balance brought forward from last year, £230,299, there remains £206,984 to be carried forward.

SOCIÉTÉ GÉNÉRALE Pour Favoriser le Développement du Commerce et de l'Industrie en France

The directors' report for the year ended December 31, 1935, states that net profits amount to Frs. 60,575,621. It was proposed to declare a dividend of 5 per cent., i.e., of Frs. 12.50, on 1,210,932 shares half paid up, and Frs. 25 on 39,068 fully-paid shares, amounting to Frs. 16,113,350. A statutory payment of Frs. 3,508,727 to the directors and auditors leaves a surplus of Frs. 40,953,544, to which is added Frs. 27,134,853 carried forward from last year. A further dividend was proposed of Frs. 32.50, the same as last year, amounting to Frs. 40,625,000, leaving Frs. 27,465,396 to be carried forward.

SWISS BANK CORPORATION

After deduction of expenses and taxes, and making provision for bad and doubtful debts, etc., the net profit for the year ended December 31, 1935, amounts to S.Fcs. 7,116,142, which together with the amount carried forward from last year, viz., S.Fcs. 1,139,943, makes a total of S.Fcs. 8,256,085. The board propose to pay a dividend of 4½ per cent. on the paid-up capital, which will absorb S.Fcs. 7,200,000, and to carry forward S.Fcs. 1,056,085.

THE YOKOHAMA SPECIE BANK, LIMITED

The directors' report for the half-year ending December 31, 1935, shows that the net profit of the bank, after providing for all bad and doubtful debts, rebate on bills, etc., was Yen 16,760,937, inclusive of Yen 9,503,102 brought forward from last account. The directors propose that Yen 1,700,000 be added to the reserve fund, and recommend a dividend at the rate of 10 per cent. per annum, which will absorb Yen 5,000,000. The balance, Yen 10,060,937, will be carried forward to the credit of next account.

THE ECONOMIST TRADE SUPPLEMENT

New Series

SATURDAY, OCTOBER 24, 1936

No. 161

THE STATE OF TRADE

THE latest industrial reports and business statistics furnish further testimony to the remarkable vitality of domestic British industry. But while the volume of exports of British manufactures is still only about 75 per cent. of the pre-depression level, the volume of imports of raw materials has recently been about 25 per cent. higher than in 1929.

Despite the remarkable expansion of the capital goods industries and the large-scale re-equipment of British industry, it would be difficult as yet to point to serious over-extension of capacity by private enterprise. Prospects in the near future remain encouraging for most branches of activity. Costs of production are increasing, but there are no signs of a really steep rise which would seriously cut into profit margins, at any rate in the immediate future. The Government's cheap money policy is reflected in an increase of £8 millions in the investments of the Clearing Banks between August and September. This is the first time in recent months, incidentally, that investments showed an increase over the corresponding month a year ago. Advances rose by £6 millions to £851 millions between August, and September.

In some branches of activity, such as the metal industries, progress is hampered to some extent by the scarcity of skilled labour and machinery. The difficulties, however, are being smoothed over by the dilution of skilled labour and by the introduction of more labour-saving machinery, as well as by increased imports of iron and steel and machinery.

The stringent supply conditions in the metal industries are partly due to the fact that armament expenditure is concentrated on these branches of activity. Despite the record level of steel production, for example, consumers find difficulty in obtaining their requirements within reasonable time. Producers of pig iron are now rationing consumers in practically all districts. Moreover, it now appears that many consumers of iron and steel had underestimated their requirements over the winter, and are now pressing for additional supplies which are difficult to obtain at short notice. The building industry also continues active, though it seems that that branch of activity may have reached a peak. Our index of Building Activity is no longer steeply upwards, and the value of new plans in September was about 8 per cent. lower than a year ago. It must be remembered, however, that these returns exclude London and relate to towns with only a little more than one-third of the total population of this country. Thanks to the expansion of industrial demand, the output of coal continues above the level of a year ago, and home consumption now exceeds the 1929 level. There are also indications that the decline in exports has been arrested. Consumers' goods trades which do not largely depend on

exports are making headway, with the expansion of general business activity. The automobile industry, for example, is receiving more orders for the new season than a year ago. There are also indications of improvement in the cotton industry, and activity in the wool textile trade remains well above the level of a year ago.

The sustained improvement in general economic conditions is reflected in the *Economist's* Index of Business Activity, which remained unchanged in September at the record level reached in August. Of the 14 constituent series of the Index, shown on page 31, 8 registered a rise and 5 declined, while one remained unchanged, between August and September. As a year ago, unemployment rose slightly in September, but may be expected to continue its downward trend during the remainder of the year. The indices relating to the consumption of power, the volume of traffic and foreign trade all registered a rise between August and September, and are well above last year's figures.

There has been some apprehension lest the devaluation of the former gold bloc may lead to a temporary reduction in British exports. So far, however, there has been hardly any evidence of a decline in export orders. Moreover, it is still too early for devaluation to have had much effect on business activity in France, Holland, Italy and Switzerland. Some

improvement in these countries is generally expected in the near future.

Another development of importance is the marked upward trend of the prices of some of the leading primary products in recent weeks. This rise of prices is benefiting a large number of countries, including the British Empire and Latin America, where business conditions are still improving, and should ultimately stimulate international trade, which is still about 20 per cent. lower in volume than in 1929.

In the Scandinavian countries business activity is maintained well above the pre-depression level. Industrial production in Germany has recently continued upwards, but in Austria and Belgium the improvement has tended to slow down. In the Far East, industrial activity is maintained at a high level in Japan, and China's foreign trade is on the up-grade. Recovery is now proceeding rapidly on a wide front in the United States though, in contrast with the United Kingdom, Scandinavia, Germany and Japan, the current level of industrial production across the Atlantic is still nearly 10 per cent. below the average of 1929.

Thus, in contrast with the uncertain European political situation, the economic barometer is still set fair in the majority of countries.

HOME INDUSTRIES AND TRADE

The following reports on British industry cover, in most cases, the period to the middle of October. In the remainder they relate to the month of September.

COAL

The position of the industry showed little change last month and employment was as slack as ever. Output rose from 17,056,000 tons in August to 18,805,000 tons in September—but the latter month had one more working day than the former. Both production and employment were, however, considerably better than in September, 1935, and exports were also higher. Demand for house coal is increasing slowly, and a cold spell would now be of considerable benefit to the collieries. The market in industrial grades of coal and coke remains very firm and a shortage of some classes is probable during the coming winter. Export demand was quiet immediately after the recent currency devaluations, but is now expected to improve. Considerable advantage is anticipated from the reduction in the French import duty to 6 francs per ton and the increase in the British quota by 10 per cent. as from October 1st.

IRON AND STEEL

Production of steel ingots and castings in September, at 1,027,000 tons, for the first time exceeded one million tons. Pig iron production also is being increased steadily, yet the expansion of the output of the iron and steel industry barely keeps pace with the increasing home demand. The pressure of home demand has not only arrested the expansion of exports, but it has necessitated a considerable increase in imports, from 89,300 tons in September, 1935, to 165,300 tons in the past month. Moreover, in most districts pig iron producers have now to ration consumers. Costs of production are tending to rise. Meantime, home demand continues on the upgrade, and it is practically impossible to place orders for finished products except for far forward delivery.

ENGINEERING

Under the stimulus of a heavy re-equipment demand, accentuated by re-armament, activity in the engineering industry is expanding steadily, and the proportion of unemployed persons in engineering has now fallen to 7.9 per cent. But, as in the case of iron and steel, the rapid expansion of the demand for machinery has necessitated a considerable increase in imports to supplement home production. Total imports, mainly from Germany and the United States, rose from 53,579 tons in January-September, 1935, to 73,785 tons during the first nine months of the current year. Exports, on the other hand, declined from 284,653 tons to 283,877 tons during this period. Although the devaluation of the former gold bloc is welcomed by the industry, it is thought possible that the "short-run" effect may be unfavourable. Despite the rising trend of costs of production the indications point to a further expansion of activity during the winter.

ELECTRICAL ENGINEERING

Activity continues at a high level in the electrical equipment industry; the volume of new orders for heavy machinery showed a further increase in September.

INDEX OF NEW ORDERS RECEIVED BY HEAVY ELECTRICAL MANUFACTURING INDUSTRY*
(1920 = 100)

Period	Home	Export	Total

* Copyright of the British Electrical and Allied Manufacturers' Association. The above index is a 12-month moving average of new orders received by the heavy plant section of the industry. It is based on the horse-power and not on the value of orders.

MOTOR INDUSTRY

The Motor Show has been very successful, and it is understood that orders booked this year are substantially in excess of the 1935 figure. According to the official returns the number of private cars licensed at August 31st (the latest figure available) totalled 1,604,948, against 1,455,721 last year; licences current for goods vehicles on the same date were 438,565, against 414,760

a year earlier. These figures give some measure of the industry's progress on the home market over the past year. Meanwhile, sales overseas also continue to run above the 1935 level. The outlook for the new season appears satisfactory.

CHEMICALS

Conditions have been more normal during September than in either of the two previous months. Wood distillation products continue good, demand for charcoal and wood tar increasing considerably. Cresylic acid continues to make steady progress, but the coal tar market on the whole is poor. There was an increase of £59,081 in the value of exports of chemicals, drugs, dyes and colours in September, compared with the same month of 1935. September imports of the same products showed an increase over last month.

COTTON

The cotton textile industry has enjoyed a slight improvement during the past month and the gain over a year ago has been well maintained. Raw cotton prices have been subject to fluctuations, but have, on the whole, shown a firmer tendency. Largely due to increased confidence in prices, demand in most sections has been more active and some spinners and manufacturers have extended their order lists. The percentage of spindles in full production rose from 79 in August to 81 in September, against 75 a year earlier. On the other hand, costs of production are showing an unmistakable tendency to advance. Meanwhile, India leave much to be desired, but business with other Dominions shows a marked improvement.

WOOL

The wool textile industry as a whole has enjoyed another active month. Employment improved in September and was generally better than in the corresponding month of 1935, employment showed practically no change in the worsted section and a considerable improvement in the woollen section. Following the firm close of the September wool sales in London, prices on world markets have been well maintained, despite the currency devaluations of the past month. Meanwhile, British exports of woollen and worsted yarns and manufactures continue well above the level of a year ago, the improvement in September being well distributed between the different categories and also between the various importing countries. The industry is now making active preparations for spring and summer demand in 1937.

JUTE

Prices on the home market firmed up during the past month and business showed an improvement. Unemployment consequently registered a further slight decline. Meanwhile, the price "war" in Calcutta between the associated mills and the "outside" mills continues.

RAYON

Demand for rayon yarns of various types is moderately active and turnover is expanding. Now that more interest is being shown in spring goods, a general improvement in business is anticipated. Meanwhile, new outlets are being found for staple fibre, and a large volume of business is looked for in the early part of 1937.

LINEN

Flax prices have advanced on Continental markets, following the devaluations of the past month. Yarns are in active demand in this country—especially damask and cambric qualities—and there is a more general inquiry for cloth, both on home and export account. Prices are firm generally.

BOOTS AND SHOES

The employment position showed a further improvement at the principal centres last month and was appreciably better than at this time last year. Exports, however, remained below the 1935 level.

POTTERY

A considerable improvement, partly seasonal in character, was recorded in September, but numerous operatives remained on short time. Exports in September showed an improvement on the corresponding month last year.

AGRICULTURE

Corn crops are generally free from disease and are in fairly good condition, but the estimated yields of wheat, at 15.7 cwt. per acre, barley, at 15.8 cwt. per acre, and oats, at 14.6 cwt. per acre, are below the average of the previous ten years. The yield of main crop potatoes is forecast at 5.9 tons per acre, or 0.5 tons below the ten years' average. The yield of turnips and swedes, estimated at 12.0 tons per acre, is above, while that of mangolds, at 17.8 tons per acre, and sugar beet, at 8.1 tons per acre, are below the average of the previous ten years. Owing to the protracted harvest, autumn cultivation is not so forward as usual.

† Annual indices represent averages of monthly figures.

STATE OF TRADE OVERSEAS

BRITISH EMPIRE

Australia.—Wheat prospects are less favourable, but butter production is slowly expanding, states a cable from the National Bank of Australasia. A large wool clip is, however, assured and the market is more stable. A slackening of business is reported in some sections, owing to shortage of rainfall and international difficulties. Building activity and sales of motor cars have recorded a slight decline, but the Stock Exchange remains buoyant. The budgetary position is satisfactory and overseas trade remains above the 1935 level.

South Africa.—Prosperity continues to reign in the Union and, following the currency developments of the past month and the rising trend of gold prices, the outlook appears favourable. Revenue is buoyant, railway receipts continue on a high level, and the building trades are very active. Imports totalled £7,109,000 in September, against £5,976,000 a year earlier, while exports (including gold) were £8,355,000, against £8,540,000 in September, 1935.

Canada.—Business activity in the Dominion has been well maintained, although the advance has been somewhat irregular. Industrial prospects appear to be generally favourable and the employment position is slowly improving. Commodity prices, led by grains and metals, are on the up-grade and the Stock Exchanges are active. Foreign trade remains above the 1935 level.

India.—Rainfall has been fairly good and the condition of the crops is reported to be generally satisfactory. The acreage under groundnuts, sugar cane and sesamum, according to official reports, is considerably higher than in 1935. Imports of merchandise in August fell to 929 lakhs of rupees, against 1,119 lakhs a year earlier, while exports of merchandise totalled 1,422 lakhs, compared with 1,204 lakhs in August, 1935.

EUROPE

France.—The devaluation of the franc was the outstanding event this month. The interval since devaluation, however, has been too short for the effects to make themselves felt in the sphere of business activity. Wholesale prices have risen by about 10 per cent. during the first half of October, while the value of industrial securities has increased by about 26 per cent. The number of persons in receipt of unemployment benefit rose from 407,733 on September 26th to 411,536 on October 17th. The latest official index of production, relating to August, shows a sharp decline of activity in that month to the level of the corresponding month last year. While France should ultimately benefit from devaluation, the outlook for the immediate future is still somewhat obscure.

Germany.—Business activity is maintained at a high level, especially in the metal industries. The engineering industry is benefiting from the inability of manufacturers in this country to supply requirements. British imports of machinery from Germany, for example, have risen from £2,731,000 during the first nine months of 1935 to £3,437,000 during the corresponding period this year. Unemployment, as officially recorded, declined from 1,098,500 to 1,035,000 during September, compared with 1,713,900 persons unemployed at the end of September, 1935. The latest decline, however, is partly due to the lengthening of the military service. Coal production in the Ruhr district rose from 342,800 metric tons per day during the first week of September to 353,700 tons per day during the week ended October 3rd. During the same period railway car-loadings increased from 140,000 per day to 143,100 per day. The official wholesale and retail price indices are again practically unchanged on the month.

Norway.—In Norway, too, the current volume of business activity continues well above the level of a year ago. The index of industrial production rose from 101.2 (1929 = 100) in July to 115.8 in August, against 106.3 a year ago. The number of registered unemployed at the end of August was only 23,477, compared with 28,281 last year. The value of both imports and exports in August was higher than in August, 1935.

Sweden.—Industrial production continued to expand in August, when the index of Sveriges Industriförbund rose to 137.1 (1929 = 100), compared with 126.9 a year ago. The latest unemployment figures show a reduction on those of a year ago. Exports rose from 131.9 million krona in July to 135.9 millions in August, against 118.2 millions in August, 1935. Imports in August, at 125.8 million krona, were slightly lower than in July, but 5.7 millions higher than last year.

Poland.—Poland is only slowly making headway against the depression. In August the volume of industrial production, though 9.5 per cent. higher than a year ago, was still 26.5 per cent. below the level of 1929. The number of applicants for work at the end of August, at 269,000, was only about 1,000 smaller than a year ago. The value of both exports and imports in August, however, was appreciably higher than in August, 1935.

UNITED STATES OF AMERICA

Business activity in the United States continues on the up-grade. The Standard Statistics Co., for example, calculated that production in the third quarter of 1935 showed an increase of 13½ per cent. over the corresponding period a year ago in the case of consumption goods trades and of 41 per cent. in the case of the capital equipment industries. Among consuming goods trades

the cotton, rayon and footwear industries are very active. Mr. Alfred Sloan, President of General Motors, has predicted a 20 to 30 per cent. increase in automobile sales in 1937. Last summer's drought does not appear to have reduced farm income; and an increased acreage is being sown to winter grain crops under favourable conditions. Moreover, expenditure on industrial re-equipment and on extensions of plant is steadily increasing, thus stimulating the capital goods industries. Altogether, business prospects for the remainder of the year are distinctly favourable.

* Preliminary estimates made by Messrs Moody, subject to revision. † Federal Reserve Board Index of Factory Employment. ‡ Closing prices. § Partly estimated. || Compared with Aug., 1935.

LATIN AMERICA

Argentina's exports of maize and linseed have increased sharply, partly as a result of the American drought, thus improving the country's balance of payments. These favourable factors have given a fillip to business activity generally, whilst the "free" market exchange rate has improved to the best level recorded since that market was recognised at the end of November, 1933. Following upon the re-alignment of European currencies, the Brazilian milreis has been linked to the dollar. During January-September the quantity of coffee supplied to world markets by producing countries other than Brazil was 1,163,000 bags greater than in the same period of 1935, whereas Brazil's supplies declined to the extent of 390,000 bags. Despite marked increases in cotton exports, coffee still predominates over all other products exported from Brazil. Brazil's exports for the seven months ended July were £20,320,732 (gold), against imports of £16,606,282, so that the net balance in Brazil's favour at the end of July was £3,714,450 (gold), against a corresponding figure last year of £3,371,821. The shortage of foreign exchange continues acute in Chile and the situation in respect to sterling and dollar cover is becoming increasingly uncertain. Reports concerning the forthcoming mild coffee crops in Central America continue favourable. Greater freedom of exchange is confidently expected in the near future in Nicaragua, but, on the other hand, the reintroduction of control in Ecuador is now being organised. German competition generally in South America continues acute under the "compensation" mark system.

THE FAR EAST

Business activity in Japan remains on a high level and there appears to be no sign of an early setback. Despite the devaluations of the past month, the trend of commodity prices remains upward. The first estimate of this year's rice crop places the probable output at 67 million koku, an increase of 10 millions on last year's corresponding figure. Imports amounted to 199 million yen in September and exports to 253 millions, compared with 136 and 227 millions, respectively, in the same month of last year. Meanwhile, the bond market has weakened on the announcement of a proposed increase in taxation, and industrial securities have also been easier. China's foreign trade continues to run well above last year's level. Thus imports totalled \$80.4 millions last month and exports \$59.6 millions, against \$54.4 and \$45.9 millions, respectively, in September, 1935.

STATISTICS

In the following tables we give trade and other statistics for as many countries of the world as possible, our endeavour being to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations (published by George Allen and Unwin, Ltd.).

Unless otherwise stated, the figures represent authorised share issue of new joint stock companies at home, and the increase of capital of existing companies. Bonus shares are excluded from the figures of Rumania and Czechoslovakia. In the case of the Netherlands, Switzerland and the U.K. both bonus shares and conversions are excluded. *c* Excluding Treasury Bills. *d* Excluding large railway issues. *e* Since Jan., 1925, foreign issues. *f* Since 1924, excluding amalgamations and conversions. *g* Until end 1922 paper marks. *h* "Société de Banque Suisse," figures of net amount of new issues, excluding western departments; since 1928 amounts actually issued, whole territory. *i* Up to 1927, authorised issues, excluding western departments; since 1928 amounts actually issued, whole territory.

AGREEMENT BETWEEN HIS MAJESTY'S GOVERNMENT IN THE UNITED KINGDOM AND THE ARGENTINE GOVERNMENT RELATING TO TRADE AND COMMERCE, WITH PROTOCOL, PROTOCOL OF SIGNATURE AND LETTERS

London, December 1, 1936

THE Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the Argentine Republic;

Affirming their common determination to uphold and carry out the Treaty of Amity, Commerce and Navigation signed at Buenos Aires on the 2nd February, 1825; and

Considering it to be expedient, in order to increase and facilitate trade and commerce between the United Kingdom of Great Britain and Northern Ireland on the one hand and the Argentine Republic on the other, to supplement the said Treaty of 1825 by certain additional provisions relating to trade and commerce between these two countries; and

Being desirous of concluding an agreement for this purpose, have accordingly agreed as follows:—

ARTICLE I

(1) The Government of the United Kingdom, fully recognising the importance of the livestock and agricultural industry to the economic life of Argentina, undertake that, in the event of their regulating quantitatively the imports from foreign countries of the kinds of meat specified in the First Schedule to this Agreement, allocations shall be granted to Argentina which will not be less either in quantity, or in proportion to total regulated imports from foreign countries, than those set out in that Schedule.

Provided that (i) if in any period Argentina is unable to supply any part of her allocation, the Government of the United Kingdom will be entitled to re-allocate that quantity among other countries, and (ii) in the event of any other foreign supplying country renouncing or forfeiting, in whole or in part, its allocation, the allocation to Argentina shall be increased in a ratio no less favourable than that applied for the purposes of an increased allocation to any other foreign country.

(2) Whenever a system of import licences is in operation in the United Kingdom and the Argentine Government exercise the control of meat exports to the United Kingdom, the Government of the United Kingdom, when issuing the import licences, will take into consideration the export licences issued by the Argentine Government.

(3) The Argentine Government agree in principle to co-operate in the scheme which is at present under discussion between the Governments concerned for the regulation of supplies of beef to the United Kingdom market through an International Conference, and the Governments of the United Kingdom and of the Argentine Republic will, as soon as possible, enter into a supplementary agreement for the purpose of giving effect to the scheme.

It is understood that nothing in the scheme for the regulation of supplies of beef to the United Kingdom market through an International Conference shall prejudice the guarantees given to the Argentine Government under the provisions of this Article.

ARTICLE 2

No quantitative limitations shall be established on imports into the United Kingdom of the articles enumerated in the Second Schedule to this Agreement, produced or manufactured in the Argentine Republic, from whatever place arriving.

ARTICLE 3

(1) In the event of quantitative limitations being established on imports into the United Kingdom of articles other than those enumerated in the First and Second Schedules

to this Agreement, treatment not less favourable than that accorded to such articles produced or manufactured in any other foreign country shall be accorded to such articles produced or manufactured in Argentina, from whatever place arriving. Where quantitative allocations are made to individual countries, Argentina will be allocated an equitable share of permitted imports from foreign countries, having regard to the proportions of the total imports of such articles into the United Kingdom from foreign countries which have been supplied by Argentina to the United Kingdom in recent years. The Government of the United Kingdom will consult with the Government of the Argentine Republic before any allocation is made to Argentina in respect of any such article, and will take all relevant circumstances into account.

(2) In the event of the Government of the United Kingdom proposing to regulate quantitatively the imports of fruit and vegetables of kinds imported in substantial quantities from Argentina, they will, before introducing any measure of regulation, consider any representations that the Argentine Government wish to make as to the method of its application and as to its effect on the trade of Argentina.

ARTICLE 4

(1) Whenever any system of exchange control is in operation in Argentina, the conditions under which foreign currency shall be made available in any year shall be such as to secure that there shall be available, for the purpose of meeting applications for current remittances from Argentina to the United Kingdom, the full amount of the sterling exchange arising from the sale of Argentine products in the United Kingdom after deduction of a reasonable sum annually towards the payment of the service of the Argentine public external debts (national, provincial and municipal) payable in countries other than the United Kingdom.

(2) Subject to the aforesaid provision being first made towards the service of the public external debts, the order in which the sterling exchange so made available shall be distributed among the various classes of applicants for remittances to the United Kingdom shall be settled by agreement between the Argentine Government and the Government of the United Kingdom.

(3) The Argentine Government undertake that in no event shall applications for exchange for remittance to the United Kingdom be less favourably treated than similar applications for exchange for remittance to any other country.

(4) The Government of the United Kingdom will co-operate with the Argentine Government to the best of their ability in order to secure that the amount of sterling exports to the United Kingdom by the export of Argentine products as possible with the value realised for such products on the United Kingdom market, due account being taken of the necessary deductions for freight, insurance, &c.

ARTICLE 5

(1) The articles enumerated in the Third Schedule to this Agreement, produced or manufactured in the United Kingdom, from whatever place arriving, shall not on importation into the Argentine Republic be subjected to duties or charges other or higher, and shall not be assessed at higher valuations, than those specified in the said Schedule.

(2) The articles enumerated in the Fourth Schedule to this Agreement, produced or manufactured in the United

Kingdom, from whatever place arriving, shall not on importation into the Argentine Republic be subjected to duties or charges other or higher, and shall not be assessed at higher valuations, than those specified in the said Schedule, subject to the reservations established in the said Schedule.

(3) Provided that a surcharge not exceeding 10 per cent. of valuation for duty may continue to be levied on the goods referred to in the preceding paragraphs of this Article, it being understood that it is the intention of the Argentine Government to maintain such surcharge only if financial circumstances necessitate it and as an emergency measure; it is further their intention to reduce and ultimately to abolish such surcharge so soon as fiscal considerations permit, so that the total charges leviable on importation of the articles enumerated in the Third and Fourth Schedules shall not exceed those therein specified.

(4) The Government of the United Kingdom agree to consider sympathetically any proposal made by the Argentine Government for replacing in whole or in part by *ad valorem* duties any of the specific duties or by specific duties any of the *ad valorem* duties set out in the Third and Fourth Schedules.

ARTICLE 6

No duty or charge of any kind shall be levied on imports into the Argentine Republic of coal, coke or any other article admitted free of duty on May 1, 1933, produced or manufactured in the United Kingdom, from whatever place arriving.

ARTICLE 7

No internal taxes shall be imposed in the Argentine Republic on whisky of United Kingdom origin other or higher than those which are or may be imposed on potable spirits according to their alcoholic strength of national or any other origin.

ARTICLE 8

(1) The articles enumerated in the Fifth and Sixth Schedules to this Agreement, produced or manufactured in the Argentine Republic, from whatever place arriving, shall not on importation into the United Kingdom be subjected to duties or charges other or higher than those specified in the said Schedules:

Provided that, if in either half of any calendar year the *ad valorem* incidence of the duty charged on Argentine chilled beef should have been 17½ per cent. or less, the duties specified in the Sixth Schedule shall, as soon as possible, be reduced for a period of six months by 2½ per cent. *ad valorem* for every 2½ per cent. by which that *ad valorem* incidence has fallen short of 20 per cent.

(2) The Argentine Government agree to consider sympathetically any proposal of the Government of the United Kingdom for replacing in whole or in part by specific duties any of the *ad valorem* duties or by *ad valorem* duties any of the specific duties set out in the said Schedules.

ARTICLE 9

The Contracting Governments agree that if either Government is of opinion that any measure taken by the other Government is liable to upset the equilibrium resulting from this Agreement, the latter Government will give

sympathetic consideration to such representations and proposals as the other Government may make with a view to effecting a mutually satisfactory adjustment of the matter. In the event of the two Contracting Governments failing to reach agreement within a period of three months from the date of the receipt of such representations, it shall be open to the Government making the representations to give notice to the other Government of their intention to terminate this Agreement and, notwithstanding the provisions of Article 13, the Agreement shall cease to have effect one month after the receipt of such notice.

ARTICLE 10

Nothing in the present Agreement shall be deemed to affect the rights and obligations arising out of the Treaty of Commerce and Navigation signed at Buenos Aires on February 2, 1825.

ARTICLE 11

The Contracting Governments agree that any dispute which may arise between them relating to the proper interpretation or application of any of the provisions of the present Agreement shall, at the request of either of them, be referred to the Permanent Court of International Justice unless in any particular case the Contracting Governments agree to submit the dispute to some other tribunal or to dispose of it by some other form of procedure.

ARTICLE 12

In this Agreement the term "foreign country" in relation to the United Kingdom does not include any territory under the sovereignty, suzerainty, protection or mandate of His Majesty the King of Great Britain, Ireland and the British Dominions beyond the Seas, Emperor of India.

ARTICLE 13

(1) The present Agreement shall be ratified and the ratifications shall be exchanged at Buenos Aires as soon as possible.

