THE ECONOMIST

"Were all nations to follow the liberal system of free exportation and free importation, the different States into which a great continent was divided would so far resemble the different provinces of a great Empire. As among the different provinces of a great Empire the freedom of the inland trade appears, both from reason and experience, not only the best palliative of a dearth, but the most effectual preventative of a famine, so would the freedom of the exportation and importation trade be among the different States into which a great continent was divided."—ADAM SMITH.

Economic Danger Signals

THERE is more than purely conventional reason for pausing at the New Year to assess the economic outlook for the nation and the world. There is a very real crescendo of activity during the autumn months, inspired by the harvest at the beginning of the season and by Christmas at the end. But in the New Year there is always a sharp reaction; the curve of British unemployment usually reaches its annual peak in January, and the economic prospect for the year depends on the pace of recovery from this turning-point.

Anybody who attempts this New Year to assess the outlook for 1937 must first of all take account of the truly astonishing recovery which Great Britain has enjoyed in the past four years. Last year has shown as rapid progress as any of its predecessors. The total of employment in December was almost 5 per cent. higher than it had been twelve months before. What is more, the labour force of the nation is being even more effectively used than the bare figures of employment would show; for *The Economist* Index of Business Activity, which is a measure of the whole economic tempo of the nation, has been some 7 per cent. higher in the latest three months than in the same period of last year. Perhaps the most encouraging aspect of the last year has been the extent to which recovery has spread to many of the basic industries which ever since the war have been among the most depressed. The production of steel in the United Kingdom, for example, was more than 18 per cent. higher in 1936 than in 1935. Moreover, imports of iron and steel increased while exports fell off, so that the domestic consumption was no less than 27 per cent. higher. These are astonishing figures when the period is as short as a year and the circumstances

those of already well-established recovery. Of the four great erstwhile depressed industries—coal, cotton, iron and steel, and shipbuilding—the two latter must now be struck off the list. The Special Areas have experienced some improvement, but in most of them it has served to lighten the blackness of their outlook only to the darkest shade of grey, and there are other districts, such as parts of Lancashire, which are hardly behindhand in depression. But these are the exceptions. The greater part of the country is prosperous to a degree it does not realise and would not have believed possible four years ago.

It is the current fashion to ascribe the bulk of this continued recovery to the Government's re-armament programme. In fact, it is difficult to assess how much truth there is in this contention. The actual expenditure of the Government on armaments clearly does not measure the total effect of the programme, since Government contractors all over the country are investing capital in additional plant and enlarging their labour force to cope with official orders. But even if every pound spent by the Treasury on re-armament is multiplied by five before its final effect is expended, the resulting expenditure hardly amounts to 5 per cent. of the national income. Perhaps a fairer way is to consider what fraction of the *increase* in national income may be due to re-armament. If we assume that the whole of the speed-up in the rate of recovery since 1934 is due to the programme (an unduly generous assumption), it still accounts for less than half of last year's improvement. Other factors have clearly been at work.

These other factors initiated recovery four years ago and gave it impetus long before even the first of the

White Papers on Defence. They have found their most striking manifestation in an amazing increase in the purchasing power of the consuming public; and the statistics which bear upon this are still among the most striking in the list—such figures as a 13½ per cent. increase in the annual production of new motor-cars or a 9 per cent. increase in one year in the total number of cars in use. Entirely apart from re-armament, it is clear that we are experiencing a boom of the classical type. All the classical features, with one exception, are present: rapidly rising prices (*The Economist* index of the prices of primary products has risen by nearly 20 per cent. in twelve months); incipient labour shortages; increasing wages; buoyant security markets; new issues of questionable quality; an increase in speculation; an expansion in credit (bank advances are 12 per cent. higher than a year ago); a rapidly growing volume of investment in fixed capital. The only element missing is a rise in interest rates. Without re-armament the boom, though less impressive, would still have been a boom.

How long will it last? That is perhaps the most difficult question of all to answer. So far as the current activity of industry is dependent upon re-armament, it will last as long as re-armament lasts. How long that will be, nobody knows; but it will at least outlive 1937. In so far as the boom is dependent upon other factors, the answer cannot be so simple. It can only be said that no reversal of the upward trend is yet in sight. The long-

heralded decline in residential building has not yet arrived (though it is doubtless on its way), and other forms of building are still increasing. There is little prospect of a sharp rise in interest rates. On the whole, the pacific aspect of recovery can be promised another twelve months of life, though the prophecy is not made with any undue confidence.

With re-armament certain, and the non-armament boom likely to continue, the outlook for 1937 seems bright. But it is a somewhat garish brightness. For with every month that passes the fraction of recovery which depends on munitions of war enlarges, and that is neither remunerative nor permanent. Moreover, even if re-armament be left on one side, it is a characteristic of all booms that in their later stages they come to depend more and more upon the volatile capital-goods industries and less and less upon the steady consumers' trades. That is happening in Great Britain now. The optimistic outlook for 1937 must therefore be qualified. The economic historian of the future may very well decide that the sound recovery of the middle 'thirties passed over into an unstable boom about the beginning of 1937. The danger of the New Year is not so much that the process of recovery may come to an end as that it may get out of control and create a situation that will sooner or later end in a fresh catastrophe. A steady pace now would be the best safeguard against a dangerous reaction.

Germany's Responsibility

SINCE Christmas Eve all eyes have again been on Germany. Chancelleries, Foreign Offices and editorial corridors have been humming with rumours of an impending demonstration by the Nazi rulers of the Third Reich; but nothing has yet happened. HERR HITLER spent a quiet holiday at Berchtesgaden, only emerging this week for the State funeral of GENERAL VON SEECKT and the colloquy of Nazi chiefs which followed it. But Europe still watches Berlin with apprehension, since it does not know the Nazi Government's reply to the urgent requests made by the French and British Governments just before Christmas for genuine German collaboration to prevent the supply of arms and "volunteers" to either side in the Spanish conflict. And European apprehension will increase if the Nazi Government, as is feared in Paris, merely play for time by an equivocal reply which leaves them free to continue intervention.

The Spanish question, however, is not the sole or even the chief cause of anxiety. Though the German answer has yet to be made public, and though GENERAL FRANCO's new assault on Madrid is said to be timed for the New Year, the Nazi directors of German foreign policy may well pause to ponder the extent to which both Germany and Europe may become involved in the Spanish struggle if they persist in buttressing GENERAL FRANCO's position. Russia, their one hated foe, has this week agreed to renounce intervention and to collaborate in supervising an international arrangement to prevent it. There is much evidence that persistent German intervention—and any aid to either side in Spain from a totalitarian State must be accounted intervention—will have to reckon before long with French intervention, to say no more of Russian. Moreover, though it is reported that Berlin has been threatening Rome with a renewal of Nazi activity in Austria if Rome now fails to support it, such support can scarcely be reliable.

But there are more disturbing grounds for the apprehension now felt about Germany. As the German winter has advanced, the voices of Germany's rulers have risen in a crescendo of complaint against the comity of nations. GENERAL GOERING, DR. SCHACHT, HERR HESS and DR. GOEBBELS, with the entire German Press which the latter dragoons, have been manufacturing complaints against other nations for the alleged economic victimisation and political ostracism of Germany, and then demanding fresh sacrifices from German citizens in the name of defence against such victimisation. As a famous editor of this journal wrote, nearly seventy years ago: "No orator ever made an impression by appealing to men as to their plainest physical wants, except when he could allege that those wants were caused by someone else's tyranny." HERR HITLER's recent unilateral denunciation of the international waterway clauses of the Versailles Treaty came before the ink was dry on separate voluntary agreements on the subject between Germany and her neighbours. Abrupt unilateral repudiation was preferred to peaceful change. Thus was the last manacle of Versailles struck from the limbs of the Third Reich. Thereafter, its rulers have had either to conjure up grievances against the outside world in order to absolve themselves from responsibility for Germany's present plight, or else to keep flogging the whipping-boys of Versailles. They have elected to do both; but the device is transparent.

For nearly four years HERR HITLER and his associates have enjoyed unchallengeable control of Germany's economic and political destinies. The day is fast approaching when, as the FUEHRER promised, if he had not abolished unemployment and realised the aspirations of the German people, they could crucify him. How does the balance-sheet stand?

Germany enters 1937 with unemployment virtually abolished, but by measures which few observers, German or foreign, could have imagined in 1933. The Nazis' totalitarian State has catalogued industrial workers on

numbered cards—a species of internal passport. The slogan "guns, not butter" has been realised with painful precision. Rationing has already begun for many conventional necessities. Money wages have not been increased, although retail prices have risen; and the great gulf between the production of consumption goods and that of armaments, buildings, roads, machinery, etc., has steadily widened. Troubles with the peasants over supplies have broken out. The Reich army has been increased from the Versailles level to about 1,000,000 in 1937. A big air force has been created under the presiding genius of GENERAL GOERING; and an expanded navy, concentrated as yet on submarines, is being built. Labour camps provide large public works at nominal labour cost; the Jews have been disfranchised; and the concentration camps remain.

On the purely financial side, the huge cost of re-armament has been superimposed on those trading and exchange difficulties which have beset every commercial country since the onset of the Great Depression. Germany's overseas trade has been placed under rigid controls to ensure that the scheduled supplies of war materials take precedence of materials for civil industries. Hence the need for a programme of self-sufficiency in foodstuffs, for bilateral barter and exchange clearing agreements with smaller States, and for the control of German private capital abroad. So far has this control proceeded that non-disclosure of German funds abroad can now be punished by death.

Such is the balance sheet with which Germany enters 1937. It would be idle to pretend that, on the political side, the Nazis have not satisfied the ardent aspirations of the great majority of German citizens. But 1937 also opens with acute economic tension. The bill for the Herculean achievements of the last four years is falling due. Finance by mortgaging the future seems to have

reached its limit; and on all sides DR. SCHACHT's foreign clients are being attracted away from Germany's orbit by rising prices and expanding markets elsewhere.

How, if at all, can Germany be helped? In spite of the dissolution of the Colonial League by HERR HITLER on the eve of HERR VON RIBBENTROP's arrival as German Ambassador in London a few weeks ago, the Nazi leaders—as well as DR. SCHACHT—have once more broken out in an insistent demand for colonies. The argument is that Germany would then be able to buy her raw materials from regions in which her own currency was valid, and would thus avoid exchange difficulties. But even if we could all hand over some territory to Germany, the problems of compensation for capital sunk in such colonies as would immediately yield Germany the materials she requires could not be solved without whole-hearted German collaboration, both political and economic, with the other trading nations. For a loan would be necessary for Germany; and a big one. What Treasury would to-day guarantee the principal and interest of such a loan? Without that guarantee, who would lend to the Germany of 1937? The Nazi leaders cannot have it both ways. They cannot both eat their cake by complete autarky and preserve it by international collaboration.

Thus, grave decisions must be taken in Berlin or Berchtesgaden within the next few days or weeks. Whether HERR HITLER will decide to dress the German window by effecting a preliminary clean-up, or whether he will decide that his lot is cast by Destiny with that of the Party fanatics, none can say. If he makes the latter choice, he will probably seek diversions for his people in foreign adventure, which may be perilous both for Germany and Europe. We can only hope that his four years of responsibility for Germany will not end in such irresponsibility.

The Newspaper Industry—I

The Changing Newspaper

No nation can afford to treat its Press merely as an industry, demanding attention from the State only when it gets into difficulties. The provision of news is a public service as essential as the supply of food or power. Moreover, the Press has an influence on politics and even, in a still wider sphere, on the national culture as a whole. It is a social organ as well as an industry. In Great Britain, least of all countries, can the sociological importance of the newspaper be forgotten; for the dense concentration of population in a small country with easy internal communications has led to the building up of gigantic circulations for individual newspapers. Both the merits and the defects of the Press appear in Great Britain in concentrated form.

So seriously are these political and social aspects of the newspaper regarded that its industrial importance is overshadowed. To many people the fact that the Press is subject to the mercenary constraints of all industries appears in some way discreditable. Newspaper proprietors are criticised for attempting to make profits out of their trade. But the making of profits differs only in degree from the avoidance of losses, and the most censorious would be constrained to admit that, until the community decides to subsidise the provision of news, a newspaper must normally take care to make both ends meet. Little excuse is, therefore, needed for devoting this article, and two subsequent articles, in the main to the British Press as an industry. Space compels a further limitation to the newspaper industry; the

variety and heterogeneity of the periodical Press almost defy orderly description.

The British newspaper has been changing rapidly in the post-war decades. It is appropriate, in the first issue of *The Economist* in its new dress, to mention first the striking changes in the outward appearance of British newspapers. The average reader, who sees his paper day by day and never has occasion to consult back files, almost certainly does not appreciate the magnitude of the change. The new type faces adopted by many newspapers about three years ago are only the most obvious of the innovations. Even *The Times*, most conservative of metropolitan journals in this matter, is experimenting with double-column headlines. As for the popular papers, a copy of only two years ago already looks queerly old-fashioned. The fundamental idea of "lay-out"—that a page should appear typographically attractive, entirely irrespective of its content—is little more than a novelty, but already it dominates the large-circulation papers to the detriment, sometimes, of the balance of the news.

These changes in typography are merely the surface indications of changes in the more fundamental character of a newspaper. Broadly speaking, there are four services which the editorial part of a newspaper can perform for its readers: it can give them the news, i.e. the current happenings; it can give its opinions on the news; it can explain and interpret the news; and it can give them entertaining reading which may or

may not have direct relation to the news. The primitive newspaper confined itself to the first two functions; the last two are innovations of the Northcliffe era. For many years the development of "features" (the fourth function) was particularly rapid, and there are very few newspapers to-day which do not actively concern themselves with the diversion of their readers, even if it be only with cross-word puzzles or with whimsical essays on golf. The most recent tendency among the popular newspapers, however, is towards the explanation and interpretation of the news they print. No newspaper is now complete without its corps of "experts" who can append to each news item an estimate of its significance and meaning. This tendency arises, of course, directly out of the complexity of the issues in economics and in international affairs which nowadays occupy the centre of the stage.

The widening of the scope of newspapers has been accompanied by an expansion in their size. This again may be hardly perceptible to the average reader, but it is striking if the newspaper of to-day be compared with its predecessor of only five years ago. The increase in average size must be something of the order of three or four pages a day for most newspapers. Accompanying this increase in average size has gone a steady tendency towards the concentration of circulation in a small number of large newspapers. There have been no actual large-scale amalgamations since the *News Chronicle* was born of the *Daily News* and the *Daily Chronicle* in the summer of 1930. But the large-circulation metropolitan newspapers have, on the whole, gained in circulation at the expense of other journals. Thus the combined circulation of ten national morning papers increased by 7½ per cent. between 1930 and 1935, while the combined circulation of thirty provincial morning papers fell by 5½ per cent. in the same period. This change is partly, perhaps mainly, due to the aggressive canvassing tactics which the *Daily Herald* adopted after 1930 to secure its place among the leaders and which it thereby imposed on all its rivals. Some support for this view can be found in the fact that the London evening newspapers, which have not indulged in canvassing or in the mass distribution of Dickens's works, have lost circulation. But other reasons have been adduced for this loss of ground by the evenings. It has been suggested that it is due in part to the more direct competition of broadcast news, and also to the declining interest in horse-racing. *The Daily Telegraph* is a standing challenge to the theory that canvassing is necessary for the maintenance or increase of circulation. This newspaper, which reduced its price from 2d. to 1d. in 1930, has since increased its circulation fivefold without any of the adventitious devices of the mass-circulation papers. Another fact which tends to show that canvassing is not omnipotent is the slight decline in the combined circulations of the Sunday newspapers, which canvass as diligently as any. The Sunday newspapers, however, in spite of their higher price, still keep the largest circulations in the country, three of them together selling nearly seven million copies every Sunday.

The advent of large newspapers and monster circulations has definitely brought the Press within the charmed circle of Big Business. Moreover, it has also made it a semi-monopoly, in which competition is virtually limited to the existing newspapers. Only one full-scale national newspaper has been established since the war, and that one, the *Daily Herald*, was built on a considerable foundation and assisted by the substantial goodwill to be derived from its official connection with the Labour Party. Even then it is rumoured that a sum of the order of £2,000,000 had to be spent before the paper reached a self-supporting position. There are very few industries which impose an entrance fee as high as this.

In these circumstances, the chief competitive interest of the industry centres on the groupings and regroupings of the existing units. A few years ago the dominant tendency seemed to be towards the utmost integration of function. There were two large groups which controlled every process from the manufacture of newsprint to the publication of every variety of newspaper and periodical. More recently, however, there have been some signs of a reversal of this tendency. The connection between the Rothermere group and the newsprint firm of Bowater's was broken some years ago, although the Rothermere group still retains its Newfoundland properties, which are integrated as far back as the timber reserves themselves. Last year the other large group, the Berry group, disposed of its control of Edward Lloyd, the newsprint firm. Even after these slimming operations, however, these two groups are still very ramified. The Berry group, for example, owns three London morning papers, six Sunday papers and thirteen important provincial dailies, as well as over 160 periodical publications. The Rothermere group has, in London, two mornings, two Sundays and one evening, as well as a string of provincial evening papers. These two are the largest "Press trusts," indeed the only organisations which penetrate every part of the field. There are, however, several other companies owning chains of papers. These include, for example, the "Starmer group," with interests particularly in the North of England, and the "Inveresk group," whose provincial papers are to be found both in the Midlands and the North. Both of these groups once had London morning papers, the *Westminster Gazette* and the *Daily Chronicle* respectively, but both have been swallowed up in the *News Chronicle*.

Apart from these examples of integration, every possible variety of business organisation can be found, from the cluster of two or three newspapers, together with a number of weekly periodicals (e.g. Odham's Press), to the single newspaper operating in dignified isolation (e.g. *The Times*). Perhaps the most frequent form of organisation is for a morning and evening newspaper to run in double harness, occasionally with a Sunday paper added. The Beaverbrook group almost qualifies as a trust, since it includes not only the *Daily Express*, the *Sunday Express* and the *Evening Standard* but also certain periodical and newsprint interests. It is also worthy of note that this group sometimes operates in alliance, commercial as well as political, with the Rothermere interests.

It is thus neither a simple nor a small industry which lives by the purveying of news. Its complexity will be forcibly impressed upon any inquirer who attempts to unravel the inter-relations or to locate the ultimate control of one of the big groups. As for size, statistics cannot be quoted for the newspaper industry as distinct from the production of periodicals. But the two together employed in 1931 more persons than either the manufacture of bricks and tiles or brewing, and had a net output in 1930 greater than iron and steel, shipbuilding or boots and shoes, and nearly as great as either cotton spinning and weaving or the woollen and worsted industry. Moreover, it is a highly concentrated industry, and in the three cities of London, Manchester and Glasgow it is one of the most important of all industries. Lastly, it is a rapidly expanding industry, its personnel having grown by 41 per cent. between 1921 and 1931.*

Having thus given a few of the salient dimensions of the industry and sketched a few of its outstanding features, we shall proceed in the next article to examine the ways and means of newspaper production.

* Many of these figures will be found in PEP Broadsheet No. 58, dated September 24, 1935, and entitled "The State of the Press," which contains a most convenient collection of statistics bearing on the industrial aspects of the Press.

The Budget Problem

THE appearance of the Treasury returns for the first nine months of the financial year provides the traditional opportunity for the first preliminary forecast of the eventual results of the year, as they will appear on March 31st. This year, with the additional problem of estimating expenditure on the Defence programme, the prophecy is even less easy than usual.

The progress of revenue and expenditure is shown in the following tables:—

REVENUE (EXCLUDING SELF-BALANCING ACCOUNTS)						
(£ million)						
	Year's Receipts			Nine Months' Receipts		
	Actual, 1935-36	Estimated, 1936-37	Estimated Inc. (+) or Dec. (-)	To Dec. 31, 1935	To Dec. 31, 1936	Inc. (+) or Dec. (-)
Customs	196.6	207.5	+ 10.9	148.3	158.9	+ 10.6
Excise	106.7	110.0	+ 3.3	82.9	84.3	+ 1.4
Motor Duties	5.0	5.0	—	1.5	1.8	+ 0.3
Income Tax	238.1	259.0	+ 20.9	79.9	77.0	- 2.9
Surtax	51.0	56.5	+ 5.5	9.3	9.4	+ 0.1

* Budget Estimates. Supplementary Estimates have already been presented for £34.0 million, which is £8.4 million more than the margin allowed in the Budget.

The two most encouraging revenue items are the increased collections from Customs duties and from stamps. Under both heads an increased revenue was expected, but whereas the Customs was expected to produce £10.9 millions more in the full year, it has already produced £10.6 millions more than in the same period of last year. Stamps have done even better, for there is an actual increase of £3.1 millions in nine months, as against an estimated increase of £1.2 millions in the full year. These are, of course, indications of the accelerated pace of industrial activity during the past year. Death duties are £2 millions below last year's collection, although an increase of £1.1 millions was expected in the year. This item is subject to the incidence of mortality among millionaires, and there is still time for the estimate to be realised. The decline of £2.9 millions in Income Tax receipts is of no particular importance. A large part of the collection of Income Tax in the first nine months of the year is made up of the half-yearly instalments due on the personal schedules on July 1st. The payments due on July 1, 1936, were part of the assessments for the year 1935-36, and, in comparison with the previous year's July receipts, they would be lower by the amount of the concessions on allowances made by the Chancellor in his 1935 Budget. There is no indication yet of the effect of the changes in Income Tax made in the 1936 Budget, upon which this year's revenue largely depends.

Revenue as a whole shows an increase of £7.3 millions. Expenditure, however, is £32.1 millions higher. The

deficit at the beginning of the last quarter of the year is therefore, at £138.9 millions, £24.8 millions higher than last year at this time. This result, as can be seen from the Expenditure table, is entirely due to the expenditure on the Defence services. A large increase was, of course, to be expected. What is quite encouraging is that the increase has not been larger. For the whole year, the Budget allowed for an increased expenditure of £42.9 millions. Actually, in nine months, the increase has been £31.6 millions, or rather less than a proportionate share of the estimate. Defence expenditure is, of course, increasing steadily, and the average monthly rate of expenditure will be higher in the next three months than hitherto. But it seems unlikely that it will greatly exceed the Budget estimate. Defence expenditure in the four quarters of the calendar year 1936 has been, respectively, £41.8 millions, £37.5 millions, £41.2 millions and £48.1 millions. To realise the Budget estimate, £53.1 millions must be spent between now and March 31st. Moreover, Supplementary Estimates have been issued for £8.4 millions more than the £25.6 millions for which provision was made in the Budget, and if expenditure is to reach the total thus foreshadowed, it will have to amount to £61.5 millions in the next three months. There is thus room for quite a considerable speeding-up in defence expenditure before last April's Budget figures are exceeded. In any case, it seems unlikely that expenditure will exceed the Budget figure by more than the £8.4 millions of unforeseen Supplementaries.

The Budget problem is thus whether revenue will show a corresponding excess over the estimates. Customs, Excise and Stamps will all help; Death duties may not hinder as much as now seems probable. Everything therefore depends on the Income Tax. But the indications are that, if there is a deficit, it will be no larger than the debt reduction which will be accomplished out of the allocation for interest and management of the National Debt (which is being under-spent as usual). And it is by no means impossible that there may be a small surplus.

More Employment in Britain

WE have all been greatly preoccupied in recent years with the unemployment caused by the trade cycle and by technological progress. Yet all the time a steady and far-reaching shift of labour from declining to expanding industries has been going on; and the demand for labour in the expanding industries has been strong enough, over the long period, to reabsorb not only the periodically appearing "cyclical" unemployment but also the "technological" unemployment resulting from labour-saving inventions. In the main this long-term shift of labour has been from the manufacturing and primary industries towards transport, distribution and the secondary trades. It is a reflection, in fact, of the gradual rise in the world's standard of living which enables more and more resources to be used for the production of goods and services over and above the bare necessities of life.

The progress of this change in Great Britain is clearly discernible in the annual figures published by the Ministry of Labour showing the distribution by trades of the insured and employed populations respectively. These figures—which do not, of course, cover the uninsured trades—show that the total of insured persons rose by 19 per cent. between 1923 and 1936, and the total of employed persons by 17.6 per cent. (compared with only 11.7 per cent. between 1923 and 1935). The great shift of labour between different trades which was meanwhile proceeding may be traced in broad outline in the following table. This table shows the total of persons employed in the different groups, expressed as a percentage of the total of persons employed throughout the country; the figure 49.3, for instance, opposite

"manufacturing" in the first column indicates that 49.3 per cent. of the total employed population were employed in manufacturing industries in 1923.

Industry Group	Percentages of the total number of insured persons, aged 16-64, in employment in different industry groups at the end of June				
	1923	1929	1932	1935	1936
Fishing	0.2	0.2	0.2	0.2	0.2
Mining and Quarrying	12.8	8.9	7.0	6.5	6.1
Manufacturing	49.3	49.4	45.9	46.9	47.4
Building and Contracting	7.2	8.2	8.2	9.1	9.3
Transport and Distribution	18.2	20.9	24.2	22.9	22.6
Gas, Water and Electricity Supply	1.6	1.4	1.6	1.6	1.7
Miscellaneous Services	4.8	5.7	6.7	6.9	6.9
Commerce, Banking, Insurance and Finance	2.1	2.0	2.3	2.3	2.2
National and Local Government Services	3.8	3.3	3.9	3.6	3.6
All Industries and Services	100.0	100.0	100.0	100.0	100.0

It will be seen from this table that there is a long-term shift in progress from the mining and manufacturing industries towards building, transport, distribution and general services. The influence of the upward swing of the trade cycle, however, which is most marked in the manufacturing industries, has been so strong that in the last few years the long-term trend has in some respects been temporarily reversed. Indeed, the different effect which the trade cycle has on different groups of industries is most remarkable:—

Industry Group	Approximate increases (+) or decreases (—) in the numbers of insured persons in employment			Total Increase (+) or Decrease (—) 1923-36
	1923-29	1929-32	1932-36	
Fishing	+ 3,750	— 1,180	+ 4,330	+ 6,900
Mining and Quarrying	— 298,750	— 279,920	+ 16,790	— 558,880
Manufacturing	+ 507,930	+ 823,550	+ 927,270	+ 2,258,750
Building and Contracting	+ 194,690	— 70,840	+ 268,240	+ 392,090
Transport and Distribution	+ 472,710	+ 128,360	+ 210,560	+ 811,630
Gas, Water and Electricity Supply	+ 390	+ 2,360	+ 37,700	+ 40,390
Miscellaneous Services	+ 145,390	+ 41,480	+ 131,430	+ 318,300
Commerce, Banking, Insurance, and Finance	+ 7,420	+ 8,720	+ 20,280	+ 36,420
National and Local Government Services	+ 130	+ 25,290	+ 31,940	+ 57,360
All Industries and Services	+1,033,660	— 983,340	+1,664,180	+1,734,480

During the recovery years 1923-29 there was a heavy drop of employment in mining and quarrying (mostly, of course, coal-mining), but a rise in all other groups, including a rise of over 500,000 in manufacturing. In the "downswing" of 1929-32 there was a continued fall in mining and quarrying, a continued rise in transport and distribution, miscellaneous services, etc., but a drop of 823,530 in manufacturing. And finally in 1932-36 there was a rise in all categories, including a rise of 927,270 in manufacturing. This instability of employment in the manufacturing trades is, of course, a reflection of the well-known fact that cyclical unemployment hits the heavy "capital-goods" trades with exceptional severity.

The shift of labour between industries may be illustrated in more detail. It is impossible to give figures of absolute employment in each industry for successive years since 1923, owing to the administrative changes made in 1927; but in the two tables below the Ministry of Labour index number, which compares employment in each year with the base year 1923, is shown together with the absolute number of persons employed in 1936. In the first table are declining industries, i.e. those with fewer persons employed in 1936 than 1923:—

(INDEX NUMBER. JUNE, 1923=100)						
Industry	Number employed in June, 1936	1929	1932	1933	1934	1935
Coal-mining	621,715	74.0	52.7	54.3	53.0	54.3
Boots and shoes	117,767	93.1	85.6	89.1	89.4	90.6
Cotton	351,166	109.0	79.8	85.2	81.9	78.4
Iron and steel	144,014	89.6	54.0	62.7	79.2	77.0
Woollen and worsted	198,599	85.2	70.7	82.2	74.9	78.2
Shipbuilding and ship repairing	114,507	106.9	46.4	45.3	55.5	61.5
Dock, harbour, etc.	115,862	87.9	83.8	82.5	86.7	85.5
Railway (non-permanent)	146,494	76.1	65.6	60.4	69.9	73.8
National Govt.	115,936	72.5	69.9	64.3	63.5	69.6

Employment in coal-mining, it will be seen, again declined last year after a slight recovery, and there were in June, 1936, only 620,000 persons employed in coal-mining compared with 1,200,000 in June, 1923. Every other "declining" trade, however, showed an absolute rise on the year; and in the case of iron and steel and shipbuilding the rise was remarkable. Employment in the general engineering industry, which has for years appeared in the list of declining industries, moved in 1936 above the 1923 level, and this industry consequently now has to be classed as "expanding."

The following table shows the changes in the expanding industries (i.e. those employing more persons in June, 1936, than in June, 1923):—

(INDEX NUMBER. JUNE, 1923=100)						
Industry	Number employed in June, 1936	1929	1932	1933	1934	1935
Elec. cables, etc.	141,755	139.3	158.5	168.0	189.3	203.1
Motors, etc.	285,183	134.4	114.4	127.9	143.2	149.9
Furniture, etc.	130,374	135.2	126.9	130.6	140.9	145.1
Metal industries	232,445	123.2	112.6	123.2	136.6	148.7
Food industries	116,099	122.0	120.0	130.2	131.2	131.8
Hosiery	109,225	121.2	118.9	121.3	126.1	124.2
Printing, etc.	260,255	119.7	122.1	123.0	122.5	121.9
Drink	102,702	111.7	101.7	106.8	108.8	108.4
Tobacco	189,451	109.9	107.5	110.9	107.0	107.5
Bread, etc.	153,483	96.2	100.3	104.5	101.7	108.4
Public works	177,047	136.0	188.9	159.6	154.7	159.7
Building	910,727	126.8	108.2	118.8	132.5	141.5
Tramway & bus	188,467	147.5	167.0	168.2	170.2	176.3
Distributive	1,859,715	136.9	149.0	153.5	155.4	155.3
Road transport	188,241	136.0	138.5	139.7	147.0	150.6
Professional services	382,646	136.3	141.8	149.8	156.7	162.9
Local govt.	151,859	115.6	126.2	131.9	138.0	142.2
General engineering	514,996	105.8	77.3	78.4	87.7	91.0

There were thus very substantial advances in employment between 1935 and 1936 in motors (which includes aircraft), the metal industries, public works, and general engineering; and the steady advance of building, road transport, the distributive trades, hotels, etc., and many minor expanding trades was continued. Electric cables, etc., motors, public works and trams and buses now employ over 70 per cent. more persons than in 1923; and the metal industries, furniture, building, the distributive trades, road transport (other than bus or tram), hotels, etc., employ over 50 per cent. more. The distributive trades alone have now absorbed into employment about 700,000 persons since 1923.

The total of persons employed in all expanding industries in June, 1936, was 8,982,529, an increase of 42.8 per cent., or about 2,700,000 persons since June, 1923. On the average, therefore, the expanding industries have been absorbing persons into employment at the rate of over 200,000 a year since 1923. The total of persons employed in all declining industries in June, 1936, was 2,648,631, a fall of 26.5 per cent., or about 1,000,000 persons since June, 1923. And the total employed in all industries and services was 11,631,160 in June, 1936, an increase of 17.6 per cent., or about 1,700,000 since June, 1923. Between June, 1935, and June, 1936, alone the increase was nearly 600,000.

In the whole period of 13 years, therefore, our expanding industries have absorbed into employment a number of persons equal to the total of (1) all those losing employment in industries suffering from a fall in demand; (2) all those losing employment as a result of technological progress; and (3) 1,700,000 additional persons. The total insured population has increased by rather over 2,000,000 during the 13 years; so that we are actually left with about 300,000 more unemployed at the end of the period than at the beginning.

How many of those finding employment in the expanding trades have come from the declining ones? The increase in employment in the expanding trades has been about 700,000 greater over the 13 years than the increase in the insured population. At least 700,000, therefore, out of the 1,000,000 losing employment in the declining trades must have found jobs in the expanding ones. It would be reasonable to guess that actually about 800,000 or 900,000 came from the declining trades and the remaining 1,800,000 or so from the increase in population. In any case the figures show that the power of our economic system to absorb labour over the long period is still very great.

Notes of the Week.

The Economist's New Dress.—At New Year three years ago *The Economist*, moving with the times, said farewell to a Gothic title which had appeared, both on and within the cover, for nearly a century. To-day, a process which began three years ago is carried to what we may hope—save for minor alterations—will prove to be a long-lasting completion. As we remark in our special weekly article on p. 3—itsself a new regular feature—the British public has become type-conscious during the last decade. It demands cleaner typography and clearer lay-out; a truce with Gothic and heavy glowering type-faces. It knows why it wants all this: easier and more pleasurable reading, in a busier and busier world. To no journal, perhaps, is easier reading more important than to *The Economist* which, perforce in these days, must give its busy (often harassed) readers both news and comment, facts and figures, from a field as wide as the world, and on almost all topics which vex, interest, or concern mankind. From now onwards this journal appears in a more serviceable, more handsome cover; it is printed on better and whiter paper; editorial matter is presented in narrower columns with wider margins; and "leading articles," properly so-called, together with the special weekly economic article of general interest, are set differently from those of a technical nature. The chief typographical improvement is the setting of titles and article-headings in bold "upper and lower case" type, instead of, as hitherto, in solid capitals, i.e. "upper case." It has been demonstrated in psychological tests that the eye reads an "upper and lower case" line more quickly and easily than a solid "upper case" line. The type-face chosen for the new headings of articles, sections of the paper, and correspondence is the "Perpetua," cut by Mr Eric Gill. The changes are confined to the manner of *The Economist's* presentation to its readers. And we would ask any of our regular readers whom the new format of *The Economist* shocks, because it is strangely new, to take last week's and this week's issues in his hand, to compare the two, and to decide which makes for easier reading.

Housing and Building.—There is still no sign of a really serious setback in building activity. The latest Ministry of Health return shows that the record number of 339,538 houses were built in the year ended September 30, 1936. There was a large increase in municipal building during the year, and very little decline in building by private enterprise, as the following figures show:—

HOUSES PROVIDED IN ENGLAND AND WALES IN THE HALF-YEAR ENDING MARCH 31, 1933, AND IN EACH SUBSEQUENT HALF-YEAR					
Half-year ending	Number of Houses provided by				Total Number of Houses
	Local Authorities		Private Enterprise		
	With State Assistance	Without State Assistance	With State Assistance	Without State Assistance	
March 31, 1933	23,503	735	1,187	79,556	104,981
September 30, 1933	24,474	501	1,269	87,088	113,332
March 31, 1934	29,399	1,466	1,644	120,781	153,290
September 30, 1934	20,280	2,197	937	136,965	160,379
March 31, 1935	14,143	4,973	202	149,409	168,727
September 30, 1935	18,542	5,887	28	125,660	149,917
March 31, 1936	27,220	908	194	146,621	174,943
September 30, 1936	36,539	217	112	127,727	164,595

It will be seen that a high level of house-building activity was still being maintained in the second six months of the year ended last September. The number of houses built by private enterprise in that six months was

actually slightly higher than in the six months ended September, 1935. Meanwhile, municipal building had doubled since the previous year, and was proceeding at the rate of 75,000 houses a year.

What light do these figures throw on building prospects and the future of British recovery? Municipal building is certain to maintain the rate of 75,000 houses a year until September, 1938; for slum-clearance activity will not slacken in the last two years of the Five-Year Plan. Probably it will increase, or at least continue beyond 1938. It will be possible therefore for private house-building to fall by 40,000 houses a year without bringing the total below 300,000. And at present there is little sign of such a fall. At the same time, building other than house-building is still expanding. Nevertheless, the "building plans approved" figures, which concern the future, and not, like the above figures, the past, have shown a distinct fall in the last few months. For November the total was £9,678,000, compared with £10,762,000 for November, 1935. Plans for dwelling-houses had fallen from £7,761,000 to £6,410,000, while plans for other buildings had risen from £3,093,000 to £3,267,800. These figures, however, do not cover the whole country, and must consequently be treated with caution. Sir Harold Bellman seems justified in saying, in his review of the housing outlook published this week, that "we may not be remote from some falling-off—though probably not a precipitous decline—in building by unassisted private enterprise." Such a falling-off, however, need not necessarily imply a fall in total building activity.

The "Overcrowding" Act.—How far is building under the so-called "Overcrowding" Act likely to help in maintaining the total level of building activity? The first Appointed Day under the Act is January 1, 1937, and it applies to 1,282 local authorities. April 1, 1937, will be the Appointed Day for a further 36 authorities; and a new order, just issued, gives July 1, 1937, for 159 more. Thus 96 per cent. of all the local authorities will bring the first part of the Act into force during 1937. On the first Appointed Day it will simply become illegal to allow new overcrowding to develop. No time limit has yet been fixed for the abolition of existing overcrowding; although a full survey has been made and plans have in many cases been prepared. It is, consequently, as yet impossible to estimate the number of houses which will be built under the overcrowding programme, and the tentative estimate of 200,000, given by Sir Kingsley Wood, must be regarded as only an informal guess. Probably building under the Overcrowding Act, as opposed to the slum-clearance programme, will be small in the next 12 months. But the plans now in preparation should provide a valuable reserve against the time when a really sharp fall in building activity begins to threaten. To some extent also the tempo of the programme—though the need to press on with it is as great as ever—will have to depend on the movement of building costs. These are at present rising, though only slightly; and they are not likely to stop rising while the re-armament programme continues.

New Laws this Week.—Besides the above provisions of the "Overcrowding" Act, several major legislative enactments and provisions came into force on January 1st. The most important is the Public Order Act, which emerged from Parliament before the adjournment in much the same form as that in which it was originally introduced. The Act makes the wearing of political

uniforms illegal, prohibits quasi-military organisations, and regulates political processions and meetings. Another law which came into force on January 1st is the Employment of Women and Young Persons Act. This empowers the Home Secretary, upon the application of the owner of a factory, to make an order permitting the employment of women and young persons of 16 or over on a system of shifts of not more than eight hours each between 6 a.m. and 10 p.m. on Monday to Friday, and between 6 a.m. and 2 p.m. on Saturday. The Act lays down a prescribed procedure by which the workers are consulted before any application is granted. Finally, according to a regulation made in 1931, all motor-cars are legally compelled from January 1st to be fitted with windscreens of non-splinterable glass. This provision is intended to reduce road danger, and it is expected to increase demand both for glass and for motor-cars as a whole.

* * *

Higher Wages and Fewer Strikes.—The British trade union movement seems to have carried bargaining skill to a high pitch in the past year. Strikes have been few, and increases in wages many. Important increases were made in coal-mining, railway, building and engineering wages in the first part of the year; and in December 100,000 cotton workers secured a rise of about 5 per cent., and 200,000 wool workers a rise of 10 per cent. The total changes in wages for the first 11 months of the year reported to the Ministry of Labour resulted in a net increase of about £422,000 a week in the full-time rate of wages of 3,520,000 workers and in a net decrease of £150 a week in those of 500 workers. Nevertheless, the "aggregate duration in working days of all disputes in progress" in the first 11 months of 1936 was actually less than in the first 11 months of 1935. Both employers and unions, in fact, would seem to have considerably developed the technique of finding a compromise without a strike. Threats of strikes have been no less frequent in the present upward movement of trade than may be considered normal, but actual major strikes have been substantially fewer. Both the United States and France could here learn a lesson from Great Britain in the benefits of orderly collective bargaining.

* * *

The Bacon Muddle.—After the breakdown in the arrangements for 1937 (upon which we commented last week), the Bacon and Pigs Marketing Boards have been hard at work seeking means to induce farmers to support the Pigs Marketing Scheme. If this support is not forthcoming the pig producers will forfeit the advantage of a sheltered market; for, although the Board of Trade is continuing to regulate imports for the time being, it cannot legally do so if the marketing scheme finally ceases to exist. Meanwhile, there appears to be little foundation for the belief that the crisis will mean dearer bacon. The requisite pigs are already in existence, and any subsequent shortage can be made good by relaxing the import quotas. On the other hand, the Bacon Board has taken steps to prevent any sudden increase in home supplies. Although the curers may now buy pigs on the open market, they are unable to deal with any farmer who is not registered under the Pigs Marketing Scheme. Moreover, producer-curers have been warned that they must not exceed the quotas already allotted to them. It will not be possible, therefore, for the curers to take advantage of the present situation to exceed their normal output by curing imported carcasses. But, even if bacon prices show little alteration in the immediate future, the plain man will still be left wondering why so much energy should be expended to keep in being a scheme which producers themselves are unwilling to support.

Italy and Britain.—A comic interlude has been going on for some time between Italy and Britain; but it has been on the *coulisse*. For weeks past, credible reports of a documentary "understanding" between

the two Mediterranean Powers have been circulating; and the activities of their respective Ambassadors have lent credence to rumours. Apparently, while His Majesty's Government have not yet decided to recognise *de jure* Italy's conquest of Abyssinia—indeed, they cannot until they have also contrived to get the League to withdraw the Ethiopian credentials—they have concluded an agreement with Signor Mussolini whereby the respective preoccupations of British and Italians in the Mediterranean and Red Seas are allayed. The Italians have clearly much to gain by this. Italy remains economically weak; she needs capital for Ethiopia; and she will need double and treble as much if she has continuously to prepare for a possible war in both seas with Great Britain. She has had to witness the rapid crystallisation of French, British, Russian and Turkish interests in the Mediterranean, first over "sanctions," and then over Spain. We give the Duce credit for nursing no desire to be dragged along at the tail of whatever mad dog unlooses general war in Europe. Germany has become deeply involved in Spain and North Africa. It is very important for Britain that a joint Italo-German occupation of these Western Mediterranean outposts—for such must be the outcome of support for General Franco—should be avoided. Thus, the news that the romantic Count Rossi has already quitted the Balears for Rome, and that no new Italian supplies are being sent to Spain, may indicate the lines along which an Anglo-Italian agreement will run.

* * *

The Powers and Spain.—We still await the German and Italian replies to the French and British representations requesting genuine and complete non-intervention in Spain. But the favourable reply by Russia on Wednesday, and the reported Anglo-Italian understanding referred to above, have combined to emphasise the counsels of caution which, by all accounts, are pressing in upon Herr Hitler. Last week-end the "Palos," a German tramp steamer on the Portuguese-Spanish service, was ordered to heave to by Spanish Government vessels within the three-mile-limit off Bilbao. When she refused she was stopped by a shell across her bows, and taken into Bilbao, where her cargo was found to consist mainly of field telephone sets. A German cruiser was sent to Bilbao, and eventually the Defence Committee released the "Palos," but *minus* her cargo; nor have the German Government as yet proceeded to such extreme measures—in view of their recognition of General Franco's forces as the Government of Spain—as might have been expected. No new shipments of volunteer "blond Moors" are reported this week; and in Spain the Government forces seem to be rendering General Franco's communications hazardous. In the north, to the north-east of Madrid, and down in Teruel, the Government forces have advanced again; and Madrid itself has been quiet, save for a rebel bombardment of the capital on Christmas Day. These events give colour to the reports that Italy will content herself with a reply which approves "in principle of the French and British representations," but leaves the onus of responsibility for calling-off the intervention in Spain to Germany.

* * *

Two Naval Treaties Expire.—The last day of 1936 saw the expiry of the most successful of all post-war disarmament agreements—the Washington Treaty of 1922 and the London Naval Treaty of 1930. Only the rules of international law, governing the conduct of submarines in war, contained in Part IV of the London Treaty, now remain in force; and the way is once again open for a race in naval armaments. Such a race would offer its most serious problems in the Pacific rather than in the Atlantic ocean. The Washington treaties gave Japan effective supremacy in naval tonnage in the Far East, and further secured her immunity from attack by prohibiting the fortification of naval bases except on the Japanese mainland. Britain

was allowed no naval base nearer to Japan than Singapore, and the United States none nearer than Hawaii. The signatories to the treaty did not foresee the development of imperialism in Japan, or the annexation of large parts of China by Japanese armies. To-day, the situation is again in the melting pot. Will Japan fortify Formosa, and her mandated islands? Will the United States retain naval control of the Philippines, develop her Trans-Pacific air bases for military purposes, and fortify the Aleutian Islands? Will Britain fortify Hongkong? Will Japan deliberately enter on a naval construction race in which all the odds are on her competitors? The proposal to maintain merely the non-fortification clause of the dead treaty has, naturally, been rejected by the United States, to whom the merits of the treaty were in the other clauses; and Japan is so far indifferent. A new naval limitation is obviously desirable for all parties, but the growing links between Far Eastern and European politics increase the difficulty of obtaining a Pacific settlement.

* * *

Happy Ending in China.—The tragi-comedy played at Sianfu has definitely come down, in its last act, on the farcical side. President Chiang Kai-shek is safe and sound again at Nanking. What is more, the Young Marshal has flown after him in order to square the account by taking his turn at putting his head in the lion's mouth. He was sentenced on Thursday to ten years' imprisonment and was expected to be pardoned on Friday. These gracious acts have been accompanied by a courtly correspondence. Marshal Chang writes to President Chiang to confess that "I have committed this impudent and criminal act" because "I am naturally rustic, surly and unpolished." And the President writes to the Marshal that he proposes to retain him in his service because he has behaved like a proper Chinese gentleman in correcting a mistake as soon as it was realised. But what does it all mean? One thing, at any rate, is clear: President Chiang Kai-shek has become, and remains, a tremendous figure in the eyes of his fellow-countrymen. Their anxiety for his safety during his detention was evident, and at Shanghai the demonstrations of joy at his release were overwhelming. His formal resignation on his return was at once refused, and his position as Prime Minister and Generalissimo is much stronger than before these events. Another bout of chaos in China has been averted; but, if we are to take Chinese words and gestures at their face value, there has not been a mere return to the *status quo*. The bonds of Chinese national unity have been drawn notably tighter; and this, no doubt, has a bearing upon the future relations of China with Japan. It remains to be seen whether the Young Marshal's Manchurian troops will still be kept in the North-West on the ungenial work of fighting the Chinese Communists, or whether some kind of united national front has been arranged behind the scenes.

Christmas Goodwill in America.—Christmas in the United States came as a fitting climax to a remarkable year. The Presidential election, which was to have been the bitterest in the history of the country, had proved mild as milk, compared with the strong liquor of the Cleveland-Blaine election. The return of Roosevelt had been pictured as the prelude to a death struggle between the industrialist Bourbons and the Rooseveltian Robespierres. Yet in the last weeks of the year the industrialists seemed to be eagerly anticipating the demands of a Government supported by a record popular majority; and the Government in its turn seems to be divesting itself of its extremist prophets. Mr Tugwell left his plans to "Make Over America," and joined the American Molasses Company. The lion and the lamb ceased to argue which was which and which were t'other, and at least pretended to lie down together. In short, the era of good feelings returned. There are signs, to be sure, of impending struggle. Mr

Lewis is striking his way towards an industrial unionism, a Labour Party, and perhaps even the Presidency. The Securities and Exchange Commission is becoming "tough." Its Chairman, Mr Landis, has reminded the bankers that, rightly or wrongly, they were blamed for the false boom of 1929, and that after the 1936 election they had better not be responsible for another speculative bubble. Nobody can say just how much of the good feelings of the Christmas days were attributable to a record flow of dividends, whose growth was stimulated by the undistributed profits tax. But Christmas, 1936, saw the United States basking in the sunshine of prosperity for the first time since the depression began, after the President had carried his greetings in person to the South American Republics on a genuine mission of peace. It is the world's good fortune that, at so critical a time in its history, a powerful America should once more be arising, dedicated to social justice at home and peace abroad.

Re-armament in the Dominions.—Great Britain is not the only part of the Commonwealth which is modernising and extending its defence equipment. The most striking instance of Dominion re-armament is presented by Australia, whose total defence expenditure in 1936-37 is estimated at £8,809,000. This is £1,792,000 more than in 1935-36 and £5,615,000 more than in 1932-33, and it represents approximately 10.8 per cent. of the Federal Budget. Part of the defence expenditure, however, is financed from a trust fund built up recently out of Budget surpluses. Other Dominions have made relatively smaller provision for defence. New Zealand's estimated expenditure of £1,264,000 (an increase of £250,000 on the amount spent in 1935-36) represents about 4 per cent. of the total Budget. The proportion of defence votes to the Canadian Federal Budget is about the same, and to the South African Union Budget a little less. Of course, these percentages are not exactly comparable, owing to the complications of federalism and to different methods of accounting. There are to-day clear signs, even in Canada, whose local defence problem is dominated by the neighbourhood of the United States, that increased world dangers are reacting on the public and political attitude towards defence outlay. Early in December it was announced that the South African Cabinet had approved its Defence Minister's plan for training a thousand air pilots in five years. This is understood to imply a force of at least 500 military planes, which would bring South Africa definitely among the second-rank air Powers of the world. Both in South Africa and in Australia it is part of official policy to render the country more independent of outside resources for materials and machines of war. The expense figures of the Dominions may individually be small compared with those of the Great Powers. In the aggregate, how-

ever, they make a considerable difference, not only to the security of the Commonwealth, but also to the demand for aeroplanes, arms and equipment in the British economic and political zone.

* * *

Australo-Japanese Trade War.—A truce has been called in the trade war which opened last May between Japan and Australia. After protracted haggling, a *modus vivendi* has been reached for a period of eighteen months to June, 1938. Australia will import 102,500,000 square yards a year of Japanese textile fabrics, divided equally between cotton and rayon piece goods. Calico for bagmaking, imports of which have averaged 17,500,000 square yards during the last three years, is to enter duty free. Duty on the other fabrics is cut by roughly one-half from the emergency levels fixed last May. Japan will import 800,000 bales of wool from Australia during the eighteen months' period. Both countries will remove the special discriminations imposed during the trade war. An ostensible motive for the original determination of the Australians to cut down Japanese imports was the protection of their market for Lancashire textiles, which are higher priced and of better quality than the Japanese. It is difficult to see how this aim will be advanced if Japan accepts the tacit Australian invitation to send goods of better quality at higher prices. Such a development of Japanese competition would be no more popular in Lancashire than the lowering of the tariffs on Japanese goods effected by the new agreement, though Lancashire continues to enjoy a substantial preference over her competitors in the Australian market.

* * *

A Projected Tube Extension.—For many residents in the northern districts of London there is interest in the news that, in conjunction with the extension of the Highgate Tube to join the High Barnet and Edgware lines of the London and North-Eastern Railway, London Transport has decided to construct a new line from Edgware to near Elstree. The L.N.E.R. Edgware Station will be closed, and the L.N.E.R. line will be diverted into the existing Tube station at Edgware, whence the new Elstree line will start. It will thus be possible to run trains to Elstree both *via* Highgate and *via* Golders Green. The land for the new extension was acquired by London Transport some time ago, and, indeed, one object of the new line is to extend the tube out beyond the present built-up areas to open land, where there will be room for the new carriage sheds required as a result of the L.N.E.R. electrification. This scheme raises one important point of principle, namely, the advisability of imposing some limitation on London's growth into the country, and there have already been local protests. Through lack of unified control, fresh building demands tube extensions, and the extended tube in turn brings still more new houses. This is really a question for Government policy; it has already been raised from another standpoint by Mr Malcolm Stewart in his memorandum on the Special Areas.

* * *

A further point to be considered is the capacity of the existing tubes to carry this new traffic without penalising

passengers from the inner areas. Already the Highgate line is served by a maximum of only 14 trains per hour to Charing Cross, against 24 on the Edgware line. From the City line 14 per hour proceed on to the Edgware line and only 7 to Highgate; but Highgate could have another 7 City trains if there were a sufficient demand for them. In fact, Highgate's service to Charing Cross suffers for the benefit of Golders Green and Edgware; but the Golders Green passenger to town, nevertheless, is liable to find his trains already full on their arrival from Edgware. In two years' time the Highgate link on to the L.N.E.R. and the electrification of the latter lines will be complete, as well as the Finsbury Park extension of the Great Northern and City tube. A complete overhauling of the service over the whole system will then be necessary, and it is arguable that the Golders Green section should surrender some of its Charing Cross trains for the benefit of the extended Highgate tube. Certainly the present inadequate Highgate service cannot be left as it is. Ultimately the quadrupling of the Charing Cross-Camden Town section may need to be considered. The whole question is complex, but a new Bill is coming before the House in connection with some of these works, and North London Members should certainly press for an expression of opinion on both the question of London's growth and on the adequacy of the existing lines to carry a reasonable volume of traffic.

* * *

The Price of Bread.—By a decision of the Joint Price Committee of the London bakers' associations the price of bread in London was raised from 8½d. to 9d. per 4-lb. loaf on Monday last. Changes in the price of the "staff of life" are now governed by arrangements first made eleven years ago. Following an inquiry into London bakers' costs in 1925, the Food Council drew up a scale relating the price of bread to that of flour. After allowing a basic price to cover certain standard costs, the maximum price of bread was to vary by ½d. per quarter (4-lb.) loaf with every variation of 4s. in the price of a sack of standard "straight-run" flour. A simple calculation shows that the scale was based on the assumption that 96 4-lb. loaves could be made from a 280-lb. sack of flour. As this estimate was admittedly rather high, the scale was not over-generous to the bakers, but it was observed voluntarily in the London baking trade from November, 1925, to March, 1930. Slightly higher prices were then charged until November, 1931, when the bakers reverted to the old scale pending the report of a committee of the Food Council. This committee recommended in 1932 that, while a variation of 4s. in the price of flour should continue to be related to a variation of ½d. in the price of the quarter loaf, the basic price should be slightly modified in the bakers' favour. This revised scale has been voluntarily observed in London—and has served as a standard for the rest of the country—ever since. When the London price of flour exceeds 39s. per sack (including the quota payment under the Wheat Act) the bakers are entitled to raise the price of the quarter loaf to 9d., and this they have just done. Actually, the price of flour in the London district is now around 41s. per sack, and in view of the trend of wheat prices is likely to go still higher. When it passes the 43s. mark, yet another ½d. will be added to the price of the quarter loaf.

* * *

Gambling in Commodities.—The boom in primary products has scarcely been interrupted by the Christmas holidays. Quotations have been driven up during the past fortnight with slight consideration for the underlying supply-demand position. In fact, the spectacle provided by a number of commodity markets suggests not a little gambling fever. Rubber, wheat, linseed oil, copper, lead and spelter (as we show in our reports on commodity markets) have all recorded a substantial rise during the past fortnight. Some increase in prices was admittedly justified by the increase in world demand and by the short-term inelasticity of supplies, especially where existing productive capacity is fully employed.

But the steep advance in recent weeks has undoubtedly been accentuated by fears on the part of consumers and by the intervention of the speculator anxious to snatch a quick profit. It is impossible to say how far such a movement is likely to go on. But there have been signs of uneasiness among operators during the last few days, and on Wednesday a perceptible reaction occurred both in the commodity and the share markets. This may have been partly due to the closing of speculative commitments at the year end; but a longer interval for breather-taking would certainly do the markets no harm.

* * *

Rising Commodity Prices.—The extent of the advance in the prices of primary products in recent weeks is shown by the rise of 8.7 per cent. in *The Economist's* index number for primary products. That this movement is not confined to this country is revealed by the simultaneous rise in the index of quotations for raw materials and crude foodstuffs in the United States:—

SEPTEMBER 18, 1931 = 100

Date	Economist Indices		Price of Gold (sterling)	U.S.A. Irving Fisher	France, Statistique Générale	Italy, Milan Chamber of Commerce	Germany, Statistisches Reichsamt

1935 July 31st	112.7	126.7	146.2	165.6	120.2	75.9	98.2
1936 Jan. 29th	118.1	131.7	145.7	165.6	121.8	82.3	95.1
Feb. 26th	117.4	132.8	145.0	166.0	121.7	85.2	95.2
Mar. 25th	117.4	133.9	144.3	165.8	119.6	85.2	95.3
Apr. 29th	117.3	132.8	143.2	165.8	119.2	85.0	95.4
May 27th	115.5	130.1	140.5	164.3	117.7	85.2	95.4
June 24th	116.2	133.2	147.0	163.2	119.8	84.1	95.7
July 22nd	118.7	140.4	157.2	163.4	120.6	86.6	96.1
Aug. 19th	119.4	141.9	163.2	162.7	121.9	88.8	95.9
Sept. 30th	121.8	144.5	159.6	165.0	122.5	102.1	95.8
Oct. 28th	123.6	145.7	161.1	167.1	123.7	105.3	95.9
Nov. 11th	125.0	148.9	167.8	167.1	124.8	106.9	95.9
Nov. 25th	126.3	150.9	172.0	167.2	124.8	108.9	96.3
Dec. 9th	128.2	157.0	179.5	166.7	125.6	108.9	96.3
Dec. 30th	131.3	163.9	187.3	166.7	127.4*	111.9*	...

* These figures relate to December 23rd.

The world-wide rise in the prices of primary products is also reflected in the more rapid upward movement of *The Economist's* complete index, and the Irving Fisher and Statistique Générale indices for the United States and France respectively. Besides raw materials, these three indices also include a number of semi-finished and manufactured articles which are not subject to violent changes in price.

* * *

But while the general trend of commodity prices has been steeply upwards in recent weeks, movements lacked uniformity. This is shown by the variations of the group indices which comprise *The Economist's* complete index of wholesale prices:—

	Economist INDEX (1927 = 100)			
	Sept. 18, 1931	Nov. 25, 1931	Dec. 9, 1936	Dec. 30, 1936
Cereals and meat	64.5	81.8	83.2	86.4
Other foods.....	62.2	64.0	65.2	65.6
Textiles.....	43.7	66.3	66.4	67.5
Minerals.....	67.4	90.0	92.3	95.4
Miscellaneous...	65.8	78.4	79.6	81.2
Complete index	60.4	76.3	77.5	79.3
1913 = 100.....	83.1	105.0	106.6	109.1
1924 = 100.....	52.2	65.9	66.9	68.5

The rise since December 9th has been most marked in the cereals and minerals groups, containing wheat and non-ferrous metals respectively. The rise of the index for textiles was influenced by the increase in the price of cotton yarn and cloth following the recent wage concessions to operatives.

7, CHANCERY LANE, LONDON

Christmas Shopping.—National expenditure on consumption goods, such as food, drink, tobacco, clothing and furniture varies directly with changes in the national income. And, since Britain has regained a wide measure of prosperity, the steady increase in retail purchases is scarcely surprising. The shopping season opened well this winter. Sales rose rapidly in October and November. According to the official returns, published in this week's *Board of Trade Journal*, the money value of retail sales in November showed an increase of 6.5 per cent. over the corresponding period last year. The improvement was well spread geographically and between the various categories of merchandise. With the exception of piece-goods, there was an increase in turnover in all the commodities shown separately in the returns. While detailed information of sales in December, when the shopping season is normally at its height, is not yet available, it appears that the Constitutional issue caused a sharp drop of purchases during the first half of the month. Indeed, the *crise de confiance* apparently affected sales in all districts and all classes of commodities. But this hesitancy gave way immediately upon the accession of King George VI. The bulk of the deferred purchases were probably made during the last few days before the holiday, and the total pre-Christmas trade appears by all indications to have been a record. The temporary dislocation of trade early in December has certainly not affected the rising trend of expenditure on consumption goods.

* * *

Record Postal Traffic.—Not merely retail trade but postal traffic reached a record at Christmas. The Post Office reports that over 200,000,000 letters and 5,500,000 parcels were handled on December 23rd and December 24th compared with 183,000,000 letters and 4,500,000 parcels last year. About 45,500,000 letters compared with about 39,000,000 last year, were posted between December 18th and December 24th in the following 12 towns alone: Manchester, Birmingham, Glasgow, Liverpool, Edinburgh, Leeds, Bristol, Newcastle-on-Tyne, Sheffield, Cardiff, Nottingham and Coventry. The number of parcels delivered from the same centres was actually 75 per cent. higher than in 1935. Over 370,000 telegrams were handled by the Central Telegraph Office on Christmas Eve, compared with 325,000 in 1935 and 195,000 in 1934. Telephone traffic also showed a large increase. Throughout the country, between 75,000 and 80,000 additional men were engaged by the Post Office during the period. The Christmas postal figures as a whole this year show a sharp rise, which contrasts with the gradual but steady rises of other years since 1931. The steepness of the rise is no doubt due to the very great increase in employment during 1936.

THE REVENUE

I.—AN ACCOUNT of the TOTAL REVENUE of the UNITED KINGDOM, in the undermentioned periods of the Year ending March 31, 1937, as compared with the corresponding periods of the preceding year.

* Includes £22,000 the proceeds of which were not carried to the Exchequer within the period of the account.

Employment in December.—On December 14th employment reached a new high level. The number of insured persons in employment in Great Britain, exclusive of agricultural workers, was 11,132,000—a figure 12,000 more than that on November 23rd and 503,000 more than a year ago. On the day of the count, however, weather conditions were unfavourable and outdoor employment was in abeyance in certain industries. Contrary to the usual trend in December, consequently, the number of unemployed on the registers increased by 5,117 to 1,628,719; but this total was still 239,846 less than a year earlier. The rise in unemployment, further, is partly attributable to the inclusion of agricultural workers, who have become entitled to benefit since November 5th. The incidence of unemployment by industries is shown below:—

Industrial Group	Dec. 16, 1935	Nov. 23, 1936	Dec. 14, 1936
Coal mining	190,027	161,652	146,729
Iron and steel manufacturing	33,659	24,020	22,699
Engineering	78,928	47,265	50,580
Metal goods manufacture	42,795	30,831	31,073
Shipbuilding and repairing	57,630	40,158	39,835
Motor vehicles, cycles and aircraft	127,675	119,289	123,256
Public works contracting	159,571	145,980	171,725
Building	77,279	57,123	52,270
Cotton	7,438	6,848	8,428
Hosiery	30,085	25,462	28,871
Tailoring	16,035	16,705	18,628
Boot and shoe	13,148	9,814	12,419
Pottery, earthenware, etc.	8,884	6,039	8,941
Stone quarrying, etc.	...	16,896	25,155
Agriculture	6,900	5,861	9,068
Fishing	78,736	78,133	71,400
Hotel, boarding house, etc., service	211,684	186,915	175,402
Distributive trades	43,888	34,525	34,700
Shipping service	46,719	40,752	42,895
Dock, harbour, etc., service	...	...	...
All persons registered	1,868,565	1,623,602	1,628,719

The effect of the adverse weather conditions was most marked in the building and contracting industries, where unemployment increased by nearly 30,000, and in agriculture, where the increase was 8,259. Seasonal influences accounted for the decline in employment in the pottery, boot and shoe and hosiery industries. In coal mining, iron and steel manufacture, the motor vehicle and aircraft industry, cotton manufacture, tailoring and the distributive trades an improvement in employment was recorded. The returns of the various administrative areas show that unemployment declined in London, the South-Western and North-Western districts and in Wales, but registered an increase in all other districts.

Cheap Milk for Jarrow.—A scheme, similar to that recently applied in Rhondda, for the supply of milk at 2d. per pint to expectant and nursing mothers, and to children under school age, was inaugurated at Jarrow on Friday of this week. Each consumer in the three categories is allowed one pint per day at the reduced price; there is no means test and the milk is delivered to the consumer's house in pint bottles. The scheme is financed jointly by the Milk Marketing Board and the Commissioner for the Special Areas, the dairymen being allowed a margin of 8d. per gallon above the Milk Board's wholesale price. In view of the burden of unemployment in Jarrow and the fact that the death rate is 15 per 1,000—against 11.7 for the whole of England and Wales—there must be nothing but praise for this new departure.

London's Boundaries.—With the recent publication of "London Statistics," another memorial has been erected to the failure of the last (1923) Royal Commission on London Government to bring order out of the chaos of the 110 local authorities in Greater London. There are two problems to be solved; first, the economies to be derived from extending the administration of local services beyond the boundary of the L.C.C., which was drawn over eighty years ago; and secondly, the financial problem arising from the fact that the rateable value from which the Council derives its income is now declining with the fall in the resident population. So long, however, as the day population continues to increase, it is difficult to reduce the cost of public services. Nearly

half-a-million people work daily in the City, where at night the residents number less than 10,000. The London ratepayers provide parks, streets and bridges for double their own number, and flat comparisons of the rates levied give a misleading impression of relative burdens:—

	Estimated Mid-1935 Population	Rates made 1935-36	Rateable Value	Rateable Value per head of population	Total Rates Levied	Rates levied per head
London	4,185,200	s. d. 10 9-35	£ 61,330,832	14-66	33,070,000	£ 7-90
Extra-London	4,289,700	10 8-01	37,680,552	8-77	20,080,000	4-68
Greater London	8,474,900	10 8-84	98,991,384	11-68	53,150,000	6-27

Although Londoners may pay the same rate in the pound, the average rateable value is much higher than in extra-London at £14.66, compared with £8.77, per head of population. The average amount of rates payable in London is £7 18s. per annum—a figure which is £3 4s. 6d. a year more than that payable by the average Extra-London resident. There is a strong case for re-drawing the boundaries of the metropolis on grounds of equity alone, quite apart from the economies in administration. Opposition from vested interests deserves no greater weight than was given to the vestry boards, whose powers were transferred to the London County Council in 1888.

Petrol and the Car.—The price of petrol is so important a constituent in the cost of running a car that variations in its price may have a vital influence on international road transport developments. How widely its price varies in different countries is shown by a comparison given in the Imperial Economic Committee's "Survey of the Trade in Motor Vehicles." In the United States, for example, the average price of petrol in 1934, exclusive of tax, was 7.79d. per gallon, against 9.25d. per gallon in the United Kingdom. The duty per gallon in the United States was then only 2.97d. compared with 8d. in this country. The "all in" cost of petrol in this country, at 17.25d. per gallon, was thus 60 per cent. higher than across the Atlantic, an important factor in the predominance of the high-powered car. In many countries it is even higher. In Berlin the cost of petrol at the end of 1934 was 3rd. per gallon, inclusive of a duty of 17.5d. In Paris, where the duty was then 22.5d., petrol cost 29.5d. per gallon. Total automobiles in use in the world in 1935 were no less than 37.3 millions, against 35.0 millions in 1929. More than 70 per cent. of the vehicles were in the United States, and only 5.5 per cent. in the United Kingdom. Nevertheless, the progress of the industry in this country since 1929 has been more rapid than in America.

THE FIGHT WITH THE "UTILITIES"

WASHINGTON, December 23

THE manufacture of electric power plays a part in American politics which a foreign observer does not easily comprehend. From village to metropolis, the "utilities" are popularly known as interests pitted against the public; in State Legislatures and in Washington they maintain the most active lobbies; and in Wall Street their properties have been the raw material out of which the most elaborate superstructures have been built, sometimes to collapse in disaster.

To say, as one must, that President Roosevelt during his first term fought only one stubborn battle, and that over the Holding Company Bill, is not as great a disparagement of his Liberalism as it may appear. The Holding Company Bill was aimed at the utilities, and the President, in choosing his battleground, knew his public, and the value of a victory. The popularity of the Tennessee Valley Authority experiment, too, was manifest from the first. The Government, by utilising Muscle Shoals, could begin working out the "yardstick," or measuring rod, for the rates of private companies, a service to every community with a lighting company; and it could, too, begin a social experiment of far-flung imaginative possibilities. Of all the President's creations, the T.V.A. is the one that labels him most legibly to the country as a liberal, and on the side of the public. It is, therefore, more than of passing importance that serious trouble arising from the T.V.A. is facing the President early in his second term.

T.V.A. AND A "GRID" SCHEME

During the recent campaign a conference was held between the electric power companies of the T.V.A. area and the President. The basis of an agreement was discussed, and the final settlement postponed till February of this year. Since the Election the conflict arising from this proposal has come to the surface. David Lilienthal, one of the two key men in the T.V.A., is opposed to the settlement, and the President is in favour of it. Mr Lilienthal is a fighting figure in the power conflict, and will carry weight with liberals. If he is against the peace plan, many liberals will condemn it solely on his authority. Almost certainly a deep and dangerous feud is brewing, and it is one of special interest to the British because the peace plan is none other than the application to the T.V.A. territory of the "grid," somewhat as operated in Great Britain. The peace plan in detail has not been published or indeed finally drafted. There is to be a pool; the Government will rent and operate the transmission systems, and it will be a member of the pool also as producer of current.

In such a solution private ownership would be safeguarded as in Britain, and investment values would not, as now, be penalised by the continual threat of competition from the Government acting through municipalities. The grid solution offers immediate savings, in that the power companies would be able to refund outstanding obligations at present low rates, and are thus ready to share the savings equally with the consumers by lowering rates. In the absence of peace in the T.V.A. territory the market value of utility shares now is depressed to a point that makes refinancing impossible. The yield at present share prices is virtually double what it is in less belligerent regions.

Those familiar with the British grid do not have to be convinced that it is a long-term solution in the interests of the public. It represents, as do other British experiments, a policy which achieves this without continual

warfare on the rentier. But in this country the power fight is stylised, and its veterans wish the battle to continue as before. The Government helps municipalities build new plant, without regard to duplication of plant, or without mercy to the investor. Such a fight is popular, but a billion dollar industry is not easily or wisely crushed.

MR. ROOSEVELT'S "SWING TO THE RIGHT"

This particular conflict is one of several which are brewing, and in all the President will find opposition from the Left. An era of vast spending is drawing to a close, and retrenchment creates more enemies on the Left than financial liberality does on the Right. Washington these days is in a mood it never has shown before under Mr Roosevelt's leadership. There is talk—much more talk than action—of many of the hard-working young men in Government service deserting the ship. They are supposed to be distressed and dismayed by the President's "obvious swing to the Right," and are said to be ready to accept lucrative posts in private life.

There has been alarm, too, over reports of the curtailment of relief, which first accounts made to appear drastic, and which drew immediate cries of protest from American mayors then meeting at Washington. Either the policy was rapidly modified or it was misunderstood, and curtailment on a large scale before early spring is not now expected. Sharp reduction in relief payments will begin then and be maintained throughout the summer, but that was the course pursued in 1936. Whether relief can be met out of \$500 millions additional appropriation, only time will tell. Mr Hopkins is reported ready to resign if he does not have \$750 millions.

There certainly is a widespread fear that the President will turn "conservative." It is a curious fear, and one often to be met in the last three years. One would think that for three years the President veered from one extreme to the other with incalculable abruptness to give rise to it. Of course he did not, and he will not now. He will not be a conservative. But neither will he be as Liberal as any one of a number of liberal specialists among his supporters. His own nature will be the same in his second as in his first term. But his problem will be vastly different. Since it entails rounding off the spending programme and balancing the Budget, he will be much lonelier.

A SELLERS' MARKET

NEW YORK, December 22

In the economic history of 1936 in the United States, first place must be given to the appearance of a sellers' market, first in labour, and later in commodities. Fairly early in the year, rumours began to circulate of local scarcities of certain types of skilled labour. Little attention was given to these stories, as they conflicted with both the political and the popular emphasis on the statistics of unemployment, and on the fact that the numbers on the relief rolls showed little diminution. The rumours, however, became more frequent and more insistent, and by late summer it seemed that something like a sellers' market was developing in skilled labour.

Nothing of the kind was then apparent in commodities. In July, the recognition of the effects of another severe drought lifted the prices of the specific crops whose supply had been curtailed by the weather. With these limited exceptions, commodity markets pursued an extraordinarily even tenor—indeed, the stability of the commodity index in the presence of a rapid and extensive increase (almost 50 per cent.) in production

between August, 1934, and August, 1936, was remarkable. Up to the end of October, commodity prices (exclusive of the drought crops) were not more than firm, and commodity markets, although fairly active in volume, were lethargic in price. Instances of forward buying, while occasional, were not conspicuous.

CAUSES OF THE RISE IN PRICES

In early November, the change came abruptly. Manufacturers plunged into extensive forward contracts, and both spot and future markets bounded forward. The dating of the phenomenon is perfectly distinct—it coincided with the Election. The proximate causation is more uncertain; the movement first became marked in the non-ferrous metals, in which the American market was following London. Possibly the Election itself was a factor; the indication that there would be no political change either in the Administration or in the complexion of Congress may have resolved hesitation into action in corporate buying policy.

The fact was that for some time, so far as one can judge from very imperfect indices, spot markets had been rather stronger than futures; and from this one might infer that corporate purchasing policy, which for years had been on a hand-to-mouth basis, had left industry in a position in which it was potentially, if not literally, "short" of commodities. Any one of several reasons, effective in different industries, may have led to a decision to test the futures' markets; and these markets under test proved to be surprisingly strong. The result is that, since early November, we have had a sellers' market, with a scramble for goods or contracts, which has brought something like a 10 per cent. rise in primary commodities, and led to more forward contracting and more distant forward contracting than at any period not only in recent years, but probably even in the '20's.

The first half of the year, in fact, continued the stability of the previous twelve-month or longer; in the second half there were two distinct spurts, the first confined to commodities affected by a curtailment of supply, the second primarily reflecting increased demand. The following table shows the course of the rise in prices:—

	Moody's Index of Spot Commodities	Dow-Jones Index of Commodity Futures
Mid-January	168	56
Mid-February	170	57
Mid-March	171	58
Mid-April	169	57
Mid-May	163	57
Mid-June	164	58
Mid-July	176	65
Mid-August	184	67
Mid-September	186	67
Mid-October	184	68
Mid-November	187	71
Mid-December	201	78

These two indices are quite different both in composition and base, but both show in the last half-year a rise in primary prices of remarkable rapidity and even violence. In one index the rise is 23 per cent. and in the other 34 per cent.

THE COST OF LIVING AND RAW MATERIALS

The Bureau of Labour Statistics index of retail prices has scarcely shown a ripple. At 83 it is one or two points above the prevailing figures of the first half of the year. The *Analyst* index shows a rise of somewhat over 10 per cent. since June, but only a minor increase above a year ago; while both Moody's and the Dow-Jones record a great increase over December, 1935.

There are two diametrically opposite aspects under which this phenomenon can be viewed, (a) as a mere change of relationship within a static price structure, or (b) as the preliminary phase of a general change in price level. It is well-known that primary commodities fluctuate much more violently than commodity prices as a whole. Even the great decline in primary commodities between 1929 and 1932 was only partially communicated to prices in general. Raw materials constitute but a varying and often minor fraction of the cost-to-consumer of most manufactured articles.

Labour cost is in most cases a more considerable element. But when both combine in direction—as they are in America at present—the probability of a general rise in prices seems great.

CHANGES SINCE 1929

The following table shows the spot prices of a number of primary commodities on widely separated, but significant dates. The "low" date (June 1, 1932) was probably not the absolute "low" of the price decline, but the prices of that date are typical of the period:—

PRICES OF REPRESENTATIVE COMMODITIES

	Avg., Sept., 1929	June 1, 1932	June 15, 1936	Mar. 2, 1936	Dec. 15, 1936

Lead	6.89	3.00	4.60	4.80	5.50
Zinc	6.80	2.80	4.90	4.85	5.35
Tin*	45.38	20.75	41.50	45.75	52.75
Steel scrap*	18.06	9.50	13.00	17.00	18.50
Sugar*	2.23	0.57	2.82	2.45	2.91
Coffee	14.57	8.25	7.00	8.38	8.75
Rubber	20.07	2.69	15.75	17.13	19.90

* Commodities now higher than in September, 1929.

There are twenty-two commodities in the list. Of these, ten are above the price of September, 1929; two (hogs, rubber) are at about the same price; silk and coffee are conspicuously lower. The non-ferrous metals are lower, and steel scrap higher; i.e. if one goes back to 1929, one sees not so much a decline in primary prices as an alteration of relationships; but looking back only to June, 1936, one is impressed by the sweeping advance in every one of these commodities except hogs. This is an economic fact of the first magnitude.

THE INCREASE IN DEMAND

To say that much of the rise is obviously speculative is platitudinous, unless one is prepared to argue the validity of the premises which have caused this urgent buying. In the past six months, a sellers' market has developed which has re-valued primary commodities as a class in terms (a) of the dollar and (b) in terms of finished goods. To a degree, this re-valuation is obviously traceable to a sudden reduction of supply, as in the crops affected by the drought; but much of the rest is attributable to an increase in demand, or at least an intensification of the urgency of the demand—the characteristic of a sellers' market. This includes the continuation of an urgent European demand for land upon military consideration—a matter which our market cannot appraise independently.

Certainly the relation between primary commodities and finished goods is more favourable to the producer of the former than it has been for several years. But that is not to say it is an abnormal relation. Nor need the rise in primary prices necessarily cause an equivalent rise in the prices of finished goods.

France

SIX MONTHS OF THE "POPULAR FRONT"

PARIS, December 31

AFTER six months of the Popular Front Government, the principal criticism made by the Opposition is that the policy of the Government has been most successful wherever it has been contradictory to the arguments which M. Blum and M. Auriol were putting forward in opposition. It appears that in the Spanish affair M. Blum is supporting a policy of which M. Laval would not have disapproved; and on the financial side M. Auriol, a staunch supporter of the liberty of capitalists, is not far from M. Germain-Martin, a Minister of deflation. If, finally, the great novelty of the present Cabinet lies in its social policy, one must remember that employers deny that they were opposed to certain reforms, which, they say, were only delayed by the opposition of the Senate.

But the Senate, that severe censor, has just passed the 1937 Budget Bill by 288 votes to 2. The Rapporteur, M. Abel Gardey, pointed out that the needs of the Treasury in 1937 would not be very different from those in 1936 (30,000 million francs). This, however, is no justification, since the public debt has increased from 261,441 millions in 1930 to 356,842 millions in 1936. The medium-term debt is 32,000 millions higher. Treasury bonds, however, stood at 6,322 millions on September 30, 1936, against 13,939 millions on December 31, 1935. Actually the total State debt is 370,000 millions, the municipal debt 40,000 millions, and the railways debt 110,000 millions.

THE OPPOSITION AND THE BUDGET DEFICIT

M. Gardey agrees, however, that "the recovery of public credit is no longer a financial problem." The deficit must be made good "by living." Confidence depends on the revival of trade, and so does Budgetary equilibrium. That is the great lesson which this social Government has taught the country after five years of unsuccessful deflation.

This is so obvious that the Opposition has modified its attack. That attack is no longer directed against the deficit, but against social disorders, which are hindering the revival of business through "stay-in strikes," interference with "the liberty of work," etc. M. Caillaux, the former advocate of the "Grande Pénitence," now emphasises the necessity of limiting new expenditure and, above all, of avoiding the dictatorship of the civil service.

“ FURTHER BUSINESS REVIVAL

The Minister of Finance replies that revival of business is the key to the experiment of the Popular Front and that this revival has begun. Business for Christmas was certainly the best for many years. Railway receipts for the forty-ninth week of the year were 190 million francs, or 20 millions more than for the same week of 1935. Loaded wagons for the fiftieth week were 313,266, against 291,139 in the same week of 1935, or an increase of 7.60 per cent.

Ordinary fiscal receipts for November, the first month affected by devaluation, were 3,167 millions, against 2,814 millions in November, 1935. Indirect taxes yielded 2,061 millions, or 17 millions less than the estimates, but 135 millions more than the receipts of November, 1935. Direct taxes yielded 1,105 millions, or 203 millions more than in November, 1935. The outstanding fact is certainly the marked increase in the yield of the turnover tax, which, at 556 millions, shows a surplus of 36 millions over the estimates, and of 51 millions over the yield of November, 1935. This 10 per cent. rise is most encouraging, even if it is remembered that internal wholesale and retail prices were increased respectively by 30 to 40 per cent. and 20 to 25 per cent. during the period.

The unanimity of emphasis on the need to revive business and on the actual appearance of this revival are in sharp contrast with the stagnant level of rentes:—

	May 5. (After the General Election)	October 5 (After the Devaluation)	December 24
Rentes			
3%	66·55	81·20	73·85
4%, 1918	67·85	80·50	72·55
5%, 1920	94·15	106	97·30
4½%, 1932, " B "	71·30	88	76·80
Obligations du Trésor			
4½%, 1933	809	1,000	827
4%, 1934	750	910	764
5%, 1935	...	883	825
Bons du Trésor			
4½%, 1933	875	932	891·50
5%, 1933	935	975	965
5%, 1934	912	946	941·50
4½%, 1934	917	965	970

This stagnation may be explained by uncertainty and the agitation accompanying the daily revival of social conflicts. The effect of the recovery of business in restoring confidence is somewhat hampered by the rise in prices, and rentes prices are depressed by the prospect of new and huge borrowings. There is no reason, however, why the business recovery should not go on, even if the long-term rate of interest continues high. Recovery has been proceeding spasmodically since the autumn of 1935. It appears to have been defence expenditure which started it then; and a high rate of interest proved no obstacle. The failure of the long-term rate of interest to fall since devaluation is disappointing. But the progress of business revival since then gives solid ground for optimism.

The Government consequently intends to organise the money market—where money is abundant as is proved by the $1\frac{1}{2}$ per cent. rate of interest—so that short-term Treasury bills may be easily sold, as in the British market.

THE RAILWAY DEFICIT

The trading deficit on the railways will be 838 millions in 1936, against 400 millions in 1935. Interest charges will reach 3,670 millions, against 3,637 millions; so that the whole financial deficit will be 4,888 millions, or 900 millions more than the estimates. Receipts for 1937 are estimated at 10,218 millions and expenditure at 13,100 millions, giving a trading deficit of 2,890 millions. Interest charges will be 3,805 millions (an increase of 135 millions); so that the estimated financial deficit will be 7,075 millions.

Germany

"NO SIGN OF BREAKING POINT"

BERLIN, December 30

THE political and economic outlook for Germany in 1937 is far from clear. The past year witnessed tranquillity at home, and there is no reason to expect acute domestic troubles in the New Year. In the general deterioration of international politics, the Reich's position has not improved—either for diplomacy or defence. In view of the violent, if not entirely genuine, antagonism against Russia, better relations with France, and in particular with England, were admittedly desirable; but no progress has been made in this direction, and the dominant German view is that Great Britain is slipping insensibly into the Paris-Moscow combination. In the light of pre-war history this constitutes a danger. On the question of the future government of Spain the German Government has committed itself to at least a negative right of decision, the execution of which is probably beyond the powers of all Europe together.

The business outlook is not unsatisfactory. It is probable that industrial activity will be maintained or even increased, since the Four-Year Plan for autarky provides a new stimulus; and unemployment may almost entirely disappear. Of any change in the currency situation there is little prospect, in view of the intimate association between Reichsbank exchange policy and foreign trade regulation, the Four-Year Plan and re-armament. The rise in prices, the shortage of necessities and the decline in the standard of living will probably continue; but there is no sign that a breaking-point is near.

Wholesale prices were steady in the last fortnight before Christmas; but non-ferrous metals, rubber and artificial fertilisers rose sharply in price.

• The Reich Price Commissary has applied to imported coal the prohibition against increase of prices above the level of October 18th. Coal is *therefore* an exception to the rule that this prohibition does not apply to imported goods. The regulations controlling trade in fodder cereals have been sharpened. Purchases of wood for pulping are henceforth subject to official permission; and producers, traders and consumers are required to report their stocks monthly.

HUGE RISE IN STEEL OUTPUT

The percentage of all working places in industry occupied in November was 72.2, against 72.4 in October. Only the building trade shows a decline. The average daily working time in industry in November was 7.80 hours, against 7.68 hours in October. Output of ingot steel in November in working days was 1,506,800 tons, against 1,704,900 tons in October, in 27 working days. Output in the first eleven months was 17,681,900 tons; so that the year's total will considerably exceed 19 million tons, against a recent lowest of 5,571,000 tons in 1932. About 2,300,000 tons of the increase is due to the Saar. The machine manufacturing trade reports great home and export activity. Delivery terms have been lengthened. The increase in home demand is due to the erection of new industrial plant and the extension of old. Export orders from some devaluation countries have declined; but the loss has been made good by increased orders from Europe and from Central and South America and Asia. Total turnover in machinery in 1936 is estimated at Rm. 3,000 millions, which is 20 per cent. more than in 1935; and the number of persons employed rose by 80,000 to about 600,000. While home sales rose 17 per cent., exports rose 30 per cent.

Reich tax revenue in the part of the financial year already lapsed, compared with the same period of last year, was as follows:—

	April–November, 1935	1936
	<i>Millions of Marks</i>	
Direct and Business Taxes	3,920	4,973
Customs and Excise	2,303	2,396
Total	6,223	7,369

The proportion of direct to indirect tax revenue continues to increase.

DEVALUATION PROFITS TAXED

An important law taxing profits derived from the devaluation of foreign currencies was issued last week. The tax is imposed on the profits made by German investors or debtors on capital or interest (but not on trade) liabilities resulting from a fall in the exchange of any creditor's currency. Profits made before the coming into force of the law are not taxed. Debtors are required to report their profits. The law has yet to be elaborated by administrative ordinances, and certain points in it are not clear.

It seems that debtors *who* have hitherto paid interest in marks into the Conversion Fund on a depreciation basis will henceforth have to pay at the old parity. It is stated that profits on interest on the standstill debts will not be taxed, because the debtor's saving is not directly due to depreciation, the interest liability being fixed by agreement. While the law formally involves a 100 per cent. tax on devaluation profits, it seems that the whole profit will not always be taken; and in individual cases appeal may be made on the ground that the tax cannot be borne.

EFFECTS OF THE TAX

The Reich Minister of Economy will determine the use to which the tax yield is to be put. The amount of the yield is not even approximately known, and the tax will be paid only in so far as debts are repaid. Before the gold *bloc* devaluations the reduction of foreign debt due to depreciation was officially put at Rm. 4,000 millions. This, however, was a book reduction,

THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office : 38 St. Andrew Square, Edinburgh

LONDON OFFICES:

City Office : 38 Threadneedle Street, E.C.2
West End Branch : 198 Piccadilly, W.1

and how much of the saving had already been realised by repayment is uncertain. Debtor corporations and undertakings will in any case suffer unexpected losses. Public corporations have of late returned their unpaid debts on the depreciation basis. Most private concerns have either booked them at the old parity, thus taking into account the fact that the exchanges have not yet been definitively fixed, or have booked at the day's depreciated exchange rate and counter-booked the profit as a reserve liability. But many concerns have used their profits in order to improve their balance sheets or to provide for writing-off; and such concerns, unless exempted, may be hard hit.

THE "SECRET" REICH DEBT

In an analysis of public and private indebtedness the Institute for Trade Research returns to the subject of the so-called secret or undivulged debt of the Reich. After pointing out that the "regularly returned indebtedness" of Reich and other public bodies increased between April, 1933, and April, 1936, by only Rm. 2,300 millions, the Institute defines the process of contraction of unreturned debt as follows:—

In the above figure are not included the future short-term liabilities of the Reich due to the short-term financing of work-creation, of the Reich motor-roads, and of Defence, which have not yet formally precipitated themselves as public debts. In so far as these Reich short-term liabilities have not yet matured, and have therefore only to be met in coming Budget years, they can be included in Reich debt only in so far as the bills fall due and have to be met by the Reich. Meantime, these credit-papers circulate either between the direct participators in work-creation finance, that is, between executors of work-creation (i.e., municipalities, etc.), contractors, and financing institutions; or appear in the money-market as investments; or are presented to the Reichsbank for re-discounting.

WORK-CREATION AND RE-ARMAMENT BILLS

In the light of this utterance, the Institute's accompanying statistical table virtually denies the existence of any considerable undivulged Reich debt. The total of home short-term credits to public and private borrowers is shown at (1935) Rm. 22,015 millions, against Rm. 20,247 millions in 1932 and Rm. 26,535 millions (recent highest) in 1929. The total for 1935 consisted of (in millions) Treasury and municipal bills, Rm. 2,914; other bills, Rm. 7,820; municipal short-term liabilities, Rm. 628; other credits, Rm. 10,236; and loans on goods, Rm. 416.

The Reich work-creation and re-armament bills mentioned in the above quotation are supposed to be included, together with all private bills, in the Rm. 7,820 millions of "other bills." In 1932 "other bills" totalled Rm. 4,289 millions. The increase was therefore only some Rm. 3,500 millions. It is known that the proportion of Reich to private bills in the "other bills" has risen very much since 1932. But even if all the "other bills" in 1935 were Reich bills, the Reich's short-term indebtedness for work-creation and re-armament would be relatively inconsiderable. From this it might be concluded that a great part of the re-armament expenditure was covered out of Budget revenue; but no such claim has been officially made.

Sweden

NATIONAL DEFENCE POLICY

STOCKHOLM, December 23

In view of the continually growing political unrest on the Continent, the question of this country's security is naturally the main object of all political discussions. Some Right-wing factions go as far as to advocate some kind of Scandinavian military alliance. It does not seem probable, however, that in present circumstances this idea will materialise, and military co-operation between the four Northern countries will hardly extend beyond an exchange of views at more or less regular intervals between the general staffs.

THE BOOM GOES ON

The general business boom is continuing, and so far no signs of slackening can be discerned. The general index of industrial production rose one point in October to 111, compared with 102 in October, 1935. Prices are also rising, and the general wholesale price index of the Board of Trade rose by one point to 123 (1913 = 100). The advance was chiefly in raw materials, the price of which jumped two points to 120. So far retail prices have not followed at this pace, and the cost-of-living index of the Riksbank stands at 101 (September, 1931 = 100). The continued price rise has naturally aroused alarm in some quarters. Among other means of restraining it, the proposal has been made to lower the present exchange sterling rate.

The estimated State revenues for the Budget year 1937-38 amount to Kr. 1,149 millions, compared with Kr. 1,055 millions in the previous year. Actual State revenues recorded an increase of Kr. 93 millions; while estimated taxes on income and capital have risen from Kr. 172 millions to Kr. 200 millions.

FURTHER RISE IN IMPORTS AND EXPORTS

The import surplus is considerably below the corresponding figure for 1935. The full foreign trade figures during the first ten months of the current year were as follows:—

(In million kronor)		1935	1936
		January-October	January-October
Imports		1,179.7	1,315.9
Exports		1,039.3	1,210.0
Import surplus ...		140.4	105.9

During the same period trade with Great Britain has been as follows:—

(In million kronor)		1935	1936
		January-October	January-October
Exports to U.K.		259.3	300.0
Imports from U.K. ...		234.9	254.4
Export surplus ...		24.4	45.6

The current year's production of timber is practically sold, and brisk sales for next year's shipments are taking place. Demand from the British market is strong and does not show signs of weakening. Pulp sales are brisk. Consumption of iron and steel on the home market is progressing and prices rising. The seasonal rise in unemployment which usually appears in October was absent this year, and the number of unemployed stands at 21,000, compared with 41,000 a year ago. The value of the new harvest—estimated at Kr. 982 millions—is practically the same as in 1935.

The money market was extremely liquid during October, but somewhat stiffened in November when tax payments were being made. During October and November the joint-stock banks reported a slight increase in advances, though the increase is not yet in proportion to the business expansion. The stock market throughout October was very firm, and the general share index rose from 159 to 166. In November the boom was less pronounced, and at the end of November the index stood at 169.

Czechoslovakia

STEPS TOWARDS FREER TRADE

PRAGUE, December 23

THE economic situation has recently been greatly under the influence of political unrest. It is true that the Little Entente was strengthened by the visit of King Carol of Roumania to this country on October 28th, and that following the devaluations in the autumn, some freeing of international trade was expected; but this latter hope failed almost completely. The Czechoslovak Government took all the internal measures necessitated by the devaluation. It ensured that there should be no chaotic movements; and offenders were prosecuted, in some cases with perhaps excessive severity. To-day, conditions have already become steadier, and the effect of the devaluation on prices is conspicuous only in those trades which are dependent on imported raw materials. The general index of wholesale prices rose between August and November from 691 to 714. Import prices rose by 55 points and home prices by 13 points only.

Another consequence of devaluation has been the Government's effort to free foreign trade and simplify the control of imports. On December 18th, the Government decided to release about 30 per cent. of imports from control and to combine the existing double control, up to now in the hands of the Ministry of Commerce and Foreign Exchange Commission, in one controlling body. The Foreign Exchange Commission is to be abolished, and the control concentrated in the Ministry of Commerce. Thus the first step toward emancipation of imports has been taken, and the Government are prepared to continue this policy of relaxing restrictions by means of trade agreements with individual countries. The restoration of economic relations with Central Europe is to be a special objective.

In agriculture, a substantially better situation, affecting in particular the Corn Monopoly, has resulted from the rise in world prices. It has been possible to lower stocks substantially by exporting. Germany is buying wheat from here. Since barley had been used as fodder on a bigger scale, the demand for barley has risen to such an extent that the brewers encountered a relative shortage. Exports of barley had to be temporarily suspended, and minimum prices fixed.

FURTHER INDUSTRIAL RECOVERY

The number of the unemployed in November rose (compared with October) to 511,787; but it was 167,083 less than in November, 1935. Industrial activity has been revived by the increase in exports, the extension of building activity, by new investment and repletion of stocks, and in a certain degree by defence measures. Output of coal rose in November to 1,303,175 tons (against 1,115,223 tons in November, 1935); output of lignite to 1,588,720 tons (against 1,463,232 tons in November, 1935); and output of coke to 190,800 tons (against 150,400 tons in November, 1935). Output of coal and coke has already regained the level of 1930; and stocks, in comparison with last year, have been materially reduced. Output of pig-iron in November rose to 111,477 tons (against 67,347 tons in November, 1935); and output of steel to 152,229 tons (against 110,273 tons November, 1935). The November production of steel is higher this year than in 1930.

In other industries improvement is also noticeable, especially in the sugar, timber, engineering and metal industries, and in the ceramic, glass, paper, clothing and leather trades. The textile industry shows some improvement, although the rise in the prices of raw materials was accentuated by devaluation. Christmas trade was very lively.

The total foreign trade returns for January to November were as follows:—

	1935	1936
	mil. Cz.K.	mil. Cz.K.
Imports	5,980.5	6,889.6
Exports	7,257.3	7,177.5

Although it is as yet difficult to judge to what extent foreign trade was influenced by devaluation, it appears that this has only happened in the case of countries not subject to import restrictions. The increased value of imports, especially of imported raw materials, may be accounted for by the world economic recovery.

NEW TRADE AGREEMENTS

Commercial negotiations have been concluded with several countries, and efforts are being made to relax import restrictions. The negotiations with France are difficult on account of Czechoslovakia's import surplus with France and the unwillingness of France to admit substantially increased import facilities. The negotiations are at the moment being carried on through diplomatic channels only. Germany wants imports of raw materials and semi-manufactured goods, such as wheat, leather, yarn and timber. With Greece a new treaty has been signed, and a new agreement with Hungary on mutual adjustment of imports in 1937 has also been signed. With Denmark a supplement to the quota-agreement has been negotiated. A new treaty with Bolivia and an import agreement with Colombia have been signed, and negotiations with Ecuador and Argentina are in progress. Negotiations with Switzerland and Italy are being prepared.

A decision by the Government to assist exports by a refund of taxes is expected shortly, and an expansion of guarantees for export credits to the amount of 1,500 million Cz.K. is under consideration.

Revenue for the first ten months of 1936 rose in comparison with the same months of 1935 by 620 million Cz.K.; but it still remains 520 million Cz.K. below the estimates. The Budget for 1937 has been passed by Parliament, with some amendments.

Japan

LARGE ARMY AND NAVY EXPENDITURE

TOKYO, December 5

THE Budget estimates for the fiscal year, which begins on April 1, 1937, were approved by the Cabinet Council on November 27th. The total national expenditure in the new Budget was fixed at a record figure of 3,041 million yen. This shows a net increase of 507 million yen upon the current year, if the increased Exchequer grants to local authorities, which are to be paid out of the revenue from the sources reserved to the National Treasury are excluded. The increase is again accounted for by the fighting services. The Army mainly accounted for by the fighting services. The Army and the Navy Estimates amount in the aggregate to 1,409 million yen, or 46.3 per cent. of the total expenditure.

The revenue for the fiscal year 1937-38 is estimated at 1,676 million yen, an increase of 161.5 million yen. There is thus a huge deficit of 1,168 million yen. Of this deficit, 336 million yen will be met by increased taxation, the raising of the prices of tobacco, and fresh raids on the Government Railway and other self-balancing services; while the remaining 806 million yen is to be financed by a new loan, which will be 102 million yen larger than in the current year. The policy of "gradual reduction of Government borrowing" has thus been abandoned under the burden of increased armaments, and a further rise of annual defence expenditure will add 1,000 million yen yearly to the national debt.

A comparison of civil votes, defence votes, and national debt services for next year with the current year and last year is set out below:—

(In million yen)			
	Civil Votes	Defence Votes	Debt Services
1935-36	784	1,032	389
1936-37	869	1,058	383
1937-38	1,224	1,409	408
			Total
			2,206
			2,311
			3,041

NEW TARIFFS AND EXCHANGE RESTRICTIONS

Tariff Revision also was approved by the Cabinet Council on the same day. The main points in the plan

The Distinctive System

of
The Scottish Provident
Institution

Under *The Distinctive System* the premiums are so moderate that, at early and middle ages, the annual sum charged elsewhere for a Whole Life Assurance of £1,000, with profits, will here secure from the first as much as £1,300 or thereby with right to share in the Surplus.

Write for an explanatory booklet

The Scottish Provident Institution

London (City) Office - 3 Lombard Street, E.C.3
HEAD OFFICE - 6 St. Andrew Square, EDINBURGH
FUNDS EXCEED £24,000,000

are: (1) the revision of the general tariff, which has remained unaltered since 1926, so as to conform to changed conditions; (2) the raising of the "key industries" duties with certain additions and modifications; and (3) the imposition of fresh duties on certain kinds of raw materials now on the free list. In addition, an *ad valorem* duty of 0.1 per cent. will be imposed on both imports and exports to raise funds for the compilation of detailed trade statistics; and another 1 per cent. export duty will be charged, the yield of which is to be used to cover the cost of export control. Customs, on account of the projected revision, are expected to yield about 40 million yen, or roughly 25 per cent., more than in the current year. The "trade statistics duty" and the "export control duty" are estimated to produce between them 8 million yen.

A Government decree for stricter restrictions on foreign exchange dealings was put into force on December 1st. The new regulations provide for the extension of control over exports—other than invisible exports. The decree also requires the banks and other exchange dealers to make more detailed reports on their business transactions. The Government obviously aims at the closing of any loophole for the flight of capital in view of the inflationary budgeting and higher taxation. Indeed, it is a fair inference from recent measures that no general change in financial policy is in sight. Inflationary borrowing for armaments is likely to be the dominant theme for some time to come.

A GROWING IMPORT SURPLUS

The course of foreign trade continues to be moderately satisfactory. The total of imports in November, at 218,050,000 yen, compared with 213,226,000 yen for the corresponding month of last year, showed an increase of 4,824,000 yen, or 2½ per cent. Exports, at 236,877,000 yen, rose by 18,500,000 yen, or 8½ per cent. Many major exports have done well, and raw silk heads the list. Raw cotton imports have been on a larger scale, but imports of raw wool are considerably lower. For the first eleven months of the year imports show an increase of 253,466,000 yen, or 11½ per cent., to 2,479,165,000 yen, and exports an increase of 120,023,000 yen, or 5½ per cent., to 2,396,301,000 yen. Thus the import surplus amounts to 82,864,000 yen, against an export surplus of 50,579,000 yen last year. Here again the influence of inflationary credit expansion is beginning to be apparent.

The latest clearing banks' statements show the continuance of the recent change in the general trend; i.e. advances are increasing faster than deposits. Loanable funds have been less plentiful; and short-loan rates have been firm. Large Government disbursements, however, have appreciably eased the stringent conditions in the short loan market, and the year-end will certainly be negotiated without undue difficulty.

Irish Free State

THE RISE IN FARM PRICES

DUBLIN, December 27

THE index number of agricultural prices has risen by 14 per cent. during the last twelve months, with obvious advantages to Irish farmers and to the balance of trade. A renewal of the demand for loans has been experienced by the banks; and many old loans, which had been regarded as irrecoverable during the depression, have been repaid. Agricultural prosperity, however, has not risen to the full extent of the rise in prices, because of the great increase in costs of production which has resulted from the policy of industrial protection. Furthermore, farmers' incomes have been deprived of a substantial part of their purchasing power by the rise in the price of urban products.

The rise in farm prices is, of course, a reflection of the general rise in the price of primary commodities, and it is only a matter of time until the price of imports rises in harmony with that of exports. Such a rise will produce serious consequences on the balance of trade, because, visible imports being twice the amount of visible exports, the import surplus will be automatically swollen; and there is little hope of imports being reduced, as practically everything that can be produced in the Free State is already being produced behind the high tariff. The strain on the invisible exports may easily become unduly great with an adverse effect on the total balance of payments; and a drain on the sterling assets of the Free State may become inevitable.

PROTECTION AND INVESTMENT

At the annual meeting of the Industrial Credit Company it was stated that during the last three years the total public issues of capital in Dublin by companies amounted to £6,277,042, compared with £160,750 in the previous three years. These figures demonstrate that the policy of industrial protection has stimulated the investment of capital in Irish industries. It is, of course, too soon to say whether this investment has been judicious. This question can only be answered when the results of the trading of the new companies are known. Complaints are directed against much of this new industrial development, on the one hand, by the trade unions and, on the other hand, by the consuming public. Unfortunately, the attempts that have been made to allay the former's criticism have only succeeded in augmenting the latter's.

AN INDUSTRIAL CODE

The Conditions of Employment Act has created an industrial code far ahead of that in force in any other country. While this must be welcomed from the social viewpoint, it has the effect, at least temporarily, of raising costs of production to such a point that the export of Irish industrial products is out of the question. Prices in the Irish market are kept artificially high, and consumers further complain of a certain lack of variety and inferiority of quality. The Minister for Industry and Commerce has recently warned manufacturers that they must not abuse the privileges of their position; but the manufacturers are well organised in trade associations which are incessant in their demands for further favours. Meanwhile the farmers and the possessors of fixed incomes are paying the price of the industrial development, which many critics think is being secured at a disproportionate cost.

The improvement in the external trade position is shown in the following table:—

Twelve months ending	Imports	Exports	Import Surplus
November, 1935 ...	37,416,103	19,720,137	17,695,966
November, 1936 ...	39,423,848	22,351,824	17,072,024

The increase in the value of exports is mainly the result of the so-called Coal-Cattle Pact between Great Britain and the Irish Free State, which followed the recent tariff war. The renewal of the Coal-Cattle Pact for 1937 has recently been announced. The fall in the import surplus may consequently be maintained for a time.

Letters to the Editor

Raising the Standard of Living

TO THE EDITOR OF THE ECONOMIST

SIR,—Like a lot of other people in this country, I am interested in the problem of raising the standard of living. Thinking over the subject, it seemed to me to be a fair question to address to the professional economist, namely, "What constructive steps would he, as a professional economist, take if he were charged with the responsibility of raising the standard of living in this country?" In order to avoid ambiguity, and possibly to simplify the problem, let us assume that raising the standard of living can be alternatively stated as increasing the material prosperity of the various individuals who comprise the population.

You must have many readers who are professional economists, and perhaps you will permit them to accept this open invitation to do one of three things:—

- State that it is not a fair question to address to the professional economist, giving their reasons.
- Outline constructive proposals.
- State that they are not capable of making proposals.

This letter is addressed to you in a genuine desire for information.

Yours truly,
FRANK MURPHY,
Chairman, Murphy Radio, Ltd.

Imports and the Special Areas

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr J. W. Banfield, M.P., writing in your issue of December 19th, shows that he regards imports as undesirable, and implies that exports are desirable. Although this outlook is very nearly general, it is high time it was questioned. If we examined our imports in detail we should find that they were composed of foodstuffs, choice oriental fruits and many other things which we desire more than the goods we export in exchange—the essence of all exchanges of goods.

Mr Banfield also indicates that he thinks (in common with most politicians of all political parties) that the purpose of the economic system is to "find work." Surely the contradiction in terms should make this apparent as a fundamental error?

But he is right in the idea that any device which merely spreads the distress of the Special Areas thinly over the more prosperous areas—where it will hardly be noticed—is wrong. Surely the only practical solution to both the internal problems and the import and export question is to manage the money system in such a way that internal purchasing power will buy automatically all the goods which the industrial machine is capable of producing—providing that the people want those goods or can export them in exchange for goods they find more desirable. It seems to be forgotten at times that if people cannot buy all the goods, they cannot buy the imports equal in value to the exports which form some part of total production.

Yours faithfully,
P. R. MASSON.

173 Walmley Road,
Erdington,
Birmingham.

Germany's Economic Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—The provision of a large and regular flow of raw materials from abroad is one of the key problems for Germany's economic and political policy. The problem became acute in 1929 when, with the outbreak of the world crisis, the flow of foreign lending ceased and Germany had to face the long-deferred task of achieving an active balance of trade. The situation was accentuated by the industrialisation of the young countries overseas.

Germany could not benefit by cheap raw materials to the full because of her policy of agricultural protectionism, which partly derived from a belief in the stabilising influence

of a prosperous peasant population, but mainly from regard for the powerful political influence of the Junkers. On the other hand Germany felt, like all old industrial countries, the intensification of international competition resulting from the shrinkage of overseas markets. If all these facts are taken into account, it is small wonder that the world crisis led to an intense international deflation and to the breakdown of Germany's economic, social and political system.

Against this background we have to see Germany's present policy, which is characterised by the four-year plan, the demand for colonies and—rapid re-armament. This policy has been called irrational. Why should Germany try to produce things which she can purchase on the world market at one-third of her costs of production? Why should Germany want colonies, when every raw material producer is only too eager to sell to her? The irrationality is only partly Germany's; partly it is the irrationality of a situation in which Germany cannot import because her exports encounter an almost absolute resistance. Given

the present state of world protectionism, given the power of the Junkers which makes high agricultural protectionism inevitable, it is in fact profitable to produce substitutes for raw materials in Germany.

Autarky, though it is the easiest method of lowering the standard of living of the masses, would not solve the problem entirely. Colonies would only be of use if Germany really "owned" them, e.g. if she could exclude competing exports. It is doubtful whether other countries will peacefully surrender their colonies, simply to find their exports excluded from them. This is why the German Government prefers armaments to all other forms of public works—and given all circumstances this, too, is rational.

PEREGRINUS.

London, N.W.3

[When it is remembered that less than 1 per cent. of Germany's exports went to her colonies before the war, we cannot agree that it is in any sense a "rational" policy for Germany to prepare to solve her economic problem by forcibly seizing colonies.—Ed., *Econ.*]

Books and Publications

What Price War?

ONE of the outstanding events of 1936 in the world of books has been the completion of Mr Lloyd George's War Memoirs, the sixth and final volume of which was published in November.* Much has been said of the great personal achievement which this task represents. Begun after a serious operation at the age of seventy by one to whom book writing was a new experience, Mr Lloyd George has written a work of 3,500 pages, which, it is justly claimed, constitutes (apart from the official histories) "the most carefully and richly documented account of the Great War."

But these volumes are much more than a monument to Mr Lloyd George's unsuspected literary powers. They are at once an essential part of the history of the world's greatest crisis and a rousing challenge to civilisation.

There is no one in any country who played so responsible a part as Mr Lloyd George from beginning to end of the Great War; and none of the outstanding figures who might possibly claim to be included in the same category with him has attempted to give a complete and personal account of the war as he saw it. Mr Lloyd George's contribution to history is, therefore, unique both in its scope and in its authority.

We do not, of course, mean by this that posterity will necessarily accept all the judgments of Mr Lloyd George as they stand. Indeed, the writer does not claim to be giving a full and unbiassed account; he is explaining his own outlook and defending his own actions in relation to the conduct of the war. On such matters as the long-continued and costly offensive of Paschendaele in the autumn of 1917, the unprepared and unvisited state of the Fifth Army in March, 1918, and the allocation of resources generally between the Western Front and the "side-shows," there are not merely a series of keen controversies to be decided on their merits, but there is also the vexed problem of the respective responsibilities of the military and political chiefs.

Mr Lloyd George fights his case with vigour right up to the very end, when he describes how the collapse of our enemies began in Palestine, Mesopotamia and on the Bulgarian front. Thus did the despised "side-shows" come into their own. Nevertheless, it may well show "come into their own." The Central Powers were not destroyed by an attack upon their extremities, but by the stranglehold of the blockade on their vital parts; by the gradual weakening of stamina through under-nourishment. That Germany was defeated by a war of attrition is a false view. Certainly the kind of battle which achieved two German casualties at the expense of three allied ones was an arithmetical folly and a dreadful waste of priceless lives. But it does not follow that

* "War Memoirs of David Lloyd George." 6 Vols. 21s. each. Ivor Nicholson and Watson.

we could easily have turned her flank in the Balkans. It was undoubtedly the combined economic and military pressure, prolonged through the years, that finally deprived Germany of her power to fortify her Allies in the minor theatres of war.

Yet, if history finally differs, as she assuredly will, from Mr Lloyd George on some of these matters, these six volumes unfold in a manner not open to challenge a story of leadership, initiative and vision which, in field after field, saved this country from disaster. The official obstruction which opposed Mr Lloyd George's efforts to enlarge the supply of munitions and the way in which he overcame it was told in *The Economist* of October 28, 1933. German testimony to the effectiveness of the myriads of British machine-gun nests and the swarms of tanks which turned the scale in the crises of the battles of 1918, are the only possible commentary on the attitude of the War Office in 1915, when it was held that "four machine-guns per battalion (in 1918 it was 52) was enough and anything higher would be a superfluity," and that it was quite inadmissible that skilled men should be kept back from the trenches to build tanks and trench mortars. The British Army won the last campaign on the fields of Flanders; Mr Lloyd George's battles included the fight to secure the complete mobilisation and scientific use of our man power (which multiplied our war effort many-fold), the long-drawn-out struggle to secure unity of command (which saved our Armies from destruction), insistence on the adoption by the Admiralty of the Convoy system for our merchant ships through submarine-infested seas (which saved the Allies from starvation), together with a host of minor engagements such as the drive to increase home production of food and the output of standard merchant ships. Little wonder that on his recent visit to Germany, when Mr Lloyd George took leave of Herr Hitler, the latter turned to him and said, "It was not your armies, Mr Lloyd George, that defeated Germany; it was you." Every European knows that there is something more than mere flattery in this terrific testimonial.

Is it, then, possible that one man can really make the difference between victory and defeat in the clash between such massive forces as were at issue in the World War? It almost seems that the outcome might have been different if there had not been a man of such dynamic energy to overcome the inertia of officialdom in so many matters of vital importance.

But if this be so, it only reinforces the conclusion to which Mr Lloyd George himself comes in the preface to his final volume, where he sets down the impressions which emerge most strongly from his five years' labour. One of these is that as a means of ascertaining the rights and wrongs of a dispute, "War is crude, uncertain and costly." Though it ended in victory for the right side—as Mr Lloyd George holds—it was won not on the merits of the case, but on a balance of resources and of blunders. These errors came first from one side and

then from the other. "Judgment which is dependent on such contingencies is too precarious. Chance is the supreme judge in war and not Right." And to illustrate the moral he continues: "If Germany had been led by Bismarck and Moltke instead of by von Bethmann-Hollweg and Falkenhayn, the event of the great struggle between a military autocracy and democracy would in all human probability have been different."

If this be true, can we be sure that the next time Chance will give the verdict to the right side? Can the nations afford to entrust their civilisation to such a hazard? Or to come nearer home, can we rely on Providence to arrange that the Lloyd George of the next war will be on our side and not on that of the enemy? Has Mr Baldwin such a one up his sleeve?

No one who reads these six volumes can rise from their perusal without an overwhelming sense that another war would be the most colossal gamble with fate—a gamble that should be unthinkable to intelligent and civilised peoples.

Is there no way out? Let us dwell for a moment on Mr Lloyd George's other impression—namely, the tremendous power of endurance and the courage of the ordinary man, which enabled so many millions of them to go through such terrible experiences without a complete shattering of nerve and brain. This quality was not confined to any one people. In training, discipline, equipment and efficiency there were marked differences between one nation and another; but in the high courage of the common man there was none.

What makes war so terrifying is that it is waged by men. No human effort brings forth so clearly and impressively the strongest qualities of mankind as a whole. But war is a prodigal and stupid waste of these virile attributes. Evoked, stimulated and organised by and for some beneficent movement which is productive not of ruin and death but of something which gives life and gives it abundantly to the children of men, it would transfigure the world.

These qualities and the sense of high duty which inspires them are very much in evidence in the world to-day. The question is whether in the years immediately ahead they are to be evoked in rival causes or to be mobilised in support of a common good. At the moment the word is with the diplomats. They should be able to avert the great disaster if in all countries they will realise with Mr Lloyd George that at best the outcome of war is the result of blundering chance, and secondly that in any case, and in the long run, no one wins.

Shorter Notices

"Abolish Slumps." By A. W. Knight. P. S. King and Son, Ltd. 142 pages. 6s.

This short book is a most praiseworthy attempt to provide an empirical justification for a theory of the trade cycle, and should be of interest both to professional economists and also to the general public. Mr Knight's general analysis follows that of Mr Keynes, but his theory of the trade cycle is perhaps even closer to that expounded by Mr Harrod in a recent essay. Income and employment, it is argued, depend essentially on the volume of investment, and slumps are the result of a decline in the latter. The relation between savings and investment (which must be equal for the economic system as a whole) is further clarified by the distinction between the "successful"—i.e. those in employment and those who make profits—and the "unsuccessful," whose incomes have to be supplemented by the savings of the former.

The most original part of the book is the attempt to show that for Great Britain the percentages of unemployment in the investment and in the consumption goods industries are always more or less in a fixed ratio to each other. From this the value of what Mr Keynes would call the "multiplier" is deduced. Mr Knight also attempts to show that for full employment 19 per cent. of the national income must be invested, and that any smaller percentage will lead to general unemployment. Any attempt on the part of the "successful" as a whole to save a larger percentage is bound to be abortive, as it will lead to losses elsewhere.

Mr Knight's use of figures is extremely simple, and more reliable statistical tests are necessary before his results can be accepted. Nevertheless, the conclusions which he draws from them have a theoretical as well as an empirical justifi-

cation. It is to be hoped that economists will for the present overlook Mr Knight's rather naïve strictures on marginal analysis, and will recognise the value of his pioneer effort in an all-important field of applied economics.

"Can Industry Govern Itself?" By O. W. Willcox. Allen and Unwin. 285 pages. 10s.

The invention of a new terminology may temporarily conceal scientific fallacies, however impotent it may be to correct them. The reader of Mr Willcox's latest contribution to economic literature will soon discover among the discussions on "proration," "unsaturation" and "super-saturation" that he is being invited to approve of restriction of output as the means of securing abundance. The author actually goes the length of holding up the sugar industry (about which he writes with considerable expert knowledge) as the model to which other types of production should be directed to conform. It is fairly generally agreed among economists at the present time that the sugar industry is the most glaring example of unwise protection and restriction. The price of sugar in those countries where "prorating" has been adopted has been raised against consumers; the countries naturally favoured for sugar production have been almost ruined; and the world's agricultural resources have been deflected into unprofitable uses. Apparently Mr Willcox would favour the extension of "prorating" to other branches of production. The essential fact which he ignores is that the possibility of "prorating" some commodities depends upon the free and unfettered production of others. A community of parasites cannot survive by mutual destruction, any more than a beehive can subsist if it contains nothing but drones.

ANNOUNCEMENT

The Nineteenth Century and After for January contains an article putting forward the solution of the economic problem, by A. G. McGregor, author of "The Correct Economy for the Machine Age" (PITMAN).

MONEY AND BANKING

Evolution in the Money Market

THE London money market is no exception to the rule which ordains that great public institutions, if they are to maintain their usefulness, must change with changing times. Not since 1931, when the gold standard was suspended, has any year seen more striking evolutionary developments than that which has just closed. The decisive significance of the exchange agreement between Britain, France and America, announced coincidentally with the devaluation of the gold *bloc* currencies at the end of September, has secured world-wide recognition. In the following article we discuss three other features of the year, whose importance, though less widely appreciated, is undoubted; for all three have established precedents and confirmed our new monetary technique.

We may begin by referring our readers to certain figures which bring out the salient features in the picture. Our first table has been compiled from the returns of the Bank of England at various "key" dates:—

BANK OF ENGLAND
(Million £)

Date (1936)	Gold	Note Circulation	Reserve	Government Securities†	Public Deposits	Bankers' Deposits
Jan. 15	200.2	397.7	63.1	83.9	13.8	110.1
Apr. 1	200.8	413.0	48.6	95.9	9.7	102.6
Apr. 29	202.7	416.9	46.6	101.3	7.5	104.7
June 3	207.3	433.5	34.7	98.5	8.2	98.7
Aug. 5	243.0	454.4	49.6	89.9	17.6	92.7
Sept. 23	247.6	445.7	63.6	82.0	10.4	108.0
Nov. 4	248.7	447.1	62.5	79.0	27.2	85.3
Nov. 18	248.7	444.9	64.6	89.1	14.1	96.1
Dec. 16* ..	313.7	467.7	46.6		10.4	96.2

* This date has been selected because, during the last fortnight of the year, the position was distorted by year-end borrowing at Bank, and by inequalities between Treasury Bill payments and maturities. The note circulation rose on December 23rd to a high record of £474.1 millions. In the Banking Department, the fiduciary note issue was reduced from £260 millions to £200 millions on December 15th.

Our next table shows the composition of the floating debt, distinguishing between Treasury bills issued by tender, and the "tap" Treasuries and Ways and Means Advances which together form the floating assets of the Public Departments:—

FLOATING DEBT
(Million £)

Date (1936)	Tender Treasury Bills	"Tap" Treasury Bills	Ways and Means Advances	Total Departmental Floating Assets
January 18	550.0	328.3	22.4	350.7
March 31	498.0	265.1	19.1	284.2
May 2	528.0	224.7	26.0	250.7
June 6	573.0	214.2	24.0	238.2
August 8	630.0	178.4	31.1	209.5
September 19	621.0	191.4	27.4	118.8
November 7	603.0	234.5	31.7	266.2
November 21	603.0	222.7	27.0	249.7
December 19	617.0	202.3	28.4	231.7

The third table shows the clearing banks' resources:—

CLEARING BANK AVERAGES
(Million £)

Month	Cash	Call and Short Loans	Dis-counts	Invest-ments	Advances	Deposits	Cash Ratio (%)
January	224.5	154.8	344.4	614.6	796.8	2,127.1	10.6
March	213.5	157.7	250.4	619.8	834.0	2,071.6	10.3
April	224.1	155.4	266.7	621.5	849.2	2,116.3	10.6
June	221.6	152.6	327.5	626.2	858.8	2,191.4	10.5
August	230.0	157.7	343.7	625.7	857.2	2,208.8	10.4
September	226.1	161.2	342.1	632.7	862.5	2,219.7	10.2
October	223.6	158.9	349.2	640.0	872.9	2,243.3	9.9
November*	229.6	174.3	327.1	640.2	875.3	2,249.0	10.2

* December figures not yet available.

The first development of the year arose from the summer flight of funds from Paris to London. The actual transfer of these funds over the exchanges was

covered by gold purchases by the Exchange Equalisation Account. To finance these gold purchases, the Exchange Account had to reduce its holdings of Treasury bills and fresh bills had to be issued by tender. Hence the summer changes in the composition of the floating debt, and also the summer increase in the clearing banks' discounts.

French hoarding of British currency, meanwhile, had raised a new problem, for it not only reduced the Bank of England's Reserve but also depleted the cash holdings of the joint-stock banks. Discount rates, consequently, began to harden, and it was clear that stringency might soon develop. The authorities, therefore, took action on lines which had been first suggested in *The Economist* on June 6th, and the Exchange Account proceeded to repatriate part of its new gold and sell it to the Bank of England. Our table shows that by August, as a result of these gold purchases, the Bank of England's Reserve had been replenished, and the joint-stock banks' cash had been restored.

This episode is important because, sooner or later, there will be a reverse capital movement, involving a repatriation of French funds and the dishoarding of British currency. In that event the Bank must obviously be prepared to re-sell gold to the Exchange Equalisation Account, and if it failed to do so, one consequence would be the creation of a plethora of money in the London market. The Exchange Account, further, may well require the gold to protect sterling. Thus, the question has been squarely raised of the proper division of the nation's stock of monetary gold between the Bank of England and the Exchange Equalisation Account. For a discussion of this question, we would refer readers to our issue of October 10th.

Secondly, official preparations for the issue of the Funding Loan in November illustrated the new technique of Government long-term borrowing. When a loan is issued, it is, in effect, underwritten by the Public Departments. The Departments were required to take up large quantities of the Funding Loan issued in December, 1935, and during most of 1936 they were disposing of their holdings gradually, by means of "tap" sales at definite prices, which were varied from time to time. Last September and October they accelerated their sales, presumably with foreknowledge of the November new issue. Their action had a triple effect on the money market. First, the banks increased their purchases of securities. Next the Departments took up more Treasury bills; and, as our table shows, there was a temporary increase in "tap" Treasuries and a contraction in tender issues. Finally, part of the cash received by the Departments, in payment for their sales of the 1935 Funding Loan, was lodged by them in public deposits at the Bank of England, thereby causing a temporary contraction in bankers' deposits and in clearing bank cash. The result was another period of slight stringency, coupled with a drop in the clearing banks' cash ratio to just below the traditional 10 per cent. for the first time within living memory.

Early in November cash was released through the payment of Government dividends. A few days later the new Funding Loan made its appearance. Meanwhile there began the repayment of the sterling credit of £40 millions, which had been granted to the French Treasury by London bankers early in the year. To cover the repayments, gold was drawn out of the Bank of France, and transferred, via the new French Exchange Fund, to the British Exchange Equalisation Account. Once more the authorities in London had to raise sterling to pay for French gold, and early in December the decision was taken to transfer £65 millions of gold from the Exchange Equalisation Account to the Bank,

in exchange for £60 millions of Treasury bills which were released to the Exchange Account by means of a reduction in the fiduciary note issue. These variations in the fiduciary note issue suggest the third precedent for future action—namely, the raising or lowering of the fiduciary note issue as an instrument auxiliary to the Exchange Account's gold purchases and sales.

Meanwhile 1936 has witnessed a steady increase in clearing bank advances, and the previous plethora of credit is slowly being absorbed. Unless appropriate steps are taken, it looks as if the recent era of cheap money may be approaching its end, for the forces now at work are tending to stiffen rates. The trade of the country is doubtless sufficiently robust to bear a slightly higher and more effective Bank rate, but the effect on the cost of the floating debt, and so on the Budget, would be more serious. The authorities have successfully tackled the problems of the past four years, but they are now being faced with a new set of problems demanding entirely different treatment. In particular they may have to transfer more gold from the Exchange Account to the Bank and possibly increase the fiduciary note issue again. Here we must not overlook the ultimate repatriation of funds to France, of a magnitude entailing a reverse movement of gold from London to Paris. Subject to this possibility, the real question is whether the authorities will use the new powers evolved during the past four years. This is why, for more reasons than one, 1936 may prove to have been a crucial turning-point in our recent monetary history.

Financial Notes

The Money Market.—Thursday was the last day of the year, when the banks strengthen their cash holdings for balance-sheet purposes. This fact has overshadowed the money market ever since Thursday of last week, which was Christmas Eve. On that day, three day's Treasury bills had to be paid for, Friday and Saturday being holidays, and there were also few Treasury bill maturities. The market therefore realised that it would be short of funds, while that was also the first day on which money could be borrowed from the Bank of England for repayment in the New Year. A fair amount was therefore borrowed, while the market also went to the Bank for smaller amounts during the early days of the current week. By this time, however, for reasons explained in the following Note, bill-brokers were receiving large amounts in repayment of maturing Treasury bills and had no new bills to pay for. The result was that by the time December 31st arrived both the banks and the market were well supplied with funds, mainly by forcing the Government to borrow at the Bank. The Market itself did not have to borrow on Thursday, and some of the banks were able to lend at $1\frac{1}{4}$ – $1\frac{1}{2}$ per cent.

	Dec. 10, 1936	Dec. 17, 1936	Dec. 23, 1936	Dec. 31, 1936
Bank rate	%	%	%	%
Clearing banks' deposit rate	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$
Short loan rate:—				
Clearing banks	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$
Others	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$	$1\frac{1}{4}$ – $1\frac{1}{2}$
Discount rates:—				
Treasury bills	$\frac{3}{4}$	$\frac{3}{4}$	$\frac{3}{4}$	...
Three months' bank bills	$1\frac{1}{8}$ – $\frac{3}{4}$	$1\frac{1}{8}$ – $\frac{3}{4}$	$1\frac{1}{8}$ – $\frac{3}{4}$	$1\frac{1}{8}$ – $\frac{3}{4}$

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

† This week's rates were $1\frac{1}{4}$ – $1\frac{1}{2}$; $1\frac{1}{4}$ – $1\frac{1}{2}$; and $1\frac{1}{4}$ – $1\frac{1}{2}$ per cent., for the three classes of loans, respectively.

There was very little buying of bills, and there is no market rate for hot Treasury bills, as no new bills have yet been issued this week.

The Bank Return.—The key to the Bank Return of this week lies in the money market's preparations for the end of the year. In these days, when Treasury

bills provide the market with its main stock-in-trade, it is possible to reduce borrowing at the Bank of England by arranging for heavy Treasury bill maturities immediately before the end of the year, while postponing payments for new bills until the New Year has opened. This is possible because applicants for Treasury bills at the weekly tender have the option of choosing which day in the following week they will pay for their bills. The result was that by December 30th the Government had had to meet the bulk of the week's maturities of Treasury bills, and was not due to receive payment for the new bills until January 1st. During the first part of the week, therefore, it had to draw on its own deposits and also borrow heavily at the Bank of England.

BANK OF ENGLAND					
	Jan. 1, 1936	Dec. 9, 1936	Dec. 16, 1936	Dec. 23, 1936	Dec. 30, 1936
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	200.0	248.7	313.7	313.7	313.7
Note circulation	411.7	458.9	467.7	474.1	467.4
Banking Department:—					
Reserve	48.9	50.5	46.6	40.2	46.8
Public deposits	10.0	17.5	10.4	21.7	12.1
Bankers' deposits	130.5	87.0	96.2	72.2	150.6
Other deposits	37.3	38.9	38.8	38.8	39.2
Government securities	110.4	81.7	89.1	83.1	134.5
Discounts and advances	23.7	8.1	6.7	6.4	17.5
Other securities	13.0	20.9	20.8	21.0	21.2
Proportion	27.4%	35.2%	32.0%	30.2%	23.1%

These movements are illustrated in the table. Government borrowing on Ways and Means at the Bank has raised Government securities temporarily to £134.5 millions, or by some £40 or £50 millions above normal. The cash so borrowed was disbursed in repayment of maturing Treasury bills, and found its way into the joint-stock banks, thereby helping them to strengthen their cash position for the end of the year. Meanwhile the return of some of the Christmas currency has both reduced the note circulation and provided the banks with additional cash. Market borrowings from the Bank were only about £11 millions. All these operations explain the increase of nearly £80 millions in bankers' deposits. Next week the banks will again be lending more freely, while the market will have paid for its new Treasury bills. The Bank return should therefore be of more normal dimensions.

Christmas Currency Expansion.—The returns of the note circulation suggest that, notwithstanding the constitutional crisis, Christmas trade was well up to the average of the preceding recovery years. The actual details are shown below:—

NOTE CIRCULATION (£ millions)				
	1933	1934	1935	1936
Mid-November	367.5	376.9	398.9	444.9
Christmas week	391.9	405.1	424.5	474.1
Increase (actual)	24.4	28.2	25.6	29.2
Increase (per cent. of Mid-November circulation)	6.6%	7.5%	6.4%	6.6%

The absolute increase was the largest of any of the past four years, but when compared with the size of the note circulation immediately before each Christmas expansion began, the percentage increase is barely up to the average. Too much must not be read into these last percentages, as any such comparison is qualified by such facts as the 1936 foreign currency hoarding and the absence of any serious rise in retail prices. On the whole, these figures suggest that the recent Christmas trade was well up to previous expectations but was not of outstanding magnitude. It looks as if the reactions of the constitutional crisis may have had a slightly retarding effect.

The Foreign Exchanges.—It has been a quiet week in the foreign exchange market and there have been no wide movements in rates. The Christmas holiday was, of course, a prolonged interruption, and busi-

ness as a whole has not been substantial. The franc spot rate has been firmly held throughout at about Frs. 105½, but the forward franc has displayed a certain weakness, the discount for three months being quoted on Thursday at Frs. 2½–3. The guilder, both spot and forward, has been firm, and forward guilders bought at the time of devaluation three months ago have been delivered without any effect on the rate. The forward rate is now more or less at par. Swiss francs are in much the same position and are very firm. The belga has been a little irregular, but the strength of its position is shown by the current three months' forward premium. Registered marks have been weak, probably on account of the current political fears, and at one time went as far as 54½ per cent. discount, subsequently recovering to about 52½ per cent. There has been no change in the ordinary rate. The dollar has displayed an erratic weakness against sterling, moving at one time to \$4.92, but this was only temporary and due to the transfer of money to England for lending in London into the New Year. This is only a passing movement and reflects no underlying weakness. The only other feature of interest has been the weakness of the yen, which may possibly be attributed to the budgetary situation in Japan. At one time the rate weakened to 1s. 1½d.–1s. 2d., but on Thursday there were signs of a recovery.

Compensation Brokers, Limited.—Further details are now available concerning this new undertaking for developing trade between the Dominions and Germany, the formation of which was announced in *The Economist* of December 19th. It is promoted by Anglo-Foreign Securities, Limited, a subsidiary of Messrs J. Henry Schroeder and Company and Hambros Bank. Lord Glenconner is chairman, and the other directors are Mr E. W. D. Tennant and Mr P. F. Tiarks. Mr Julian Piggott, general manager of the export department of the British Iron and Steel Corporation, is to be managing director. As we explained a fortnight ago, the company is to act as an intermediary, operating on a commission basis. It will not facilitate the importation into Germany of raw materials used exclusively for re-armament, and it will take great care not to deprive British exporters of trade. On the contrary, the underlying idea is to obtain for Germany orders from the Dominions which otherwise would go to countries such as the United States. Even if an order is obtained for Germany to-day on the ground that Great Britain is unable to fulfil it, this would not necessarily constitute a precedent for future years when Great Britain might be able to supply. Within these limitations, whose existence should be clearly understood, we agree that the scheme may perform a useful function under the present abnormal conditions of international trade, but we repeat our previous warning that great care will be needed in its operation.

Canadian Banking Trends.—Sir Charles Gordon, the president, and Mr W. A. Bog, a general manager of the Bank of Montreal, discussed the Canadian banking position at last December's annual meeting. The banks are in a very liquid condition, but owing to the diminution in the demand for advances they have had to add to their holdings of securities. Naturally they prefer to hold "shorts," for this minimises the risk of future depreciation, but the trouble is that most short-term securities yield a very low return. This is a more serious matter for the Canadian banks than for the American banks, for whereas the latter now pay no interest on banks' deposits, 70 per cent. of the Canadian banks' deposits consists of money lodged with the savings bank departments and therefore subject to interest. One consequence is that the rate of interest paid on savings deposits, which had stood at 3 per cent. for thirty years, has since 1933 been reduced to 1½ per cent. The contraction in the demand for bank advances was ascribed by Mr Bog to various familiar causes, such as greater economy and efficiency in production and distri-

bution and the growing integration of Canadian industry. The report of the Royal Bank of Canada also suggests that the recent reduction in the wheat carry-over has facilitated the liquidation of outstanding wheat loans. This has relieved the banks of an anxiety which has persisted for several years, but it does not solve the banks' other problem of finding fresh credit-worthy borrowers. We may note in conclusion the retirement of Mr Bog from his position as one of the Bank of Montreal's general managers. He has been appointed a Vice-President of the bank.