(2) The Agreement shall come into force on the date of the exchange of ratifications, and shall remain in force until December 31, 1939. In case neither of the Contracting Governments shall have given notice to the other six months before the said date of their intention to terminate the Agreement, it shall remain in force until the expiration of six months after the date on which either Contracting Government shall have given to the other notice of termination through the diplomatic channel.

In witness whereof the undersigned, being duly authorised to that effect, have signed the present Agreement and affixed thereto their seals.

Done at London this 1st day of December, 1936, in duplicate in English and Spanish, both texts being equally authentic.

NOTE 1.—Except where the Tariff headings are amended or sub-divided in the Schedule, the Schedule covers the articles which, on the 1st May, 1933, were classified for duty purposes under the Tariff numbers and headings quoted therein.

NOTE 2.—The 10 per cent. surcharge is not included in the rates of duty set out in the Schedule.

Tariff No.

Animals :

- 3 Pedigree livestock, bovine, ovine and equine for breeding.
(Horses):
Valuation: \$1,000.00 gold each, without the 60 per cent. surcharge.
Duty: free.
(Mares):
Valuation: \$300.00 gold each, without the 60 per cent. surcharge.
Duty: free.
(Rams):
Valuation: \$100.00 gold each, without the 60 per cent. surcharge.
Duty: free.
(Ewes):
Valuation: \$50.00 gold each, without the 60 per cent. surcharge.
Duty: free.
(Bulls):
Valuation: \$1,000.00 gold each, without the 60 per cent. surcharge.
Duty: free.
(Cows):
Valuation: \$300.00 gold each, without the 60 per cent. surcharge.
Duty: free.

Coal:

- 9 mineral, for burning.
Valuation: \$7.00 gold, increased by 60 per cent., per 1,000 kilos.
Duty: free.
12 coke.
Valuation: \$8.00 gold, increased by 60 per cent., per 1,000 kilos.
Duty: free.

Wedges :

- 13 rails of steel or iron, sleepers of iron and fish-plates for railways or tramways (steam, animal or electric power), also plant for the installation and traction of electric tramways, comprising as plant, only motors for coaches, coach undergear, cables, trolleys, wire, coils, fuse boxes, brakes, tyres, lightning conductors, springs, insulating media, controllers, wheels, "rosettas," crossings and switches.
Valuation: Declared value, provided that these articles are not comprised in other tariff numbers.
Duty: 5 per cent. on valuation.
When intended for use in towns of less than 100,000 inhabitants and complying with the requirements of Article 4 of Law No. 11,281, duty free.

Dynamite :

- 14 for mines.
Valuation: \$0.20 gold per kilo, increased by 60%.
Duty: 5% on valuation.

Tariff No.

Boats :

- 16 for rowing clubs.
Valuation: Declared value.
Duty: 10% plus 2% on valuation.

Locomotives :

- 26 and spare parts for same.
Valuation: Declared value.
Duty: 5% on valuation.

White Lead :

- 58 including packing.
Valuation: \$0.20 gold per kilo, increased by 60%.
Duty: 10% plus 2% on valuation.

Cotton :

- 61 yarn, unbleached, for weaving, of counts up to 40 (English measure).
Valuation: \$0.40 gold per kilo, increased by 60%.
Duty: 10% plus 2% on valuation.

- 61A yarn, unbleached, for weaving, of counts above 40 (English measure).
Valuation: \$0.40 gold per kilo, increased by 60%.
Duty: 9% on valuation.

- 62 yarn, dyed, for weaving, of counts up to 40 (English measure).
Valuation: \$0.50 gold per kilo, increased by 60%.
Duty: 10% plus 2% on valuation.

- 62A yarn, coloured, for weaving, of counts above 40 (English measure).
Valuation: \$0.50 gold per kilo, increased by 60%.
Duty: 9% on valuation.

China Clay :

- 86 for industrial use.
Valuation: \$0.09 gold per 10 kilos, increased by 60%.
Duty: 5% on valuation.

Soda :

- 98 nitrate for industrial purposes including the packing.
Valuation: \$0.03 gold per kilo gross, increased by 60%.
Duty: 10% plus 2% on valuation.

- 98 bis carbonate, soda ash, Solvay soda and silicate for industrial purposes including the packing.
Valuation: \$0.03 gold per kilo gross, increased by 60%.
Duty: 5% on valuation.

- 99 sulphate and hydrate, impure (caustic soda).
Valuation: \$0.05 gold per kilo gross, increased by 60%.
Duty: 5% on valuation.

Herrings :

- 116 smoked in kegs, including such packing.
Valuation: \$0.20 gold per kilo, increased by 60%.
Duty: 10% plus 2% on valuation.

- 117 the same, in boxes, including such packing.
Valuation: \$0.30 gold per kilo, increased by 60%.
Duty: 10% plus 2% on valuation.

Dried cod fish (bacalao) :

- 127 whole, and other similar fish.
Valuation: \$0.14 gold per kilo, increased by 60%.
Specific duty: \$0.0446 gold, without the 25% surcharge.
Additional duty, 2% on valuation.

Tariff No.

128

cut, including the packing :

Valuation: \$0.20 gold per kilo, increased by 60%.
Specific duty: \$0.064 gold without the 25% surcharge.
Additional duty, 2% on valuation.

Preserved goods :

- 159 fish, shellfish and mushrooms preserved in any manner, including the packing, with the exception of herrings.
Valuation (with the exception of dried mushrooms): \$0.35 gold per kilo, increased by 60%.
Specific duty: \$0.50 gold, increased by 25%. Additional duty, 7% on valuation.
Valuation (dried mushrooms): \$0.35 gold per kilo, increased by 60%.
Specific duty: \$1.50 gold, increased by 25%. Additional duty, 7% on valuation.

- 159 bis herrings, preserved in any manner, in tins or glass containers.
Valuation: \$0.35 gold per kilo, increased by 60%.
Specific duty: \$0.35 gold, without 25% surcharge and additional duties.

Eggs :

- 191 in general.
Valuation: \$0.20 gold per kilo gross, increased by 60%.
Duty: free.

Mustard :

- 204 called English, in pots, packets or bottles, including such packing.
Valuation: \$0.30 gold per kilo, increased by 60%.
Specific duty: \$0.08 gold, increased by 25%.
Additional duty, 7% on valuation.

Fish :

- 223 pickled or salted, excluding herrings, in small casks or tins, including the packing.
Valuation: \$0.15 gold per kilo, increased by 60%.
Specific duty, \$0.10 gold, increased by 25%.
Additional duty, 7% on valuation.

- 223 bis herrings, pickled, or salted, in small casks or tins, including the packing.
Valuation: \$0.15 gold per kilo, increased by 60%.
Specific duty: \$0.0368 gold, increased by 25%.
Additional duty, 2% on valuation.

Salt :

- 233 fine, in barrels or bags, including the packing.
Valuation: \$0.02 gold per kilo, increased by 60%.
Specific duty: \$0.01 gold, increased by 25%.
Additional duty, 7% on valuation.

NOTE.—Fine salt, intended for curing hides or preserving meat, provided proof of its intended use is furnished, will be dutiable under Tariff item No. 232.

- 234 in glass bottles or in tins, including such packing.
Valuation: \$0.06 gold per kilo, without 60% surcharge.
Specific duty: \$0.02 gold, without 25% surcharge.
Additional duty, 7% on valuation.

Tariff No.		Tariff No.	
235	<i>Sauce :</i> English and the like, in bottles, including such packing. Valuation: \$0.50 gold per kilo, increased by 60%. Specific duty: \$0.1088 gold increased by 25%. Section 4.	varnishes of polymerised or oxidized oils or stand oils, without resins, with or without volatile solvents. Valuation: \$0.25 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2616	the same, for typewriters. Valuation: \$3.00 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.	Section 5.	oily black varnishes with a base of natural or synthetic asphalt, with siccative oils and resins. Valuation: \$0.225 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2653	<i>Pens:</i> for writing, of steel or other metal. Valuation: \$2.50 gold per kilo, without 60% surcharge. Duty: 25% plus 7% on valuation.	Section 6.	black volatile varnishes with a base of pitch, asphalt or tar and volatile solvents. Valuation: \$0.094 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2687	<i>Racquets:</i> the same, strung, for other games. Valuation: \$3.75 gold each, increased by 60%. Duty: 25% plus 7% on valuation.	Section 7.	water varnishes. Valuation: \$0.20 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2687 bis	the same, unstrung. Valuation: \$1.875 gold each, increased by 60%. Duty: 25% plus 7% on valuation.	2914	<i>Calcium:</i> chlorides, in general, impure. Valuation: \$0.02 gold per kilo, increased by 60%. Duty: 5% on valuation.
2730	<i>Ink:</i> for writing, black or coloured, in any condition, including the exterior packing. Valuation: \$0.10 gold per kilo gross, increased by 60%. Duty: 25% plus 7% on valuation. NOTE.—Writing ink, black or coloured, packed in stone jars, will be assessed for duty with a deduction of 10% from the valuation.	2967	<i>Copper:</i> sulphate, impure. Valuation: \$0.10 gold per kilo, increased by 60%. Duty: 5% on valuation.
2743	<i>Bands:</i> insertions, trimmings and motifs, of cotton, embroidered, with or without silk. Valuation: \$4.00 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.	3072	<i>Phosphorus:</i> sesquisulphide. Valuation: \$1.15 gold per kilo nett, increased by 60%. Duty: 5% on valuation.
2867	<i>Arrowroot:</i> arrowroot, in general. Valuation: \$0.20 gold per kilo, increased by 60%. Duty: 20% plus 2% on valuation.	3080	<i>Medicinal Gauzes:</i> absorbent, in general. Valuation: \$1.00 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2877	<i>Blue:</i> and green, ultramarine. Valuation: \$0.10 gold per kilo gross, increased by 60%. Duty: 25% plus 7% on valuation.	3193	<i>Nuts:</i> nutmegs. Valuation: \$1.00 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2877 bis	in small cakes or bags, in general. Valuation: \$0.13 gold per kilo gross, increased by 60%. Duty: 25% plus 7% on valuation.	3226	<i>Paints:</i> in paste, vermilion or cinnabar. Valuation: \$1.00 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
2886	<i>Varnishes:</i> varnishes with a base of celluloid, cellulose, nitrocellulose, acetyl-cellulose and the like, coloured or not. Valuation: \$0.70 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.	3227	in paste, with pigment exclusively with base of copper compounds, chromic oxides, chromates and Prussian blue. Valuation: \$0.30 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
		3228	in paste, unspecified, and fillers, not mentioned in other tariff numbers. Valuation: \$0.14 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.

Tariff No.	
	<i>Paints (contd.):—</i>
3229	paints or pigments in powder or lumps, not specially mentioned. Valuation: \$0.20 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3229 bis	Iron oxide in powder or lumps and lithophone. Valuation: \$0.10 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3230	in tubes. Valuation: \$0.50 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3231	liquid, in general, without varnish, and anti-corrosives. Valuation: \$0.22 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3232	in paste or liquid with varnish, excepting those of tariff numbers 3232A and B, anti-corrosive paints for ships' bottoms containing compounds of mercury, copper or arsenic, fillers and putties of pyroxyline, cellulose, celluloid, viscose and their ethers. Valuation: \$0.40 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3232A	called enamels and those with a base of celluloid, cellulose, acetyl-cellulose and the like. Valuation: \$0.55 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3232B	with aluminium, bronze or copper. Valuation: \$0.70 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3233	for marking sheep. Valuation: \$0.08 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3234	for mixing with water. Valuation: \$0.157 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3234A	with rubber. Valuation: \$0.40 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
	NOTE.—When paints are imported in containers weighing more than 50 kilos nett, they will be accorded a reduction of 20% either in their valuations or duties.
	<i>Lead:</i>
3241	minium (red lead). Valuation: \$0.15 gold per kilo, increased by 60%. Duty: 20% plus 2% on valuation.
	<i>Sodium:</i>
3296	hypo-sulphite, for industrial use. Valuation: \$0.05 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
3296 bis	bicarbonate, for industrial use. Valuation: \$0.03 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.
	<i>Salts:</i>
3481	fruit, Eno's and the like. Valuation: \$4.00 gold per dozen, increased by 60%. Duty: 40% plus 7% on valuation.
	<i>Paste:</i>
Section E.	for footwear, of every origin. Valuation: \$0.50 gold per kilo, without 60% surcharge. Duty: 25% plus 7% on valuation.

Tariff No.	
	<i>Panels:</i>
Section K.	main electrical, distribution or circuit-breaking, totally armoured or enclosed in boxes of cast iron filled with insulating compound, weighing more than 300 kilos up to 500 kilos. Valuation: \$0.48 gold per kilo, without 60% surcharge. the same weighing more than 500 up to 1000 kilos. Valuation: \$0.32 gold per kilo, without 60% surcharge. the same weighing more than 1000 kilos. Valuation: \$0.24 gold per kilo, without 60% surcharge. NOTE.—Those weighing less than 300 kilos will continue to be classified as "electrical accessories in iron boxes" in the relevant tariff item of Section K.
	<i>Towels:</i>
Section N.	sanitary, of gauze with absorbent cotton. Valuation: \$1.00 gold per kilo, without 60% surcharge.
	<i>Specifics for treating livestock and plants, and appliances for that purpose:</i>
	Specifics for treating livestock and other remedies in paste, powder or liquid form, employed for the treatment of animal pests and diseases; tablets, powders and liquid drenches for administration to livestock for the destruction of internal parasites; appliances, both power and hand, employed in the application of insecticides to fruit trees and crops, also dipping baths and cattle spraying machines, shall pay customs duties at the following rates on the valuations established in the Valuation Tariff and complementary laws: 22%, the articles which pay 47%. 17%, those which pay 32%. 5%, those subject to duties higher than 5% and less than 32%. Duty free, those which pay 5%.
	<i>Artisans' Tools of Iron and Steel, scheduled in Resolution No. 327 of August 9, 1932.</i> Valuation: various. Duty: free.

FOURTH SCHEDULE

NOTE 1.—Except where the Tariff headings are amended or sub-divided in the Schedule, the Schedule covers the articles which on the 1st May, 1933, were classified for duty purposes under the Tariff numbers and headings quoted therein.

NOTE 2.—The 10% surcharge is not included in the rates of duty set out in the Schedule.

Tariff No.	
18	<i>Specifics:</i> for treating scab, and tick specifics. Valuation: \$0.30 gold per kilo, increased by 60%. Duty: free when the Ministry of Agriculture declares that they are suitable for that purpose.
880	<i>Pumps:</i> of other classes, of one or more cylinders, of iron with accessories of brass, including donkey steam pumps, electric pumps and capstan driven pumps. Valuation: \$0.25 gold per kilo, increased by 60%. Duty: 15% plus 2% on valuation. Only pumps for wells or for the extraction of water will be included in this tariff number and the consolidation of the duties is established until such time as a new customs classification is introduced.

	<i>Machinery:</i>
1247A	in general, and spare parts for same not provided for in other tariff numbers, weighing less than 100 kilos nett. Valuation: \$0.30 gold per kilo gross, increased by 60%. Duty: 25% plus 7% on valuation. The consolidation of the duties is established until such time as a new customs classification is introduced.
1247B	in general, and spare parts for same not provided for in other tariff numbers, weighing from 100 up to 500 kilos. Valuation: \$0.30 gold per kilo gross, increased by 60%. Duty: for machinery, 5% on valuation; spare parts, 10% plus 2% on valuation. The consolidation of the duties is established until such time as a new customs classification is introduced.
1248	the same, weighing more than 500 up to 1,000 kilos. Valuation: \$0.20 gold per kilo gross, increased by 60%. Duty: for machinery, 5% on valuation; for spare parts, 10% plus 2% on valuation. The consolidation of the duties is established until such time as a new customs classification is introduced. NOTE.—Parts and accessories for machinery which have a separate classification in the Tariff will not be dutiable under tariff numbers 1247, 1248 and 1249, when not imported together with the machinery to which they belong. In such case, they will be dutiable under the tariff numbers to which they belong and will pay the relevant duty.
	<i>Motorcycles:</i>
	NOTE.—If the duty payable on motorcycles of more than 350 c.c. capacity (Tariff No. 1317) is reduced, the duty on those of a lower capacity will be reduced in the same proportion.
	<i>Motors or dynamos:</i>
1612	electric motors or dynamos in general of more than $\frac{1}{2}$ horse power. Valuation: \$0.30 gold per kilo gross, increased by 60%. Duty: 5% on valuation. The duty on electrical dynamos and motors in general weighing more than 500 kilos is fixed.
	<i>Cotton tissues:</i>
2010 bis	bleached, plain or twilled, weighing more than 160 grammes per square metre. Valuation: \$0.80 gold per kilo, increased by 60%. Duty: 25% plus 7% on valuation.

Tariff No.

Artificial silk:

If the customs duties payable on tissues of natural silk are reduced, a proportionate reduction will be effected in duties payable on tissues of artificial silk.

Candles:

NOTE.—If the duty payable on paraffin wax for industrial purposes, excepting paraffin for medicinal uses (Tariff No. 3215) and mineral wax or ceresine (Tariff No. 2952), is reduced, a corresponding reduction will be made in the rate of duty established for candles.

Absinthe:

Absinthe in general and drinks containing it will pay \$4.50 m/n. on each bottle of a capacity up to 50 centilitres, and \$9.00 m/n. on each bottle of a capacity from 51 centilitres up to 1 litre.

Whisky:

Whisky will be taxed according to its alcoholic graduation in accordance with Law 11252. The 50% reduction accorded under Article 76 of Law 11281 will not apply to whisky which will pay the additional 25% on alcoholic drinks in accordance with its category.

FIFTH SCHEDULE

(Article 8)

	Rate of Duty
Chilled beef and veal	\$d. per lb.
Frozen or salted beef and veal	\$d. per lb.
Mutton and lamb not preserved in airtight containers	Free
Pork not preserved in airtight containers	Free
Wheat in grain	2s. per quarter of 480 lb.
Linseed	10% <i>ad valorem</i>
Maize in grain, not being flat white maize	Free
Quebracho extract	10% <i>ad valorem</i>

SIXTH SCHEDULE

(Article 8)

	Rate of Duty
Boned and boneless beef and veal and edible offals of beef and veal	20% <i>ad valorem</i>
Beef (excluding tongues) preserved in airtight containers	20% <i>ad valorem</i>
Beef extracts and essences	20% <i>ad valorem</i>
Tongues preserved in airtight containers	30% <i>ad valorem</i>

PROTOCOL

PART I

At the moment of signing the Agreement of this day's date between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the Argentine Republic relating to trade and commerce, the undersigned Plenipotentiaries, being duly authorised to that effect, declare that they have agreed on the provisions set out in this Protocol, which shall form an integral part of the above-mentioned Agreement.

The Argentine Government, fully appreciating the benefits rendered by the collaboration of British capital in public utility and other undertakings, whether State, municipal or private, carrying on business in Argentina, and following their traditional policy of friendship, hereby declare their intention to accord to those undertakings, as far as lies within their constitutional sphere of action, such benevolent

treatment as may conduce to the further economic development of the country, and to the due and legitimate protection of the interests concerned in their operation.

PART II

The Government of the United Kingdom are prepared to co-operate with the Argentine Government in a joint enquiry into the economic and financial structure and working of the meat trade, with particular reference to the means to be adopted to ensure a reasonable return to the cattle producers.

PART III

With reference to paragraph (1) of Article 1 of the Agreement and to Items 2 and 3 in the First Schedule thereto, it is understood that the minimum proportions guaranteed to Argentina of total regulated imports from foreign countries of frozen beef and frozen beef offals shall be subject to any arrangement which may be made between the Government of the United Kingdom and the Argentine Government for an increase of imports from Argentina of frozen beef offals and a corresponding decrease of imports of frozen beef other than offals; but that, in calculating the quantities to be imported from Argentina on the basis of such proportions, regard shall not be had to any variation of total imports from foreign countries in the respective categories caused by any similar arrangement which may be made between the Government of the United Kingdom and the Government of any other foreign country.

PART IV

With reference to paragraph (2) of Article 1 of the Agreement, the Argentine Government when proceeding to exercise the control of meat exports to the United Kingdom will, while taking into consideration the interests of the Argentine producers organised under a special law and the efficient marketing of meat in the United Kingdom, give to the British companies engaged in the trade equitable treatment and treatment which is no less favourable than that accorded to any other undertaking in the trade whatever its nationality, so long as those companies conduct their business in compliance with the laws and regulations in force in Argentina.

PART V

With reference to Article 6 of the Agreement, the Contracting Governments declare that it is their intention to maintain the position in the markets of the Argentine Republic of coal, coke and manufactured fuel produced or

manufactured in the United Kingdom and to this end have agreed—

- (a) that during the currency of the Agreement no new or increased charge by way of slingage, landing charges or otherwise shall be imposed on coal, coke or manufactured fuel produced or manufactured in the United Kingdom;
- (b) that if the Government of the United Kingdom should consider that the position in the markets of the Argentine Republic of coal, coke and manufactured fuel produced or manufactured in the United Kingdom is not being maintained, consultations shall take place between the two Governments with a view to remedying the situation.

Done at London in duplicate in English and Spanish, both texts being equally authentic, the 1st day of December, 1936.

ANTHONY EDEN.
WALTER RUNCIMAN.
MANUEL E. MALBRÁN.
T. A. LE BRETON.

PROTOCOL OF SIGNATURE

At the moment of signing the Agreement of this day's date between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the Argentine Republic relating to trade and commerce, the undersigned Plenipotentiaries, being duly authorised to that effect, declare that they have agreed as follows:—

The said Agreement shall be deemed to have come into force provisionally on the 20th day of November, 1936, pending the exchange of ratifications.

Either Contracting Government may, prior to the exchange of ratifications, terminate the provisional application of the Agreement by giving the other three months' notice through the diplomatic channel.

Done at London in duplicate this 1st day of December, 1936, in English and Spanish, both texts being equally authentic.

ANTHONY EDEN.
WALTER RUNCIMAN.
MANUEL E. MALBRÁN.
T. A. LE BRETON.

LETTERS

Letter No. 1

Letter from Argentine Signatories on the Subject of the Treatment of British Shipping Companies

Argentine Embassy,

December 1, 1936.

Your Excellency,

DURING the course of the discussions which have led up to the conclusion of the Trade Agreement signed this day, the United Kingdom Delegation have drawn attention to the representations received by their Government from the British Shipping Companies engaged in the carriage of refrigerated cargoes from Argentina to the United Kingdom who are anxious to ensure that their position will not be detrimentally affected in the event of the Argentine Government undertaking the control of the export of meat. The Companies have pointed to the expenditure which has been incurred in the past in building up an organisation to cater for the needs of this trade, to the fact that certain of the Companies concerned will shortly have to expend further capital on the building of new refrigerated ships and to the difficulty of finding other employment for vessels especially built for the Argentine trade.

We are happy to inform you that, in the event of our Government assuming the control of meat exports, it is their intention that the position of the British Shipping Companies engaged in the carriage of refrigerated cargoes from Argentina to the United Kingdom shall not be detrimentally affected so long as the Companies continue to

carry on their business without any discrimination as between shippers of the meat exported in accordance with the export licences issued by the Argentine Government.

We have, &c.

MANUEL E. MALBRÁN.
T. A. LE BRETON.

Letter No. 2

Letter from the Argentine Signatories on the Subject of the Control of Imports of Cotton and Rayon Piece-goods into Argentina.

Argentine Embassy,

December 1, 1936.

Your Excellency,

WITH reference to the discussions which have taken place in connection with the negotiation of the Trade Agreement signed this day, we have the honour to inform you, on behalf of our Government, that, in the event of the quantitative regulation of the imports into Argentina of piece-goods of cotton and/or rayon, the allocation for such piece-goods of United Kingdom origin (i.e., piece-goods spun, woven and finished in the United Kingdom) will not be less than the average of the quantities imported from the United Kingdom in the years 1933, 1934 and 1935.

We have, &c.

MANUEL E. MALBRÁN.
T. A. LE BRETON.

THE ECONOMIST

THE ENGINEERING INDUSTRY

INTRODUCTION

SINCE the Balfour Committee on Industry and Trade published its report on British engineering in 1928 the industry has undergone significant changes. It is the purpose of this Supplement to record these changes in the most important branches of this vital industry.

The products of the engineer, while entering almost every branch of industry, differ widely in purpose and application. Consequently there has been a tendency to specialisation, even in the early history of the industry. Unlike the coal industry, for example, the engineering industry cannot be regarded as a single unit. In the words of the Committee on Industry and Trade, it is rather "an amalgamation of a considerable number of separate industries differentiated by product but united by the fact that the basic metal working operations underlying them are all substantially the same." Nor is it easy to define the boundaries of the industry, for the iron and steel industry, for example, is also engaged in the manufacture of heavy engineering products.

The scope of this Survey is confined to what is generally known as mechanical engineering. Electrical engineering, shipbuilding and the motor trade, therefore, are excluded from its pages. But even the range of mechanical engineering is so wide that it has been found necessary to limit discussion to some of its more important branches. The large variety of purposes served by individual branches of mechanical engineering renders generalisation inappropriate. Some branches of the industry, such as those engaged in the manufacture of agricultural and textile machinery, and marine engineering, are directly dependent on the fortunes of the industries which they serve. Activity in other sections, especially in machine tool manufacture, is largely a function of general business activity, particularly in the capital equipment industries. Again, others, such as locomotive construction, depend almost entirely on foreign markets. It is possible, therefore, for some industries to be prosperous while others are in the throes of depression. These divergent tendencies are clearly shown in our survey of recent developments in important individual branches of the industry.

With a few exceptions, however, the various branches of mechanical engineering have all been hard hit by the impact of the depression. The impact of the slump has been the more severe as it is the general practice of industrial concerns to postpone replacements and re-equipment during lean times. During the past three years, however,

most sections of the industry have recovered rapidly with the improvement in general business conditions. The large-scale re-equipment of British industry, now proceeding apace, is making heavy calls on engineers, and their difficulties in keeping pace with the rapidly increasing demand have been accentuated by the Government's re-armament programme, which is concentrated on the metal working trades.

One result of the depression was a substantial loss in the labour force of the industry, accompanied by a deterioration of skill caused by long periods of unemployment. Consequently the shortage of skilled labour soon made itself felt when the industry began to recover.

Another aspect of the mechanical engineering trade, revealed by our survey, is the rapid technical progress made by the industry in recent years. Machine tool makers have made further headway in their attempt to increase cutting speed and to reduce idle time and, hence, the overhead costs of machinery. Makers of prime movers and boilers quickly adapted themselves to the tendency of British industry to substitute electrical energy purchased from the electricity supply undertakings for power produced at its works. Again, the progress made by marine engineers in improving hull and engine design has been so rapid during the past five years that many of the older vessels still in existence, though practically as sound as when they were launched, are technically obsolete and of doubtful competitive value. Another notable tendency, made possible largely by technical improvements, is the increasing mechanisation of building operations.

With the exception of those branches of mechanical engineering which, like locomotive building, depend largely on overseas markets, the prospects of the industry during the next few years are fairly encouraging. The industrial relations of the industry have long been satisfactory. Raw material costs, it is true, are now rising fairly rapidly, but there are no indications that rising prices will arrest the recovery of the industry in the near future. The only unsatisfactory feature of the industry is the relatively slow improvement in export business, due partly to the pressure of home demand. In a few years' time, when domestic revival has run its course, the industry will again become dependent to a greater extent on foreign markets. And to neglect them meanwhile might well prove disastrous to the industry in the future.

MACHINE TOOLS

MACHINE tools form the basis of modern engineering. While most branches of engineering are concerned with the production of capital or semi-capital goods—motor cars, for instance, come into the latter category—machine tool makers are providing the equipment necessary for the production of capital goods. At the same time the machine tool section is also one of the most unfortunate branches of engineering, for it is subject to violent fluctuations of activity.

The machine tool industry in this country does not occupy as predominant a position in the world as some of the other branches of British engineering. In 1935 Germany accounted for about 37 per cent. in terms of value, of the aggregate exports of the five leading countries; the United States held second place with 35 per cent., and the United Kingdom came third with 15 per cent. Switzerland and France together accounted for the remaining 13 per cent. The British proportion of the aggregate exports of the five countries has risen considerably in recent years, while Germany's share has fallen sharply from the high level of 66 per cent. in 1933.