Bank of New South Wales.—At the general meeting of the bank, held in Sydney on November 27th, Sir Thomas Buckland, the President, strongly criticised the new legislation in New Zealand which requires the trading banks to maintain statutory deposits at the Reserve Bank. These deposits must be not less than 3 per cent. of the trading banks' fixed deposits and 7 per cent. of their call deposits, and the Reserve Bank also has power to vary these minimum ratios at will. As these minimum deposits must be maintained, the Bank of New South Wales refuses to regard them as part of its cash, but shows them as a special item of £342,000 in its latest balance sheet. Sir Thomas also criticised the tendency of the New Zealand Government to control the Dominion's export trade. In discussing Australian banking conditions, Sir Thomas pointed out that the ratio of advances to deposits was already as high as 94 per cent., and that some reduction in the ratio was called for. The banks have already raised their rates on fixed deposits, which eventually will mean an increase in the advance rate of interest, and other steps are being taken to control advances. The fact that the cash reserves of the trading banks are determined by fluctuations in London funds, which in turn depend upon the ebb and flow of trade, makes it difficult to pursue a consistent banking policy. It is clear from the whole of Sir Thomas' speech that Australia's banking and monetary system is still in process of evolution, and in several respects it still needs greater elasticity.

Average Money Rates.—For purposes of record we give below a table of average short loan and discount rates over the past eight years. We must warn readers, however, that conditions in the money market have recently changed so much that at the moment average rates are misleading:—

AVERAGE MONEY RATES				
Year	Bank Rate	Market Rate, 3 Months' Bills	Deposit Rate, Banks	Short Loans
1929	£ s. d. 5 10 0	£ s. d. 5 5 4	£ s. d. 3 10 0	£ s. d. 4 12 3
1930	3 8 5	2 12 3	1 8 5	2 9 6
1931	3 18 7	3 11 0	2 1 0	3 0 10
1932	3 0 2	1 16 9	1 5 2	1 15 7
1933	2 0 0	0 13 10	0 10 0	0 15 5
1934	2 0 0	0 16 7	0 10 0	0 16 10
1935	2 0 0	0 11 3½	0 10 0	0 14 10½
1936	2 0 0	0 11 10½	0 10 0	0 15 6

To-day, most rates in the money market are largely controlled. Thus, during most of 1936, the clearing banks lent money at fixed rates of $\frac{1}{2}$, $\frac{3}{4}$ and 1 per cent., the rate depending on the collateral lodged against each loan. Other banks and financial houses, usually known as "outside lenders," varied their rates at will, but as a rule charged $\frac{1}{2}$ per cent. Discount rates were also subject to agreement, for the clearing banks during most of the year fixed a minimum buying rate of $\frac{1}{2}$ per cent. for Treasury bills and also refrained from buying "hot" Treasury bills—that is, bills with their full three months to run. The minimum buying rate was usually the effective rate. Three months' bank bills were dealt in more freely, and so their average rate for the year was more representative of actual conditions.

THE STOCK EXCHANGE

Green Light or Amber?

THERE are no question marks to set against the investment record of 1936. It was the most brilliant year since recovery first raised its head in 1932; post-war comparisons were challenged; and in some markets activity was reminiscent of pre-war vintage years. At times, even, the physical resources of dealers were strained almost to the limit, and the markets threatened to boil over into a boom.

Any diversified holding of industrials, therefore, was bound to yield impressive capital appreciation as well as excellent dividends. The Actuaries' Investment Index of 178 equity shares, for example, records an advance of 12.4 per cent. over the year, while the *Financial News* index of 30 industrials—a more sensitive market indicator—has appreciated by 16.5 per cent. From the end of May to mid-November the advance in share prices was almost uninterrupted. The year began with renewed emphasis on cyclical domestic recovery, fed by building activity, but before two months had passed the market was in the middle of a re-armament boom. During the winter months, rising prices and production of primary commodities introduced a further shift in market interest towards rubber, base metal and oil shares, and the bonds of depressed producing countries. These trends may be studied in detail in the tables of active securities and investment indices which appear on page 44.

Almost every important market group has now enjoyed a spectacular recovery. Even the laggard industries like cotton and shipbuilding, handicapped commercially by export problems and financially by preference dividend arrears, have received the speculator's attention. True to expectation, irredeemable gilt-edged stocks have reacted amid this plethora of industrial gains, though their fall has been no greater than about 2½ per cent. The forces which influence fixed-interest stocks are still making for a fall rather than a rise. Cheap money remains, together with the banks' stabilising interest in the gilt-edged market. But in a period of rising prices the relative attractions of "money stocks" are inevitably diminished. No prudent investor anticipates a dramatic fall through the gamut of fixed-interest securities, but many will wonder whether the time is approaching when living on a bank deposit may be preferable to holding unlimited quantities of gilt-edged stocks.

This, at any rate, appears a reasonable inference from the course of the Old Consols index, which is charted in the adjoining column. But the decisions required of the investor in industrial shares are even more complex. In about four-and-a-half years equity share prices have risen, on the average, by approximately 100 per cent. Both in duration and magnitude, this advance is significantly close to the limit of earlier recovery movements. In many directions, the rise in equities has clearly not exhausted its impetus, but the record of the past year shows that significant sectional changes are in progress. These may well be reinforced by the manifest shift of emphasis from natural economic factors—"honest business," as Mr Arthur Chamberlain calls them—towards re-armament expenditure. Does this necessarily imply the continued expectation of prosperity for makers of ploughshares?

Industrial investors, in fact, must consider two basic quantities: output and profit-margins. In some industries the capacity for a further expansion of current output is now limited. Steel and engineering companies,

in particular, are unable to keep pace with current demand. Other things being equal, the increase in earning power of the constructional industries may be less rapid this year than last, even assuming that the general level of business activity continues to improve. But will other things be equal? In particular, will profit-margins per unit be maintained in industry generally? The answer depends upon the relative division of expenses, in different industries, between prime costs and indirect costs. Industries with small prime costs—like brewing—can resist the effect of rising prices longer than those whose expenses are incurred largely for materials and, to a lesser extent, wages. And companies which cater for "consumption goods" trades may have greater difficulty in passing on the incidence of rising costs to the consumer than those in the construction trades.

At the threshold of the New Year it is clear, at least, that the rising trend of prices, which means so much for the holder of rubber, base metal and oil shares, is much less of a bull point for the industrial shareholder. It would be most dangerous, at this stage of recovery, if the authorities responsible for commodity restriction schemes were to allow the initiative to slip from their hands, and thus to precipitate a speculative boom, instead of a natural movement towards freer production.

GILT EDGED AND INDUSTRIAL SHARE
MOVEMENTS SINCE 1931

Among commodity shares, the discounting of improved earnings prospects has been curiously uneven; it has been carried farther for copper shares than for other base metals, and by comparison the present level of rubber shares is the least forward-looking of all. On these groups generally (including oil shares), speculative activity seems likely to be mainly concentrated for the next few months. When the bulls are roaring after higher commodity and metal prices, the agile but watchful quick-turn operator has most chances of profit.

For the general investor, who usually expects to hold what he buys, say, for at least a year, it follows that the run of the industrial market may be less favourable. By any investment reckoning, four and a half years is a long life for a recovery market. When the small speculative investor reappears at the door (as he did last year) and it becomes impossible to satiate the "stags" with enough small, second-rank industrial issues, the more experienced and conservative investor may well

look towards the window. Throughout the recovery, Stock Exchange prices have fully kept pace with rising dividends. The dividend yield on the shares included in the Actuaries' Index was as high as 5.92 per cent. at the end of June, 1932, and a year later it had fallen to 4 per cent. But between the current yield (3.68 per cent.) and those of a year ago and two years ago there is no quotable difference.

And what, in fact, are future dividend expectations? The coming Spring will certainly produce a good crop of company reports, and rising costs may not reveal themselves as a potent influence until reports are published a year hence. At this stage of the cycle, however, the possible range of spectacular advance in profits is becoming more restricted, except, perhaps, in the traditional export industries. It will be generally agreed that, on any representative batch of ordinary shares, a permanent return at a rate only ½ of 1 per cent. higher than that on Government securities is much too low, and that, consequently, even a relatively large increase in dividends in the next few months would not, in itself, justify a new advance in ordinary share prices over a wide front. Finally, if the basis of recovery under the ægis of re-armament were to be called in question, perhaps a year hence, past experience strongly suggests that the necessary adjustment in equity prices would begin some months in advance.

In short, after a long and unimpeded journey along the road of recovery, the investor may find short excursions preferable to touring during the coming year; and some of the less frequented side streets—like commodity shares and bonds and shares in export trade companies—may be safer than the crowded main roads of heavy industry, rails, and certain consumption trades shares. But, whichever route he takes, the investor should be ever on the watch for road-side signals, and, above all, be ready to make the appropriate movement if the traffic lights change from green to amber.

Investment and Company Notes.

A Commodity Share Portent?—Commodity shares have been most in the picture during this week's four-day market. Rubber jumped to 111½d. on Monday, and carried the prices of leading shares to yet higher levels. Some, including Gula Kalumpung and Kuala Lumpur, were as much as 5s. higher on the day, and most of the pound shares appreciated by a sixteenth. But the weak nature of some recent speculative buying of the commodity was subsequently exposed. Trade buyers, significantly, were holding aloof, and operators were quick to snatch their scant profits. Although the public was still a buyer of rubber shares in mid-week, therefore, Lane's signal, and falls in quotations, though not severe, were general. Since rubber shareholders can look forward to potential earnings yields of well over 8 per cent. with rubber 1d. below its present price, it would be unreasonable to expect a sharp fall in existing share levels. But the reaction of the commodity market to the Committee's efforts to control speculative buying will be important during 1937. The danger, for consumers and investors alike, is that boom speculation may get out of hand. Hence, the reaction in rubber and base metals in mid-week was welcome. In all commodities, expectation is centred upon rising prices and increased production, but the market is not uniform in its valuation of prospects. Copper shares stand relatively highest, followed by base metal issues, and finally rubber shares.

Home Railway Year.—The four home railways celebrated the fifty-second week of 1936 with an aggregate increase of £624,000 in gross traffic receipts, as compared with a Christmas week in 1935. Even when allowance is made for the "splitting" of Christmas travel between two weeks' returns last year (when Christmas day fell on a Wednesday), the figures still suggest a satisfactory Christmas movement of merchandise and men. The totals for the fifty-two weeks show an increase of £5,056,000 over 1935, of which 33 per cent. came from passengers, 50½ per cent. from merchandise and only 16½ per cent. from coal and coke:—

1936 GROSS RAILWAY RECEIPTS
(52 weeks)
£000's

Traffic	L.M.S.R.	L.N.E.R.	G.W.R.	S.R.	Total
Passenger	25,772	16,784	10,935	15,954	69,445
Gain over 1935	693	362	236	366	1,677
Merchandise	24,932	17,030	9,967	3,251	55,180
Gain over 1935	1,414	590	480	71	2,555
Coal and Coke	12,675	12,149	5,274	1,611	31,709
Gain over 1935	405	375	18	26	824
All Classes	63,379	45,963	26,176	20,816	156,334
Gain over 1935	2,512	1,327	754	463	5,056

The London, Midland and Scottish Railway alone, it will be seen, provided half of the fifty-two weeks' net gain. The increases on the other three lines were divided, roughly, according to the magnitude of each company's operations. This result must be accounted somewhat disappointing for the London and North-Eastern, which has a large stake in the fortunes of the heavy industries. During the first eleven months of this year *The Economist's* Index of Business Activity showed a rise, as compared with 1935, of 6.6 per cent. The increase in total railway receipts during the past fifty-two weeks has been 3.3 per cent. It is evident that, while industrial prosperity has not by-passed the railways in 1936, many of the limiting factors on revenue, to which Sir Josiah Stamp alluded at the L.M.S. meeting, have not been eliminated.

Railway Dividend Prospects.—Before the financial year ends, the L.N.E. still has five and the other railways four days to go, and the figures for the precise calendar year, when published, will include an extra day for leap-year in 1936. Already, however, on the basis of known facts, it is possible to make more than an informed guess (though less, perhaps, than an informed estimate) of possible dividends. The approximate incidence of decreased rating and freights rebate liabilities, and of higher wage costs can be roughly allowed for. The unknown factors are the extent to which higher working costs have offset part of last year's increase in revenue; and, secondly, the way in which amounts recovered for past over-payments on account of rates and freights rebates will be allocated between reserves and dividends. Making reasonable assumptions under the first head, but allowing for no dividend windfalls whatever under the second, it would appear that something more than 1 per cent. and less than 1½ per cent.

LONDON
Lombard St.

has been earned for the year on L.M.S. ordinary; something in the neighbourhood of $\frac{1}{2}$ per cent. on L.N.E. second preference; a little more than 2 per cent. on Great Western ordinary; and a mere token amount, which may be anything from a fraction up to 1 per cent., on Southern deferred. The market takes it for granted that the Great Western directors will maintain the sweet simplicity of a 3 per cent. dividend, but any generosity of the other three railways is likely to depend on the extent to which rating and freight rebates windfalls are drawn upon. The L.M.S. already appears to be committed to a policy of one-hundred-per-cent. conservatism in this respect. Other boards are likely to frame their policy with due regard to the serious rise in costs for materials, coal (and, not improbably, wages), which will need to be faced next year. At present prices, marginal railway stocks appear to offer the investor more inducement to lighten than to extend his portfolio.

Wall Street in 1937.—For several months, Wall Street has been blessed with unanimous prophets, some earning honour in their own country, and many reaching similar conclusions a thousand leagues away. All are agreed that the American economy is in an inflationary phase, whose concomitants are rising prices, higher rents, and increasing industrial activity. Part of the latter is attributed to sheer physical necessity. The re-equipment movement in the utility and railroad industries, which began last Spring, has still a good way to go. Major concerns like U.S. Steel and the utility companies, are in the midst of expansion programmes. The constructional trades should therefore be facing a good year. This applies particularly to heavy steel producers, who may have an opportunity during the coming year to widen their profit margins. The shares of railroad equipment, rolling stock, and brake companies, have already an active following, since the railroad companies are now able to afford renewals and reconditioning. The building industry has so far achieved only a partial recovery, and has certainly not made the same major contribution to industrial revival as its counterpart in Great Britain. The business outlook, altogether, is favourable, but the investor should take note of certain more doubtful administrative and social features. The foreign investor may be made less welcome on Wall Street, if means can be found to discourage him. But he should not object, if his memory goes back eight years, to the Administration's anxiety to stop the market breaking into boom. Some rise in industrial costs must also be reckoned with. Labour is being cautiously handled, but it is still restive. And Congress has yet to take off its coat and start work. But although the President may not love Wall Street, he is yet a bull of American recovery. By helping his own cause, particularly on lines which the market venerates as "orthodox," he would be confounding his harshest critics and doing a multitude of ordinary investors a good turn.

Bulgarian Debt Agreement.—The history of the Bulgarian debt service during the past four years might well be presented under the title "The Mystery of the Effective Leva." That elusive unit has been the key to the actual debt service since the arrangement of April, 1934. Under this scheme, some $37\frac{1}{2}$ per cent. of the service was to be provided in non-interest bearing bills and $32\frac{1}{2}$ per cent. in effective leva. "Effective" was, from the first, the operative word. The full $32\frac{1}{2}$ per cent. was provided, but owing to difficulties in obtaining exchange, only 15 per cent. was actually transferred to the creditors, leaving 17 per cent. credited to blocked accounts. In March last a new agreement was reached, under which the actual payment was raised to $21\frac{1}{2}$ per cent., leaving 11 per cent. to be placed in blocked accounts as before. Then, last November, a settlement for the final discharge of untransferred arrears, negotiations 40 per cent. of their value paved the way for negotiations for a new agreement in December. This provided that $32\frac{1}{2}$ per cent. of interest is actually to be paid,

1937 and 1938, and new discussions will take place before 1939. As before, the Budgets for 1937 and 1938 will include the full debt service, but the untransferred $67\frac{1}{2}$ per cent. of interest will in effect never reach bondholders. After it has been paid to the League of Nations Commissioner in non-interest-bearing Treasury bills, it will be returned at the end of each year when transfer of the $32\frac{1}{2}$ per cent. in foreign exchange has actually been made. Though the basic percentage should be comfortably afforded by Bulgaria, the arrangement suggests that her Government recognises the wisdom of improving her credit, and giving the bondholders some definite assurance of payment.

London Transport's Half-year.—London Transport has justified its claim to record pre-holiday operations by publishing an excellent traffic return. For the twenty-sixth week of the board's financial year (which ends in June) an increase of £47,000 was recorded, compared with Christmas week in 1935. The improvement in traffics over the half-year is analysed below:—

TRAFFIC RECEIPTS (BEFORE POOLING WITH THE MAIN-LINE RAILWAYS)

26 weeks to December 28, 1935	£14,147,000
26 weeks to December 26, 1936	14,607,200
Increase for past half-year	£460,200 (3.3%)

The rate of increase during the past half-year is more than double that for the first half of 1935-36, which showed a gain of 1.46 per cent. compared with 1934-35. But the vital consideration for the "C" stockholders is how much of the gross increase will be retained, net? The earnings last year for the "C" stock were some £384,000 short of meeting the $5\frac{1}{2}$ per cent. dividend which is due either this year or next. It is now evident that London Transport is even more vulnerable to rising costs than the main line railways. Further wage adjustments have accrued since last June, the cost of stores is rising, and fuel costs may conceivably follow suit. Under these conditions, any estimate of the half-year's net earnings for "C" stockholders must be tentative, but something more—though not much more—than 2 per cent., actual, should be achieved. Meanwhile, the market is taking a less optimistic view about the possibility of windfalls arising from the "generosity" of its renewals provisions during the last three years. But the "C" stock is still in demand, after its recent fall to 95, on the argument that a reasonably stable 4 per cent. income with the prospect of a further $1\frac{1}{2}$ per cent. every third year, is worth something nearer par. It closed on Thursday at 98 $\frac{1}{2}$.

Cordoba Central Sale.—After many months of market rumour, the official terms of the sale of the Cordoba Central Railway to the Argentine Government have been announced this week. The agreement, which

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

Address

is subject to ratification, provides for Government acquisition of the undertaking in consideration of the issue of £8,800,000 State Railway bonds, guaranteed by the Argentine Government, a payment of £700,000 in cash, and a further sum for stores. The bonds will carry interest at 4 per cent. and will be repayable through a sinking fund. They are, however, to be "blocked" for five years—a disadvantage which the market had anticipated, although no exchange risk is assumed. With the cash portion of the deal, the company must pay off its creditors (£702,000 at June last) and it must provide further for staff payments and expenses until the bonds are released. These terms do appear very fair, in relation to the level of Cordoba stocks early in 1936, and to its small equity in Argentine recovery. Market estimates of the eventual payments to be received by the various classes of stockholders put the share of the $4\frac{1}{2}$ per cent. first debentures at 70-80 per cent., of the income debenture stock at 25 per cent., and of the consolidated income stock at perhaps 6 per cent. These accord broadly with current prices, which have jumped spectacularly during the past account. But the Argentine Government's message to Congress, urging declaration of a new policy. It is suggested that, eventually, all the railways should be acquired within the limits of available finance, since railway tariffs should be determined without regard for remuneration of shareholders. British investors may, perhaps, welcome this statement with a certain grim humour. But the tone of the Argentine Press is distinctly cautious, and the example of local and other State-owned lines is referred to in somewhat critical terms. The new policy, further, may represent the sincere intention of the Government, but "the limits of available finance" will probably circumscribe its application.

Aircraft Company Profits.—The announcement by Fairey Aviation of an increased profit of £60,676, against £39,613, compares most favourably with recent aircraft producers' results. *Fairey*, it is true, is an established maker of military aircraft, but even these profits would have been scoffed at by many an aircraft share speculator last spring. *De Havilland*, on the other hand, has been a victim, rather than a beneficiary, of the air programme. Its modest share in Air Ministry work has been inadequate compensation for the delay it has experienced in obtaining supplies, and for sub-normal export business. The fall in profits, however, from £77,367 to £71,709, has not threatened the 10 per cent. dividend. But among other companies there is an almost uniform absence of net earnings. *Pobjoy Airmotors*, for example, has published a first report covering eighteen months, showing a loss of £38,308. This heavy deficit is attributed to costs incurred in changing from civil to military subcontract work. *Westland Aircraft*, whose accounts covered fifteen months, reported a net profit of no more than £3,250. This result—which compared most unfavourably with the past record of the Petters aircraft works acquired by the Westland company—caused no little dismay in the market. Another boom flotation, *Aero Engines*, formed eighteen months ago under the auspices of General Air-craft, has incurred an initial loss of £11,851. The balance sheet shows that the factory and contents were revalued in June, 1935—a somewhat unusual procedure for a concern which, a few days previously, had paid a fixed consideration for its assets. This process has disclosed a "surplus" of £247,000, and, from the resulting reserves, special stock depreciation of £60,000 has been provided, in order to meet depreciation "rendered necessary because the company's business differs from that previously carried on at the works." Finally, both *Airspeed* and *British Marine Aircraft* produced disappointing reports on Christmas Eve, a date which might have been considered somewhat inconducive to a close study of the accounts by shareholders. In more than one case, shareholders were first apprised in the reports of changes in directorates during the year.

Some Aircraft Questions.—The position of British Marine Aircraft deserves special consideration, "in the light of this week's meeting. The company was formed to exploit a licence to manufacture American "Sikorsky" flying boats. The prospectus described a contract for the sale of five machines. This contract, which had an aggregate value of £225,000 in February last is now to be cancelled in consideration of £3,000, and the company will in future devote itself to sub-contract work. The chairman has explained that, although this contract had been made with a company whose capital at the time was inadequate for commitments of this order, the purchase was in turn guaranteed by British Pacific Trust. British Marine Aircraft has, for many weeks past, been the subject of merger rumours. Together with British Aircraft, it was formed under the aegis of Aircraft Industries Corporation, which has subsequently acquired indirect control of Westland through a controlling interest in Petters. The chairman explicitly stated on Wednesday that negotiations were afoot for amalgamation "with another well-known company." But apparently a wider scheme has not yet been entirely abandoned by some interested parties. There is one major objection of principle which may be urged against mergers of fledgling companies, which have yet to prove their profit-earning capacity. No adequate substitute for a profits record exists, and independent expert valuations are but a second-best. An exchange of shares, based on Stock Exchange values in a narrow market, may be equally open to criticism. Investors generally may be advised to consider the implications of Lord Swinton's warning, a fortnight ago. It is clear that the profits of established producers on the Air Ministry's list may be satisfactory, but they will be controlled, nevertheless. The position of the sub-contracting firms, however, when the first rush of the programme has been completed, will be much more equivocal.

Company Results of the Week.—Owing to the Christmas holidays, there have been no spectacular company reports, and a much abbreviated summary of profit and loss accounts consequently appears on page 43. The results, which include those of *Fairey Aviation* and *United Serdang*, are discussed in detail on page 35 under the heading "Shorter Company Comments."

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—*Oroville Dredging*, *Tarkwa Banket West*, *Obuom Gold Mines*, and *Stoughton (Perak) Rubber Plantations*. At the *Oroville Dredging* meeting the chairman remarked that the head consulting engineer had declared the Pato Consolidated property to be one of the large placer deposits of the world. Lieutenant-Colonel Johnson, at the *Tarkwa Banket West* meeting, reported that the company had taken a quarter share in an option to purchase the Tokosea Concession in the Enchi district. At the *Stoughton (Perak) Rubber Plantations* meeting, Mr A. P. Hadow discussed the joint purchase of the Moh Lee property by *Sungei Reyla Company* and his own undertaking, neither company being able to undertake the purchase alone. At the *Obuom Gold Mines* meeting, Mr Howell Hopwood expressed regret that the diamond drilling carried out so far in the hope of finding a continuation of the reef had proved negative, but he pointed out that the company still possessed a complete modern milling plant.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: JANUARY 5 ACCOUNT: JANUARY 7

The Stock Exchange saw the old year out with a volume of trading which did credit to the tail-end of a three-week account. Only commodity shares and foreign bonds have made the headlines, and there the pace has been a little too good to last. The tone right to the eve of the New Year remained good, although interest in industrials was selective and fixed interest securities remained in glum condition.

Gilt-edged stocks, indeed, have been very uninspired. No volume of selling was reported, but mere lack of interest proved depressing, and the prospect of new corporation borrowing some time in the future did not help the market. Foreign bonds, indeed, have provided the feature among Government issues, on the logical argument that rising commodity prices must help even "busted bonds." Chilean, Peruvian and Brazilian issues moved steadily higher. Chinese were supported on the Gilbertian episode of President Chiang Kai-Shek's release. Even European bonds—and particularly German issues—shared in the forward movement.

Home rail stocks faced the final traffic figures with confident expectation, but made no substantial move (except for Southern preferred) when the bumper results were published. Great Western and L.M.S., indeed, made most of their rise on Tuesday. In the Argentine market, Cordoba Central issues were the feature, on the purchase terms agreed with the Argentine Government and discussed on page 28. Other stocks were encouraged by crop news.

The last week of the holiday account naturally saw quiet conditions in the industrial markets, although there were a number of bright features. Outstanding in the iron and steel market were Cammell Laird on the order for a Cunard White Star Liner, John Brown on the prospect of an order for the Navy, and Dorman Long. Excellent coal output figures helped a number of coal company shares, with Bolsover prominent. Standard and Rolls Royce led in the motor section on good trading reports. The demand for Electrical Equipment issues was well maintained on the general prospects for the industry, British Insulated being strong on bonus hopes. Woolworth were supported in anticipation of the results. Brewery issues gained a little in mid-week on higher beer consumption figures. Early in the week General Accident were the centre of interest among insurance shares on the share-splitting proposal. Movements in the miscellaneous industrials sections were small and not of great importance.

Business in the oil share market was brisk at the opening of the week, although confined to the leading issues. News of higher prices in America, and the optimistic statement of the president of Standard Oil of New Jersey were the main causes of the early strength. Prices were fairly well maintained into mid-week, although business tailed off considerably. Shell and Royal Dutch continued to improve, and Anglo-Iranian were a feature. The rubber shares market was very active at first, but prices were not maintained since the drop in the commodity price confirmed anticipations, and the approach of the end of the account encouraged profit-taking. Carry-over facilities were difficult to arrange. In mid-week the recovery in the commodity price saw security prices once more on the upward grade. Business in the tea-shares market improved as the week advanced, and demand, although small, spread from Ceylon tea-cum-rubber issues to the Indian section. There were no public auctions in Mincing Lane to provide a check on tea prices.

Very satisfactory conditions prevailed in the Kaffir market despite the holiday account. Anglo-American Corporation were prominent, and many shares in the Far Eastern and Far

Western Rand groups were very well supported, both from London and from the Cape. The newer companies were favoured. Central Mining reached a new high in mid-week. Amalgamated Banket improved steadily in an otherwise fairly quiet West African section; Ashanti were not affected by the dividend. Rhodesian copper issues were one of the brightest features of the mining market, and prices improved on a considerable turnover. Roan Antelope were laggard, owing to the profit-taking which was apparent early in the week; the outstanding feature was the new high touched in mid-week by Rhokana. A good demand in the tin shares market found supplies inadequate and prices generally were higher.

"FINANCIAL NEWS" MARKET INDICATORS

	Dec. 23	Dec. 24	Dec. 28	Dec. 29	Dec. 30	Dec. 31
Approximate total of bargains recorded in S.E. List	8,108	5,279	8,259	10,142	11,206	11,387

FOREIGN STOCK EXCHANGES

NEW YORK

A surprise Christmas present for the railway companies came on the eve of the holiday from the Interstate Commerce Commission, which gave authority for the raising of trans-Continental freight rates to an extent sufficient to compensate for the revenue lost when the emergency surcharges were not renewed. This gave only a temporary fillip to railroad securities, and after the holiday the markets generally were more affected by technical factors, particularly by sales of securities at a loss for income-tax purposes. The opening day of this week found prices drifting downward, due in part to the spread of labour disturbances, but commodity stocks were able to resist the trend. Conditions improved rapidly as the week progressed, and gains of up to three points were registered in mid-week. Steel and railroad issues were in the lead, the latter being stimulated by a year-end estimate of a 35 per cent. increase in earnings by 35 major railroads during 1936, and by the optimism which had been spreading even before the I.C.C. authorised the increase in rates. Oil and building shares were also well to the fore, but motor issues reacted on the activities of the labour unions. Business reports are still excellent. *Iron Age* estimates steel mill activity at 79.5 per cent. of capacity, against 78 per cent. last week; and orders in hand are sufficient to maintain this output for some time, although strikes in the automobile industry may begin to affect demand for steel. Electricity output maintains its gain over last year, the week to December 26th showing an increase of 12.7 per cent.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a future date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

QUASI-ARC PURCHASE TERMS.—The directors of British Oxygen have allotted to Turner and Newall 170,000 ordinary £1 shares, having market value of over £1,000,000, in exchange for 400,000 shares in the Quasi-Arc undertaking. The shares are fully paid and have been converted into stock.

COMPANY MEETINGS

OROVILLE DREDGING COMPANY,
LIMITED

COMPANY'S VALUABLE INTERESTS

The twenty-fifth ordinary general meeting of Oroville Dredging Company, Limited, was held, on the 30th ultimo, in London, Mr F. W. Baker (the chairman) presiding.

The Chairman, in the course of his speech, said that dividends had been received on their holdings in Pato Mines (Colombia), Bulolo and Asnazu amounting to £65,131, and other credits increased the item to £66,568. With the amount brought forward and deducting the dividend paid in January, £164,166 was carried forward.

Pato Mines (Colombia) held 40 per cent. of the issued capital of Pato Consolidated, which company had during the year considerably extended its holding in Colombia by further purchase and options acquired over dredging areas by its existing holdings. Dredging and drilling results had warranted the decision to install four further dredges and in addition hydraulic equipment on a substantial scale.

Mr Short, the head consulting field engineer of Placer Development, estimated that, based on dredging and extensive testing, the properties controlled by Pato Consolidated contained 189,000,000 cubic yards with an "indicated" recovery of 17.4 cents per cubic yard, to yield a profit of approximately \$21,350,000. He also estimated a further 300,000,000 cubic yards of "probable" ground of a recoverable value of 12.9 cents per cubic yard with a profit of approximately \$23,000,000. He further added that the Pato Consolidated property stood out as one of the great Placer deposits of the world. Their holding in Bulolo Gold Dredging had been increased to 73,843 shares. That company made a net operating profit for the year of \$3,190,000 and two interim dividends of \$1.40 (Canadian) and an interim dividend for the current year of a similar amount had been received. The properties of Bulolo, according to indications based on drilling results, contained 204,000,000 cubic yards of an average recoverable value of slightly over 33 cents with gold at \$35 per fine ounce, and a net operating profit of \$50,000,000. It was anticipated that when the full fleet of dredges now under construction was in operation Bulolo should be earning \$4,500,000 to \$5,000,000 per annum on the existing capital of 1,000,000 shares of \$5 each.

VALUE OF THE COMPANY'S SHAREHOLDINGS

To give an approximate idea to the shareholders of what their shareholdings were worth, the chairman pointed out that under "shares in mining companies at cost" they held four interests—namely, 73,843 Bulolo shares at a cost of £134,555, having a market value of £452,000; 615,000 Asnazu Gold Dredging shares at a cost of £44,253, which, at par, the price at which they bought the shares, were worth £123,000; 10 per cent. in the Golden Queen Mining Company at a cost of just under £44,000, which interest, having regard to encouraging developments, should in the future have an appreciating value; and their interest in Deep Lead Companies, which had cost them £108,000. Those four items amounted to £727,000, against £332,000 shown in the accounts. Pato Mines (Colombia), Limited, held as to over 99 per cent. by their company, held 1,000,000 Pato Consolidated shares, which, at \$2.50, represented a value of £500,000. Pato Mines (Colombia) also held 12,500 Placer Development shares, having a market value of £48,000.

Those two items amounted to £548,000, against a valuation in their balance sheet for their Pato Mines holding of £139,000. Those total holdings were estimated as having an approximate value of £1,275,000, against their book value of £472,000. In addition, at December 17, they had cash, after allowing for the dividend, £76,500, and a loan due from Pato Consolidated of £29,000, increasing the figure of £1,275,000 to £1,380,000.

FAVOURABLE PROSPECTS

They would be receiving in due course, when the Nechi Consolidated Gold Dredging, Limited, was formed, 960,000 shares of \$1 each, which they would be justified in believing, with the information to hand as to the future dredging possibilities, would represent in due course an appreciable addition to their assets when the property was equipped and in operation.

From the information furnished in his remarks, indicating enormous gravel reserves controlled by the companies in which they were interested, nearly all of which were now engaged in extensive increased programmes of dredge construction, to be followed normally by increased production, he would be amply justified in claiming that they might look to gradual yearly augmentation of dividend payments culminating in maximum payments within a period of from two to three years.

The report was unanimously adopted.

TARKWA BANKET WEST, LIMITED

DIVIDEND OF 20 PER CENT.

The ordinary general meeting of Tarkwa Banket West, Limited, was held, on the 30th ultimo, at River Plate House, London, E.C. Lieutenant-Colonel Frank Johnson, D.S.O. (the chairman), presided.

The Chairman, in moving the adoption of the report and accounts, said:—Property account remains practically unaltered at £11,985. With regard to shares in mining companies at cost, £124,224, at the date of the closing of the accounts these shares had a market value of over £210,000, a sum which, on the basis of yesterday's quotations, is increased to over £260,000. (Hear, hear.)

Summed up, our assets come under three heads—viz., cash and liquid loan, say, £175,000; market value of share holdings, say, £210,000; and cost price of extensive mining properties and options, say, £12,000; or, in round figures, say, £400,000. The unknown factor in the equation is, of course, the potential value of the properties standing at £12,000, about which we hope to have further information to give you before our next annual meeting.

There is, however, a fourth heading under which we may anticipate profits—viz. our determination to adopt not only a more active policy in connection with our present properties, but to lose no opportunity of acquiring a participation in any mining business of promise that may be offered to us.

In this connection I may tell you that, since the issue of the report, we have been offered and accepted a 25 per cent. participation in an option to purchase a gold proposition known as the Tokosea Concession, situated in the Enchi district of the Gold Coast Colony, on which extensive developments and crushings were carried out from 1911 to 1914, when the conditions caused by the War caused the cessation of work. On the 100 ft. level, driven for 500 ft., a lode is reported to have been exposed, averaging for that length 5 ft. in width with an average assay value of 16 dwt., while some 3,000 or 4,000 tons milled yielded a plate recovery of over 8.5 dwt. In addition to this one mine, the area of over 2½ square miles is said to contain at least two other occurrences of promise. It is intended to start work on this property within the next few months. The last item on the balance sheet, cash at bankers, £155,667, requires no further comment.

The net result of the profit and loss account is a realised profit of £158,993. There remains a final balance of £121,318 10s., and from this we recommend the payment of a dividend of 20 per cent., less deduction for income tax, leaving £91,328 to be carried forward.

The report and accounts were unanimously adopted. A resolution was agreed to adopting new articles of association.

OBUOM GOLD MINES, LIMITED

POSITION AT THE PROPERTY

The second ordinary general meeting of Obuom Gold Mines, Limited, was held, on the 30th ultimo, at River Plate House, E.C.

Mr Howell A. Hopwood (the chairman) said that in his speech last year he had foreshadowed a certain disappointment arising from a communication from their consulting engineer regarding the ore reserve position. The actual position obtaining was that they had had an efficient milling plant ready to operate and only a modest supply of ore to crush. The supply of ore had given out on September 12, 1936, resulting in 13,118 tons of an average value of 6.44 dwts., yielding 4,227 fine ozs. of gold.

From the moment when they obtained technical control of the company steps had been taken to have the mine examined, and as a result they had embarked upon a diamond drilling programme in the hope of tracing the continuation of the reef, and had also pushed ahead with development work. He regretted to say that all that work had, up to date, proved negative. They were now awaiting the recommendations of Mr Eaton Turner, consulting engineer of the Ashanti Goldfields Corporation, Limited, whom they had invited to inspect the mine in consultation with Dr. McCann. Whatever the fate of the Obuom mine itself might be, they still possessed a complete modern milling plant.

They had taken interest in two syndicates formed to develop mining properties in the Gold Coast Colony, in both of which the combined financial resources of the participants were sufficient to assure adequate working capital and the best technical advice.

The report was adopted.

STOUGHTON (PERAK) RUBBER
PLANTATIONS, LIMITED

AMALGAMATION WITH SUNGEI REYLA

The seventeenth annual ordinary general meeting of this company was held, on the 30th ultimo, in London.

Mr A. P. Hadow, who presided, said that the result of the year's working showed a net profit of £7,313, and they recommended the payment of a dividend of 4 per cent.

With regard to the joint acquisition by the company and the Sungei Reyla Company of the Moh Lee estate, comprising approximately 261 acres of rubber three to six years old, situate close to the Sungei Reyla estate, for some time past the board had endeavoured to acquire an area of young rubber at a reasonable price in order to put the company on more favourable competitive terms with other producers. The Moh Lee property was considered a desirable acquisition by the boards of both companies, but owing to financial circumstances neither company was able to undertake the purchase on its own account. The price asked, which was for cash and quick settlement, was the reasonable one of £30 per acre. In order not to let pass an opportunity to progress, the directors had concluded an arrangement with the Sungei Reyla Company for the joint acquisition of the property. On further consideration it had become apparent that a fusion of interests by amalgamation would be advantageous to the shareholders.

The report was unanimously adopted.

At a subsequent extraordinary general meeting held to consider the amalgamation of the two companies and the formation of a new company, the chairman said that the new company, the name of which was intended to be Padang Senang Rubber, Limited, would have an authorised capital of £200,000 in shares of 2s. each and an initial issued capital of £150,000, of which £88,900 would be issued to the existing shareholders of the Stoughton company and £61,100 to the existing shareholders of Sungei Reyla. It was then proposed to make an issue of 150,000 shares of 2s. each at a price—subject to market conditions—of 2s. 6d. per share, to be offered in the first instance to the shareholders of the two companies in the proportion of one share for every ten fully-paid shares which they would be entitled to receive in the new company.

The amalgamation was unanimously approved.

At a meeting of the Sungei Reyla (F.M.S.) Rubber Estates, Limited, subsequently held, the amalgamation was also unanimously approved.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the twelve days ended December 31, 1936, amounted to £15,200,000, against ordinary expenditure of £19,165,500. After allowing for an increase in Exchequer Balances of £159,958, the operations for the period, as shown below, increased the gross National Debt by £4,350,000 to approximately £8,047 millions.†

GOLD MARKET

Messrs. Samuel Montagu and Company write on December 23, 1936:—The Bank of England gold reserve against notes amounted to £313,660,659 on December 16, 1936, as compared with £248,660,346 on December 9, 1936. This increase is due to the purchase of £65,000,000 referred to in our December 16th letter. The present figure easily constitutes a record holding of the Bank of England. In the open market about £2,150,000 of bar gold was disposed of at the daily fixing. There has been some general demand, but prices have continued to rule at about dollar parity. The s.s. "Strathnaver," which sailed from Bombay on December 19th, carries gold to the value of about £255,000.

Writing on December 30, 1936, Messrs. Samuel Montagu and Company say:—

The Bank of England gold reserve against notes amounted to £313,660,659 on December 23rd, showing no change as compared with December 16th. In the open market about £1,800,000 of bar gold was disposed of at the daily fixing during the four days under review. There was a general demand and gold was also taken for America, prices continuing to rule at about dollar parity. The s.s. "Ranchi" which sailed from Bombay on December 26th carries gold to the value of about £221,000.

SILVER MARKET

Their bulletin of December 23 declares:—

Until December 23, 1936, there had been little movement in prices and buying by the Indian Bazaars and sales on China account had again been the main features. The tendency became easier at the end of the week following weaker advices from Bombay and to-day Indian reselling was in evidence; owing to poor support prices declined sharply, the quotations of 20½d. for cash and 20½d. for two months' delivery being ½d. lower than those of December 22nd. The market is mainly influenced by movements in Bombay and prices would be likely to decline further should reselling from this quarter continue.

The bulletin of December 30 continues:—

Owing to the Christmas holidays, the week under review comprised only four working days. The market has been steady and prices showed some improvement on buying by the Indian Bazaars; on December 24th the demand from this quarter for silver for near delivery resulted in the cash price being quoted at a premium of ½d., which, however, was not altogether maintained; the difference between the two quotations had decreased to ¼d. by December 29th, but widened to ½d. on December 30th. China sales have continued and there have been speculative resales, but offerings have again been on a moderate scale. There is no indication of any important change, but the Indian Bazaars are the main support of the market and their attitude is likely to continue to decide the tendency.

Quotations for gold and silver are shown below:—

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

The world-wide upward movement of the prices of raw materials and crude foodstuffs continued during the past fortnight at an increasing pace. Indeed, there was little evidence this season of the usual lull in business on the commodity markets over the Christmas holidays. The wider implications of the recent upward rush of prices are discussed in a Note of the Week.

Wheat prices continued to advance rapidly to the highest level since 1929. Unfavourable weather in Argentina and Australia and a persistent demand by European importing countries focussed attention on the narrow margin between estimated world supplies and requirements this season. Quotations for raw sugar, though still well below the pre-depression level, experienced a sudden jump. The markets in cocoa and coffee were firm, but no tea auctions took place this week. At Smithfield, beef was cheaper and mutton slightly dearer. Bacon was marked up in price, but butter and eggs were seasonally cheaper.

Hectic dealings took place in the market for rubber, and the price of this commodity was driven up to the highest level since 1929, although no shortage of supplies is in sight.

Among non-ferrous metals, tin was cheaper than a fortnight ago, but copper, lead and spelter again went ahead. The price of lead is now well above the average for 1929, but quotations for copper and spelter are still considerably below that level. Linseed and linseed oil were marked up on the news that the import requirements of the United States in 1937 may be 50 per cent. higher than during the past year and because of unfavourable weather in Argentina. United States cotton rose slightly, and the markets in textile raw materials were generally firm.

In the United States, too, many primary products advanced rapidly in price during the past fortnight. Thus, Moody's index (December 31, 1931 = 100) rose to 207.0 on Wednesday against 201.3 a week earlier, 191.0 a month ago, and 165.7 on the same day last year.

COAL

SHEFFIELD.—After the pre-Christmas rush the market has been quieter, especially in household supplies. There is, however, a good inquiry for industrial fuel of all descriptions, and collieries are very well booked. The market in gas coal is steady. There is considerable pressure for coke, supplies of which are short. Export business is on a fair scale. Prices generally show no change.

NEWCASTLE-ON-TYNE.—As the production of coal in this district has been interrupted by the holidays, supplies for prompt delivery cannot be obtained. Inquiry from Scandinavia for Northumberland steam coals is good, and there are indications that quotations for these coals may be obtained. Further during the first few months of this year. Durham gas and increase manufacturing coals are in active demand from home consumers, and it will be necessary to increase production as a result of the resumption of trade with Italy. The market in coals of every class is steady.

GLASGOW.—The market is closing the year on a firm note. New export and home business is quiet, mainly because supplies are fully booked. Indeed, collieries find difficulty in covering contractual commitments. The arrival of delayed tonnage has created considerable congestion at the loading ports. Bookings after the colliery holidays are substantial, and the outlook is good.

CARDIFF.—Conditions on the Cardiff coal market have been exceptionally favourable this week. There has been a good supply of tonnage; collieries have been unusually well stemmed; prices have been firm with a rising tendency; and pits have been regularly employed. Colliery owners and exporters are quite optimistic concerning the probable course of trade during the early part of the new year. The chief fly in the ointment is the increase in transport and shipment costs. Since January 1st the rebate on the conveyance rate from pit to port is 5.4d., compared with the previous allowance of 6.86d. per ton, while of the scheduled rebates on shipment charges all that survive are 4d. per ton on tipping and weighing and 10 per cent. on wharfage rates. It is estimated that these cuts will add approximately £200,000 per annum to the transport and shipment costs on a volume of traffic equal to that of 1936. Representations have been made to the Great Western Railway Company on the subject, and Sir James to the Milne, the general manager, has agreed to receive a deputation of the Commercial Committee of the Monmouthshire and South Wales Coal Owners' Association next week. France is the most active market, but shipments are heavier in most directions, and there have been several fixtures for Italy during the past few days. The position of large coals is better than it has been for several years, while smalls of all classes continue scarce, price increases being recorded of 6d.-9d. per ton for bunker throughs, 6d. for washed smalls, 3d. for inferior qualities, and 1s.-1s. 6d. for bituminous peas. Coke is in active demand, and patent fuel and pitwood are firm.

IRON AND STEEL

LONDON.—Last week's report of the London Iron and Steel Exchange indicated that the year was drawing to a close with conditions of scarcity in practically all the world's iron and steel markets. British production in 1936 exceeded all previous records; but it was not sufficient to meet all requirements, and nearly all steelworks entered the new year in shortage of steel which has developed in other parts of the world. Continental deliveries under the quota seem likely to be delayed, as the Cartel countries appear to have no surplus steel for the British market. Business in pig iron has been limited by the reluctance of producers to add to their already congested order books. Efforts are being made to increase production, but uncertainty regarding supplies of coke and ore are checking developments.

In the semi-finished steel department the scarcity which was temporarily relieved a short time ago by increased imports from the Continent is again in evidence. British producers, although operating at capacity, are unable to meet the demand, and in several cases have booked up their production for some months to come.

quotations to over 11d. a lb. during the past week. At this higher level, however, demand eased off and speculators hastily made profit-taking sales. Quotations consequently reacted and closed on Wednesday well below the week's best. The spot price in New York on Wednesday was 21½ cents per lb., compared with 20½ cents per lb. a week ago and 18½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10d. on the corresponding day last week. In forward positions, business has been done at 10½d. to 10¾d. for "February" shipment, as against 10d. to 10½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 79,121 tons, against 80,315 tons a week earlier.

VEGETABLE OILS AND OILSEEDS.—Markets opened after the holiday with a strong tone. Linseed in particular rose further in price. Contributory causes being the modified prospects for the Argentine yield and confirmation of the small crop in the United States, which suggests that that country may have to import larger quantities. Moreover, consuming

centres are not too well supplied to meet the growing demand for oils and fats. The final official estimate of the linseed yield in the United States is only 147,700 tons, compared with 353,000 tons last season and 130,000 tons in the drought year 1934. At the present rate of oil consumption, America will probably require not less than 750,000 tons of seed to meet the demand for oil. United States imports in 1937 may reach 600,000 tons, against 400,000 tons purchased abroad in 1936. In Argentina, harvesting of the new crop is being interfered with by stormy weather. The latest bulletin places the exportable surplus, including the balance of the old crop, at 1,671,000 tons. The quantity of linseed afloat for Europe has increased to 152,400 tons, including 29,000 tons from India. The new crop has begun to arrive at the sea board in substantial quantities, and both Continental and English crushers have been good buyers in forward positions. Linseed oil is firm, and the year closed with prices at the highest level. Cottonseed is quieter but firm, while cotton oil is firmly held. Vegetable oils generally are firm at recently advanced quotations. Oleakes are in good request and firm.

WHOLESALE COMMODITY PRICES

A Bare Promise

THE much-rumoured convention between the British and the Italian Governments was signed last Saturday; and the text of the three documents embodying the agreement has now been published. The principal document is a joint declaration in which the two Powers

recognise that the freedom of entry into, exit from, and transit through, the Mediterranean is a vital interest both to the different parts of the British Empire and to Italy and that these interests are in no way inconsistent with each other; disclaim any idea to modify, or, so far as they are concerned, to see modified, the *status quo* as regards national sovereignty of territory in the Mediterranean area, and undertake to respect each other's rights and interests in the said area.

There is also an exchange of notes in which SIR ERIC DRUMMOND recites, and COUNT CIANO confirms, the assurances which the British Government has received from the Italian Government about the latter's intention to respect the *status quo* in the Western Mediterranean in general and in the Balearic Islands in particular.

This agreement is the logical sequel to our British failure to uphold the Covenant of the League against Italy's conquest of Abyssinia. It is hardy to be expected, therefore, that the country will receive the Government's new pact with enthusiasm. We have to recognise, however, that the political and moral disaster of Italy's triumphant aggression is now an accomplished fact. Therefore, in so far as the likelihood of further aggression and conflict would be diminished by this pact, we could accept it with unenthusiastic approval as a step calculated to prevent a bad situation from becoming worse. But we cannot take it for granted that it is going to have even this negatively beneficial effect.

This pact is the inverse of the Anglo-German naval pact of Waterloo Day, 1935. With Germany we have agreed on naval strengths without any stipulations about policy. With Italy we have agreed on policy without any stipulations about naval strength. Whether or not the Admiralty were warranted in believing, the year before last, that HERR HITLER would keep to the naval ratio which he had accepted, it would be impossible now, in view of SIGNOR MUSSOLINI's treaty-breaking record, for any country to bind itself to any naval ratio agreement with Italy. To do so would be simply to place oneself at the Italian dictator's mercy. Therefore, in the new Anglo-Italian pact provisions for naval limitations are conspicuous by their absence; and Anglo-Italian armaments competition will silently continue.

The political bargain implicit in the Anglo-Italian Mediterranean pact is that Great Britain will refrain from doing anything which might be a threat to Italy's hold upon Abyssinia, in return for an Italian undertaking not to threaten British security in the Mediterranean by seizing the Balearics, by aggression in Spain itself, or by any other way. But a British observer has to ask himself whether this has now really been secured—as far as it ever can be secured by Italian promises: whether COUNT CIANO's declaration "that, so far as Italy is concerned, the integrity of the present territories of Spain shall in all circumstances remain intact and unmodified" really covers what *we* mean by the maintenance of the *status quo* in the Western Mediterranean. COUNT CIANO has also declared "that the Italian Government had not, either before or since the revolution in Spain, engaged in any negotiations with GENERAL FRANCO whereby the *status quo* in the Western Mediter-

ranean would be altered, nor would they engage in any such negotiations in the future."

There are, of course, other ways of altering the *status quo* than by cessions or leases of territory. It can be altered out of all recognition if FRANCO makes himself master of Spain by the aid of foreign arms, and is consequently compelled to place himself in the hands of the foreign Power without whose armed support he could no more hold Spain than he could have conquered it. The Anglo-Italian pact does not cover this eventuality—at least not in the letter. And SIGNOR MUSSOLINI, perhaps remembering MR EDEN's rôle in "sanctions," has elected to ignore the spirit of the pact right at the outset. On the very eve of the pact's signature and of the repetition of Italian assurances at Rome, the Italian Government was landing another 6,000 Italian troops in Spain to fight GENERAL FRANCO's battles for him. Thus, the pact seems already to have been nullified by the DUCE. It is what the Romans called *nudum pactum*, a naked pact—a bare promise on our part without any consideration in return. MR EDEN must report not a success, but the opposite, to our Government and to Parliament when it re-assembles.

Italy is puffed up by her recent defeat of the League of Nations. Yet she is still the weakest of the Great Powers. It is, therefore, probable that, in wrecking our post-war system of international law and order, she has been working not for herself but "*pour le Roi de Prusse*." The paralysis of the collective

system, and the world's consequent relapse into power politics, are likely to make the fortune, not of a weak Power which has an appetite for aggression, but of an aggressive Power with the strength to profit by the opportunity thrust into its hands by SIGNOR MUSSOLINI. That Power is not Italy but Germany.

From the point of view of Italy's future it makes little difference whether she continues to support GENERAL FRANCO as Germany's junior partner or swings back towards the Stresa Front. When a strong Power achieves supremacy, it is not very important whether the weaker Powers have postured as the conqueror's confederates or as his opponents. Germany is not a world conqueror yet. But she will have advanced a very long stage towards that goal if she makes herself mistress of Spain. And her reply to the Anglo-French invitation to define her attitude towards "volunteers," appears to leave her free to continue her intervention; for it makes her withdrawal conditional on being extremely difficult of fulfilment.

This is the setting in which the Anglo-Italian pact must be regarded. Instead of a triumph of British diplomacy it begins to look ominously like a second, perhaps even a more resounding, British diplomatic defeat at the hands of Italy and Germany. Victory can only be snatched from the jaws of such a defeat if, at this late stage, our own and the French Governments make plain their joint decision to oppose active intervention in Spain by all the means at their command.

The State of the Union

THE Seventy-Fifth Congress of the United States began its sessions this week, as is prescribed in the Constitution. And on Wednesday, in similar obedience to the same document, PRESIDENT ROOSEVELT delivered his annual Message "giving to the Congress information of the state of the Union, and recommending to their consideration such measures as he shall judge necessary and expedient." The Message, as is usual nowadays, followed the Constitution in the spirit rather than in the letter, for the PRESIDENT made little attempt to render an exact account of the political and economic development of the country. The accounts, in short, were taken as read, and the report on the state of the Union, as is customary with other presidential addresses at other statutory annual meetings, consisted mainly of eloquent generalisations. Nor were the recommendations for legislation much more specific. With the exception of the amendment to the neutrality Act (mentioned elsewhere in *The Economist*), the PRESIDENT listed only the broadest heads of the Bills he desired, and postponed further elucidation to a later occasion. Not even so strong a President as MR ROOSEVELT can tempt the political fates by presenting an incalculable and jealously independent Congress with a Speech from the Throne. The only novelty in the Message was a resurrection of the N.R.A. idea. The law, said the PRESIDENT, had been outlawed; but the problems had not; that of the Constitution should not be amended, it should at least be interpreted more liberally.

It is not unprofitable at this moment to consider the state of the American Union; for the disappearance of one uncertainty in the outlook has been succeeded by another. Three months ago it could be said with truth that the economic outlook was beginning, for the first time since the crisis of 1933, to appear really settled; but in the sphere of politics all was uncertainty and speculation. It was not known who would be the next President, or what his policy would be. Now the position is exactly reversed. The political uncertainties have been resolved in the most decisive manner possible. The only open question remaining is how the PRESIDENT is going to

interpret his mandate, how he will master Congress and how circumvent the Supreme Court. But an outbreak of industrial strife has disturbed the economic outlook, and Wall Street is inquiring, with some nervousness, whether it should elevate MR LEWIS to the niche so recently vacated by MR ROOSEVELT as the chief impediment to full-bodied recovery.

The present strike in the motor-car industry is not due to an attempt by the workers to escape from conditions imposed on them by the severity of the depression; for they effected their escape some time ago in the N.R.A. period. The main quarrel, as is frankly admitted by both sides, is whether the United Automobile Workers of America shall be recognised by the employers as the sole and exclusive bargaining agency of the workers in that industry.

Who are the ultimate parties to the dispute? It is complicated by the quarrel within the ranks of Labour between MR LEWIS and his Committee for Industrial Organisation on the one side and MR GREEN and his American Federation of Labour on the other. The A.F.L. has been built up on a craft organisation. MR LEWIS and the C.I.O., on the other hand, believe that all the employees of a single industry should be organised in a single union. That has been achieved in the coal-mining industry by the United Mine Workers, of which MR LEWIS is president, and the C.I.O. was formed to extend the same principle to other industries and pre-eminently to steel and motors. If MR LEWIS succeeds in his aim, he will rob the old-fashioned craft unions of their members. If MR LEWIS is defeated, it will be the Federation's victory.

Another complication is that the striking union does not include, and does not claim to include, a majority of the workers of the industry. It claims, of course, to represent their interests, but it does so unasked. Indeed, it is not a distortion of the purpose of the strike to say that it is intended to exert pressure on the workers as much as upon the employers.

In these circumstances, it is difficult to predict either

the outcome or the attitude that will be ultimately adopted by American public opinion. One may be wholly in favour of the organisation of the workers in trade unions, and yet doubt whether strikes of this nature are legitimate weapons to be used for the advancement of particular unions. But, on the other hand, there is at least an element of truth in MR LEWIS's contention that until the dominance of the automobile employers and their insistence on docile "company unions" has been broken, the workers of the industry will be unable even to begin with the process of self-organisation.

Right or wrong, however, the strike is going to prove a serious impediment to recovery unless it is speedily settled, for the ramifications of the automobile industry are so far-reaching that a stoppage at the centre is progressively affecting more and more ancillary industries. It is not quite true to say that there are no other threats to the smooth progress of industrial expansion, but it is at least a sober estimate that without labour trouble the advance of recent months would be continued. American recovery started about a year later than British recovery, and it has not, on balance, advanced so rapidly. America should, therefore, in all probability, have from a year to eighteen months more recovery to come before it reaches as mature a stage as that of Great Britain at the moment—and there is no reason to believe that Great Britain has yet reached the limit.

This contrast between the present position of Britain and America can be strikingly illustrated by a few of the salient statistics. In Great Britain many series are breaking into new ground month by month. In employment, in the production of such staple commodities as steel, houses, motor cars, in the note circulation or the total of bank clearings, we are touching what the Americans,

in the golden days of the 1920's, used to call "all-time highs." But in the United States, in spite of the rapidity of the advance in recent months, very few new records are being made. Nor is it a fair objection to remark that 1929, the previous record year, was quite abnormal and exceptional. In the stock market that is doubtless true. But it would be a confession of quite unwarranted defeatism to assume that 1929 was exceptional and unrepeatable in such respects as the consumption of food, the production of motor cars, traffic on the railways or, above all, the volume of employment. The American population has grown by seven millions since 1929; why should not its production of the necessities of life be at least equally large? Yet industrial production stands at little more than 90 per cent. of the 1929 level, residential building is only about half the 1929 amount, the production of motor cars is not yet up to the figure attained in that year, and the loadings of freight on the railways are just over three-quarters of what they were seven years ago. The index of factory employment has not yet reached 90 per cent. of its average for 1929, and the total volume of money moving in circulation, as measured by bank debits, even after the removal of the figures for New York City, is still about one-third below the level in that year of blessed memory.

In view of these facts, and countless more that could be quoted to the same effect, there is hardly room for doubt that the scope for further recovery in America is still enormous. The more is the pity that the troubled questions of industrial democracy have had to be fought out at this precise moment. The more also is the hope that some means will be found to bring the present strikes to an end, and to stave off their threatened successors, before the whole momentum of American expansion is slowed down.

The Newspaper Industry—II

Economics of the Press

ENOUGH has been said in the first of these articles to show that the industry of newspaper production has a number of features peculiar to itself. Not the least unusual of its characteristics are to be found in its financial construction. The nature of its chief assets is an example. It is not necessary to make heavy investments in fixed capital before bringing out a newspaper. It is true that most newspaper companies own the machinery on which their papers are printed. But the capital cost of this machinery is not very heavy in relation to the whole income of a newspaper, and it is always possible to have the printing done by an outside firm on a contract basis. *The Morning Post* and *The Observer* (to mention only two examples) are printed in this way. The fixed capital of such a paper need consist of no more than a suite of offices. But if a newspaper needs no tangible fixed capital, it needs a very large intangible investment. To be a financial success, a newspaper must be run at a loss during a period of development while it is building up circulation. When circulation has reached the paying point, the money thus sunk is represented by the copy-right of the paper's title. This is "goodwill" in the strictest sense of the term; it consists of nothing more substantial than the empirical knowledge that the people who bought the paper to-day, or the vast majority of them, will buy it again to-morrow.

This is the first paradox of newspaper economics: a very large expenditure before profitable production can begin, but nothing whatever to show for it. The second paradox is even stranger, and has an even greater

influence on the economics of the industry. The effects on an industry of large overhead expenses are familiar from the examples of the Lancashire cotton industry and others. But the contrary case is not so usual. A newspaper has comparatively few fixed expenses. Editorial costs are comparatively inflexible, at least as between two newspapers endeavouring to compete in the same market. But almost every other category of expense varies to a greater or less degree with output. Although the newspaper thus has very little overhead expense, it can be said to have a very large overhead income, distinct from the direct current revenue from sales of the newspaper, in the shape of its revenue from advertisements. The effects of this overhead income will be the theme of a third article.

These two peculiarities should be borne in mind in considering the finance of newspaper production. Newspapers do not publish their full trading accounts, but it is possible to make an informed guess at the probable size of the chief items in the profit and loss accounts of a large mass-circulation paper. The figures below were published by the body known as PEP in a broadsheet entitled "The State of the Press" in September, 1935. They were then stated to be "based on knowledge" but not to refer to any particular newspaper. The newspaper is assumed to consist of twenty pages a day and to have a circulation of 2,000,000. The figures can serve as an illustration of the probable appearance of such a paper's accounts, although the actual position of any particular newspaper might differ quite consider-

ably. This is particularly true of advertisement revenue, and the figure entered in the table is no more than the advertisement revenue which such a paper might reasonably be expected to receive. The figures are also represented in the accompanying diagram.

Revenue —	
Sales revenue	1,600,000
Advertisement revenue	1,800,000
Total revenue	3,400,000
Expenditure —	
Paper and ink	1,100,000
Production (composition and printing)	500,000
Editorial	350,000
Distribution (principally railway carriage)	350,000
Canvassing and publicity	300,000
Readers' insurance	100,000
Maintenance and depreciation	200,000
Miscellaneous (rent and rates, social services, etc.)	100,000
Total expenditure	3,000,000
Profit	400,000

These figures require a certain amount of annotation. In the first place, they refer only to the newspaper's own accounts. Thus the sales revenue amounts only to 0.6d. per copy per diem, the price at which the paper is sold to the wholesale newsagents. If the figures were to show all that happens to the purchaser's penny, a further large item of approximately £1,000,000 would have to be added to the list of Expenditure for costs and profits of newsagents, wholesale and retail. The figures bring out very clearly the well-known fact that the purchaser of a newspaper only pays part of its cost. In point of fact, on these figures, the paper costs 1.16d. per copy to produce, omitting both proprietors' profit and also newsagents' costs and profits. Including these items, the cost is 1.70d. per copy. The gap, of course, is filled by the advertiser.

Among the expenditure items, little needs to be said about paper and ink or production. The figure entered for editorial expenses will probably surprise most people by its comparatively modest amount. "Canvassing and publicity" is an item which is subject to considerable variation. Any newspaper which aspires to a circulation in the million class is compelled to undertake some expenditure of this nature, if only for defence against the depredations of other newspapers. But the amount varies with the ebb and flow of competition.

Not the least noteworthy feature of the Press as an industry is the remarkably high standards of work and wages which its employees enjoy. Printing labour is highly and intricately organised, and, at least in London, all the large offices are one hundred per cent. unionised. The strength of the unions arises from two facts. The first is that the cost of labour (other than the professional labour of the editorial department) is part only of the item "Production" in the table above, and this item itself is only one-sixth of the total expenditure of the business. The entire cost of direct labour, in other words, is, at most, about 10 per cent. of total costs. Secondly, newspapers, whose assets are peculiarly bound up with goodwill, which in turn depends on regular publication, are loath to risk a strike. In recent years, the chief newspapers have made arrangements among themselves for mutual support in certain events, but their bargaining position is still inherently a weak one.

The effect of these circumstances is to produce astonishingly favourable labour conditions. Standard rates of wages on London morning daily papers start at 86s. 6d. per week for general labourers and rise to 160s. per week for compositors paid on time. These rates are increased, in practice, by the prevalence of overtime and piece-work. The aristocrats of printing labour, the compositors, are paid on a scale of piece rates of infinite complication, and their earnings range from £8

to £12 per week. Hours are equally favourable, being 44 per week for day work and 38½ per week for night work. In addition, the unions are in an almost dictatorial position as regards apprenticeship and recruitment of labour, demarcation of functions and assignment of jobs.

Journalists as well as printers have also benefited from these conditions. Since 1921 a minimum wage of £9 9s. per week has been in force in London for reporters and sub-editors with three years' experience on London national dailies. In the provinces there is a sliding scale, but the minimum wage, for work on weekly papers in towns where there is no daily, is £4 7s. 6d. a week. London hours are 44 for day work and 38½ for night work, with three weeks' paid holiday per annum.

There is nothing, then, of which the Press need be ashamed in its relations with its employees. The same

APPROXIMATE PROFIT AND LOSS ACCOUNT OF A HYPOTHETICAL NEWSPAPER (20 PAGES, 2,000,000 CIRCULATION)

cannot, however, be said with equal confidence of its dealings with the investor. For such a large industry, the Press is still to a surprising extent in private hands. Of the seven main London morning dailies, for example, there are only three in which the public can acquire any form of participation. Even in those three cases, so intricate is the tracery of holding companies that the lay investor would be hard put to it to determine the exact nature of his participation. In none of them can he hope, without the consent of the interests already in possession, to acquire any measure of control. Those newspaper securities which are quoted on the Stock Exchange are not rated very highly. The four which happen to be included in our weekly list of active security prices give at present an average yield of almost £5 7s. per cent., which, in these days, when seasoned industrial shares yield £4 per cent. or less, is an indication that the Stock Exchange considers the industry to be speculative.

At first sight, this may seem somewhat puzzling. The industry is organised in large units, with competition limited to the existing firms. It has an assured and expanding market and, in recent years, it has obtained its main raw material at low prices. The explanation is to be found in the expensive ways in which newspapers compete for circulation. To the layman, especially the investing layman, these struggles seem to be merely megalomaniac wastefulness. But even in this madness there is some element of method, arising out of the fundamental economics of the industry. Our third and concluding article will attempt to discover whether there is a rationale of mass circulations.

Rising Prices

MUCH has been heard recently of the sharp upward turn of the prices of primary products, such as wheat, cocoa, copper, lead, spelter, rubber and wool. What are the causes of this movement? How far is it likely to go? How will it affect the course of business activity at home and abroad? These questions are of vital import to the consumer, to the business man and to our monetary authorities.

The causes of the rise in prices are reasonably clear. Broadly, the years preceding the depression witnessed a marked expansion in the world's demand for raw materials and crude foodstuffs. But productive capacity increased even faster. Consequently, the increasing output of primary products could be sold only at declining prices. The downward trend was accentuated by the accumulation of unsold stocks, which, in the case of nine important primary products, increased by nearly 100 per cent. between December, 1923 and 1929.

The course of *The Economist* index of wholesale commodity prices, which includes a large proportion of unmanufactured goods, clearly reflects this tendency. As will be seen from a table on page 92, it declined by 33 per cent. between 1924 and 1929. The index of the United States Department of Labour also took a downward course during the years preceding the depression. Of the more important commodities, there is hardly one whose price had not begun to decline long before the depression. The average prices, in 1929, of cotton, jute, lead, crude oil, rubber, spelter, sugar, tin and wheat—to name only a few—were appreciably lower than in 1925.

When the demand for primary products began to fall off in 1930, the pace of the downward movement increased, and in 1932 many commodities sold at a mere fraction of their former price. In the case of some commodities, such as tin, the decline was arrested by artificial restriction of supplies. In general, however, the turning-point came only when world demand began to expand once more in 1932-33. At first the rise was gradual, for stocks were heavy and productive capacity remained only partially employed. But the upward curve soon became steeper. Between the end of 1932 and the end of 1935, the world's stocks of eight leading primary products declined, on the average, by 17 per cent. During the first nine months of 1936 alone, however, they fell by a further 12 per cent. By last autumn, broadly, surplus stocks had been eliminated, and the rapid expansion of demand had practically eliminated idle capacity. The commodity markets suddenly began to stir; the prices of wheat, cocoa, copper, lead, spelter, rubber and wool bounded upwards, and opinion, both professional and public, became excited and slightly apprehensive. Naturally, there were considerable divergences in the movements of the prices of individual commodities. Some, like sugar, flax and jute, even finished the year with a slight net loss. The extent of the rise in quotations for individual commodities, as well as of a group of representative primary products in the United States and in this country, is shown on page 92. The trend of British prices since 1924 is shown below:—

THE ECONOMIST INDEX OF WHOLESALE PRICES
Average 1913=100

Date	Cereals and Meat	Other Foods	Textiles	Minerals	Miscellaneous	Complete Index

This broad outline of the tendencies at work provides a clue to the future trend of prices. We are not primarily concerned with intermediary fluctuations due to crop

reports, or with the inevitable market rumours which produce erratic but ephemeral movements, but purely with long-term trends. Except in the case of a few commodities, such as coffee, stocks have now been reduced to reasonable proportions; in some cases, such as tin, supplies are even below the safety line. Moreover, production of many commodities has already reached a volume whose further expansion requires either the resumption of work by high-cost producers, who were forced out of production by lower prices, or the extension of current capacity. But the production of many raw materials presupposes the installation of costly and complicated machinery, and some time must elapse before capacity can be increased. Where supplies depend upon seasonal crops the delay may be longer still. Even if an increased area is sown to wheat this year, for example, the final yield will be determined by climatic influences. These have played havoc with North America's crops for the last three years in succession. On the other hand, all available indications point to a sustained increase in demand. Industrial activity is still expanding in most countries of the world, especially in the United States. The immediate outlook, therefore, strongly favours a further upward movement in the prices of primary products. In the past, such a rise has always stimulated an expansion of production beyond the point at which available supplies can be marketed at prevailing prices, and there is every indication that, sooner or later, history will repeat itself. But that time is not yet at hand.

The significance of the rise in the prices of primary products can scarcely be exaggerated. It has already raised the income of producers of raw materials and crude foodstuffs, the world over, by some hundreds of millions of pounds. This, in itself, should give a marked fillip to international trade; indeed, omens of an increase in the volume of goods and services exchanged between different countries are more favourable to-day than at any time in the last seven years.

The recent trend of commodity prices stands in striking contrast to the downward movement before 1929. Ten years ago a growing disparity was being created between the purchasing power of primary producers and of industrialists throughout the world. The continued expansion of industrial activity eventually culminated in a colossal over-expansion of capacity in the United States, and in the débâcle of 1929. To-day, quotations for primary products are rising in the middle of a cyclical upward swing in world industrial activity, whose end is not yet in sight.

The rise in quotations for primary products has as yet been scarcely reflected in the prices of manufactures and in the cost of living in this country. Moreover, the rise of wages during the past year, amounting to about 2½ per cent., has kept pace with the slight increase in the cost of living. Again, the Board of Trade index of the average price of British exports of manufactures rose by only 1½ per cent. between the third quarters of 1935 and 1936, when the index was still 17½ per cent. below the level of 1930.

There is, however, a real danger that the orderly rise in prices and production in this country and in the United States, stimulated by a liberal monetary policy, may shortly give way to a more precipitous advance which would shorten the recovery movement. In this country, where there is already a shortage of skilled labour at certain "key" points; and where many industries are now operating at capacity, the possibility of a steep rise in manufacturing costs is by no means remote. Moreover, although there are as yet no indications that the rise of prices will get out of hand in the near future, monetary control will become increasingly difficult as the rise gathers momentum. The authorities, who have hitherto proclaimed that higher prices are a goal of their policy, will be well advised to take stock of the movement at each stage in its future course, and to make every effort to prevent its assuming an inflationary character. In particular, producers operating under officially-sponsored output schemes should be given every inducement to ensure that restriction is self-liquidating.

Transition in the Coal Industry

Is there justification for the view that British coal-mining is a declining industry? Or is its *malaise* an obstinate but none the less a passing phase, after its long pre-war record of expansion? At a moment when legislation is pending which may be vital to the future of British coal-mining, it may be helpful to set out the underlying tendencies governing the fortunes of the industry.

The coal problem has its domestic as well as its international aspect. Coal was a main agent in the speeding-up of production towards the end of the 18th century, known as the "industrial revolution." Coal supplied the power necessary for the emergence of the factory and for the improvement of transport by land and sea. The demand for coal, consequently, rose almost without interruption, both in the United Kingdom and elsewhere, until the outbreak of the Great War. After the war, however, the dominance of coal was challenged by alternative sources of heat, light and power. Production of crude oil, which had been rising steadily before the war, suddenly increased by leaps and bounds. Liquid fuel was consumed by the petrol engine, in ships and for heating. Technical progress in electrical engineering, again, made possible the harnessing of water-power, which was accelerated in countries with poor coal resources as a result of the nascent desire for self-sufficiency.

But the sudden emergence of competitive substitutes after the Great War was not the only factor which tended to slow down the rate of increase in the demand for coal. Owing to the availability of a plentiful supply of cheap coal in many countries, little attention was paid, before the war, to the possibilities of its more economical utilisation. During the past sixteen years, however, technical progress in the utilisation of coal has made rapid strides and the proportion of coal consumed in a crude state has tended to decline fairly rapidly.

It is difficult precisely to assess the effect of these developments on the demand for coal, since they have themselves tended to increase the total consumption of heat, light and power. World production of crude oil rose from 53 million metric tons in 1913 to 139 million tons in 1924, 211 million tons in 1929 and 226 million tons in 1935. Production of hydro-electric power between 1924 and 1935 increased from 9,159 million kw.h. to 21,014 million kw.h. in Canada, from 19,969 millions to 39,965 millions in the United States, from 3,600 millions to 7,040 millions (1934) in France, from 6,193 millions (1925) to 11,560 millions (1934) in Italy, and from 3,275 millions to 5,705 millions in Switzerland. In Great Britain, where water-power resources are relatively small, production of hydro-electric power is still a negligible proportion of the total power consumption. But the rapid improvement in the utilisation of coal is attested by the increased quantity of gas and electricity which can now be produced from one ton of the black fuel. Between 1921 and 1935, the thermal efficiency of the gas and electricity industries, on this basis, has risen by 100 per cent. and 23 per cent., respectively. The amount of coal necessary to produce one ton of pig iron has declined from 44.4 cwts. in 1920 to 33.6 cwts. in 1935. Indeed, there is scarcely a field in which efficiency in the use of coal has not been increased. Even in the home, gas and electricity are displacing the cheerful but wasteful open fire, whose mark is still seen on the sooty face of our public buildings.

The intensification of these tendencies since the Great War not only made for a decline in the rate of expansion of the coal industry, but challenged the whole traditional basis of the coal-mining industry's organisation. World production of coal had risen rapidly, from 755 million tons in 1900 to 1,320 million tons in 1913; and in 1929, at 1,540 million tons, it had shown a further increase of 16½ per cent. But British production, after rising rapidly from 86 million tons in 1863 to 287 million tons in 1913, showed an absolute decline in the post-war period. The

position is summarised by the following table:—

BRITISH PRODUCTION, EXPORTS AND HOME CONSUMPTION OF COAL (In millions of Tons)				
	1913	1929	1935	
Production	287	258	222	
Domestic consumption { Total	184	174	164	
Per head of population (cwts.) ...	89	78	72	
Exports and shipments for use of steamers	98	82	56	
Workers employed (thousands)	1,104	970	768	
World Production	1,320	1,540	1,290	

The decline in exports has been due partly to shrinkage in total international trade in coal and partly to a reduction in Britain's share of world trade. British exports, expressed as a proportion of the aggregate exports of the United Kingdom, Belgium, France, Germany, Holland and Poland, declined from 53 per cent. in 1929 to 47 per cent. in 1935. During the same period the total exports of these six countries fell by more than 25 per cent.

Owing to the declining rate of expansion abroad and the absolute shrinkage of output at home, the industry has been faced since the war with a recurring problem of excess capacity, and the standard of living of its workers has been depressed. This, in turn, has given rise to frequent labour disputes.

During the first decade after the war the industry was somewhat bewildered by this change in its background, and many of those concerned have been slow to realise the imperative necessity to take up the challenge by a change in outlook and of traditional methods. In view of the important part played by coal in the rise of modern industry, it is surprising that the method of producing coal remained practically unchanged until quite recently. In 1913 only 8 per cent. of the total quantity of coal produced in this country was cut by machines. But between 1929 and 1935 the proportion cut mechanically suddenly rose from 28 per cent. to 51 per cent. Actually, the industry is now in the middle of its "industrial revolution," a process which was largely completed in most other industries during the past century. Despite the reduction in the output of coal disposable commercially, from 239.3 million tons in 1929 to 206.4 million tons in 1935, profits increased during this period from 4½d. per ton to 6½d. per ton. Moreover, this improvement was achieved without a further reduction in coal-miners' earnings, which actually rose from £29 11s. 7d. per quarter in 1929 to £29 12s. per quarter in 1935, though employment diminished rapidly.

But the scope for a further increase in the efficiency of the industry is limited by its present organisation. It is of the utmost importance that the conditions should be created under which the rapid progress of recent years can be continued. This involves the unification of royalties and the adoption of measures designed to enforce concentration of production. The Government must proceed forthwith, in the interests of the industry, not only to submit their promised Bill for unification of coal-mining royalties, but to reinforce its provisions with others providing for compulsory reorganisation after only a short period of grace. There is everything to be said for introducing the two series of measures simultaneously, and for vesting the administration of royalties in the same body as that charged with the reorganisation of the industry. The problem is the more urgent as the increase in wages a year ago was borne by the consumer, with a definite promise of speedy and far-reaching reorganisation.

Given the increase in efficiency which follows the establishment of a single landlord, accompanied by internal reorganisation, the industry may look forward to the future with moderate optimism. Despite increased competition from substitutes and economies in utilisation, consumption of coal is on the up-grade (as we show in a Note on page 59). Given agreement with other exporting countries, there is no reason why the coal-mining industry should not again enjoy a fair measure of prosperity. Technical progress in the production of oil from coal is making rapid strides and the world's oil resources are not unlimited. The world demand for heat, light and power, moreover, seems likely to continue its rapid expansion for many years to come.

Notes of the Week

Two New Dreadnoughts.—Punctually on the first day after the naval limitations in the Washington Naval Treaty of 1922 and the London Naval Treaty of 1930 had expired, i.e. on New Year's Day, two new British 35,000-ton battleships were laid down. The "King George V" is being built at Vickers-Armstrongs' yard on the Tyne; the "Prince of Wales" at Cammell Laird's yard, Birkenhead. They are the first to be built since 1922, when the Washington Treaty, and its successor, the London Treaty, stopped all capital-ship construction until January 1, 1937. The new dreadnoughts are reported to be armed in the main with 14-in. guns, to embody the latest provisions against submarine and aerial attack, and to show a speed of "not less than 30 knots." As the latest Italian and French 35,000-ton battleships—two are in hand for each country—are expected to show 35 knots and more, it may be presumed that the new British ships will have a margin of speed "up their sleeve." They are scheduled to take only three years for completion, i.e. two-thirds of the time taken on the "Nelson" and "Rodney," the latest British battleships; and it is authoritatively reported that two additional dreadnoughts will be begun later this year, when the 1937-38 programme has been sanctioned by the Commons; that tenders for these are to go out this very month; and that orders for three 5,000-ton cruisers in the current programme will be placed in February. The Great Powers' naval race has begun; and though this country can afford to bid the stakes well above those of all Great Powers save the United States, the running which our Government set on New Year's Day looks like proving a killing pace. It may even prove too hot for the British Budget, unless the rumoured "Rearmament Loan" is to be mainly allocated to the Navy's needs.

Spain—and Germany.—On Sunday, the rebel forces round Madrid launched a violent offensive against the Government's positions to the north-west and north-east of the capital, on the Guadarrama sector, and in the vicinity of Sigüenza. At the same time, Madrid has this week been subjected to continual bombardment by air and artillery. This week, the German Admiral sent an ultimatum to the Spanish Government, stating that if the warlike cargo of the German s.s. "Palos" were not surrendered within three days, he would "sell" two Spanish Government vessels he had captured on the high seas this week to the rebels. The Spanish Government have not replied to this ultimatum as we go to press. Meanwhile, the German Government on Thursday replied to this week's sharply reiterated British invitation to them to ensure non-intervention. They express surprise that the British and French Governments should now raise the question of "volunteers" outside the Non-intervention Committee; inveigh against "Bolshevik" intervention; and pose three conditions for German co-operation. First, all countries must abide by non-intervention; secondly, all foreign material aid, and foreign aiders and abettors of either side in Spain, even "propagandists," must be withdrawn, to arrive at the situation as it was last August; and finally, both this objective and non-intervention in future must be internationally supervised *in situ*. This is a poser for the London Committee. To call a halt to intervention at its present level and to ensure non-intervention in future, is feasible. To evacuate all foreign *matériel* and *personnel* from Spain is a task which could only be effectively accomplished if all the Powers proceeded to occupy Spain. The Italian reply is not to hand as we write; but the German Government's reservation of their right to allow "volunteers" to go to Spain as long as "Bolsheviks" are there is a broad hint that Germany is not anxious to ensure non-intervention from now onwards.

American Neutrality.—The desire of the American Government to preserve the strictest neutrality in the Spanish imbroglio has taken an active turn ever since it was discovered that American citizens were proposing to ship arms to Spain and that the Government had no legal means of stopping them. Since then it has been a race between these unneutral Americans and the processes of legislation. As soon as Congress reassembled, resolutions were presented, and passed in each House, giving the President the same powers, and the same mandatory instructions, to stop the export of arms to either side in the Spanish Civil War as he already possessed in the event of war between nations. One of the arms exporters, however, was too quick for Congress, and after every legal means of delaying him had been exhausted he got the ship away from New York and out of American territorial waters before the resolution became law. The episode illustrates to a nicety the disadvantages of mandatory legislation which, since it leaves no loophole for discretion, has to define its application with the utmost rigour. There was some talk of an intention of the President to declare that the behaviour of the German cruiser "Königsberg" had brought about a state of war between Germany and Spain, which would have enabled him, under the existing law, to ban exports to both sides in Spain. But it would also have compelled him not only to ban exports of arms to Germany, but also to warn Americans against travelling in German ships, and it was evidently thought that this was going a little too far. But the lesson will presumably not be lost on Congress when the time comes, as it must before May 1, to renew or revise the Neutrality Act itself. The President will repeat his request for discretionary powers, and this time he may secure them.

Road Accidents.—The statistics of road accidents for the year 1936 (or, more accurately, for the 52 weeks ended December 26th) give cause for a certain amount of very modified satisfaction. They are still appallingly high—6,489 persons killed and 225,689 persons injured. But the number killed is lower than in 1935—lower, in fact, than in any year since 1928. Compared with 1934, which was the worst year on record, the number of deaths has declined by nearly 12 per cent., in spite of the fact that the number of motor vehicles on the roads has increased in the same period by over 300,000, or very nearly 20 per cent. The number of non-fatal accidents shows an increase of about 3 per cent. in twelve months. Here again, some crumbs of consolation can be found. The rate of increase is smaller than that of vehicles on the road. Moreover, the Ministry of Transport claims that a large number of minor accidents which previously went unreported is now being included in the returns. And lastly, accidents to pedestrians, whether fatal or non-fatal, show a decline. The pedal cyclist is still the most rapidly increasing sufferer.

These figures supply a large measure of justification for the safety measures which have been taken by the Ministry of Transport during the term of office of the present Minister. The speed limit in built-up areas is

BRITANNIC

holding down the toll of deaths in spite of increasing traffic, and it is stated that when the figures have been sub-divided to show separately accidents occurring in town and country, the effect of the speed limit will be still more apparent. At the same time, the provision of pedestrian crossings appears to be having some small effect in reducing injuries to this category of road user. If pedestrians would use the road less and the crossings more, the effect might be still more favourable. Nothing in these figures, of course, supplies any warrant for satisfaction with the present woefully inadequate state of our road system. On the contrary, they are an encouragement to press forward with the construction of new highways in the knowledge that they will not automatically become merely new death-traps. It is incidentally announced that the accident figures will henceforth be published monthly. This will not only enable them to be presented in a much more informative form, but will also avoid the present undue, and purely fortuitous, weekly fluctuations.

* * *

The Influenza Epidemic.—The Nation's public and private life is being threatened, at the moment, by an assiduously subversive force whose activities were apparently overlooked by the draughtsmen of the Public Order Act. A visitation of influenza (fortunately "of a mild type") has stricken down 1,400 officers and men of the Metropolitan Police. Among its other victims are the stipendiary magistrate and city coroner of Birmingham. Even the British Army has been affected, and gargling has divided attention with recruiting and rearmament at the War Office. Factories in the Midlands have been attacked, and the flow of motor-car production has thus been checked. Influenza, like its near relation the common cold, still has power intermittently to ravage high and low, rich and poor, without distinction of age, sex or creed. Its successive visitations at least reinforce one moral—that there must be no slackening of the effort to raise the standard of national hygiene and nutrition.

* * *

Railway Wages.—The claim for improved wages and shorter hours, made by the Associated Society of Locomotive Engineers and Firemen, has been rejected by the Railway Staff National Tribunal. This follows logically the Tribunal's decision of last July, when less extensive claims by the National Union of Railwaymen and the Railway Clerks' Association were refused. The Tribunal stated that to grant the claims, which included the restoration of standard rates of payment, and the introduction of a six-hours day, would cost the companies about £50 millions annually if the concessions were extended to all railway workers. While the Tribunal pointed out that the earnings of the railways could not bear this extra cost, even if the payment of interest and dividends were stopped, it was made clear that considerable improvement had taken place in the financial state of the companies, the gross receipts of 1936 exceeding those of 1935 by about £5,000,000. The suggestion that it may therefore be possible to restore in August the last quarter of the 5 per cent. cut made in 1931 is significant, and the principle is unexceptionable that "if the present improvement continues, railway employees should obtain a share in the improvement." But the companies might question the equity of restoring the wage levels of 1929, when the earnings of the railways are still considerably below the returns of that year.

* * *

Wages on the Road.—Attention to the remuneration of transport employees has not been confined to the negative decisions of the Railway Staff National Tribunal. The Road Transport Inquiry set on foot by the Minister of Transport and the Minister of Labour has this week been hearing evidence on the regulation

of wages and conditions of service in the road transport industry. The provisions of the Road Traffic Act of 1933 concerning wages and hours apply only to the holders of "A" and "B" licences, and it has been urged by the National Joint Conciliation Board for the Road Motor Transport Industry that these should be made compulsory in the case of "C" (private carriers) licences. Many considerations of impracticability have been urged in evidence by such bodies as the Shipbuilding Employers' Federation, the Institution of British Launderers, and Unilever, Ltd. We appreciate the force of these comments, but we maintain, nevertheless, our opinion expressed in 1933 (see *The Economist*, April 22, 1933) that a prime objective of transport regulation should be the protection of workers against exploitation and the general public against accidents due to fatigue.

* * *

The Netherlands and Germany.—The Nazi Press has seized the occasion of the Dutch royal wedding in order to stir up trouble between the Netherlands and Germany. It is an oddly perverse Prussian policy; and if the Dutch attitude towards Germany is denounced as unsatisfactory and even insulting, it is hard to conceive what any of us can do to keep in the Nazis' good graces. For the betrothal between a German prince and the crown-princess of the Netherlands was received by the Dutch public with enthusiasm. In the second place, a Dutch millionaire, Sir Henri Deterding, has just initiated a scheme for placing Dutch food supplies at the disposal of a hungry German populace at the expense of his own private purse. These are surely not the acts of an unfriendly nation. Yet the only thanks which the Dutch have got is to be abused as roundly as the Russians in the German newspapers. The Nazi grievances are that a Dutch crowd tore down a Swastika flag hung out by a German resident in Holland in honour of the royal marriage; and that the tune played in Prince Bernhard's honour by Dutch bands has been the Prince's own Lippe-Deimold march and not the German national anthem or the Nazi Party's Horst Wessel song. On these grounds the German police temporarily impounded the passports of a number of distinguished German friends and relations of Prince Bernhard, invited to attend the wedding. The Prince has now announced that, since he has taken Dutch nationality, it is his personal wish that nothing shall be played in his honour except the Dutch national anthem—as the Dutch Government protested, with some acerbity, to Berlin on Monday. And it is the only possible retort to a Nazi attack which appears to rest upon the thesis that Prince Bernhard ought to have abused the position which he is to enjoy in his adopted country by exploiting it for the benefit of the Third Reich in *partibus Batavorum*. No doubt, from the Nazi point of view, the Dutch are truants from the fold; for are not the Dutch, like the English, Nordic men with a Teutonic language? It is a point of view, however, which neither Dutch nor English can be expected to share.

* * *

The French Budget Passes.—At half past one in the morning of last Sunday the 1937 French Budget was finally passed—over a day late, and after five readings in the Chamber and four in the Senate. This time, instead of "stopping the clock" before midnight of December 31st, the traditional way of keeping the old year's session still in being, the sessions were merely "suspended," not adjourned, for the extra time. The final deficit on the ordinary Budget comes out at Frs. 4,585,268,442, compared with the earlier estimate of Frs. 4,366 millions. In addition, however, there is the extraordinary Budget for defence and State public works, amounting to about Frs. 15,000 millions, which must be covered by loans; and there is, finally, a further Frs. 7,000 millions for the railway deficit and pension funds loans—making a combined real deficit of State expenditure over public revenue of about Frs. 26,500

millions, or £250 millions at current rates. The Finance Minister, M. Vincent Auriol, pointed out recently that the ordinary 1935 Budget, which was balanced on paper, showed a deficit in the actual results of Frs. 6,500 millions, excluding the effects of the new social laws of that year, and of Frs. 10,000 millions, including them. He argued that it was better to budget for a deficit on a rising curve of business and profits than for a surplus on a descending curve; and he clearly anticipates greatly increased revenue as a result of increasing profits and the slow repatriation of French funds abroad. The latter are expected to lower interest rates and facilitate conversion of the Debt, the annual service on which accounts for 48 per cent. of total State expenditure. M. Blum's Government have reason to be pleased with themselves. The 1937 Budget is passed; the Tax Reform Bill and Arbitration Bill were also passed in the last hours of the 1936 session, with minor modifications by the Senate; and business and foreign trade are unmistakably and steadily on the up-grade. Indeed, M. Blum's Government have contrived with singular success to raise their goodwill value in the country as a whole to a very high proportion of their political balance sheet. In any break-up of the assets, M. Blum's name would command priority—which may explain why his Communist supporters are now seeking to prevent his glances straying away from them towards the Centre.

* * *

Congress and the Constitution.—With an outward display of solidarity, the Indian National Congress at Faizpur has given a remarkable demonstration of its disunity on vital political issues. Reiterating "its entire rejection of the Government of India Act, 1935," it expressed the opinion that "any co-operation with this Constitution is a betrayal of India's struggle for freedom." Almost in the same breath it resolved to postpone until after the provincial elections—for which the whole Congress organisation is diligently preparing—a decision on the question whether Congress party members elected to the legislatures should accept Ministerial office. The general expectation is that the party will take office where it has a chance of assuming real control, but will prefer political boycott to minority government. Yet, not long ago, Pandit Jawarhalal Nehru, who from all accounts dominated the Faizpur sessions, was roundly declaring that "it would be a fatal error for the Congress to accept office." The more realistic of his followers draw from the history of non-co-operation in the past two decades, in Ireland as well as in India, a different lesson, and are mingling their diatribes against the Federal Constitution with practical appeals to the people to vote them into such power as it offers. Pandit Nehru and other Congress spokesmen appear now to be drawing a distinction between the federation and the provincial autonomy associated with it. This may yet focus Congress policy into unanimity again on the co-opera-

tion issue, since a Congress Ministry at the Centre seems out of the question for a long time ahead.

* * *

Arabs and the Royal Commission.—The decision of the Higher Arab Committee on December 6th to rescind their boycott of the Palestine Royal Commission took no one by surprise. It had been fore-shadowed by inspired statements in the Press, and by consistent reports of the attitude of the neighbouring Arab rulers whose advice was being sought. It was made certain by the decision of Hassan Sidky Effendi Dajani, who organised last year's strike movement in Jerusalem and who had just returned from attending the Emir of Transjordan on an errand to Baghdad, himself to give evidence before the Commission. His explanation, that he now perceived the Arabs to have fallen into a trap deliberately laid by the British Government, smacks of the fabricated excuse for a change of front. So, indeed, does the whole appeal of the Higher Arab Committee to the Kings of Iraq and Saudi Arabia, whose intervention has saved the Committee's face once again. In retrospect, the boycott of the Commission appears to have been an unwise move from the beginning, for it was founded on no really compelling grievance, and it was tactically misjudged. Whether, however, the giving of evidence by the Arab leaders will now further their cause, on balance, remains to be seen. Any extreme presentation of their case would certainly excite no more sympathy with the Commission than appears to have been secured by extremism on the opposite side.

* * *

A Bulgaro-Yugoslav Pact.—The announcement that Yugoslavia and Bulgaria are to conclude a pact of amity is welcome news. This reconciliation is as remarkable a triumph for international good feeling and good sense as the foregoing reconciliation between Turkey and Greece. In this case, as in that, the initiative has been taken by the last party to suffer a reverse in an age-long but hitherto inconclusive feud. In resolving to bury the hatchet with Yugoslavia, King Boris has shown the same wisdom and magnanimity as were shown a few years ago by the late M. Venizelos when he made his famous good-will tour to Ankara. And the Yugoslavs to-day, like the Turks yesterday, have shown a laudable alacrity in responding to the overtures of a former enemy. The Yugoslavs and Bulgars are now of one mind in their desire to pass the sponge over this invidious chapter of past history; and the Yugoslav have gone to great lengths in smoothing the Bulgars' path. The Yugoslav Government have not demanded that Bulgaria shall join the Balkan Entente. They have not even made it a condition that she shall abandon her claims to a Bulgaria *irredenta*—as she would be doing if she were to renounce her right to work for a revision of the Peace Treaty of Neuilly even

Member of the Federal Reserve System, the New York Clearing House Association and of the Federal Deposit Insurance Corporation

by peaceful means. Yugoslavia has had the active support of Turkey. On the other hand, the other two members of the Balkan Entente—Roumania and Greece—appear to have felt some misgivings lest the Bulgaro-Yugoslav Pact might inhibit Yugoslavia from fulfilling her obligations towards her partners in the Balkan Pact if a *casus foederis* touching Bulgaria were to arise. The Yugoslav Government have succeeded in overcoming these fears; and the announcement of Yugoslavia's proposed agreement with Bulgaria has now been made with the consent of all her allies. Greece and Roumania may well be satisfied at any arrangement with Bulgaria which satisfies Yugoslavia; for Bulgaria's largest claims to treaty revision are those which would be at Yugoslavia's expense.

A Cloud Over the Levant.—The Turkish word "Sanjak" arouses unpleasant historical associations. It has generally contrived to crop up as a prelude to great wars. This week the dispute between France and Turkey over the future status of the autonomous Sanjak of Alexandretta and Antioch has reached a sudden crisis. (The history and antecedents of the Turkish and the new Syrian Republic's conflicting claims to the region were given in *The Economist* of December 26, 1936, page 631.) The Turkish-French agreement of October 20, 1921, settled a boundary between Turkey and the French mandated territory of Syria on linguistic lines, i.e. between Arabs and Turks; but, perforce, it left the Turks of Antioch and Alexandretta in a "pocket" which had to be included in the French mandate in order not to cut off Aleppo from the sea. The French, in accord with a promise given to the Turks in the 1921 agreement, gave the region a greater measure of autonomy than the rest of Syria; but when the mandate was recently turned into the Syrian Republic—on the lines of the British renunciation of the Iraq mandate—the Turks urged two arguments. First, that the Syrian Republic could not give the same assurances as France that the Sanjak's autonomy would be scrupulously respected in future; secondly, that if the whole Syrian territory could become sovereign after being a mandate, then the Sanjak had an even greater right to that boon. The Turkish Government allowed the dispute to go to the League, where it is at present being sifted; but apparently Kemal Ataturk and his Cabinet expected the French Minister in Ankara to be able, when lately in Paris, to induce the French Government to do a "deal" over the Syrian Republic's head. This has not occurred; the French Minister has returned to Ankara empty-handed; and Kemal Ataturk, after hurried consultations with Cabinet and General Staff, has left for the southern frontier of Turkey. The French Government have every right to await the League's views; for the new Franco-Syrian Treaty secures special powers to France, and also secures the continuance of the autonomous regime for the Sanjak. With tact and patience, there is no reason why the future status of the Sanjak should not be adequately assured by negotiations, under the aegis of the League, between France, Syria and Turkey.

Argentine Transport Co-ordination.—After four-and-a-half years of painful Congressional gestation, an Argentine National Co-ordination of Transport Bill has been passed. Its every provision bears signs of inevitable compromise. Argentina has a federal form of Government, and "state rights" have proved sufficiently strong to limit the Bill's terms to inter-Provincial services. Some 90 per cent. of Argentina's import and export trade is still carried by the railways, which have played an invaluable pioneer's part in the development of the country, and must continue to play it in the outer areas. This, and the fact that a large part of Argentine railway capital is foreign-owned—mainly by investors in countries with which Argentina, for trade

reasons, must maintain good relations—argue the expediency of some form of safeguarding the railways against excessive road competition. But it has been found no more possible or equitable in Argentina than in England to deny the private trader the right to carry his own goods in his own vehicles. Under the Bill as finally passed, a National Commission for Co-ordinating Transport will be set up. Its personnel will comprise a chairman named by the Government and approved by the Senate, four members of an *ex officio* character representing the highway, State railway and port authorities, and one representative each of the railway and motor transport companies. All inter-Provincial motor transport services, carrying passengers or goods for hire, must obtain a licence from the Commission, unless they work only one vehicle. In granting licences the Commission will have regard to public necessity, efficiency, continuity and the avoidance of duplication. All road transport tariffs will be subject to the Commission's approval. Routes, services, charges, wages and working conditions will be controlled, and licensed transport companies will become public carriers in the fullest sense of the word, since they will be obliged to accept all goods offered to them for transport. A Road Maintenance Fund will be financed by a tax of 100 to 400 pesos (approximately £6 to £24) on each vehicle in service.

The railways, naturally, will regret the non-application of the Bill's provisions to intra-Provincial trading, for road competition is a serious factor in extensive and well-populated Provinces like Buenos Aires. And they may regret still more a provision in the Law under which services which now operate wholly inside a Province can, apparently, continue their present operations for five years, even if they extend their services into another Province. On the other hand, the denial of the right to pick and choose consignments to road companies coming under the law, and the prevention of competitive rate-cutting by insistence on the approval of all tariffs by the Commission, are most valuable concessions to the railway viewpoint. We discuss the effect of the Bill on prospects for Argentine railway stockholders in a Note in our Stock Exchange Section on page 74. Much will depend on the spirit in which the Commission interprets its mandate; and, with all due respect to the railways' legitimate interest, it may well be that the rigid policy hitherto pursued by the road transport authorities in Great Britain will be out of place in a newer country like Argentina.

Newspaper Canvassing.—The share of canvassing expenses in the total bill of costs of a modern newspaper is discussed in a leading article on page 51 of this issue of *The Economist*. In this context, confusion may have been caused to some readers of last week's article (page 4) by inadequate definition of terms. It was stated that "*The Daily Telegraph* is a standing challenge to the theory that canvassing is necessary for the maintenance or increase of circulation"; and it was added that "this newspaper . . . has increased its circulation fivefold without any of the adventitious devices of the mass-circulation papers." In point of fact, it is understood that *The Daily Telegraph* does employ canvassers who attempt to induce an increase in the paper's circulation by means of personal persuasion. But "canvassing" has come in the newspaper industry to have a much wider significance. What it was intended to convey was that *The Daily Telegraph* has not supplemented the arguments of its canvassers with such blandishments as free silk stockings, or clothes-mangles or the collected works of Charles Dickens.

Sustained Shipping Revival.—The marked, though partly seasonal, increase in the demand for shipping tonnage since last autumn continued during the

past month. Consequently, the margin between the supply of, and the demand for, tonnage has narrowed still further and freight rates continued their rapid upward movement. As the following table shows, *The Economist's* index of freight rates in December showed an increase of no less than 34 per cent. over the corresponding month a year ago. Moreover, while the index for 1936 as a whole is still 12.6 per cent. below the average for 1929, the figure for December is 13.9 per cent. above the average for the pre-depression year:—

(1898-1913 = 100)					
	Average 1913	Dec. 1935	Oct. 1936	Nov. 1936	Dec. 1936
European waters	110.0	104.8	113.0	126.1	142.5
North America	113.1	91.2	96.8	100.1	105.6
South America	123.4	86.2	102.6	102.9	127.8
India	106.3	107.1	110.6	123.1	125.0
Far East and Pacific	117.4	92.6	109.1	113.5	126.2
Australia	127.9	92.6	103.6	108.6	142.1
Total	116.3	95.7	105.9	112.4	128.2
1913 = 100	100.0	82.3	91.1	96.6	110.2

As will be seen from the more detailed analysis of changes in freight rates between November and December, striking rises took place on some of the routes:—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	134.3	+18.2	South America:—		
Bay—outwards	157.8	+25.7	Outwards	82.6	+13.8
Bay—homewards	179.0	+4.8	Homewards	173.0	+36.0
Mediterranean:—			India—outwards	92.6	+4.2
Outwards	101.8	+8.7	India—homewards	157.4	—0.4
Homewards	147.8	+22.9	Far East, etc.	126.2	+12.7
North America	105.6	+5.8	Australia	142.1	+33.5

Since the indications point to a more marked expansion of international trade this year, and as shipping tonnage cannot be increased at short notice, a further improvement in freight rates may be expected this year.

Improved Coal Outlook.—The latest returns of production and profits in the coal-mining industry provide further evidence of the improvement in this branch of activity, to which we draw attention in a leading article this week. Production showed an increase of 2.3 million tons between the third quarters of 1935 and 1936, and a loss of 1½d. per ton was converted into a profit of 5d. per ton. The measure of the improvement may be gleaned from the fact that the third quarter's operations have shown a loss in every year since 1924, when profits were ¼d. per ton:—

Period	Tonnage Dis-posable (Mill.)	Costs per Ton		Proceeds per Ton	Profit per Ton	Output per Man-shift	Earnings per Man-shift †
		Wages	Total net				
1932		s. d.	s. d.	s. d.	s. d.	Cwts.	s. d.
3rd quarter 1932	40.9	9 3½	14 2½	13 7½	—0 7½	21.50	9 2
3rd quarter 1933	42.1	9 11½	13 8½	13 3½	—0 5	22.05	9 1½
3rd quarter 1934	46.3	8 8½	13 3½	13 1½	—0 1½	22.55	9 1½
1st quarter 1935	51.3	8 6	12 9½	13 6½	0 8½	23.40	9 2½
2nd "	47.8	8 7½	13 2½	13 2½	0 0½	23.10	9 2½
3rd "	46.6	8 8½	13 0½	13 2	—0 1½	22.93	9 3½
4th "	54.1	8 4½	12 7½	13 11½	1 4	23.89	9 4
1st quarter 1936	54.4	8 11½	13 2½	14 8½	1 5½	23.95	9 11½
2nd "	48.2	9 3½	13 11	14 3½	0 4½	23.26	10 0½
3rd "	48.9	9 3½	13 11½	14 4½	0 5	23.12	10 0½

† Excluding allowances in kind.

If the industry had not been able to pass on to the consumer last year's increase in wages, the result would have been very different. But the scope for further increase in the efficiency of the industry is such that, given the conditions outlined in our leading article, it should have little difficulty in improving its earning capacity at slightly lower inland selling prices.

The outlook is further improved by the unmistakable upward trend of coal consumption. Despite a further

decline of 4.9 million tons in exports and shipments for the use of steamers between January-November, 1935 and 1936, production rose by 4.6 million tons to 207.9 million tons. Home consumption during the first eleven months of 1936, therefore, was 9.5 million tons higher than during the corresponding period in 1935. As exports are now on the up-grade, and home demand is still expanding, the current year gives promise of substantial relief from the depression which has harassed the coal-mining industry almost without interruption since the war.

Record Oil Production.—While demand for coal has tended to expand during the past year with the progress of world recovery, the increase in oil consumption has been even more marked. Thus, while world production of coal recorded an increase of 8 per cent. between the first nine months of 1935 and 1936, world production of crude oil rose by 11 per cent. during this period. According to a preliminary estimate, world production of crude oil rose from 226 million metric tons in 1935 to 245 million tons in 1936, compared with 211 million tons in 1929. Nearly all oil-producing countries have increased their output, but the improvement was particularly marked in the United States, the U.S.S.R. and Venezuela. Moreover, the increase in production has been accompanied by a further recovery of prices. The index of gasoline prices (f.o.b. Gulf), compiled by *Petroleum Press Service*, rose from 57.4 (1929 = 100) in 1935 to 62.2 in 1936, and the index of fuel oil prices advanced from 103.4 to 113.3. Quotations for kerosene, on the other hand, showed a slight decline in 1936. The general tendency of demand and prices, however, remains upwards.

An Electric Supply Problem.—It is now generally agreed that reorganisation of the electrical supply industry should include the consolidation, on a territorial basis, of the existing 650 undertakings into a much smaller number of concerns. This will involve the question of the terms of transfer of independently owned undertakings to the new large operating units, and the prices to be paid for such acquisitions. It is generally agreed, writes a correspondent, that where a local authority owns an undertaking and operates it simply with a view to giving a supply on the most economical terms, the undertaking should be transferred to the newcomer (whose objects will presumably be the same) on the basis of the physical value of the assets. Where a company, however, has established an undertaking of which it is to be dispossessed, its compensation, besides covering the physical value of its assets, should reasonably include an element for "goodwill"—i.e. the expectation of profits over the period for which it

obtained its rights. The bodies to which these undertakings will be transferred will be either public authorities, charged only with the duty of covering their capital charges, or companies whose rate of capital return is controlled by a sliding scale. But if the costs at which they acquire their properties are the same as those paid to the outgoing proprietors, inequitable results will ensue. For example, in London there will be one operating unit to which will, probably, be transferred both the Finsbury undertaking of the County of London Electricity Supply Company, and the undertaking of the St. Pancras Borough Council. These areas are adjacent and not dissimilar. The flat rate price for lighting charged by the Borough Council is 3d. per unit; the price charged by the County Company is 5d. If the joint undertaking pays more heavily for the Finsbury than for the St. Pancras undertaking, and proceeds to pool its charges and operating expenses, the consumers of St. Pancras will be saddled with charges relating to Finsbury. The economies of pooling will thus inure, for a long time to come, almost entirely to the residents of Finsbury and not to those of St. Pancras.

Another example is provided by the adjacent undertakings of the Barnes Corporation, which has always been in municipal hands, and the Brentford and Chiswick Corporation, which was transferred by a company to the Corporation in 1935. The terms of transfer included a substantially smaller price for goodwill than is to be expected in the majority of cases. The present flat rate lighting price at Barnes is 2½d. per unit; at Chiswick 4½d. If the two undertakings were pooled on a fifty-fifty basis, the resulting price would be 3½d. If allowance were made for economies, it might be reduced to 3d. Such a price would represent a reduction of 33½ per cent. for Chiswick, and an increase of 20 per cent. for Barnes. What is the cure for such inequalities? It may be suggested that the people of St. Pancras and of Barnes, through their local government, took the risks of establishing their own supply of electricity; the people of Finsbury and of Chiswick handed them over to private enterprise, which is now entitled to its reward of its enterprise. It would be reasonable, therefore, if, in the new regime, the compensation to the outgoing proprietors included goodwill where necessary, but the incoming undertaking acquired its property merely on a valuation of the physical assets acquired. The difference would be borne by the ratepayers of the local authority which had created the anomaly in the first place, by handing over the risks of electric supply operation to private enterprise. A general reduction of electricity prices would follow, and the burden of paying a handsome reward to the descendants of the private electricity pioneers of fifty years ago would be placed where it rightly belongs.

Banking in Latvia.—In a Note under this heading last March 14th (page 591) we referred to the extensive and extending powers of the Latvian Finance Ministry over all banking and finance in Latvia, whether local or foreign-controlled. We then pointed out that new legislation had given the Finance Minister plenary powers, by non-appellable decrees, over domestic and foreign banking concerns. The Latvian Cabinet have now approved an important change in the Credit Law. By Article 492 the Finance Minister already had the power to dismiss from office, at any time, members of the Board, Council, or Auditing Commission of any credit institution within the meaning of the Credit Law (which applies to foreign as well as Latvian institutions). Under an amendment to this Article, the Finance Minister may now recall from their posts, employees engaged under a private agreement. Now, British trade with Latvia involves financial services of British merchants and bankers. If these reports are true, and the Finance Minister proceeds to apply his powers literally and extensively, British traders and bankers may soon have to choose between retiring from business with Latvia, or undertaking it as an *appanage* of the Latvian Finance

Ministry and its sub-department, the Latvian Credit Bank.

New Life Assurance.—The amount of new life Assurance business transacted by British offices as published in their preliminary statements is given in the following table. Industrial assurances are excluded.

(£ thousands)			
Office	1936	1935	Increase + decrease -

	4,618	4,551	+ 67
	2,750	2,430	+ 320
	170,285	159,326	+ 10,959

* Include decreasing term and group assurances.

The aggregate new business of the offices shows further increase, and about one-half of the offices succeeded in obtaining new record figures. Too much importance should not be attached to a comparison of the figures for different offices. The type of business transacted varies considerably; and different methods are followed in computing the sum assured under certain special low-rated plans.

Co-operative Production and Policy.—The report of the directors of the Co-operative Wholesale Society for the nine months ended October 10th records sales of £76,826,648 for that period—an increase of 9½ per cent. over the corresponding period of 1935. Of this total, some £26,451,918 consisted of supplies for the Society's own productive works, which increased by 9½ per cent. This approximation of the increase of co-operative productive sales to the rise in the total turnover suggests (writes our Co-operative correspondent) that the policy of giving additional dividend on the former has incited societies to increased loyalty. Grocery and provisions are the main factor in co-operative business, and were responsible for £57,478,772 of the turnover, while drapery accounted for £3,644,081; furnishing for £3,773,503; men's wear for £2,490,093; boots and shoes for £1,951,232; and coal for £3,329,020. Significant of the changing policy of the Wholesale Society in association with the retail societies is the encouragement that is being given to federations of local societies for mutual services. Encouragement is being given to eight societies in the formation of the West Wales Boot Repairing Society, Ltd., and also of the West Wales Co-operative Bakeries, Ltd. The C.W.S. is also definitely embarking upon an extended agricultural policy, having purchased land for another bacon factory at Winsford, an egg-collecting centre in Lincolnshire, and sites for tomato cultivation under glass at Tadcaster (Yorkshire) and near Darlington. A milk depôt is to be developed on a 25-acre site near Accrington, and creameries are to be set up in Cornwall and Leicestershire. These, with a meat depôt at Ipswich for the eastern counties, suggest the increasing concern of the industrial co-operators over the agricultural problem.

France

Public Opinion and the Revival of Business

PARIS, January 6.—In his New Year broadcast speech M. Blum declared that his Government was not a Socialist Government, but a "National Government," a Government for the public welfare, that the country has recovered its faith in its destinies, and that the revival of business was certain. It sounded like an appeal for the collaboration of capital. It followed another speech of M. V. Auriol in favour of the liberty of markets. These good intentions were a few days later partially verified by extending to the hoarders of gold in foreign countries and to the holders of foreign currency the amnesty which was formerly guaranteed to the internal hoarders.

The public did not take over-seriously the catastrophic forecasts which the Opposition had made during discussion of the Budget. The final figures are as follows:—

	Frs.
Expenditure	48,071,167,731
Revenue	43,485,899,289
Deficit	4,585,268,442

Both the Senate and the Government made concessions at the last hour, as they did for the Tax Reform Bill, notably on the question of the 2 per cent. super-tax on the profits of joint-stock companies, which will not be imposed on profits which do not exceed 5 million francs. On the other hand, the death duties proposed by the Government were lowered; the publication of income-tax payment at the local civic centres has been rejected; the famous pension fund has been created, but for two years only, etc. Ministerial words of goodwill, like sinister predictions, seem to have lost much of their influence on public opinion and on the Stock Exchange, where everyone is inclined to observe with a more realistic spirit the signs of a revival of business.

The Strike Problem

Therefore the perpetual strikes are a most regrettable fact. They are not, however, actually as great as the detailed daily lists of the Opposition Press might suggest. But the facts are unpalatable in a country where saving is very sensitive to that sort of trouble. The initial application of the new law of December 31, 1936, introducing compulsory arbitration in all industrial disputes will perhaps have the favourable effect of preventing social conflicts from being solved only after lengthy strikes. This law, however, fixes no punishment against the party which refuses the findings of arbitration when they do not fully correspond to its wishes. The declaration of certain members of the trade unions and Communist Party that they will refuse to accept findings every time they do not obtain full satisfaction from the arbitrator is not very encouraging.

It must be noticed, on the other hand, that after six months of social reforms the authority of the extremist leaders on their troops is perhaps less, while that of the Government on Parliament, and that of Parliament on the partisans of movements in the streets, has certainly gained.

Favourable Business Pointers

Railway receipts for the fiftieth week of the year were 192 million francs, or 21 millions more than for the same week of 1935. Loaded wagons for the fifty-first week were 319,183, against 287,568 in the same week of 1935, or an increase of 10.99 per cent., against one of 1.68 per

cent. for the first fifty-one weeks of the year. At the end of December the figure of unemployed was 410,785 (309,884 were men and 100,901 women), against 408,336 at the end of the preceding week and 439,782 at the end of 1935. Production of pig iron in France was 552,000 tons in November, against 551,000 tons in October and 468,000 tons in November, 1935. Production of ingot steel and steel casting was 581,000 tons, against 627,000 tons in October and 508,000 tons in November, 1935.

Coal Mines and the 40-Hour Week

The French coal mines' production was 3,536,912 tons in November, against 4,265,682 tons in October and 4,065,310 tons in November, 1935. This is the first month in which the 40-hour week was in operation, with the same daily hours, but for five days only. There were thus effectively 20.8 work days only, against 25.7 in October and 22.3 in November, 1935. Average daily production was 170,000 tons in November, 1936, against 166,000 tons in October and 182,000 tons in November, 1935. The number of men employed was 228,792 at the end of November, against 226,369 at the end of October, 222,192 at the end of June and 223,309 at the end of November, 1935. The increase of 6,600 units is lower than the number of new employed. In the North, for instance, there were 9,734 new employed for an increase of only 2,747 units in the staff. Of the diminution of 528,000 tons in the production of November, 1935, and November, 1936, 300,000 tons is due to the reduction of the work time and 230,000 tons to the diminution of the individual yield as a consequence of the new work-regulations of May and June. The consumption in November has diminished by 140,000 tons, and the decline in production could easily be covered by taking 322,000 tons from the stocks. The production of coke in the coke plants of the coal mines was 304,126 tons in November, against 328,333 tons in October and 319,579 tons in November, 1935.

Germany

Germany's War "Liabilities" in Spain

BERLIN, January 6.—The international situation is regarded by business circles with ever less favour, and early this week shares dropped sharply. But it cannot be said that the latest aggravation, the ship-seizing incidents in Spain, caused any surprise. It was from the first foreseen that even if all countries remained genuinely neutral in the Civil War, dangerous international incidents would occur; and that if, as has proved to be the case, most of the Great Powers were not genuinely neutral, plenty of pretexts for armed intervention would arise. That Germany should lead in quasi-intervention is natural, for from Berlin came the first formal expression of sympathy with either side.

The Reich has in great measure committed itself. It forecasted incorrectly the course of hostilities between the two Spanish factions, since it was convinced early in November that the Madrid party was on the eve of collapse. When that calculation was falsified there was a temptation to validate it by active measures. Further, in certain quarters there is a natural desire to demonstrate once more the vigour of Nazi foreign policy, and to show that the new armaments are already a potent factor in international affairs. Cautious observers are not so enthusiastic. War, they realise, cannot be conducted on limited liability principles; and there is no

knowing how far Germany, having gone so far, will ultimately have to go. This consideration naturally appeals to military and naval experts. The liabilities of intervention against Madrid, it is realised, are unlimited. But the gain is likely to be meagre. Few intelligent persons believe that Germany, Russia, or any other outside Power is destined to determine the future political system of Spain.

The State and the Productive Machine

Problems of prices, food supplies and raw material supplies dominate most surveys of business in 1936 and forecasts for 1937. The forecasts stress the importance of preventing a further rise in prices, of adapting food consumption to the limited supply, and of increasing the stringency of raw material control. No doubt is expressed over the continued activity of industry. The Trade Research Institute's quarterly report estimates total industrial production last year as 14 per cent. over that of 1928, the standard good trade year. Many industrial branches are occupied to full capacity as determined by plant, labour supply, or raw material stocks. Investment for expansion and renovation in 1936 totalled Rm. 13 to Rm. 14 milliards, which was also the figure of 1928, when, however, capital goods were 17 per cent. dearer. (The Bureau of Statistics' recent estimate was Rm. 12½ milliards.) The national income rose in 1936 by Rm. 4 or Rm. 5 milliards, to Rm. 61 to 62 milliards. Governmental policy, as described by the Institute, will aim at preventing trade-cycle fluctuations, a factor in which policy will be the enforced stability of prices and wages.

A policy of increasing and influencing the character of production has replaced the former policy of reducing unemployment. In general, the unemployment problem is considered solved. In 1937 there will be only 300,000, and in 1938 only 100,000 "genuinely" unemployed. It is a mistake, however, says the Institute, to think that with the cessation of unemployment there will be no labour reserves. The labour supply is more elastic than is generally believed. In the period 1882-1933 the number of manual workers and other employees doubled; but only 64 per cent. of this increase was due to growth of population, the remaining 36 per cent. representing a decrease in the proportion of non-workers. On this basis, the Institute predicts that the number of employed persons in the years 1937 and 1938 will increase by two millions, of whom only a few will come from present unemployed ranks. If this is so, the expansion of industry can be checked, it seems, only by raw material shortage. Whether the Four-Years' Plan will make good this shortage in the near future is not certain. Few analyses of the raw material problem are entirely optimistic. The problem of capital-supply is generally ignored.

Foreign Trade and Exchange

The Reichs-Kredit A.G. Bank publishes lengthy comments on foreign trade and exchange questions. It implies that the recent gold *bloc* devaluations will compel intensification of the export subsidy system. On this subject little has been said of late. The paucity of German receipts in free foreign exchange, despite an export surplus last year of some Rm. 500 millions, is attributed by the R.-K. Bank to seven different factors. The bank accepts the statement of the official balance of foreign payments that in 1935 Germany transferred (net) Rm. 550 millions for interest; and adds that the figure for 1936 was no smaller. The official balance of payments for 1935 in fact showed receipts from "interest, dividends, etc." Rm. 100 millions, and payments therefor Rm. 650 millions. This figure is inexplicably large. According to a Reichsbank estimate the debt service transfer in 1935 was Rm. 250 millions. The second factor mentioned by the R.-K. Bank is tourist traffic under clearing agreements. Next comes the repayment of old trade debts out of the active trade balance. The largest repayments have been to France and Yugoslavia. Germany's new indebtedness under clearing agreements was reduced from Rm. 567 millions in March, 1935, to Rm. 415 millions in October, 1936.

Such debt reductions reduced Germany's cash receipts in exchange. Yet another factor is German gratis coal deliveries in payment for the Saar mines, about Rm. 20 millions yearly. Some 150 million francs were lost through insolvencies of French importers. A temporary loss of exchange naturally resulted from giving long-term credits, against which Germany paid for a great part of her imports, in particular from overseas, immediately. Finally, the gold *bloc* devaluations caused an estimated loss of Rm. 80 to Rm. 100 millions. All these factors are given as reasons why the active trade balance of last year failed to replenish the Reichsbank's reserves.

Prices, Production—and the Public

The official cost-of-living index number for December was the same as for November. As compared with December, 1935, the index rose by less than 1 per cent. For January, 1933, when the present Government took office, the index number was 117.4. The rise in the four years is therefore shown as less than 6 per cent. So small a rise can only be appreciated by a Bureau-of-Statistics family. The real rise for a real family is certainly 20 to 25 per cent. The cereals returns for November show continuing heavy consumption, partly for food—owing to the meat shortage—partly for fodder, partly in consequence of the bad quality of the 1936 crops. The hectolitre weight (which is the German quality standard) of both wheat and rye was much below that of 1935. In November farmers consumed on the spot 46 per cent. more wheat than in the same month of 1935; and the total consumption in the first four months of the crop year was 2,154,000 tons, against 1,835,000 tons in the same months of the preceding crop year.

Industrial consumption of electricity in November was 17 per cent. higher than in November, 1935. On December 1st 1,014 kilometres of the new Reich motor roads were open for traffic, and 1,553 k. were under construction. The Reich Railways Corporation returns its operating surplus in 1936 at Rm. 460 millions, as against Rm. 152 millions in 1935. Operation cost was 88.89 per cent. of operation receipts, as against nearly 96 per cent. in 1935. Non-operation expenditure was some Rm. 515 millions, of which Rm. 235 millions was for traffic tax, Rm. 70 millions for contributions to the Reich, and Rm. 160 millions for pensions, etc. With the aid of certain extraordinary revenue, this non-operation expenditure will, for the first time since the depression, be fully covered.

Holland

Equalisation Fund Policy

AMSTERDAM, January 1.—The Netherlands Government are evidently taking the view that depreciation of the guilder in the neighbourhood of 20 per cent. needs to be maintained. The policy of the equalisation fund, at least, has recently been concentrated upon absorbing all offers of foreign currency appearing on the market at around that level. This is apparently why the Netherlands equalisation fund, after its few months of operations, now consists entirely of foreign currency and gold. In order to embark upon further operations on the foreign exchange market, the equalisation fund has found it necessary to resell to the Netherlands Bank about 150 million guilders' worth of gold. Prior to the devaluation of the guilder, leading opinion in the Netherlands was divided into two fiercely controversial groups, the advocates and the antagonists of the gold standard. The pro-gold group prophesied that devaluation of the guilder would involve catastrophic consequences for this country; a chaotic situation would inevitably ensue, the credit of the State would be disrupted, the cost of living would soar, resulting in agitation for advanced wages, and so on. The other group regarded devaluation as a real boon for the country. They foresaw that it would result in reduced unemployment and only a slight increase in the cost of

living, they anticipated enhanced industrial activity and an improvement in State credit and State revenue. Now that devaluation has become an actual fact practically nothing more is heard from the opposing factions, and from their silence there is surely justification for the conclusion that on the whole the people of the Netherlands are satisfied with the measures their Government have adopted. Calm has been restored, and that in itself is already a factor of great significance. In addition, the economic situation of this country is indisputably showing an improvement, and the greatly advanced prices on the Stock Exchange are already discounting a decidedly better future. The revival is manifesting itself in many branches, and already in the first weeks succeeding the devaluation unemployment became less acute in the larger urban districts. In the cost of living there has been practically no advance. This should be an inducement to face the future with optimism and greater confidence. It is a great relief to see a ray of hope.

Gold Clause in the Netherlands

A Bill has been presented to Parliament providing for the nullification of the gold clause in certain commitments within the Netherlands. If this Bill is passed into law the gold clauses on domestic bonds, mortgages and tenancy contracts will be declared void, except those entered into since September 27, 1936.

The Government take the attitude that in the event of currency devaluation, the gold clause burdens the debtor unduly, at the same time benefiting the creditor, which is unreasonable, especially as the Government have taken measures to combat rising prices. It is a different matter with debts contracted by foreign borrowers in gold guilders; they will not lose by the gold clause, apart from instances in which their own currency has depreciated too. In the same way, a foreign creditor with claims in gold guilders will not derive benefit from maintenance of the gold clause. For this reason the proposed legislative measures are only to apply to inland issues, that is to say, agreements to be fulfilled solely in the Netherlands.

They do not apply, however, to gold clauses on bonds quoted on the Stock Exchange. The Government regard the bonds quoted on the Stock Exchange as being in the nature of merchandise. Contrary to loans without gold clause, the borrower incorporates the gold clause in his bonds with the express object of ensuring the highest possible valuation on the exchange, manifesting itself either in the percentage of interest or in the issue rate. The Government are of opinion that it would not be just if this difference, brought into being by the borrower at his own desire, were to be nullified by action on the part of the Government. In addition, the securities concerned pass into international circulation, and therefore loans of this sort are not of a specifically domestic character.

Imports and Exports up Again

The depreciation of the guilder was already reflected in the import and export figures of the Netherlands for the month of October. In that month imports and exports both advanced in comparison with September, contrary to the usual trend for those months. The trade returns for the month of November, too, make a satisfactory showing. According to the data compiled by the Central Statistical Bureau, the imports in November amounted to 1,813,000 tons (value 100,577,000 guilders), as compared with 1,894,000 tons (value 92,388,000 guilders) in October. Exports aggregated in November 1,283,000 tons (value 77,015,000 guilders), against 1,364,000 tons (value 75,375,000 guilders) in October. The adverse balance for the month of November, amounting to 23,532,000 guilders, was well above the 17,013,000 guilders shown by the preceding month, but it was almost 2 million guilders lower than in November, 1935.

State Revenue Increasing

The revenue returns for November leave a satisfactory impression. The item called "sundry sources" yielded 34.4 million guilders, comparing with 29.9 million guilders in November, 1935. The estimate was surpassed by 3.4 million guilders.

Thanks to the improved yields of the last two months, the revenue position is now making a decidedly better showing. At the end of September the total for the first nine months of the year was 6.1 million guilders in arrears in comparison with 1935, but by the end of last November the aggregate yield of the eleven months was 2.2 million guilders in excess of the 1935 figure. The deficit in relation to the estimated revenue was reduced to 3.3 million guilders; if December turns out advantageously, too, the estimate for 1936 may even be reached, contrary to original expectations.

Less Unemployment

The unemployment situation continues to be satisfactory, and in the last week of November the number of unemployed was even below the 1935 level. The official return shows that of the 457,100 insured persons (agricultural workers excluded) the following percentages were entirely unemployed:—

23rd-30th November, 1936	29.5 per cent.
9th-14th November, 1936	29.0 "
Corresponding week 1935	30.4 "

Money Rates Still Dropping

Liquidity on the money market is still increasing. We give below a table of money rates compiled by the Central Statistical Bureau (in percentages):—

	1936	Nov. 15/21	Nov. 22/28	Nov. 29/Dec. 5	Dec. 12/13	Dec. 13/19
Official bank rate	2.50	2.50	2.29	2.00	2.00	2.00
Private discount	0.91	1.00	1.04	1.01	0.76	0.76
Prolongations	1.50	1.35	1.56	1.46	1.62	1.62
Call money	0.50	0.50	0.50	0.50	0.50	0.50

This enhanced liquidity of the money market is, naturally, coupled with increased activity on the part of the issuing houses. Numerous conversion loans are appearing on the Amsterdam exchange, and now the market is on the look-out for a new State loan.

Hungary

Favourable Political and Financial Omens

BUDAPEST, January 2.—New Year prospects are favourable. Political truce in domestic affairs, higher wheat prices in the world markets, and a practically balanced Budget, the first since 1930, promise well for many impending political and economic problems.

It is expected that electoral reform will be part of the constitutional reform, aiming at extension of the prerogatives of the Regent and the Upper House and leading to an extension of secret ballot in rural constituencies. In the preliminary discussions between the Government's supporters and the leaders of the Opposition parties, it was agreed that reforms must be carried out in the prevailing favourable political circumstances and in the lifetime of the present Parliament. Since this does not expire until 1940 there is no need for undue haste. It is significant that all parties declared themselves in favour of the parliamentary system and against dictatorships, and that the constitutional reform, notably the extension of the prerogatives of the Regent

THE COMMERCIAL BANK OF SCOTLAND LIMITED

RESERVE FUND - - - £3,050,000

ESTABLISHED 1810

and the Upper House, is proposed as the best means to safeguard the traditional parliamentary form of Government against possibilities of untoward contingencies. These might arise as a result of a sudden introduction of secret ballot in the rural areas.

Higher wheat prices will undoubtedly benefit the country. The Rome Protocols regulating the guiding principles of trade between Italy, Austria and Hungary will have to be modified before the next harvest to secure the advantages of higher world prices to Hungary. Higher prices and improved marketing possibilities for wheat and certain other agricultural products have partly compensated Hungary for the losses resulting from the devaluations in the gold bloc.

Improved National Finances

In the first four months of the financial year receipts of the Budget proper amounted to 285.3 million pengő, against expenditures totalling 266.5 millions. The State undertakings also show a modest operating surplus for the July-October period. It is satisfactory to note that while receipts have increased by more than 10 per cent. over last year, expenditure has risen by a lesser percentage. Provided the trend of prices continues to rise, it is not unreasonable to hope that current receipts will suffice to meet current expenses plus the deficit on the State undertakings.

In spite of the above improvements, exchange control and the transfer moratorium will be continued in 1937. Foreign debts, though subject to a moratorium so far as transfer is concerned, receive in practically all instances a regular interest, which amounts roughly to 2 per cent. in the original currency of the creditors. Neither the exchange control nor the transfer moratorium can be finally regulated until Hungary's foreign debts are settled. It is hoped that further progress will be achieved in this direction during 1937. A considerable part of the transfer on account of interest on foreign debts was only made possible by such extraordinary measures as the export of certain commodities at a premium, the cost of which was met by the creditors out of their blocked balances. Such expedients cannot continue under normal circumstances, if and when the exchanges are stabilised and the premia are discontinued.

A Stock Exchange Boomlet

The Stock Exchange after a continuous boom, which began in the latter part of 1935, came to a halt in December. But even after the minor losses suffered in the last weeks, quotations of the leading shares are 50 to 100 per cent. higher than at the end of last year, and they all anticipate considerably higher dividends in 1937. The bond market remains firm, securities yield about 6 per cent., and some of the mortgage bonds, which are sought for capital repayment, have reached their par for the first time since 1931. Owing to the repatriation of the Hungarian shares and bonds there is a very considerable discrepancy between their prices at home and abroad. This discrepancy towards the end of the year was lessened in the case of shares, but remained at its worst in the case of bonds.

Poland

Colonel Beck on Danzig

WARSAW, January 4.—Speaking before the Foreign Affairs Committee of the Senate on December 18th Colonel Beck, by ignoring Czechoslovakia and Lithuania, viewed the foreign relations of Poland with more satisfaction than the public at large feels. Most of the Opposition newspapers believe that the Danzig problem is far graver than Colonel Beck admits, and that the "satisfactory progress" which he reported in the negotiations with the Senate of the so-called Free City may turn out to be much more satisfactory for

Danzig and the Reich than for Poland and the League of Nations.

These negotiations, now in progress, concern the "mediatory mission" which the Polish Government accepted from the League last October, the better safeguarding of Poland's rights and interests, and the position of the Polish minority on the Danzig territory. It now seems to be regarded here as probable—though by no means desirable—that before long the Danzig Constitution will be changed to suit Nazi tastes, and that in consequence the League High Commissioner who will shortly succeed Mr Sean Lester will have a much easier task than his predecessor. The Polish minority, which is very small, would then be in much the same position as the Polish minority in the Reich. In other words, they would be tolerated.

Colonel Beck is understood to attach much greater importance, however, to the safeguarding of Poland's rights and interests. It has been alleged in this connection that Poland is exploiting her "mediatory mission" to strengthen her economic position in Danzig. This is probably true, but with reservations. The original reason for placing a League High Commissioner in Danzig was to protect the Germans against the Poles. Poland's economic arrangements with the Free City have been steadily built up over the last sixteen years with the present Danzig Constitution as the foundation. If this Constitution is now to be "Nazified," and the League High Commissioner to become in effect the guardian of a Nazi Constitution, Poland must try to strengthen her rights and interests in order to safeguard them.

Germany and Danzig

It is, moreover, contended that by strengthening her rights Poland could in some measure retard the movement towards complete "Nazification" of the economic life of Danzig. Poland, for instance, can properly demand changes in the organisation of the Labour Bureau, so that Polish enterprises, of which there are many in Danzig, would not be forced to employ only Nazis. Some measure of protection could also be given to the trade unions and to the principle of collective bargaining. This may not be a very dignified and courageous method of combating "Nazification," but Poland alone could hardly be expected to stand firm for the prestige of the League and the rights of the non-Nazi Germans in Danzig. The Nazis have at least understood that Poland feeds Danzig and that the Reich would have difficulty at present in doing so. It is being charged, and with much justification, that Colonel Beck is pursuing a short-range policy with Germany and Danzig, and that eventually the Nazis will establish complete control over the mouth of the Vistula. But Colonel Beck seems to be about the only European Foreign Minister at present who is able to "view with satisfaction" not only his general line of policy but the results so far attained.