EFFECT OF RE-ARMAMENT

Owing to the exigencies of the war, the British machine tool industry was expanded enormously 20 years ago. Subsequently the industry experienced a very serious contraction from which it never recovered fully in the post-war decade, for even during the 1928-29 boom the volume of activity in the capital goods industries was relatively low. During the past two years, however, the trade has made rapid headway with the large-scale re-equipment of British industry which is now taking place. And, as a result of the super-imposition of re-armament on the progress already achieved by the industry, there are now many firms which cannot offer delivery of machine tools inside a year. The capacity of the industry is now being enlarged considerably under the pressure of demand; but this bodes ill for the time when the re-equipment of British industry and re-armament are completed, unless capital re-equipment overseas can be stimulated to a greater extent than hitherto.

A feature of machine tools is their rapid rate of obsolescence. Equipment 10 or 15 years old, though technically still efficient, is often much inferior to modern machine tools in output capacity, and this may frequently be a factor of primary importance, especially in mass production. But the mere fact that older machines may technically still be efficient tends to delay replacement during a period of general economic depression. On the whole, however, the British machine tool industry was affected less seriously by the depression than might have been expected, owing largely to the coincidence of Russian purchases with the early part of the crisis, which actually led to an increase in exports between 1929 and 1932.

Owing to the pressure of demand, imports, which have always provided a fairly substantial part of British machine tool requirements, are on the up-grade. The rate of increase would probably have been even greater if it were not for the delay in delivery, due to the high level of home demand in Germany and in the United States, and for the tariff, though price normally plays a somewhat subsidiary part in the placing of orders. Total imports of machine tools were 7,708 tons in 1935, against 6,567 in 1934, a low record of 3,219 tons in 1933 and 11,077 tons in 1929. More recently, however, the rate of expansion in imports has tended to increase, purchases abroad during the first nine months of this year amounting to 12,949 tons, compared with 5,506 tons during the corresponding period in 1935 and 4,777 tons in 1934. Imports are characterised by a high average value per ton, which indicates that they consist largely of complex and precision tools in the manufacture of which Germany has always occupied a leading position. Incidentally, precision tools are of considerable importance, especially in aircraft production.

OVERSEAS MARKETS

There was a considerable increase in British exports of machine tools from 12,218 tons in 1934 to 16,506 tons in

1935, compared with a maximum of 23,829 tons in 1932. Russia remains the largest individual overseas market; but, owing to the expansion of capacity and technical skill in that country, the downward trend of Russian imports in recent years is not likely to be reversed. It is hoped, nevertheless, that the agreement concluded last August between the Export Credits Guarantee Department and the Russian trade organisations, providing for the placing of £10 million-worth of orders in this country, will benefit the machine tool industry more than any other. Apart from sales to Russia, exports are fairly well spread geographically. But there is some reason to fear a contraction as a result of the intense re-armament demand at home. This would be a serious matter, for markets once lost are never easily regained. Moreover, the decline in the rate of expansion of several branches of British engineering, due to inability to obtain delivery of machine tools is also serious. Machine tool makers have some excuse in that deliveries of steel have fallen in arrears. Reports of the difficulty of obtaining skilled labour, moreover, continue to circulate in spite of denials by the Union. Incidentally, requirements of skilled labour in the machine tool section are higher than in any other branch of engineering.

The trend and distribution of the production of machine tools as revealed by the 1930 Census of Production and the subsequent Import Duties Act Inquiries, is shown below:—

OUTPUT OF MACHINE TOOLS (METAL WORKING)

	1930		1933		1934	
	(Tons)	(£'000)	(Tons)	(£'000)	(Tons)	(£'000)
Drilling	4,026	415	3,210	376	5,025	503
Grinding	3,627	527	2,976	424	3,886	572

* Not including cutting parts.

SPECIALISATION

Specialisation is a feature of the machine tools industry. The four main centres of the industry are Manchester, Birmingham and Coventry, Halifax and Leeds. In the Manchester district Kendall and Gent specialise on milling machines, milling cutters, etc.; Craven Brothers (Manchester) specialise on the heaviest classes of machine tools for railway, shipbuilding and armament engineering, though the company has recently developed a range of smaller tools for light engineering; the Churchill Machine Tool Company specialises on grinding machines, and John Holroyd and Company, of Rochdale, on gear-cutting machines. Craven Brothers acquired various machine tool businesses, including that of Sir W. G. Armstrong Whitworth in 1928, and is now one of the largest makers in the country.

In the Birmingham area, Modern Machine Tools, of Coventry, specialise in re-manufactured machine tools; B.S.A. Tools concentrate on multiple spindle and single spindle automatic turning machines and on centreless grinding machines; Coventry Gauge and Tool, one of the three largest gauge manufacturers in the country, is expanding rapidly.

In Halifax there are William Asquith and Kitchen and Wade, the latter specialising in drilling and boring machines. Finally in Leeds there is Greenwood and Batley, with a wide range of interests, but specialising on presses; this concern has done quite well in recent years, but has not expanded as rapidly as some of the other companies.

The Machine Tool Trade Association represents the link between the industry and the Government, and organises publicity, but is not concerned with price-fixing.

TINPLATES

The tinplates manufactured by Richard Thomas & Co. Ltd. owe their widespread success to their consistent quality and accuracy, without which no can-making plant can enjoy rapid and uninterrupted production.

RICHARD THOMAS & COMPANY LTD.

SHELL-MEX HOUSE, STRAND, W.C.2

RICHARD THOMAS

In addition there is the Associated British Machine Tool Makers, an organisation understood to have eight members, which was formed to encourage specialisation and to act as a selling organisation for the group.

In general, technical improvements have two main objects: (a) the increase of cutting speed, and (b) the reduction of idle time and, hence, overheads on the machine. Past efforts were mainly concentrated on the increase in cutting speed, but more attention has recently been given

to the second general object which involves a simplification of controls and an increase in the ease with which the work is mounted and withdrawn from the machines.

Immediate prospects for the industry appear bright. There should be little or no decline in demand during the next two or three years. But there is the danger of over-expansion of the capacity of the industry which, in the absence of a more marked revival of exports, might involve machine tool manufacturers in difficulties a few years hence.

PRIME MOVERS AND BOILERS

THIS branch of the mechanical engineering industry is concerned literally with making the wheels of industry go round, since it embraces the whole range of appliances required for the production of power in stationary engines. There have been important changes since the war, both in the popularity of the various types of installation and in the relative importance of the industry's many customers. The extent of these changes is revealed by a comparison of the results of the Census of Production for 1924 and 1930. Further changes have probably taken place since 1930, which will be brought to light by the 1935 Census.

CHANGES IN POWER EQUIPMENT

Between 1924 and 1930 the total capacity of prime movers in industry rose from 16,674,000 h.p. to 21,208,000 h.p. The increase was due entirely to the expansion of the capacity of prime movers in the electricity supply industry, from 5,573,000 h.p., or 33.4 per cent. of total capacity in 1924 to 10,164,000 h.p., or 48.0 per cent. of total capacity in 1930. The capacity of prime movers in the remainder of British industry actually declined during this period from 11,100,500 h.p., or 66.6 per cent. of total capacity, to 11,046,000 h.p., or 52.0 per cent. of total capacity. The progress and co-ordination of the electricity supply industry stimulated the centralisation of power production and, consequently, diminished the dependence of individual firms upon their own power resources to an extent which is only partly measured by the increase in the capacity of electric motors installed in industry, from 7,721,000 h.p. in 1924 to 10,593,000 h.p. in 1930. This change in the relative importance of the two main producers of power was accompanied by an important change in the principal methods of power production. Practically the whole of the motive force of the electricity supply industry, in both years, was supplied by steam turbines, although there was some increase in the use of heavy oil engines and hydro-electric installations, which, however, remained of very minor importance.

The proportion of the horse-power capacity of British industry represented by reciprocating steam engines declined from 71.5 per cent. in 1924 to 63.4 per cent. in 1930, while that represented by steam turbines and by internal-combustion engines operated on heavy oil rose from 18.2 per cent. to 26.3 per cent. and from 0.75 per cent. to 2.2 per cent. respectively. These changes are shown in detail in the table opposite—compiled from the Census of Production returns—which also shows the proportion of each type of plant which was idle or held in reserve. These figures, relating to idle and reserve plant, give some indication of technical trends, since there is a general tendency to hold the oldest and least efficient plant in reserve and to use only the most efficient equipment in times of slack trade.

The tendency of British industry to substitute electrical energy purchased from the electricity supply undertakings for power produced at its works is one of the features of present industrial trends. Hence, despite the recent increase in the demand for replacements and additions to the capacity of private power plants, there can be little doubt that manufacturers of prime movers and boilers are becoming increasingly dependent on the public electricity supply industry, at any rate in the home market.

OUTPUT OF INDUSTRY

The Census of Production of 1930 and of the Import Duties Act Inquiries of 1933 and 1934, which, incidentally, record only part of the output of the industry by weight, indicate a decline of 30-40 per cent. between 1930 and 1933 in the production, by value, of complete steam turbines, boilers of all sorts, economisers, as well as other boiler-house plant, though the decline was much more marked in the case of steam turbines. By 1934, however, output seems to have recovered to about 80 per cent. of its volume in 1930. Apart from heavy oil engines, whose output between 1930 and 1934 increased by 15 per cent. in volume and by nearly 40 per cent. in value, the fall in the value of production was much more marked than the decline in volume, a consequence of lower prices.

Despite the increasing volume of orders from the electricity supply industry and the revival of industrial activity, the recovery in the production of prime movers and boiler-house plant has not been very marked, owing to the slow expansion of exports.

IMPORTANCE OF EXPORTS

Overseas markets are of considerable importance to the industry. In 1930, for example, exports accounted for 66.5 per cent. of the production, by value, of stationary internal-combustion engines, 24.3 per cent. of the production of steam reciprocating engines, 38.8 per cent. of the production of steam turbines and 56.2 per cent. of the production of boiler-house plant. Although these figures exaggerate the importance of foreign markets—since shipments in 1930 largely represented orders placed in 1928 and 1929—the decline in both the volume and the value of exports has been severe.

There has been some recovery between 1933 and 1935. But the figures for the first nine months of 1936 indicate that the improvement has not continued, and exports of prime movers, boilers and boiler-house plant remain substantially below pre-depression levels. Exceptionally, exports of heavy oil engines in 1935 exceeded shipments in 1930 in weight, and even more substantially in value.

PROSPECTS

For further recovery this branch of the engineering industry appears to depend increasingly on an expansion of exports. At home, the electricity supply industry is likely to expand for some time, and industrial demand is probably higher now than it has been at any time in the past five years. The extent to which the industry is dependent upon new orders for extensions and replacement, as distinct from repairs, may be gathered from a preceding table, though this factor is likely to diminish in importance with the increase in total plant.

The industry is at present able to look forward to a fresh batch of orders for development under the "Grid" scheme, designed to bring generating capacity up to the level demanded by the upward trend of electricity consumption.

The time lag between decisions on extensions and the completion of plant is normally considerable, and manufacturers are probably still working on orders placed as long ago as early as 1935. During 1934 and 1935 the Electricity Commissioners sanctioned the installation of over 1,200,000 kw. of new generating plant at various selected stations, at a total outlay of nearly £15 millions. In their report for 1935, the Central Electricity Board, looking forward to the probable demand for electricity in the winter of 1937-38, estimated that further additions to generating plant of a total capacity of 670,000 kw. and of

boilers of a total evaporative capacity of 8,000,000 lbs. per hour will be necessary. Hence, it was announced early in 1936 that instructions had been given to a number of selected stations to carry out extensions of about 500,000 kw. involving an expenditure of about £5 millions. The stations involved in this programme are Portobello, Clarence Dock (Kearsley), Hartshead, Sculcoates, Ferrybridge, Longford, Ironbridge, Deptford West, Willesden, Hackney, Barking and Portishead.

While these orders should maintain the present level of power-station work during the next eighteen months, it is improbable that the rate of increase in demand for electric power will be such as to require the continuance of the expansion of generating capacity at the current rate. It is possible, therefore, that producers of prime movers will again have to rely in a larger measure on the demand for motive power by industry and especially on exports during the next few years. Manufacturers of stationary internal-combustion engines are not as dependent on the demand of power companies as manufacturers of steam plant, though they produce a considerable volume of smaller plant for private generation of power. The heavy oil engine, in particular, seems assured of a steady expansion in demand for some time to come.

SOME PRODUCERS

The principal manufacturers of stationary gas and oil engines are situated in the Midlands, with one outlying group in Lincolnshire and another in the West Country. National Gas and Oil Engine, of Ashton-under-Lyne, Crossley-Premier Engines, of Nottingham (a subsidiary of Crossley Bros.), Petters, of Yeovil, and R. A. Lister, of Dursley, are some of the most important producers. Other important producers of stationary engines are Tangyes, Mirlees Bickerton and Day of Stockport, W. H. Dorman, and Company of Stafford, and Henry Meadows of Wolverhampton, though the latter is more concerned with diesel engines for traction purposes. The English Electric Company produces large diesel generator sets.

Babcock and Wilcox is pre-eminent in the manufacture of boilers and boiler-house plant. That concern

supplies at least 80 per cent. of the demand of the electricity supply industry for large water-tube boilers and has a considerable interest, through its principal subsidiaries—Edwin Danks, Spencer Bonecourt, the Vickers Boiler Company, and the Stirling Boiler Company—in the manufacture of smaller boilers. Chain-grate stokers, superheaters, boiler fittings and pulverised fuel and oil-firing systems are also produced by this company, while another branch of the business—the manufacture of electric cranes, conveyors, etc.—has been considerably enlarged in recent years. The most important of the remaining firms in this group are International Combustion, Yarrows and the John Thompson group.

There are one or two firms specialising in the manufacture of high-pressure steam fittings, of which Hopkinson's is a public company. The Bennis Combustion Company, a public concern since 1935, is mainly concerned with automatic stoking plant. Among makers of turbines and turbo-generators C. A. Parsons, of Newcastle, is well known. Hick, Hargreaves, of Bolton, and W. H. Allen and Sons, of Bedford, also manufacture turbine sets; but apart from C. A. Parsons the principal manufacturers of turbines are the producers of heavy electrical plant, such as the General Electric Company (through their subsidiary, Fraser and Chalmers, of Erith), British Thomson-Houston and Brush Electrical Engineering Company.

AGRICULTURAL MACHINERY

In common with most branches of the engineering industry, the agricultural machinery section has experienced some improvement in recent years. Overseas markets form an important outlet for this industry, for no less than about half of the total British output of agricultural machinery was exported in 1930. The relative importance of exports has probably been further increased since the establishment of the Ford plant at Dagenham, for Fordson tractors are manufactured mainly for export, even to the United States.

Although the volume of British exports of agricultural machinery has increased from the low level of 7,898 tons in 1932 to 16,220 tons in 1935, sales abroad are still well below the 1929 level of 23,991 tons. The average value per ton of exports remained practically unchanged during the depression, amounting to £78 per ton in 1929 and £79 per ton in 1932. Partly perhaps as a result of the export of Fordson tractors, the average value fell to £71 per ton in 1935.

The overseas market in agricultural machinery is dominated by the United States. In 1935 the United States exported no less than 73.4 per cent. of the aggregate value of the shipments of the United States, the United Kingdom, France and Germany—the four leading exporting countries. Nevertheless, Britain held second place as an exporter, its share of the aggregate exports of the four leading countries being 12.6 per cent., compared with 8.4 per cent. contributed by Germany and 5.6 per cent. by France. Moreover, although Britain's share of the total declined somewhat in 1935, it has increased appreciably during the past four years. In 1929, for example, this country exported only 5.4 per cent. of the aggregate exports. The relative increase of British exports compared with those of other countries may be ascribed, in a large measure, to the depreciation of the £ in 1931. The recent improvement in exports has been most marked in the case of tractors, the tonnage of which has risen from 1,709 tons in 1934 to 6,527 tons in 1935 and 8,229 tons in January-September, 1936. During the first nine months of this year tractors contributed no less than 44.5 per cent. to the total value of agricultural machinery exports, compared with 40 per cent. in 1935, when ploughs accounted for 20 per cent. and lawn mowers and threshing machines for 7 per cent. each.

OUTPUT OF AGRICULTURAL MACHINERY

The trend and distribution of production of agricultural machinery as recorded by the 1930 Census of Production and by the Import Duties Act Inquiries are shown in the table opposite. By 1934 production had practically recovered to the 1930 level. Since then the industry has made further headway. The output of hand-operated lawn mowers increased by no less than 81 per cent. between 1930 and 1934, probably as a result of the building boom and of the reduction in the price of small lawn mowers, brought about by the introduction of mass production methods by such firms as Qualcast. In 1934 lawn mowers and grass cutters, as a whole, accounted for 37 per cent. of the volume, and 40 per cent. of the value of the total output of agricultural machinery.

While exports of agricultural machinery represent an

appreciable proportion of the total output, imports are also fairly substantial. Thus, purchases abroad rose from 6,710 tons, valued at £438,000, in 1934 to 10,891 tons,

	1930		1933		1934

(ii) Agricultural Tractors	3,659	277	494	57	5,204	436

valued at £722,000, in 1935. The greater part of these imports consists of tractors. In 1935, for example, tractors represented 69 per cent. of total imports of agricultural machinery by volume and 50 per cent. by value. There is now an import duty of 33½ per cent. on tractors, but those used exclusively for agricultural purposes are admitted on payment of 15 per cent. The bulk of these tractors is supplied by the International Harvester Company of the United States and the Massey Harris Company of Canada.

The improvement in the agricultural machinery industry in this country is reflected in the resumption of dividend payments last June by Ransomes, Sims and Jefferies, of Ipswich, after an interval of six years. Ruston and Hornsby, a company associated with Ransomes, Sims and Jefferies, also returned to the dividend list after a similar interval. This company, like many other manufacturers of agricultural machinery, is also interested in other engineering products. Again, R. A. Lister and Company, of Dursley, are as well known for their oil engines as for their agricultural machinery. Marshall, Sons and Company (Successors), of Gainsborough, are manufacturers of traction engines and boilers, and tea machinery, besides agricultural machinery. E. W. Tarry and Company produce mining equipment as well as agricultural machinery.

PROSPECTS

It is difficult to assess the prospects of agricultural machinery in the British market. It is generally contended that the majority of British farms are not of a size and type which lend themselves to a high degree of mechanised farming. On the other hand, at a conference held in Oxford last January on "Mechanisation in Mixed Farming," the impression was gained that mechanisation in this country might be increased considerably if a suitable farming technique were worked out. In many of the engineering industries in this country it is now realised that the manufacturer must be in a position to teach the user his job; and in view of the difficulty in any branch of activity of changing from a traditional to a scientific and mechanical basis of operation, the impetus towards

mechanised farming must probably come from the agricultural machinery makers to a greater extent than hitherto if it is to make much progress. Among the factors which may stimulate mechanisation are the Agricultural Marketing Acts and the upward tendency of agricultural prices. Apart from mechanisation of arable farming, however, there is a considerable market for agricultural machinery

of a specialised kind in dairy farming, particularly in view of the widespread tendency towards the modernisation of cow-houses necessary for the production of "Tuberculin Tested" and "Accredited" milk.

In general, therefore, the indications point to a further, though modest, improvement in the agricultural machinery section of the British engineering industry.

TEXTILE MACHINERY

THE British textile machinery industry is one of the most important in the world and has the lion's share of the international trade. In 1935 British exports accounted for 40.7 per cent. of the aggregate value of the exports of the five chief exporting countries, a share which has been maintained since 1929. Germany's share has declined somewhat in recent years to 36.9 per cent. in 1935; the United States comes next with 9.5 per cent., Switzerland with 8.2 per cent. and France with 4.7 per cent.

The growth of economic nationalism abroad, which has been reflected particularly in the textile industries (as they are relatively easy to establish and, as far as the simpler products are concerned, easy to operate with semi-skilled labour) has benefited the British textile machinery industry. Owing to the depression of the chief textile trades at home, producers of machinery consequently have had to look increasingly to overseas markets.

Exports totalled £6,912,812 in 1935 against £6,672,060 in 1934, a minimum of £5,280,713 in 1931 and £11,643,902 in 1929. As the production figures are on an ex-works basis, and the exports on an f.o.b. basis, strict comparison is not possible. On this basis, the proportion of total output exported in 1934 was somewhat below 57 per cent. The increase in the value of exports in the last two years was due to rising prices, the actual tonnage exported

having declined from 78,486 tons in 1934 to 67,121 tons in 1935. But in the early part of the slump prices had declined sharply, the average value per ton of all classes of textile machinery in 1933 being £67, against £97 in 1930.

DISTRIBUTION OF EXPORTS

British exports of textile machinery are spread over many countries. British India, which has been the most important market in recent years, accounted for 33.5 per cent. of the value of total exports in 1935, against 26 per cent. in 1929. Exports to India have recovered well in the last three years; but, in view of the difficult period through which the Indian cotton industry is passing, further expansion of sales to that country is doubtful. In 1929 Japan was the second most important market, taking 9 per cent. of the value of British exports in that year. But as a result of the growth of the Japanese textile machinery industry, exports to Japan are now negligible. Russia, formerly also a large purchaser of British textile machinery, has developed her own industry. Nowadays, the chief customers for British textile machinery are European countries, the United States, Brazil and China. As several of the former gold bloc countries, particularly France, have in the past bought a substantial volume of

British textile machinery, a recovery of their textile industries would soon be reflected in purchases of capital equipment.

British imports of textile machinery are by no means insignificant. Imports in 1935 were 7,116 tons, valued at £1,393,424, some 44 per cent. of which, in terms of value, consisted of hosiery and knitting machines imported mainly from Germany and the United States. Significantly, hosiery and knitting machines were among the few categories of textile machinery whose output increased throughout the depression. As fashion continues to favour knitted fabrics, and as chain stores are anxious to stimulate demand by reducing the price of women's hose, this trend may be expected to continue.

The following table, based on the 1930 Census of Production and the Import Duties Act Inquiries, shows changes in British production of textile machinery in recent years:—

PRODUCTION OF TEXTILE MACHINERY

	1930		1933		1934

THE HOME MARKET

Much controversy has recently centred on the efficiency of the technical equipment of the British cotton industry.

However, had the industry had more money to cover depreciation and obsolescence in the years following the slump of 1921, it would probably have installed more new machinery. Actually spinners and manufacturers have done more than is commonly appreciated in improving their technical efficiency by the use of apparatus and attachments of various kinds. Any improvement of profit margins in the cotton industry, consequently, is of considerable importance to the textile machinery makers.

There has recently been some improvement in the American section as a result of the various price agreements usually associated with the name of Mr Frank Platt. However, partly owing to the increased change-over of American spinners to finer counts, there has been a deterioration in the position of the Egyptian section, previously the more prosperous. As a result, the Egyptian spinners have regarded the price agreements with greater favour. The average dividend paid by 170 spinning and manufacturing companies rose from 1.60 per cent. in 1934 to 1.64 per cent. last year, and has probably shown a further and more substantial increase this year. The work of the Cotton Spindles Board, moreover, is likely to lead to improved profit margins, for the elimination of some of the surplus plant is expected to reduce price-cutting. The work of the Board will be watched with the greatest interest, since similar schemes have been mooted for the weaving and finishing sections of the cotton industry.

While the cotton industry is the chief market for textile machinery in Great Britain, it is not the only one. The silk, wool, jute, hemp and flax textile industries are all of importance, a rough measure of this significance being the net imports of the textile raw materials; these were as follows in 1935 (in thousand tons): Cotton, 535; silk 281; wool 270; jute 162; hemp 91; flax 56. The current prosperity of the wool textile industry is revealed by the increase of 41 per cent. in the net imports of raw wool between 1932 and 1935, but the great progress made by the silk industry, largely as a result of the establishment of foreign companies in this country following the increase in import duties, is less widely known. Net imports of raw silk in 1935 were 89 per cent. above those in 1931. The rayon industry is also a market for textile machinery of a specialised kind.

PRINCIPAL MANUFACTURES

In 1930, the six chief textile machinery companies were amalgamated. But Textile Machinery Makers, the combine, was unable to show a profit until last year. Platt Bros. and Company (Holdings) was able to pay arrears of preference dividends. Tweedales and Smalley, of Castleton, in which T.M.M. hold a controlling interest, also improved its financial position. A leading independent company, Fairbairn, Lawson, Coombe, Barbour, has recently been in the throes of capital reconstruction. Among loom specialists are British Northrop Loom, of Blackburn; Butterworth and Dickinson, of Burnley; Hacking and Company, and Robert Hall and Sons, of Bury.

Recently a number of textile machinery companies (e.g. Howard and Bullough, of Accrington, who are in the T.M.M. group) have turned over to the production of munitions, on which they were largely engaged during the war. Several firms are turning out products other than textile machinery. Howard and Bullough, which has long been famous for high-speed winding and twisting frames, is now making machinery for the rayon and staple fibre industry. The chief centre of the hosiery and knitting machinery section is Leicester, where among the most important firms are Wildt and Company, which now controls the production of the largest range of circular machines in the world; Mellor Bromley, who specialise in interlock machines; G. Stibbe, T. Berridge, and Bentley Engineering. Another well-known firm is Cotton and Company, of Loughborough.

A development to which all textile machinists have recently been giving considerable attention is the spinning of mixed fibres. While rayon has, perhaps, led the way in this respect, considerable attention has also been given to flax. On the whole, prospects of the textile machinery industry are brighter than they have been for some years.

ENGINEERING AND BUILDING

In spite of the slow progress of mechanisation in the building and allied industries, a surprisingly large amount of machinery is used directly or indirectly in a number of constructional processes. Progress would probably be more rapid if it were not for the marked conservatism of the building trade as a whole, and for the very slow evolution of its old craft traditions. Moreover, the difficulties encountered in any attempt to secure changes in the building regulations and the introduction and development of any new technical process in this industry inevitably impose a considerable and often decisive handicap on enterprise. Nevertheless, as a result of the high level of building activity in recent years, and the expansion of auxiliary trades, quite a substantial proportion of the output of the mechanical engineering industries goes to meet the needs of the constructional trades for mechanised tools.

EXTENT OF MECHANISATION

Concrete is entering more and more into modern building and road construction, and cement manufacture and concrete mixing have been almost completely mechanised for some time. Moreover, the increased use of concrete tiles and bricks, slabs and paving stones in place of clay or stone is increasing the amount of machinery employed in the industry, while technical progress in the handling of concrete—by means of vibrators and pumps, for example—is providing an additional market for engineering products. The same is true of the extraction of clay for the manufacture of bricks, which is now practically all won by mechanical means. Woodworking, for which the building industry provides directly about half the market, is also almost completely mechanised. In general, as high a degree of mechanisation has probably been achieved in the industries producing building materials as in most other manufacturing industries.

In the actual process of building, the increase in the employment of machinery has been less noticeable. The use of mechanical hoists, even on small contracts, is becoming increasingly common, but so far there has been little evidence of any tendency to extend mechanisation to the horizontal as well as the vertical transport of materials by the introduction of conveyors. Even this moderate extent of mechanisation on the site, however, has not been extended to the process of demolition. This is the more surprising in that road-breaking is now almost completely mechanised. But demolition contracts are still carried out practically without any motive force other than human muscle and the force of gravity. It is improbable that this state of affairs will persist for very long, particularly in view of the change-over from building in lime to building in cement, which will make demolition much more difficult.

There is, of course, a limit to the extent of mechanisation on the site. The employment of more machinery in the building industry will depend on the extent to which the proportion of the work executed under factory conditions can be increased at the expense of the proportion of the work executed on the site. If the cost of building is to be reduced in relation to the general level of prices, it is essential that this development, which, incidentally, reduces the dependence of building operations on the weather, should be pushed very much farther than it has gone so far. There has been some increase in the use of factory-made units in the last ten years—such as factory-made windows and doors, hollow block floors, and plaster board—but the progress so far achieved in this country has been nothing like the progress achieved abroad.