Financial Help from France

The loans and credits which Poland is to receive from France for national defence purposes have been fixed at 2,600 million francs (about £25 millions). The cash portion, against which bonds guaranteed by the French Government, with an interest rate not exceeding 6 per cent. per annum, will be issued, amounts to 1,350 million francs. The cash will be used in large part for completing the Silesia-Gdynia railway. There will be deducted from this amount 45 million francs for buying out the French shareholders of the Zyrardow textile mills, now entirely under Polish ownership, as well as the sums due to French creditors whose interest claims have been "blocked" since the announcement last June of the suspension of transfer on debt service to countries with which Poland has an unfavourable balance of trade or an adverse balance of payments. Until such time as the cash portion of the loan has been entirely transferred to Poland, which may be two or three years, French creditors will no doubt continue to receive their debt service claims in francs.

It is understood that of the arms credits, amounting to 1,250 million francs, approximately 1,000 million francs will be spent in France for equipment which cannot at present be manufactured in Poland, the balance of 250 million francs to be used for fitting out Polish armament plants under the direction of French experts. This transaction is a purely military affair. The loan and credit arrangements are quite separate from the ordinary rediscount operations between the Bank of Poland and the Banque de France, which usually amount to several hundred million francs a year. There is a general feeling of satisfaction here that the visit to Warsaw last month of General Samsonovici, the Roumanian Chief of Staff, has re-established close military collaboration between Poland and Roumania, which promises also to benefit their economic relations. These understandings are taken to mean that France, without necessarily weakening her arrangements with the Soviet Union, has finally understood that a "strong" Poland closely allied to Roumania, and good relations with all the Baltic States except Lithuania, offer the best insurance available against trouble in Eastern Europe.

Improved Trade

Business conditions improved noticeably during the final quarter of 1936 under the stimulus of active re-armament, public works and much better prices for timber, grain and other agricultural products, and sentiment appears on the whole to be more hopeful than at any time since 1929. An encouraging factor in the later months of 1936 was the substantial increase in the export of pig products to the United States, mainly in consequence of the drought, with the result that the pressure of a large adverse trade balance with the United States has been lifted. This improvement has occurred simultaneously with the suspension of transfer on debt service to the United States, which amounts to over 50 million zlotys a year.

Difficult Negotiations with Germany

The Polish-German compensation trade agreement of October, 1935, which expired at the end of October, 1936, and was then extended for two months, has been further prolonged until the end of February. A new agreement is proving very difficult to negotiate, partly because those German manufactures which have to compete with British are too expensive under the existing barter arrangement, and also because Poland can now find advantageous cash markets for most of the products which she contracted in October, 1935, to export to Germany. Economic relations between the two countries are further complicated by the transit charges for German railway traffic across the "Corridor," on which there are arrears amounting to over £3,000,000 still outstanding.

U.S.S.R.

Production and Armaments

Moscow, January 2, 1937.—Soviet leaders are well satisfied with the political, financial and economic position of their country at the end of 1936. Armaments have been brought nearer the level considered adequate for defence, Moscow's stabilising influence in Europe and the Far East has been more generally recognised, foreign trade has been balanced at less expense to the population, and the standard of living has improved.

The chances seem better than for several years that the Soviets will be able to avoid war. With Japan more deeply involved in China, Japanese pressure upon Soviet Far Eastern borders has been reduced. The rapid increase in the Soviet armaments is believed to have diverted Germany's attention elsewhere.

During 1936, Russia moved steadily toward the admitted goal of self-sufficiency. Foreign purchases

were concentrated, as in the past, upon armaments, machinery and machine tools. Industrial production increased by about 30 per cent. as compared with 1935. Extension of mechanised agriculture and irrigation partially offset the drought; cereal grain crops, estimated at 82 million metric tons, covered the needs of the population. A record cotton crop of 2,200,000 tons made Russia independent of foreign supplies. Increases were reported in sugar-beet and flax crops.

Soviet leaders estimate their progress by reference to the State plan, which is their own estimate of what should be accomplished. The plan was fulfilled in production of pig iron, steel, rolled metals, synthetic rubber, gold and platinum, and generally in light and food industries. Production fell below the plan in oil, coal and timber. The unpublished plan for armaments apparently was over-fulfilled, as the armament industry has first call upon men and materials.

"According to Plan"

Development of the gold and synthetic rubber industries without regard to expense shows the determination to attain self-sufficiency. Money has been poured into these industries for several years, with the result that in 1936 synthetic rubber constituted 44 per cent. of that used, and gold production was estimated at eight million fine ounces, about three times that of 1932. Russia's gold apparently is being held for use in case of war; there is no suggestion that it will be used for currency-backing. It is claimed that in two or three years Russia will be able to manufacture enough synthetic rubber to supply all it needs; several different formulas are used.

During 1936, internal bond issues bearing 12, 10 and 8 per cent. interest, totalling 14,600 million roubles, were exchanged at par for 20-year 4 per cent. non-negotiable bonds, and a new issue of 4,000 million roubles was quickly absorbed. Foreign debts against imports were reduced to \$75 millions, which will be paid off in 1937. The Commissar of Foreign Trade, M. Rosen-goltz, declared that Russia is now in a position to pay cash for all necessary foreign purchases, but will buy more abroad if credits are offered on acceptable terms.

The State plan for 1937 slows down the rate of increase in industrial production; attention will be concentrated upon improvement in quality, which is badly needed. The damage to materials is appallingly high in many industries, both in capital and consumers' goods. The enormous expense of industrialising Russia with abnormal rapidity and of mechanising and collectivising agriculture of peasant holdings, has imposed heavy burdens upon all classes of the population. This process has now been sufficiently advanced to enable the consumer to get more attention. Service and supplies in retail shops were improved in 1936; in 1937, the people hope that a larger share of the national income will be devoted to housing, to mitigate over-crowding and slum conditions.

Family provision scheme

A scheme to secure a Capital Sum payable at death and a regular income over a period of years for dependants in the event of early death, at a cost which is little more than that of ordinary life assurance.

It is readily adaptable, and rates will be quoted on application for policies to suit the needs of each individual.

Denmark

Trade Agreement with Germany

COPENHAGEN, January 3.—A trade agreement for 1937 between Denmark and Germany was concluded just before Christmas. For the first quarter Germany undertakes to buy Danish products to the value of 70 million Kroner; of this, about 61 million Kroner will be for agricultural produce, and about 3 million Kroner for fish. For the second quarter, Denmark's exports will be in proportion to Denmark's imports during the first quarter, and so forth for the third and fourth quarter. It is stipulated in the agreement that Denmark's imports from Germany shall exceed the exports to such an extent that the present credit balance with the Reichsbank, which is believed to be about 20 million Kroner, will be liquidated. The maximum for Danish exports under the agreement is estimated at 280 million Kroner.

Revision of Exchange Control

Although the present Exchange Control Act does not expire until December 31, 1937, the Government has already intimated that certain changes in the Act will be carried through during the present session of the Rigsdag. The present system of exchange control will remain in force until the end of 1938. The practical administration of the Act will be improved so that importers will have ample time to make purchases before the expiration of the import-permits, for at present the time between the issue of import-permits and their expiration is too short. A special clause limiting Danish tourists' expenditure abroad is foreshadowed. The Prime Minister has on various occasions hinted at this, but such a clause is apparently rather a bone with some meat on it thrown to the socialist voters than necessitated by the foreign exchange position.

On December 16th, a 25-year loan of £1,500,000 at 3½ per cent. interest at 93 was contracted for between Hambros Bank, Limited, and the Mortgage Bank of the Kingdom of Denmark (*The Economist* of December 26th, page 647). The proceeds of the loan will be a welcome addition to the foreign exchange balances of the country, and it is taken to indicate that the recurrent rumours of further Krone devaluation are entirely unfounded.

On November 19th, the discount rate of the national bank was raised by ½ per cent. to 4 per cent. The general opinion in financial circles is that this increase should have been made long ago, but for political reasons it was postponed until after the Landsting elections, and until the renewal of the 65.5 million Kroner 4 per cent. three-year treasury bonds was secured.

Winding-up of Shipbuilding Company

The committee for the winding-up of the old Burmeister and Wain Shipbuilding Company has published a proposal for a final winding-up. The creditors are to receive 11/25th in cash and 14/25th in 6 per cent. preference shares in Burmeister and Wain, and the shareholders will receive 350,000 ordinary shares at Kr. 1 each, in exchange for the old share capital amounting to Kr. 35,000,000, with the prospect of appreciation of their new shares as and when earnings permit repayment of the preference share capital. Even with the present satisfactory earnings, any appreciation of the new ordinary shares is a bill drawn on a distant future. No dividends will be paid on the ordinary shares until the whole preference share capital of Kr. 14,000,000 has been repaid. A large block of old Burmeister and Wain shares is believed to be in British hands.

New Year Prospects

The various New Year résumés by prominent personalities in trading, industrial, financial, agricultural and shipping circles contain different comments on the

results obtained in 1936. The wholesale trade calls attention to the regrettable fact that the exchange restrictions make it exceedingly difficult to develop markets to advantage, while retailers and industry are, on the whole, satisfied. Some relief of the financial situation of farmers has been experienced, but the position of agriculture as a whole is not considered satisfactory. In shipping circles comparatively favourable results for the year are expected, but it is emphasised that the improvement of freight rates only applies to the last few months of the year, and many holes from the lean years have still to be filled.

Letters to the Editor

Raising the Standard of Living

TO THE EDITOR OF THE ECONOMIST

SIR,—If a layman is eligible to reply to Mr Murphy's inquiry I offer the following in notebook form in order to save space. "Material prosperity" available per head of population depends upon (a) total national income; (b) manner in which income is divided. Therefore, to increase prosperity per head it is necessary to increase income either by working harder and/or more efficiently. Or we may be content with present output and re-distribute income so that many poor people become a little richer and a few rich people become much poorer. Or we may combine efforts to increase the total income with measures to distribute it on a more equalitarian basis than is at present the case. There is a third possibility, viz., that we should increase annual consumption per head by spending more and saving less of our total income.

You will not expect me, Sir, to tabulate here the various technical proposals which exist or could be devised for increasing our output of goods and services, or the many ways in which existing income could be re-distributed. On this point the Labour Party will supply full details.

It may, however, be pertinent to point out that a "standard of satisfaction" (I prefer that expression to standard of living) may, and in my case does, include a week-end devoted so far as possible to uneconomic pursuits. An increase of national income obtained through a decrease in national leisure would be a lowering of the standards of living, unless the decrease of leisure took place in the depressed areas. You can't get something for nothing; and an increase in national income can only be obtained by more work and more efficiency. Since manufacturers must be presumed to be working as efficiently as they feel worth while or know how, some people think extra stimuli should be provided, i.e., courts-martial followed by ten years' hard labour for directors who blunder. This might, however, check enterprise, and so lower total income.

Yours truly,
STEPHEN KING-HALL.

Hartfield House,
Headley,
Hants.

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr. Frank Murphy's first suggestion is right. It is not fair to address his question about the means of raising the standard of living to the professional economists. He should approach the political scientists.

There is no politically practicable panacea for the poverty and inequalities of this silly world. No politician honestly proposing reforms which would exterminate physical suffering and create equality of opportunity could survive an election. He would be ridiculed by the stupid but effective cry of *laissez-faire*. The vested interests in poverty have captured the mind of the intelligentsia and have a powerful hold on public opinion. That is the crux of the matter.

Let Mr. Murphy ask the political scientists why the poor should continue to tolerate or even to fight for poverty—precipitating policies in the belief that they are thereby curbing an exploiting capitalism.

Yours faithfully,
W. H. HUTT.

63 Derby Road,

The Colonial Question

As Mr Macaulay agrees, his book* is essentially a polemical tract, and as such it must be judged. Presumably it is addressed to those who do not yet share his view that a short and final "No" is the only sound answer to Germany's colonial demands. Is it likely to convince them? One cannot help feeling doubtful. Mr Macaulay speaks plainly and hits hard, but he hits all round him with his eyes shut, not only at Dr. Goebbels and General Ritter von Epp, but equally at Mr Baldwin, Mr Eden, Mr Pirow and anonymous High Financiers. His argument is like a Chinese cracker; it sizzles for a while and then bangs, and hops about disjointedly.

Curiously, he seems not to realise the strength of his case, but rests it largely on two aspects of the colonial problem that are almost the least secure he could have chosen to justify a flat negative to Germany—the status of mandated territories and the comparative wisdom and humanity of German and British methods of governing African natives. On both these matters Mr Macaulay has some valuable and trenchant things to say (though it would have given a greater impression of fairness if, for instance, he had said more about the notorious Bondelswartz rising of 1922 in South-West Africa than that the natives who took up arms "were taught a swift and salutary lesson by local police and other forces"; this is just the kind of thing a German apologist might have said about the Herrero rebellion). But surely Mr Macaulay would have found his task easier if he had based his theme on German motives rather than British rights. The economic motive is clearly a forced card; German trade is already safeguarded under the Open Door, and the proportion of her required raw materials that she could procure from the whole of her former colonial empire, and that she does not already obtain there under the present regime, is negligible. The familiar argument about a single currency system, whatever its merits, does not alter the fact that what is bought has to be paid for. That leaves strategy and prestige as the two genuine motives inspiring German demands. Whether we should satisfy German strategical interests and the prestige of Herr Hitler's Government, possibly at the expense of our own, is a question Mr Macaulay would know well how to answer.

This is not, however, his approach. Apart from quoting some figures about raw materials, his treatment of the economic aspect of the matter is frankly incomprehensible, confused as it is with some strange vaporisings apparently borrowed from the latter-day gospel of Douglas Credit. The following sentence, for example, is among the more straightforward of those that have baffled the reviewer: "Another factor which benefits the foreign merchant is that in British colonies such as Kenya and the neighbouring mandated territory, Tanganyika, the local currency is pegged to sterling, although Great Britain herself has abandoned the gold standard." Again, Mr Macaulay needs but one short paragraph to prove that "the necessity for direct or indirect taxation of any community does not exist." It is not by such eccentricities, nor by such haphazard argument as Mr Macaulay's, that the colonial question will be answered. But he has come to his task with at least one advantage over keener-minded controversialists; he talks the same language as those with whom he has to contend, and wears the same intellectual spectacles as Herr Hitler and General Goering. His antipathies extend beyond the "bankrupt" League, and the "sinister" Bank for International Settlements, and the "godless" Russia, to "the world hegemony of Judæo-Masonry."

* "Mandates," by Neil Macaulay. (London) Methuen. 213 pages. 6s.

Shorter Notices

"Silber." Wandlungen in der Erzeugung und Verwendung nach dem Weltkrieg. By Dr. Herbert Wegner. Heft 5, Wandlungen in der Weltwirtschaft (edited by Prof. Schumacher). Bibliographisches Institut A.G. I. Leipzig, 1936. Pages 176. Rm. 7.50.

Although silver has not yet quite lost its old romantic character, its story in recent times, as Professor Schumacher points out in the preface to this book, has been no longer one of brilliant ascendancy, but rather of the declining status of an aristocrat ("Verbürgerlichung eines Aristokraten") with all the disappointments and difficulties as well as the hopes born of past memories carefully kept alive. Dr Wegner is mainly concerned with an inquiry into the causes of this "decay" and the prospects and conditions of an improvement in the status of silver. His conclusions imply the same pessimism which is shared by all those who do not vaguely talk of a rehabilitation of silver, but have cared to probe deep into the causes of its vicissitudes.

Dr Wegner has drawn on varied sources and he provides a useful bibliography. His book is both informative and interesting, particularly Chapter II, on the trend in the industrial consumption of silver, and Chapter III, on the development in the monetary demand for silver.

"Spanish Front," by Carlos Prieto. Nelson. 2s. 6d.

In less than a hundred pages "Carlos Prieto" has given us the best introduction available to Spanish affairs. The complexity of the historical background is the initial point he makes, and one is glad to see his summary disposal of the notion that the Spaniards are a "Latin" race. Coming to recent history, he makes us appreciate what might be called "the necessity of anarchism"—as a healthy reaction against the persistent despotism of Church and State. The

H. G. WELLS says: "A model of how that sort of subject should be treated; it is as interesting as a good story and far more interesting than most stories."

CAMBRIDGE UNIVERSITY PRESS

pseudo-parliamentary system of 1876-1923 was enough to damn democracy in the parliamentary sense for all time. Yet, as Carlos Prieto insists, what is happening in Spain is essentially a struggle between Fascism and Democracy—an engagement being fought out on the Spanish Front. And, should the democratic Government in Madrid win the day, "it is the republican democrats who would have to do most of the preliminary work for a Communistic Left. . . ." The author is convinced that the best outcome of the present travail would be "a new philosophic Anarchism . . . based essentially on the old slogan of the French Revolution: Liberty, Equality and Fraternity." But he foresees a preliminary phase of either Fascism, or Communism, or both. That depends, clearly, on extra-Spanish factors which no one can evaluate. Carlos Prieto is scathing about the behaviour of the British Government. The book contains a valuable "note on Spanish character" and the observation that "the Spaniard loves ritual, but he is not really a pious, religious person. He is a pagan . . ." It is a mistake, however, to compliment (page 75) Largo Caballero on his "astuteness in bringing about the Popular Front," since he was actually against it, favouring a United Proletarian Front. And a new edition should replace Miguel by Manuel Azana.

"Dividend on Co-operative Purchases." By J. A. Hough. Co-operative Union, Ltd. 187 pages. 7s. 6d.

This book is a useful summary of the economic position of the wholesale and retail co-operative societies in Great Britain. The discussion centres round an examination of dividend policies, and the arguments in favour of high and low dividends are examined in detail. Mr Hough inclines to the view that societies in the south of England have been justified in their adoption of a low dividend policy, without which they would have been far less able to withstand the competition of large private stores. He puts the case for lower prices and lower dividends moderately but persuasively, and thinks that there should also be greater uniformity of policy on the part of retail societies.

The least satisfactory part of the book is the chapter on the uses to which co-operative capital is put. Many of the really important questions, e.g. the proportion of capital invested outside the movement, and the significance of changes in the rate of interest on shares and loans, are not examined at all, or are only treated in a superficial manner. The arrangement of the statistical tables is also not always satisfactory. These shortcomings do not, however, detract from the general utility of the book. One may hope that the Co-operative Union will undertake a more detailed study on the economics of co-operation, which will deal fully with some of the important general problems which are here left unanswered.

"Southern India." By Gilbert Slater. Allen and Unwin. 373 pages. 15s.

"Southern India" gives an account of Dr. Slater's service in India as Professor of Economics, Acting Publicity Officer and nominated member of the Madras Legislative Council, together with comments upon Indian social, political and economic life. The first eighteen chapters consist of reminiscences of the author's first impressions of India, of his teaching experience, and of his visits to and studies of many villages and rural areas in the neighbourhood of Madras. Subsequent chapters comment upon such various aspects and problems of Indian life as organisation of modern large-scale industries, the results of the War on economic and political life and thought, the problems of industrial labour in Madras, and the working of the reformed, dyarchical constitution.

The author's views are often controversial, but are invariably based upon close and critical observation, and a broad-minded study of the heterogeneous, but intimately interwoven aspects of Indian life. He records the high admiration evoked in him by the Indian students of the university, British and American missionaries, and last, but not least, the members of the I.C.S. Of the latter he says that they "as a body, are beyond any other corps of administrators, distinguished for complete freedom from even suspicion of corruption and nepotism, and for whole-hearted zeal in the public service. For the causes of what is wrong in Indian Government—and there is much that is wrong—we must look elsewhere and particularly at home." His judgments on home policy, as can be inferred from this quotation, are much more severe.

The book deserves to reach a large public, as it gives a vivid picture of Southern India, and includes a large number of little-known, but most interesting and illuminating information about such varied subjects as marriage customs, local lore, agricultural methods and deficiencies, and the working of the Montford Constitution.

MONEY AND BANKING

Sterling Exchange Policy

A YEAR which may well prove decisive for the future of sterling exchange policy has just closed; and we may profitably draw lessons from 1936 for the conduct of that policy in 1937. The long-deferred devaluations of the gold *bloc* currencies last September, and the surprising suddenness both of these and of the agreements between the authorities handling the world's leading Exchange Funds, have raised up new problems which must be solved by these authorities both *ambulando* and in common. The outlook for sterling by itself—i.e., apart from sudden withdrawals of foreign funds lodged in London—is not as discouraging at the outset of 1937 as at one time seemed likely. The so-called unfavourable balance of trade is up by over £80 millions; but Sir Robert Kindersley's recently published estimates of our investment and shipping freight income from abroad (see *The Economist*, December 26, 1936, page 631) show notable increases, and it is known that the balances of the sterling area, which have to be kept in London, are showing no diminution. Nevertheless, since last September we must take more account of international forces if we are to apply the lessons of 1936 in 1937.

Devaluation of the gold *bloc* currencies last September was achieved suddenly and in the best possible way. It was heralded by the tripartite monetary agreement between Great Britain, France and the United States, pledging all these nations against competitive currency depreciation. Other nations rapidly acceded, and by the end of October, France, Switzerland, Italy and Czechoslovakia had all devalued, the Dutch guilder was riding free of gold, and other countries had forsaken gold for sterling. This restoration of comparative monetary equilibrium came as a tonic to the whole world—a tonic added to the natural recovery of world commodity prices. Consequently, in the purely monetary sense, there was a definite shifting of the centre of gravity from one side to the other of the whole pound-dollar-franc triangle. The franc ceased to be hopelessly over-valued, and while the degree of devaluation may not have fully offset the reactions of M. Blum's "new deal" with its influence upon French prices and costs, the franc is no longer seriously out of alignment. Instead, the rapid rise in British prices during the closing months of the year has tended to make sterling once more an over-valued currency; and we should note the warning that only the absence of a similar increase in wages and the cost of living is saving us from serious over-valuation. As matters stand, the time has come to pay heed to our internal trade boom, with its rising prices and shortages of skilled labour; to our growing imports and languishing exports; and to the increasing demands for credit. If our exchange position is strong, it is partly due to circumstances beyond our control, and notably to the reluctance of Frenchmen to repatriate their funds sent abroad during the earlier years of doubt. It must not lead us to ignore the other warning signs.

In 1936 there was a definite easing of world monetary conditions. The year's rapid advance in the prices of primary products is bearing fruit in the rehabilitation of numerous countries who provide us with our chief markets and are the repositories of much of our overseas investments. The Dominions' currencies and finances stand firm. Canada is liquidating her wheat stocks, and Australia is marketing her wool. India and South Africa continue to send the world gold, and to achieve liquidity where the Government, through its growing monopoly over exports, is equally monopolising foreign exchange, leaves room for a few slight doubts; and this is really a

technical question to be solved by willing co-operation between the Government and the banks. Scandinavia is equally prosperous, save where its trade impinges on the closed systems of Germany and other Continental countries. Last, but not least, Argentina has so strengthened her position that she is now almost able to give a lead to the world by sweeping away her foreign exchange control.

At home we have developed our monetary technique by multiplying the contacts between the Exchange Equalisation Account and our internal money and banking system. In the summer the French hoarding of British currency taught us that in certain circumstances the Exchange Account must re-sell gold to the Bank of England. We found, for example, that for every £1 note hoarded by foreigners, the Bank must buy £1 of gold (at the Bank's valuation) from the Exchange Account. Even when foreign funds, notably francs, came on to deposit at the British banks it was advisable for the Bank to buy from the Exchange Account £1 of gold for every £10 so deposited. In this way alone could the paradox be avoided of an influx of foreign funds creating monetary stringency in London. A few weeks ago, when the French credit was repaid in gold, we learned another lesson. The Bank took over £65 millions of gold from the Exchange Account, simultaneously reducing the fiduciary note issue by £60 millions (see *The Economist*, December 19, 1936, page 588). This relieved the Exchange Account of gold indigestion, and also set the precedent of using the fiduciary note issue as an auxiliary to the Exchange Account to give greater freedom and elasticity to our monetary system. Henceforward the Exchange Account and the Bank can work together, and the fiduciary note issue can be varied so as to regulate at will the impact of gold imports and exports upon the internal supply of credit.

Meanwhile the gold *bloc* devaluations have led to the creation of Exchange Funds in France, Holland and Switzerland. The British authorities must now face both these resources and those of Washington. Still, all the indications are that the leading countries are slowly establishing a new and elastic form of gold standard in which the former gold *bloc*, the sterling area, and the United States will play the principal rôles.

There remain the restricted countries—Germany, Italy and Central and South-East Europe—joined during the year by Poland. Here there is little, if any, progress to record. We ourselves have been driven into concluding clearing agreements with several of these countries. The trouble is that exchange restrictions, clearings and trade on a compensation basis have become an integral part of their economic, social and even their political systems. While the sharp and sudden rise in world commodity prices has greatly improved the prospects of currencies of the smaller States—e.g. Hungary, the Baltic countries, Roumania, Brazil—the effective absence of Great Powers like Germany and Italy from the new association of exchange-stabilising countries leaves some uncertainty in the 1937 picture.

Nevertheless, 1937 opens under much more favourable auspices for the trading world—and therefore for sterling—than any other year since the great depression parcelled the world into separate national currency portfolios. Sterling has to face three main problems: withdrawal of foreign funds, a drain of English speculative funds to the United States, and an over-steep rise of prices—and therefore of costs—in Britain in relation to the rise in other leading countries. The first two problems can be faced administratively by the controllers of our

Exchange Equalisation Account and by such "requests" to bankers and the Stock Exchange from high quarters as those with which the City is already familiar. But the last is a real problem, for, as we pointed out in our first leading article last week, the British domestic recovery is reaching an advanced stage of "boom." The British authorities may have to envisage before long the possibility of a real discrepancy arising between the rate of increase in business activity and prices here and those in, say, France and the United States. At the outset of 1937, however, this is happily only a contingency, not a prophecy, and still less a certainty. If the new international monetary collaboration speedily devises its canons and procedure, 1937 may prove a quiet year for sterling in the exchange markets.

Financial Notes

Bankers' Clearings in 1936.—The past year's returns of London and provincial bank clearings provide abundant evidence of the progress of trade revival and the more rapid circulation of money:—

	1934	1935	1936
	(£ million)		
Town clearings.....	30,740	32,444	35,039
Metropolitan clearings.....	1,760	1,887	2,040
Country clearings.....	2,984	3,229	3,538
Total—London clearings.....	35,484	37,560	40,617
Total—Provincial clearings....	1,295	1,283	1,394

Generally speaking, London clearings have increased since last year by 8 per cent. and provincial clearings by 8.6 per cent. Part of the increase in town and metropolitan clearings is due to the admission a year ago of the District Bank to the London Clearing House, but country and provincial clearings are unaffected. The quarterly returns show that on the whole the increase in activity became more pronounced as the year progressed. Comparing each quarter of 1936 with the corresponding quarter of 1935, the largest increases were recorded in the fourth quarter of 1936 by Birmingham, Leeds, Liverpool, Manchester, Newcastle-on-Tyne and Sheffield. Re-armament activity and the recent revival in shipbuilding and the cotton trade are the obvious explanation in many instances, while the Liverpool returns may have been affected by the upward trend of wheat and other primary products prices. The largest increases for the fourth quarter were Birmingham (28.3 per cent.), Sheffield (23.5 per cent.) and Liverpool (21.2 per cent.). Town and metropolitan clearings also registered their largest increase in the fourth quarter.

The Bank Return.—Since Christmas £21.4 millions of notes have returned to the Bank, but the circulation is still £18 millions above its level of the middle of November. The reserve is £15 millions higher, the discrepancy arising mainly from the net expansion of £5 millions in the credit base at the time of the Bank's December gold purchase.

BANK OF ENGLAND					
	Jan. 8, 1936	Dec. 16, 1936	Dec. 23, 1936	Dec. 30, 1936	Jan. 7, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	200.2	313.7	313.7	313.7	313.7
Note circulation	405.6	467.7	474.1	467.4	462.7
Banking Department:—					
Reserve	55.3	46.6	40.2	46.8	51.4
Public deposits.....	11.3	10.4	21.7	12.1	13.5
Bankers' deposits.....	107.8	96.2	72.2	150.6	110.2
Other deposits	36.8	38.8	38.8	39.2	38.4
Government securities	84.4	89.1	83.1	134.5	93.3
Discounts and advances	21.3	6.7	6.4	17.5	14.4
Other securities	13.1	20.8	21.0	21.2	21.1
Proportion.....	35.4%	32.0%	30.2%	23.1%	31.7%

The market's limited borrowings from the Bank over the turn of the year have now been repaid, and the net increase of £8.0 millions in discounts and advances since a fortnight ago suggests that there have been other opera-

tions at the Bank. Most of the £57 millions borrowed by the Government on Ways and Means on December 31st has also been repaid, but Government securities are still higher than in December. All these influences have combined to maintain bankers' deposits at £110 millions.

The Money Market.—Christmas and the end of the year are now over, and the market is returning to the conditions of last November. Bankers' deposits are once more high compared with the closing months of last year, and so money is again very easy. This week the clearing banks charged their normal rates for loans, while outside money was plentiful at $\frac{1}{2}$ per cent.

	Dec. 17, 1936	Dec. 23, 1936	Dec. 31, 1936	Jan. 7, 1937
Bank rate	2%	2%	2%	2%
Clearing banks' deposit rate	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$
Short loan rate:—				
Clearing banks	$\frac{1}{2}$ – $\frac{3}{4}$ –1*	$\frac{1}{2}$ – $\frac{3}{4}$ –1*	1–1 $\frac{1}{2}$	$\frac{1}{2}$ – $\frac{3}{4}$ –1*
Others	$\frac{1}{2}$ – $\frac{3}{4}$	$\frac{1}{2}$ – $\frac{3}{4}$	1	$\frac{1}{2}$
Discount rates:—				
Treasury bills	$\frac{1}{8}$ – $\frac{1}{4}$	$\frac{1}{8}$ – $\frac{1}{4}$	...	$\frac{1}{8}$ – $\frac{1}{4}$
Three months' bank bills	1–1 $\frac{1}{4}$	$\frac{1}{2}$ – $\frac{3}{4}$	$\frac{1}{2}$ – $\frac{3}{4}$	$\frac{1}{2}$

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Some of the banks were buying March Treasury bills at $\frac{1}{2}$ per cent., but there was no demand for Februaries. Discount rates are likely to remain weak, as the Government is now beginning to repay Treasury bills out of the seasonal revenue surplus.

The Foreign Exchanges.—The market has experienced a dull week. The New York rate rose to \$4.92 on the news of the American strikes, but returned to \$4.91 on Thursday afternoon on rumours of an impending settlement. Forward dollars are at a small premium. The Paris spot rate continues to be held by the French Control at Frs. 105.15, and French official buying of forward francs has now brought the three months' rate down to Frs. 1 $\frac{3}{4}$ discount, against Frs. 2 $\frac{3}{4}$ a week ago. Guilders have been firm at rates of Fl. 8.96 $\frac{1}{2}$ to Fl. 8.98 $\frac{1}{2}$. The Dutch Control has continued to sell guilders in order to prevent an appreciation. During December the Netherlands Bank added Fl. 150 millions to its gold stocks. This gold was bought from the Dutch Exchange Fund, and the motive must have been to relieve the Dutch Exchange Fund of surplus gold and to replenish its holdings of guilders. This follows our recent precedent. There have been minor fluctuations in belgas due to liquidations at the end of the year. Exchange on Barcelona has been offered on American account at Ptas. 68 to the pound, presumably in connection with this week's hurried shipment of munitions from New York. The only demand for pesetas is from dealers with open positions.

American Banking Results.—The following table gives the changes during 1936 in the deposits and the chief assets of some of the leading New York banks:—

	CHANGE DURING 1936			
	Deposits	Cash	Securities	Loans
Chase	+ 211	— 187	+ 119	+ 134
Guaranty Trust	+ 224	+ 40	+ 116	+ 77
Bankers Trust	+ 50	+ 36	— 10	+ 44

These results reflect the continued expansion of credit, for the drop in Chase National Bank's cash reflects the abnormally large amount of cash held by it a year ago. With this exception, there has been a general increase in banking liquidity, which, if anything, accentuates the problem of finding remunerative employment for available resources. On the other hand, there has been a growing demand for loans, and one of the three banks has reduced its holdings of "Governments." This has not impaired the liquidity of the banks and should be adding to their earning power.

THE STOCK EXCHANGE

How Companies Finance Recovery

ONE of the most remarkable features of Britain's trade recovery has been the ability of industry, during the last four years, to finance an increase of approximately 30 per cent. in activity, although the total advances of the clearing banks have risen only by about 10 per cent. We have previously suggested, with due deference, that the banks, who have admittedly not reduced their rates for advances fully in proportion to the decline in general interest levels since 1932, have been charging a little more than the traffic would bear, and have consequently lost some of their business to various competitors. Who are these competitors? One of them, apparently, is industry itself, which possesses—to a greater extent, perhaps, than was universally realised—the camel's faculty for living on its own hump.

How far has recovery been self-financing? To learn the approximate answer to this question we have examined the balance sheets of twenty large and representative British companies, whose names are household words to the investor. The results of our inquiry are set out in the table at the foot of this page. It will be seen that the latest returns of these concerns show a rise in aggregate disclosed profits, since 1932, of 28 per cent. Clearly, they have transacted an increasing volume of business, and, in the process, have required enhanced financial resources. Whence have these resources been derived?

It is clear, at least, that their provision has not involved any substantial reduction in the working capital which all companies must keep for the current requirements of their business. The surplus liquid assets of these twenty concerns have not declined, but have actually risen by 7 per cent. since 1932. (For a definition of "surplus liquid assets" we would refer our readers to a footnote to the attached table.) Our figures suggest that if British companies were "liquid" in 1932 they are even more "liquid" to-day. In the interim, eleven of the companies shown in the table have obtained £17 millions (less issue expenses) by issues of new capital for cash. But nine companies have not increased their capital; and a substantial share of the proceeds, in any case, has been used for additions to fixed rather than floating capital.

We must evidently look elsewhere for a complete explanation of the remarkable buoyancy of liquid assets.

The published balance sheet figures of the majority of British companies are notoriously obscure and imperfect. Bank loans, for example, are not always separated from amounts owing to other creditors. And, more important, the accounts of a holding company may not show the true extent of fluctuations in the "current" assets and liabilities of satellite companies. Three of the holding companies published no figures of stock-in-trade in 1932 (though Unilever now gives the group total), and another is a shipping company to whose business such a figure is irrelevant. Of the remaining sixteen companies, it will be observed, thirteen were carrying a larger stock of raw, semi-finished and finished goods at the date of their last accounts than in 1932. Of the total increase of £11 millions, however, nearly £6 $\frac{1}{2}$ millions was attributable to one company, Imperial Tobacco. Of the remainder it may be said that, for the most part, ability to finance an increased business has at least been facilitated by their success in keeping down the inevitable growth in their stock-in-trade to a moderate level.

If stock-in-trade figures—which are sometimes the least "liquid" of current assets—be omitted altogether, the surplus liquid assets of the sixteen companies in question have fallen since 1932 from £36.5 millions to £33.3 millions, or by 9 per cent.—a decline which, though appreciable, is certainly not proportionate to the rise in the business activity and earning power of these concerns. Have they cashed their marketable investments on a considerable scale in order to finance trade recovery? In some cases, Yes; but on the whole, No. The apparent increase in the aggregate investment totals shown in our table may reflect, in part, the rise in Stock Exchange prices since 1932; but as many companies value their investments at cost or market price, whichever is the lower, it is reasonable to infer that, for the most part, the volume of company security holdings has tended to increase rather than to decline.

The columns headed "debtors" and "creditors" throw some light on the main question, for both show a considerable increase, amounting (for the whole

(a) Excess of floating assets (stock-in-trade, investments, debtors, cash and miscellaneous) over current liabilities (creditors, amounts required for dividends, and miscellaneous, excluding amounts due to subsidiary companies). (b) Excess of floating assets (stock-in-trade, investments, debtors, cash and miscellaneous) over current liabilities (creditors, amounts required for dividends, and miscellaneous, excluding amounts due to subsidiary companies). (c) Investments exclude advances to companies' balance-sheets. (d) Including loans, if any. (e) Holding companies. No stock-in-trade shown in parent companies' balance-sheets. (f) Shipping company, which has no stock-in-trade account. (g) Includes loans to allied companies, whose amount is not separately ascertainable. (h) Excludes £460,000 reserve for income tax. (i) British Government securities only. None shown in latest accounts. (j) Assets exclude gilt-edged securities held in reserve for redemption of debenturestocks.

twenty companies) to 31 and 23 per cent. respectively. Enhanced inter-company credit provision has clearly been a concomitant feature of trade revival. Finally, thirteen of the twenty companies have drawn on their cash holdings; and although seven have increased them, the total for the whole twenty shows a drop of 13 per cent.

When these figures are read in conjunction with the sluggishness of bank advances, the impression most strongly given is that the resources for financing trade revival have come partly from the long-term capital market, but mainly from industry itself. During the twelve months to June, 1936, we analysed the reports of 2,138 British companies, with a total issued capital (preference and ordinary) of over £2,400 millions (see *The Economist*, July 18, 1936, page 146). Of the £224 millions which these companies earned in profits in 1935-36 (after debenture interest) they "reserved" no less than £55 millions, or practically 25 per cent. The whole of the money thus ploughed back—in addition to undisclosed amounts set aside for contingencies, etc., before striking profits—was available, temporarily or permanently, for addition to working capital. The "reserved" proportion, moreover (as our analyses show), has tended to increase, both absolutely and proportionately to total earnings, during the last five years. It is beyond question that these ploughings-back of profits have contributed much to the ability of industry to meet the financial demands of a period of rapidly growing activity. The extent to which the relative dearth of bank advances has contributed to this result is a controversial question. But in view of the part which retained profits have played in the financing of industrial expansion during the recovery years since 1931, both British directors and British investors may at least be grateful that there is no counterpart, in this country, of the Rooseveltian system of taxing company reserves.

Investment Notes

S.E. Turnover in 1936.—It is not surprising that a year which saw an almost unchecked advance in equity share prices should have produced a satisfactory volume of business, which rivalled, on occasion, that of historic boom markets of earlier years. Unlike the New York Stock Exchange, where every transaction goes into the record and total sales statistics are reported, the London Stock Exchange has no machinery for computing the total turnover in securities. No one, therefore, can claim—at least, scientifically—that 1936 was a "record." To obtain some indication of the rate of increase in Stock Exchange transactions, however, it is possible to fall back upon a "count" of bargains recorded in the Stock Exchange Official and Supplementary Lists. We have taken out a total of the bargains recorded by the *Financial News* daily bargain index for 1935 and 1936 with this object. The results are given below:—

	1935	1936
First 26 weeks	1,179,922	1,215,134
Second 26 weeks	1,074,159	1,333,769
Total	2,254,081	2,548,903

Over the whole year 1936 shows a 13 per cent. advance; in the first half-year the increase was no higher than 3 per cent., but in the second half-year the rate was 24 per cent. These figures suggest that the smaller type of speculator, who had been shy to enter the market while the political disturbances of March 7th were still within recollection, became distinctly more active in the second half of the year, in response to rising commodity and metal prices. But the figures should be used with caution. "Markings" are a notoriously inadequate record of the total number of transactions, and even if they were complete they would not indicate the total volume of turnover. There is some presumption, however, that a larger proportion of deals last year was for smaller amounts of stock than in earlier years.

Stock Exchange Bank Clearings.—A second, and more satisfactory, indication of Stock Exchange activity is provided by our usual calculation of the average excess of bank clearings on Settlement Days over Non-Settlement Days in 1936. The "non-settling day" averages are obtained by deducting the total clearings on Settlement Days from the total clearings for the year and dividing the difference by the number of non-Settlement working days—counting Saturday as three-quarters of a full working day. The resulting figures, compared with 1934 and 1935, follow:—

	(In Millions)		
	1934	1935	1936
	£	£	£
Grand total of clearings on non-Settlement days	32,016	33,863	36,463
Daily average	118.6	125.9	134.4
Daily average on Settlement days ..	144.3	154.0	173.0
Increase on Settlement days:—			
Amount	25.7	28.1	38.6
	(21.6%)	(22.3%)	(28.7%)

The proportion of the total clearing directly connected with Stock Exchange business is, of course, higher than the percentage increase shown above for Settlement Days, for there is a substantial Stock Exchange clearing turnover on all working days and especially on those immediately following the Settlement. Compared with 1935, the grand total of clearings on Settlement Days showed an increase of 12.3 per cent. to £4,153 millions. This substantial advance brings the total very close to the 1930 figure of £4,196 millions. The increase on Settlement Days in 1936, compared with the previous year, was again greater than the increase shown on non-Settlement Days, which amounts to 6.8 per cent. These figures suggest that the increase in monetary turnover on the Stock Exchange is still relatively ahead of the advance in general business.

Gilt-Edged Outlook.—Many trustees, institutional investors and other large holders of gilt-edged securities are concerned with the problem whether interest rates can indefinitely be kept down if commodity prices continue to go up. Hitherto, there has been no serious recession in gilt-edged values. The high point reached at the end of 1934 and beginning of 1935 was a "false peak"—an optimistic aberration—and the price of Consols was in fact much steadier in 1936 than in 1935. But the period of heavy investment in gilt-edged by the banks certainly appears to have reached and passed its climax. Between January, 1932, and January, 1935 (as a Stock Exchange circular points out this week) the investments of the clearing banks rose by £310 millions, while advances fell by £150 millions. To-day, however, advances are rising, and although their total is still a long way below the 1929 figure, the rate of advance is quickening. The wholesale price of representative primary commodities is now half as high again as it was when Mr Chamberlain made his War Loan conversion operation. More "accommodation" is necessary to finance the movement of the same volume of goods, and investors who are not shackled by legal or prudential considerations have an increased incentive to switch from fixed interest stocks to equities. Certainly the Treasury can prevent competition from foreign new issues and can regulate the flow of home borrowing of trustee character. The authorities may be credited with the desire to maintain a firm market, for every day brings nearer the problem of financing the Government's re-armament programme. For this task, undoubtedly, there is one formidable weapon in their armoury, for they can widen the basis of credit if they wish, and so increase the volume of bank cash. But to do that, on a considerable scale, in a period of depression is one thing, and to do it at a time of rapidly rising prices is another. Altogether, while it may be premature to look for a very early, or a very consider-

able, decline in gilt-edged prices, it must be concluded that cyclical factors, as such, are becoming increasingly unfavourable for investors in fixed interest securities.

"Insiders'" Control in Wall Street.—When the Securities and Exchange Commission was set up in 1934 to establish a code of business ethics it attempted to restrain corporation officials from turning inside knowledge to personal profit through dealing in their companies' securities. Legally, profits on stock sold by insiders are recoverable by the company, but although there is evidence of considerable in-and-out trading in certain cases, no attempt has yet been made to enforce the law. To assist its objects, the Commission obtains a monthly report of holdings of equity securities by officers and directors of companies, and by persons who own more than 10 per cent. of stocks listed on National Securities Exchanges. The first analysis of these reports, lately published, shows a much greater concentration of ownership than had been suspected in the past. Some 21 per cent. of the aggregate outstanding shares of some 1,736 companies were held by "insiders," including holding companies. Officers and directors held under 8 per cent. The proportion of "inside" holdings varies greatly from industry to industry, the highest figure being 67 per cent. in the lumber industry, and the lowest 7 per cent. for chain store companies. It is singular that the proportion of stock held by "insiders" has tended to be somewhat higher for companies whose shares have recently been listed on the Exchange. This development is said to be due to the relaxation of extensive distribution requirements by the Exchange authorities, who feel that manipulation by "insiders" is less dangerous in Exchanges controlled to a considerable extent by the Commission. The constitutionality of the Commission's attempt to enforce rules of good conduct is in doubt, but its purpose is admirable, and will appeal to many English investors who are baffled by the too frequent appearance of nominee companies in annual returns.

Foreign Bond Movements.—The end-year activity in foreign bonds has been signalised by an all-round rise in the "Municipal and General" indices for December. The complete index of 113 bonds reached the highest point since 1934. The table of component series below shows that "defaulted" bonds—in particular South Americans—have again provided the sharpest advance:

AVERAGE JAN.-JUNE, 1934-1936									
Month	Europe	Near and Far East	Egypt	South & C. America		Complete Index	Undefaulted	Defaulted	
				State	Prov. Govt.	Total			
No. of Bonds	(32)	(31)	(4)	(36)	(11)	(47)	(114)	(60)	(54)

November* ..	95.4*	110.6	99.6	107.2	101.0	105.7	103.9*	104.5*	103.2
December ...	97.7	114.0	99.7	120.2	110.0	117.8	110.3	105.8	115.3

* From November, 1936, Europe 31 Bonds, Complete Index 113 Bonds, Undefaulted 59 Bonds.

Reviewing the movements of 1936, it will be seen that whereas the total index advanced by 17.4 per cent., the "defaulted" index rose twice as fast (35.4 per cent.) and the "undefaulted" index by only 3.7 per cent. South American bonds made the most spectacular recovery, although their present level is still slightly below 119.1 recorded in September, 1934. These securities, which can properly be described as speculative commodity equities rather than first-grade foreign bonds, are still in the forefront of market favour.

Not a fixed trust; not a managed investment trust company; but a combination of the two with the advantages of both.

Investors FLEXIBLE TRUST Certificates

offer a really sound investment spread over a wide range of first-class industrial, commercial, banking, insurance, and other stocks and shares, selected from the issues of a permitted list of over 250 companies. On the basis of the cash dividends paid in the past year upon the securities contained in the initial portfolio of the Trust, the investment is expected to show a gross yield of about 4½%. Trustees: Midland Bank Executor & Trustee Co. Ltd.

OVER £11,000,000 HAS ALREADY BEEN INVESTED IN BRITISH ENTERPRISE BY 45,000 INVESTORS THROUGH THE MEDIUM OF THE "15 MOORGATE" GROUP OF UNIT TRUSTS.

Write for the descriptive booklet EC7, which is the basis of all transactions, to the Managers:
Fifteen Moorgate Unit Trusts Limited,
15, Moorgate, London, E.C.2.
Branch Office: 7, Pall Mall, Manchester 2.
Member of the Unit Trusts Association.

Company Notes

Higher Banking Profits.—The dividends of British banking institutions have, since 1931, been as stable as the Constitution. No changes were anticipated this year, and none have been reported. But without exception, profits have shown a substantial increase to the highest level since 1929-30. Details of profits and appropriations so far announced will be found on page 95. Barclays Bank shows an increase of 6.2 per cent. or, since these profits are struck "net," of 7.5 per cent. after adjusting for the change in the standard rate of tax. The Martins Bank figures are even more progressive, for after adjusting for taxation, the profits have increased by 14.1 per cent. Comparisons for both Westminster and District Banks are complicated by the 1935 Centenary Bonus of the former and the absorption by the latter of the County Bank in the same year. A straight comparison of the National Provincial Bank's profits, which have increased from £1,665,437 to £1,770,173, tells the same story. Stability of dividends, coupled with increased earnings, has released additional sums for reserves, pension funds and premises. These results appear the more creditable since short money and bill rates have made but slight progress on the average. Although the advances of ten clearing banks (excluding the District) rose by 11.6 per cent. in the year to November, 1936, the increase is still comparatively recent, and may have derived as much—if not more—impetus from Stock Exchange activity as from any increase in the demand for industrial credit. But the condition of debtor accounts during 1936 must have been sounder than at any time since 1929, and evidently the banks have been spared the necessity for making extensive internal provision for bad debts. These results have kindled fresh interest in bank shares this week. Traditionally, bank shares are protected in each phase of the trade cycle—in depression by low interest rates and in recovery by rising profits. The second phase has been delayed, but it is now within sight.

THE FIRE "PROBLEMS"

No problem is too big or too small for us to tackle!

May we advise you on the protection of vital records against the ravages of fire?

The size and number of your records is immaterial, WE HAVE EQUIPMENT TO MEET EVERY NEED AND TO COVER EVERY RISK.

THE CHATWOOD FIRE-PROOF EQUIPMENT offers something more than protection for your records. It offers contentment of mind.

Write, 'phone or call, we shall be pleased to place a Technical Representative at your service.

The Chatwood Products can be seen at The Building Centre, Bond Street, W.1.

THE CHATWOOD SAFE CO. LTD.

SECURITY ENGINEERS & MANUFACTURERS OF FIREPROOF PRODUCTS

SHREWSBURY, ENGLAND.

Branch Office: 3, Laurence Pountney Hill, LONDON, E.C.4.

Home Rails and the Calendar.—The Railway stockholder and statistician is in something of a dilemma this week, for the first traffic week of the New Year in fact includes four days of 1936, and even five days for the L.N.E.R., and may include some 1936 "sweepings." Should this rank as first week of 1937, or should that distinction be accorded to the week ending January 10th? If the former, then the first week of 1938—to January 2nd—will include only two days of 1938 traffics, and only one for "Berwick." The effect of Leap Year, in fact, coupled with the irregular length of the solar year, periodically throws up an opening week which properly belongs neither to old year nor new. We propose therefore to adopt the second alternative, starting our regular traffics tables with the week ending January 10th, and concluding the 52 weeks on January 2, 1938. For the latest week's traffics, accordingly, we have adopted a provisional comparison with the first week of 1936, although the latter traffics will again be used for comparing next week's traffics with 1936. Our usual table is replaced, on page 90, by this provisional form.

Argentine Transport Bill.—The main provisions of the Bill for Co-ordination of Transport, which has now been approved by the Argentine Senate, are examined on page 58 of this issue. The investor will welcome its passage, after four-and-a-half years of bitter controversy, with real relief, although current levels of Argentine rail stocks appear fully to have discounted its passage into law. It is, doubtless, not the measure which they would have drafted themselves, for the exigencies of local politics have demanded compromise at many points. But it marks the defeat of acrimonious criticism of "absentee capital," recognises the importance of the railways in the Argentine economy, and proves the efficacy of the "benevolent treatment" clause inserted in the Argentine Trade Agreement for the protection of British concerns in the Republic. Argentine railway stockholders, however, would be wise to expect gradual, rather than immediate, results from the measure. Its numerous exceptions arm the National Commission (on which only one representative out of seven will speak for the railway companies) with no power over intra-Provincial or municipal services (although these may be controlled by the respective authorities), nor over road transport services carried out by firms producing or dealing in the goods despatched. The Commission, like the Area Transport Commissioners in this country, will thus be able to restrict new entrants into road transport, but may find it more difficult to achieve immediate reduction in road services. But the stabilisation of tariffs and the future obligation on all permitted transport authorities to act as "common carriers" should assist the railways in solving their traffic problems. All these benefits, however, are essentially of a long-range order.

Canadian Pacific Year.—Recovery is slow to come to all railways, and Canadian Pacific is no exception. During 1936, gross receipts, which advanced by 6.8 per cent., kept pace with the improvement in Canadian conditions. But, translated into net revenues, they tell a less impressive story, which Sir Edward Beatty's review of 1936 has emphasised this week. Net operating results are only available to the end of November. At that date, an increase of \$8,212,000 in gross receipts (7 per cent.) compared with an increase of \$678,000 in net receipts (3½ per cent.). Selected comparisons between cumulative gross and net revenues are given below:—

Period	(In \$'000s)		Gain			Gain
	Gross Receipts	1935	1936	Net Receipts	1935	1936
Jan.-March	26,439	29,284	2,846	2,101	2,828	727
Jan.-June	56,529	62,045	5,516	6,062	6,791	729
Jan.-September	92,040	99,943	7,903	11,387	11,828	441
Jan.-November	118,098	126,310	8,212	19,091	19,769	678
Jan.-December	129,679	138,564	8,885	...	...	...

The table reveals that net receipts are still struggling to regain what they lost by a sharp fall in June and July. At the end of May, a "plus" of \$957,000 was recorded; at the end of November, the increase was no higher than \$678,000. This indecisive trend still reflects the first demands on improving railway revenues—increased operating costs and maintenance expenditure carried over from previous years.

It is difficult to frame really optimistic estimates for the holder of Canadian Pacific stocks on the basis of these figures. Including the increased dividends received on the holding of Consolidated Mining and Smelting shares, net earnings may total \$4,700,000, before including anything extra for steamships and hotels. This sum would represent earnings of 3.4 per cent. towards a full dividend on the 4 per cent. preference stock. The actual rate of dividend, however, depends (as the President has previously indicated) on the demands of the "Soo" line for further financial assistance. Its net earnings were \$600,000 up for the first ten months of 1936. Even assuming that the stockholder can reconcile himself to the treatment of exceptional charges in the accounts, recovery still appears to be round the corner. The ordinary stock is showing tentative signs of recovery, but preference stockholders should frame their 1936 dividend estimates with caution.

"Shell" Interim and Bonus.—For two years the market has been anticipating a resumption of interim dividends by "Shell" Transport and Royal Dutch. On Wednesday these hopes were realised. "Shell" announced an interim payment of 7½ per cent. tax free—up to the best expectations—together with an unsuspected and uncanvassed capital bonus of 20 per cent. The bonus will call for the capitalisation of £4,824,272 of reserves which stand at £8,131,609, and may be interpreted as a partial revelation of the undisclosed financial strength of the group as a whole. Investors have always recognised that "Shell" Transport is merely a holding company instrument for paying out dividends earned by the group. The scrip bonus, therefore, at least suggests that the excess of undisclosed earnings of past years will cover satisfactory dividends on the bonus shares, for there is no indication that the rate will be changed in consequence of the bonus. In normal circumstances, where shares can be valued on disclosed earnings, a free capital bonus should not, in theory at least, be followed by any rise in the market value of the shares. But in this case, where the shares can be valued only on dividends paid and the fair name of the directorate, the market's response to a bonus can be rationally defended. Market opinion has been actively considering the permanence, or otherwise, of this scrip bonus policy. And for Royal Dutch, whose 5 per cent. dividend was slightly below expectations, it is suspected that, when the outstanding gold-clause case is disposed of, a similar policy may be introduced. Doubtless there are large holders in each company to whom more frequent, though not necessarily annual, scrip bonuses would be welcome, with the present expansion of oil earnings and high taxation. The calculation of the current yield on "Shell" Transport, *ex interim* until the bonus, must necessarily be provisional until the final dividends are declared, but assuming the maintenance of last year's total rate of dividend, the return is £4 1s. 6d. per cent. The shares are a progressive holding.

Richard Thomas Capital.—Semi-official indications have been given this week regarding the form which the long-awaited capital proposals of Richard Thomas may

take. It is evident that the programme of expansion in South Wales is to be more far-reaching than was originally contemplated. The construction of the American strip mill and associated works was originally estimated to cost £4½ millions. If this week's reports are to be relied upon, the total cost of development schemes may reach £7 to £8 millions, for additional steel capacity is also being installed. Definite information regarding the finance of these projects is not available, but negotiations are proceeding with Messrs N. M. Rothschild. Originally, it was suggested that a large issue of ordinary shares might be placed with existing holders on bonus terms, leaving a supplementary operation for a later date. But the reported size of the extensions has suggested the possibility of a single large issue, to cover capital expenditure and the redemption of £1,221,722 debentures on July 1st next. Shareholders will be officially informed next week regarding its terms. Some reports suggest that it may take the form of 4 per cent. debenture stock, convertible into ordinary shares at a substantial premium. Such an issue would be one of the most interesting "equity" debentures issued in recent years, not merely on account of the conversion rights it would carry, but because it would necessarily be secured upon the results of a far-reaching scheme of development, which we outlined on November 21, 1936. The latter, to some observers, may appear to anticipate a fairly generous increase in demand for sheets, but it will be the most efficient milling plant in the country.

Coal and Allied Industries.—The search for some process for coal carbonisation by which the coke, gas and chemical products may yield a large profit over the costs of material and manufacture, holds a peculiar fascination for the small investor, which is unshaken by the persistent rebuffs of experience. provides the leading example of such disappointed expectations. The company was originally registered in 1909 as *Motor Fuel Proprietary, Limited*, but remained dormant until 1923, when a licence to operate the Dvorkovitz patents for the treatment of coal was secured. A subsidiary company was subsequently formed, and capital was raised to finance the exploitation of the process at Slough. In 1932 the subsidiary was wound up. In 1933, Mr H. P. Stephenson became technical adviser to the company. He advised the board to discontinue work on the Dvorkovitz process and to develop an entirely new process evolved by himself. In 1934, an issue of 5s. shares was made at 15s. in order to provide funds for the exploitation of Mr Stephenson's process, and in the subsequent enthusiasm the shares advanced to over 30s. This represented a market capitalisation of over £1,500,000 which was based, presumably, on the 1934 prospectus anticipation of annual profits equal to over 150 per cent. on the issued capital. These hopes were disappointed in the event. Mr Stephenson's appointment was terminated. Mr A. Fisher then became technical adviser. He advised the board that, subject to the expenditure of another £150,000 to finance "modifications and extensions," the plant would, by the beginning of 1938, be capable of earning a profit of "approximately £66,000 per annum." For the finance of this scheme an issue of £200,000 5 per cent. convertible non-cumulative income debentures was proposed. But at this stage, the shareholders were suffering from hope too long deferred. The amount of applications was negligible, and the board proposed a voluntary winding-up. At an extraordinary meeting held on New Year's Eve, these proposals were defeated and a committee of shareholders was appointed to enquire into the finance and general position of the company. Does

this imply that an attempt will be made to resuscitate the company's fortunes? It is difficult to discover any grounds for optimism in the facts of the company's past history.

Burma Corporation Ore Reserves.—Although Burma Corporation Rs. 9 shares have naturally participated in the recent rise in base metal issues, their rate of advance has been less rapid than that of the Barrier Reef companies. Mr P. E. Marmion's recent review of the Corporation's position clarified the relationship between metal prices and profits. The Corporation's remoteness from markets and its policy of selling forward involve a considerable time-lag between shipments and realisation, and between rising metal markets and sales prices. For these reasons, advancing metal prices produce delayed effects. Fortunately, the rise in lead will more than compensate the company for the relative fall in silver this year. The chairman indicated, in fact, that a movement of rd. per ounce in silver was equivalent to 7s. 6d. per ton of lead, and whereas the former stands at 21½d., compared with 21¼d. a year ago, lead has jumped from £15½ to £26½ per ton. It is impossible, in fact, to judge the potentialities of Burma Corporation on any one metal—lead, spelter, copper or silver—although silver is of traditional importance to its fortunes. When valuing Burma Corporation shares, however, the market has one eye upon its prospective life. Here the vice-chairman gave some news. Since the end of 1934, when the life was put at 9 years, there has been no material change in the developed ore position. But the mine is being prepared for re-assessing the ore reserves—a necessarily difficult task, for payability depends upon cost factors, and there are metallurgical problems to solve in the upper levels. Despite the rather irregular nature of development recently, the vice-chairman's words have encouraged the feeling that, in fact, the life of the mine may be prolonged somewhat beyond present estimates.

Company Results of the Week.—Although our usual analysis of company reports on page 95 covers only 22 companies, many of the results are of interest to investors. They include British Tin Investment and Apex (Trinidad) Oilfields, and are discussed on page 94 under the heading "Shorter Company Comments."

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Bank of New South Wales, Bank of Montreal, and Burma Corporation. Sir Thomas Buckland, as usual, devoted his speech at the meeting of the Bank of New South Wales to a comprehensive review of economic conditions in Australia and New Zealand. He warned his hearers that, in the absence of appropriate action by the Central Bank, the Australian banking system would be unable to continue expanding advances at the rate now demanded by industry. After reviewing the improved prospects of the pastoral industries, Sir Thomas discussed the industrial development of Australia, describing it as encouraging but dangerous if trade diversion were carried beyond the barest needs. Sir Charles Gordon, addressing the shareholders of the Bank of Montreal, stressed the new importance of Canada's mineral production. He noted with gratification that the Dominion Government's Budget was within sight of being balanced. Mr P. E. Marmion's address to the shareholders of Burma Corporation is discussed above.

THE WEEK IN THE MARKETS THE STOCK EXCHANGE

SETTLING DAYS

TICKET: JANUARY 19 ACCOUNT: JANUARY 21

AFTER a fairly active opening, the nerves of the Stock Exchange were tested before the New Year account had run but three days of its course. Once again, the fear of political deterioration was abroad. The British request to Rome and Berlin, coupled with a speculative flurry on the American motor strike, created a condition of mid-week uncertainty, akin for a moment to that of September, 1935. Conditions recovered somewhat on Thursday, but it is clear that the market has lost some of the impetus of the end-1936 account.

Gilt-edged opened a little firmer on new buying from the interest distributions, but conditions subsequently became quiet and dull owing to the international situation. Among foreign issues, Chilean bonds again forged ahead—a little too fast in relation to service prospects and some sizable profit-taking was in progress on Wednesday. Brazilians suffered for the same reason, although there was still some support for low grade issues. European bonds felt the brunt of the Spanish complications.

London Midland and Scottish ordinary were the opening feature in the home rail market on optimistic dividend estimates, but the terms of the Locomotive Engineers' wages award, suggesting the probability of further wage claims during the year, checked the upward movement. Switching operations from L.M.S. ordinary to Southern deferred followed the excellent traffics. Argentine rails opened quietly firm, and the passing of the Transport Co-ordination measure (discussed on pages 58 and 74) inspired no fresh advance. Brazilian rails, however, continued firm.

Industrial shares were cheerful at the opening, but proved unable to hold interest during subsequent days, and came back to life again only on Thursday. The quietness was relieved by several good features. Dorman Long were the best market in the Iron and Steel group, but reacted later amid general profit-taking. In the motor group, Standard were consistently in demand on talk of a bonus. The aircraft section continued heavy, with little business, since uncertainty still prevails regarding the profits outlook. Outstanding in the electrical

equipment market were British Insulated and English Electric. Brewery shares opened depressed on fears of increased taxation, and remained disturbed later. Woolworth provided the usual centre of attraction in the Stores group, and Unilever among Provision and Catering issues. Banking shares found favour on the encouraging profit statements, discussed on page 74. The miscellaneous industrials market was in good form at the opening, when higher prices were recorded by many building materials and engineering shares, but later conditions were indifferent, and firm prices the exception.

In the oil market the dividend announcements from Royal Dutch and "Shell" Transport provided the week's news. The latter encouraged higher prices, and active business spread to other issues, Burmah being particularly favoured, on its large holding of "Shell." In mid-week the best prices were not maintained, amid profit-taking, but the prospects of higher crude oil prices in America again stimulated demand. Rubber shares were initially depressed by the heavy fall in the commodity price, but conditions improved slightly later. Tea shares rose steadily on a more generalised demand.

Conditions in the Kafir market were bright after the week end, thanks to the accumulation of orders, but interest died away, only to recover in mid-week. West African issues could not maintain their early firmness. Rhodesian Copper issues fell on steady sales by speculators. Tin shares progressed on the ratification of the new restriction scheme, but some profit-taking sales were reported.

Business at Paris was irregular. Industrials were the only bright feature at the opening, but after a depressed session an all-round improvement followed in mid-week. Conditions on the Berlin Bourse became cheerful after a poor opening.

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the quotation includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

COMPANY MEETINGS

BANK OF NEW SOUTH WALES

IMPROVED CONDITIONS IN AUSTRALIA

SIR THOMAS BUCKLAND'S ADDRESS

The ordinary general meeting of the Bank of New South Wales was held, on November 27, 1936, at the Head Office, Sydney.

Sir Thomas Buckland (the president of the bank) was in the chair, and, in the course of his speech, said:—The balance of the year's profit, £470,454, shows an increase of £27,793 on that of last year. Your directors recommend the payment of the fourth and final quarterly dividend at the rate of 6s. per share in Australian currency.

REVIEW OF CONDITIONS IN AUSTRALIA

An examination of various aspects of business activity in Australia over the past year shows that satisfactory progress out of depression continues to be made. Recovery is obviously fairly well on the way, but we cannot safely continue expansion at the rate at which it has taken place during the past two years. That does not mean that recovery has to stop. We can quite safely continue the upward movement at a somewhat slower pace without risking the development of boom conditions.

But in the absence of action by the Central Bank to keep deposits rising, the banking system cannot continue expanding advances at the rate now demanded by industry, and will even find it difficult to support the present level. It is rather difficult to estimate what increase in deposits should be looked for, but the experience of the past might be a guide. During the last twelve years before the depression there was an average annual increase in deposits of 4.8 per cent. Population was increasing a little faster during that period, and the rate of expansion was also a little too fast. But a rate of expansion of something like 2 per cent. per annum should not be out of the way. This would mean an annual addition to deposits of £5,000,000 to £6,000,000. Failing action by the Central Bank in this direction, it will become necessary gradually to reduce advances, which will put a definite brake on recovery. In the United Kingdom the deposits of the banks increased by 19 per cent. between 1929 and 1936, whereas Australian bank deposits increased by only 1.3 per cent.

During the depression we adopted certain emergency measures to check and counteract the fall in incomes and to stimulate recovery. As recovery proceeds it becomes necessary to discard these measures in favour of action suited to a more smoothly running economy.

As far as Government finances are concerned, it is pleasing to note that the deficits justifiably incurred during the depression have been converted into a slight surplus. Taxpayers are benefiting slightly from the buoyancy in revenue which is leading to a reduction in the heavy rates of taxation imposed in an attempt to spread depression losses equitably through the community. In time consideration must also be given by the Governments to a gradual reduction in the debts incurred in financing their depression activities. But great caution is necessary, particularly in regard to the short-term debt, lest reduction be effected too early, thereby unduly retarding recovery. Treasury bills have now taken their place among the liquid reserves of the banking system, and their withdrawal will mean another complete re-organisation of the assets of the system, probably involving an increase in the margin between the interest rates paid on deposits and the rates charged on advances.

The general conclusion is that we have accomplished much in the past year, but there is still a great deal to be done in order to consolidate our progress. The future looks fairly bright, provided nothing is done to counteract the tendencies making for better business conditions. The coming year should therefore see a further building up of our reserves abroad, and at the same time allow some further improvement within Australia.

Whether this improvement is allowed to develop will depend on the actions of the Governments and the Central Bank, who will no doubt base their decisions on the best information available. But one cannot avoid the conclusion that a far more accurate study of changes in business activity should be undertaken.

PRIMARY INDUSTRY

Throughout the depression it was providential that although prices were low, they were to a certain extent offset by a series

of good seasons. But in the 1935-6 season, when almost all export prices improved considerably, weather conditions were far from good, and there was an all-round reduction of output. Taking a general view of the conditions obtaining in the Commonwealth during the period from March to October of this year, prospects for the 1936-7 season are reasonably good.

The price outlook for the main primary products is generally good, in part because of the improvement in world prosperity, but chiefly because supply has been reduced owing to adverse seasons in several primary producing countries overseas.

WOOL

Wool supplies vary only slightly from year to year both in Australia and elsewhere, so that the marketing of this commodity is the chief problem. Two main factors in the last two years have temporarily undermined confidence. The first of these was the threat that substitute fibres would displace wool, but it has now been fairly well established that these so-called wool substitutes are more likely to compete with cotton and rayon than with wool, while wool consumption may even be widened if wool is mixed with synthetic fibres, since this produces a cheaper cloth. In the second place, Germany and Italy practically ceased buying our wool in 1934 and 1935, the former owing to difficulty in obtaining foreign exchange, and the latter in an endeavour to redress her adverse trade balance with this country. The only effect was a temporary slackening of demand, since Germany and Italy transferred their purchases for the most part to countries other than Australia, and total demand remained very much as before.

This year Japan is the disturbing factor in the market. In spite of this, 1936-7 sales have been fairly satisfactory, owing to increased support from Great Britain and several Continental countries whose stocks of wool were very low.

WHEAT AND BUTTER

Wheat is a commodity which has now definitely recovered from its depressed state in recent years. The average price for 1935-6, continuing the trend of the previous two years, rose to 3s. 7½d. per bushel (f.o.b. Sydney). This price, the best since 1929-30, has since risen considerably further, and although Australian wheat production will probably not be as great as last year, the total value of the harvest is likely to be higher. Future prices for this commodity seem to be dependent mainly upon how much longer the North American wheat crops continue to be affected by severely adverse weather conditions.

Butter production in the Commonwealth increased each year from 1926-7 to 1934-5, but decreased last year owing to adverse weather conditions. On the other hand, prices rose considerably, the average for 1935-6 being higher than for any year since 1931-2. Butter output may be larger again this season than in 1935-6. For some time prices have been good and a continuation of purchases by America on the London market from time to time will help to maintain them. Butter is the commodity chiefly affected by the Privy Council decision in the Dried Fruits Case and, unless the referendum succeeds, some new method is likely to be devised to subsidise butter producers as well as the dried fruits industry.

Developments in the meat export trade seem to point to an increasing substitution of frozen lamb for frozen mutton. The trend of prices is in favour of frozen lamb and chilled beef rather than frozen mutton and frozen beef. There does not seem at present any reason to doubt that Great Britain will continue to absorb Australia's surplus meat of all types.

NEW INDUSTRIES

Events of the past year indicate that Australia is entering with vigour a new stage of industrial development. Several new industries have been established, and proposals to set up or extend others have been announced. Many industries which formerly required protection can now face overseas competition unaided, and are expanding in directions unexplored in this country.

EMPLOYMENT

As to employment, the degree of recovery has varied in different States. In New South Wales and Queensland improvement over the 12 months has been marked; in the former State unemployment, counting in the full-time equivalent of part-time relief workers, had fallen in August, 1936, to 9.2 per cent., compared with 12.3 per cent. in August, 1935, and 25.6 per cent. at the census of June 30, 1933.

In Queensland the average number in employment (including again a proportion of relief workers as fully employed) during the three months ended July, 1936, was 170,000; unemployment was 7.4 per cent., an appreciable improvement on the figure of 22.2 per cent. unemployed during 1932.

Whilst conditions in every centre have thus appreciably improved, the large number of men who are still unable to secure work remains a disquieting feature. With the increasing mechanisation of agriculture, and the development of economic nationalism which has led many countries to restrict the import of foodstuffs and raw materials, it would seem that employment in the primary industries is unlikely to expand in the near future; the absorption of more men in the immediate future appears to rest upon the further establishment of secondary industries on a fairly large scale.

The improvement in employment conditions now appears sufficiently satisfactory to abandon the system of part-time relief work introduced during the depression. Reproductive public works on a full-time basis are preferable to the present stop-gap methods for those who cannot find private employment.

There is a marked shortage of skilled labour in certain industries which raises a problem that Australia now has to face. It may be possible to provide for the immigration of such men, but even this has its limitations, as there is a similar shortage of skilled men in Great Britain and other countries. The only other way out is an increase in the facilities for technical education in order that youths may be given the belated training in the trades which they were prevented from taking up at an earlier age.

Total wage receipts expanded during the year as a result of the increase in the number employed and the higher average wages paid; as retail prices did not increase markedly there was an improvement in the standard of living of the workers.

BANKING

The most important feature of Australian banking during the past year has been the restrictive policy which the banks have been obliged to adopt towards their advances. The necessity for this was all the more cogent in the absence of any action by the Central Bank to relieve the position of the trading banks.

To protect their cash reserves the banks were obliged to raise their rates on fixed deposits, which in the long run will mean an increase in their rates on advances. As I have already mentioned, other steps are also being taken to restrict advances.

An inspection of the quarterly averages of the trading banks' figures over the last year does not completely reveal the effect of this restrictive policy; some time must elapse before it has its full influence on banking figures. The total advances of the nine trading banks increased during the year by £8.3 millions, but the demand for advances was much greater. Most of the year's increase was provided for by the sale of Government securities, the banks' holdings of which decreased by £7.6 millions. Deposits changed only slightly, while a decline of £4.5 millions in cash reserves was only partially offset by an increase in Treasury bill holdings of £1.1 million.

Thus the cash position of the trading banks is somewhat less pleasing than it was in September, 1935. It should be remembered, however, that this is due rather to the fact that restriction of advances cannot rapidly be applied in full force than to any present tendency to expansion beyond the limits imposed by present cash holdings. A seasonal strengthening of the cash position should be revealed by the returns for the coming December and March quarters, when the proceeds of our harvest are available.

PUBLIC FINANCE

There was a general improvement in Australian public finance over the last financial year, heralding the attainment of one of the ultimate objectives of the Premiers' Plan—namely, the restoration of balanced budgets.

For the financial year 1935-36 the deficits of all the States amounted to some £2.5 millions, but when offset by the Federal surplus of £3.6 millions the combined accounts showed a surplus of £1.1 million, the first since the depression. The result is all the more creditable as the combined surplus was obtained after sinking fund payments amounting to £9.2 millions had been made.

Developments such as these are being stimulated, partly by the Government's policy of trade diversion, dictated by economic nationalism abroad and the need for defence at home, partly by the continued demand for replenishing stocks of capital goods depleted during the depression, partly by the efficiency induced by the struggle for reduced markets in the depression, and partly by the general attractiveness of capital investment in Australia.

These developments are very encouraging, but I should like to point out the dangers of allowing the policy of trade diversion to go beyond the barest needs. New tariff restrictions are not to be recommended unless they can be proved to be an absolute necessity. For this reason it is regrettable that the Government has recently seen fit to embark on such measures without consulting the Tariff Board. This board has now a unique knowledge of the tariff requirements of Australian industry. It has been in existence for 14 years, and in that time has gathered a mass of data concerning the position of most Australian industries and concerning the effects of the tariff generally, and it is regrettable that such knowledge should be allowed to go to waste.

DOMESTIC TRADE

Wholesale.—The volume of wholesale trade continued to improve throughout Australia during the year under review. Commonwealth sales tax receipts, which are a fairly good index of the value of internal trade, increased over the period by about 10 per cent.

Comparing the present levels of trade and prices with those obtaining in pre-depression years, one is pleased to find that in the year ended June, 1936, the volume of trade was about the same as in the pre-depression period, 1926-28, although wholesale prices were 15 to 20 per cent. lower.

There are prospects of the rise in wholesale prices continuing in the coming year. The volume of trade should also expand, although the rate of increase may not be maintained.

Retail.—The volume of retail trade now appears to have reached the pre-depression level, although the level of retail prices last year was still 15 to 20 per cent. below the pre-depression level. The expansion of retail buying over the past 12 months has been quite noticeable. Retail prices advanced only very little, but retail turnover during the year ended September 30th was about 7 per cent. greater than in the previous year, the increase being the same as in the previous 12 months. It is not the level of retail prices in relation to the pre-depression level which matters so much as the margin between retail and wholesale prices. This margin in 1935-36 was about the same as in 1928. The most satisfactory feature is that the volume of trade is steadily expanding.

OVERSEA TRADE

In the year which ended in June last, Australian overseas trade expanded considerably. Both imports and exports were higher in value than in any year since 1929-30. Australian imports of "machinery, metals and metal manufactures" have shown an enormous increase over the last few years, typical of the replenishing of capital equipment which has been occurring in most primary producing countries since the passing of their lowest depression points. This expansion is not a phenomenon peculiar to Australia, because world trade as a whole is undergoing similar expansion, as I have already mentioned in my review of the world situation.

The chief reason for the higher value of exports in the last financial year was the improvement in wool prices; the increase in the value of wool exports was 68 per cent. of the total increase. Higher prices for wheat, fresh fruit, lead, silver, zinc and sheep, rabbit and hare skins also increased the value of exports compared with the previous year.

The United Kingdom still remains predominant as a market for our exports and source of our imports.

Balance of Payments.—In 1935-36 there was an increase on the credit side through better prices for our exports, but tourist expenditure and imports increased so that there was probably another deficit, although only a small one.

In the current year the credit side of the account is being swollen by enhanced returns from exports and an increasing transfer of capital to Australia, and although tourist expenditure and increasing imports are offsetting factors, one may reasonably expect a small surplus in the balance of payments. The absence of large surpluses in the balance of payments since 1933-34, when there was a surplus of about £84,200,000, causes no anxiety as to the adequacy of London funds, but it is preventing an accession to the Australian resources of the banks, which is necessary if bank lending is to become more liberal.

In every case the actual results were better than the estimates, two States returning surpluses. This has been due to buoyant revenues caused by improving economic conditions.

The 1936-37 estimates give promise of still further improvement in the budgetary position during the current financial year. The Commonwealth Government has made substantial taxation concessions, but despite this should show a surplus in excess of the nominal one budgeted for. With the exception of South Australia, which followed the lead of the Commonwealth Government, the State Governments have postponed concessions in taxation in order to make what may well be the final step towards balanced budgets. The budgets of all States are officially estimated to show a net deficit of £1.2 million for 1936-37, which is an improvement of £1.3 million upon the actual figures for 1935-36.

During 1935-36 three conversion loans totalling nearly £65,000,000 (£stg. 52,000,000), were floated in London. Two were successful, but half of the largest issue was left in the hands of the underwriters. This, however, gives no cause for apprehension, as it was due to the uncertain international situation at the time, and not to any weakening of Australian credit in London. These conversion operations brought the total of Australian loans in London converted since 1932 to lower rates of interest to £248.1 millions (£stg. 198.5 millions), representing a saving in interest charges of nearly £4,000,000 per annum.

CONDITIONS IN NEW ZEALAND

The Chairman, having dealt with conditions in Papua, New Guinea and Fiji, continuing, said:—In New Zealand, even more than in Australia, national prosperity is dependent on the prices obtainable for the staple exports of primary produce. The rise in the prices of her main exports has therefore been especially welcome and has stimulated an increase in every phase of economic activity. Government finances have strengthened, retail turn-overs are rising, and manufacturing industry is expanding. There is evidence of increased employment in many directions, but employment statistics have not improved correspondingly. The present Government has been in office for a year, and in that time some economic institutions have been drastically reconstructed. Amendments to the Reserve Bank Act have given the Government supreme control over monetary policy and administration. The amended Industrial Conciliation and Arbitration Act has invested the Government with virtual dictatorship of industry. Railways, transport and broadcasting have been subjected to political control. But perhaps the most significant innovation has been the institution of State control over the marketing of dairy produce through the device of the "guaranteed price," as the first step towards State control of all primary products.

The policy of the Labour Government, though radical, has so far, I am glad to say, allayed the anxiety of many who had feared that the election would be followed by dangerous financial experiments. At the same time it is by no means certain that some of these projects will not be instituted later in the Government's career. A continuance of the present particularly favourable export conditions is necessary if the Dominion is to continue its social and economic experimentation without serious consequences.

The apprehension of business men has been increased by a number of developments during the year, which have tightened the grip of the Government on the financial mechanism of the Dominion. Through the Government's control of the marketing overseas of New Zealand's dairy produce the Reserve Bank has been brought into direct contact with industry. If these marketing powers are extended to include other exported produce, the Reserve Bank will be so closely tied to industry that it will have an important influence on industrial policy. Experiences in other countries point to two dangers of this situation. Firstly, it is not impossible that the bank's assets may become frozen under adverse conditions. Any tendency in this direction will make it more difficult to avoid the second danger. The Reserve Bank will then have at its disposal the proceeds of the sale in London of all exports, and adverse internal conditions resulting in a shortage of funds will tend to bring strict control of foreign exchange. With so many examples of exchange control in other countries there is no need for me to elaborate the dangers of the situation in New Zealand.

This year's budget, however, presents several striking features. Almost the whole of the increase in revenue, amounting to some £5 millions, is to come from taxation. The increased expenditure is chiefly to provide pensions and the maintenance of works which the Government hopes will provide employment, although any direct return from these works is unlikely for some years. During the year £10.5 millions is to be expended on public works, about half of which is to be a charge on consolidated revenue.

The report and accounts were unanimously adopted.

BURMA CORPORATION, LIMITED

(Incorporated in India)

SUCCESSFUL RESULTS—INCREASED PROFITS

MR P. E. MARMION'S SPEECH

The annual meeting of the Burma Corporation, Limited, was held on December 18 in the company's offices, Strand Road, Rangoon.

Mr P. E. Marmion (vice-chairman) presided, and among those present were Mr L. Burnet and Mr J. B. Hartnoll (directors) and Mr H. Ponsford (secretary).

The notice of the meeting and the auditors' report having been read,

The Chairman, in the course of his speech, said:—In concluding my address last year I ventured the opinion that the outlook for base metals was brighter than it had been for a very long time and expressed the belief that the revival in trade we were experiencing might prove to be the forerunner of a much broader recovery, having regard to the range of industries that use the metals we produce. Happily my prediction proved to be well founded, and my task of reviewing our operations to-day is in consequence a particularly pleasant one.

From the comparative statement in the directors' report you will have noted that higher prices have ruled for all the base metals we produce, though silver unfortunately has suffered a decline of 1.3818d. per ounce, as an aftermath of the abandonment of the buying policy adopted by the United States Government, to which I referred last year. Notwithstanding the considerable loss of revenue which this nominally small decline in the price of silver entailed, the year's work has resulted in a substantial expansion of our profits, as reflected in the increased dividends we were happily able to pay.

Operating profit at Rs. 1,43,76,710 shows an increase of Rs. 49,02,151 over the previous year. Revenue from metal sales, after allowing for the decrease in the value of stocks, has expanded by Rs. 53,36,378, in spite of a decline of Rs. 7,40,594 in our receipts from silver, while operating expenditure increased by Rs. 4,40,596.

The increase in operating expenditure which I predicted last year is the natural consequence of the restoration of salaries and wages as from November 1, 1935, and of higher commodity prices resulting in some advance in the cost of our supplies, thus indicating that others like ourselves are sharing in the present more active conditions of trade. Some further advance in operating expenditure must be expected.

INCREASED TONNAGE OF ORE MINED

The tonnage of ore mined was 468,898, an increase of 23,608 tons over the previous year's total. The grade continued to show a downward trend for reasons I have explained on previous occasions.

Notwithstanding this large increase in the tonnage of ore extracted from the mine, you will no doubt have noticed from the accounts that the total expenditure on development and ore extraction at the mine, and on transport from the mine to the mill at Namtu, actually declined by Rs. 65,358.

During the year all development work in the extreme north and south sections of the mine was abandoned in consequence of the unfavourable results, and the savings effected were considerable.

METAL PRICES

The price movements for lead and spelter followed similar trends. The year opened in July, 1935, with demand good, stocks healthy, and expectations that the impending changes in the import duties into the United Kingdom would restore activity to the London market and induce a price level reflecting the improved situation. On this occasion the favourable expectations were fully confirmed, and by October the price of lead had risen to £18 4s. 2d. and that of spelter to £16 11s. 1d. From these high points prices reacted in December and turned downwards, the year closing in June, 1936, with lead £15 4s. 3d. and spelter £14 8s. 2d.

In the case of copper the restriction scheme has worked smoothly and the trend continued in the right direction throughout the year. The price opened in July, 1935, at £34 11s. 10d. and closed in June, 1936, at £40 11s. 3d.

It is interesting to note that we have to go back to the average prices of individual months in the year ended June 30, 1931, to find prices for lead, spelter, and copper comparable with their averages for the year under review. This comparison would seem to indicate that the recovery in base metals has made great progress during the year and suggests a favourable outlook for the

wide range of commodities which a heavy demand for base metals connotes.

SILVER

I had the misfortune last year to describe to you the events which had resulted in the collapse of the price of silver from 35d. in May, 1935, to 22d. in December, when I was speaking. Shortly after that date the price receded still further and remained in the region of 20d., while recently it has hovered around 21d. You will have noted in the directors' report the striking contrast between the average price for the first and second halves of the year, which, if applied to six months' production, represents a decline of some Rs. 15 lakhs in our revenue. In this connection it may interest you to note that, as applied to the figures of the year's production, a movement of 1d. in the price of silver is, in terms of revenue, equivalent approximately to 7s. 6d. per ton of lead—that is to say, if the average of about 20d. for the first five months of the year should be the average for the year to June 30th next, or about 4½d. below that for the period we are reviewing, the average for lead would require to increase by 33s. 9d.—that is, from £16 4s. 5d. to about £17 18s. 2d.—if the combined revenue from these two metals is to be maintained.

While I would stress the influence of the prices of lead and silver together upon our revenue and profits rather than that of either one of them, we cannot overlook the fact that, owing to the high silver content of the Bawdwin ore, our finances are particularly sensitive to fluctuations in the price of silver. Over the last decade the average price of silver has varied between 26.544d. in 1927 and 14.68d. in 1931, while the proportion of our revenue attributable to it has moved between 34.2 per cent. in 1935 and 20.6 per cent. in 1927, and it is from these figures that we can realise most clearly the extent of our dependence upon the price of silver and of our concern in its future prospects. Paradoxically, you will note that although the price of silver during the decade was highest in 1927—that is, 26.544d.—its contribution to our revenue that year was actually the lowest—that is, 20.6 per cent.—which clearly illustrates the difficulty in judging the fortunes of our company on the movements of any individual metal that we produce.

While the contribution from lead and silver is remarkably constant and, over the same period, we have consistently derived some 75 per cent. of our revenues from them.

POLICY OF UNITED STATES

The outstanding effect of the American Silver Purchase Act was, as I said last year, to drive China, the one remaining silver standard country, off silver and thus to concentrate by far the major part of the world demand for the metal in the United States.

In pursuing this policy during 1935 the United States purchased no less than 543 million oz., or 87 per cent. of the available world total from current production and all other sources. In spite of this enormous offtake, preceded as it was by the purchase of 307 million oz. in 1934, the United States in June, 1936, had still 1,111 million oz. to buy to reach the objective of the Silver Purchase Act, delayed as this had been by large concurrent acquisitions of gold.

It would be unprofitable to attempt to visualise the situation which would arise if the United States, last year the buyer of 87 per cent. of the world's available supplies, should attain, abandon or even modify her present policy, for the world would take long to adjust itself to these conditions and to re-establish demand in the old channels. One can only say that so long as the policy remains in force and its objective still unattained the silver available to the rest of the world for coinage, the arts and every purpose is no more than sufficient after the satisfaction of the United States' requirements.

The entire responsibility for the future of silver thus clearly rests with the United States Government, and we can but hope that the magnitude of their own stake in the metal—estimated at 1,577 million ozs.—will bring about some scheme for the maintenance of its value and for its future stability.

To me it seems that the greatest hope for the future of silver lies in the proper appreciation of its past history and in the recognition of those functions in the conduct of trade which it so long and faithfully performed.

Until the American legislation of 1934 silver occupied the dual rôle of a medium of exchange and a commodity, and its value reflected the general price level. It also occupied a unique position because its prestige and mobility endowed it with the capacity to move in the van of commodities and, like a barometer, accurately to foreshadow commodity price movements. Even now, I think that with sympathetic guidance silver might in course of

time find its way back to its old channels of usefulness, when its value would once again rest upon the solid foundation of trade, to which in the past it was inseparably allied.

METAL PRICES AND PROFITS

It is natural that the progress of an important industry like ours, with more than 25,000 shareholders, should be keenly watched, both by the proprietors and by the Press, and in connection with estimates which I see from time to time of the probable effect of price movements upon our fortunes I should like to offer a word of explanation.

The remoteness of our situation from our markets and the incidence of the terms of the selling contracts of a large proportion of our metals, based as they always are upon forward prices after arrival at destination, inevitably cause a long period of delay between shipment and final realisation. During this period we have to base our accounts on conservative estimates of the ultimate yield of the products shipped, but not priced. In this way the full impact of metal prices upon our finances tends to be continuously postponed and in some measure disguised, so that our profits for interim periods may not always accord with expectations based upon contemporary metal prices.

None the less, it is, of course, axiomatic that our fortunes are inseparably linked to metal prices.

Mr Marmion then dealt in detail with the year's accounts and, in referring to the increase in expenditure, pointed out that the recent substantial rise in the general commodity price level must inevitably cause a further increase in operating costs.

Development work added 417,881 tons to the reserves. The result of the year's work gave cause for gratification, and had raised the ore so far developed since mining operations were initiated to a total of 10,146,000 tons, a figure which placed the Bawdwin ore bodies among the world's greatest lead deposits. The tonnage of ore extracted—468,898—was the second highest in the company's history, and exceeded the ore added to reserve by 51,000 tons, leaving 3,914,182 tons remaining in reserve.

LEAD AND SPELTER

Continuing, the Chairman said:—The demand for lead in the United Kingdom continued throughout 1935 at the record level of the previous year. Consumption expanded in every country with the exception of several members of the recent "Gold bloc" group, and for the first time the aggregate for every Continent, excluding the Americas, exceeded its previous peak figure of 1929. The statistical position remains sound, with the principal producers co-operating towards the maintenance of equilibrium between supply and demand.

The expansion that has taken place in the production of spelter in recent years is remarkable, and the fact that consumption has been able to keep pace with it indicates very clearly that spelter has assumed a more important place in the field of industry than hitherto. The estimated production for 1936 is 1,430,000 tons, or about 100,000 tons in excess of the previous year, and so far as the stock position can be ascertained it would appear that consumption has expanded at an equal rate.

Thanks to the substantial increase in consumption and to the agreement regulating production into which producers entered in March, 1935, the statistical position of copper has been greatly improved, and now ranks with lead and spelter as thoroughly sound. Demand continues at a high level and producers' stocks have been further reduced, leaving the immediate future quite free from anxiety in this respect. With copper, as with lead and spelter, recovery in the United States during 1935 compared unfavourably with the rest of the world.

THE OUTLOOK

The great advance in the price of silver had no influence upon production outside of the Americas, and even there the bulk of the increase is a natural incidence of the large expansion in the production of non-ferrous metals. Production of silver in the two Americas continues to expand with the increasing output of its associated non-ferrous metals, and world production for 1936 bids fair to approach 250,000,000 ounces.

Regarding the life of the mine, the chairman said that the position had not altered very materially since he referred to the subject in December, 1934, except in this respect, that they had completed the exploration of a large portion of the favourable area in the upper levels, which naturally reduced the area still remaining to be explored by the corresponding extent. Work in this area was still proceeding, and the results were reported regularly. Every effort within their control was continuously being exerted to extend the life of their industry, but it would be understood that there were many essential factors concerning their economy over which they exercised little or no control.

The report and accounts were unanimously adopted.

THE BANK OF MONTREAL

YEAR OF RECOVERY IN CANADA

SIR CHARLES GORDON'S ADDRESS

The one hundred and nineteenth annual general meeting of the shareholders of the Bank of Montreal was held, on December 7th, in Montreal.

Sir Charles Gordon, G.B.E., the president, in the course of his address to the shareholders, said: It has been said that fear to-day has many spokesmen, confidence but few. I feel that circumstances warrant my speaking with more confidence than for several years past regarding conditions in this country, this view being based to a great extent on personal observation. In my recent trip to the Pacific Coast, I found a marked improvement over the conditions which prevailed at the time of my previous tour two years ago. The year under review can truly be said to be a year of recovery, in which, with certain reservations, it can be claimed that every province of the Dominion has participated. Five fundamental features are outstanding in any review of the year's progress. They are: The recovery in agriculture; the extraordinary activity in mining; the all-time record in newsprint production; the gratifying increase in the tourist trade; the striking expansion in our export trade.

While this has been a year of recovery throughout Canada, there are important industries in which recovery is only now becoming apparent. They are the building industry and what are known as the capital goods industries, by which is meant industries which supply the requirements for production. Building and capital goods industries are among the first to feel a depression and the last to recover. We are approaching the time when an upswing in these industries may be anticipated. The best way to stimulate this and to bring our whole economic life to a balance is to introduce an element of certainty about the future into the picture. I am glad to observe that this feeling apparently permeates the Administrations at Ottawa.

During the past year the external trade of the Dominion has continued to expand, particularly on the export side, and the favourable balance has grown to substantial proportions. The excess of exports is, of course, decidedly advantageous to the Dominion as a debtor country.

The four most important items entering into our international trade are wheat, the tourist traffic, mineral products, and newsprint, and I would draw your attention for a moment to what I consider the most important of these at this time—namely, mineral products.

MINING ACTIVITY

This country is now well launched upon what is undoubtedly another major movement in the history of her development. I refer to the mining of metals. The activity of mining such metals as gold, copper, nickel, lead, and zinc is phenomenal. It has been estimated that a total of more than \$200,000,000 annually is being placed in circulation by the mining industry.

The state of Dominion Government finances reflects the change that has recently come over business and other conditions. Up to October 31st the excess of total expenditures over total revenue is only \$7,000,000. If the present rate of revenue receipts is maintained, with accompanying measures of operating economy, there is every indication that the deficit of the Dominion Government for the present fiscal year, aside from loans and investments which presumably may be classed as recoverable, will be reduced to a relatively small figure. It is gratifying to note that at last there is in sight a balanced Budget—the goal of every Finance Minister and the corner-stone of any programme for restoring business confidence and the free functioning of private enterprise.

INCREASED BUSINESS FOR RAILWAYS

The publicly and privately owned railways will benefit from the increasing volume of business which is evident in Canada. It is to be hoped that this relief for the taxpayers will be considerable, but I wish to record again the opinion that prudent administration of the public affairs requires that we should give the most careful consideration to some more complete and permanent solution of a grave national problem than can be obtained by any expected increase in earnings.

In my remarks to you last year I made reference to the General Election which had taken place a short time before, expressing satisfaction that the country, by returning one of the established parties to power, had emphatically repudiated the Utopian experiments which had previously been advocated by certain new political cliques. I think you will agree that in the interim the affairs of the Dominion have been in good hands, but I am sorry that I cannot say as much for all of our provinces.

I would not wish to close my remarks on a discouraging note. While, as I have intimated, there are domestic political factors carrying implied threats to our future well-being, and while we must all be deeply conscious of the foreign developments affecting the general outlook, it must be clear to all of us, from our own observation, that the forces of recovery are once more in the ascendant. A wide variety of factors is combining to give full play to the enterprise of our people, and among these factors is the growing conviction that there are no short-cuts to better times and that the observance of age-old economic laws must be the basis of sound progress. We still have problems to face, but as regards these problems I stand squarely on the opposite side of the fence from the pessimists, and I believe that, with the experience gained in the past few years, we in Canada will steadily work our way toward better things.

GENERAL MANAGERS' ADDRESS

The Chairman then called upon Mr W. A. Bog, as joint general manager, to read the address of the joint general managers, which was as follows:—Important changes in the balance sheet figures are as follows: Our total assets amount to \$805,100,000, as compared with \$792,800,000 a year ago. Quick assets, including cash, total \$606,500,000, representing 83.27 per cent. of all liabilities to the public. This ratio of liquidity, which is higher than normal requirements, while reflecting the reduced demand for commercial loans, emphasises the extremely strong position of the bank.

Profits, after the deduction of Dominion and Provincial Government taxes, amount to \$3,181,501, as compared with \$3,005,212 in 1935, an increase of \$176,000.

The two greatest depositaries for the savings of Canadians in all walks of life are the banks and the insurance companies.

A great part of these funds belonging to depositors and policy-holders is invested in securities. The protection of the savings of Canadians, built up so laboriously and with such self-denial over the course of years to ensure a measure of security in old age or to provide for dependents after death, is and always has been the first consideration of this bank, and should also be that of all Government authorities. In most instances these savings are not large, and a loss of only a small portion of the principal is sufficient in many cases to bring want and anxiety. Any policy which would tend to weaken the sanctity of contracts is to be deprecated.

The effect on our credit abroad is also of paramount consideration. There is a large volume of foreign capital invested in Canada, which has contributed very materially towards building up the country, and we may be sure that we shall continue to need such capital in our future development. At all events, it would be imprudent in the extreme to foster any legislation which would unsettle those foreign investors who have already in a tangible way shown their confidence in Canada.

IMPORTANCE OF TOURIST TRAFFIC

It is estimated that the expenditure of tourists in Canada this year will amount to \$285,000,000, as compared with \$202,000,000 in 1935 and \$130,000,000 in 1934. When it is realised that these expenditures in 1936 brought into the country more money than any single item of our exports, the importance of fostering this industry will be appreciated.

Canada, as the fifth trading nation in the world, is vitally interested in any efforts to facilitate international trade. The recent tripartite stabilisation and gold exchange agreements entered into by Great Britain, France, and the United States, and to which Holland, Switzerland and Belgium have latterly subscribed, are steps in the right direction.

The apprehensions expressed in the past that there is insufficient gold in existence for the purpose of a return to an international gold standard would now appear to have lost their force. With the rise in the price of gold since 1931, production has been accelerated considerably. The increased production of gold by Canada has helped the country materially in meeting its foreign obligations.

Notwithstanding some disturbing legislative influences in Canada, which cannot but act as a deterrent to recovery, there is a distinct improvement in business as a whole and a feeling of confidence in every phase of our economic activity.

The report was unanimously adopted.

GOVERNMENT RETURNS, &c.

TREASURY BILLS BY PUBLIC TENDER

Tenders for £40,000,000 Treasury bills were opened on January 1, 1937. The amount applied for was £75,450,000. Tenders were accepted for Treasury bills at three months dated Monday at £99 16s. 11d., and above in full; Tuesday to Saturday at £99 16s. 10d., about 25 per cent. and above in full. The average rate per cent. was 12s. 5-63d. The amount allotted was £40,000,000.

Date	Amount Offered	Total Applications	Amount Allotted	Average Rate %
January 4, 1935	30,000,000	49,560,000	27,500,000	6 1-64
July 5, 1935	40,000,000	60,905,000	40,000,000	0 12 4-32
January 3, 1936	35,000,000	68,075,000	35,000,000	0 10 10-72
July 3, 1936	50,000,000	72,750,000	50,000,000	0 12 1-27
December 24, 1936	45,000,000	61,155,000	45,000,000	0 12 11-77
December 31, 1936	40,000,000	75,450,000	40,000,000	0 12 5-63

NATIONAL SAVINGS CERTIFICATES

Total Sales of Savings Certificates	No. of Certificates	Value
Week ended December 12, 1936	531,482	£398,611
Week ended December 19, 1936	531,751	£398,813
February, 1916, to December 19, 1936	1,279,577,507	£1,006,120,968

At the end of November, 1936, the amount remaining to the credit of investors in Savings Certificates, excluding interest, was £390,110,062.

Movement, September 21, 1931 (gold standard suspended) to January 7, 1937 (inclusive) £176,972,176 in

GOLD MARKET

Messrs. Samuel Montagu and Company write on January 6, 1937:—The Bank of England gold reserve against notes amounted to £313,660,659 on December 30, 1936, showing no change as compared with December 23, 1936. In the open market the amount of bar gold disposed of at the daily fixing was about £1,300,000; there was a general demand, and further purchases were made for New York. Prices were fixed at about dollar parity.

The s.s. "Strathaird," which sailed from Bombay on January 2, 1937, carries gold to the value of about £47,000. The Southern Rhodesian gold output for November, 1936, amounted to 64,377 fine ounces, as compared with 64,935 fine ounces for October, 1936, and 62,886 fine ounces for November, 1935.

SILVER MARKET

Little movement was seen until January 6, 1937, when, with offerings increased by Indian reselling orders, the cash price declined from 21½ d. to 21¼ d., and the two months' price from 21½ d. to 21d. Sales have been made on China account and by speculators, but the premium on spot has made the latter disposed to carry bull commitments forward. The inquiry for early shipment to India has again been a feature, and whilst this continues a difference between the two quotations in favour of cash is likely to be maintained. The appearance of Indian reselling has given the market a somewhat duller tone.

Quotations for gold and silver are shown below:—

1936	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard	Price of Silver New York per ounce -999 fine
			Cash	Two Months
Dec. 31, '36	141 7	12 0-05	21½	21½
Jan. 4, '37	141 8	12 0-13	21½	21½
" 5, '37	141 5½	12 0-13	21½	21½
" 6, '37	141 5½	12 0-13	21½	21
Average	141 6½	12 0-05	21-266	21-125
Jan. 7, '37	141 7	12 0-01	21½	21½

The highest rate of exchange on New York recorded during the period from December 31, 1936, to January 6, 1937, was \$4.91½ and the lowest \$4.90½.

Statistics for the month of December, 1936:—

	Bar Silver per oz. std.	Bar Gold per oz. fine
Cash delivery	Two months' delivery	
Highest price.....	21½d.	142s. 1d.
Lowest price.....	20½d.	141s. 4d.
Average.....	21-2375d.	141s. 8-28d.

The Problem of the Foreign Exchanges

by L. L. B. ANGAS

This book goes right to the heart of one of the most crucial economic questions confronting the business-men and statesmen of our day.

Financial News: "Mr. Angas has written the most clear and searching criticism of the gold standard which I have ever read."
Journal of the British Institute of Bankers: "His summing up of the pre-requisites of a successful functioning of a free gold standard is masterly."

Macmillan & Co., St. Martin's Street, W.C.2.

(a) Includes centenary bonus 2 per cent. † Free of income tax.

CITY OF SAO PAULO SIX PER CENT. GOLD BONDS, 1908.—Bank of London and South America, Ltd., have received the funds for payment of 2½ per cent. of coupon due January 1, 1937.

THE MODDERFONTEIN DEEP LEVELS, LIMITED.—First liquidation distribution 9d. per share has been declared payable to shareholders registered December 31, 1936.

THE LONDON MERCHANT BANK, LIMITED.—Owing to the continuance of adverse conditions and the debit balance on Profit and Loss Account, no dividend will be paid on "A" Shares either for half-year to December 31st or on account of arrears.

BURBERRY'S LTD.—A four months' dividend to May 31, 1934, of 2½ per cent., less tax, will be paid February 1, 7½ per cent. cumulative preference shares to holders registered January 15th.

ENGLISH AND DUTCH INVESTMENT.—Dividends on 5 per cent. first cumulative preference shares in arrear due October 1, 1930, to October 1, 1936, inclusive will be paid on January 18th.

DOMESTIC INVESTMENT TRUST.—First distribution on January 1, 1937, in respect of period from July 14, 1936, to January 1, 1937, is 2-185881d. per unit, equivalent to 2-864,273d. per unit gross.

ROYAL DUTCH PETROLEUM.—Interim dividend 5 per cent. for 1936, the first interim dividend since 1930.

THIRD BRITISH FIXED TRUST.—Sixth distribution of 8/315d. per sub-unit, free of tax, payable February 15. The two distributions for year total 17 1/5d. per sub-unit.

SHELL TRANSPORT AND TRADING.—This company has resumed interim dividends. Payment of 7½ per cent. free of income tax, will be made on January 30, to holders registered January 9th. Previous interim dividend, 10 per cent. tax free, in 1930. The board recommends free share bonus of one new £1 share for every five held.

WEEKLY TRAFFIC RETURNS
RAILWAYS OF GREAT BRITAIN AND IRELAND

For reasons discussed on page 74 of this issue, the comparison of home rail traffics for the week ending January 3, 1937, (for L.N.E.R., January 2, 1937), given below, is provisional. It is proposed to commence the 1937 traffics proper with the weekly returns to January 10 (for L.N.E.R., January 9, 1937), comparing them with the same week of 1936.

SHORTER COMPANY COMMENTS

OTHER COMPANY RESULTS.—The improved outlook for tin shares is reflected in the 23 per cent. rise in the profits of BRITISH TIN INVESTMENT to £169,777 against £137,793. The dividend is raised from 8½ per cent. to 11 per cent. Further substantial improvement is reported by PETROLEUM STORAGE AND FINANCE CORPORATION, whose earnings have advanced by £52,532 to £211,911. Dividends on the highly-gearred deferred capital have been resumed at 72 per cent. The full report of APEX (TRINIDAD) OILFIELDS confirms the good impression made by the preliminary profits statement (discussed on page 645 of *The Economist* of December 26th). Production rose from 460,145 tons to 529,369 tons, while 95 per cent. of the cost of wells has now been written off, after the latest allocation of £132,378. The results of rubber companies continue to show general progress. SENDAYAN (F.M.S.) has earned £22,683 against £16,460. The profits of HOULDER LINE are slightly below the recent level at about £125,000 (after deducting some £5,000 profit on the sale of investments). An improvement in the River Plate grain and cargo business occurred later in 1936. The majority of trust reports now show better increases in profits. HOLLINS MILL CO. return to the dividend list with a payment of 2½ per cent., and profits of £48,740 against £40,234. HENEKEYS earned £54,420, compared with £51,176, and raise their dividend from 17 per cent. to 19 per cent., while LEIBIG'S EXTRACT OF MEAT reports a small increase of £5,028 over the previous year's profits of £257,813. Earnings of RIO DE JANEIRO FLOUR MILLS have fallen from £104,164 to £92,255; trading conditions were difficult owing to the higher cost of wheat and the lower exchange.

BRITISH BANKING PROFITS

BARCLAYS BANK, LTD.—Net profit for 1936, £1,894,361, compared with £1,783,784 for 1935. Allocated to reduction of premises account £250,000, against £150,000. Dividend maintained at 10 per cent. on "A" shares and 14 per cent. on "B" and "C" shares, absorbing £1,588,239. Carry forward increased from £583,645 to £639,767.

DISTRICT BANK, LTD.—Profit for 1936, £490,324, compared with £419,588 for 1935. Dividends unchanged on "A" and "C" shares at 10½ per cent. for year and 10 per cent. for year on "B" shares, but absorbed £362,191, compared with £318,759. To pensions and annuities fund, £70,000 compared with £50,000. To bank property £50,000, against £40,000. Carry forward increased from £261,103 to £269,236.

MARTINS BANK, LTD.—Net profit for 1936, £769,988, compared with £693,117 for 1935. Dividend 14 per cent. absorbing £582,406, as before. To premises redemption £50,000, as before. To pension fund £75,000, compared with £50,000. Carry forward increased from £233,466 to £296,048.

NATIONAL PROVINCIAL BANK.—Net profit for 1936, £1,770,173, compared with £1,665,437. Final dividend, 7½ per cent., again bringing total for year to 15 per cent. To premises account, £100,000. To pension fund, £200,000 (against £100,000). Carried forward, £970,667 against £922,406.

WESTMINSTER BANK, LTD.—Net profit for 1936, £1,731,955, compared with £1,402,656 for 1935 (after providing for centenary bonus to staff). Dividend, 18 per cent., absorbing £1,184,867, compared with 18 per cent. and centenary bonus of 2 per cent. To premises account, £200,000, against nil. To officers' pension fund £200,000, as before. Carry forward increased from £369,849 to £516,937.

UNION BANK OF AUSTRALIA.—Final dividend 3s. per share. This compares with 2s. 6d. and makes, with the interim distribution, a total of 5½ per cent. for the year, free of United Kingdom tax, against 5 per cent. The balance to carry forward is £146,864, compared with £126,016.

WILLIAMS DEACON'S BANK.—Net profit, £293,636 against £278,536. Dividend maintained at 12½ per cent.

ALEXANDERS DISCOUNT COMPANY.—Dividend for half-year ended December 31, 1936, at rate of 20 per cent. per annum, carrying forward about £127,000, as against £126,000 brought in. Total dividend 19 per cent. for fifth successive year.

NATIONAL DISCOUNT COMPANY, LTD.—After providing £10,000 for staff pension fund, dividend for 1936 on "A" shares is 10 per cent., as before. Final dividend on "B" shares 6s. 6d. per share and bonus of 2s. per share, making 26 per cent. for year as before. Carry-forward, £232,000.

UNION DISCOUNT COMPANY.—Final dividend, 7½ per cent. plus 2½ per cent. bonus, equivalent to the final dividend for 1935 on the doubled capital. Balance forward, £425,000 (before setting aside £250,000 to reserve) against £399,886.

MOODYS MINING SERVICE

A separate folder is provided for all Mines quoted on the London Stock Exchange. The information given, in addition to the usual profit figures and balance sheets, includes monthly and quarterly operating statistics, directors' reports, chairman's speeches, etc. All "news" published by the companies is added daily. The service provided is filed in loose-leaf binders, and spare copies of the folders are available.

AMERICAN BANKS PROFITS

CHASE NATIONAL BANK.—Deposits on December 31, 1936, amounted to \$2,286,209,000, compared with \$2,083,326,000 on June 30, 1936, and \$2,075,121,000 on December 31, 1935. Total resources, December 31, 1936, \$2,562,182,000, compared with \$2,350,549,000 on December 31, 1935. Undivided profits, December 31, 1936, \$26,464,000, compared with \$21,897,000 on December 31, 1935.

GUARANTY TRUST COMPANY OF NEW YORK.—Total resources, December 31, 1936, amounted to \$2,086,978,870.17 (the largest in the bank's history), compared with \$1,847,433,862.46 on December 31, 1935. The Bank's deposits reached new record of \$1,744,810,010.75, against \$1,513,931,162.96 a year ago. Undivided profits, \$9,356,562.00 up by \$1,958,150.28 for the year.

BANK OF AMERICA.—Total resources, \$1,430,337,200 on December 31, 1936, as against \$1,277,419,381 at end of 1935. Deposits, \$1,298,976,758 show an increase of 12.4 per cent. Earnings totalled \$22,522,000 for the year, an increase of 38.3 per cent.

LATE COMPANY NEWS

LEYLAND MOTORS. Profits, £463,012 against £364,887. Dividend 20 per cent. against 17½ per cent. £150,000 to reserve, making £750,000.

APPOINTMENTS AND PERSONAL

Sir Arthur Worley has for reasons of health resigned as managing director of North British and Mercantile Insurance, but will retain his position as deputy chairman. The Hon. Robert H. Brand, C.M.G., has been appointed joint deputy chairman.

The Eagle Star and British Dominions Insurance Company, Ltd., have appointed Mr. E. G. Spater, as Deputy Agency Manager of the Company from January 1, 1937, and Mr. Harry Routh as Manager of the Leeds Branch.

Atlas Assurance announces the retirement of Mr F. E. Gowlan, Home Fire Manager, and the appointment of Mr H. A. Lane as Assistant Life Manager, Mr C. A. Melville and Mr S. F. Isaac as Assistant Actuaries.

Mr Ogden L. Mills, formerly Secretary of the United States Treasury, is elected a Director of the Chase National Bank.

The Chartered Bank of India, Australia and China announce that Mr A. A. Jamieson has retired from the board of the Bank.

Col. J. J. Gillespie has resigned from the board of British Ropes. Mr Herbert Smith succeeds him as chairman.

MISCELLANEOUS

APEX (TRINIDAD) OILFIELDS, LTD.—Report for year to September 30, 1936, shows that production rose from 460,145 tons to 529,369 tons and was obtained from 189 wells. The total production of crude oil from the property up to September 30, 1936, was approximately 5,263,000 tons. The balance sheet shows that stores and oil are up from £35,312 to £115,026 and debtors for oil sold from £140,077 to £186,527. Cash is higher at £106,102, against £103,574. Investments which stood at £48,969 a year ago have been realised. A sum of £132,378 has been written off wells during the year and £29,992 off depreciation of plant. The ordinary dividend has been raised from 27½ per cent. to 35 per cent. It is proposed to offer one new 5s. share for each ten held at the price of £1 per share.

BEIRA RAILWAY.—Gross revenue for year to September 30, 1936, rose by £31,464 to £801,352, but working expenses rose from £338,900 to £374,171, leaving net revenue £3,807 lower at £427,181. Dividend for year raised from 1s. 6d. per share to 1s. 8d. per share. The allocation to reserve is £25,000 lower at £70,000. Carry forward £33,982.

FANTI CONSOLIDATED INVESTMENT COMPANY, LTD.—Interest and dividends received, etc., total £49,049, against £41,761, while the net profit on realisation of investments was up to £45,122 from £35,244. After crediting £23,892, depreciation of investments written back, and providing £2,254 for tax, net profits are £45,633 against £109,808. The dividend is raised from 12½ per cent. to 15½ per cent., less tax. This absorbs £84,375, leaving the carry forward at £93,882, against £68,449 brought in.

THE SCOTTISH STOCKHOLDERS INVESTMENT TRUST, LTD.—Report for year to November 30, 1936, shows revenue at £43,287, compared with £36,600 for 1934-35 and £35,308 for 1933-34. The preference dividend is 5 per cent., absorbing £18,000 compared with 3½ per cent. absorbing £13,500 for 1934-35, and 2½ per cent. absorbing £9,900 for 1933-34. The carry forward is increased from £13,305 to £13,605. Depreciation on investments, nil, against 23.42 per cent. in 1934-35 and 35.76 per cent. in 1933-34.

BRITISH TIN INVESTMENT CORPORATION, LTD.—Profit for 1936 £169,777 compared with £137,793. Ordinary dividend 11 per cent. absorbing £167,452, against 8½ per cent. absorbing £129,394. The carry-forward is increased from £10,337 to £12,662. The corporation will acquire investments mainly in tin-producing companies in Malaya and Nigeria for £1,004,900 to be financed by rights issue of 1,065,600 10s. shares at 18s. 6d. each at rate of seven new for each twenty held.

PETROLEUM STORAGE AND FINANCE.—Trading profit, £266,152 in the year to October 31, 1936. This is an increase of £46,564 over the figure for 1935. Depreciation amounts to £51,637, against £39,240. To staff fund £5,000; to reserve £25,000; deferred ordinary dividend, 72 per cent.; carry forward, £36,831.

NORTHAMPTON TOWN AND COUNTY BENEFIT BUILDING SOCIETY.—Balance sheet for 1936 shows assets now exceeding £6,300,000 and satisfactory profit after providing for all contingencies.

"CAMROSE" GROUP DIRECTORATE CHANGES.—Lord Camrose has acquired Lord Kemsley's interest in the "Daily Telegraph" and the major portion of Lord Iliffe's holding. The latter remains a shareholder and will continue as a director. Lord Camrose has sold to Lord Kemsley his holdings in Allied Newspapers. Lord Camrose has resigned from the Board and Lord Kemsley has been appointed chairman with Lord Iliffe deputy-chairman. Lord Iliffe has acquired a control of Kelly's Directories, and succeeds Lord Camrose as chairman, Lord Kemsley remaining as deputy-chairman. Lord Kemsley and Lord Iliffe are resigning from the Boards of the Amalgamated Press, and the Financial Times, having sold their holdings to Lord Camrose. No changes in personnel are involved. Lord Camrose, Lord Kemsley and Lord Iliffe remain in close association in a number of other directions.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

THERE was a pause this week in the hectic advance of the prices of primary products. Corrective reactions were noticeable in some commodity markets, while others, which have tended to lag behind in the general advance, showed a firmer tendency. The causes of the sharp rise in prices since last autumn and the long-term prospects of the commodity markets are surveyed in a leading article.

The improvement in wheat prices was maintained; although business has not been as active as previously, the indications point to heavy purchases by importing countries during the next few months. The resumption of tea auctions this week was characterised by a strong demand at advancing prices. Quotations for cocoa are unchanged on the week, but raw sugar, which did not participate in the general advance until recently, was marked-up in price. Beef, Danish and Dutch bacon, and butter were dearer, but eggs registered a further seasonal decline.

The market in metals was not quite as active this week; copper was slightly dearer than a week ago, but lead and spelter showed a decline, due partly to the news of an increase in world production. Tin also suffered a slight setback; the announcement of the International Tin Committee that the prolongation of restriction had been confirmed and that quotas would remain unchanged had been taken for granted by the market. So far, however, the details of the revised restriction scheme have not yet been published. A feature of the past week was the reduction in the price of nickel announced by International Nickel. The market in coal was firm, with an improving tendency, but business in iron and steel is still limited by supplies. There was a slight reaction in the price of rubber, the labour disputes in the United States being a contributory cause. Among textile raw materials, United States cotton was slightly easier, but wool advanced in price following the conclusion of an agreement between Australia and Japan, under which the latter undertook to purchase 800,000 bales of wool during the next eighteen months.

In the United States, too, the past week witnessed a consolidation of the previous advance in prices. Thus, Moody's index (December 31, 1931 = 100) rose to 207.1 on Wednesday against 207.0 a week earlier, 194.8 a month ago, and 168.3 on the same day last year.

COAL

SHEFFIELD.—Demand has been good this week, but supplies have been somewhat short. The dispute at a number of pits in the South Yorkshire area has reduced the tonnage available. Business in industrial fuels is active, but the mild weather has affected the market in household coal. The market in coke is very strong, and some difficulty is being experienced in securing full supplies. Furnace qualities are quoted at 22s. to 23s. per ton on rail at ovens. An all-round increase in export prices was announced by the Humber Coal Exporters' Association, but inland prices are unchanged.

WORKINGTON.—There is an acute shortage of coal. Ireland alone could do with 4,000 tons more weekly than is being shipped across Channel, and there is such a scarcity of smalls for coking that Welsh coal is being imported. Demand for house coal is being fairly well satisfied. Coke is in sharp request by iron smelters in the district. Prices are firm.

NEWCASTLE-ON-TYNE.—Collieries in this area are fully stemmed for the greater part of this month, and demand is as strong as before the holidays. Northumberland steam collieries continue to benefit from the trading agreements with the Scandinavian countries, and they obtain a good share of home trade. As a result of increasing business with Belgium and Italy, coupled with a very active home demand, there is an acute shortage of Durham coking coal. Gas and bunker coals are in steady demand.

GLASGOW.—Work at the collieries was resumed gradually this week, the restart being impeded in some areas, notably Fife, by the influenza epidemic. The epidemic has held up vessels at the ports. With supplies well booked ahead, prices are firm, many collieries having nothing to offer for a month or six weeks ahead. Inland needs are again brisk, and bunkering trade is active. Total shipments last year, at 12.64 million tons, were about 200,000 tons less than in 1935. The decline in shipments, however, was more than made good in inland trade, and it is estimated that colliery profits, at about £1,750,000, were doubled.

CARDIFF.—The improvement on the Cardiff coal market is being maintained. A number of contracts have been concluded recently. The British Admiralty have placed their usual orders, subject to a substantial increase to meet the additional requirements of depots, and the Portuguese Railways have purchased about 100,000 tons of small and through coals for delivery during the first quarter. There are inquiries for supplies from the Yugoslav Naval Authorities, the Bona and the Algiers Electricity Works. The French coal import quota remains nominally unchanged at 58.5 per cent. of the monthly average figure for 1928-30, but for the time being there is

no real restriction on supplies, as supplementary licences are being granted for imports as they are required. Production has increased a little, and prices are firm, large classes showing a tendency to advance above schedule figures for the first time since the introduction of the output and price regulation scheme. The market in coke is still active and strong, and there is a slight improvement in patent fuel and pitwood. The provisional returns of the foreign and coastwise shipments of the Great Western Railway Company for 1936 give a total of 17½ million tons, compared with 19½ million tons in 1935, while the Customs returns of cargo exports to foreign countries showed only 12.4 million tons, against 15 million tons in 1935.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that, although the Christmas and New Year holidays were curtailed in the producing districts, business in the iron and steel markets was not fully resumed until this week. The British steel industry is entering the New Year under difficult conditions, for in spite of the record production of steel there seems little hope of overtaking demand for some months to come.

In the pig iron department most of the consumers of foundry iron can obtain only sufficient for their immediate requirements, and have no opportunity of accumulating stocks. In many cases, however, they have placed contracts for delivery over the greater part of 1937, and would be glad to ensure further supplies to meet the heavy demand for their products. The steel trade requirements of hematite are heavy and the recent advance in prices has not affected the demand.

In the semi-finished steel department consumers are finding it difficult to secure all the material they need, and some anxiety is felt regarding the adequacy of future supplies. Many of the home-producing works have retired from the market for the time being owing to the congested state of their order books.

Great activity developed in the finished steel market after the holidays and business was only limited by the ability of manufacturers to accept orders for the required deliveries. Most works are in arrears against contracts although mills are operating at capacity. Export business has been on a comparatively small scale owing to the enormous pressure of home demand.

SHEFFIELD.—Active conditions have marked the opening of the year in the iron and steel market, consumers showing great keenness to place orders. Pig-iron producers could easily book contracts over the whole year, but few are willing to commit themselves beyond September next. The majority of consumers appear to be covered over the next six months, but there is sharp competition for any extra parcels of foundry which come on offer; with virtually the full output already spoken for, however, these are not numerous. Forge business is less pressing but there is no glut of this material. Basic pig iron is in good request. Supplies of hematite are limited for early delivery, but with the stabilisation of the increased prices makers are showing rather more disposition to enter into new business. East Coast material is more readily available than West Coast material, the shortage of which is likely to persist for some months. Deliveries under contract are fairly regular. In finished iron the outlook is encouraging, especially for common and marked bars, makers reporting very satisfactory order books. Crown bars show further improvement. Iron hoop business is good. Demand for basic and acid billets is very insistent, and early delivery is no longer guaranteed. Business in wire rods, bars, stainless steel sheets and structural steel is at a high level.

Full operations have been resumed at all works here, and, so far as steel production is concerned, there is every indication that the new records set up in 1936 will be surpassed in the next twelve months. So great is the pressure of orders that steps are being taken still further to increase output, not only of raw and semi-finished material, but of the costly special steels in which Sheffield specialises. A gratifying feature is that there is a decided upward tendency in the flow of orders from abroad, although the bulk of business is on home account.

WORKINGTON.—Output of hematite on the North-West Coast is nearly 5,000 tons per week short of requirements, and this stringent position will obtain until production is increased in June. On all sides appeals are being made to smelters to oblige users with accommodation parcels. But even this partial relief is only occasionally forthcoming. Makers are sold six months ahead; if they cared and the iron were available,

OFFER TO NEW READERS

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

Name

Address

they could dispose at once of the whole of the year's output. Price considerations do not rule, since the recent advance of 12s. 6d. per ton will suffice only to mid-summer, consumers being well aware that a further rise will then be justified by the increase in costs. Local steelmakers are not affected by the shortage of iron. The whole of the inconvenience falls on the Midlands, South Wales and Scotland. Deliveries are again substantially in arrears. Bessemer mixed numbers are quoted at £4 18s. per ton at Glasgow; £5 3s. 6d. at Sheffield; £5 6s. at Manchester, and £5 9s. at Birmingham, with special qualities an additional 5s. 6d. to 16s. 6d. per ton. Malleable iron, at £6 5s. delivered at Birmingham; ferro-manganese at from £11 15s. to £12 5s. home, and refined iron are all in sharp request. The steel trade is strong. Orders represent a tonnage that necessitates another eighteen months of rolling at capacity. Workington is engaged on rails, billets, bars and slabs, and Barrow is on rails, hoops and strip. Native ore, at 18s. to 17s. 6d. per ton, is in lively local request. None can be spared to users outside the district.

MIDDLESBROUGH.—Total shipments of pig iron from the Tees during December amounted to 7,010 tons, of which 3,530 tons were shipped coastwise, the bulk of it going to Scotland. Shipments of manufactured steel during December amounted to 39,067 tons, of which 16,217 tons were shipped coastwise. The market continues strong in all sections, but a little more pig iron is being released for export, early in January a quantity of 780 tons having been shipped to Germany; it is expected that a cargo of about 1,500 tons of Cleveland foundry iron and East Coast hematite will be shipped this week to Denmark. Producers of pig iron have sold their output for some time ahead. Prices of these qualities are unchanged. There has been a revision of the price to be charged for basic pig iron, there having been an advance of 7s. 6d. per ton, making the price 82s. 6d. per ton delivered Middlesbrough, less the rebate of 5s. per ton. This does not affect this area as very little basic iron comes on to the market, producers requiring the whole of their supplies for their own steelworks.

Manufacturers of semi-finished and finished steel are almost fully booked over the first half of the year and are doing their utmost to keep pace with the requirements of producers under contracts already concluded. There has been a revision of the prices of small steel sections and channels, prices being 18s. per ton higher from January 1st with a rebate of 15s. per ton, leaving a net increase of 3s. per ton, which is to cover the withdrawal of the railway rebates. Steelworks are in the market for supplies of scrap and are ready to pay 62s. 6d. per ton for heavy steel melting scrap, delivered at works. Good Durham blast furnace coke continues to realise 24s. 6d. per ton, delivered at furnaces, whilst foreign ore prices are not quoted but are rising owing to the higher rates of freight.

GLASGOW.—Operations have been resumed at some of the plants, but the holiday does not end until the beginning of next week at many of the establishments in the West of Scotland. While ordinary work has been suspended, many repairs have been carried out, and for those engaged on this work it has been a period of great activity. In practically every branch it is expected that after the re-start there will be regular and continuous employment for many months. Clyde shipbuilders are beginning the new year with order books better filled than for many years past, some very important contracts having been announced since the beginning of the year.

CARDIFF.—The new year has opened with favourable conditions in both the heavy and the re-rolling branches of the South Wales iron and steel industry. The operating blast furnaces and steel works are fully employed and the tinplate works are working at 70 per cent. of their allotted capacity under the pooling scheme. Prices of steel bars, sheets and tinplates are firm at their recently advanced figures, and a further rise in steel bars is possible in the near future. Shipments of tinplates at Swansea last week, which included the holiday period, totalled 67,020 boxes as against 73,433 boxes in the corresponding period of 1935, and stocks amounted to 122,340 boxes as against 50,915 boxes.

OTHER METALS

COPPER.—Prices fluctuated violently during the week. On the last day of 1936 the standard cash quotation, at £49 7s. 6d. per ton, reached the highest level since 1930. On Tuesday it reacted to £48 7s. 6d., but on Wednesday there was a recovery to £48 17s. 6d. Daily turnovers were fairly large, consisting to a considerable extent of speculative liquidations, a natural corollary of the recent boom. The decline was largely due to the uncertain international political outlook and the strike movement in the United States. The fact that the reaction has been such a sharp one shows that the present price level is not well founded. In the United States a new "window-dressing increase" in the domestic price by 1 cent to 12 cents per lb., was made effective on December 31, 1936—the third increase within just over a fortnight. This was not justified by the market position, but by the desire of producers to secure a high valuation basis for their end-year balance sheets. It is not surprising, therefore, that the American market has turned dull and idle this week.

Sales on the London Metal Exchange: 5,400 tons on Monday, against 4,050 tons last week; 2,600 tons on Tuesday, against 5,050 tons last week; 2,650 tons on Wednesday, against 3,250 tons last week. Domestic spot was quoted at 11.67½ cents per lb. in New York on Wednesday, against 11.57½ cents a week ago and 10.52½ cents a month ago. Wednesday's official closing price for standard cash in London was £48 17s. 6d. to £48 18s. 9d., compared with £48 10s. to £48 11s. 3d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 45,337 tons, show an increase of 547 tons, while stocks of rough copper, at 757 tons, were 99 tons smaller.

TIN.—Cash tin declined during the week by £4 5s. to £228 15s., while the forward quotation fell by £4 to £229 15s. The "contango" has thus increased to £1. The decline was closely associated with the general decline in metal prices. In addition the December statistics showed a fresh increase in stocks. According to A. Strauss and Company, Ltd., the total visible supply at the end of December was 21,834 tons, against 21,133 tons at the end of November. New supplies showed a decline from 13,708 tons to 11,890 tons during December, but at the same

time deliveries increased from 8,778 tons to 10,372 tons, a fact which was largely connected with the change in the United States shipping strike position. The outlook for further increases in stocks in the first quarter of this year is fairly favourable, as the 100 per cent. quota on the basis of the new standard tonnages (which are very high in the case of Siam and Belgian-Congo) was finally adopted at the January meeting of the I.T.C., which took place in Brussels on Tuesday. After this meeting it was also officially confirmed that international restriction will be continued for a period of five years as from January 1st. Sir John Campbell, the chief British delegate, was re-elected chairman for this period. The next meeting of the Committee is to take place in Paris on March 5.

Sales of tin on the London Metal Exchange: 275 tons on Monday, against 450 tons last week; 375 tons on Tuesday, against 550 tons last week; 275 tons on Wednesday, against 450 tons last week. The New York quotation on Wednesday was 51.00 cents per lb., against 51.45 cents a week ago and 52.25 cents a month ago. Wednesday's official closing quotation in London for standard cash was £228 15s. to £229 5s. per ton, compared with £233 to £233 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,198 tons, a decrease of 114 tons on the week.

LEAD AND SPELTER.—Lead and spelter prices fluctuated even more heavily than that of copper. Lead closed the week on Wednesday £1 6s. 9d. down at £26 11s. 3d., after having touched £28 7s. 6d. on December 31. Spelter closed at £18 8s. 9d., i.e. £1 10s. lower than last week. Both markets were, of course, affected by the uncertain political outlook in Europe and the labour troubles in the United States, but at the same time lead speculators received a shock from the detailed November production statistics; these revealed that the sharp increase in output, mentioned in this column last week, was mainly due to developments in Mexico. The Mexican November output at 20,064 metric tons was nearly 5,000 tons higher than in October, being the highest monthly total since the beginning of the slump. As the decline in the Mexican output in recent years was one of the main causes of the present scarcity of supplies, the reported sharp recovery excited considerable attention. It was only natural that spelter quotations should follow the decline, as the recent strong improvement in spelter was only a result of the strong position of lead. The immediate future of both markets is mainly dependent on the question, whether speculative holders will regain their confidence.

Sales of lead on the London Metal Exchange: 3,050 tons on Monday, against 3,550 tons last week; 3,000 tons on Tuesday, against 2,200 tons last week; 2,350 tons on Wednesday, against 2,600 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 5.20 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £26 11s. 3d. per ton, compared with £27 18s. 9d. a week ago.

Sales of spelter on the London Metal Exchange: 2,550 tons on Monday, against 2,250 tons last week; 3,000 tons on Tuesday, against 4,750 tons last week; 2,750 tons on Wednesday, against 3,000 tons last week. Wednesday's quotation in East St. Louis was 5.45 cents per lb., against 5.45 cents the week before and 5.05 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £18 8s. 9d. per ton, against £19 18s. 9d. last week.

NICKEL.—This week's reduction in the price of nickel from £200 to £205 per ton to £180 to £185 per ton is the first since May, 1934 and is noteworthy in view of the upward trend of consumption. In the first 10 months of 1936 consumption amounted to 162 million lbs., against 160 millions for the whole of 1935. But the latest price reduction accords with the general policy of the International Nickel Company and should have a stimulating effect on consumption.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was in active request at £180 to £185 per ton, against £200 to £205 per ton a week earlier. Quicksilver, on the spot, was quoted at £14 5s. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £62 to £63 per ton ex warehouse, as against £60 per ton last week. Chinese wolfram for "January-February" shipment was quoted at 32s. 6d. to 33s. 6d. per unit, c.i.f., the same as last week. Refined platinum was steady at £9 15s. per ounce.

TEXTILES

COTTON.—Manchester.—There has been no shortage of inquiry in the market during the past week and in certain quarters demand has tended to broaden. Buyers who have orders to place are realising that there is little probability of more favourable terms in the near future. In connection with the American cotton situation, a development of interest has been the announcement by the Commodity Credit Corporation that a reasonable amount of the 3,000,000 bales of 1933-34 cotton on which the Government had made loans will be released between February 1

them. As domestically, so internationally, co-operation is the efficient cause of progress. "We do not believe in conflict. We believe in co-operation."

But this positive co-operation can only be effective if it is based on freedom. In translating the creed of positive liberalism to the international plane to-day, MR EDEN and the Government he represents should apply its lessons thoroughly. Merely to say that democracy rejects the necessity of mutually exclusive ideologies is as barren as a supine *laissez-faire* would have been in our own political and social development last century. Every householder rejects the necessity of burglary, but he also pays taxes to maintain the policeman. Our tolerance, our democracy, our liberalism, must become as positive in foreign affairs as it has long been in domestic matters. While democracy does not seek to interfere or to imperialise, or to impose any form of government in another country in the world to-day, its principles cannot govern the relations of States to one another, even if any of them seek to act on an opposite principle. If a democratic people disclaims the intention of interfering with others, it must equally deny the right of interference to the apostles of totalitarianism. How grievously the democratic peoples have failed in this respect during the last weeks, months and years! What were the leaders of positive British democracy doing that allowed Japan to seize Manchuria; or Italy

to seize Ethiopia; or the Fascist dictators to intervene in Spain?