PRINCIPAL PRODUCTS

The table on page 10 shows the output of some of the principal products of the mechanical engineering trade which are employed predominantly by the building industry or in connection with new constructional works. Some of the items listed, such as conveyors, telfers and transporters, cranes, hoists and lifting machinery, as well as welding machinery, have a somewhat slender connection with the building industry proper, though they are closely dependent on the constructional and factory equipment trades. Similarly, a substantial proportion of the out-

SERVICE

*the lubricant
of Industry*

The British Oxygen Company is proud to offer its contribution towards the progress of the industry of the country. The growing use of compressed gases, such as oxygen and dissolved acetylene, during the last fifty years has brought in its wake significant reductions in production costs, and increases in efficiency.

By ceaseless research into the application of compressed gases, the Technical Department of this Company has accumulated vast knowledge and experience which has been carefully recorded for the benefit of all whose problems it helps to solve.

Applications are invited for a copy of an illustrated booklet demonstrating the wide field covered by the activities of this Company. This booklet, "B.O.C.—what's in a name?" is indeed a valuable and enlightening publication.

put of pneumatic tools is probably attributable to the demand from the mining and shipbuilding industries.

OUTPUT OF THE MECHANICAL ENGINEERING INDUSTRY:
MACHINERY FOR THE BUILDING, BUILDING MATERIALS AND
CONSTRUCTIONAL TRADES
(In thousands of £'s)

	1930	1933	1934
Road rollers—			
Steam	...	...	26
Motor	...	...	157
Brickmaking machinery	269	269	493
Cement making machinery	...	59	81
Concrete mixing machinery	362	312	419
Conveyors, telfers and transporters	1,554	1,445	1,869
Cranes, hoists and other lifting machinery	5,317	2,637	3,106
Excavating machinery	...	...	753
Pneumatic tools	422	366	400
Refuse and sewage disposal machinery	530	312	247
Roadmaking machinery	425	254	269
Stoneworking machinery	454	505	517
Waterworks equipment	584	426	731
Heating and ventilating appliances	2,935	2,282	2,799
Woodworking machinery	574	456	615
Welding machinery	144	129	187

The next table shows the total value of constructional engineering work carried out in the years 1930, 1933 and 1934, as recorded by the Census of Production of 1930 and the two subsequent Import Duties Act Inquiries. By far the greater part of this work is carried out by engineering firms:—

VALUE OF CONSTRUCTIONAL ENGINEERING WORK
(In thousands of £'s)

	1930	1933	1934
By the mechanical engineering industry	17,069*	7,409*	8,160*
By the iron and steel trades—Smelting and rolling (including wrought tubes)	90*	725*	697*
Hardware, hollowware, etc.	110	128	166
Chain, nail and screw trades	52	36	51
Iron and steel foundries	425	425	492
TOTAL	18,567†	8,733	9,566

* Excluding an output of £230,500 by the mechanical engineering industry and £143,000 by firms in other trades which were not included in the 1933 and 1934 inquiries.

† The 1930 figures include, and those for 1933 and 1934 exclude, steel purchased and fabricated which, in 1933, amounted to £3,856,000 by the mechanical engineering trade and £26,000 by the smelting and rolling trade.

The constructional engineering trade is likely to be stimulated considerably by the increase in factory construction, which will also benefit, among others, manufacturers of cranes, conveyors, hoists, and elevators. There is, in addition, quite a large volume of bridge-building and re-building in connection with road-widening and new road projects.

EXPORTS

As far as it is possible to ascertain, foreign markets are not very important, compared with domestic business, except in the case of conveying and lifting machinery, pneumatic tools and woodworking machinery. Imports of cement-making machinery, which are considerably greater

than exports, have been as large as home production in recent years. Nearly 20 per cent. of the output, by value, of conveyors were exported in 1930, and the corresponding proportions for the remaining categories in that year were: cranes, etc., 43.5 per cent.; pneumatic tools, 43 per cent.; and woodworking machinery, 34 per cent. Measured by weight, exports of pneumatic tools in 1935 were considerably above the level of 1930, a consequence of increased mining activity abroad, especially in South Africa. Although there has been some recovery in the export of other machinery, the volume of foreign sales remains substantially below the level of 1930—especially in the case of exports of cranes, which have fallen, in volume, by more than 50 per cent. The value of these exports has been fairly well maintained:—

EXPORTS OF MACHINERY
(In thousands of £'s)

	1930	1933	1934	1935	Jan.-Sept., 1936
Conveyors, telfers and transporters	293	86	127	207	132
Cranes, hoists, lifting and excavating machinery	2,309	693	932	1,190	999
Pneumatic tools	181	136	212	242	167
Woodworking machinery	196	89	121	142	120

A large number of firms are interested in this branch of the mechanical engineering industry, but many of them are small and not very well known to the public. There are several manufacturers of road rollers, of which Aveling and Barford, Ruston and Hornsby, and Fowlers of Leeds are probably among the best known. Ruston and Hornsby, together with Ransomes and Rapier, are the chief producers of excavating machinery. Well-known manufacturers of concrete machinery of all kinds are Ransomes and Rapier of Ipswich, Fowlers of Leeds, Wingets of Rochester, Parkers of Leicester, Stothert and Pitt of Bath, Powel and Hill of Croydon and Millars Machinery Company of Bishop's Stortford. Stothert and Pitt, however, are mainly interested in cranes. Cranes and transporters are also produced in some quantity by Babcock and Wilcox, while most of the heavy electrical manufacturers produce electric cranes. Herbert Morris of Loughborough is one of the best-known firms specialising in hoisting, elevating and conveying equipment. Waygoods hold a very large proportion of the market for lifts. The principal producers of pneumatic tools are Ingersoll-Rand and the Consolidated Pneumatic Tool Company. Murex, Quasi-Arc Electrode (a subsidiary of Turner and Newall) and British Oxygen have hitherto held the bulk of the market in welding plant. The demand for welding plant by the building industry is likely to expand fairly rapidly with changes in the building regulations. There are a number of well-known constructional engineering firms—the largest of these being Sir William Arrol and Company, Braithwaite and Company, Dorman Long, Redpath Brown, Cleveland Bridge and Engineering, Horseley Bridge and Thomas Piggott. The two Manchester firms, Bannister Walton and Company and Edward Wood, are also well-known constructional engineers.

MARINE ENGINEERING

The fortunes of the British marine engineering industry are closely linked to those of the shipbuilding industry, which, in turn, depend on world trade and shipping conditions. At the moment prospects for marine engineers are encouraging, for shipping freight rates are rising, and shipbuilding activity is rapidly expanding. Mercantile tonnage commenced in this country during the first nine months of 1936 exceeded that commenced in the whole of 1934, the tonnage under construction at the end of September last being 929,000, compared with 1,561,000 at the end of 1929.

Marine engineers suffered with the shipbuilding industry from the effects of the virtual cessation of construction during the depression. Incidentally, under the impact of the depression, the marine engineering industry lost about

one quarter of its labour force, and may encounter a serious shortage of skilled labour if the expansion of shipbuilding activity continues:—

EMPLOYMENT AND UNEMPLOYMENT IN MARINE ENGINEERING

G.E.C.

Regd. Trade Mark

THE LARGEST BRITISH ELECTRICAL MANUFACTURING ORGANISATION IN THE EMPIRE

The G.E.C. activities cover every phase of electrical production from the largest power plant and power transmission systems, railway electrification schemes, plant for industrial purposes, etc., down to the smallest electrical apparatus and accessories.

ELECTRIFICATION SCHEMES FOR ALL SPHERES OF INDUSTRY

The Company undertakes electrical and mechanical contracts of any size in any part of the world, installing plant and machinery made entirely in England in its own works and those of its associated companies under the name "G.E.C." and the company's various registered trade marks.

THE GENERAL ELECTRIC CO. LTD.

Head Office: Magnet House, Kingsway, London, W.C.2. Branches throughout Great Britain and in all principal markets of the world.

TECHNICAL PROGRESS AND REPLACEMENT

The world's existing shipping tonnage is only slightly larger than in 1929, while the ships which were doing duty then are seven years older. Progress in hull and engine design has been so rapid during the past five years that many of the vessels in existence, though still practically as sound as when they were launched, are technically obsolete and of doubtful competitive value. Increased speed, greater cargo space, and lower fuel consumption have been the principal objectives of naval architects in recent years, and remarkable progress has already been achieved. Fuel consumption per ton-mile of cargo carried has probably been reduced by nearly 50 per cent. in recent years. As a result, the running costs alone of many vessels in existence exceed the running costs *plus* the fixed charges on similar vessels built to-day.

The effective life of a cargo vessel to-day is probably not much above fifteen years, and less for a tanker. Now, at the end of last June, no less than 41 per cent. of British mercantile tonnage was fifteen years old or more and 18.2 per cent. twenty years old or more. Abroad, the percentage aged fifteen years or over was 63.7 per cent. and that twenty years or over 31.5 per cent. This factor is probably of even greater significance to marine engineers than to the shipbuilding industry. A tendency to renovate existing vessels to meet the more exacting requirements of modern conditions is already noticeable, for the modernisation of old cargo tonnage is taking place on quite a large scale. By installing superheaters and perhaps also exhaust turbine equipment, and by taking advantage of the latest discoveries in propeller design and stream-lined rudder form, it is possible, at no very great expense, to reduce the fuel consumption of vessels with reciprocating steam engines by 25 per cent., add one knot to average speed and improve all-round efficiency by as much as 50 per cent. Progress in steam turbine and diesel installations has already been so rapid that nothing much can be done to increase the horse-power of cargo and passenger liners, which are mostly driven by one or other of these two sources of power, except by fitting them with completely new engines. It is interesting to note that the Union-Castle Line, which has been compelled under the new mail contract to increase the average speed to the Cape from seventeen to twenty-one knots in order that the passage time may be reduced from seventeen to fourteen days, has bought only three new vessels and has chosen five of its present ships to be re-engined in order to bring them up to the required standard of efficiency.

The shipbuilding industry is emerging from the slump with its internal affairs in good order. Between 1929 and 1932 the price of the average type of cargo vessel was halved, and there was strong competition to obtain contracts at any price in order to meet some of the expense of retaining essential staff. National Shipbuilders' Security, Ltd., has succeeded, with the co-operation of the whole industry, in reducing the capacity of British shipyards from about three million to about two million tons by buying up and scrapping yards that would in any case probably never have again been used for shipbuilding, but, nevertheless, did represent potential capacity. This work has been followed by the formation of a Shipbuilders' Conference to continue co-operation in other fields, so that the advantages of a rising turnover should not be dissipated by price-cutting.

The industry has also benefited indirectly from the Government's subsidy to tramp shipping and directly from the scrap-and-build scheme. The former, which provides assistance to British tramp shipping conditional on the elimination of rate-cutting in favour of co-operation, paved the way for the institution of minimum freight agreements on the majority of the great trade routes, though this success was due in no small measure to the improvement in trade. Nevertheless, these international agreements have introduced an element of stability into the shipping world which has reacted to the advantage of shipbuilders. The scrap-and-build scheme has not been an unqualified success, though it has already led to the placing of orders for about 190,000 tons, valued at £3½ millions, in return for which about 325,000 tons of old shipping have so far been nominated, or bought, for scrapping.

PROPULSION MACHINERY

Technical progress in the design of ship-propulsion machinery, which has been considerable in the last ten years, has set in motion a tendency towards the replacement of both steam reciprocating engines and steam turbines by internal-combustion engines. There has inevitably been a simultaneous change-over from coal to oil as a source of power, though this is also due to the substitution of oil-firing for coal-firing in boilers. The continuance of this trend should not, however, be taken entirely for granted. In the past five years there has been relatively little construction of small, low-powered cargo vessels, compared with passenger and cargo liners. As far as such cargo vessels are concerned, steam reciprocating engines are still holding their own, particularly when combined with exhaust-turbines, although the geared-turbine is gaining at the expense of that type of installation in low-powered vessels. In "luxury" vessels of medium size, as well as in the coasting trade, it is doubtful whether the predominance of the motor ship will be shaken. As regards competition between coal and oil as a fuel, much depends on the relative cost of the two fuels; it appears to be the general opinion that bunker coal may rise in price relatively to oil. The Blue Funnel line, for instance, is reported to be converting 23 of its turbine ships from coal to oil for this reason. On the other hand, considerable improvements have been made in the design of automatic stokers for coal-firing, whether used with water-tube or cylindrical boilers. Manchester Liners, for example, have been experimenting with some success with cylindrical boilers arranged for mechanical firing with coal.

In general, high-pressure steam turbines probably remain the most practical method of ship propulsion in really large vessels, where an installation with a power output in excess of 15,000 h.p. is required. It is interesting to note, however, that the two new Union Castle mailboats—the "Stirling Castle" and the "Athlone Castle"—are propelled by twin-screw ten-cylinder Burmeister and Wain two-stroke double acting engines developing over 20,000 h.p. At the other end of the scale, diesels are rapidly becoming pre-eminent in the coasting trade owing to economy in fuel consumption, since they can be stopped completely during the long periods which this type of vessel spends in port. In the vast intermediate range between these two extremes, diesel engines, steam turbines and reciprocating engines, and the alternatives of coal and oil firing, are still more or less capable of competing with each other for different purposes. In fuel consumption and fuel cost, diesels are the most, and reciprocating engines the least, economical, whichever type of firing is employed, but in the matter of capital cost the position is reversed. When overall running costs are considered it is generally found that diesel propulsion is the most, and reciprocating machinery the least, economical form of installation, notwithstanding the higher capital charges involved by the use of diesels. Much, however, depends on the relative cost of coal, boiler oil and diesel oil on different routes. On some routes and particularly in the United Kingdom trade, bunker coal is sufficiently cheap to give reciprocating machinery a slight advantage if the most efficient methods of coal-firing are employed. The next table, which is compiled from the annual report of Lloyd's Register, shows the relative importance of each type of machinery in new vessels and in the total tonnage in existence:—

RELATIVE IMPORTANCE OF VARIOUS METHODS OF SHIP PROPULSION

Built during	Total Steam and Motor Tonnage	Type of Engines			Fuel	
		Steam Reciprocating*	Steam Turbines†	Internal Combustion‡	Coal	Oil
(a) <i>Tonnage Built during Years ended June 30</i>

* Includes reciprocating engines with exhaust turbines.
† Includes turbo-electric. ‡ Includes Diesel-electric.

DECLINING EXPORTS

A less encouraging tendency in recent years has been the decline of shipbuilding orders for export, due mainly to economic nationalism, which does not count the cost, but also to the introduction of barter agreements between countries, and, in the case of Germany, to unwillingness to repay certain foreign debts except in the form of goods.

* Estimates.
(a) These figures are not quite complete, since it is impossible to distinguish exports of steam turbines for marine purposes. Exports of steam turbines for all purposes were valued at £466,121 in 1935 and £341,848 in January-September, 1936.

The marine engineering industry has inevitably suffered from this trend, for exports of marine engines and machinery other than in complete ships has never been proportionately very great, except in the case of diesel engines. Nor are exports of mercantile vessels likely to expand very much, at any rate in the near future. At the end of September, for example, only 5.1 per cent. of the shipping tonnage under construction in this country was intended for registration abroad as for sale, compared with 21.1 per cent. a year ago.

Practically all the large shipbuilding firms—such as John Brown, Swan Hunter and Wigham Richardson, Harland and Wolff, Vickers Armstrong, R. and W. Hawthorn Leslie, William Gray of West Hartlepool and the Fairfield Shipbuilding and Engineering Company of Glasgow—are manufacturers of ship-propulsion machinery. In addition to these, a number of firms specialise in the manufacture of marine machinery. These include North East Marine Engineering, and Wallsend Slipway and Engineering, both of Wallsend, White's Marine Engineering, Parsons Marine Turbine of Newcastle, Richardsons Westgarth, J. G. Kincaid of Greenock, and Wm. Doxford and Sons of Sunderland are well known. J. Stone of Deptford and the Manganese, Bronze and Brass Company are specialists in the manufacture of propellers, while G. and J. Weir is an important manufacturer of auxiliaries, such as pumps.

Naval re-armament orders have not yet played a major part in swelling shipbuilding activity. The 1936 naval programme calls for the construction of two battleships, seven cruisers, eighteen destroyers, two aircraft carriers, eight submarines, six sloops and six motor torpedo boats. It is not possible to lay down all of these ships until the expiry of the Naval Treaty on December 31, 1936. But the White Paper on re-armament (Cmd. 5107), which was published early this year, holds out prospects of a considerable expansion in naval orders during the next four years. The marine engineering industry is likely to benefit from naval re-armament, especially as it is practically certain to receive orders for machinery for such capital ships as are built in the Naval dockyards.

OTHER BRANCHES OF MECHANICAL ENGINEERING

THE ramifications of mechanical engineering extend far beyond the six branches already surveyed, and its boundaries cannot be closely defined. The engineer plays an important rôle in iron and steel concerns, and such firms as Stewarts and Lloyds, the well-known iron and steel tube manufacturers, and Richard Thomas, the tinplate makers, as well as producers engaged in constructional steel work and in the production of rails and castings might well be included on a wide interpretation. Some of the remaining sections of mechanical engineering, as defined in a more narrow sense, are briefly discussed below.

Locomotives.—Their manufacture at one time held a high place in the engineering industry, but in recent years this section has declined seriously. The explanation is not far to seek. When the British railways opened their own engineering shops a number of years ago the industry came to depend almost exclusively on foreign markets. No fewer than 581 of the 585 main line locomotives produced in 1930 were exported. The virtual cessation of railway development abroad during the slump and the curtailment of replacement programmes hit British manufacturers hard. The value of locomotives exported fell from £3,750,743 in 1930 to £305,958 in 1932 and shipments of parts from £1,232,000 to £288,013. There has been some recovery since then, however, exports of complete locomotives rising to £739,507 in 1935 and £853,247 in the first nine months of 1936, and of parts to £653,273 and £547,939 respectively. At the same time, the industry has benefited from increased replacements at home in recent years, when the British railways have placed orders outside their own works. Nevertheless, it is doubtful whether the probable expansion of world railway transport will be sufficient in the near future to enable British locomotive manufacturers to recover their former level of output. According to the Census of Production of 1930 and the Import Duties Act Inquiries, the value of the output of main-line and light locomotives and parts fell from £5,612,000 in 1930 to £1,029,000 in 1933. Despite the increase in the value of output, to £1,694,000 in 1934, which has since continued, prosperity seems still a long way off. North British, the largest concern, has made no profit since 1927. Among other leading manufacturers, Beyer Peacock, Vulcan Foundry, Robert Stephenson and Nasmyth Wilson have been slightly more fortunate. Armstrong Whitworth are also important manufacturers of locomotives.

Rolling Stock.—Manufacturers in this industry have been more fortunate than locomotive builders, mainly because they are less dependent on exports. They are assured of a fairly constant, if not very profitable, flow of orders from the British railway companies, and, in times of expanding general business activity, of numerous and more remunerative orders from private wagon-owners, particularly from concerns engaged in the heavy industries. In the 1930 Census of Production, the output of railway carriages, wagons and parts, colliery tubs and trucks, and tramway cars was recorded at £8,450,000; wagons represented £4,204,000, or about one-half of the total value. Exports of carriages, wagons and parts were £5,021,600 in 1930, but, partly owing to the time-lag between orders and their completion, this figure is not strictly comparable with the Census returns and probably exaggerates the relative importance of exports. The value of production fell to £2,418,000 in 1933, but recovered to £3,981,000 in 1934. Exports, which fell to £527,291 in 1933, subsequently rose again, reaching £1,224,826 in 1935 and £945,197 in the first nine months of 1936. These figures do not include exports of complete wheels, and of complete wheels and axles.

The majority of carriage and wagon builders and of the wagon hirers have succeeded in reducing their losses or converting losses into profits during the past two years. The largest of them, Metropolitan-Cammell Carriage and Wagon, which took over the rolling stock interests of Vickers and Cammell Laird, recently underwent a drastic

process of rationalisation. The next largest concern—Birmingham Railway Carriage and Wagon—has paid dividends throughout the depression. Hurst Nelson and Company has a much steadier record, largely on account of its low capitalisation, its strong financial position and its interest in wagon hiring. Gloucester Railway Carriage and Wagon has also a substantial interest in hiring, but a less satisfactory profit record; like several of the other firms, it has launched out into allied work, such as the construction of bodies for buses.

Mining Machinery.—This section, by contrast, is one of the few British industries whose exports have more than doubled in value since 1930. In that year the value of the output of coal-cutting machinery, winding gear and other mining equipment was £2,428,000 and that of exports £1,074,000. By 1933 output had fallen to £2,043,000 and exports to £979,200, but in 1934 output recovered to £2,590,000 and exports to £1,514,000. In 1935 exports reached £2,285,300, and the value of shipments during the first nine months of 1936 was £1,254,844. The expansion of the industry in recent years was due mainly to the great increase in mining activity, particularly, gold-mining, within the British Empire. But the home market, too, has shown improvement, for mechanisation in coal mines has made rapid strides in recent years, and will no doubt continue with increasing profitability and pressure for higher wages. Although mechanisation has reached an advanced stage in some districts, it has hitherto made little progress in others, notably in South Wales.

A large number of companies are interested in the production of mining equipment. Metropolitan Vickers, Head Wrightson of Thornaby-on-Tees, Goodall Clayton of Leeds, Fullerton Hodgart and Barclay of Paisley, and Sir William Arrol and Company of Parkhead specialise on surface plant. Holman Brothers of Camborne, Mavor and Coulson of Leeds, Climax Engineering, Cowlishaw Walker of Stoke, the British Flottman Drill Company of Cardiff, Hardypick of Sheffield, and British Jeffrey-Diamond produce underground equipment, and Bradley Craven of Wakefield and J. Ward and Sons of Wigan, haulage gear.

Printing and Bookbinding Machinery.—This is another fairly stable branch of the engineering industry. The total value of output in 1930 was £3,745,000; type-setting and printing machines accounting for £2,895,000, bookbinding machinery for £124,000, and other machinery, such as bag, envelope, box- and carton-making machines for the remainder. The total value of output fell to £2,616,000 in 1933, but recovered to £2,984,000 in 1934. Exports declined from £1,308,764 in 1930 to £728,031 in 1932, and, after a slow recovery in the two following years, rose to £1,144,318 in 1935 and £783,585 during the first nine months of 1936.

Refrigeration and Air Conditioning.—These two branches of the engineering industry have benefited from the rise in the standard of living and the introduction of mechanical aids to modern life. The domestic refrigerator is rapidly rising to the position of a conventional necessity among the middle class. Moreover, the increase in the demand for perishable commodities, one of the features of the rise of the standard of living, and the results of scientific research into the problems of bulk food storage, have enlarged the demand for refrigerated space in ships, warehouses, and railway rolling stock. During the twelve months ended June 30, 1936, 41 vessels were fitted with new refrigerating installations under the supervision of the Surveyors of Lloyd's Register, and the total number of vessels holding the Society's Refrigerating Machinery Certificate rose from 546 in 1935 to 571, with an aggregate capacity of over 91 million cubic feet. The value of the output of refrigerating machinery rose from £1,471,000 in 1930 to £1,534,000 in 1933 and to £1,931,000 in 1934. The fall in prices masks an increase of, say, 80 to 100 per cent. in

the volume of production of refrigerating machinery between 1930 and 1934. The output of refrigerators in 1934 for domestic use accounted for only £397,000, or less than 21 per cent. of the total. Exports did not expand proportionately, with the result that the excess of imports over exports in 1935 was larger than in 1930. J. and E. Hall, Lightfoot Refrigeration, Electrolux, Frigidaire, Prestcold, and Kelvinator are well-known manufacturers of refrigerators. Recently, Electrical and Musical Industries have also entered this market. Some of these manufacturers produce air-conditioning plant, which is also produced by specialised concerns such as the Carrier Engineering Company.

Air conditioning has made considerable progress in the factory, cinemas, shops and restaurants, but some time may elapse before it is used on any scale in residential buildings. The 1930 Census of Production and the subsequent Import Duties Act Inquiries recorded an increase in the value of output of air-filtering plant from £30,000 in 1930 to £38,000 in 1933 and £41,000 in 1934; but these figures are incomplete, for air-conditioning plant was probably included under heating and ventilating appliances and general plant. The value of the output of these items in 1934 was £3,046,000, compared with £2,504,000 in 1933 and £2,935,000 in 1930. Owing to the fall in prices, the expansion in the volume of plant installed was probably greater than these figures indicate.

Machinery in Food and Drink Preparation.—The rise in the standard of living and changes in consumption are reflected in the trend of output of machinery for the food, drink and tobacco trades. In spite of a severe fall in the output of plant for the brewing and distilling industries, the value of the output of food processing plant, etc., was £4,098,000 in 1934, compared with £3,960,000 in 1933 and £4,053,000 in 1930. Details are given in the table below:

OUTPUT OF EQUIPMENT USED IN FOOD AND DRINK PREPARATIONS
(In thousands of £'s)

	1930	1933	1934
Brewing and distilling plant	612	210	354
Dairy plant	265	312	389
Food preparation machinery	1,544	1,375	1,394
Grain milling machinery	421	494	513
Sugar-making and refining plant	518	1,131	789
Tobacco and cigarette making machinery	693	438	659

Most of the output of sugar-refining plant is exported, the big increase of output in 1933 being due to large export orders. About half of the output of grain-milling machinery and about 40 per cent. of the output of dairy equipment is exported, but exports of the latter are practically offset by imports.

Washing Machinery.—Evidence of an increased demand for services is provided by the growth of the laundry industry. In the past ten years the laundry trade has been rapidly mechanised and transformed into a factory industry. It is not surprising, therefore, to find that the value of output of laundry machinery rose from £655,000 in 1930 to £743,000 in 1933 and £1,037,000 in 1934. Rather surprisingly, the value of the output of mangling and wringing machines for domestic use in 1934 was still £895,000, against £864,000 in 1933 and £854,000 in 1930.

Pumps and Weighing Machinery.—These two products of mechanical engineering are used practically throughout industry, and, consequently, accounted for as much as £5,000,000 of the output of the industry in 1930. The extent of the market which these products enjoy is partly responsible for their stability of output, which is illustrated in the following table:—

OUTPUT OF PUMPS, ETC., AND WEIGHING MACHINERY
(In thousands of £'s)

	1930	1933	1934
Air and gas compressors and exhausters	993	792	1,068
Pumps, kerbside petrol and oil	264	264	264
Other equipment	2,738	1,836	2,294
Weighing machinery	1,436	1,328	1,508

* Included in "Other equipment."

Between one-quarter and one-third of the output of compressors and exhausters is normally exported, the proportion for pumps being about one-third and for weighing machinery about one-tenth. Exports of air and gas compressors and exhausters nearly doubled in value between 1933 and 1935, having risen from £205,208 to

£391,284, compared with £322,000 in 1930. Exports of pumps were valued at £891,382 in 1935, against £673,067 in 1933 and £1,215,000 in 1930. Exports of weighing machinery fell from £324,000 in 1930 to £139,417 in 1933, but recovered to £211,573 in 1935. Among well-known makers of pumping equipment of all sorts are Worthington Simpson of Newark, G. and J. Weir, Mather and Platt, British Pulsometer, and Tangyes. W. and T. Avery, Limited, of Birmingham have a large share of the market for weighing machines and are also interested in the production of petrol pumps through Avery-Handoll.

Other Machinery.—There remains a group of smaller industries which specialise in the production of plant or machine tools for other trades. Of these the most important are makers of furnace plant, rolling mill equipment, gas and chemical plant, paper-making machinery and boot and shoe and sewing machinery. Apart from the last group, the prosperity of these sections depends on the fortunes of the industries which they serve and, more particularly, on the rate at which these industries are expanding. Among other specialised activities of the engineering industry are the manufacture of ball and roller bearings and the cutting of gears. The output of these various branches is shown below:—

OUTPUT OF VARIOUS ENGINEERING PRODUCTS
(In thousands of £'s)

	1930	1933	1934
Blast furnace plant	...	372	397
Other metallurgical furnaces and appliances	...	181	191
Other steel works, blast furnace and coke-oven machinery	234	...	...
Rolling mill machinery (excluding rolls)	365	150	365
Gas and chemical plant	1,245	682	705
Paper-making machinery	850	781	896
Tanning and leather working machinery	143	150	191
Sewing and boot and shoe machinery	3,524	2,693	2,684
Ball bearing and roller bearings	2,363	2,165	2,760
Gears and gear wheels	1,166	1,196	1,747

The manufacture of sewing machines is the only section which exports a substantial proportion of production.