The Foreign Secretary has delivered an address on the challenging doctrine of positive democracy; and he has further added a reminder that, if a free democracy is the golden mean between dictatorship of the Right or Left, "courage is a mean between foolhardiness and timidity." There is unfortunately too much reason to lament that, while we see around us accumulated evidence of international foolhardiness, the democracies have been guilty of excessive timidity. This week our Government made a positive gesture by accepting the offer of GENERAL FRANCO'S *locum tenens* in Spanish Morocco to receive a British commission of inquiry into the extent of German infiltration into that zone. But, whatever its tactical objective, there is little positive achievement in a unilateral ban on the scanty enlistment of British subjects on behalf of either side in Spain. And we have allowed France to shoulder the responsibility of warning HERR HITLER, surprisingly successfully, of the grave international situation which would arise if the German preparations in Spanish Morocco were carried to any greater lengths.

The Foreign Secretary's words are doubly welcome for their overdue arrival. If they betoken an access of courage to the Cabinet in its foreign policy, the country as a whole will be truly thankful.

Morocco and the Powers

THE sudden concern in France over the reported activities of German citizens in Spanish Morocco is not at all surprising. If the many recent circumstantial reports are confirmed, it is natural that, in spite of the assurances given by HERR HITLER to the French Ambassador in Berlin this week, the French and British Governments should feel a specially grave anxiety; for both Governments have for long considered that the active intervention of Germany in Morocco would be a menace to their essential interests.

Take the strategic aspect first. It is obvious that the Straits of Gibraltar can be commanded from the African as easily as from the European side; that Ceuta is potentially a counter-Gibraltar; and that, under the conditions of modern warfare, a competition between two rival Powers for the control of the Straits on opposite sides would almost automatically be decided in favour of the competitor whose territorial base of operations was the larger. This last consideration would mean that the historic British control of the Straits of Gibraltar might be snatched out of British hands by any hostile naval Power that had made itself mistress of Spanish Morocco.

The coastline of Spanish Morocco includes not only the African shore of the Straits but also a frontage on the Atlantic, flanking the French route to Casablanca and the British route to the Cape, as well as the long strip of Mediterranean coast. Except for the Atlantic end, this expansive and important coastline is protected in the rear by a continuous chain of mountains which might be fortified into virtual impregnability—so that any efficient military Power which had once dug itself in here might turn the whole territory into one gigantic fortress. In German hands, this fortress, once organised and garrisoned and supplied, might stand a long siege, even if it were cut off from the Reich by hostile fleets and armies. An enemy besieged in Spanish Morocco by the armed forces of France might still be able to take the offensive with the weapons of propaganda; for Spanish Morocco lies on the threshold of French North Africa. There was a moment, twelve years ago, when the foundations of France's North African Empire quaked under the far-

reaching psychological impact of a short military thrust which ABD-AL-KARIM made out of Spanish Morocco into the adjoining part of the country which is under French domination. ABD-AL-KARIM was a native Moorish leader, unskilled in the modern arts of mechanised warfare, unable either to make or to import munitions, and at war not only with France but also with Spain simultaneously. Suppose that the master of Spanish Morocco were not an ABD-AL-KARIM but a German General Staff with a friendly Franconian Spain behind it, and an Italy as benevolently neutral as she is over Spain—the French might well tremble for the security of their African empire.

Now take the political aspect of the case. Perhaps the first point to observe is that Spanish Morocco is not a Spanish creation. At the opening of the present century, Spain's holdings on the African side of the Mediterranean were confined to the so-called *presidios*: half-a-dozen footholds on islands and peninsulas along the Mediterranean coast of Morocco. These *presidios* were on an even smaller scale than Gibraltar; and Spain neither showed the desire, nor possessed the means, to enlarge her Moroccan dominions. Spanish Morocco was thrust upon Spain for British convenience; and was conquered for Spain by French arms. The coastline of Spanish Morocco, apart from the *presidios*, represents the length of African coast on which the British Government insisted that no new fortifications must be built and that no Great Power must enter into possession. This was part of the terms of the Moroccan chapter of the pre-war Anglo-French *entente*. It was, in fact, the condition on which Great Britain agreed to the extension of French control over the bulk of the Moroccan Empire. Great Britain was concerned to make sure that no Great Power—neither France, nor any other—should get hold of a coastline which, even at that time, would have been a menace to Gibraltar if it had fallen into any strong Power's hands.

This introduction of Spain into Morocco was, from the Franco-British point of view, the line of least resistance. It was hoped that Spain would provide that neutral "packing" round the Straits of Gibraltar which

was supplied by Denmark and Sweden on either side of the entry into the Baltic. Unfortunately, Spain proved unable to play the part for which she was cast. Her attempt to make herself mistress of her zone by

her own unaided military efforts came to a disastrous end in 1922 at Anwal, where the Moorish chieftain, ABD-AL-KARIM, annihilated a Spanish army commanded by many of the generals who are now rebels. And it was not until the victorious Moor had made the blunder of turning his arms against the French as well that the Spanish Humpty-Dumpty was set up again on his Moroccan wall in 1926.

On the map, Morocco looks as though it had simply been partitioned into two zones: a large zone

appropriated by France, and a small zone consigned to Spain. But in law, the status of the two parties in their respective zones is not identical. For the Sultan of Morocco has in theory retained the plenitude of his sovereignty over the whole of his empire, embracing both the zones. At the same time he has accepted a French protectorate, and a French protectorate only. Spain has acquired no protectorate over the Sultan—neither jointly with France nor severally in her own zone. The legal situation is that the Sultan, acting on French advice after having come under French protection, has assigned the administration of one portion of his territory to a third party, Spain, and has appointed a Khalifah, or deputy, to represent his sovereignty in this territory. This Khalifah in the Spanish Zone is the representative of a sovereign who is himself a *protégé* of France. Therefore, in holding her zone of Morocco from the Sultan, Spain is holding it from France.

This legal position may give France a title to intervene in the Spanish Zone in order to vindicate the Sultan's rights there. Nor would this be simply a legal quibble. Spain has undertaken by treaty with France not to allow any other Power to gain a footing in the Spanish Zone, and not to fortify, or allow anyone else to fortify, this African territory—the *presidios* always excepted. The French Government might, therefore, reasonably argue that, in leasing the Spanish Zone to Spain, neither they nor the Sultan had any intention of alienating it to Germany or to anyone else.

When Europe is brought to the brink of war, for the second time within living memory by a crisis arising out of alleged German designs upon Morocco, we are almost driven to confess that history does repeat itself—and this with a disconcerting celerity.

The Newspaper Industry—III

The Race For Circulation

NOTHING in the newspaper industry has attracted as much attention in recent years as the methods adopted by the largest organs to obtain increased circulation. For very many years the popular newspapers have employed large numbers of canvassers seeking to enrol new readers. Indeed, canvassing became an integral part of the sales organisation of the popular Press from the time when free reader insurance was introduced. But in the last six or seven years the intensity and the expense of this canvassing have greatly increased. Various forms of inducement have been held out to hesitating subscribers. In the first instance, these inducements were relatively inexpensive objects such as, in a previous age, used to be given away with a pound of tea. But gradually this buying of circulation became more costly. Thereupon, the newspaper proprietors made an agreement among themselves to refrain from offering free gifts and to limit expenditure on canvassing. But under the pressure of competition these barriers gave way. The climax was reached in the spring of 1933 and took the surprising form of a competitive rush to present the British public, at prices which admittedly did not cover the cost of production, with sets of the complete works of Charles Dickens. Since then the excitement has somewhat abated. But every newspaper with ambitions towards a sale in the million class still spends a very large sum of money on the maintenance or increase of its circulation by means of canvassing and the offer of books, fountain pens or other small articles at less than cost, on condition that the paper is taken for a period of four to eight weeks.

These competitive practices have come in for more than a little derision. It may be admitted at the outset that in their extreme, or Dickensian, aspect they cannot be justified by purely commercial considerations. But it would be a mistake to assume—as is so frequently assumed by the critics of the Press—that there are no real advantages to be gained from an increased circulation.

Every industry which has any overhead costs at all can derive some benefit from an expansion of its output. This is true of a newspaper, to which it is an advantage to spread its editorial costs and capital charges over as wide a circulation as possible. But it is of minor importance compared with the advantages of swelling its large "overhead income" from advertisements. For a popular paper, advertisement revenue is at least as important as sales revenue; and the main object of increasing circulation by canvassing expenditure is to increase both the volume of, and the rate charged for, advertising. Hence, newspapers which adopt this form of expansion will commonly spend much more in canvassing than the additional readers contribute in sales revenue.

The advertiser is primarily interested in the number of people who will see his advertisement. For him the dominating consideration is not the absolute cost of an advertisement, but its cost per thousand readers. A paper with a large circulation can charge a higher rate per page or per column-inch than it could if its circulation were smaller. This is not to say that total circulation is the only criterion in fixing advertisement

rates. The character of the circulation must also be taken into account. For example, a local paper all of whose circulation is "effective" for the local advertiser, or a "specialist" or class paper, can naturally obtain a higher rate per column-inch per thousand readers than a paper with a general circulation. But it is universally true that a paper of any type which increases its circulation sufficiently can raise its advertisement rates per page. Thus an increase in circulation augments both sales and advertisement revenue, and it is commercially justifiable to pay a considerable price for it. In practice, the advertisement revenue will tend to increase at first only through a larger volume of advertising, and the rate will not be raised until the increase in circulation has been well consolidated; but this hardly affects the argument.

A large circulation is, in fact, essential to a popular paper with a general appeal if it is to secure a large enough revenue to cover its general costs. Moreover, even after it has attained a profitable circulation, it still finds it necessary to engage in the circulation race; otherwise, the marginal part of its circulation which is needed to secure a healthy profit and loss account would be filched away by its competitors. Every paper has a solid basis of loyal readers. But there is a floating surplus which is at the disposal of the highest bidder. Here is clearly a case for agreement to avoid purely internecine competition. Failing agreement, every paper must fight to retain its readership at the required level.

But there is a further reason. As in every other competitive industry, each newspaper is constantly under pressure to improve the value of its product. Much the easiest way in which this can be done is to increase the number of pages sold for a penny. But additional pages cost money, and if more pages are to be given for the same penny a bigger subsidy in aid of sales revenue will be needed from the advertiser. This can only be secured if circulation is maintained or increased. If one paper increases its size, the pressure on the others to follow suit is sufficient to make them also urgently desire an increase in circulation in order to be able to expand the size of their issues. The larger the size of paper which competition dictates, the larger the minimum circulation which will enable the accounts to balance.

The race for circulation thus brings very direct benefits to the newspaper reader. He may dislike seeing advertisements on every page. But he should reflect that there would be very much less reading matter for him if

it were not for the advertiser. For example, if a paper which is now printing twelve pages of editorial matter and eight pages of advertisements, and selling 2,000,000 copies a day, were suddenly to impose on itself a self-denying ordinance against the acceptance of advertisements, it would either have to increase its circulation to about 5,000,000, or else reduce its editorial pages to about six per day.

There are obvious dangers in an excessive concentration of newspaper readership—dangers that are in no way diminished by the fact that in this country the control of the papers with large circulations has been so largely determined by the chances of competition. No democrat would exchange our present Press control for the appallingly dangerous dictatorship of the printed word which exists in totalitarian States. But even in England much damage might be done by irresponsibility on the part of those who happen to be in control of the popular Press. It will, therefore, be generally agreed that since there is safety in numbers it would be against the public interest if there were any further reduction in the number of our popular newspapers.

On the other hand, it would be contrary to the universal trend the world over if in this country we were to revert to a multiplicity of papers of moderate or small circulation. One distinguished former editor of a London daily has been quoted as saying that the circulations of newspapers should be limited by law to 100,000 copies. But it is doubtful whether he realised that in that case there would be very little room for news, and very little money for such expensive items as special correspondents in foreign capitals, cabled dispatches and special pictures. A newspaper of this size would have to be filled with the unadorned reports of the news agencies, compiled by the cheapest possible staff. It is all very well for the philosopher to cast doubts upon the advantages of larger newspapers, replete with "features" as well as news. But the newspapers are not produced for philosophers. So long as the public wants the size and quality of newspapers that it is getting, the industry will be dependent upon advertisement revenue. And so long as it is so dependent, there will be an urge towards large circulations. In short, though in many ways newspaper proprietors may lead and may stimulate demand, their critics would do well to bear in mind that in a free country of educated citizens the Press is to a large extent the servant and not the master of the public.

Boom in Steel

REPORTS of a growing scarcity of iron and steel materials, accompanied by rising prices, have recently caused much concern. Why is an industry, which until recently was suffering from surplus capacity and unremunerative prices, now unable satisfactorily to meet the demand for its products? What is the industry's position in the general industrial make-up of this country? And what should be done to solve the present shortage of iron and steel? These problems are of urgent public importance, and the best way to approach them is by examining their historical and international setting.

The period of rapid expansion of iron and steel production, during the fifty years preceding the Great War, coincided with the rise of modern industry, first in this country and later abroad. World production of pig iron rose from 8.9 million tons in 1866 to 77.9 million tons in 1913. In the former year, British output, at 4.5 million tons, represented more than one-half of world production; but during the following years the industrialisation of other countries, particularly Germany and the United States, proceeded apace. By 1913 Britain's proportion of world output had fallen to 13.2 per cent. Owing to technical difficulties, the phase of rapid expansion

in steel production began considerably later than in the case of pig iron. In 1866, for example, world output of crude steel was only 0.3 million tons, of which Britain produced 37 per cent. World production of pig iron exceeded the 11 million-ton mark in 1870, but that volume was not reached by steel until twenty years later. During the first thirteen years of the present century, however, world output of crude steel increased almost threefold, and in 1913 it was almost as large as the production of pig iron.

Though the war did not arrest the growth of world demand for steel, its conclusion, nevertheless, marked the end of the period of rapid expansion of the industry in this country. In 1924, both British and world production of crude steel was only slightly above the pre-war level. Between 1924 and 1929, however, world production took a sharp upward turn, while British output showed only a slight expansion. During the subsequent depression the industry suffered a sharp contraction in most countries of the world, but in 1932 activity resumed its upward trend. In recent years the progress of the industry in this country has been more rapid than abroad; for while world production of steel in 1936

only just exceeded the pre-depression level, production in this country showed an increase of 21 per cent. The trend of pig iron and steel production since 1900, both in this country and in the world as a whole, is shown below:—

BRITISH AND WORLD PRODUCTION OF PIG IRON AND CRUDE STEEL
(In millions of tons)

	1900	1913	1924	1929	1932	1935	1936
Pig iron:—							
British production....	8.96	10.26	7.31	7.59	3.57	6.42	7.69
World production....	39.81	77.90	67.13	97.35	39.09	72.54	90.10†
Crude steel:—							
British production....	4.90	7.66	8.20	9.64	5.26	9.86	11.70
World production....	27.83	75.15	77.23	118.37	49.90	96.29	121.00†

† Estimated on basis of production in January–October.

The trend of the figures suggests that Britain has lost her former world dominion in the industry. The process of industrialisation in foreign countries has inevitably been accompanied by the establishment of native iron and steel plants. But the growth of iron and steel production in foreign countries before the war did not prevent the continued expansion of production in this country. Nor did it seriously affect Britain's competitive strength in the export markets. British iron and steel manufacturers were then fairly prosperous; for demand rose almost without interruption.

After the war, however, the industry in this country had to face considerable changes in the conditions determining its fortunes. Foreign competition became increasingly severe, and the strong secular upward trend of home demand gave way to more gradual expansion. Thus, like the coal and cotton trades, the British iron and steel industry has been beset with difficulties ever since the war, when its capacity was greatly extended at inflated prices. Again, as in the coal and cotton trades, the low profit-earning capacity of iron and steel manufacture prevented the industry from raising the capital necessary for reorganisation. Consequently, some British producers tended gradually to fall behind their competitors overseas in the efficiency of their plant and equipment.

In 1925, the industry applied to the Board of Trade for an inquiry, with a view to the imposition of an import duty. The application, however, was refused, and the industry did not obtain protection until five years ago. Its imposition actually coincided with the beginning of a rise in home demand for iron and steel, which has not only absorbed all surplus capacity, but has outrun the immediate productive power of the industry. Exports have been curtailed, and imports have been increased beyond the limited quantities fixed by agreement with the International Crude Steel Cartel.

The present scarcity of materials, therefore, is partly a legacy of the war, the apathy of manufacturers during the post-war decade, and the difficulty of raising fresh capital during the period of depression. The rapid expansion of demand during the past few years, however, could hardly have been foreseen even five years ago. More recently, the industry has made vigorous efforts to put its house in order by the modernisation of plant and equipment and by extensions of capacity. But these improvements have failed to keep pace with the rapid increase in home demand. Had larger imports of cheap foreign materials been permitted, the position would have been much less acute. That remedy is less practicable to-day, when world demand is rising sharply and other countries have less material available for the British market. But the industry is in duty bound to neglect no opportunity of procuring even a partial increase of immediate supplies.

The further extension of home producing capacity may well be necessary, even if a more liberal tariff policy is pursued. But it is essential that the industry should take a long view, and avoid haphazard extensions which might involve new difficulties a few years hence. Since the war the industry has been subject to violent fluctuations in activity, whose extent and consequences are revealed by the next table. The figures compare the trend of home consumption of iron and steel with the course of general business activity in this country, and

contrast the trend of profits and dividends in coal, iron and steel with their trend in general business:—

INDICES OF ACTIVITY AND PROFITS IN COAL, IRON AND STEEL AND GENERAL BUSINESS
(1929=1000)

	Indices of Activity*		Indices of Profits†		Average Rate of Dividend Paid	
	Index of Business Activity	Home Consumption of Iron and Steel	All Companies included in <i>Economist</i> Profit Analyses	Coal, Iron and Steel Companies	All Companies included in <i>Economist</i> Profit Analyses	Coal, Iron and Steel Companies
					%	%
1923	...	...	77.4	15.3	9.5	5.0
1924	89½	89	85.0	21.3	9.9	4.1
1925	90½	81½	91.4	51.8	11.1	3.3
1926	81½	51	89.5	35.5	11.0	3.3

1936	107	127	...	...	...	...

* Calculated by *The Economist*.

† Based on reports published during twelve months ended June 30, of following year.

The indices of activity clearly show that there was no capital equipment boom in the years preceding the depression. Between 1924 and 1929 general business activity and home consumption of iron and steel increased at an almost identical rate. During the subsequent depression the fall in the consumption of iron and steel was more marked than the decline in general activity—a normal feature of a cyclical downswing. In common with general business activity, iron and steel consumption began to expand again in 1933, and two years later both indices were slightly above the pre-depression level. In the past year, however, iron and steel consumption rapidly forged ahead of general business activity. This, again, is a normal cyclical phenomenon; for, during recovery, activity in the capital equipment industries usually rises above the general level of business. But the indices also confirm the view that Britain has now reached a fairly advanced stage of the trade cycle, when there is a tendency to over-expansion of industrial capacity. The absence of a boom in the capital equipment industries before the depression is largely due to the fact that British recovery was impeded by the effects of an over-valued pound.

Fluctuations in profits have been even more marked. Between 1923 and 1929 a steady rise in general business profits was accompanied by a more marked increase in the earnings of coal, iron and steel concerns. On the other hand, earnings, expressed as a percentage of capital invested, remained at a low level in the coal, iron and steel industries, and were reflected in the disparity between rates of dividends. As in the case of the comparison of activity, coal, iron and steel profits fell more during the depression than general business earnings. But the recovery since 1932 has been all the more rapid. In 1935, when general business profits were still 11.4 per cent. below the pre-depression level, coal, iron and steel earnings showed a rise of 165 per cent. over 1929. Moreover, although the rate of dividend paid by coal, iron and steel companies in 1935 was still much lower than the average rate paid by all companies, payments were then already higher than in 1929, while the average dividend of industry as a whole was still below the pre-depression level. The profit-earning capacity of the iron and steel industry continued to improve rapidly in the past year; for, as our analysis of industrial profits (see next article) shows, the rate of increase in coal, iron and steel profits during the past year has been more marked than in any other branch of domestic British activity.

Unless demand by importing countries begins to expand at the moment when British consumption takes a downward turn, the iron and steel industry may be faced with a serious contraction of output a few years hence. For the time being, however, demand is likely to continue its upward trend and some expansion of capacity cannot be avoided. But the danger of over-

extension of capacity, say two years hence, must not be overlooked. The prompt removal of all restrictions on imports offers the only means of mitigating the present shortage of iron and steel materials. It would also tend to mitigate the next depression in the iron and steel industry (whenever it occurs) by minimising the over-expansion of capacity. Again, the various concerns comprising the iron and steel industry might with advantage consult together in order to prevent simultaneous additions to capacity which, in the aggregate, might exceed potential demand. Such a development, incidentally, might ultimately lead to greater concentration, which, in the long run, is essential to a satisfactory solution of the industry's problems. At present the capacity of a single organisation in America—the United States Steel Corporation—is more than double that of the entire British industry. If the Government are to continue to afford assistance to the industry, in any shape or form, reorganisation and consolidation must be enforced.

Swelling Profits

WITH the courteous co-operation of many company secretaries, *The Economist* takes a census of British industrial profits, uninterruptedly week by week and year by year. Our census is not exhaustive, for the figures of private businesses are outside its scope; but it may be claimed to be representative of industry generally, since it includes practically every company whose shares are well known to the investor.

Our latest batch of results, which are given on page 146, are of special interest, for they incorporate data received as recently as December 31st, and are the first available measurement of the effect on industrial earning power of last year's rapid increase in trade activity. They show that some 382 companies which reported in the third quarter of 1936 increased their net earnings (after debenture interest) by 14.3 per cent.; and that 496 companies which reported in the last quarter increased their earnings by 15.2 per cent. The majority of these companies made up their accounts on dates between the end of June and October. Their results, therefore, do not yet afford a complete picture of last year's operations. But they relate mainly to the calendar year, and the impression they give is entirely gratifying. It is clear that recovery is well-distributed and well-sustained. From the second quarter of 1933, our analyses have shown an increase in total profits during fifteen successive three-monthly periods, with only two breaks.

Readers who examine the detailed tables, however, will be impressed by the unequal extent to which different groups of companies shared in last year's recovery in profits. If the percentage increases in 1936, compared with 1935, be arranged in descending order for various industries, the following table emerges:—

INCREASE, 1936 OVER 1935

(Reports Received in Last Six Months of 1936)

Group of Co.'s	% Increase	Group of Co.'s	% Increase	Group of Co.'s	% Increase
Rapid Rise (over 20 per cent.)					
Tea	130.0	News and Printing	17.3	Hotels	9.2
Oil	43.7	Financial, Land	16.9	Breweries	9.1
Steel and Coal	38.4	Warehousing and Trading	15.9	Trusts	5.0
Motors and Aero	30.1	All Companies ... 14.8		Tobacco	4.8
Elec. Equipment	23.9	Building Materials	14.3	Water	3.4
Elec. Power	22.0	Textiles	11.6	Food	0.5
Average Rise (10 per cent. to 20 per cent.)					
Miscellaneous	17.6	Shops and Stores	11.1	Falling Profits	
		Rubber	10.9	Shipping	5.0
				Gas	7.4
				Trams and Buses	*

* Debit balance in 1936, but results are insufficiently representative.

There is an obvious relationship between these results and last year's rise in primary commodity prices, the activity in the steel, engineering and "re-armament" trades, and the increasing electrification of industry. Broadly, the race has run true to form, and the best-backed industries have led the field. But how does the rise in earning power compare with the expansion of

industrial activity, as a whole? From the figures of our Index, given regularly in *The Economist* Monthly Supplement, we know that trade activity as a whole last year was about 6 per cent. above 1935, about 25 per cent. above 1932 (the worst year of depression) and about 9 per cent. above 1929. The extent to which profits per £100 of issued capital have varied during the last seven years may be inferred from the following table:—

RETURN ON CAPITAL

Reports published in last six months of	No. of Companies	Profits (after debenture interest) (£'000)	Profits: Per cent. of total issued Capital*	Index of Return on Capital (1929 = 100)
1929	677	56,732	10.7	100
1930	838	55,801	8.5	79
1931	794	28,289	3.9	36
1932	775	32,166	4.1	38
1933	771	36,511	5.3	50
1934	781	45,751	6.9	64
1935	830	56,033	8.5	79
1936	878	71,109	10.1	94

* Ordinary and Preference.

Our sample of companies is not identical throughout, and numerous concerns have increased or reduced their issued capital since 1929. Comparison with our Business Activity Index can obviously be no more than approximate; but it is nevertheless instructive. Taking the figures as they stand, the average rate of earnings last year was 19 per cent. above 1935, two and a half times as high as in 1931-32, but 6 per cent. below 1929. Profits, in other words, fell much more rapidly than industrial activity in the years of depression, and are rising more rapidly now. There are two main explanations of this difference—namely, the incidence of "overhead charges," and the effect of the successive decline and recovery of commodity prices on "inventory values." But even the figures in our table fail to give an adequate idea of the extent to which the return on ordinary capital, which normally carries the largest share of industrial risk, has varied in the last few years. A "fixed" return on debenture and preference capital absorbs a considerably larger proportion of total earnings when profits are low than when they are high. How much recovery has meant to ordinary shareholders can be inferred from the following figures, calculated from our records for 1932, when our Business Activity Index touched its lowest point, and for 1935 and 1936:—

ORDINARY CAPITAL

Reports published in last six months of	Proportion of Total Profits* taken by Fixed Payments† (%)	Ordinary Capital		Proportion of Total Ordinary Earnings "Reserved" (%)
		Rate Earned (%)	Rate Paid (%)	
1932	47.3	4.4†	4.6	Dr. 4.1
1935	32.4	10.8	7.4	31.6
1936	27.9	13.3	8.5	35.9

* Before debenture interest. † Debenture interest plus preference dividends paid. ‡ True figure probably lower, owing to unearned and unpaid preference dividends.

Debenture and preference payments absorbed under 28 per cent. of total profit last year, against over 47 per cent. in 1932. The rate of earnings on ordinary capital is now at least three times as high as it was during the slump. But the average rate of dividend shows less than a twofold increase, for directors have become more conservative as profits have risen. The companies which reported in the last six months of 1932 paid out, on the whole, more than they earned; the companies of 1936 "reserved" more than one-third of the aggregate profits earned for their ordinary shareholders.

We may, therefore, draw three main conclusions from this survey. Business profitability, on the whole, has followed business activity, both in general direction and in distribution between different industries. But its fluctuations, inevitably, have been much more severe, particularly for ordinary shareholders. And an increasing share of "recovery earnings" is being reserved and used to finance new business. This tendency, as we showed last week (page 71) has had a perceptible influence on the total volume of bank advances and on banking profits. Its ultimate effect on industrial earnings however, must necessarily be beneficial.

Willow-Pattern Recovery in China

CHINA abandoned silver, adopted a managed currency, and pegged the exchange on the sterling price of gold on November 3, 1935. Many then prophesied that the experiment would fail. But the experience of the past year has falsified that expectation. China is having a recovery—but it is recovery of the willow-pattern kind.

Before the change-over, China had experienced depressed conditions in agriculture, falling prices, a heavily adverse balance of trade, a rapid flow of silver from the interior to Shanghai and from Shanghai abroad, a steady drain on the currency reserve, and violently erratic exchange rates. Since the change-over, the exchange rate on London has been maintained within extremely close limits; the outflow of silver has been reduced and has been used to build up foreign exchange holdings for exchange control; the indices of prices have risen; and the National Government has had considerable success in impounding the silver holdings of the country. The adverse balance of foreign trade (excluding Manchuria) was reported at \$1,087 millions in 1931, \$733 millions in 1933, and \$343 millions in 1935. The figure for the first nine months of 1936 was \$177 millions, against \$323 millions for the same period of 1935.

The new monetary system is far from complete. The Central Reserve Bank has yet to be put into operation; the Central Bank control over commercial banks is yet to be properly developed; and the new currency has hardly begun to replace the old. But so far the story has been a success. The National Government has been able to reduce the burden of domestic internal debt by its reorganisation, on the basis of a more gradual rate of amortisation. Efforts have been made to improve the expectations of the foreign holder of Chinese bonds.

But there are many other features which make the task of maintaining the economic improvement difficult and uncertain. The Budget is not balanced; and with 80 per cent. of national expenditure devoted to military purposes it is not likely to be so. Peace, both inside and outside China, is essential to domestic reconstruction; and peace may not be granted. Smuggling of goods into North China, under benevolent Japanese protection, threatens to undermine the Customs revenue essential to service of foreign debts and to national expenditure. The loss of Customs revenue was running early in 1936 at almost one-third of the total. Customs duty and salt revenue amount to over 60 per cent. of national revenue. The Central Government has not yet established control over provincial finances and note issues. The collapse of the revolt in the South and the enhanced prestige of Chiang Kai-shek after the abortive Chang Hsueh-liang kidnapping episode may strengthen the Central Government. But victory over the rival political forces in the outlying areas is by no means complete.

Even if all political conditions favour the Chinese Government's new monetary control, its successful operation will touch only the fringe of the main problem ahead of the Chinese National and Provincial Governments: rural reconstruction. There are about 420 million people in China proper, excluding Manchuria, Outer Mongolia, and Tibet; and probably 80 per cent. of them are employed in agriculture. Their lot, to put it mildly, is not a happy one. The extraordinary strength of the Communist movement in China is a measure not of the weakness of the opposing Government military forces, nor of the size of imagined assistance from other countries, but of the poverty and depression of the peasant, to whom desperate remedies alone seem to offer relief.

The nature of the rural problem has frequently been discussed in recent years, and remedies are developed on paper, and on the statute books, if not in reality. Foremost in urgency comes control of floods and famines. Just as important is the need for economic reform, relief of land tax, revised systems of land ownership and facilities for cheap credits. Land tax, increased by surcharges which sometimes make the burden ten times greater, collected in one case for

60 years in advance, demanded even on occasion from peasants whose land has been appropriated without compensation, is the fundamental source of revenue of Local Governments. Relief expenditure by these bodies comes only too frequently from the parties in need of relief. And since the richer landlord can frequently find a way to evade taxation, and since he may be himself the tax collector, the burden is laid more and more heavily upon the man least able to pay it. China may claim the distinction of having developed perhaps the most regressive system of taxation in the world. And if economic reconstruction is to be reared on a lasting base, there must be revision of land tax. A reform law was passed by the Legislative Council in 1930, and came into force in March, 1936. But it has far to go before it becomes effective.

Some peasants find slight economic relief through co-operative societies, which have rapidly grown from feeble beginnings. But in 1935 there were only just over 1,000,000 members in some 26,224 societies, and in a population of 420 millions. In the majority of cases the farmer must rely for expensive credit upon moneylenders, pawnbrokers, landlords and merchants.

Essential elements in rural reconstruction are the improvement of agricultural methods and products; afforestation, and irrigation; and the development of transportation to prevent local famine, to encourage economic diversification, and to strengthen the Government's control over irresponsible Provincial officials. And most important, if most difficult, is the spread of education, both technical and political. For China's progress cannot go far without a reversal of the old-established system of Government—by officials for their own benefit—with the working people prohibited from taking part in it. It is one of the causes of criticism of Chiang Kai-shek by some Chinese that he seems to favour reconstruction of the peasantry along lines of Fascist obedience, checked by police-spying, rather than through the growth of democratic education.

Progress is being made in many of these directions, but it is inevitable that the attention of the National Government should be concentrated on making roads, with obvious military advantages. Indeed, their use for goods transport is negligible; imported gasoline bears a heavy tax which makes it prohibitive for the farmer. The census of April, 1936, gives a total of 44,802 motor vehicles for the whole of China. But road-building proceeds apace, new construction having risen from 1,185 km. in 1921 to 96,345 km. in 1935.

Compared with past standards, expenditure on rural reconstruction is making rapid progress. Appropriations in the 1935-36 National Budget are 16 times the 1931-32 figure; but the 1936 figure was still only \$36,500,000, or 3.7 per cent. of the total budget. Expenditure by Provincial and local governments is larger than by the National Government; but the total is still Lilliputian compared with the work to be done.

It is hoped that the end of economic deflation may encourage a re-investment in domestic industries, particularly in the light industries suitable for a farming country; but industrial development must depend to a large extent upon assistance from other countries—both financial, and of a technical kind. China is determined that foreign assistance must come through co-operation with joint undertakings, in which Chinese hold the control; and it is eminently desirable that foreigners should develop their interests in this way, instead of by the old method of foreign concessions and monopolies protected by extra-territorial rights.

The events of the last year prove conclusively that China is "on the move" to solve her economic and political problems. The stimulus of Japanese aggression and of the platonic friendship of the League of Nations has evoked a national reaction in China which, if encouraged by a wise assistance from Britain, America and Japan, may produce great results. If the first two countries enunciate firm policies, the latter country must co-operate, instead of conquering. In view of the political and social forces at work in the Pacific, it would be a profound mistake to assume that conquest by Japan is China's inevitable fate.

Notes of the Week

Parliament's Programme.—An interesting series of new Bills will come before the resumed session of Parliament which begins next Tuesday. First in all probability will come the Special Areas Bill, which is expected to contain a scheme for spreading rate burdens more equitably over the country as a whole. It remains to be seen whether the Government have adopted the other measures proposed by Mr Malcolm Stewart for attracting new industries to the Special Areas. Next will come the two beef industry Bills. The first, which has already been introduced, sanctions the proposed levy-subsidy; and the second is to provide for the reorganisation of the industry. There is likely to be keen opposition to the levy-subsidy plan, unless the Government propose to ease the present quota on foreign imports. Thirdly, a Factory Act will be introduced; and this sadly belated measure will be welcomed by all parties. One may hope that it will be bold enough to compensate somewhat for the tardiness of its introduction. The last major Bill to be discussed before Easter will be the long-deferred coal-mining measure. Nationalisation of royalties is bound to be included; but it is now feared that the Government will use the congestion of the time-table as an excuse for dropping once more the compulsory amalgamation provisions which the Mining Association so vehemently oppose. If the Government would stick to these proposals, it would win much support from every party. All these Bills will be passed, it is hoped, before Easter; and it is possible, though unlikely, that the Government's "physical culture" plans may also take legislative form by that time. As a whole the programme, with the rather dubious exception of the beef Bills, should furnish a respectable batch of internal reform measures to set off against the inevitable—and now usually embittered—debates on armaments and foreign affairs.

Mr Keynes on British Policy.—Most of the conclusions reached in our recent articles on British monetary policy (*The Economist*, October 17th, October 24th and December 5th) are endorsed by Mr J. M. Keynes in a series of articles in *The Times* this week. Mr Keynes agrees that over the greater part of our economic system unemployment has fallen so low that general expansionist measures are no longer necessary. A better distribution of demand is at present more important than a larger aggregate demand; and the further cure of existing unemployment must be found in special measures directed to the Special Areas. From the general point of view, the problem is accordingly to avert a possible slump rather than to stimulate more rapid recovery. Mr Keynes also agrees that we are on the verge rather than in the midst of a "precarious boom"; and—here again agreeing with the economists who contributed to our recent symposium on British monetary policy (November 14th and November 28th)—he thinks that a rise in the long-term interest rate would do more harm than good. It would check general activity while leaving unaffected the trades most in danger of over-expansion as a result of armament expenditure. Mr Keynes would consequently seek to check unbalanced expansion now by heavy direct taxation designed as far as possible to pay for the whole armaments programme, and by an easing of import restrictions. An increase of imports should check a rise in prices and costs now, and should result in an increased demand for British exports from the primary producing countries when the slump threatens later. Meanwhile, as the principal weapon against the eventual slump, Mr Keynes advocates the preparation in advance of a public works programme; and we welcome his endorsement of our suggestion that some Governmental agency should be given the task of translating this idea into practice. Finally, as part of a more long-term policy, Mr Keynes would like to see far-reaching measures of redistributive

taxation designed to stimulate the public's spending; and the short-term aspect of this argument provides a strong reason for financing arms expenditure by increases in direct rather than indirect taxation. In brief, Mr Keynes's articles bring a further measure of support to the following four proposals put forward by the contributors to our symposium and by our own articles: (1) the financing of arms expenditure by direct taxation; (2) the easing of "import restrictions"; (3) the preparation of public works plans for the future; and (4) the maintenance of the rate of interest at near its present level.

Controlling the Boom in Sweden.—The controversy over British monetary policy now proceeding in this country lends special interest to the decisions of the Swedish Social-Democratic Government announced this week. So successful has the Swedish Government been in rescuing the country from the depression of four years ago, and in combining recovery with reform measures, that its present boom policy is bound to attract widespread attention. In the depression period the Government financed public works and unemployment relief by a deliberately created deficit. In the new Budget now announced the emergency direct taxes are to be maintained with the express purpose of creating a Budget surplus, paying off debt, and so checking the increase in aggregate national expenditure. The actual Budget total for the financial year 1937-38 is Kr. 1,291,486,300 compared with Kr. 1,167,069,000 in 1936-37. Revenue on current account is expected to increase by about Kr. 92,000,000, or 10 per cent., without any increase in rate of taxation; and expenditure will show a rise of about Kr. 113,000,000, or nearly 12 per cent. Defence plans have accounted for a substantial part of the increase in expenditure; but there are also to be further improvements in child welfare, mothers' pensions and rural housing, and higher salaries for various State employees. The whole Budget is planned on the assumption that the present boom will continue in the coming year and that restrictive rather than stimulative measures are more necessary. Sweden has set a notable example in paying for the present high level of expenditure out of taxation—and so incidentally following the advice given to the British Government by experts in this country. If her attempt to control the boom should prove as successful as her attempt to cure the depression, the Social-Democrats will certainly be able to congratulate themselves on a remarkable achievement.

Steps to Freer Trade.—Since the devaluations of last September, the way has been open for the resumption of the co-operative efforts towards freer trade which Holland and the Scandinavian nations were making at the time of the Ouchy and Oslo conventions. Holland, during the deflationary period of 1933-36, was not only cut off from the growing prosperity enjoyed by Sweden, Denmark and Norway. She was also impelled by falling prices to take refuge in protectionist and restrictionist measures which made any sort of co-operation for freer trade impossible. Now the whole situation is changed: prices and production are rising in Holland; and this week Dr Colijn has publicly suggested that the signatories of the Oslo Convention—Norway, Sweden, Denmark, Finland, Holland, Belgium and Luxembourg—should meet at once in order to investigate the possibility of freeing their mutual trade. Dr Colijn's statement is a reply to the recent declaration of M. Hansson, the Swedish Prime Minister, that "all Swedes would welcome any proposal for strengthening economic contacts between Sweden, the other Scandinavian States, and Holland, Belgium and Switzerland." This statement

was very well received in the Scandinavian Press. It is also announced this week that the Dutch Ministers of Commerce and Agriculture are leaving shortly on a visit to Scandinavia; and there is talk in Holland of a subsequent approach to the British Government. The whole movement is hopeful and significant. Here are further signs—following the tariff reductions made by France and Switzerland after the devaluations—that the democratic nations may be at last on the brink of forming a free trade bloc. It is a movement which any British Government with the real interests of this country at heart should do everything to encourage and assist.

Non-intervention Manœuvres.—The German and Italian Governments' replies, on which we commented last week, to the British Government's two Notes appealing for their help to establish effective non-intervention in Spain have led to activities on the non-intervention front. Their surprise at the British Government's insistence has shown their unwillingness to be stigmatised as the chief disturbers of the European political scene. The French Government, taking them at their word, have tabled a Bill giving powers to prevent volunteers going to Spain, as soon as other countries do likewise. The Portuguese Government replied on Wednesday, in a "hopeful" manner, that they would take the necessary preventive and supervisory measures in their country as soon as other Powers did so; but they reject any idea of foreign supervisors on Portuguese soil. As the French Government—the other State limitrophe to Spain—the Spanish Government, and General Franco are agreed in principle on this measure proposed by the London Non-intervention Committee, Portugal should be prevailed upon to come into line. Doubtless His Majesty's Government have not lost their former powers of persuasion over "England's oldest ally." Meanwhile, His Majesty's Government have outstripped all other Governments with an aptly Quixotic gesture which, incidentally, does not appear to be quite good in law. They have warned all British volunteers helping either side in Spain—these Britons really are volunteers, often at their own expense, unprotected by the British Government and its forces, for the sake of their convictions—that they are liable to heavy fines and up to two years' imprisonment under the 1870 Foreign Enlistment Act, if from this week onwards they help either side in Spain. Compared to the direct help afforded by totalitarian Powers' citizens, whose lives are at the disposal of their States, the British volunteers' material aid has been minute. The Government's gesture seems out of place, niggling, and even ineffective as a moral example. The Cabinet's reported firmness last week-end—when even the possibility of a unilateral British naval blockade of Spain was mooted—had disappeared by Tuesday, after consultations between the Prime Minister and Sir Samuel Hoare, First Lord of the Admiralty. Perhaps Herr Hitler's informal assurance to M. François Poncet in Berlin on Monday, to the effect that Germany would respect Spanish territorial integrity in Spain and Morocco, gave the British Cabinet the occasion to leave to France the occasion for showing firmness towards Germany and Italy.

Spain and North Africa.—General Franco's New Year attack on Madrid has been held up on the Escorial road; and stalemate is once more the position of the contending forces all over Spain. The focus of this week's interest, however, has been Morocco, and the reactions in Paris, Berlin and Rome to the grave circumstantial reports of German penetration of the Spanish Zone. *The Times* published a remarkably outspoken report from its Special Correspondent in Tangier last Monday; and the Paris papers for the last few weeks have given detailed accounts of German military infiltration into the Zone, and occupation of the Rif mines by German "experts." Moreover, it is reported this

week that the resident staff of the British-owned Rio Tinto and neighbouring mines, in the parts of Spain held by Franco, are being compelled by the rebel authorities to sell their current output under cost to German firms. The welcome and unexpected forthrightness of the French Government's warning to Germany last week-end was doubtless evoked by the sudden coalescence of all shades of political opinion in France in resistance to German occupation of Spanish Morocco, however disguised. This French coalescence was rendered more striking by the reactions of Dr Goebbels' journalistic lieutenants, whose acrimony against France seemed like that of a culprit caught in *flagrante delicto*.

Two unexpected sequels in Germany this week were the sudden departure of General Goering to Rome "on a holiday," and a report of a visit by Dr Schacht to Paris, officially denied almost immediately on its appearance. General Goering's "holiday" is not, apparently, a rest cure; his Italian programme is remarkably full; and he was welcomed at the station by the Duce on Wednesday. This may be a *douceur* to Germany in exchange for the Anglo-Italian Pact; though it more probably covers discussions on German liberty of action in the Western Mediterranean. As to Dr Schacht's position, it is understood that a new Franco-German commercial agreement is on the way to signature. M. Blum's reported offer of amity to Herr Hitler may herald a *détente* in Western Europe, and a liquidation of the international Spanish problem. January 30th, the crucial fourth anniversary of Herr Hitler's assumption of power, rapidly approaches. All the signs are that Germany is seeking a face-saving exit from the Spanish toils. How she is to find it, and if she can accept it on reasonable terms, are the vital questions.

Dietary on Tyneside.—In September, 1934, the Health Department of Newcastle-upon-Tyne investigated the diet of 69 "representative" working-class families; in 38 cases the breadwinner was unemployed, and 24 families were living on new housing estates. The results of the inquiry, which have just been published, are, unfortunately, largely inconclusive. The average diet of the 69 families was found to be "sufficient." Fresh meat was consumed by all of the persons examined, fresh vegetables by 99 per cent., fresh fruit by 88 per cent. and fresh fish by 71 per cent.; and the 21 per cent. higher rents in the new housing estates had no obvious effect on the consumption of food. Although there was a comparative deficiency of a stone in weight among the unemployed males, blood tests showed "no general shift downward" in physical condition among those without work. It is significant, however, that the families with an employed breadwinner spent 36 per cent. more money on food, and consumed more vegetables, milk,

offices at Gothenburg, Stockholm
and Malmö.

**SKANDINAVISKA
KREDITAKTIEBOLAGET**

bacon and butter than the families whose breadwinners were all unemployed; and their diet was slightly more adequate in calories, calcium and animal protein. The minimum standards of "sufficiency" in diet adopted in this inquiry fall considerably below the optimum requirements laid down by Sir John Orr. Last summer, the alarming evidence of malnutrition given by the Medical Officer of Health for Stockton was followed by the conclusion of an expert investigation, conducted by the Ministry, that there was a progressive deterioration in public health between the Tees and the Tyne. It remains true that there is a serious problem of nutrition, which arises from poverty and inadequate purchasing power. It can only be solved by an advance on all fronts: by the removal of trade barriers and the lowering of food prices; by the revival of staple industries and the improvement of wages and employment; and by the extension of social services to meet the direct dietetic needs of the poor. In the words of Mr Eden this week, "we definitely prefer butter to guns."

The American Budget.—The Budget Message which Mr Roosevelt sent to Congress on Friday of last week was an unusually unexciting affair. The Budget, it is true, is not yet completely balanced, but there is at least an attempt to preserve some orderly relationship between income and outgo. It must be remembered that a Presidential Budget Message is very different from a Budget Speech of a British Chancellor of the Exchequer. The end of the current financial year is still nearly six months off. Moreover, though the President may make proposals for next year, it is Congress, with the Supreme Court intervening, which disposes. In the year which ended on June 30, 1936, Congress—by passing the Veterans' Bonus—and the Court—by invalidating agricultural processing taxes—completely upset the President's calculations. The result was a deficit of \$4,764 millions, larger than the whole of the revenue. In the current year the President estimates that revenue will show an increase of \$1,712 millions, while expenditure will be about \$400 millions lower. The deficit (including provision for debt retirement) will be \$2,653 millions. For 1937-38 the President has set himself the task of balancing the Budget except for the statutory sinking funds. This will involve an increase in revenue from \$5,828 millions to \$7,294 millions, which he proposes to accomplish without any increases of taxation.

It is true that the peculiar nature of the American tax system makes for very rapid increases of yield in the upward phase of the trade cycle, and this feature has been intensified by the tax on undistributed corporation earnings. But an increase of 25 per cent. in revenue, nevertheless, pre-supposes a very considerable rate of economic recovery. The same assumption underlies the estimate for expenditure, which is put at \$7,695 millions (including \$402 millions of debt retirement), or \$786 millions less than in the current year. This appears to depend upon a rate of expenditure on relief only three-quarters, or even less, of the amount being spent in the current year. If Mr Roosevelt's estimates are correct, the Budget will be nearly balanced in 1937-38 and, it is to be presumed, completely balanced in 1938-39. Events are thus bringing a measure of justification for the fiscal policy the President has pursued during the depression. A Budget which is unbalanced in depression and yields a surplus in prosperity is, in theory, perfect. But this is not quite what Mr Roosevelt has attained. He looks like balancing his Budget only at the top of the boom. One surplus is not enough to offset eight consecutive deficits.

American Governmental Reform.—One of the methods by which President Roosevelt hopes to be able to reduce expenditure is by his long-promised plan of administrative reform, which took shape in a Message to Congress on Tuesday. The structure of the executive

branch of the American Government, which had for long been unequal to the demands placed upon it, has entirely cracked under the strain of the New Deal. The defects are manifold. The Cabinet members, for example, have become entirely too departmentalised. The Cabinet as a body has long since ceased to exist, and its meetings have been mere battle-grounds for the Departments. Most of the new agencies of the last four years have been created entirely outside the Departments. As a result, all the burden of co-ordination is thrown directly on the President. Mr Roosevelt proposes that all the agencies of the Government shall be re-allocated to twelve Departments—the existing ten and two new ones to be called Social Welfare and Public Works. In addition to the twelve Heads of Departments the President would have six Executive Assistants, who would inevitably become the real Cabinet. In addition, the Civil Service (i.e. those officials who have security of tenure beyond the reach of patronage) would be greatly increased in scope. Whether a scheme of this nature will pass the gauntlet of a Congress jealous of the patronage powers which the present chaos places in its hands, is more than a little doubtful. Changes of this nature, however, would certainly make for greater efficiency within the Executive, although the sterile influence of the separation of powers between Executive, Legislative and Judiciary would remain. Efficiency of one arm is of limited value so long as the United States retains her present constitutional system.

Anglo-Canadian Trade.—A slight flurry occurred in two or three London newspapers at the end of last week over the delay in the negotiations for renewing the Anglo-Canadian trade pact. Ottawa correspondents reported "mystification" and "concern" in political circles, and attributed the delay to divisions of opinion within the Government of the Dominion. We may recall that, as Leader of the Opposition, Mr Mackenzie King denounced the pact that resulted from the Ottawa Conference, claiming that it was an unjust and unsafe bargain, in which Canada had taken far more than she had been ready to give. This criticism certainly seemed to be borne out by the subsequent figures of Anglo-Canadian trade. Soon after his return to office, Mr Mackenzie King announced his intention of entering into negotiations forthwith with the United Kingdom Government for a liberalisation of the Ottawa pact. These negotiations were carried through their first stage last summer by a mission headed by Mr Charles Dunning, the Minister of Finance. Since then, they have apparently hung fire. Speculation has hinted at various reasons, the most plausible being anxiety in the Canadian Cabinet for the future of the trade agreement with the United States. Some Ministers are said to be reluctant to pledge away the chance of making further trade concessions to the United States, which would give a larger return than anything the United Kingdom is likely to offer. Their reluctance may be reinforced by political motives, since more esteem is to be gained by the Liberals through the enlargement of their own trade pact with Washington than through the improvement of Mr Bennett's pact with London. Whatever the truth of these particular rumours, it is clear that the perennial economic and regional tug-of-war in Canadian public affairs is again in evidence within, as well as between, the great political parties.

South Africa and the Crown.—The opening of Parliament at Capetown on January 8th was remarkable for two things—the action of the Malanite Nationalists in walking out when the Prime Minister moved that a loyal address be sent to the King, and the announcement that a Bill would be introduced dealing with a revised form of oath to be taken by the King at his Coronation. It is not apparent from the cabled reports whether the Nationalists' demonstration was inspired by anything more typical than their anti-monarchical creed. Presumably, however, they are reserving their expected criticism

of the Union's part in the abdication crisis for the debates on the promised measure validating the change in the succession. The announcement about the Coronation oath is of wider significance; it implies an all-Commonwealth agreement on a new formula, in accordance with the present status of the Dominions as autonomous and equal members of the Commonwealth. At his Coronation in 1911 King George V promised "to govern the people of this United Kingdom of Great Britain and Ireland, and the Dominions thereto belonging, according to the statutes in Parliament agreed on, and the respective laws and customs of the same." The notion of subjection contained in those phrases, and justifiably repugnant to Dominion thought, is repeated in the present Latin form of the Royal Style and Titles: *Dei Gratia Britanniarum et terrarum transmarinarum quae in ditone sunt Britannica Rex, Fidei Defensor, Indiae Imperator*. In accordance with the sense of the Statute of Westminster, any amendment of these forms requires the approval of the Parliaments of all the self-governing members of the Commonwealth. Now that there are six sovereign Parliaments it will be interesting to see what amendment is made to the phrase "according to the statutes in Parliament agreed on."

Tin Control Continues.—Another event of importance in the metal markets was the publication of the terms of the revised tin restriction agreement, which was ratified on January 5th, and is to remain in force for a period of five years. The allocation of standard tonnages under the new agreement shows the price which the original restricting countries have had to pay for their price policy during the first few years of control. The following table shows the output of the countries participating in the new scheme in 1929, as well as the standard tonnages and votes allocated to them under the new agreement:—

	Output in 1929 Tons	Standard Tonnages under New Agreement Tons	Votes allocated under New Agreement
Belgian Congo	970	13,200	2
Bolivia†	46,338	46,490	4
French Indo-China	584*	3,000	1
Malaya†	69,366	71,940	5
Dutch East Indies†	35,730	36,330	4
Nigeria†	10,734	10,890	2
Siam	9,939	18,000	2
Total	173,661	199,850	20

* Imports into Straits Settlements.
† Original restricting countries.

The share of the total output secured by Malaya, Nigeria, Bolivia and the Dutch East Indies, it will be seen, has been considerably reduced.

So much for the past. The second point which deserves mention is that the new agreement is less rigid than the original scheme. If the estimated output outside the seven territories during a period of consecutive six months has exceeded 15 per cent. of world production, or 12,500 tons of metallic tin, whichever is the lower, any country adhering to the scheme may give six months' notice of its intention to withdraw from the scheme. Moreover—and this is important—majority control has been substituted for unanimous decisions, as required under the old agreement. Any proposal will now be carried by eleven votes. But whether the new restriction scheme is likely to be more successful than the original plan will depend on the policy pursued by those in control. During the first quarter of the current year the restricting countries are to be allowed to produce to the extent of their standard tonnages. At the present moment, however, when world demand for primary products is rapidly expanding, while stocks are declining and production is nearing capacity, the only way to prevent a wild upward rush in prices is to suspend

restriction altogether for the time being. The copper producers have already led the way, and both the rubber and tin industries might do well to follow their example. At the same time, the organisations set up under the various restriction schemes might continue to function, especially as the rubber and tin producing industries consist of a multiplicity of independent units.

Copper Sets an Example.—The commodity markets continue to attract a good deal of attention. The rising trend of prices, recently accentuated by the increasing activity of speculators, is still going on. The market in rubber has been somewhat erratic this week, but has partially recovered from the previous setback. Liverpool wheat futures, too, are again dearer, and the price of petrol, after remaining unchanged since May 1, 1935, was raised by a halfpenny to 1s. 6½d. per gallon on January 14th. Recent developments in the oil situation are surveyed on page 152. The most important developments, however, took place in the non-ferrous metal markets. Despite the successive increases in the production quotas of the copper companies adhering to the international restriction scheme, from 70 per cent. last July to 105 per cent. of the "standard" tonnages in November, the quotation for standard copper has risen from £36 10s. per ton to over £54 per ton. During the past week the quotation rose by more than £5 per ton. Seeing that the pace was getting too hot, the restricting copper producers very sensibly suspended restriction altogether on January 14th, subject to its re-introduction later on, if necessary. In any case restriction had become unnecessary. World production of refined copper during November, for example, was 159,400 short tons (of 2,000 lbs.), while deliveries amounted to 163,200 tons. And, since world stocks of refined copper had been reduced to 353,300 short tons by the end of last November, supplies are now equivalent to little more than two months' requirements. But although restriction has now been suspended, some time must necessarily elapse before production can be increased to any extent. A slump in prices, therefore, is unlikely. The implications of this far-reaching move of the copper producers for the investor are discussed on page 152.

London Evening Newspaper Circulation.—A London evening newspaper has made a very curious use of a statement in the first of our articles on the newspaper industry (see *The Economist*, January 2nd). In a paragraph devoted to a discussion of the effect on circulation of intensive canvassing, we remarked that whereas the popular national morning papers, which indulge in this canvassing, showed a marked gain in circulation over the period 1930-35, the London even-

ing papers, which do not canvass, had lost circulation. Last Monday the *Evening News* quoted this statement from *The Economist*, pointing out that for some years past its own sales had been increasing and reached the triumphant conclusion that the sales of its nearest rival must have been falling. The *Evening News*' argument is disingenuous in two separate respects. In the first place, the period over which that newspaper's sales have shown an increase is more recent than that to which *The Economist* was referring, namely, 1930 to 1935. Indeed, in the earlier years of that period the sales of the *Evening News* were falling sharply. Secondly, the context of our statement made it quite clear that it referred to the whole sale of the newspapers in question, and that the poor comparison of the "evenings" with the "mornings" was largely due to falling sales of racing editions. The *Evening News*, however, chooses to publish figures of those editions only which carry advertisements, and their argument referred only to these so-called "home" editions.

None of the papers has published complete and continuous monthly figures throughout, and there must, therefore, be some element of estimation in any comprehensive figures quoted. But we do not think any responsible authority will challenge the following as being approximately correct:—

	Four Popular Morning Newspapers	Three London Evening Newspapers All Editions	Home Editions
1930	6,140,000	1,850,000	1,580,000
1935	6,890,000	1,760,000	1,570,000
	+ 750,000	- 90,000	- 10,000

During part of 1930, the *Daily News* and the *Daily Chronicle*, between which there was a certain amount of duplicate circulation, were published as separate newspapers. The figure for the morning newspapers in that year is, therefore, higher than it would have been if the *News Chronicle* had been published as a single paper throughout the year. The contrast between the experience of the two categories is thus even stronger than appears. The *Evening News* figures included in the final column are 714,750 in 1930 and 716,100 in 1935.

The purpose of *The Economist* in the present series of articles is to give as objective a picture as possible of the newspaper industry. We have the greatest admiration for the achievement of the London "evenings" in distributing not far short of two million newspapers in a few hours every evening over the great area of the Home Counties, and we certainly did not suggest in any way that they are less progressive than the "mornings." Nor are we concerned with the rivalry of different newspapers; and we are glad to record that in 1936 the home editions of all three London evening newspapers showed gratifying increases. But since the *Evening News* does us the honour of considering us an authority on these matters, it is very desirable that our statements should not be misrepresented by being torn out of their context.

Germany's Raw Material Supplies.—The German claim for colonies, actively resuscitated in recent weeks, among others by Herr Hitler himself, Dr Schacht, General Goering, Herr Hess and Dr Goebbels, has been based on her needs of raw materials. By these needs, allegedly starved by foreign countries, the new Four-Year Plan for economic self-sufficiency and the ever more drastic State control of private industry and private funds are alike justified. It is opportune, therefore, to examine the volume of Germany's imports and home production of basic raw materials before the Great Depression, and to compare the figures with those most recently published. The first table contrasts her situation in 1929 with that in 1935.

(Yearly Figures, in 1,000 Tons)

Commodity	1929			1935		
	Net Imports	Home Production	Total Supply	Net Imports	Home Production	Total Supply
Wool	161	15	176	149	17	166
Cotton	358	...	358	349	...	349
Flax	...	12*	...	...	14	...

Tin and ore	21	...	21	12	...	12
Lead and ore	173	167	340	125	218	343
Total non-ferrous metals	930	1,477	2,407	910	1,520	2,430

All figures, if not otherwise stated, are official.
* Estimate on basis of acreage figure. † Negligible. ‡ Crude oil only.

In the textile group, increased home production of staple and other fibre and rayon has more than offset a negligible reduction in imports of cotton and wool; while imports of flax, hemp and jute together actually increased, as well as home production of flax; the total increase in net imports and home production of textile raw materials resulting in a net increase in supplies of nearly 5 per cent. More startling is the increase of over 50 per cent. in total supplies of mineral oils, caused by a fourfold increase in home production and a 40 per cent. increase in net imports. Germany's net imports of iron ore fell by 17 per cent. and her home production by about 5 per cent.; so total supplies fell by about 10 per cent. Evidently a good deal of scrap has been used in Germany. Imports of rubber have risen by 50 per cent. Net imports of the four non-ferrous metals fell slightly, but the home production rose more than proportionately; accordingly, the total supply increased slightly. This movement comprises a big increase in imports of zinc and a fall in home production; a fall in imports of tin and reduced imports of copper and lead, together with increased home production. Only for tin was Germany worse off than in the last year of prosperity and foreign lending.

Germany's 1936 Supplies.—Now let us compare figures for the first eleven months of 1935 with those for the corresponding period of the year just ended:—

(Figures for the First 11 Months, in 1,000 Tons)

Commodity	1935			1936		
	Net Imports	Home Production	Total Supply	Net Imports	Home Production	Total Supply
Wool	144	16*	160	115	18†	133
Cotton	318	...	318	284	...	284
Flax	...	13*	...	...	27*‡	...
Hemp	229	...	229	180	...	207
Jute	...	...	...	...	...	...
Silk	9	...	9	6	...	6
Rayon	1	40*	41	— 2¶	50	48
Fibre	8	15*	23	4	41*	45*
Total textile raw materials	709	84	793	587	136	723
Mineral oils	3,121	391**	3,512	3,494	405**	3,899

Rubber	67	...	67	72	...	72
Copper and ore	548	1,030	1,578	612	1,026	1,638
Zinc and ore	145	167	312	160	181	341
Tin and ore	11	...	11	10	...	10
Lead and ore	106	200*	306	153	221	374
Total non-ferrous metals	810	1,397	2,207	935	1,428	2,363

All figures, if not otherwise stated, are official.
* Estimate for 11 months on basis of yearly figure, in the annual report for 1936.
† Based on estimate given in *Frankfurter Zeitung*, September 26, 1936. ‡ Negligible amount. ¶ Net export. || Estimated on basis of half-yearly figures.
** Crude oil only.

Imports of wool, cotton, hemp, flax and jute dropped sharply, offset only by a doubling of flax production. Total supplies were drastically reduced during the twelve

months of 1936, compared with Germany's experience during the whole depression between 1929 and 1935, as shown in the first table above. Imports of silk were cut by a third last year, after having increased more than threefold from 1929 to the end of 1935. Germany changed to a net exporter of rayon between 1935 and 1936; increased her home production of fibre almost threefold; and halved her imports of it, all in twelve months. The net result in the textile category was a sharp reduction in supplies. On the other hand, imports of mineral oils continued to rise steeply, while home production of crude oil tailed off; and, after falling between 1929 and 1935, imports of iron ore suddenly spurted in 1936 by over 33½ per cent., while home production rose, carrying the eleven months' total supply virtually level with the figure for the whole year of 1929. Imports of rubber rose further last year; and, while home production of zinc reversed its 1929-35 downwards trend and that of lead rose further, home production of copper remained stable in 1936. Yet imports of copper, lead and zinc all increased appreciably, and only those of tin fell further. Accordingly, Germany's total supply of these four non-ferrous metals together increased substantially last year.

We can draw a few pertinent conclusions from these two tables. First, compared with 1929, a year of prosperity, Germany was suffering nothing like starvation of raw material supplies, either in 1935 or last year. In 1929 she had no armaments comparable with those of other Great Powers; yet she has now built up a formidable array of them. The starvation, if any such there has ever been, must have—and as these tables show, has—fallen on the more "civil" industries of Germany. The totals being what they were in 1935 and 1936, the diversion of much more of them into armaments compared with 1929 "starves," *pro tanto*, civil industry. Moreover, it follows that Germany's rulers have voluntarily chosen to do this, cost what it may to the great German export business of the last pre-depression year, and to the German public's requirements of imported food and fodder-stuffs. To the extent that imports of these latter have been cut down to maintain the pre-depression level of imports of raw materials shown in these tables, Germany has lost export business with her potential supplies of food and fodder. There-with the insistence on the self-sufficiency attempted in the Four-Year Plan is explained. But, be it noted, this has not been caused by any deliberate boycott, strangulation or economic victimisation of Germany by other countries. It is the simple reflection in Germany's foreign trade returns of a policy deliberately pursued inside Germany by her own Government. Incidentally, a final conclusion, clearly shown in the second table, is the intensification of re-armament last year, evidenced by the severe curtailment of textile imports and the offsetting increase in "strategic" raw material imports.

Twelve Months' Overseas Trade.—The outstanding feature of our overseas trade this year has been the heavy increase in imports and re-exports. British exports made little headway during the first half of the year, and although some improvement has taken place since June, the excess of merchandise imports over exports is 26.5 per cent. higher than last year. In December, imports reached the highest total since December, 1930; while the export total was the second highest of 1936. The following tables give details for the past three years:—

OVERSEAS TRADE IN DECEMBER
(000's omitted)

	1934	1935	1936	Change between 1935 and 1936	
Total imports	£ 63,240	£ 74,413	£ 89,557	+ 9,244	+ 12.4
British exports	34,300	34,917	40,516	+ 5,599	+ 1.6
Re-exports	3,608	5,432	6,100	+ 668	+ 13.9
Total exports	37,908	40,349	46,616	+ 6,267	+ 15.5
Excess of imports over exports	25,334	34,064	37,041	+ 2,977	+ 8.7
Transshipments under bond	1,871	2,482	2,906	+ 424	+ 17.1

TWELVE MONTH'S OVERSEAS TRADE
(000's omitted)

	1934	1935	1936	Change between 1935 and 1936	
Total imports	£ 731,414	£ 756,041	£ 848,936	+ 92,895	+ 12.3
British exports	395,986	425,834	440,719	+ 14,885	+ 3.5
Re-exports	51,243	55,303	60,416	+ 5,113	+ 9.2
Total exports	447,229	481,137	501,135	+ 19,998	+ 4.2
Excess of imports over exports	284,185	274,904	347,801	+ 72,897	+ 26.5
Transshipments under bond	23,783	25,471	28,946	+ 3,475	+ 13.6

The increase in imports reflects the growth of industrial activity in this country; but some allowance must be made for the recent rise in raw material prices. As far as exports are concerned, the increase is mainly in the category of manufactured goods. Considerable progress has been made in our export trade in textiles and motor cars.

Shipbuilding Revival.—The marked improvement in freight rates, due to the expansion in the volume of international trade, is an indication of the growing scarcity of mercantile shipping tonnage which has been reduced during the depression. Consequently the demand for new tonnage and for the re-fitting of existing vessels is steadily expanding. This tendency is revealed in the latest returns of *Lloyd's Register*. The mercantile tonnage launched in this country during the last quarter of 1936, at 280,400 gross, showed an increase of 68,300 gross over the previous quarter and of 148,300 gross over the corresponding period in 1935. The new tonnage commenced during October-December, 1936, was 272,500 gross, compared with 293,200 gross in July-September and 311,100 gross during the last quarter of 1935. Although the new tonnage commenced was slightly lower than in the preceding quarter, the volume of work on hand increased from 743,100 gross at the

A 6% ANNUITY with CAPITAL RETURN at death

"WHAT investment do you advise?" is a question often asked. To the ageing, the best return combined with security is the Annuity, but everyone is not prepared to surrender their entire capital and so deprive their heirs of legacies.

The new 6% Annuity Scheme solves this difficulty in a very satisfactory way. On capital invested there is allowed 6% interest for the life of the Annuitant. At death a generous return is made. Have particulars of this new and attractive Scheme by you. A supply of prospectuses will be sent to you upon request.

end of 1935 to 928,600 gross at the end of September and 963,600 at the end of December, 1936. Concurrently with the improvement in shipbuilding at home, construction abroad has also tended to expand. Work in hand outside the United Kingdom at the end of December was 1,287,600 gross tons, compared with 1,182,900 gross at the end of September and 800,100 gross a year ago. There has been a slight improvement in foreign orders during the last quarter, the proportion of the total tonnage under construction in this country at the end of last month being 7.3 per cent., against 5.1 per cent. at the end of September and 16.1 per cent. a year ago. British shipbuilders and marine engineers, however, are also benefiting from the increase in naval construction following the lapse of the Washington and London treaties at the end of last year. Meantime, prospects for the industry remain encouraging.