ENGINEERING AND THE INVESTOR

THE preceding pages of this Survey have stressed two main factors which determine the fortunes of the engineering industry—the ebb and flow of constructional activity and fluctuations in the volume of export trade. It follows that engineering shares, as a class, are subject to greater variation in capital value and earning power than industrial equities in general. The earnings of representative engineering ordinary shares, in fact, are subject to a double "gearing"—the first of a technical, and the second of a financial, nature.

It follows that a given reduction in the volume of the turnover of engineering companies in general is accompanied by a more than proportionate reduction in ordinary share earnings. Conversely, their rate of recovery from depression can be distinctly more rapid than that of typical concerns in the stable consumption goods trades. These factors stress the need for discrimination between engineering shares and stable industrials, at various phases of the trade cycle. Within the engineering industry itself there is scope for further selection. Some sections have been, and still remain, affected by secular handicaps. The slow recoveries of the railway equipment and textile machinery branches are clear illustrations. And the recovery of marine engineering profits is hardly more than a year old.

These factors are apparent in the accompanying table of profits and dividends of some representative concerns. For convenience the companies have been grouped according to their main (though sometimes not exclusive) interests. Babcock and Wilcox, for example, although grouped under "Prime Movers," does an extensive marine boiler business, which has undoubtedly contributed its quota to the satisfactory profits recorded last year. English Electric, on the other hand, may be taken as a typical concern which is likely to benefit from the swing from mechanical to electrical drive. For over a decade, however, earnings have been sub-normal, but the recent revival in home and overseas business suggests that the preference arrears from January, 1934, should be made good at no distant date.

The marine engineering group illustrates the ability of such leading concerns as John Brown, which has come through depression without accumulating heavy losses, to make a spectacular return to the dividend list, after active business has been restored for a comparatively short time. Tyneside, represented by Swan, Hunter, Wigham Richardson, has not been so fortunate as the Clyde, but already has a substantial share of naval work to promise better things in future. Harland and Wolff's record is, to some extent, a reflection of the *crise de famille* arising from the Royal Mail group collapse. Among the smaller concerns, Yarrow and Parsons Marine Steam Turbine have shown consistent profit-earning ability throughout depression.

A much more hopeful view has recently been taken of railway equipment concerns. There are, perhaps, better prospects from the rolling stock business than from locomotive building. Even before the depression the locomotive builders were unable to make satisfactory profits, and only Vulcan Foundry has shown modest recovery since. In this country the main-line railways largely cater for their own requirements, and the full force of reduced export business has thus been felt. Although arrears of maintenance are accumulating on railways the world over, there is still insufficient revival of railway fortunes to offer really good prospects for the locomotive manufacturers. Rolling-stock builders, however, enjoy more stability of profits, particularly through goods wagon hire-purchase business, and have already felt the incidence of industrial recovery.

Among the innumerable general engineering companies whose shares are quoted in the Stock Exchange list, the investor must discriminate carefully. Many have a somewhat localised market; some are affected by rising costs, particularly of materials; others have a specialised and consistently profitable business. While there may be good opportunities for the investor with local connections, therefore, it is largely to the latter class that the general investor must look. Under the heading "Textile and General

we have included three such companies. British United Shoe Machinery combines an enviable stability of dividends and rising earnings with frequently recurring share bonuses. Mather and Platt produce fire-fighting appliances and textile machinery, but their general engineering business has undoubtedly contributed to the recent improvement in earnings. W. and T. Avery is essentially a "stable-dividend equity," with occasional capital bonuses. The company occupies a predominant position as a maker of weighing apparatus of all kinds.

We may, finally, turn to a group which has attracted much recent market interest—machine tool makers and precision engineers. The former, after a long period of sub-normal demand, are now working at peak pressure to supply tools for British industry, and in particular for the re-armament programme. Current profits are near an all-time peak, and the investor has been invited to subscribe on terms which discount a further rapid advance in earnings. There seems no reason why this should not be achieved during the next twelve months, but present share prices might with advantage be related to the prospects of a longer period. This section of the engineering industry has hitherto shown the most pronounced fluctuation in earnings. About forty new issues have been made during the past two years, and although most of the companies are small, their re-armament interest ensures them a popular speculative following.

THE ECONOMIST

TRADE SUPPLEMENT

New Series

SATURDAY, NOVEMBER 28, 1936

No. 162

THE STATE OF TRADE

THE expansion of business activity has been well maintained in recent weeks, and the latest industrial reports point to a continuation of recovery. The *Economist* index of business activity, which is adjusted for normal seasonal movements in activity, remained unchanged in October. The index shows that the volume of activity is now about 8½ per cent. above last year's average level.

While the general trend of activity remains upwards, the incidence of recovery has been gradually changing recently. In the first place, the upward movement is now proceeding on a wider front. Hitherto industries dependent mainly on outlets overseas have tended to lag behind the trades working mainly for the domestic market. The majority of export industries are now gaining ground more rapidly. For example, the increase in demand for shipping accommodation has brought about a material improvement in shipping, shipbuilding and marine engineering. The flow of orders to shipbuilders and marine engineers is gathering momentum. In addition to new construction of mercantile tonnage, many existing vessels are now being re-equipped

authorities, like those for September, was smaller than in the corresponding month a year ago. Compared with a year ago, the decline in October was 12 per cent., against a fall of 8 per cent. in September. It is possible therefore, that "unassisted" dwelling-house construction may soon take a definite downward turn; but the maintenance of "assisted" dwelling-house building and the increase in factory and commercial construction may prevent an early and steep recession in this branch of activity.

In general, the metal industries remain in the vanguard of recovery. The process of re-equipment of British industry, accelerated by re-armament, is still in full swing. Most branches of the metal industries are working at capacity, production of iron and steel, machinery and electrical equipment now being well above the pre-depression level. And, although the capacity of the iron and steel and engineering industries is being increased, they are unable to meet the rapidly increasing domestic requirements. Consequently the trend of exports is downwards,

while imports are steadily increasing. The current volume of imports of machine tools, for example, is more than twice as high as a year ago. Industries catering directly for the domestic consumer are able to expand their output with the increase in the national income. The value of retail

machinery. Again, the volume of new business in cotton textiles since September has been heavier than for a number of years. The downward movement in exports of cotton goods has been reversed. There has also been an improvement in jute textile manufacture, while exports of coal are tending upwards and should improve further with the resumption of trade with Italy.

The cause of the gradual permeation of recovery to the depressed sections of British industry is to be found largely in the steady progress of recovery abroad. The increasing demand for, as well as the rise in the price per unit of, primary products has been accompanied by an increase in the purchasing power of a large number of countries and, consequently, by an expansion of international trade. As a result, the downward course of British exports, noticeable during the first half of this year, has given way to an upward trend. In October, for example, the value of British exports was higher than in any month since November, 1930. It is significant, moreover, that the expansion in exports has taken place despite a reduction in the volume of shipments of iron and steel, machinery and chemicals—three of our most important export industries. The improvement in exports has been quite marked in the case of cotton and other textiles, commercial vehicles and cycles, a reflection of the rising standard of living in primary producing countries.

Secondly, evidence is steadily accumulating that building activity has reached a peak. Although the volume of construction remains well above the level of a year ago, the value of all building plans passed in October by 146 local

sales in October, for example, showed an increase of 7.4 per cent. over the corresponding month a year ago. Most of the textile, clothing, and food, drink and tobacco industries are gaining ground; and the automobile industry is already assured of an increase in sales of private cars next year.

The incidence of recovery abroad is tending to become less uneven. The majority of primary producing countries are able to increase their exports at rising prices. Business in many countries of the sterling area, and especially in Scandinavia and the British Dominions, is still expanding. Moreover, the latest reports from former gold bloc countries are more encouraging, though the improvement has not yet gained much momentum, especially in France. Mainly as a result of re-armament and increased constructional activity, production and employment have continued to increase in Germany. In Belgium, Czechoslovakia and Poland industrial activity is higher than a year ago; but last year's improvement in Austria is not being fully maintained. In Japan there are some indications of hesitancy, but China's foreign trade is now expanding more rapidly.

In the United States the trend of activity remains upward. The output of consumers' goods is now practically as high as in 1929, and activity in the capital equipment industries is expanding rapidly. Foreign trade is also increasing, and the value of imports has exceeded that of exports in recent months.

HOME INDUSTRIES AND TRADE

The following reports on British industry cover, in most cases, the period to the middle of November. In the remainder they relate to the month of October.

COAL

Although conditions are still bad in certain areas, the coal trade is now benefiting from a modest seasonal improvement. Output was again higher in October and unemployment was further reduced. Moreover, the position is generally more satisfactory than at this time last year. Demand for house coal has, however, been slow to expand, and the volume of orders passing to the collieries has not yet attained the normal winter level. On the other hand, the market in industrial fuel has been very strong, little coal being available when contract demands were met. No shipments were made to Italy during October—a factor which is more than sufficient to account for the decline in exports compared with October, 1935. Under the recently negotiated agreement, Italy will take rather less than 2,000,000 tons of British coal and coke annually—or about one-half as much as was normal before the Abyssinian adventure.

IRON AND STEEL

Activity in the industry is still on the upgrade. The output of steel ingots and castings in October, at 1,060,500 tons, marked a new all-time record. But although imports of iron and steel are now running at a higher level, and exports at a lower level, than a year ago, the industry is still having difficulties in meeting the rapidly growing requirements of domestic consumers. Even in the finished steel section demand is in excess of capacity, and there is a tendency for deliveries against contracts to fall into arrears. In many districts producers of pig iron are now rationing consumers; moreover, it is understood that some consumers have had to substitute lower grades of iron for those generally used. On the other hand, the stringency in the semi-finished section has been somewhat relieved by increased imports of Continental materials.

ENGINEERING

Production continues to expand rapidly in most sections of engineering. With the exception of a seasonal decline in agricultural engineering activity, all sections are making headway. Moreover, demand is still expanding and there is no likelihood of a recession for at least twelve months. The proportion of insured workers in general engineering unemployed in October was only 7.0 per cent., compared with an average of 9.7 per cent. in 1929. Indeed, activity in the industry is now higher than at any time since the post-war boom. Home requirements are so large that the volume of exports has tended to fall, while imports continue to increase rapidly. Total imports of machinery increased from 1,233,200 tons in January-October, 1935, to 1,612,500 tons during the first ten months of 1936. During the same period imports of machine tools rose from 6,363 tons to 14,896 tons.

ELECTRICAL ENGINEERING

Activity in the electrical equipment industry continues to expand. The orders for heavy electrical machinery placed last month constituted a record for the industry.

INDEX OF NEW ORDERS RECEIVED BY HEAVY ELECTRICAL MANUFACTURING INDUSTRY*
(1920 = 100)

MOTOR INDUSTRY

Latest information suggests that the advance over last year has been well maintained. Thus, new registrations of private cars and goods vehicles in September amounted to 21,557 and 6,297, respectively, against 19,031 and 4,963 in the same month of 1935. During the past year production figures, month by month, have exceeded the previous year's level. Output of private cars during the year ended September amounted to 353,838, against 311,544 in the previous twelve months, while commercial vehicle production totalled 108,109 units, against 92,176. Exports of cars during October, again exceeded the previous year's corresponding

figure, but, mainly in consequence of a reduction of prices. The average value per car was slightly lower than in 1935. Imports have also been well above the level of a year ago.

CHEMICALS

During October domestic business was fairly satisfactory in most sections. Industrial chemicals were in steady demand and, in general, a good trade was transacted in wood distillation products. In the coal tar products market there was not much interest in the heavy products, but other sections were steady, although business was restricted by a shortage of prompt supplies. Business in pharmaceutical chemicals was about average for the time of year. Exports of chemicals, drugs, dyes and colours during October showed a decline of nearly £160,000 compared with the same month of last year. There was also a decrease in imports, the total value being £125,570 less than in October, 1935.

COTTON

Stimulated by the belief that prices are now likely to show an upward trend, consumers have been operating more freely, and spinners and manufacturers have consequently been busier than for a long while past. The improvement is reflected in the employment position, which is now considerably better than a year ago, and in the increase in the percentage of spindles in full production from 81 at the end of September to 86 a month later; this figure compares with 83 per cent. a year earlier. Home demand has continued active and exports have also improved. During October, the principal overseas markets all absorbed appreciably more than in the same month of last year, and order books are reported to have been extended.

WOOL

Active conditions continue, the improvement last month being reflected in a further reduction in the unemployment percentage and in an all-round hardening of prices. Unemployment is now lower than for many years past. Although short time is still being worked by some operatives, overtime is much more common and machinery is generally very active. During October, British exports of woollen and worsted yarns and manufactures suffered a slight setback and were rather smaller than in the same month of last year. However, with the notable exception of Germany, which is Yorkshire's best overseas customer, the majority of the export markets have absorbed larger quantities this year than last. Shipments to Italy have been drastically reduced, but this outlet is not of great importance.

JUTE

The strong statistical position of the fibre has resulted in an advance of prices, an increase which has spread to yarns and manufactures. Calcutta goods have been marked up, despite the failure of the associated mills to reach an agreement with the "outside" mills regarding working hours. Manufacturers in this country have received more orders, but unemployment remains heavy.

RAYON

In the spinning section activity is well maintained. Demand for staple fibre is increasing, and progress is being made with wool and staple fibre mixture yarns spun on cotton machinery. Nervousness regarding proposed increases in Lancashire weavers' wages is, however, hindering business, especially on the export side. Business in hosiery shows some improvement.

LINEN

With all classes of flax in active demand and sellers reticent, prices have advanced; high-class fibre is difficult to obtain. Despite the advance in quotations, consumers of yarn have operated freely, while cloth has also received increased attention, with producers securing better margins. Export business shows a further improvement, especially in damasks and fine goods.

BOOTS AND SHOES

Little change occurred in the footwear trades last month, an improvement in some districts being counterbalanced by a decline in others. Export trade, however, was below the level of a year ago.

POTTERY

A further improvement in this industry took place last month. Although the movement was mainly seasonal in character, the employment position is noticeably better than at this time last year. Exports of general earthenware were well ahead of the corresponding 1935 figure.

AGRICULTURE

The lifting of the potato crop has been carried out under favourable conditions. Some varieties are reported to be yielding light and small tubers, but others have done well. The yield per acre is forecast at 5.8 tons. Root crops have grown appreciably during October. The yield per acre of turnips and swedes is forecast at 12.4 tons, that of mangolds at 18.6 tons, and that of sugar beet at about 8.4 tons of washed and topped beet. Good progress was made with autumn cultivation during October. Wheat will probably be sown to the same extent as in recent years. Both cattle and sheep made good progress and, except in

a few districts, milk yields have been kept up to normal without difficulty.

SHIPPING

Demand for shipping tonnage continues on the upgrade, and freight rates consequently showed a further hardening tendency last month. The *Economist* index for October (1893=100), at 105.9, showed a rise of 5.5 per cent. over September, and was over 12 per cent. higher than a year ago.

BUILDING

The trend of activity has recently been somewhat uncertain, and the latest evidence apparently confirms the view that the expansion of the volume of construction has reached a peak. Our index of building activity, adjusted for seasonal variations, declined slightly between September and October; on the other hand, the index is still well above the level of a year ago. As in September, the value of all the building plans passed by 146 local authorities in October was lower than a year ago. While the total decline amounted to about 12 per cent., the fall in plans passed for dwelling houses was 17 per cent. It is somewhat uncertain, however, how far the plans passed by 146 local authorities reflect the trend of building activity in the country as a whole, especially as the London County Council area is excluded from the sample.

1936

Jan. 25 1936

Revised.

Provisional.

STATE OF TRADE OVERSEAS

BRITISH EMPIRE

Australia.—Crop prospects, states a cable from the National Bank of Australasia, have improved in consequence of good rainfall in the south-east; the wheat harvest is estimated at 130 million bushels. Butter production is, however, restricted by drought in the coastal districts of New South Wales and Queensland. Employment has improved and foreign trade is on the up-grade, but there are indications of some slackening of activity in certain industries. The Stock Exchange, however, is buoyant.

South Africa.—Although some authorities have recently expressed doubts regarding the continued expansion of business activity in the Union, there appears to be no sign of any setback. Markets in primary products are generally active and firm, and the outlook for agricultural industries appears satisfactory. Building activity is well maintained, gold production is on the increase and railway earnings continue to exceed Budget estimates. Foreign trade remains above last year's level.

Canada.—The expansion of business activity continues to make gradual progress and the general position is satisfactory. The improvement is reflected in better employment and in a higher level of industrial production. Bank clearings are also on the up-grade and wholesale prices are slowly rising. Construction industries still lag behind, but they are expected to benefit from a new housing scheme sponsored by the Government, with the co-operation of the banks.

India.—In consequence of satisfactory rainfall, the majority of the principal crops remain in good condition. The acreage under cotton, however, is 5 per cent. smaller than a year ago. Meanwhile, wholesale prices are slowly rising. Merchandise imports amounted to 1,067 lakhs of rupees in October, against 950 lakhs in September and 1,181 lakhs a year earlier. Exports of merchandise were 1,661 lakhs, against 1,518 lakhs in September and 1,450 lakhs in October, 1935.

EUROPE

France.—The official index of industrial production (1913 = 100) rose from 93 in August to 95 in September. A year ago the index stood at 94. So far the devaluation of the franc, which took place on September 26th, has not led to a marked expansion of business activity. Progress appears still to be hampered by the legislation on working hours and wages which is coming into force by stages. Moreover, the repatriation of capital has not yet assumed large dimensions and interest rates remain at a fairly high level. Nevertheless, there are signs of a slight improvement. Contrary to the normal seasonal trend, unemployment has tended to decline in recent weeks; the number of persons in receipt of benefit declined by 1,994 during October, compared with an increase of 11,884 during the corresponding period last year. Both wholesale prices and quotations for industrial securities continued to rise in recent weeks.

Germany.—Re-armament, industrial re-equipment and dwelling-house construction continued at a fairly high level. The index of industrial production of the German Institute for Business Research (1928 = 100) rose from 111.1 in August to 112.9 in September, compared with 103.4 a year ago. There was a seasonal increase in unemployment during October, from 1,035,200 to 1,076,000. The number of railway trucks ordered rose from 142,400 per day in September to 150,800 per day in October, against 138,700 per day a year ago. Pig-iron output increased from 1,198,000 metric tons in October, 1935, to 1,379,000 tons during the past month. Production of coal is also increasing and activity in the engineering industry continues at a high level. Wholesale and retail prices are scarcely changed on the month, and quotations for industrial securities have been fairly well maintained. Both imports and exports rose by about Rm. 20 millions between September and October, and the excess of exports over imports consequently remained unchanged at Rm. 75 millions.

Norway.—The index of industrial production rose by 5.7 per cent. between August and September, and foreign trade returns indicate an increase of 12 per cent. in turnover over September last year. Freight markets, especially for tankers, improved substantially, and laid-up shipping tonnage was reduced during the month by about 60,000 tons dw. Domestic trade improved appreciably, and prices showed an upward trend. Business on the Bourse—especially in shipping, whaling and industrial shares—was very brisk, and quotations climbed to new heights.

Austria.—Last year's expansion of business activity has not been maintained in recent months. The index of production for August (1929 = 100) was 80.4, against 85.3 a year ago. The number of applicants for work rose from 289,944 at the end of September, 1935, to 303,981 at the end of September last. The trend of wholesale prices continued upwards.

Poland.—Industrial production in Poland continues to expand gradually. The index of production for September is 74.9 (1929 = 100), against 73.5 in August and 68.3 in September, 1935. Both imports and exports in October were appreciably above the level of a year ago.

Greece.—Weather conditions were favourable for agriculture. The tobacco and currants markets were lively. Public receipts were satisfactory. Internal trade was better than in September. Foreign trade in September was slightly lower in volume, but higher in value, than a year ago. The wholesale and cost-of-living index numbers rose further. The Stock Exchange was less active than in September and prices tended to fall.

UNITED STATES OF AMERICA

The trend of business activity continued upwards. But according to the Federal Reserve Board's index of industrial production, the level of output in September was still about 8 per cent. below the pre-depression level. The output of consumers' goods is now practically as high as in 1929. Christmas trade is expected to be better than in any year since 1929, and sales of automobiles in 1937 are expected to exceed this year's sales. Activity in the capital equipment industries is increasing rapidly. As production in some branches of activity is reaching capacity, expenditure on renewals and extensions of plant and equipment is increasing. Foreign trade is also expanding rapidly, and the value of imports has exceeded that of exports in recent months. The outlook remains encouraging.

AMERICAN TRADE STATISTICS—OCTOBER, 1936

	September, 1936	October, 1936	Compared with Oct., '35
EMPLOYMENT —(1923-25 = 100)†	88.9	...	+ 5.3

LATIN AMERICA

The decline in Argentina's exports, compared with last year, is being rapidly made good, the feature being the increase in maize shipments. Prospects for the fine cereal crops are excellent and the general outlook in Argentina is quite good. In Uruguay, the Exchange Commission is dealing promptly with applications covering payments for imports received from countries to which quotas have been allotted; these quotas are now based upon the £ sterling instead of the French franc. The currency is now pegged to the £, and its exchange value is being supported by sales of new-clip wool. A law in Paraguay provides for the liquidation of obligations hitherto protected by moratoria, and commercial debts in foreign currencies arising from imports will be liquidated by quotas extending over eighteen months. In Chile, the difficult situation in the export market for sterling and United States dollars continues. Peru's overseas trade continues to expand. German "compensation" trade is noticeable in Brazil, Peru, Chile and the Central American countries. Prices of coffee in Brazil have risen following the Coffee Convention in Bogota. It is doubtful whether the proposed quota system for coffee-producing countries will solve the problem of over-production in Brazil. The growing coffee crops of the Central American countries are generally reported as good.

THE FAR EAST

In Japan, business conditions appear to be rather less active than of late. The movement is reflected in a reactionary tendency on the commodity markets, prices of cotton and silk yarn having been noticeably easy during the past few weeks. On the Stock Exchange, foreign bonds slumped on the news of impending special taxation, and industrial shares were a dull market. Meanwhile foreign trade, both in China and Japan, continues to make headway. Japan's imports amounted to 197 million yen in October and exports to 246 million yen, against 186 and 246 million yen respectively for the corresponding month of 1935. China's imports totalled 81.9 million dollars in October, against 61.2 last year, while her exports amounted to 59.2 millions, against 48.4 in October, 1935.

STATISTICS

In the following tables we give trade and other statistics for as many countries of the world as possible, our endeavour being to combine brevity with comprehensiveness. The greater number of the figures are taken from the Monthly Statistical Bulletin of the League of Nations (published by George Allen and Unwin, Ltd.).

PRODUCTION (Thousands of Metric Tons)

Unless otherwise stated, the figures represent authorised share issue of new joint stock companies at home, and the increase of capital of existing companies. Bonus shares are excluded from the figures. In the case of the Netherlands, Switzerland and the U.K. both issues of 1913 and 1929 are included. Excluding Treasury Bills. Excluding large railway issues. Until end 1922 paper mark. Société de Banque Suisse. Figures of net amount of new issues, excluding western departments; since 1928 amounts actually issued, whole territory.

ment, certain temporary restrictions are imposed on this principle, as well as on the principle of self-government, particularly at the Centre;

(4) *Decentralisation*, so that the Federation, though in the case of the States it derives its authority from the surrender by them of certain powers, is in the case of the Provinces based on the delegation by the Crown of large powers to them.

THE FEDERAL CENTRE

The federal section is, of course, the most complicated part of the whole scheme, since it associates units which have very different political structures. Thus, the States are now autonomous units which, by a series of individual treaties and agreements, have recognised the suzerainty of the King Emperor, but form no part of his dominions. In all matters, therefore, over which the Federation will have control, it will be necessary for the Rulers of the States, by means of an Instrument of Accession, to delegate their powers to the Federal Authority. In all other matters they will retain their present degree of autonomy, subject, of course, to the supervision of the Paramount Power exercised through the Viceroy and not the Federal Authority. Under the Act, the Federation cannot be established until the rulers of States representing at least half the total population of the States, and entitled to at least half the State seats in the Federal Upper Chamber, have adhered to the Federation. For British India, the Act will restore all powers to the Crown, and these powers will then be re-divided as between the Centre and the Provinces. Most of the powers of the Federal Authority will apply equally to the States and to British India, but there are certain matters, such as income tax and other direct taxation, in respect of which the Federal Authority will have power over British India alone. In the Federal Centre the principles of self-government and responsibility are conceded, but as a transitory measure certain subjects (i.e., Defence, Foreign Affairs and Ecclesiastical Matters) are removed from the control of the Federal Legislature and Executive, and are reserved to the Governor-General, who will have control over them and be responsible to the Secretary of State and the Imperial Parliament for them.

The Governor-General will also have a special responsibility in five questions:—

- (1) Prevention of any grave threats to the peace and tranquillity of India, or any part thereof;
- (2) Safeguarding of the financial standing and credit of the Federation;
- (3) Protection of the rights of the Indian States, and the legitimate interests of minorities and of the rights and legitimate interests of the Public Services;
- (4) Prevention of commercial discrimination;
- (5) Any matter which affects the administration of any department under the direction and control of the Governor-General.

In these questions he will normally be guided by the advice of his Ministers; but he will have power to reject such advice and act on his own initiative if, in his opinion, the advice given by his Ministers endangers the interests which he is required to protect. He will also have power to take over the whole administration in the event of a breakdown in the Constitution. It should be emphasised, however, that all these are reserve powers which it should not normally be necessary for the Governor-General to employ. Apart from these restrictions, the Executive will be responsible to the Federal Legislature. But the Act has been careful to avoid the laying down of definite rules in such matters as the appointment of a Prime Minister, the collective responsibility of Ministers, or the representation of minority interests in the Executive. The last question is, however, referred to in the Instrument of Instructions to the Governor-General.

The three reserved subjects of Defence, Foreign Affairs and Ecclesiastical Matters will be administered by three Counsellors appointed by the Governor-General, and he will also have the assistance of a Financial Adviser. It will be seen, therefore, that the Federal scheme is essentially dyarchic in character. This has been accepted in principle, not from any belief in its intrinsic merits, nor from a lack

of realisation of the difficulties inherent in it, but because it appeared to be the only practical way in which a half-way house could be found between the maintenance of the present irresponsible Executive and complete self-government and responsibility.

The Federal Legislature will be bicameral. The Council of State will consist of 260 members, of whom 156 will represent British India and 104 will represent adherent States. Of the 156 British-Indian members, 6 will be nominated by the Governor-General. The Legislative Assembly will consist of 375 members, of whom 250 will represent British India and 125 will represent adherent States. The Council of State will be directly elected on a high franchise, and the Legislative Assembly by members of Provincial Lower Houses, with special reservation of seats for the minority communities, for which the electorate will be the communal members of the Provincial Lower Houses. The Representatives of the States will be appointed by their Rulers, or by a group of Rulers, in the case of the smaller States.

THE PROVINCIAL FIELD

In the provincial field, dyarchy has been abolished and a unitary government established under a Governor appointed by the King. The Governor will be advised by a Council of Ministers, who will be responsible to an elected legislature with full powers over the whole field of provincial administration. The relationship between the Governor and his Ministers will be much the same as that between the Governor-General and his Ministers in the transferred sphere, and the provincial Governor will also have comparable powers and special responsibilities. His special responsibilities will be the same as those of the Governor-General, except that the financial stability of the province will not be included, but he will be responsible for securing the execution of orders issued by the Governor-General. The Governor will have executive and legislative powers (both negative and positive), which will enable him to carry out his special obligations and also to take over the entire government in the event of a breakdown in the Constitution. These powers are, of course, simply reserve powers, which it is not intended that he should use as long as the normal system of government functions smoothly.

In six Provinces the Legislature will be bicameral and in the remainder uni-cameral; but provision is made for any province to be able to alter this form after ten years with the approval of the Imperial Parliament. The principle of direct election to the Legislature has been accepted and the franchise is to be extended from the existing 3 per cent. to 14 per cent. of the total population of India, or 40 per cent. of the adult male population. Provision is also made for the representation of minorities, on the basis of the Communal Award, as modified by the Poona Pact.

THE CONSTITUTION AND THE FUTURE

Such is the framework of the new Act, though it is impossible in this article to deal with many important questions covered by the Act, such as the consequent limitation of the powers of the Secretary of State and the Council of India, the protection of the Public Services, the Judicature (including the establishment of a Federal Court) and the prevention of commercial and other forms of discrimination, and the separation of Burma. It must, moreover, be borne in mind that it will come into operation in two parts. The provincial sections will take effect as from April 1, 1937, but the federal sections will only be put into operation after the stipulations with regard to the adherence of the States have been carried out and both Houses of Parliament have presented an Address to the Crown.

The new Constitution is, in fact, an elaborate system of checks and balances, under which a great advance is made towards both self-government and responsible government, but with considerable reserve powers retained by British authorities. The basic idea is that, with the exception of Defence, Foreign Affairs and Ecclesiastical Matters, the administration of India should be in the hands of Indians responsible to elected legislatures, but supported by a Governor-General or Governor appointed by the King and assisted by the Indian Civil Service. So long as this

administration is efficiently carried out and due regard paid to the subjects forming the special responsibilities of the Governor-General or Governor, there should be no interference by the representatives of the British Government. At the same time abundant powers have been given to the Governor-General and the Governors to intervene in any of these matters if the Indian administration fails. The critics of the scheme are mainly divided between those who say that the checks are so strong that no real freedom and responsibility will accrue to Indian Ministers and, on the other hand, those who feel that so much power has been given to Indians, that it will prove impossible in practice for the Governor-General or Governor to take effective action against the wishes of his Ministers. Time alone can show whether either view is correct; but this great divergence of view in itself shows us the measure of flexibility inherent in the new Constitution. The trend of Indian thought leans towards precise definitions and clear

statements of powers and responsibilities, while British political psychology is based on its own experience of an unwritten political Constitution. The new Indian Constitution is a compromise between these two attitudes of mind, and the first fence to be negotiated in the point-to-point of Indian political development is to secure the combination of these two attitudes of mind in making a practical application of the paper Constitution to existing conditions and contemporary thought in India. At present, the British opposition to the Act has died down and the doubts of the Indian Princes seem in a fair way towards being resolved. Before further progress can be made in the relationship between Great Britain and India, the functional process of the digestion of the new Constitution must take place internally. The question of the mutual relationship between the different races, religions and political units of India must be settled first and must be settled by Indians themselves.

THE PEOPLES AND REGIONS OF INDIA

It is almost impossible for those who have no first-hand acquaintance with India to form any adequate conception of the conditions under which the new constitution of India will have to work. Excluding minor administrations such as Goorg or Delhi, and Baluchistan, little of which is British territory, there will be eleven self-governing Provinces. These together with the Indian States constitute an area as great as Europe without Russia, containing just as many varieties of race and language, if not more, and considerably greater varieties of script. This position is illustrated with least difficulty Province by Province, but the federal legislature will only reflect the composition of the provincial ones in so far, of course, as it represents British India. The Indian States are likely to modify that complexion considerably.

SIND	
Population in millions	
Hindu ...	1
Muslim ...	3

In the north-west are Sind and the North-West Frontier Province, both predominantly Muslim; but the former contains a considerably higher proportion of Hindus, who are, on the whole, better educated than their Muslim fellows. The Hindus of Sind resent the separation of Sind from Bombay, by which they lose the solid backing of the great Hindu majority of that province.

N.W.F.P.	
Population in millions	
Hindu ...	0.1
Muslim ...	2

In the North-West Frontier Province the Hindu element is comparatively small, even if the Sikhs be counted with them; though this community uses a different character (*Gurmukhi*) for the written language, the Punjabi of the Hindus being ordinarily written in the same Persian script as the Pashto of the Muslims in that province. It is perhaps significant of the whole position in Indian provinces that in spite of having two different languages, and two different characters for one of these, the North-West Frontier Province is the most homogeneous of the autonomous units—in all but language.

PUNJAB	
Population in millions	
Hindu ...	6
Sikh ...	3
Muslim ...	13
Density, 283 persons per square mile	

The Punjab is also predominantly Muslim, and although the bulk of the Muslim element is, like the Hindu portion, Punjabi-speaking, and is also very largely akin to the Hindu element in the race, there is a marked political cleavage between them. This is complicated by the presence of the Sikhs, who, as the rulers of the province immediately before the British conquest, claim a greater preponderance in public affairs than their actual numbers

would justify. Their relations with the Hindu population are intimate, and since the local Government has been allotting appointments proportionally to the various communities, cases have occurred of parents bringing up their sons as Sikh or Hindu according to the state of the official employment market.

UNITED PROVINCES	
Population in millions	
Hindu ...	41
Muslim ...	7
Density, 442 persons per square mile	

In the Punjab's eastern neighbour, the United Provinces, the division of the population is at first sight simpler. Only one language, Hindustani, need be considered. It is called Hindi where it leans more to the Sanskrit, and Urdu when more flavoured with Persian; but two scripts are in use, the Devanagari and the Persian. In this very thickly populated province, Hindus are greatly in the majority. But in spite of this, or perhaps because of it, the United Provinces have been the scene of some of the most savage religious faction-fighting that India has known of recent years. On the whole, however, the United Provinces of Agra and Audh, the traditional stronghold of the northern Hindu culture, is in a better position, as far as cultural and religious unity goes, to control its own destiny than the majority of Indian provinces.

BIHAR	
Population in millions	
Hindu ...	26
Muslim ...	4
Tribal ...	2
Density, 447 persons per square mile	

The case here is complicated by the Chota Nagpur plateau and the Santal Parganas, with their large population of more or less primitive tribes, alien in life, in interests and in languages to the rest of the province, and partially excluded from the new constitution, a position to which reference will be made later.

Although the density of population on the Chota Nagpur, inhabited by these partially excluded tribes, is only 258 to the square mile, the density in the plains is 642. This figure approaches Bengal's 646.

BENGAL	
Population in millions	
Hindu ...	22
Muslim ...	27
Density, 646 persons per square mile	

The Bengalis live almost entirely under rural conditions, except for the million and a half in Calcutta. Although language and script are common to Hindu and Muslim, the feeling between the two is acute. Muslims predominate in the east of the province, Hindus in Calcutta and in the west, while the two are more evenly balanced in the central districts. The Hindus of Bengal are educationally much ahead of the Muslims, and the proportion of Hindus who

November to May inclusive, of less than one inch; Bombay of less than half an inch, and the dry season of Hyderabad lasts from October to June. The only two important regions that do not experience drought during the winter half-year are the Punjab plains of the extreme north-west, which receive up to 30 in. of cyclonic rain in winter during the cool season, so that they can grow wheat unirrigated as a winter crop; and the coastal plains and hills of south-east India, which receive winter rains from the north-east trades which have traversed the Bay of Bengal, augmented by heavy cyclonic storms in the late autumn.

The bulk of India's rain comes with the south-west monsoon winds which, when the sun approaches the northern tropic, reversing the north-east winds of those latitudes, sweep across India from the south-west. The over-heated plains of India seem almost at a given moment to tap the saturated air-currents of the equatorial Indian Ocean, and the monsoon "bursts" with torrential rains on the steep face of the Western Ghats of Bombay, and on the Arakan coastal hills of Burma. The mean monthly rainfall figure for Bombay jumps from half an inch in May to 21 inches in June. Accompanied by electric storms, born in the Bay of Bengal, the monsoon current forces its way up the funnel of the Ganges plain, and against the highlands of Assam and eastern Bengal. Very heavy, and in parts excessive and even devastating rains fall in these areas. The average annual rainfall for Cherrapunji in Assam is 418 inches.

But, as the winds descend, after crossing the Western Ghats to pass across the Deccan plateau, or weaken as they penetrate into the scorching plains of the upper Ganges and Indus, the rainfall decreases rapidly, becoming deficient in amount and even negligible. Hyderabad's rainiest month has a mean of less than 4 inches.

Owing, then, largely to the relief features of the land, the blessings of the monsoon are very unevenly distributed.

But this is not all. A very serious feature of this seasonal rainfall regime is the uncertainty that characterises it. The expressions "a good monsoon," "a poor monsoon," "the monsoon has failed," spell the story of hopes realised, of disappointment, or it may be of disaster.

We may divide India into regions of natural plenty—the alluvial rice plains of Bengal, where water control is as important as water supply, the jute swamps of the Ganges delta, the tea plantations of the Bengal and Assam hills, the coastal plains of Bombay and Madras, the water-holding "black-earth" region of the Bombay cotton district; into regions of uncertainty, e.g. the United Provinces, Bihar and Orissa, and the Central Provinces, where, on an average, one year in five is dry, and where severe drought occurs every ten years, and where irrigation is a protection against famine in years of bad monsoon; and into regions of deficiency, e.g. the Punjab, Sind and Rajputana, where irrigation forms an integral part of the agricultural regime. But even in the areas of heavy and reliable rains the long period of drought must be remembered, and it is only by the toil of man that the dry months can be made productive. Irrigation and water management are essential even in the most favoured districts if advantage is to be taken of the warm climate throughout the year. Unfortunately, irrigation possibilities are limited.

The main problem is that of water storage. The northern plains reap the benefit of Nature's stores in glacier and snow-field; and the Ganges and Indus waters can be tapped by canals which store the water and lead it to the cultivable fields. Over 18 million acres of crops were irrigated in 1934-35 by Government canals in the United Provinces, Punjab and Sind, and some extension of this, the most effective type of large-scale irrigation, is no doubt possible in the fertile alluvial plains of the north and along the coasts of the peninsula. Irrigation by the peasant by means of shallow private or deeper communal wells plays a very important part in Indian agriculture. The high-water table of the Ganges plain is tapped by innumerable wells. This is undoubtedly the most economical method of irrigation and is estimated to produce the best results with a minimum of waste. The Government encourages construction of wells by rebates of taxation and other means, and is increasing the number of State electric tube wells. It is estimated that about 12½ million acres are irrigated annually by wells. There would seem to be a wide field for the extension and improvement of such constructions in most parts of the country.

The most serious problem is presented by the plateau areas of peninsular India, where there is little or no natural storage, where the run-off of rain water is rapid (partly as a result of deforestation), where the deeply incised valleys make the conducting of water by canals extremely difficult, and where, with a marginal rainfall, the failure of the monsoon is disastrous. The damming of rivers and streams to form reservoirs to collect and store the monsoon rain is the chief method of combating water shortage in the Deccan. These reservoirs, usually called "tanks," vary from tiny primitive earth-dammed ponds to huge masonry-dammed lakes like the new Cauvery-Mettur reservoir covering 60 square miles and emponding 93,500,000,000 cubic feet of water, and feeding an elaborate canal system.

But in these regions of unreliable rainfall the farmer only too often sees his embankments washed away by flood, his tank filled with silt, or dried up completely with the dwindling of the supply stream. Only a great outlay and elaborate engineering can augment the water supply on a large scale, and the return for such outlay would be much more uncertain than that on the alluvial plains fed by permanent streams. It is as dangerous to extend cultivation in an area of unreliable irrigation as it is in an area of marginal and uncertain rainfall.

Owing to its peculiar climatic conditions, India has come to be the most heavily irrigated country in the world. Nearly 30 million acres are irrigated by Government works. Undoubtedly, the organisation and development of Indian agriculture will depend largely on the extent to which irrigation can be carried out.

INDIA AS AN INDUSTRIAL PRODUCER

INDUSTRIALISATION has long been a cherished goal of the articulate classes in India. Great resentment has been felt at the decline of the traditional indigenous industries under British rule and at the invasion of the Indian market by cheap mass-produced Western goods. During the second half of the nineteenth century, modern cotton and jute mill industries developed, mineral production (in particular from the Bengal coalfields and the Burma oilfields) and factories in connection with the plantation industries increased; while early this century the commercial production of steel and the industrial use of hydro-electricity began. Nevertheless, the policy of the Government remained *laissez-faire*; the proportion of the population dependent upon industrial pursuits (including the handicrafts) did not rise above 10 per cent.; and India continued to import two-thirds of her consumption of iron and steel goods and machinery, and a mass of miscellaneous manufactures. Foreign capital and management continued to predominate in the large-scale industries, with the exception of the cotton mills (financed mainly by Indian capital from their inception), and the various Tata concerns, including the steel and hydro-electricity works.

Since the middle 'twenties, under the protection of the tariff, the expansion of industrial output has been phenomenal, although, partly owing to improvements in organisation and technique, there has recently been no equivalent expansion in employment. In fact, the proportion of the population dependent upon industry as a whole has tended to decline, and in some industries—in particular the jute and cotton industries—there has in some years been an absolute decline in numbers employed. On the other hand, the real wages of workers in large-scale industries have been maintained, in great contrast with the drastic decline since 1929 in the incomes of the agricultural classes. Hence the problem of industrial unemployment in its Western form has begun to make itself felt. In addition, there has been continuous depression in the cotton mills of Bombay, which have suffered severely from the competition of lower-cost goods from the new "up-country" mills.

THE INDIAN COTTON MILL INDUSTRY

	Number of Mills	Paid-up Capital (lakhs)	Looms	Spindles (millions)	Numbers employed	Output of piece-goods (million yds.)
1913-14	264	18.60	96,888	6.6	260,847	1,164
1925-26	303	47.50	154,591	8.4	370,617	1,954
1930-31	310	40.06	171,725	8.8	407,189	2,561
1932-33	331	37.76	181,705	9.1	403,760	3,169
1934-35*	336	...	187,234	9.0	414,884	3,397

* Figures for 1934-35 are from the Indian Finance Year Book, 1936.

In spite of the situation in Bombay, the Indian cotton mill industry has reconquered the home market. In 1934-35 it produced 3,397 million yards of piece-goods (3,567 millions in 1935-36), compared with an import of 943 million yards, thus more than reversing the pre-war situation. In 1933-34 it was calculated that, of the total consumption of cotton piece-goods in India, Indian mills supplied 56 per cent., imports supplied 15 per cent., and hand looms supplied 28 per cent. The steel industry supplied 72 per cent. of the home market in 1932-33, contrasted with 30 per

cent. in 1927-28; production has since continued to increase. Hence, whereas before the war India imported about 820,000 tons of iron and steel goods per annum, and exported only 42,000 tons, in 1934-35 she imported only 370,000 tons and exported 476,000. The match industry now has a practical monopoly in the home market (which before the war was supplied entirely by imports); the output of refined sugar has increased sixfold in six years and is expected in a few years to supply the whole of India's needs; and India is rapidly becoming self-sufficing in cement, paper, glass, soap and hardware.

A number of "modern" industries, although still small in scale, produce electric lamps and appliances, rubber tyres, water-softening plant, cooking stoves, asbestos, paints and enamels. Nevertheless, India will require to import a large variety of manufactured goods, especially those of high quality, for many years to come.

It must not, however, be forgotten that the bulk of this progress has been achieved in the home market. In the past the jute mills have been the only industry organised primarily for export, while it has also been the one great industry which has been depressed. This depression may be accounted for partly by the speed of economic nationalism and partly by increased competition from substitutes. The increased use of grain elevators, in particular, has reduced the demand for jute bags. In future, only the iron and steel industry promises to be able to compete on equal terms in foreign markets. A considerable export of pig-iron and steel bars has already developed. This industry has great natural advantages, and is the cheapest large-scale producer of pig iron in the world.

PRODUCTION AT THE TATA IRON AND STEEL WORKS* (In 1,000 tons)

	1921-22	1925-26	1929-30	1931-32	1933-34	1935-36
Pig-iron	270	573	739	804	841	900
Steel ingots	182	470	580	602	721	880
Finished steel	125	320	408	449	531	646

* The Tata works at present is the only producer of steel in India, but pig-iron is produced at several works.

At present subsequent processes are relatively costly, but great improvements are being introduced at the Tata works, which should eventually enable Indian steel to hold its own in competition with the products of any country.

The progress made in almost all the other industries appears to depend upon continuance of protection. Although India has great advantages in raw materials, she suffers from a number of grave disadvantages. In particular, capital is dear, and there is a prejudice against the use of foreign capital; there are great defects in the spheres of industrial leadership, organisation and finance; and the inefficiency of labour is not fully counterbalanced by the prevailing very low rates of wages. Another disadvantage is that sources of industrial power, for instance, coal and oil, are highly localised; so power is dear in many centres.

Although India has begun to modernise her industries, it can hardly be said that she is as yet being "industrialised"; and her industrial progress seems to depend upon the maintenance of protection.

INDIAN AGRICULTURE

AGRICULTURE supports nearly 75 per cent. of the Indian population. The budgets of the Central and Provincial Governments are vitally influenced by the state of agricultural production and prices during the year; and it is the silent and toiling agriculturists of India who are at the background of every scheme of national uplift and development.

India has been one of the countries most severely hit by the fall of agricultural prices; and the Indian ryot, particularly susceptible to the movements of prices and peculiarly vulnerable by reason of his antiquated and inefficient methods of cultivation and marketing has been left exposed in an increasingly competitive world. The precise extent

of the fall in prices may be measured from the statistics published by the Director-General of Commercial Intelligence and Statistics, Calcutta. In 1928-29, the year before the onset of depression, the value of agricultural crops (rice, cotton, groundnut, wheat, barley and sugar-cane), taken at an average harvest price, was about Rs. 1,034 crores. In 1933-34, it was only Rs. 473 crores—a fall of 53.4 per cent.

The present helplessness of the Indian agriculturist may be due to this "Great Depression"; but even before it, his position was never bright. There is appalling poverty among the rural population. Various causes have combined to bring about an abnormally low standard of living.

None stands out more vividly than the excessive pressure on land. While in the countries of Europe and elsewhere the movement of the population has been from agriculture to manufacturing industries, in India the opposite has been the case. In 1891, agriculture engaged 65 per cent. of the people; in 1931, the percentage had increased to 73.9. During the same period the area of cultivation has remained almost constant. The total net area sown to crops in 1932-33 was 228 million acres—less than one acre per cultivator. "Economic" holdings of land are rare, and their paucity is accentuated by laws of inheritance which tend to increase fragmentation. Even the changing seasons adversely influence the agriculturist; if drought occurs, he is ruined; for, despite increased irrigation, only 18 per cent. of the cultivable land has irrigational facilities.

INDIA—PRODUCTION OF STAPLE CROPS
(Lakhs)

	1915	1920	1929	1933	1934	1935
Rice (tons)	273	320	321	311	309	301
Wheat (tons)	101	96	86	95	94	97
Sugar (tons)	24	30	27	47	51	59
Groundnuts (tons)	9	8	32	30	33	21
Cotton (bales)	52	58	5	46	50	48
Jute (bales)	104	85	99	71	80	85
Tea (lbs.)	3,133	3,771	4,038	4,337	3,832	3,985

Agriculture absorbs the ryot's energies only for about six months in a year, and for the rest of the time he is in a state of enforced idleness, for he has no subsidiary industries to augment his income. He has to labour under the burden of a debt of formidable dimensions. Various estimates have been made regarding the volume of indebtedness for each province; the Central Banking Enquiry Committee investigating in 1931 concluded that it must

be nearly Rs. 900 crores (£675 millions). To-day the weight of the debt must be considerably higher and more crushing, because the slump of agricultural prices has concomitantly expanded the real burden of debt, which may now be nearly Rs. 1,500 crores. Many ryots in India are born, live and die in virtually unredeemed enslavement to the village money-lender. Transfers of land from agricultural to non-agricultural classes are increasing.

The Government are aware of the extent of the agrarian problem. In 1926 the Royal Commission on Agriculture was appointed with wide terms of reference. Its report was one of the first of its kind in India. But, save for the creation of the Imperial Council of Agricultural Research and the recent appointment of some Agricultural Marketing Officers, measures designed to improve the cultivators' lot have yet to be passed. Barring a few Land Mortgage banks in Madras and Bombay, there is hardly any credit institution in India to emancipate them from the bondage of unproductive debt. Despite the laudable work of the Agricultural Departments in the Provinces, especially in the Punjab, cultivation still remains inefficient.

The problem as a whole bristles with difficulties. What is required is not rose-water surgery, but an energetic effort to attack it on every side. "Agriculture is not merely a way of making money by raising crops . . . it is essentially a public service performed by private individuals for the care and use of the land in the national interest; and farmers in the course of their pursuit of a living and private profit are the custodians of the basis of national life." The present time is propitious for the beginning of a new and bold policy. In another six months the new constitution in the Provinces will have come into being; and as agriculture is a Provincial subject, much of the success of the new constitution will depend on the spirit in and the method by which the people's elected representatives grapple with the problem.

INDIA'S FOREIGN TRADE

UNTIL the end of last century the growth of India's foreign trade was due to a great export trade in foodstuffs and raw materials (e.g. wheat, rice, cotton, jute, tea, oilseeds), in return for which cotton piece-goods, plant and machinery for the railways and growing factory industries, and a wide variety of miscellaneous manufactures were imported. Towards the end of the century a large demand also developed for sugar and mineral oil, India's own supplies proving insufficient for her growing needs.

During and after the Great War, new trends became visible in the nature and direction of trade. For instance, manufactures tended to form a larger proportion of the export trade, while there was a considerable decline in imports of those manufactures which competed with Indian products, e.g. cotton goods and certain iron and steel goods. The direction of trade changed because of the decline of trade with enemy countries, the shortage of European shipping (which tended to eliminate England's former *entrepôt* trade, and to stimulate direct trade with the United States and the Far East), and changes in the relative importance of the principal items of trade. England lost a considerable proportion of her lion's share in Indian trade, especially in exports to India, largely because of the decline in demand for cotton piece-goods due to the development of the Indian mills and of increased competition from Japan. The United Kingdom's share in India's imports fell from 62.8 per cent. pre-war to 35.5 per cent. in 1931-32, while her share of India's exports, which was 25 per cent. pre-war, after actually rising during the war (to 31.1 per cent.) fell to 21.9 per cent. in 1929-30.

In 1929 the "great depression" began, on account of the unprecedented fall in prices, especially of foodstuffs and raw materials. This depression was characterised in India by a severe relative (as well as absolute) fall in exports, which practically eliminated India's normal excess of exports over imports. India's payments to England on account of the political and commercial connections between the two countries, e.g. for pensions and salaries,

shipping charges, interest on loans, profits due in England, etc., had to be met from some other source.

Luckily, gold filled the gap. Between 1931 and 1935 no less than 32 million ounces, valued at 270 crores (£203 millions) were exported. Since about 1933, however, a revival has been apparent: the fall in prices has been checked; the discrepancy between the prices of imports and exports has been almost eliminated; both the value and volume of trade has increased (although neither the pre-depression nor even the pre-war level has yet been regained); and the outflow of gold has slackened. Moreover the United Kingdom's share in the Indian market in India's export trade has tended to revive, although the latest completed returns (for 1934-35) show a slight setback in comparison with 1933-34.

India, like most other countries, exhibits a strong tendency towards greater self-sufficiency. Whereas before the war cotton manufactures formed no less than 36 per cent. of the value of her total imports, they now form less than 15 per cent.; imports of sugar have fallen from 9 per cent. to 2 per cent. of the value of total imports; and imports of iron and steel goods from 7 per cent. to 5 per cent. Nevertheless artificial trade restrictions have not been as far-reaching as in many countries. Quotas, for instance, have been confined to Japanese goods. The Indo-Japanese Agreement of 1934 allotted to Japan an annual import quota of 125 million yards of piece-goods unconditionally, 325 million yards if she purchased one million bales of Indian cotton, and 400 million yards if she purchased 1½ million bales. It also fixed the duty on non-British piece-goods at 50 per cent. The agreement was to remain in force until 1937, and at present renewal is under consideration.

N.B.—I = imports. E = exports. T = total. Exports exclude re-exports.

but as it started before 1932, and has already received a check, it is clear that other factors, such as the adhesion of India to the sterling standard on the one hand, and the keen competition from Japan (which extends far beyond the sphere of cotton goods), have still more potent effects on the distribution of trade than Imperial preferences.

One interesting development is the improvement in the position of Indian raw cotton and pig iron in the British market. It is hoped that Lancashire may soon consume some 500,000 bales of Indian cotton,* while India has already captured practically the whole British market for imported pig iron. Indian preferences have undoubtedly helped sales of British manufactures to India. India and the United Kingdom are the best market for each other's goods. Nevertheless Indian public opinion, or at least the Indian legislature, objects to Imperial Preference, and notice has already been given for the termination of the Ottawa Agreement. Under the new Constitution India is more likely to raise than to lower tariffs, even on British goods. Whether substantial preference will be retained for British goods depends, of course, on the result of the negotiations at present proceeding. No one can foretell political judgments; but on purely economic grounds it is to be expected that, provided there is no ground for the suspicion that preference is being forced upon India, the undeniable importance of the British market will suffice to induce India to conclude some kind of preferential agreement. There is little expectation that the Indian market for Lancashire goods will be regained, but owing to the high (50 per cent.) duties on foreign cotton goods, there is no reason why Lancashire's one big remaining market should be quickly reduced.

In this context it may be noted that the new Federal Constitution provides ample safeguards against disruptive financial policies and against commercial discrimination.

In the second place, even though India becomes more self-sufficing in staple commodities, it should not be concluded that the value of her market will decline. Given internal and external peace, there is every reason to expect considerable expansion in home production (agricultural and industrial) and hence in incomes; while mere growth in population means increased demand. Should the standard of life improve even slightly, the demand for the conventional necessities and luxuries of civilised life will greatly expand. The very fact of industrial development will necessitate the purchase of goods which India herself does not produce. As India's productive powers overtake her own demand for certain goods, new wants will develop. It is already noticeable that imports of "modern" types of manufactures are beginning to take the place of the older staple goods formerly obtained from abroad—e.g. motors instead of cotton piece-goods. The position and outlook of India's export trade is satisfactory, as India mainly supplies goods which are complementary to, rather than competitive with, the products of highly industrialised countries, such as Great Britain.

* In 1935-36 Great Britain imported 455,000 bales of Indian cotton.

THE INDIAN TARIFF

In most countries fiscal policy has undergone drastic modification in the post-war years. India is no exception to the Indian rule. Originally imposed for revenue purposes, the Indian customs tariff has recently been transformed into a highly effective protective instrument. That India should levy customs duties is almost inevitable; for in such a country the customs tariff forms one of the most convenient means of taxation. Accordingly, after a period of almost complete free trade, a low general tariff, accompanied by certain countervailing excise duties, was imposed in 1894. Little change was made until after the outbreak of the war, when the imperative need for increased revenue compelled the Government to stiffen the tariff. Successive increases carried the general import duty from 5 to 15 per cent. *ad valorem*, the latter figure being reached in 1922, when the public finances had been subjected to the full strain of a severe post-war depression. By this time the tariff was already having a protective effect. Protection had not, however, been adopted as the Government's official policy; for the excise duties had generally been left at the pre-war level.

Securing fiscal autonomy early in 1921, the Government of India appointed a Fiscal Commission to make recommendations for future tariff policy. Urging that the industrial development of the country had been by no means commensurate with its vast size, its enormous population or resources, the Commissioners favoured a policy of protection, designed to develop the country's industries. A minority advocated drastic action; but the majority report, the main recommendations of which were adopted by the Government, was couched in more moderate terms. A policy of "discriminating protection" was advocated, applicable to industries selected after their claims had been carefully examined by a Tariff Board. Further suggestions were that raw materials and machinery

should be admitted free; that semi-manufactures should be subject to a small duty only; that export duties should be abolished altogether or reduced to a low level; and that Imperial Preference should not be adopted as a general principle. In deciding whether any particular industry was eligible for protection, the Tariff Board should adopt the following criteria: the industry must be one for which India possesses natural advantages; it must, however, be unlikely to develop without protection; and it must offer the prospect of being able ultimately to produce at a profit without artificial aid. These proposals found favour with the Government and on July 10, 1923, the Legislative Assembly accordingly passed a resolution appointing a Tariff Board and adopting the proposed policy of "discriminating protection."

The Tariff Board, appointed initially for one year, and subsequently on the basis of biennial renewal, remained in existence, with changes in personnel, until July, 1934, and conducted over fifty different investigations. When the spate of applications began to abate, it became unnecessary to keep a permanent board in being. The present method, therefore, which may be open to obvious abuses, is to appoint a Tariff Board *ad hoc* for each inquiry. It may be emphasised here that an industry claiming protection is required first to apply to the Government and to make out a *prima facie* case. Only when this has been done is the application referred to the Tariff Board, who are expected when advising the Government to bear in mind the three criteria mentioned above. Despite these safeguards, however, it would appear to the impartial observer that protection has in practice been granted on a more liberal scale than the strict interpretation of these criteria would seem to warrant.

The present position of the Indian import tariff is thus approximately as follows. There are general revenue duties,

STRANGE peoples, age-old pageantry, magnificent architecture—all play their part in the thousand scenes that await you in India. The role of modern man has been to link those scenes with one of the world's finest railway systems. Travel in India is supremely comfortable and inexpensive. Sleeping berths are provided without extra charge.

ranging usually from 20 to 30 per cent. *ad valorem*, supplemented by stiff protective duties (some specific, some *ad valorem*) on certain commodities. There are also some special duties—specific in character—levied under the Safeguarding of Industries Act, 1933, which, although of general application, were primarily designed to protect the Indian manufacturer against the importation of cheap products from Japan. Finally, the import tariff provides for Imperial Preference which, although opposed in principle for a number of years, was reluctantly adopted after the Ottawa Conference. It may also be noted that *export* duties are still levied on raw jute, jute manufactures and rice.

The principal industries now benefiting from protection are iron and steel, textiles, sugar, paper and matches. It is proposed to examine the experience of the first three of these in some detail, to illustrate how the Indian essay in protection has worked out in practice.

The Indian steel industry, like its British counterpart, has been singled out for especially favourable treatment at the hands of an apparently generous Government. Large extensions of plant during the war left the industry—which is actually little more than one concern, the Tata Iron and Steel Company—seriously over-capitalised and encumbered with much surplus capacity. An appeal to the Government fell on ready ears; for the prosperity of the industry was held to be necessary not only for economic reasons, but also on grounds of national defence and (one suspects) of national prestige. The Tariff Board's first inquiry was accordingly into the position of this industry and, in brief, its recommendation was that assistance should be given in the shape of a protective tariff. The measure of protection was to be the difference between a fictitious "fair selling price" for Indian steel and the probable price of imports. These proposals were incorporated in the Act of June, 1924, which was to remain in force for three years and which granted the executive power to increase the duties if necessary. Only three months elapsed before additional assistance was granted in the form of bounties. The essential provisions of the 1924 Act were extended for a further seven years when the original term expired in 1927. Needless to say, protection—which in this case takes the form of a combination of specific and *ad valorem* duties—was again extended, this time until 1941, when the provisions of the 1927 Act came to an end. That this programme of protection has been effective, is shown by the steady contraction of imports since 1924. Behind the tariff wall the domestic steel industry has been able greatly to extend its activities; but it does not yet appear to be any more able to stand on its own feet than it was in 1923.

The cotton textile industry, an old-established Indian industry, derived considerable advantage from the raising of the tariff during the war and was further benefited when the notorious cotton excise was suspended in December, 1925, and finally abolished in the following year. Not content, however, with the advantage already enjoyed, the industry appealed for thorough-going protection and its case was referred to the Tariff Board in June, 1926. After deciding, when the report of that body had been received, that there was no case for protection, the Government yielded to pressure from the Bombay millowners and imposed specific duties upon imported cotton yarn in September, 1927. These duties were alleged to be necessary to protect the home industry against "unfair" Japanese competition and were accordingly imposed for a period of three years, by which time labour legislation in Japan would have removed the cause. That legislation was duly passed, but the Indian import duties were renewed for a further term of three years, on a different pretext, in 1930. Under the latter Act piece-goods were also protected by a combination of specific and *ad valorem* duties, the object being to exclude the cheaper manufactures of Japan, while still permitting the importation of finer qualities from Britain. These duties, which are now to be continued until March, 1939, imposed a burden upon the struggling hand-loom weaver and upon the consumer of cotton manufactures, but indubitably stimulated the development of the Indian cotton mill industry. Thus, imports of cotton manufactures, which were valued at Rs. 5,348 lakhs in 1929-30 and at the still higher figure of

Rs. 5,695 lakhs in 1928-29, fell abruptly to Rs. 2,217 lakhs in 1930-31. The output of woven goods from domestic mills has accordingly enjoyed a progressive expansion and is now about 170 per cent. above the pre-war level.

We turn, finally, to a rather different example—that of cane sugar. The duty on imported sugar, now avowedly protective, was first imposed for revenue purposes during the war and proved such a fruitful source of income that measures were soon taken to increase it. After being raised on an *ad valorem* basis several times in the post-war years, the duty was made specific, at Rs. 4-8 per cwt., in June, 1925. At current prices this was equivalent to over 50 per cent. *ad valorem*. One consequence of the change was a drop in the value of imports from Rs. 207 millions in 1924-25 to Rs. 156 millions in 1925-26. In March, 1930, the duty was raised to Rs. 6 per cwt., equivalent to approximately 120 per cent. *ad valorem* at the current level of prices; imports duly fell from Rs. 158 millions in 1929-30 to Rs. 110 millions in the following year. All this time the duty was still regarded as a revenue duty; but in 1930 the Government invited the Tariff Board to consider the sugar industry's claim to protection. The Board recommended that a protective policy should be adopted for a period of fifteen years. In March, 1931, although this recommendation had not been formally adopted, the import duty was raised to Rs. 7-4 per cwt., the rate suggested by the Board for the first seven years of protection. Subsequent increases, accompanied, however, by the imposition of a small excise duty, have carried this impost to a figure of no less than Rs. 9-1 per cwt. According to present arrangements, this is to be continued until March, 1938. So drastic a measure of protection could hardly have failed to promote the hot-house growth of the cane sugar industry, and the output of raw sugar has, in fact, risen continuously from 27 lakhs of tons in 1929 to 59 lakhs in 1935. Imports have now fallen to small dimensions, and the time when the industry will be able to satisfy the whole of the domestic demand is near at hand.

What conclusion does our survey suggest? Any attempt to assess the consequences of the adoption of the new tariff policy is rendered difficult by reason of the fact that numerous other changes in the economic data have been occurring simultaneously. It would appear certain, however, that the policy of "discriminating protection," though moderately liberal in conception, has in practice proved more protective than discriminating. True, the development of the country's industries has in some measure been achieved—but at a heavy cost. Some industries have been enabled to expand their output, but only in consequence of a rise in prices which the consumer has had to pay. Moreover—since a tariff cannot be at the same time protective and revenue-producing—the new policy has involved the Government in a loss of revenue under certain heads, which has had to be made good elsewhere. Well over one-half of the national revenue is derived from the customs; and the loss from one duty has therefore necessitated the raising of others. A system of taxation which, judged by Western standards, was already seriously regressive has been made still more so, and a rise in the on excellent authority—and British domestic experience lends colour to the suggestion—that protection has served in many cases merely to bolster up inefficiency and to create a very vocal body of vested interests, which will make it exceedingly difficult for the Government to revert to a more liberal fiscal policy should it desire to do so in days to come.

It is not to be expected that the Government will be able in the near future to do much to reduce the general level of the protective duties now in force. It is, however, profoundly to be hoped that every effort will be made to increase the productive efficiency of existing enterprises, that the fruits of such improvements may be passed on to the consumer; and that, in bestowing any additional favours, the Government will be more ruthless than hitherto in its interpretation of the criteria laid down by the Fiscal Commission. The relief of the poverty-stricken masses in this great Dominion requires a much more far-reaching Government policy than a piecemeal programme of "discriminating protection."

INDIA'S INTERNAL AND FOREIGN DEBT

(BY A SPECIAL CORRESPONDENT)

WITH large constitutional changes in the offing, India's credit assumes paramount importance. When the Indian Federation comes into being the administration of Indian finance will, subject to the special responsibilities vested in the Governor-General, be in the hands of an Indian Finance Minister sitting in the Indian Cabinet. It is, therefore, well worth while to consider the position of India's internal and external debt, as expressing the results of a long period of official administration, and as indicating the nature of the heritage to be transferred in due course to the Indian Ministry.

It may be useful to consider India's public debt under certain distinct aspects:—

- (1) The volume of the debt, and its division between rupee debt and sterling debt;
- (2) The cost of the service of the debt; and the extent to which the debt is represented by productive assets; and
- (3) The provisions made for the reduction or avoidance of debt.

India sterling debt originated from the days when the loanable resources of India itself were altogether insufficient to meet the growing needs for capital for the purpose of developing the railways and irrigation system. It was natural also, for political and financial reasons, that India should supply its needs from the London market, which was both the cheapest centre for borrowing and was also in the best position to appraise the credit of the country. In the last 25 years the rising wealth of India has enabled the country to meet its capital needs from internal resources to a far greater extent than was formerly the case, with the result (as will be seen from the figures below) that though the aggregate debt has largely increased, the proportion of the debt expressed in rupees has risen in greater degree than the sterling debt:—

At	Rupee debt*	Sterling debt
March 31, 1911	Rs. 138 crores (£103.5 millions)	£178 millions.

It may be taken that the policy of the Government aims at satisfying as large a share as possible of the country's capital needs from resources raised within the country; but the execution of this policy depends partly on the relative cost of borrowing in London and in India respectively, and partly on the exigencies of exchange. It is significant that during recent years, when exchange has been favourable, the Government of India have been able to make a substantial reduction in the sterling debt, which on September 30, 1936, stood at about £358 millions, compared with £388 millions on March 31, 1931.

The real burden of the debt is closely bound up with the character of the debt itself—that is, how far it is balanced by productive assets and how far it is unproductive, representing war debts or Budget deficits. From this angle, India is probably in an almost, if not completely, unique position among the great countries of the world. It has always been the policy of the Government to devote certain appropriations from its Budget revenues for capital purposes and the amounts thus contributed have had the result that the unproductive debt has been subjected to a process of attrition, and a part of India's Railways have been built out of current revenues as distinct from loaned funds. The Indian Government have, moreover, always enjoyed a just reputation for conservative finance. While there have been times when, for one reason or another, the year's accounts have shown deficits, as is inevitable in the case of a country exposed to seasonal vicissitudes, these have been largely outweighed by the surpluses of prosperous years.

A large part of the aggregate surpluses of the past has been devoted to the reduction or avoidance of debt. Alterations in exchange rates and the complexities of accounting make mathematical precision in such matters difficult, but the figures below bring out the essentials of the position and compare the amount of debt debited to the Commercial Departments—mainly Railways—with the total permanent and floating debt. In the former are included certain amounts loaned to the Provincial Governments on an interest-bearing basis.

	Debt debited to commercial departments	Total permanent and floating debt
March 31, 1911†.....	Rs. 344 crores	Rs. 405 crores.
March 31, 1926*.....	Rs. 738 crores	Rs. 874 crores.
March 31, 1936*.....	Rs. 968 crores	Rs. 960 crores.

* Sterling portion converted at 1s. 6d. per rupee. † Sterling portion converted at 1s. 4d. per rupee.

At the end of the last financial year the total of the Unfunded Debt, excluded from the above figures and covering such items as Provident Fund balances, Post Office deposits and cash certificates, amounted to about Rs. 250 crores. Leaving these liabilities out of account the upshot of the preceding table is to show that at the end of the last financial year the Central Government's debt was fully balanced by the productive assets, of which the railways formed the largest part. The recent trade depression has, it is only fair to state, seriously affected the profitability of the Indian railways, though in this regard they still compare favourably with the railways of most leading countries. When in latter years the net earnings have not sufficed to cover the full interest costs, the deficiency has been met from reserve funds accumulated in better times, and there is every reason to hope that, as prosperity returns, the Indian railways will regain a large measure of their former prosperity.

The credit position of India has been fortified by specific allocations from general revenue in the nature of sinking funds which in the past ten years have varied from approximately Rs. 7 crores to Rs. 3 crores per annum. The aggregate amount of these appropriations over the last decade reveals an excess of Rs. 28½ crores over the net results (plus or minus) of the revenue budgets. These facts serve to explain the result that, in spite of substantial borrowings necessitated by the Great War, the financing of past deficits and other unproductive expenditure, the Government of India finds itself to-day without any dead-weight unproductive debt in the usual sense of the term. In the circumstances it is natural that Indian Government loans command a high prestige in the critical market of the City.

The investor may, however, ask whether the forthcoming constitutional changes will affect the security which has hitherto existed during a prolonged period of official administration. The answer is two-fold. When the Federal scheme is introduced, the new Government of India Act will impose on the Governor-General an individual responsibility for the safeguarding of the financial stability and, of course, to the protection not only of the external debt, but also to the correspondingly large volume of internal debt. The Act provides the Governor-General with adequate powers to make this responsibility effective and enables him to appoint a specialist Financial Adviser to assist him in the discharge of his duties in this sphere. While this is an ultimate safeguard, there is no reason to doubt that Indian Ministers will desire to maintain the high standing that Indian credit enjoys in the world's money market. They will recognise that the interests of the country will require in the future as they have in the past the observance of the accepted canons of sound finance; for only the resources required for developing the economic structure of the country.

THE BUDGET OF BRITISH INDIA

It must be remembered—as is pointed out elsewhere in this Survey—that the Central Budget of the Indian Government covers only (a) British India, apart from the States' and Provinces' budgets, and the railways; and (b) the Central services. This explains why the Budget of the Central Government, which touches some 288 millions of people, amounts to an annual sum of no more than about 121 crores of rupees, i.e. 12,100 lakhs, or £90,750,000 at 1s. 6d. to the rupee—not so very much more than the London County Council's annual budget for a city of eight millions.

The Central Budget itself is framed simply. Since, and including, the financial year 1924-25, the railways have separate finances, and only the net railway revenue and expenditure is carried into the Central Budget.

The Budget totals have not varied much during the last decade. On the revenue side, the mainstay is customs revenue, which has steadily accounted for a large proportion of the total—it is just under 50 per cent. in the current year. As might be expected in a country of low current year. As might be expected in a country of low incomes, income-tax yields only 12½ per cent. of the total, to which it has fallen since its peak share when the depression was at its worst. Taxation per head in British India in 1933/4-1936/7, inclusive of the provincial land-tax, works out at between Rs. 4.68 and Rs. 4.89. In 1936-37 it is estimated to work out at Rs. 4.81. Opium, for social reasons, now yields a negligible revenue; the contentious salt-tax, made notorious by Mr Gandhi, keeps up its yield; and the currency and mint operations no longer yield the handsome—though, absolutely, scarcely significant—profit they once did. It is a monument to the conduct of British India's Central finances that the tax which was levied on income levels below Rs. 2,000 per annum

in the slump, has been abolished since April 1, 1936, and that surpluses now arise. Nevertheless, it is clear from the Budget that the British Indian population as a whole bears a not inconsiderable burden of indirect taxation, which altogether accounts for well over one-half of the revenue.

The following table shows the main items in the Central Budgets before the depression began, in 1932-33 at the bottom of the depression, in the last two financial years, and in the current year. The figures are "gross":—

BRITISH INDIAN BUDGETS: 1927/28—1936/37

(In crores and lakhs of rupees)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2

On the expenditure side, military services account for a steady 40-45 per cent. of the Central expenditure; and if certain transport and other charges on military account be included under this head it would rise to 50 per cent. of the total. Railways' interest and miscellaneous charges have been stable, while the debt services have been reduced by a combination of measures raising India's credit standing preparatory to big conversion operations. The military and railway items alone account for three-quarters of the Central expenditure, and if we add debt services and civil administration, the four items cover more than five-sixths of the total.

The railways' deficit has been a source of trouble since the depression. Net receipts have not sufficed since 1932-33 to replenish the reserve fund, and so to cover expenditure. Consequently loans have been made from the Railway Depreciation Reserve Fund as described in the article on page 19.

The inauguration of the new Constitution was made dependent on the existence of favourable financial conditions in India. Early last spring, the British Government sent out Sir Otto Niemeyer to report to Parliament on India's finances and the financial relations of Centre and Provinces, as a preliminary to the necessary Orders-in-

Council which, under the new Government of India Act, will usher in provincial autonomy next April. Sir Otto's report was favourable. Consequently only one more Central Budget under the existing regime remains to be presented, that of next March. Sir Otto was mainly concerned with the size of the necessary Central subventions to "deficit" Provinces, and the time-table for the transfer to the Provinces of part of the proceeds of income-tax, as provided in the new Constitution. Of the Rs. 4½ crores needed as subventions from the Centre, Rs. 2½ crores are provided in the 1936-37 Budget; Rs. 2 crores must be found, plus Rs. 2½ crores to compensate in 1937-38 the loss of revenue from a newly separated Burma. Sir Otto accordingly recommended retention of the remaining "depression" income-tax surcharges, and provided a schedule of provincial allocations of tax burdens.

On all the evidence, the finances of British India would appear to be well able to bear the initial stresses of the new Constitution. A period—perhaps as long as five years—must pass before the new Centre and Provinces arrange their new financial relations. But of the country's economic ability to meet these tests, and of its financial resources, there can be no question.

INDIA'S BALANCE OF PAYMENTS

THE balance of payments for a big trading country and big debtor like India is vital. It measures her competitive trading capacity and her transfer capacity, and conditions her credit. The value of the foreign trade of India in the first ten post-war years showed a considerable rise above the pre-war level. There was, however, no commensurate increase in the volume of trade, since post-war prices were so much higher. There was also a simultaneous rise, though relatively small, in India's export surplus, which reached 86.5 crores in 1928-29. Since then the values of both exports and imports have dwindled in successive stages till they were almost equal in 1931-32 in the neighbourhood of 135 crores, the favourable surplus having been practically wiped out. In the following years the export balance showed signs of recovery, but only haltingly and with occasional setbacks. The figure for 1935-36 (30.55 crores) does not include the trade over Kathiawar, which in 1934-35 showed an import surplus of 3.7 crores. It would therefore be more correct to write this figure down to somewhere near 27 crores.

Although the fall in exports was due to the effects of depression, economic nationalism has hit India. For example, the balance of Indo-German trade which, according to Indian trade figures, was 14 crores in 1913-14 and 16 crores in 1928-29 (in both cases a ratio of over 2:1 in favour of India) has been turned into an appreciable unfavourable balance in recent years (-367 lakhs in 1935-36). In pursuance of her foreign exchange policy Germany has been increasingly substituting Brazilian cotton and Italian rice for Indian products.

It is difficult to foresee what the resultant effect of these varying forces on India's balance of trade will be. On the whole a further increase in the export surplus seems probable, particularly if world agricultural prices go on rising. On the other hand, it appears very unlikely that the annual export surplus could, over the next few years, be restored to its pre-depression level of some 80 crores.

The most remarkable development in India's balance of payments in recent years has been transactions in specie. The traditional "sink for precious metals," to use the expression first introduced by Jevons, where gold in millions of ounces had disappeared uninterruptedly through decades, suddenly started disgorging it in vast quantities at a time when the Indian Government seemed to stand on the threshold of a long period of transfer difficulties.

With the linking of the rupee to sterling in September, 1931, gold appreciated much above its legal parity, fixed by the Currency Act, 1927, at 1 tola of 180 grains troy = Rs. 21 3a. 10p. In the following November it reached

almost 28.5 rupees per tola. The prospect of higher prices, coupled with the acute economic distress prevailing in the country, induced many to part with their gold. It is, however, not always clearly realised why this gold was exported. Theoretically, the Government was—and still is—under the obligation to buy gold, but only at the price corresponding to the legal parity of the rupee. To sell gold to the Government would have meant a sacrifice of the market premium on gold. As the Government, however, regularly purchased large quantities of sterling at the current exchange rate, bullion dealers could export gold, obtain sterling in return, sell that to the Government in exchange for rupees, and by this roundabout process realised the market rupee price for their gold.

Silver movements show some striking alterations. The post-war average of silver imports was more than double the pre-war figure. In 1926-27 the net imports amounted to some 20 crores. During the following years the figure fluctuated downwards and stood at 10 crores in 1930-31. Since then, the silver import surplus on private account has practically disappeared; and if Government transactions are included, there has been an appreciable export surplus amounting to 6, 4, 5.4 and 1.6 crores of rupees respectively during the last three financial years. Silver imports on private account showed some signs of revival in the later

Before the present depression started, the export surplus in commodity trade substantially exceeded the requisite minimum of 55 or 60 crores, the excess margin having been utilised for large imports of specie. Since 1931-32 there has been a constant deficiency, and the balance of payments has been adjusted only by exporting gold. It is therefore pertinent to ask how long and in what dimensions gold exports might be expected to continue. The total gold outflow, amounting to 32.5 million fine ounces from 1931-32 till March, 1935, compares with a previous net inflow of 44 million ounces since April, 1920. On the available data, the total gold holdings of India in September, 1931, i.e. before the heavy efflux set in, might

Next comes the Imperial Bank of India, which was originally an amalgamation of the three Presidency banks. As such it formerly performed many of the functions of a

Since 1931 there has been a race, as it were, between an unfavourable commodity balance and gold exports. So far they have tended to meet half-way. Although the danger zone is not yet crossed, a possible diminution in gold exports would probably be compensated by a growing export surplus in merchandise trade, thus enabling the Government to tide over such transfer difficulties as will immediately confront it.

If the mahajan finds that his own resources are becoming strained, he seeks accommodation from a shroff, or native banker. This accommodation takes the form of hundis, or bills of exchange, usually of two months' usance. The shroff discounts these bills out of his own resources, and if he in turn needs accommodation he may obtain it from

We have stressed the aspect of Indian banking which is concerned with the financing of the peasant—because, all said and done, this is India's main banking need. Obviously it stands in need of reform, but it is not easy to find the right cure. Fundamentally it is a question of social change. So long as savings take the form of hoarding there must be a scarcity of credit, and it is noticeable that since the great gold dishoarding movement began in 1931 the internal banking system has become more liquid, and so, in the banking system proper, money has been much cheaper. The first need to-day is to spread banking facilities into the heart of the mofussil or outlying districts. One step in this direction would be to replace the present hierarchy of the banias, mahajans and shroffs by branch banking systems, of a size and extent suited to the needs of each part of the country. Even that would by itself be insufficient, for the next and almost insurmountable task would be to educate the people to make use of the banks. It is difficult to see how the centuries-old habit of hoarding could be quickly eradicated, but the common instruments of banking, such as cheques and bills of exchange, should be available in the vernacular, and

Sir Otto Niemeyer, referring to the "frankly disquieting" position of the railways in his recent inquiry into the allocation and distribution of the Central and Provincial sources of revenue, declared that it was "not enough to

All these suggestions do little more than touch the fringe of the problem. The real difficulty lies in the social habits of the population. If under the new Constitution they progress, banking and investment may replace hoarding. Then the demand for a wider banking system will automatically arise and in time will be met. Then and only then can the parallel problem of financing India's crops be satisfactorily solved.

contemplate that in five years' time the railways may merely cease to be in deficit," a result which would "tend to prejudice or delay the relief which the Provinces are

AUTHORISED CAPITAL	Rs. 40,00,000
SUBSCRIBED CAPITAL	Rs. 40,00,000

entitled to expect." The demand for adequate revenues from the Provinces, particularly in view of the additional expenditures involved in the working of the new Constitution, renders it imperative that railways pay their way as early as possible and resume their contributions to the State. The need for immediate financial rehabilitation in the interest of the railways themselves was even more emphatically urged by the Public Accounts Committee of the Assembly. The recommendation by these two authorities for immediate inquiry by an expert has led to the appointment of the Railway Committee, with Sir Ralph L. Wedgwood as chairman, to suggest measures for improving the financial condition of the railways at an early date.

The collapse of railway earnings since 1930 has unfortunately synchronised with the rapid growth of road motor transport, and the railways have begun to complain seriously of the severity of competition. Comparative statistics of inland transport facilities have so far shown that India, compared to other countries, has been poorly served and that there is greater scope for the expansion of both rail and road facilities than is usually assumed. But the increasing buses and lorries are reported to be more competitive than complementary. The Government of India Act of 1935 has taken over the present system into its sections by placing the roads and road development in the Provincial legislative lists and the railways in the Central or Federal lists.

With the threat of diversion of traffic to the road looming before them, the railways will, sooner or later, have in their own interests to seek some sort of compromise and co-ordinated arrangements with motor transport. Any attempt to do so, to the extent that the road carriers would be worse off under the bargain, will be clearly opposed by interests which would by then have organised themselves in the Provinces. The provincial psychology needs to be appreciated. The provincial citizen knows that the road and the road carriers are within the ambit of his influence, and he could by proper pressure get roads constructed and the motor transport undertakings conform to his requirements. The railway obeys the behests of a Central or Federal authority, situated probably far from the Province.

Impending changes of a far-reaching character have been somewhat obscured this year by the continued deterioration in railway finance and the efforts to set it right. The establishment of the Federation within a year or two means that the constitution of the Statutory Railway Authority, the non-political body contemplated by, and to be created under, the Government of India Act to administer the railways of the country, is not far off. Before the transfer of control of the railways from Government to that Authority, a drastic revision of the present out-of-date Railway Act,

1890, has to be undertaken. Apart from changes designed to bring an ancient Act into conformity with modern conditions, the proposed legislation will have to amplify the railway sections of the Parliamentary Act and define the relations of the Statutory Authority and the Federal Government. The present Railway Convention of 1924 may have to be overhauled and the railways may get an opportunity to state their case for scaling down the present rate of contributions to the State. Though the situation offers little promise of any great relaxation in this respect, a remission of the contributions already accrued during the past six years, but not paid, may be expected in view of the practical impossibility of the railways meeting them in the near future. Another event affecting the Indian railway system will come with the separation of Burma. The Burma railway, which has been part of the Indian railway system since 1877, will, with its 1,900 miles of line and 35 crores of railway capital, become a separate entity by itself, with its own railway board, budgets, etc.

Indian public opinion on railway matters is more concerned over a different problem. The policy of extending direct State management over State-owned railways now operated by companies incorporated in Great Britain received a temporary check in 1929 on account of high interest rates, and the contracts with the Assam, Bengal, and North-Western and Rohilkund and Kumaon Railways were renewed. In view of the present favourable conditions of the capital market, the demand for extending the policy has been recently made. The contracts with the Bengal and North-Western and the Madras and Southern Mahratta are due to expire in 1937, and a resolution recommending their acquisition and operation by the State was carried in the Assembly early in 1936. The Government of India have not announced their decision yet, but it seems very doubtful that the present position can be maintained. No compromise seems feasible, as the State had definitely committed itself to nationalisation in the closing decades of the last century when it bought out the original proprietary companies. With the enlarged scope for public opinion to influence Government policy under the new constitution, the pace is likely to be accelerated and the policy of nationalisation unhesitatingly pursued. If the process of acquiring the present company-managed lines on the expiry of their existing contracts is continued, no more companies will be left after 1950, the year in which the Bengal-Nagpur will pass into the hands of the State.

Thanks to the sagacity of the administrators and the conservative principles of finance adopted from the beginning, the Indian railways have been on the whole free from the effects of over-capitalisation and duplication, a fact imparting a great confidence in the financial stability of the railways under fully-fledged State management.

INDIA AND THE INVESTOR

INDIA'S industry, for the most part, is locally financed. The British investor, therefore, is largely restricted to Indian Government and railway obligations. An examination of the section dealing with India's Debt and Budget will convince him that India's finances are managed with a financial austerity and a regard for debt redemption which could hardly be equalled. Finance, in fact, has always been a "reserved subject" in the administration of British India. It remains so under the new Constitution.

In this section, it is necessary only briefly to recapitulate the main features of the Indian Budget. About two-thirds of the tax revenue is provided by Customs, and about one-fifth by income tax. On the expenditure side (excluding the self-balancing railway budget) defence appropriations account normally for about 55 per cent. and the debt services for rather below 15 per cent. In terms of direct "cover"—if such a calculation bears much meaning—the Government debt services could be met nearly 7½ times.

This combination of administrative control and adequate revenue (even in the deficit years 1931-32) gives the Indian

sterling loan a status which is second only to the credit-ranking of the British Government itself. It is measured, in the market, by a yield differential of about 5s. per cent. in the terms which India has obtained in the London market for conversion operations. The latest of these issues, in July last year, was of 3 per cent. 14-17 year stock, at 98. The replacement of £12 millions of 6 per cent. bonds by £10 millions of this 3 per cent. stock yields its full benefit during the current year, and a further £16.8 millions of 5½ per cent. sterling stock have been repaid without floating redemption date before 1942, but the 3½ per cent. stock, of which £88,667,884 is at present outstanding, is redeemable at the Indian Government's option. It is doubtful, however, whether the Government could obtain better terms in perpetuity by recalling this issue.

Will the position of the debt service be affected by the introduction of Provincial Autonomy? The Provinces will need assistance from the Central Budget, estimated at

nearly 2 crores annually. In addition, the separation of Burma will involve a net loss in revenue of 2½ crores. Subventions on this scale from the Centre will commence from April next year. Again, the adjustment of income tax from revenue between Centre and Provinces, and the size of grants-in-aid under Sec. 142 of the Act must be determined, so that the Provinces can start on "an even keel." Will there be any repercussions upon the financial stability of the Centre?

We may conclude, broadly, that the budgetary and exchange security which holders of Indian stocks at present enjoy is not likely to be weakened when Provincial finance is self-administered. What other opportunities does the investor enjoy in Indian securities? He has a selection of well-secured Corporation stocks, including the issues of the Commissioners of the Port of Calcutta and of the Trustees of Bombay and Karachi Ports. The railway issues occupy a very specialised terrain. Several provide a guaranteed minimum return, plus a share of profits, such, for example, as Assam-Bengal, Bengal Nagpur, Madras and Southern, and Bombay, Baroda. These are trustee stocks, with a speculative interest.

In this section, too, are found several annuity issues. These are the legacy of the old "Guaranteed Companies" whose ordinary capitals were converted into Government guaranteed annuities at the expiration of their contracts with the Government. Four classes of annuities exist, designated "A" to "D." It is a matter of some complication for the lay investor to compare the current quotations with an estimated redemption value, since the rates at which the sinking fund investments have been made must necessarily be assumed. Among the debenture stocks, however, comparisons are clearer. It is still possible, to quote one example, to obtain an appreciably higher yield on East Indian 4½ per cent. irredeemable stock, which is a trustee issue guaranteed by the Secretary of State, than on Indian 2½ per cent. stock.

We may, finally, glance at the openings offered by banking, industrial and mining companies, in India. Her two representative banking institutions—Chartered Bank of India, Australia and China and National Bank of India—enjoy high status with the British investor. A number of British industrial concerns have established subsidiaries there—Imperial Chemical Industries and Associated Portland Cement among them. Industrial ordinary share opportunities, however, are largely confined to utilities, steel, jute and mining. Calcutta Electric is the largest concern in the first group. It has, in recent months, been concerned in a rates controversy, which has affected the market to some extent. Smaller and well esteemed issues are also represented by Cawnpore, Delhi and Madras electricity undertakings. The recently announced merger arrangements between the Bengal and Indian Iron and Steel concerns appears to have changed the outlook for the Indian steel industry considerably. For too long, essential technical expansion has been held up, owing to the peculiar profit-sharing arrangements between the two companies, and the funding of loan capital will yield substantial economies.

The jute industry has recently staged a recovery, at least in prices. Calcutta's present demand, indeed, almost suggests that prosperity has been restored over-night. In fact, however, the manufacturing industry, represented by such concerns as Victoria Jute, Samnuggur and Titaghur, has still to solve the problems of "outside" competition and working hours. Until the effect of crop restriction becomes clearer, the recovery prospects of shares in this industry cannot be regarded with complete confidence. Among mining concerns, the group of gold producers on the Kolar field in Mysore includes Champion Reef, Mysore, Nundydroog and Ooregum. Burma Corporation's prospects have been improved by recent development, but the shares have made much smaller progress than other representative base metal producers owing to the shorter expected life of the mine.

THE EASTERN BANK LTD.

Head Office: 2 & 3 CROSBY SQUARE, LONDON, E.C.3

Authorised Capital - £2,000,000
Paid-up Capital - £1,000,000

INDIAN SHIPPING

BRITISH INDIA possesses only a small mercantile marine, though its carrying capacity is slowly increasing. The number of steamers and motorships of 100 tons and over, classified by Lloyd's Register as belonging to India and Ceylon, rose from 138 in 1929 to 167 in June, 1936. Concurrently, the capacity of the fleet increased from 175,400 gross to 223,685 gross. But despite this increase, the mercantile tonnage represented only 0.35 per cent. of the world's carrying capacity.

In his address to the shareholders of the Peninsular and Oriental Steam Navigation Company on December 9th, the Hon. Alexander Shaw pointed out that only about one-half of the trade between Calcutta and Japan, via the Straits and China, is now carried in British vessels, and that over 80 per cent. of the traffic from Bombay to Japan, and over 89 per cent. of the trade from Japan to Bombay,

is now in the hands of Japanese companies. No less than about 73 per cent. of the total tonnage employed in the trade from India to Japan now flies the Japanese flag. Formerly the bulk of this trade was carried by British vessels.

II. SHIPPING MOVEMENTS IN COASTING TRADE

(Tonnage in thousands)

Native craft	1,269	1,168	1,285	1,281
Total	19,927	20,559	22,417	24,984

Coastal traffic, it will be seen, has increased fairly rapidly in recent years. The bulk of the coastal traffic, as of over-sea trade, is carried by British ships. The British proportion of the total tonnage entered and cleared with cargoes rose from 67.6 per cent. in the year ended March, 1930, to 68.6 per cent. in 1934-35. Apart from native craft, the Indian proportion of the tonnage entered and cleared, though still relatively small, rose from 11.5 per cent. in 1929-30 to 12.5 per cent. in 1934-35. The traffic handled by native craft has remained practically unchanged in recent years, and its relative importance, therefore, has tended to decline. Swedish, Norwegian, Italian and Japanese vessels have all shared in the expansion of India's coasting trade.

LIFE ASSURANCE IN INDIA

INDIA is a great and growing market for life assurance. In 1933 official figures show that the number of companies subject to the provisions of the Indian Life Assurance Companies Act of 1912 and the Indian Insurance Companies Act of 1928 was 341, of which 194 were constituted in India and 147 outside India. Of the Indian companies, only 15 do not transact life business; 34 carry on both life and other branches; and no less than 145 confine their activities to life assurance only. The converse holds for the 147 foreign companies, of which 123 do no life business; 13 transact both life and other branches; and 11 are interested only in life assurance. Of the companies in the last two groups, 16 are constituted in the United Kingdom and 6 in British Dominions and Colonies.

The 1912 Act follows closely British life assurance legislation as set out in the Assurance Companies Act, 1909. Consequently there is much less Government regulation and control in India than in most countries. For example, no restriction exists on investments, and no Government standard is laid down for the actuarial valuation of liabilities. Insurance conditions in India, however, naturally differ widely from those in this country; and at present an Advisory Committee is considering what changes are desirable in the legislation.

Premium rates are much in excess of British rates. Thus, if we compare the whole-life non-participating rates of a large first-class Indian office with those of a similar institution in this country, we find that the difference in

premium amounts at age 20 to about $\frac{1}{2}$ per cent. of the sum assured, and at age 50 to 2 per cent. of the sum assured. The differences in respect of endowment assurances are smaller, and vary between $\frac{1}{2}$ per cent. and 1 per cent. of the sum assured.

The average net rate of interest earned by the Indian offices in 1929 was about 5 $\frac{1}{2}$ per cent. Since then the rate has fallen steadily, but in 1933 it was still in excess of 5 per cent. These high interest earnings are useful in mitigating the high premiums required by mortality considerations. Unfortunately, the expenses of management are also extremely high, measured by British standards. Thus, in 1933 the average rate of expense was 30 per cent. of the premium income, or about twice the rate in this country.

In the last ten years new sums assured have expanded very rapidly—a feature which, of course, has tended to produce a heavy expense ratio. Thus, in 1933, new sums assured written by the Indian offices were Rs. 24.83 lakhs, against Rs. 6.89 lakhs in 1924; in the same period the total income of these offices has increased from Rs. 2.90 lakhs to Rs. 8.15 lakhs. Total new business in 1933 amounted to 183,000 policies, assuring 33 crores, and yielding a premium income of 1 $\frac{1}{4}$ crores, to which the Indian offices contributed 155,000 policies, 24 crores and 1 $\frac{1}{4}$ crores, respectively. The share of the British offices in the new sums assured was 3 $\frac{1}{2}$ crores, and of the Dominion and Colonial offices, 5 crores. The average new sum

assured was Rs. 1,555 for the Indian and Rs. 3,126 for the non-Indian companies. The totals in force at the end of 1933 of all the offices, home and foreign, were 867,000 policies, covering sums assured and bonuses of 193 crores, and having a premium income of 9½ crores. Indian companies alone account for 636,000 policies, 114 crores and 5½ crores respectively. The largest office, the "Oriental," has in force 230,000 policies representing sums assured and bonuses of 48 crores, and premium income of 2½ crores. There are a few other offices of substantial size, but the great majority are very small indeed. In respect of about one-half, the life assurance fund ranges downwards from 1 lakh to a negative quantity.

While in this country a new life office would be little short of a phenomenon, Indian life offices spring up each year in large numbers. For example, in the latest official

annual publication it is mentioned that during the year under review 28 new companies were established and more than 80 in the preceding five years. The lapsing of policies is extremely high among the young offices, suggesting uneconomical expenditure in search of business, which, of course, must have repercussions throughout the industry. A strong warning is given against the "indiscriminate flotation of such offices."

It would seem that Indian life assurance is at a stage when it would be much to the ultimate advantage of the offices to engage the services of fully-trained actuaries and to encourage Indian actuarial students to study for the full British degrees of F.I.A. or F.F.A. Their activities would find full scope not only in the valuation work but in the general day-to-day administration of the business.

ECONOMIC DEVELOPMENTS AND PROSPECTS IN BURMA

THE separation of Burma from India, in April, 1937, will end an anomalous situation. Physically, racially and socially Burma is quite distinct. Historically the countries were unrelated until under British rule. They were united for administrative convenience.

The total area of Burma—which is larger than any British Indian Province—amounts to some 230,000 square miles. The vast majority of the total population (i.e. 14.5 millions, less than that of any British Indian Province except Assam and the North-West Frontier Province) is of Mongol stock, professes Buddhism, and speaks Burmese. The caste system is unknown, and the Burmese are remarkable for tolerance, the freedom and independence of their women, and a high degree of literacy.

Owing to the extent of rugged, mountainous areas, and to the fact that over two-thirds of the area is forest—from which comes its valuable trade in teak—economic development has so far been practically confined to the Southern coastal regions, the basins of the Irrawaddy and its tributary, the Chindwin, and to the much narrower delta of the Sittang. The Yanangyaung and Singu oilfields of the Burma Oil Company, from which oil is brought by pipelines to Rangoon, lie in the Irrawaddy basin, but neither they nor many towns of the central "dry bone" are connected by rail with Rangoon. The main line of the Burma railway, State-owned and managed since 1926, runs down the Sittang valley to Mandalay, and another line runs from Rangoon up the Irrawaddy valley to Prome. The forests produce magnificent timber, especially teak, which is marketed in Rangoon, upon which port, indeed, Burma's commercial life is almost completely concentrated. The coastal and delta districts are extremely fertile and are the great rice-producing areas, while the rubber plantations are situated on the hilly slopes of the south and south-east.

Owing to the configuration of the country there is considerable variation in climate but except for the central dry zone, where millets, sesamum, beans, groundnuts and cotton are grown, the rains never fail; so Burma has no famine problem. Besides rice, timber and petroleum—all obtained mainly from Lower Burma—there are also plentiful mineral supplies, including tin, lead, gold, silver, copper, zinc, wolfram and precious stones, such as rubies, but these (except tin, which is found in Tenasserim, the narrow coastal strip between Siam and the Gulf of Martaban) are situated mainly in the north, and their commercial exploitation is of recent date.

Rangoon itself is a cosmopolitan city, with a population of 400,000, no other town, except Mandalay, having more than 100,000. The value of Rangoon's foreign trade, even when trade with India is excluded, is greater than that of any Indian port except Calcutta and Bombay. Including trade with India, Burma's exports amount normally to some Rs. 56 crores (£42 millions) and her imports to Rs. 28 crores (£21 millions) per annum. Nearly 50 per cent. of this trade is with India, and some 85 per cent. is conducted through Rangoon. When the new Constitution is fully

implemented, trade between India and Burma will become "foreign" trade to both countries. The rice-milling, petroleum refining and timber preparing industries are all situated in Rangoon.

Overseas trade consists mainly of the export of mineral oil, rice, timber, metals and ores, and rubber, in return for cotton goods (Indian and British), machinery and millwork, coal (from Bengal), sugar, hardware and miscellaneous manufactures. The trade between Rangoon and Calcutta is of outstanding importance. The bulk of Burma's mineral oil goes to India, supplying practically the whole of India's demand for petrol, and much kerosene, although Burma is unable to satisfy India's needs for the latter. Paraffin wax is the only petroleum product of which any considerable quantity is sent to other countries. Rice is exported mainly to Ceylon, China, Germany and the Straits Settlements, but some is always sent to Bengal, releasing a certain quantity of "Patna" rice for export, whilst in times of scarcity rice normally sent elsewhere is readily diverted to India. Timber is sent both to India and to other countries. The valuable teak trade is almost entirely in the hands of old-established British firms—and it is a source of revenue for British shipping. India, especially Calcutta, supplies a great part of Burma's need for manufactures, including cotton and iron and steel goods, and jute bags used in the rice trade.

A trade agreement, formed in August, 1935, provides that during the transitional period (while the new Constitution is being introduced) there shall be no restriction on trade or migration between the two countries, and that the existing tariff on goods from other countries shall remain in force. Eventually Burma may favour a different tariff policy, but can hardly afford to adopt one which might restrict trade with her most valuable market.

The financial position of Burma is not unsatisfactory, as after four years of depression and deficits a substantial surplus was achieved in 1934-35, owing to drastic retrenchment and some revival in prices and trade. Since then the Budget has been balanced. The Joint Committee on Indian Constitutional Reform was satisfied that Burma would not in the long run be worse off financially as a result of separation. Moreover, while separation will involve additional administrative expenditure, some Rs. 2½ crores previously paid over to the Central Government will in future be retained by Burma.

Burma is naturally favoured by her fertile soil and resources; her principal products find ready markets; and her greatest need appears to be not to limit overseas trade or the activity of foreign enterprise within her borders, but to encourage her own people, by education and training, to play an ever-increasing part in the development of their country.

* Of recent years India has produced some 300 million gallons of mineral oil per annum, of which Burma accounts for about 250 millions, and sends some 180 to 200 millions to India.

THE ECONOMIST

TRADE SUPPLEMENT

New Series

SATURDAY, DECEMBER 26, 1936

No. 163

THE STATE OF TRADE

THE seasonal expansion of business activity, which began in September, continued during the past month, though it was less marked than a year ago, when activity was speeded up in anticipation of a coal strike. The seasonal quickening of the pulse of economic activity since September, moreover, has not been strong enough to raise *The Economist's* index of business activity—adjusted for normal seasonal movements—above the level attained in August. But the current level of business is appreciably higher than a year ago. The number of insured persons, aged 16 to 64, employed in Great Britain last month, at 11,120,000, showed an increase of no less than 560,000 compared with November, 1935.

Apart from seasonal movements, the lull in the progress of economic recovery in recent months is partly due to short-run physical limitations to a further expansion of activity in certain important industries. The metal industries, for example, have been working practically at capacity for some time. Since some of the capital equipment trades are unable even to satisfy home requirements,

the downward trend in exports of iron and steel, non-ferrous metals and manufactures, instruments and implements, machinery and electrical equipment is not surprising. But as demand for metal goods, reinforced by re-armament exigencies and the revival in shipbuilding, is still on the up-grade, activity may be expected to continue its upward trend as capacity is extended.

Owing to the cessation of shipments to Italy and a substantial reduction in Spanish purchases, exports of coal continued below last year's level. Compared with the first eleven months of 1935, exports and shipments for the use of steamers this year showed a reduction of 4,933,000 tons. But home demand has been so good that production during January-November this year was 4,600,000 tons higher than a year ago. As a result of the resumption of trade with Italy and larger French requirements, the outlook for export business is now more encouraging.

The building and public works contracting industries experienced a seasonal decline in activity during November. The current volume of construction, however, is still above the level of a year ago. In the absence of a prolonged period of unfavourable weather, the outlook for the building and ancillary trades during the next few months is still fairly promising. Though the steady decline in the value of building plans passed for dwelling-houses by 146 local authorities cannot be overlooked, the maintenance of "assisted" dwelling-house and commercial construction may be expected for some time to provide strong resistance to an abrupt recession in total building activity.

The physical limitations to a further rapid expansion in the metal industries at this stage, however, are not preventing the continued progress of the consumers' goods trades,

including those which, like cotton manufacture, depend largely on foreign markets. The constitutional issue earlier this month caused some hesitancy, but this was quickly brought to an end with the accession of George VI to the Throne and the news that the date of the Coronation was to remain unchanged. At home, consumers' purchasing power is steadily rising with the increase in employment and higher wages and dividends. Consequently, the demand for food, clothing, automobiles and services is steadily increasing. Moreover, the rise in the prices of primary products is beginning to be reflected in our exports. The marked rise in the prices of primary products is of good augury for the purchasing power of our overseas customers.

On the other hand, the rise in commodity prices is tending to increase manufacturing costs. But as the trend of profits shows, industrialists have so far been able to pass on to the consumer most of the increase. A point may come when consumers begin strenuously to resist any further increase in prices and when industrial profits consequently begin to decline, but that point seems still some way off.

Apart from political developments on the Continent, the international background is improving. Perhaps the most important feature is the strong upward movement of the prices of raw materials and crude food-stuffs, accompanied by an increasing volume of trade between primary producing and industrial countries. British American and Japanese imports are rapidly increasing, and the British Dominions, Scandinavia and South America, especially Argentina, are making steady progress. In the United States, business activity continues to expand, but there is some anxiety that labour difficulties may lead to temporary dislocation and setbacks in individual industries, especially in steel and automobile manufacture. Among other industrialised countries, France, Holland and Switzerland are showing signs of recovery, though little ground has so far been gained. Heavy re-armament expenditure is still stimulating activity in Germany, but there is a shortage of certain raw materials and foodstuffs which, if accentuated, may lead to serious difficulties next year unless Germany decides in the interval to resume co-operation with other countries.

In the absence of unfavourable political developments abroad, the outlook for 1937, both in this country and elsewhere, is not unpromising. The trend of activity in the United Kingdom remains strongly upwards, and there are no indications of an early recession in any of the major branches of activity. Moreover, the rise in commodity prices and the steady expansion of world industrial activity may lead to a continued, if slow, expansion of international trade. But time alone will show whether or not the year 1937 will mark the peak of the present cycle of prosperity.

HOME INDUSTRIES AND TRADE

The following reports on British industry cover, in most cases, the period to the middle of December. In the remainder they relate to the month of November.

COAL

The November employment and production figures reflect a further seasonal improvement in the coal-mining industry. In contrast to conditions on the home market, exports again made a poor showing last month and were substantially below the level of the two previous Novembers. Conditions in this section have, however, shown a noticeable improvement in recent weeks; business with France has broadened out and Italian buying has been resumed, following the visit to Rome of representatives of British coalowners. Meanwhile, the demand for house coal has been steadily increasing, and large orders are now passing to the collieries. The market in industrial fuels remains as strong as ever, and deliveries against contracts are occasionally in arrears. Supplies on the open market are accordingly scarce.

IRON AND STEEL

Production of iron and steel continued at a high level during November. Pig iron production during the first eleven months of 1936, at 7,014,300 tons, exceeded output during the whole of 1935 by 588,300 tons. Similarly, the output of steel ingots and castings during January-November this year showed an increase of 836,600 tons over the whole of 1935. Exports continued their downward trend, amounting to 2,000,900 tons in January-November, against 2,128,000 tons a year ago. Imports, on the other hand, rose from 1,038,700 tons in January-November, 1935, to 1,388,800 tons this year. But, despite the heavy increase in the volume of iron and steel available for home consumption, there is still acute stringency in numerous sections of the industry, and many manufacturers appear to be quite unable to satisfy all requirements within the time specified by consumers. The recent increase in the prices of iron and steel has had little effect on business.

ENGINEERING

The engineering industry as a whole is making headway, and the volume of new business continues to expand. The proportion of insured workers unemployed in the industry was only 6.6 per cent. in November, compared with 11.1 per cent. a year ago. As in the iron and steel industry, home requirements are so heavy that domestic production has had to be supplemented by increased imports. Under the circumstances the industry has been unable to expand its foreign business. The outlook for most branches of the industry remains good, but engineers are somewhat concerned about the stringency of the supply of iron and steel. As far as individual sections are concerned, business in agricultural machinery is seasonally dull, and the textile, locomotive and railway equipment sections are not quite as active as a few weeks ago; activity in most other branches has been maintained or increased in recent weeks.

ELECTRICAL ENGINEERING

The electrical engineering industry continues to expand; the proportion of insured workers unemployed in November was only 3.4 per cent. The volume of new orders for heavy electrical machinery, however, declined a little in the past month.

INDEX OF NEW ORDERS RECEIVED BY HEAVY ELECTRICAL MANUFACTURING INDUSTRY*

(1920 = 100)

* Copyright of the British Electrical and Allied Manufacturers' Association. The above index is a 12-month moving average of new orders received by the heavy plant section of the industry. It is based on the horse-power and not on the value of orders.

MOTOR INDUSTRY

Activity in the automobile industry continues on a high level and demand shows no signs of slackening. New registrations of private cars and of goods vehicles in October, at 24,027 and 7,291 units, respectively, were 1,351 and 1,502 units above the previous year's level. The increase in sales has not been confined to the home market, for 6,322 private cars and chassis were sold abroad last month, against only 4,925 in November, 1935; exports of commercial vehicles in the same month amounted to 1,637, against 1,157 a year earlier. On the other hand, imports have also been

rising steadily, entries in November including 1,290 private cars and 111 commercial vehicles, against 756 and 26 units in the same month of last year.

CHEMICALS

Business in the home chemical market was on a very fair scale during November. Industrial chemicals were in more active demand than for some months past, and there were a fair number of inquiries for new business. A continued steady trade was reported in wood distillation products, but, as stocks are still available, no rise in prices has taken place. In the coal tar products market chief interest was shown in tar acids, business in the heavy products being dull. Only limited interest was shown in pharmaceutical chemicals. Overseas trade figures for November showed the same tendency as has been evident during the greater part of this year—an increase in imports and a fairly considerable decrease in exports, as compared with November, 1935.

ELECTRICITY

GENERATION OF ELECTRICITY*

COTTON

A feature of the past month was the settlement of differences between operatives and employers in both the spinning and weaving sections. With the threat of a stoppage averted, the outlook is now much brighter. Although business in yarns and cloth has fallen off somewhat during the past month, sufficient orders have been booked to clear production, and the improved position of the industry has been well maintained. The advance over 1935 is reflected in the unemployment percentage, which fell from 17.5 to 13.6 during the past twelve months. In the spinning section production is now at 89 per cent. of capacity, against 86 per cent. a month ago and 83 per cent. last year. In the spinning section as a whole, the constitutional crisis caused anxiety regarding the disposal of Coronation goods, but the losses are likely to be much smaller than was at first feared.

WOOL

A further improvement in the wool textile industry occurred last month, the unemployment percentage falling to 6.7, against 7.6 in October and 8.2 in November, 1935. The constitutional crisis and the anticipation of a postponement of the Coronation caused the recovery process to falter early in December; raw material prices consequently lost ground. With the passing of uncertainty, however, business enjoyed a rapid recovery, and the outlook is now good. The carpet section is particularly well placed, with unemployment at a low level. Meanwhile, sales overseas last month were again smaller than in the corresponding month of 1935, the decline, which was especially marked in the case of Germany, being fairly widely distributed.

JUTE

After a period of hesitancy, prices in all sections are now firm, and show a rising trend. Despite the extension of working hours, the Indian Jute Mills have been able to dispose of their output and stocks are not increasing. Meanwhile, spinners and manufacturers in Dundee have experienced sufficient inquiry to absorb production, and export business has been quite good. Nevertheless, the outlook is obscured by the threat of labour troubles, following the demand by the operatives for a 12½ per cent. increase in wages.

RAYON

Despite a seasonal lull in new orders in certain sections, the general position remains fairly satisfactory. Yarn deliveries for the weaving trade are maintained on a high level, and there is a tendency for rush orders to be placed for delivery before the advance in weavers' wages comes into force.

LINEN

Business in flax has been restricted, owing to the reserve of sellers, but good quality fibre remains in general demand; prices

for all classes are firm. In the yarn market similar conditions have prevailed. Cloth prices have again moved upwards, with buyers following, both for home and export requirements.

BOOTS AND SHOES

Unemployment in the footwear trades showed a slight increase last month, when sales overseas were smaller than a year earlier. A high percentage of operatives are on short time, but in some instances overtime is being worked.

POTTERY

The employment position showed little change last month, but was considerably better than a year earlier. The improvement over 1935 was, however, entirely in the home market, exports being rather smaller than in November, 1935.

AGRICULTURE

Work on the land is fairly well forward and early-sown corn has germinated well. The quality and condition of the potato crop is fair generally, the total production being provisionally estimated at 2,813,000 tons. The quality of mangold roots, which are of medium size, is generally good, total production being put at about 4,625,000 tons. The yield per acre of swedes and turnips is estimated at 12.5 tons, or 0.8 tons above the ten years' average. The sugar beet crop generally is satisfactory, and present indications are that the sugar content will be

slightly above that of last year. Cattle and sheep have made average progress, and it is expected that the amount of winter keep will be sufficient. Milk yields have shown a seasonal fall.

SHIPPING

The steady expansion in the demand for tonnage is reflected in The Economist index of freight rates (1898-1913 = 100), which rose from 105.9 in October to 112.4 in November. The index is now no less than 17½ per cent. above the level of a year ago. In recent weeks the strength of the market has continued, and the outlook is bright.

BUILDING

There was a seasonal decline in building activity in November, but the current rate of construction remains above the level of a year ago. Activity in public works contracting also declined between October and November, but the proportion of insured workers unemployed, though still 42.9 per cent., showed a reduction of 4.8 per cent. on November, 1935. The value of building plans passed in November by 146 local authorities, however, was again well below last year's level. Plans for new dwelling-houses were substantially lower than in November, 1935, but those for other forms of building showed an increase over last year's corresponding figure. Although building activity may not expand further, there are no indications of a sudden recession in the near future.

a Including bullion and specie.

e Until February, 1923, Julian Calendar.

Economique Belgo-Luxembourgeoise.

foreign trade of the Irish Free State.

b Since 1922 declared values.

f Including bullion.

h From April 1, 1923, including trade of Great Britain and Northern Ireland with the Irish Free State, and excluding the direct foreign trade of the Irish Free State.

l From February, 1935, Saar including with Germany instead of France.

n Method of valuation changed—1935 average of revised figures.

c Including Danzig.

g Since 1928 declared values.

i Since May, 1922, figures refer to "Union

d Trade across all frontiers. Exports exclude raw platinum.

h Old Greece only.

j Since May, 1922, figures refer to "Union

k Since May, 1922, figures refer to "Union

m Including parcel post for the half-year.

o Provisional figure.

a Value in new roubles.

Unless otherwise stated, the figures represent authorised share issue of new joint stock companies at home, and the increase of capital of existing companies. Bonus shares are excluded from the figures of Roumania and Czechoslovakia. In the case of the Netherlands, Switzerland and the U.K. both bonus shares and conversions are excluded. ^a Excluding Treasury Bills. ^b Excluding large railway issues. ^c "Rivista Bancaria." ^d Issues exceeding Fls. 100,000 on the Dutch market including Colonial, and since Jan., 1925, foreign issues. ^e Since 1924, excluding amalgamations and conversions. Until end 1922 paper mark. ^f "Société de Banque Suisse," figures of net amount of new capital paid-up. ^g Compiled by "Commercial and Financial Chronicle." ^h Up to 1927, authorised issues, excluding western departments; since 1928 amounts actually issued, whole territory.