* * *

Iron and Steel in 1936—The past year has been the most active in the history of the British iron and steel industry. Between 1935 and 1936 the output of pig iron rose by 19.6 per cent. to 7,685,700 tons, while production of steel ingots and castings increased by 18.7 per cent. to the recent total of 11,698,200 tons. But the increase in activity has not been due, as formerly, to a simultaneous expansion of domestic and foreign demand. The volume of exports of iron and steel materials actually declined by 107,200 tons, from 2,312,400 tons in 1935 to 2,205,200 tons in 1936, while imports rose by 331,100 tons, from 1,151,900 tons to 1,483,100 tons. The pressure of home demand has thus prevented the industry in this country, unprepared as it was for the increase in demand, to benefit from the expansion in the requirements of importing countries:—

(in thousands of tons)

Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports

" October	670.3	1,060.5	101.0	194.4
" November	643.1	1,001.3	90.7	193.3
" December	671.4	1,019.2	94.8	204.8

But while the industry has surpassed all previous records in 1936, the past year closed without a diminution in the momentum of the upward movement of demand, which was unaffected by an average increase of 10 per cent. in the prices of iron and steel materials. There are difficulties ahead, the possible solution of which is discussed on page 104. Increased imports cannot now be obtained as easily as a few months ago; moreover, apart from the shortage of steel production capacity, it may be difficult to obtain sufficient raw materials. Coke supplies, for example, are none too plentiful, for although the output of oven coke exceeds the requirements of the blast furnaces, an increasing quantity is being used as domestic fuel.

* * *

Commodities Still Dearer.—The advance in world wholesale prices continues. In England, *The Economist's* complete index number has risen during the past fortnight by 1.8 per cent. and the primary products index number by 0.7 per cent. Primary products have risen in the United States by 1.5 per cent., while there has been

an increase of 1.4 per cent. in the Irving Fisher general American index number. French wholesale prices have conformed to the general upward trend, but the impact of devaluation now appears to have spent itself:—

* These figures relate to January 6th.

Since last May, when the present rapid rise began, the complete British index number has risen by 15.7 per cent. and the primary products index number by 26.0 per cent. In the United States the advances are 11.0 per cent. for the complete index number and 35.1 per cent. for primary products.

* * *

The past fortnight's rise has been very general, other foods being the only group to register a decline. This was due to a fall in the price of coco-oil, which previously had been rising very rapidly. Tea, sugar and butter recorded advances:—

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	Dec. 9, 1936	Dec. 30, 1936	Jan. 13, 1937
Cereals and meat	64.5	83.2	86.4	88.2
Other foods	62.2	65.2	65.6	65.2
Textiles	43.7	66.4	67.5	69.4
Minerals	67.4	92.3	95.4	98.0
Miscellaneous ...	65.8	79.6	81.2	82.3
Complete index	60.4	77.5	79.3	80.7
1913 = 100	83.1	106.6	109.1	111.0
1924 = 100	52.2	66.9	68.5	69.7

Canadian wheat and maize were steadier after their previous advances, but English wheat, flour, beet and bacon were dearer. All textile prices advanced with the exceptions of silk and jute. There were further increases in non-ferrous metals (except tin), while in the miscellaneous group there were advances in petrol, leather, tallow, sulphate of ammonia and creosote, offset by a reaction in linseed oil.

* * *

Record Electricity Output.—Britain is passing through a period of rapid electrification. Increased demand for electricity, which has replaced alternative sources of energy, has been accentuated in Great Britain since 1932 by the expansion of the total demand for heat, light and power. Production of electrical energy by authorised undertakings rose from 10,204 million units in 1929 to 17,568 millions in 1935 and 20,220 millions in 1936. Although statistics of private generation in the past year are not yet available, private output has probably also registered some increase in 1936. Moreover, the demand for electricity from authorised undertakings is expected to continue its upward trend, for the Central Electricity Board has already made arrangements for a considerable extension of capacity to meet increased demand during 1938 and 1939.

American Neutrality and the Spanish Conflict

WASHINGTON, January 5.—Congress has yet to prove itself pronouncedly liberal, and certainly it is in no mood to be relegated to the function of the rubber stamp of White House decisions. The first indication of this came with the revival of the neutrality discussion. The Supreme Court, in upholding the grant of discretionary powers to the President, in the suit against the Curtis Wright and other aeroplane companies which had defied the Chaco embargo, enormously strengthened the legal basis of the President's desire for a fairly free hand in conducting foreign affairs. But the new Congress has not been greatly moved by the Supreme Court's ruling. Amendment to the present neutrality legislation was needed to stop shipment of aeroplanes to the Spanish Government. There was readiness to assure this by giving the President discretionary power for a brief term. But Congress wanted it kept clear that this was not to be a permanent grant. Neutrality, as the majority holds at this time, must be mandatory, with the President unauthorised to depart from the letter of the law. It is not that Mr Roosevelt is not trusted; Congress does not wish any individual to be empowered to make decisions which by any hypothesis can bring the United States into a foreign war.

There is a breath of unreality about this now chronic debate between the mandatory and discretionary methods. Bound though it is to-day by rigid legislation, the State Department finds itself enjoying considerable independence, and was able to give some support to British and French efforts to preserve peace early this month. The incident of the licensing of shipments of aeroplanes and engines by Henry Cuse to the Spanish Government was neatly publicised and presented, so that America's interests in neutrality in Spain could be emphasised in Europe at the moment that Britain and France were trying to cajole Italy and Germany into a quieter policy.

A few days later crates of American aeroplanes for Madrid were waiting on the quay at Vera Cruz, and the State Department invited the interference of the Mexican Government to prevent shipment. President Gardenas, fearing the imminence of civil disturbances, was anxious to maintain favour in Washington, and complied. The State Department felt that in this way it was able to exercise considerable influence in Europe, and will continue to do so, no matter what Congress decides to be the President's power.

Labour and the Democrats

The size of the Democratic majority in Congress is an open invitation to party rebels, and will easily lead to a disintegration into blocs. This year, however, the inflationists and silverites are not the menace; they belonged to the acute period of the depression. This being a recovery year, an economy bloc is in the making, which will be much more engrossed with the possibility of balancing the Budget than of emphasising the humane tendencies of the New Deal. The labour war in the automobile industry is sure to create a split in Democratic ranks, with one wing ready to support labour in any reasonable demand for real collective bargaining, and a smaller wing fearful of the rising power of radical unionism.

The President had the support of such a conservative as Senator Robinson, the Democratic floor leader in the Upper House, for empowering either the Federal Gov-

ernment or the States to legislate for better labour conditions, whether by statute or by constitutional amendment. But the automobile strike will determine whether the conservative Democrats will stay with the President on this issue, as indeed it may decide whether the President himself can afford to press it. If labour is badly beaten in that conflict, the President cannot be asked to rescue it. If the conflict should be bitter and sanguinary, with too great a show of radicalism on the labour side, much of the public's present good-will toward labour will be lost. Only if labour proves itself both powerful and moderate, can the President hope to lead Congress through the intricate difficulties of framing labour legislation which the Supreme Court will accept, or in the still harder task of adopting a constitutional amendment.

Exchange Fund Policy

NEW YORK, January 1.—The announcement that the Treasury was to increase the scope of the operations of the Exchange Stabilisation Fund was generally expected. It will be recalled that, as our Fund was created out of the "gold profit," it was only a book-keeping item, though this profit could be monetised. Since the only method of monetisation provided was the issue of non-legal-tender gold certificates to the Reserve Banks, any use of the Fund would produce an effect identical with that of the import of an equivalent amount of gold. In other words, the Fund was set up in such a way as to enable it to meet an export of gold without disturbance to the credit position; but it could not act in the event of an inflow of gold. This serves as a reminder of the vividness of the apprehensions of January, 1934; and of the one-sided character that distinguished the "emergency" monetary legislation. Actually, since January, 1934 (when our price of gold was set at \$35 an ounce) our gold stock has increased from \$6,829 millions to \$11,222 millions (December 16, 1936)—or by \$4,393 millions. This current figure of \$11,222 millions must be set against the actual gold stock, as it was at the end of January, 1934, namely \$4,033 millions, on the former valuation. That is, our stock has been increased by \$2,800 millions by revaluation, and by another \$4,400 millions, so far, from increments.

The gold profit was mostly impounded in the Stabilisation Fund, and the remainder was largely used to retire the National Bank currency. But the acquisitions were promptly monetised by the Reserve Banks; and member bank reserves rose from \$2,652 millions at the end of January, 1934, to a current figure of \$6,674 millions, in spite of a substantial increase of currency in circulation. Of this increase in member bank reserves, only a small part was actually used in the process of refating bank deposits; a part was sterilised by the 50 per cent. increase in required reserves (August 15, 1936), and something over \$2,000 millions remain at present in the System in

The COMMERCIAL NATIONAL BANK and TRUST COMPANY of NEW YORK

the form of excess reserves. Unless positive action had been taken, this last figure would have been expanded by the post-holiday reflux of currency; while there is reason to anticipate a net increase in gold stocks in coming months, although not necessarily of the same magnitude.

Reducing the "Excess Reserves"

Positive action was taken in the announcement of December 22nd that the Stabilisation Fund would buy gold with funds acquired in the market, thus making our procedure similar to that of the British Equalisation Account. This action, however, concerns the future rather than the present; it will of itself have no effect upon the existing excess reserves. It is generally expected that the Reserve Board will deal with the excess; and the action most commonly predicted is another increase in reserve requirements. It has been estimated that if the required reserves were increased by the full amount provided by law (another 50 per cent. of the base schedules), there would still be left in the System about \$800 millions of excess reserves, after the Christmas currency had returned. If these excess reserves were evenly distributed, there would still be a more than comfortable situation; in the past the system has usually operated with a margin of excess of a little over \$25 millions.

Full use of this power would lift the base schedules of 13 per cent. on demand deposits for central reserve city banks, 10 per cent. for reserve city banks, 7 per cent. for country banks, and 3 per cent. on time deposits, to 26 per cent., 20 per cent., 14 per cent., and 6 per cent., respectively. But it must be remembered that Reserve Board control applies only to the member banks; the numerous State banks, operating under State charters, would then be subject to reserve requirements virtually equivalent to half those imposed on the member banks. With excess reserve so abundant, the question of earmarking a greater or less sum as "required" is hardly more than technical, but so wide a disparity would be anomalous.

The question of the territorial distribution of these excess reserves within our system is another consideration. The fact that a 50 per cent. increase could be imposed last August without the slightest disturbance is no guarantee that the manoeuvre could be repeated. A variety of alternatives is available, singly or in combination; and the choice would depend upon a number of technical considerations involving detailed information about (a) the geographical distribution of the excess reserves and (b) the nature of our internal balances of payments, which are now largely determined by political factors.

"Inflation" or "Control"

But beyond these questions of technique, there is the major question of objective. The relation programme has been completed, and the present programme emphasises control. The definition of control, except as applied to a single element of our economy—the stock market—has not been stated. Furthermore, there has always been an element which wished to expand "reflation" into "inflation," and which has already launched an attack against even the modest measures of control instituted; and this may find support among groups which have developed what might be called a vested interest, if not in expansion, at least in the absence of control. These groups will be represented in the 75th Congress, but their strength and aggressiveness have still to be tested.

At this stage in our monetary evolution, it would appear that there are three specific questions associated with the transition from a period of reflation to a period of control: (1) the political question—that is, the amount of control which could be imposed without encountering effective political objection; (2) the administrative question—monetary responsibility is not lodged with a single agency (the Federal Reserve Board) but is distributed between the President, the Treasury, and the Reserve Board, and to a lesser extent such agencies as the F.D.I.C. and even the several States; and (3)

the technical question—that is, the choice of devices or combinations of devices best adapted to secure the control desired with a minimum of disturbance.

Such questions as these are topics of active discussion in financial circles. Elsewhere discussion seems to centre upon labour problems. The strike in the glass industry has been in progress about six weeks, and caused such a shortage to develop as threatened to stop the production of motor cars. With the New Year, however, the Automobile Workers' Union apparently decided not to wait for the stoppage, but to take direct action, singling out the General Motors Corporation as its immediate target. The three great motor companies are not identical in form. General Motors is a vertical combination, geographically decentralised a little more than the others, and producing a somewhat larger proportion of its products in its own factories or in wholly-owned subsidiaries.

Motor Unions' Demands

The principal demands made on General Motors include: collective bargaining for the entire Corporation rather than by units; the abolition of piece-work; a 30-hour week; minimum pay; the determination of speed of production by a committee of the management and the union; and the recognition of the United Automobile Workers as the sole bargaining agency. Some of these demands are obviously contingent. For example, one motor company alone could hardly accept the 30-hour week.

The year closed with a period of bottle-neck strikes, in which a few workers have been able to threaten stoppages affecting many times their number. The New Year opens with larger strikes (or threatened strikes) in great corporations, but not in the form of a general strike throughout a great industry. The ultimate objective would appear to be the vertical organisation of labour in whole industries, in which production is now only semi-vertically organised.

France

The Rise in Prices

PARIS, January 14.—The Opposition's main attack on the Government is now concentrated on the social conflicts, the rise in prices and the alleged danger of inflation. Social conflicts have, however, nearly disappeared since the beginning of the year. This was immediately welcomed by the Stock Exchange; all shares have now become firm, particularly since the recent improvement in Franco-German relations. The "Rentes" have also risen.

The rise in commodity prices continues, as the following table shows:—

	1936		1937	
	June	Sept.	Dec.	Jan. 9
Wholesale prices.....	372	407	496	502
Domestic products.....	415	457	522	528
Imported products	296	319	448	455
Foodstuffs	396	447	511	517
Industrial products	352	373	483	489
Retail prices	458	483	534	...
Lighting and heating.....	79	88	93.6	...
Clothing	57	61.2	77.2	...
Cost of living	493*	504†	540‡	...

* Second quarter. † Third quarter. ‡ Fourth quarter.

This rise of prices has apparently disquieted M. Spinasse, the Minister of Economy, who recently explained that French prices in June were 15 per cent. higher than foreign prices, and that the 33 per cent. devaluation was calculated on the expectation that they would become 50 per cent. higher after the new social laws had been enforced. The Minister declared that, at the end of the year, French and foreign prices had been brought into line, and remarked that the need for

monetary alignment put certain limits on French social progress. At the end of December, three months after the devaluation, French wholesale prices had risen by about 23 per cent., but fortunately foreign wholesale prices had risen in the same period by 18 per cent., and the equilibrium re-established by the devaluation had therefore been maintained.

On the other hand, retail prices have risen by about 11 per cent., which is appreciably less than the rise in wholesale prices. The relatively small rise in retail prices is obviously due to the slow rise in the price of foodstuffs; the index of foodstuff prices has only risen 14 per cent., against a 30 per cent. rise in the price of industrial products. The next task of the Government will be to bring agricultural and industrial prices into equilibrium; agricultural prices are to some extent supported by the Wheat Office, although the farmers still complain. Industrial prices are naturally dependent on the activity of the trade unions.

The cost of living rose from 493 (second quarter 1936) to 504 (third quarter) and 540 (fourth quarter), or nearly 10 per cent. M. Spinasse has also drawn attention to the rise in the cost of living of 11.2 per cent. between May and November. This is still appreciably less than the estimated increase in wages between the same dates.

Signs of a Return of Confidence

The position of the Treasury is not easy. Parliament authorised the Minister of Finance to issue Treasury bonds to a maximum of 20,000 million francs or to borrow from the Bank of France a maximum of 10,000 million francs. But in 1937 the Treasury will probably require 30,000 million francs or 35,000 million francs.

Of the authorised issue of 20,000 million francs some 4,500 million francs have been issued in "Auriol bonds," and 7,000 millions of bonds have been subscribed by banks and various institutions. But short-term borrowing possibilities have been nearly exhausted. There remain the middle and long-term ones, which may be considerable, if strikes do not recur, if the signs of a revival of business are confirmed, and if improved conditions on the Stock Exchange continue. Signs of a return of confidence and capital are now more apparent than recently.

It is being widely remarked that stringency in the capital market cannot last for ever. At the same time, the gold certificates are quoted at improved rates, which seems to indicate that the French Equalisation Fund is more comfortably situated than it was. It is now probable that public opinion will be encouraged by the recovery of business preceding the opening of the International Exhibition in Paris in May. Public opinion, favourably impressed by the sympathetic comments of the English newspapers on the progress of the Blum experiment, is likely to strengthen the hands of the Government, if the present improvement in social conditions and foreign relations and the increased confidence of the Stock Exchange can be maintained until the spring.

Further Increase in Industrial Production

Meanwhile the increase in industrial production has been proceeding steadily since the devaluation at the end of September. The increase has been spread over most of the major industries. This may be seen from the latest monthly figures of industrial production in France (1913 = 100) published by the Statistique Générale.

In November 13,439 motor cars and 1,825 lorries were put on the road, against 14,059 and 1,810 respectively in October. The figures for the cotton industry were as follows:—

	Aug., 1936	Sept., 1936	Oct., 1936	Nov., 1936
<i>Spinning</i> (average per spindle in kilograms)—				
Production	1.191	1.722	1.969	1.836
Deliveries	1.185	1.844	2.052	1.960
 Stocks	1.714	1.642	1.469	1.322
Unfulfilled orders	4.765	4.926	5.474	5.583
<i>Weaving</i> (average per loom in pieces of 100 metres)—				
Production	3.21	4.74	6.00	5.53
Deliveries	3.95	4.90	6.28	6.04
Stocks	6.02	5.74	5.29	4.86
Unfulfilled orders	22.39	21.85	23.89	25.41

Railway receipts for the fifty-first week of 1936 were 206,465,000 francs, against 184,278,000 francs for the same week of 1935; an increase of 12.02 per cent. Loaded wagons during the fifty-second week were 252,823 (seven days), against 281,394 in 1935 (eight days). Loaded wagons for the whole year (December 29th included) were thus 14,861,064, against 14,648,009 in 1935 (December 31st included).

Unemployment Falling

Unemployment at the end of 1936 was 410,785; against 439,782 at the end of 1935 and 419,129 at the end of 1934. The seasonal increase in December was only 2,954; against 30,316 in December, 1935, 49,694 in December, 1934, and 60,684 in December, 1933.

Germany

Restricting Capital Extensions

BERLIN, January 13.—The problem of providing capital and labour for the industrial boom, and in particular for the Four Year Plan for raw materials, continues to dominate public interest. Semi-official utterances leave no doubt that the State will increasingly intervene in this matter, and not merely in order to further its immediate aims. A Reich-owned bank predicts that "a number of the political-economic expedients which originated in the fight against depression will become permanent factors in, and elements of, our economic structure." This forecast seems to apply to both negative and positive State measures. An instance of the former is the wholesale prolongation of the vetoes of the Reich Ministry of Economy on the erection or expansion of industrial plant. The ostensible purpose is to save capital, materials, or labour for more urgent enterprises.

It is also declared that the vetoed trades suffer from excessive competition; but in effect this merely means that there is a deficiency of supply of the products of the trades officially favoured. Most of the prohibitions expired at the end of 1936, but some came to an end earlier. With a single exception all have been

prolonged, many for one year, some for two, some even for four, years. Altogether thirty-two prohibitions are now in force. These direct prohibitions constitute only a small part of the measures directed against investment or competition; for numerous restrictions are imposed upon investment by cartel contracts and virtual prohibitions result from the discretionary power of the Supervision Boards to refuse raw materials to newly-formed concerns.

If the supply of capital is limited, so, owing to the restriction of enterprise, is the effective demand. The savings available are the funds of the Reich, the accumulations of existing industrial concerns, such cash as may be raised by bond or share issues, and bank credits. The Reich will this year have a considerably increased tax revenue. It claims for the not yet completed financial year 1936-37 an increase of some Rm. 2,000 millions. The *Frankfurter Zeitung* estimates that in 1936-37 the Reich, including the saving on payments to the unemployed, had some Rm. 7,000 millions for "supplementary expenditure," to which should be added some Rm. 2,000 millions raised by long or middle-term loans. This does not take into account short-term borrowing.

Increase in Tax Revenue

The tendency is for the Reich to rely increasingly on revenue from taxation and long-term loans. Although little new taxation has been imposed, revenue has rapidly increased: one important factor is the increase in nominal incomes with the consequent transfer of numerous tax-payers to a higher place in the progressive scale. On the basis of the official estimates of tax-revenue in 1936-37 and of national income in 1936, it appears that 25 per cent. of total income was collected in taxes of all kinds, as against 22.6 per cent. in the first year of the Nazi administration, and 17.6 per cent. just before the depression, when the nominal national income was higher, but revenue from taxation lower. If the Reich's current expenditure had not increased, it would certainly be able to provide capital liberally.

The labour question is not entirely solved. In December, the number of unemployed increased by 281,000 to 1,478,000, as against an increase of 524,000 to 2,508,000 in December, 1935. In the chemical trades there were practically no unemployed. In spite of official protests, manufacturers who are short of labour attempt to entice men from rival works by offering higher wages. The "work book," an innovation regarded by workers from the first with suspicion, is henceforth to be used to prevent this. In the metal, building, and agricultural trades employers are authorised to confiscate the "work books" of employees who leave their jobs arbitrarily. Against this an appeal lies to the Labour Courts.

Standstill Credits and Colonial Claims

The problem of the standstill credits must soon be settled for 1937. In authoritative utterances this question is treated in its relation to colonial and foreign trade policy; and it is affirmed that Germany would be ready to make important commercial concessions, not however defined, if the debts were reduced and a supply of foreign raw materials were ensured. In effect, the latter demand is for the return of the colonies. The Reichskredit Bank says that "Germany's economic aim . . . is to abolish her foreign exchange control; but this can only be done if a solution of the problem of debts and raw materials can be found which will be satisfactory to Germany, and will correspond to her structure as a debtor and industrial country." The speeches of the Prime Minister of Holland advocating a free-trade bloc, from which Germany, as a result of her policy of autarky, would be excluded, have been unfavourably received.

Germany dislikes Democratic blocs as much as Communistic; and she believes that she is already threatened by at least three Communistic, or semi-Communistic, neighbours. But so far she has been careful to exclude the smaller North European countries from her attacks.

She objects to plans which may involve negotiating with neighbouring States as a group. In this spirit, she opposed the suggestion of a Customs Union made by the Little Entente at Pressburg last September, and, despite her reconciliation with Italy, she still suspects that the Rome Pact between Italy, Austria and Hungary is potentially an instrument for excluding her commercially from South-Central Europe. This attitude is partly determined by considerations of defence. Whatever may be the character of the next war, it is unlikely that the Reich will be able to draw supplies from overseas; but she might be able to draw them from the small neighbouring States of North and South Europe. Since the Nazi Government took office, German imports from Hungary, Roumania and Yugoslavia have doubled. Towards these countries, and towards Austria and Czechoslovakia, German trade policy is not "autarkic." It is relatively liberal, but is based on bilateral agreements; this plan the Reich desires to extend to the North European countries.

Coercing the Farmers

The steel market is active; but the Steel Trust's output in the last quarter of 1936 shows a considerable decline. The grain shortage has evoked new measures. Farmers are now urged to deliver quantities in excess of their compulsory quotas, which must in any case be fulfilled by the end of February. Lists are to be compiled of the farmers who consent. This measure unquestionably constitutes semi-compulsion. In addition, committees of experts have been set up to find out why the compulsory quotas have not been delivered. The consumption of purchased wheat or rye as fodder has been entirely forbidden. The fodder supply is quite inadequate, and the alternative therefore seems to be: sufficient bread, or sufficient meat.

Spain

"Collectivisation" in Catalonia

BARCELONA, January 6.—Catalonia is now well started along its highway of "collectivisation," which is merely another word for Communism of a kind. The new economic order in Catalonia is embodied in three decrees. The first and most important is that of October 27th for the socialisation of large industries and land holdings; another is a decree whereby the municipalities are made the social-economic units, while the third divides Catalonia into nine economic areas in accordance with geographical boundaries.

For the moment the situation is unpromising. Catalonia, a manufacturing and agricultural region, has lost its markets in a large part of Spain and in foreign lands as well, while industries are threatened with stoppage for lack of raw materials. The foreign exchange situation is so unsatisfactory that most foreign firms simply decline to send materials unless they have been paid in advance. The exchange rate against the peseta is so high in the free market that Catalonian importers find themselves faced with grave difficulties.

A National Bank Proposed

One of the principal functions of the new Council of Economy, the controlling organ of "the new economy" is "to regulate the total production of industry, stabilising prices, studying the necessity of consumption and production and the possibilities of interior and foreign markets; to propose the suppression or extension of factories and the reform of methods of work . . . suggest modification of tariffs or of commercial treaties . . . procure credit or banking facilities . . . organise technical laboratories . . . study the substitution of materials of foreign origin by internally produced materials." The Council of Economy is now studying the

creation of a Catalan Bank of Industrial and Commercial Credit as a necessary organ of the "new economy." The function of this bank, according to one of the spokesmen of the Council, would be "to canalise the possible losses and gains of collectivised industry." More specifically, he explained, it would impound the gains of profitable enterprises, extending credits to those that need them and compensating other industries for their losses. Catalonia is rapidly moving toward a very comprehensive control of its financial regime, and the new bank, when established, will probably be a national bank with certain limited powers of issue.

The Government's Financial Resources

As announced in the press, the Catalan Government has already issued its own money—20 million pesetas' worth of currency in notes of two and one-half, five and ten pesetas, guaranteed by the resources of the Catalan Government. There appear, however, to be no reserves of any kind to support them. The Catalan Government has resources. It has expropriated millions of dollars' worth of lands and buildings since July 19th; currency, bonds and similar paper, worth perhaps several times the amount of the issue, from the Church; gold, silver and jewellery seized from "factionous elements." The police continue their daily visits to the domiciles of suspected persons, where they seize valuables, which are then handed over to the Government.

"Collectivisation" is being put into practice piecemeal because the municipalities and their districts have been accorded a large measure of autonomy—so much so, in fact, that Catalan cities and towns have been described as so many little republics. This may make for individuality and independence, but it certainly does not make for harmony; for, as one of the Catalan councillors recently expressed it, each municipality seems to think itself the centre of the world, whose interests are superior to those of all other cities and towns, to the Republic and to the universe itself. In many cities "collectivisation" has hardly got under way, while in other localities it is rushing forward pell mell.

Foreign Properties and Workers' Control

The question of the foreign-owned industrial properties, of which the British-owned Riegos y Fuerzas de Ebro (Barcelona Traction Company) is the most outstanding, still awaits solution. Its foreign personnel departed more than three months ago, and the company is now in the hands of the workers. To all outward appearances they are doing well; for the supply of electricity is normal, and the deposits of subscribers are being refunded, although there are no reductions in rates. The Catalan Government's decree provides that there shall be compensation to foreign companies on the basis of mutual agreement, and workers have been advised to refrain from further "collectivisation" in the case of such properties until agreements have been reached. It seems, however, that compensation is still a matter for the future.

Turkey

The Sanjak of Alexandretta

ISTANBUL, January 2.—Political interest is chiefly focused on the negotiations with France about the Sanjak of Alexandretta. The question is difficult because the Quai d'Orsay treats it only as a juridical problem, whereas the Turks claim that its political aspect cannot be separated from the legal issues involved.

The important point, which has been discussed only in the foreign Press, is that the Turks object to any situation which might one day favour the exertion of hostile influences on their Southern frontiers. Moreover, they

cannot agree to a compact Turkish population being placed under a Syrian administration, i.e. of a country with no experience of independence or proof of political maturity. Turkey entrusted the "Hatay" Turks to a French administration, and she cannot admit that a French mandate should be replaced by what is looked upon as an Arab mandate.

As to the legal aspect of the question, the Turks reject the claim that the Ankara Convention of October 20, 1921, was signed by France on behalf of Syria, and maintain it was negotiated with France herself, since in 1921 there existed no recognised State known as Syria. They also suggest that the Convention recognised the right of the Sanjak to a special flag embodying the Turkish flag. The subsequent Treaty of Lausanne, moreover, stipulated that the future of the territories over which Turkey renounced her rights was settled, or was to be settled, by "the parties concerned." Thus, either France was the direct signatory, and in that case she is not entitled to transfer her authority over the Sanjak to any other country without Turkey's approval; or she was not the direct signatory, and in that case the "party concerned" is the population of the Sanjak and not any other party covered by the French mandate.

The claim that the Sanjak should become independent and then become part of a Syrian federation is considered moderate. Meanwhile, feeling runs higher and higher, and seems to be based on the conviction that Turkish rights are being thwarted at Geneva.

New Zealand

Growing Business Confidence

CANTERBURY, January 1.—Substantial increases in the prices of wool at the season's opening sales have given a marked stimulus to confidence in the Dominion. At the first four sales average prices were 50 to 70 per cent. above those ruling a year ago, and it is anticipated that the price per bale, which averaged £NZ21 12s. 6d. for the eight years 1922-29 and about £NZ7 10s. during the three worst years of depression, will now average nearly £NZ19. Japanese and Continental competition has been strong, while Bradford buyers have been comparatively inactive. Exports, which totalled £NZ43.36 millions for the year ending September, 1935, have increased steadily during the year, helped by higher prices and larger quantities of wool, and by better prices for dairy produce, during the last season. The year's exports now exceed £NZ56½ millions, a figure higher (in domestic currency) than that for 1929, and only once exceeded, when £NZ57.1 millions was reached in 1924-25. Imports have responded to increasing demand, following the expansion of internal business, and for the latest year exceeded £NZ42 millions, an increase of about £NZ6 millions on the figures a year earlier.

Internal trade is more active than at any time since 1930. It is being realised that the depression is over, and there are suggestions that high wool prices will carry exports for the season above the £NZ60 millions mark and create a boom. The recovery, especially in retail trade, has been helped by the general restoration of wages to pre-depression levels and by a revival of heavy Government expenditure on public works. Its extent is indicated by the fact that the September quarter's yield of sales tax was 25 per cent. greater in 1936 than in 1935, while total bank debits were 18 per cent. higher. Average share prices, however, have fallen by 7 per cent. during the year.

The Labour Government's Measures

This is partly a reaction to the change in Government and in policy. An enormous amount of new legislation has been passed during the year, much of which is enabling legislation, and it is not yet clear how it will be used. The Industrial Efficiency Act, for instance, passed last session, set up a Bureau of Industry, with

wide powers of industrial and trade regulation; and a few prices have been fixed, including the guaranteed price for exported dairy produce and domestic prices of wheat, flour and bread. A basic wage, representing a minimum below which no award rates may fall, was announced by the Arbitration Court. Part of the Government's policy, including some public works expenditure, was designed to increase spending and relieve depression. It appears now that the rise in export prices will make such assistance unnecessary. About 36,000 registered unemployed remain, but in many occupations a scarcity of competent labour is being experienced.

Public Finance and the Trading Banks

The public works programme announced required £NZ13 millions to finance it, and the Finance Minister stated that no public issue would be necessary. Later it was announced that £NZ3 millions would be advanced for housing by the Reserve Bank. The Bank has already advanced to the Government £NZ4.4 millions against exports of dairy produce under the Government marketing scheme and £NZ700,000 for other and unstated purposes. These advances, however, would in former years have been made by the trading banks. The transfer of such business accounts in some measure for the slow rise in trading bank advances. These have shown an increase of £NZ3 millions to £NZ48 millions since June. Combined with Government advances, they indicate an increase of £NZ7½ millions, or 17 per cent., in total advances since June, which represents more than the usual seasonal expansion. Bank deposits remain high, £NZ62 millions at the trading banks, and £NZ3.6 millions Government deposits at the Reserve Bank.

40 per cent. Rise in Export Prices

The recovery experienced has so far had little effect on internal prices. It is expected that higher costs, due to the restoration of wage cuts, shorter hours in many industries, and heavier taxation, must increase domestic prices. Higher export prices will also increase the prices of exportable goods sold locally. During the past year retail prices have increased about 4 per cent., while import and wholesale prices have remained practically stationary. Compared with the year 1933, export prices for October, 1936, have increased by 41 per cent., retail and wholesale prices by 9 per cent. (mainly owing to export influences) and award wage rates by 21 per cent. The depression was due very largely to the fact that export prices fell much more heavily than internal prices.

Letters to the Editor

Dearer Money and Rising Prices

TO THE EDITOR OF THE ECONOMIST

SIR,—In a Note on the "Gilt-Edged Outlook" on page 72 of your issue of January 9th, you remark that the authorities desire to maintain a firm (gilt-edged) market while financing the re-armament programme, and that this might be done by widening the basis of credit and so increasing the volume of bank cash. You continue with the reflection that "to do that, on a considerable scale, in a period of depression is one thing, and to do it at a time of rapidly rising prices is another"—meaning, presumably, a worse thing.

But widening the basis of credit is not merely a means of strengthening the gilt-edged market; it is also a means, and the only means, of financing net additional expenditure with rising prices.

No reasonable person would deny that prices can rise unduly fast, or that increased public expenditure (on re-armament or anything else) may, other things being

equal, accelerate their rise. But if prices do rise unduly fast, the causal factor will be the increased expenditure, not the provision of additional bank cash to finance it. To incur public expenditure on credit, and at the same time to try to neutralise its effect on prices by declining to widen the basis of credit and increase the volume of money, would be a policy which could only succeed (as we found in 1923-24, when we combined public works with a return to the gold standard) by depriving private industry of the resources attracted by the public expenditure.

No doubt a simple way to do this would be to render marginal private industry unprofitable by raising an item of industrial costs, namely, the rate at which business men can raise long-term capital; and no doubt this would be just the effect of increasing public expenditure without providing enough additional bank cash to finance both it and private industrial expenditure. But is this really what *The Economist* expects our authorities to do?

The proposition that it is one thing to increase the volume of money in a time of rising prices and another to increase it during a depression is, indeed, easily grasped; but the inference that, if we indulge in a policy of public expenditure while prices are rising, we shall proceed (with 1,500,000 workers still unemployed) to create enough counterbalancing depression to enable us to finance it without accelerating the rise of prices, is less self-evident. Common sense would suggest choosing the lesser of two evils. But perhaps the point is that common sense is hard to reconcile with "cyclical forces."

I am, etc.,
HUGH TOWNSEND.

21 Hillcroft Crescent,
Ealing, W.5.

[We would agree with Mr Townsend that if a further rise in commodity prices is necessary to absorb genuinely cyclical unemployment, there is no valid objection to an expansion of credit necessary to finance such a rise. But if prices are beginning to rise beyond the point associated with a disappearance of cyclical unemployment, the case may very well be otherwise. We would also suggest that additional expenditure at rising prices might be financed by an increase in the velocity of circulation.—ED. *Econ.*]

Anti-British Propaganda in Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—Having just completed a long tour through Germany, I should like to call your readers' attention, if I may, to the increasingly anti-British tone which Nazi propaganda has recently assumed. I have been there several times before, and so perhaps the contrast this Christmas was much more noticeable. Although one can sympathise with Germany over her colonial difficulties, it is difficult to do so when one is told so often by the inhabitants that "England has robbed her of her gold, and despoiled her of her colonies." Still more unpleasant are the slights cast upon the incompetence of the British Government, and the disparaging contrasts so often drawn in the newspapers, on the wireless and even on the films, between the depressed areas and the present position in Germany.

The crowning insult, however, is the theory, deliberately propagated by the Government, that England is under the thumb of a Jewish autocracy, and that Sir Oswald Mosley is the only Englishman who has "the foresight to see the danger and the courage to speak his mind." I have spoken with several Germans, who are convinced as a result of this propaganda, although none of them had even been to England, that our country is controlled by Jewish cliques, and I have even seen on an official Government notice-board a picture of a pair of dark spectacles labelled "A Christmas present for England—so that she won't see her own Jews."

The most distressing feature about this insidious campaign is that it all emanates from the German Government, and is not from private persons, as is the case with any anti-Nazi feeling which may exist in this country. One wonders, therefore, how much sincerity there can be in Herr Hitler's alleged desire for peaceful and friendly relations with other States, and, above all, in his claim not to interfere with the internal policies of his neighbours.

I am, Sir,
Yours faithfully,
GEORGE A. BONNER.

Vienna.

A GOVERNMENT SERVICE for BUSINESS MEN throughout 1937

"THE BOARD of TRADE JOURNAL" The authoritative weekly journal of the Board of Trade contains essential news for exporters. It includes news of trade openings, exchange regulations, commercial treaties, Customs regulations, &c. The issue of December 10, 1936, contained a special 16-page supplement giving the complete text of the new trade agreement between the United Kingdom and Argentina. On January 14, 1937, Part I of the British India Customs Tariff was included. Annual Subscription 30s. post free.

MINISTRY OF LABOUR MAGAZETTE An invaluable monthly news service on very many aspects of industrial labour and employment including employment and unemployment, wages and hours, cost of living, strikes and lock-outs, legal cases, etc. 6d. per copy. Annual subscription, 7s. post free.

ACCOUNTS relating to A TRADE and NAVIGATION These monthly returns give the volume and value of imports and exports for the current month with aggregate figures for the previous months of the year. Similar totals for the corresponding periods in the previous two years are given for purposes of comparison. Summary tables of imports and exports preface the figures analysed in more detail. In the return for December, preliminary figures are given for the past year. Each monthly return is adequately indexed. Annual subscription, £2 17s. 0d.

ANNUAL STATEMENT of the TRADE of the UNITED KINGDOM This work, appearing in four volumes, contains the final figures for each year's trade analysed in considerable detail with comparative figures for the previous four years. The division is as follows:
Vol. I.—Summary of imports and exports.
Vol. II.—Detailed Statements of imports; exports of imported merchandise, bullion and coin and free goods in transit.
Vol. III.—Detailed Statements showing exports of produce and manufactures of the United Kingdom.
Vol. IV.—Detailed statement of the trade at each port or place, etc.
Prices for the volumes relating to the year 1934 are as follows: Vol. I, 12s. 6d. (13s.); Vol. II, 35s. (35s. 8d.); Vol. III, 22s. 6d. (23s.); Vol. IV, 25s. (25s. 7d.); post-free prices in brackets. Returns for 1935 now in course of publication.

OVERSEAS TRADE REPORTS Concise and informative accounts of the commercial and economic conditions prevailing in the principal countries throughout the world are presented in the series of reports by H.M. Trade Commissioners and Commercial, Diplomatic and Consular Officers. Some thirty to forty reports are issued annually at a subscription price of 40s. post free. Reports on individual countries may be obtained separately at various prices.

Books and Publications

The Dilemma of Poland

It is perhaps the main duty of an historian to interpret, and of a journalist to record. In these two books,* it is the journalist, M. Václav Fiala, who interprets, the historian, Mr. Robert Machray, who records. "The Poland of To-day" is, in the words of its author, a "consecutive record in chronological order of the day-to-day drama of the restored Polish State, with Pilsudski as the central figure." It incorporates Mr Machray's previous book, "Poland, 1914-31" and carries on the history of Poland till July, 1936. The very thoroughness with which Mr Machray has collected his facts does much to obscure their significance. The record of frequent changes of government, of frequent financial crises, of *communiqués* after foreign visits, and of Press reports, only elucidates what the reader already knows; his curiosity about the real springs of Polish action remains as great as before.

In the chapter headed "Relations with Germany," an account is given of the negotiations leading up to the surprising Polish-German Ten Years' Pact of January, 1934. The chronological order here is wholly out of place; for the dominant features of the treaty at that time were the secrecy with which the treaty was negotiated, and the suddenness of its publication, not only to the world at large, but to Poland's closest ally, France. It was this which chiefly caused the surprise and suspicion which Mr Machray, representing the Polish point of view, finds so unjustified. While fully describing the tension between Germany and Poland which grew increasingly with Hitler's approach to power, Mr Machray, nevertheless, treats the pact itself without astonishment and with little explanation. With his "sympathetic but not propagandist point of view," he underestimates the strategic and other factors which caused France to regard the pact as an encouragement to potential aggression in Central and South-Eastern Europe.

M. Fiala, on the other hand, gives an excellent account of Polish-German and Polish-Russian relations. He shows how Poland's exposed position between these two countries inevitably determines her foreign policy and, to a large extent, her home policy also. He gives an acute analysis of the foreign policies of Pilsudski and Colonel Beck, and does much to suggest the superiority in diplomacy and single-mindedness possessed by Pilsudski. Much light is thus thrown on the peculiar political and strategic dilemma of Poland—situated as she is between two huge and highly-armed Powers.

Mr Machray, in his chapter "Poland since Pilsudski," gives one little idea of the real significance for Poland of Pilsudski's death. On the one hand he says that it meant no change in home or foreign policy: on the other, that "a fresh period in the history of Poland had begun." "Marshal Pilsudski," writes M. Fiala, "vanished at the height of his power, but without having achieved his object." He died leaving a dictatorship but no dictator, and it is this which sets one speculating not only on the probable course of Poland's foreign policy but on the eventual stability of her internal regime.

Though M. Fiala, who is a Czechoslovak citizen, wrote his articles at various times during the last two years, he writes with such intelligence and care, that he enables one to understand not only the past of which he writes but the present which was then unknown. He has certainly attained his object of writing a book which "can be consulted with interest to-day by the contemporary reader who is interested in politics, and in the future by the historian who is studying the problem of Poland."

"La Pologne d'Aujourd'hui." By Václav Fiala. Paul Hartmann. 280 pages. 15 frs.

Shorter Notices

"The Four Green Fields." By George O'Brien. (Dublin). The Talbot Press, Ltd. 152 pages. 3s. 6d.

The point about the Four Green Fields is that there are only three; for this is an essay on the partition of Ireland. Dr O'Brien is very well known as a sober, moderate, well-informed observer, possessed both of the historical background and the economic knowledge necessary to form a balanced judgment on Irish affairs. This only makes the more disturbing to the English reader his emphatic insistence that there can be no peace between England and Ireland so long as the whole island of Ireland is not a juridical whole. Dr O'Brien admits that the desire for reunion with Ulster is utterly illogical. It is not a desire for domination, as virtually any concession of practical autonomy would be made in return for the admission of theoretical juridical unity. It is not love for the Protestant Ulstermen; Dr O'Brien's remarks about the Orange order are bitter in the extreme. It is merely that attachment to a mystical combination of history and geography which is the most powerful force in Irish politics. The Englishman cannot understand it; but he must accept it as a fact.

This book, though published in Ireland, is clearly intended for English readers, and it deserves to have many of them. They will find an essay which is both witty and wise and delightfully written. With the exception of the major hypothesis, all is logic and reason. If that hypothesis can be accepted, the book is a powerful tract on what can still be called the Anglo-Irish problem.

"Handbook on the Formation, Management and Winding-up of Joint Stock Companies." ("Gore Browne.") By His Honour Judge Haydon and Stanley Borrie. 39th Edition. Jordan and Sons. 916 pages. 20s.

This famous work on Company Law is now in its seventieth year. That its authority has been strengthened as its subject-matter became more complex must be attributed to the succession of talented editors who have been responsible for its many editions. The late Sir Francis Gore-Browne was responsible for no fewer than twenty-two of its thirty-nine editions, and for its familiar short title. The present editors have ably succeeded to his task. They have revised the company case law and have altered the text, where necessary, to conform with the present practice of the registrar. For all who are intimately concerned with company legal work, "Gore Browne" is indispensable.

MONEY AND BANKING

The Function of the Discount Houses

JANUARY is a month of financial stock-taking, when the leading banks and discount houses issue their accounts. The bank balance sheets which have already appeared confirm earlier indications of a growing demand for bank credit, but we propose to reserve our detailed comment upon them until the complete set of accounts is available. In the meantime, we may concern ourselves with the results of the discount houses, who are engaged in a more specialised form of short-term finance. The accounts so far available are summarised below:—

December 31st	Alexanders			National		
	1934	1935	1936	1934	1935	1936
Liabilities:—	£mn.	£mn.	£mn.	£mn.	£mn.	£mn.
Capital	1.0	1.0	1.0	1.0	1.0	1.0
Reserve fund	1.0	1.0	1.0	1.0	1.0	1.0
Loans, deposits, etc.	22.3	22.3	28.2	30.4	31.7	36.3
Rediscouts	1.2	1.4	0.9	12.9	17.5	18.5
Rebate	0.2	0.2	0.1	0.3	0.3	0.3
Assets:—						
Cash	0.6	0.6	0.6	0.8	0.9	1.0
Investments	12.6	12.9	13.4	8.7	8.7	11.2
Loans	0.7	0.4	1.7	0.6	0.4	0.5
Discounts	12.0	12.1	15.7	35.6	41.6	44.5
Gross profits	£'000	£'000	£'000	£'000	£'000	£'000
Expenses	458	334	206	202	221	223
Investment reserve	54	49	41	41	41	44
Net profit	200	185	165	161	180	179
To pension funds	10	164	164	10	149	148
To dividends	164	164	164	140	149	148
Change in undistributed profits	+30	+21	+1	+11	+21	+23

The figures illustrate the strength and power of these institutions, but we are here concerned mainly with their broad functions.

As their name implies, the function of the discount houses is to discount bills of exchange. They grew up in the nineteenth century, which was the heyday of the bill of exchange, both in internal and external trade. At home, it was the era of the independent country bank, which discounted bills for its customers and looked to London for rediscounting facilities. It was equally the era of the small independent trader who obtained a large part of his credit from discounting rather than from the bank overdraft. Reference to the centenary histories of the British joint-stock banks or to George Rae's famous book on the duties of a country banker makes this abundantly clear. The bill of exchange was the main instrument for financing international trade, and London's pre-eminence as a bill market was unchallenged. Round the bill of exchange grew up an elaborate system, under which the accepting house gave its name to a bill, which was then purchased, initially, by the discount house. The joint-stock bank looked to the discount market as a means of employment for its surplus cash and as a source whence it could obtain bills of the suitable character and dates of payment for inclusion in its own portfolio. To-day a trader can still approach one member of this system, secure an introduction to other members, obtain an acceptance to his bills and proceed to discount them.

The difficulty at the present time is that the machinery of discounting remains, but the commercial bill has largely disappeared. The inland bill has gone, with the growing integration of British industry and banking, and internal financing and the bank overdraft have taken its place. International trade has shrunk in volume, and exchange clearings and the growing domestication of industrial and commercial operations have further restricted the use of the bill. Thus the discount market has had to find new outlets for its

activities, and so far it has found these in the Treasury bill and the short-term Government security.

It is questionable whether Walter Bagehot could possibly have foreseen all the implications of his "invention" of the three months' Treasury bill as an instrument of Government finance. It was originally intended to bridge seasonal discrepancies between revenue and expenditure. For its growth to its present colossal dimensions the Great War was primarily responsible. The extent of its growth since 1913 is shown by the following table:—

TENDER ISSUES OF TREASURY BILLS

	£ millions
December 21, 1913	10.5
December 28, 1929	565.0
December 26, 1936	614.0

This table speaks for itself. Changes since 1929 have been largely fortuitous, and they indicate no permanent trend. The predominance of the Treasury bill in the discount market was established long before that year.

The growth of the Treasury bill and the decline of the commercial bill have produced a fundamental change in the structure of the discount house—a change which would be even more apparent if the three houses showed Treasury bills separately in their accounts. This change is illustrated in the following table:—

Date	Capital and Reserves	Loans, Deposits, etc.	Discounts	Securities
	£ mill.	£ mill.	%	£ mill. %
Alexanders:—				
end of—1912	0.6	9.7	8.8	90.7 1.0 10.3
1928	1.3	21.4	17.2	80.6 5.1 23.8
1935	2.0	22.3	10.7	48.0 12.9 57.8
1936	2.0	28.2	14.8	52.6 13.4 47.6
National:—				
end of—1912	1.3	15.9	12.8	80.6 2.5 15.7
1928	1.9	25.2	22.7	90.2 3.2 12.7
1935	2.0	31.7	24.1	76.2 8.7 27.4
1936	2.0	36.3	28.0	77.6 11.2 30.9
Union:—				
end of—1912	1.5	18.9	16.0	84.8 2.2 11.6
1928	3.0	45.9	39.2	85.4 9.0 19.6
1935	3.0	59.2	42.2	71.3 16.2 27.4

Note.—The figures in italics represent the percentages borne by discounts and securities, respectively, to loans, deposits, etc. Discounts exclude bills rediscounted.

The three discount companies have met the post-war situation in different ways, but in every case they have ceased to be almost exclusively holders of bills, and have admitted a larger proportion of securities among their total assets. Alexanders, in fact, to-day hold bills and securities in almost equal proportions. Thus, while the three companies have greatly increased their total resources since pre-war days, they have ceased to be predominantly interested in the financing of trade, and have largely become a part of the machinery for providing the Government with short-term finance. They have continued to be of the utmost service both to the Treasury and the banking system. They still provide the banks with an outlet for their short-term funds. If, however, the machinery of short-term Government finance were being designed *de novo*, it is by no means certain that it would include a component with functions precisely similar to those of the discount houses to-day.

What are the future profit-earning potentialities of the discount houses? It is patent that during the past four years of cheap money these bills have contributed little or nothing to net profits. Short-term Government securities give a higher yield, and until recently they also offered scope for capital appreciation and "jobbing profits." Last year, however, must have been very lean

from this point of view. The trend of the gilt-edged market was downwards, and increased appropriations to depreciation reserves must have been necessary. On this occasion Alexanders have followed the procedure of the other two houses and have not disclosed these appropriations. This is the probable explanation of the drop in Alexanders' disclosed gross profits.

This suggests a conclusion—which can hardly be denied—that Government securities are not a wholly adequate substitute for self-liquidating bills of exchange, for an institution which derives the bulk of its working capital from short-term loans and deposits. Nor are jobbing profits a satisfactory substitute for the income formerly derived from bills of exchange; for, as we are seeing to-day, jobbing profits in time begin to be replaced by losses. Initially the discount houses could set the upward trend of gilt-edged prices against the downward trend of interest rates, but to-day they can no longer do so. Thus either the bill of exchange must be revived or the discount house must find a way of taking part in the newer forms of short-term finance, such as hire-purchase or instalment buying. This raises very wide questions, some of which we hope to discuss at a later date. Our concluding word to-day is that the strength of the discount houses is unquestionable, and they are still able to earn profits and to pay a reasonable dividend on their capital. On the other hand, the financial world has moved on, so that old methods of finance have fallen into disuse while new methods have been invented. It seems that the financial mechanism of London may in consequence need modernising in its turn.

Financial Notes

Japanese Exchange Restrictions.—At a time when other countries are relaxing their exchange regulations it is disconcerting to learn that Japan is imposing fresh restrictions, which came into force without warning on January 8th. Purchases and sales of foreign exchange, remittances abroad, and even the execution of exchange contracts made before the issue of the ordinance, now require the permission of the Finance Minister. The only exceptions are amounts of less than Yen 30,000 a month, the settlement of documentary bills in respect of goods shipped not later than one week after the issue of the ordinance, and transactions arising from letters of credit for which permission has either been granted or is not required. Traders also require permission before they can dispose of foreign currency assets arising from the shipment of goods. Finally, foreign exchange banks must obtain permission to make payment to a bank in accordance with instructions from abroad unless the sum involved does not exceed Yen 10,000. The new ordinance is to remain in force until July 31, 1937, and it is officially stated that its objects are to stabilise the exchange, to prevent speculation, and to impose a check on excessive imports which might otherwise be made in anticipation of the higher duties due to come into force next April. These explanations are not entirely convincing. During the past year imports into Japan have been shrinking, while exports have been rising, though it is fair to add that the import surplus for the first nine months of each year was greater in 1936 than in 1935. In any case, London bankers rightly take strong exception to the retrospective character of the section of the ordinance controlling inter-bank payments, for this interferes with the covering of forward exchange positions opened prior to the ordinance. It is difficult to dissociate these new restrictions from Japan's heavy military expenditure and the dubious condition of her national finances. Finally, this is not the first occasion when a country has announced exchange restrictions for a limited period, and on previous occasions the restrictions have remained in force indefinitely.

The First Russian Notes.—The first of the Russian five and a half per cent. five-year notes, endorsed by the Export Credit Guarantee Department under the Trade Agreement of last July, have now been placed in the London money market. The amount issued so far is very small, being only about £50,000, but as the Russian orders for British goods are completed and fall due for payment, more notes will appear. Orders for the whole of the £10 millions of British goods arranged for under the Agreement must be placed by the end of next September, so that the notes should now be appearing with fair regularity. The few notes placed so far were taken at a price of 115, which was the exact figure suggested by us last July. The premium of 15 per cent. accrues to the Export Credits Guarantee Department, to cover the cost of the work and to act as a margin by way of insurance, in place of the premium normally payable by the British exporter. One disquieting fact is that Russia is using the Agreement to place orders for heavy machinery, British makers of which are already working at capacity for the home market. It would be much better if Russia bought other goods such as textiles, for which there is not so intense a home demand, and it is possible that delays over the delivery of heavy machinery will induce Russia to divert her orders in this direction.

A New Czech Loan from France.—The financial and economic negotiations conducted for many months in Paris by the Czech Minister, Dr Osucky, have ended in an agreement in principle which, when the remaining details have been filled in, will be signed at the end of the month. The Czech balance of trade with France is passive by about Kc. 120 millions annually, and Czechoslovakia annually owes France in addition about Kc. 300-350 millions net, for interest on loans, dividends, etc. The Czechs wished to cover this high passive balance of payments towards France by increasing exports in her direction—as the Jugoslavs, for obvious political reasons in view of German economic penetration there, were able to get the French to balance the passive Yugoslav account by multiplying fourfold the French import quotas for Yugoslav products. The French, however, preferred to offer Czechoslovakia a new loan, despite the latter's desire to increase her exports. In 1932, France made the last loan to Czechoslovakia, Kc. 600 millions at 5 per cent., secured by a second mortgage on the net profit of the Czech tobacco monopoly. This loan, originally taken up at 94.5 and quoted at 99, was to be repaid at par. It is now to be prolonged. But in addition, Czechoslovakia is to get a new loan, reported to be of Frs. 800 millions, half payable this year and half next. Accordingly, the Czechs' desiderata—increased import quotas in France—have only been met to a very narrow degree, involving an increase in the value of Czech exports to France of only Frs. 120 millions per annum. Probably, however, as French foreign trade continues to improve, Czechoslovakia will be easier able to secure an increase in her commodity exports to France, wherewith to pay off both the old and the new debts. In view of this, the outcome of the long negotiations in Paris is favourable to Czechoslovakia, at an important juncture for the political leaders of that progressive and comparatively prosperous little country.

Floating Debt Changes.—We publish below our usual table showing changes in the size and composition of the floating debt during the past calendar year. The position at the end of the last financial year is also given, to illustrate the effects of the heavy revenue collection between December 31st and March 31st. To avoid

the distortion due to the preparations for the end of the calendar year, the dates chosen are not December 31st, but an early date in each January.

	Jan. 11, 1936	March 31, 1936 (£ millions)	Jan. 9, 1937
Treasury bills—			
(a) Tender	556.0	498.0	599.0
(b) Tap	338.9	265.1	174.9
Ways and Means Advances—			
(a) Public Depts.	27.0	19.1	30.0
(b) Bank of England	Nil	Nil	Nil
Floating Assets*	365.9	284.2	204.9
Total, Floating Debt.....	921.9	782.2	803.9

* i.e., tap Treasury bills plus ways and means advances from Public Depts.

During the past year there has been a reduction of £118 millions in the floating debt. Simultaneously, payments on the 1935 and 1936 Funding Loans, offset by redemption of Treasury bonds and other minor operations, added £153 millions to the non-floating debt. This means an increase of £35 millions in the total National Debt, probably due to this year's heavier expenditure and to the fact that the bulk of the year's extra revenue has still to be collected. From the narrower angle of the money market, the floating assets of the departments are reduced by £161 millions, while tender issues of Treasury bills have increased by £43 millions. This points strongly both to the Exchange Equalisation Account's large gold acquisition during the year, and also to the departments' support of the new Funding Loan. It was noticeable that there was no significant change in floating assets at the time of the Bank's gold purchase and reduction in the fiduciary note issue. This suggests that the Treasury bills taken from the backing to the note issue, and transferred by the Bank to the Exchange Account, formed part of the tap issue.

The Money Market.—The stringency that developed at the turn of the year has now entirely disappeared, and money is by contrast extremely plentiful. Rates are unchanged from last week at the usual lowest figures. Banks with funds still available at the end of the day found considerable difficulty in placing them.

	Dec. 23, 1936	Dec. 31, 1936	Jan. 7, 1937	Jan. 14, 1937
Bank rate	2%	2%	2%	2%
Clearing banks' deposit rate	1½	1½	1½	1½
Short loan rate:—				
Clearing banks	1½-1*	1½-1*	1½-1*	1½-1*
Others	1½-1*	1½-1*	1½-1*	1½-1*
Discount rates:—				
Treasury bills	1½-1*	1½-1*	1½-1*	1½-1*
Three months' bank bills	1½-1*	1½-1*	1½-1*	1½-1*

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The small percentage allotment at last week's Treasury bill tender was a not unexpected disappointment, and the market has consequently been averse from selling the few bills at its disposal to the clearing banks, which are quite willing to buy. A few March and early-April maturities have, however, gone at the minimum rate of ½ per cent. A significant feature is that money is not going into the gilt-edged security market, as it usually does at this time of year.

The Foreign Exchanges.—It has been a very quiet week indeed in the foreign exchange market, and movements of rates have been minimal. Sterling has on the whole sustained its strength against other currencies, the whole sustained its strength against other currencies, and whatever fluctuations there have been in the rates were directly attributable to the varying tension of the international situation in Europe. This was particularly noticeable in the case of American dollars, which were offered and bid alternately in step with the Franco-German statements and negotiations over the question

of Morocco. The quotations only varied, however, within the limits of \$4.91 and \$4.91½, with the three months forward rate steady at ½ cents premium. The Swiss franc, the guilder and the belga have all been firm, and neither the spot nor the forward rates have varied significantly. The French franc alone has shown a certain weakness, discernible not in the spot rate, which is firmly held by the French Control at Frs. 105½-¾, but in the three months forward rate, which at the end of last week went out as far as Frs. 2 discount, coming back this week to the more normal figure of Frs. 1½-1½ discount. This periodic weakness is due to the persistence in some quarters of the belief that sooner or later the franc will be further devalued to the lower statutory limit. As far as can be ascertained, this belief is entirely without foundation. The new restrictions on exchange dealings in Japan, discussed in another Note, resulted in a strengthening of the yen to the officially desired rate of 1s. 2d. "Bear" speculation had previously reduced the rate on occasion to 1s. 1½-¾d.

The Bank Return.—This week's Bank return shows that we have returned to the normal conditions prevailing before Christmas.

	Jan. 15, 1936	Dec. 23, 1936	Dec. 30, 1936	Jan. 6, 1937	Jan. 13, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	200.2	313.7	313.7	313.7	313.7
Note circulation	397.7	474.1	467.4	462.7	455.0
Banking Department:—					
Reserve	63.1	40.2	46.8	51.4	59.0
Public deposits.....	13.8	21.7	12.1	13.5	12.4
Bankers' deposits.....	110.1	72.2	150.6	110.2	106.7
Other deposits	37.5	38.8	39.2	38.4	38.3
Government securities	83.9	83.1	134.5	93.3	83.2
Discounts and advances	20.0	6.4	17.5	14.4	12.5
Other securities	12.5	21.0	21.2	21.1	20.8
Proportion.....	39.0%	30.2%	23.1%	31.7%	37.4%

The note circulation is down by £7.7 millions, but is still at a substantially higher level than last year, which reflects the considerable increase in business activity. Bankers' deposits are down by £3.5 millions, but still stand at a high level. Government securities are down by £10.1 millions, reducing them to the normal pre-Christmas level. This shows that the Government borrowing on Ways and Means necessitated over the turn of the year has now been fully repaid.

Prosperity in Canada.—At the annual meeting of the Canadian Bank of Commerce two points of view were expressed. The general manager, Mr S. H. Logan, presented an array of statistics illustrating the measure of Canada's recovery in 1936. Exports for the year were above the \$1,000 millions level, placing Canada fourth in importance in world trade, and ahead of France and Japan. Mining, newsprint and the heavy industries all made substantial improvements, and agriculture benefited from higher prices, although crops were light. By contrast, the address of the President of the Bank, Sir John Aird, contained more than one note of warning that the duration of this recently acquired prosperity should not be taken for granted. Thus he explained that the average yearly requirements since 1932 onwards of the wheat-importing countries have been about 500 million bushels, compared with 750 millions in the previous five years. Yet to-day there is a tendency to increase acreage beyond what even the earlier figure would justify. Sir John Aird insisted that it was imperative that to meet this situation Canadian agriculture should be more efficient and more diversified, that the farmers' sales policy should be more aggressive, and that sub-marginal lands should be withdrawn from cultivation. The most salutary and effective remedy would be the freeing of world trade, and Canada, who exports 30 per cent. of her national production, should be thankful for the recent movements in that direction.

THE STOCK EXCHANGE

Oil Company Prospects

AMID the recent exuberance of commodity shares, the oil group has enjoyed its share of attention. The resumption of interim dividends by "Shell" Transport, coupled with a capital bonus, is one reminder that recovery in the oil industry is now established. A second is the raising of British petrol prices by $\frac{1}{4}$ d. per gallon this week. Yet the market still lacks a stimulus comparable with the recent experience of the rubber and copper share markets. Seasonally, the opening weeks of a new year are the least favourable period for oil shares. The statistical position of the industry in the United States usually shows some deterioration, owing to the reduced winter demand for gasoline. The present season is no exception, and though the current level of consumption has exceeded all prophecies, stocks of gasoline are rising. On the other hand, the general statistical position is stronger than for a long time. At the end of a year of record output, stocks of crude oil stand at little more than fifty days' absorption—their lowest for a decade. Consumption of motor fuel in 1936 exceeded the 1935 figure—its record—by more than 11 per cent. And the demand for fuel oil, both for industrial and domestic purposes, has been quite exceptional.

The present situation, however, is in some respects anomalous. Now that crude oil stocks have been reduced to record low levels, an advance in prices might appear imminent. Yet, so far, none of the major American companies has shown any eagerness to follow the Continental Oil Company, which recently raised its buying price for mid-continental crude by no less than 17 cents to \$1.35 a barrel. This reluctance is due to a legitimate fear that higher crude prices may encourage production and thus prevent the gasoline companies from raising the prices of refined products adequately later on. The increase at the beginning of 1936 had precisely this effect. But, on the whole, the omens for a further rise in the near future would appear to be bright. Though gasoline prices are still below the level of twelve months ago, they show an unseasonal tendency to harden. The current demand for motor spirit rivals summer dimensions, and the consumption of heavy fuel oils is the market's strongest point. All these tendencies should be maintained. Only two uncertainties cloud the picture. The first is the extent of the increase in gasoline stocks. The second is the persistent excess of crude oil production over that recommended by the Bureau of Mines.

Provided that neither of these problems assumes

threatening dimensions, 1937 may conceivably bring a substantial advance in oil prices. In comparison with prices of other commodities, oil is undoubtedly lagging. It would be unwise, however, to base any undue expectations on the development of an "oil boom." For the moment, attention is being rightly devoted to the record of 1936 and to its reflection in company profits.

Any attempt to estimate oil company revenue encounters obstacles rarely found among other leading commodity groups. Oil is not a unitary product, and the price trends of different grades are not necessarily uniform. Nor are costs data available in many instances. Estimates of net profits, therefore, are immediately precluded. To circumvent these difficulties we have attempted to segregate the oil products on which the receipts of a number of leading oil companies have been found, in the past, to depend most closely. By means of separate indices of prices and of output we have endeavoured to compute the percentage changes in gross revenues in 1936 compared with 1935. The final "receipts indices" obtained must obviously be regarded as no more than a rough approximation. Even if they are accurate, they represent only the first step in the final determination of net profits. Nevertheless, some indication is provided, by this method, of the extent of changes in oil revenues, compared with the latest year for which results are obtainable. The figures, which are as good a pointer to probable dividends as any, are tabulated at the foot of this page.

The suggested results show significant differences for individual companies. Attock Oil and Mexican Eagle stand out with the largest relative increase in estimated receipts. But the financial record of the former has not been fortunate and an immediate resumption of dividends can hardly be expected. The Mexican Eagle estimate is complicated by the fact that no figure for gross revenues in 1935 is available. For 1936, however, receipts in excess of £1,250,000 would not be surprising, and the company might easily pay up to, or over, 15d. a share against 10d. the year before. For the investor, as distinct from the speculator, however, the prospects of Burmah Oil and "Shell" would appear more attractive. Official output figures for 1936 are not available for either concern, and the movement in gross receipts must be largely a matter of conjecture. Burmah Oil should have benefited substantially from the advance in Indian kerosene prices last year, and provided that sales were

at least equal to those of 1935, earnings might easily exceed 25 per cent. on the ordinary capital. A dividend of this figure might not, therefore, be surprising, while a 20 per cent. increase in the gross receipts of "Shell" should make a final dividend of 15 per cent. possible, bringing the year's dividend rate up to 22½ per cent., against 17½ per cent. on the smaller capital.

Of the remaining companies, the three crude oil producers all promise a substantial advance in receipts. The 20 per cent. increase for Anglo-Ecuadorian is, however, estimated for the year ending next June and is based on the assumption of a 10 cents rise in crude oil prices by the spring. It is thus in the highest degree provisional. For Lobitos and Venezuelan Oil Concessions, the estimates are for 1936 only. The Lobitos operating subsidiary should be in a position to resume dividend payments this year, and an increased distribution by the parent concern thus appears likely. The prospects for V.O.C. are rather less certain, since the company has been increasing its output of relatively low-grade crude oil. For this reason, a big increase in dividends cannot be looked for. On the other hand, the high gearing of the United British ordinary capital suggests that, although the company's oil output was unchanged, a substantial increase in net profits may be expected to result from the 7 per cent. advance in prices which was recorded in 1936. The Roumanian producers appear to be in the least favourable position, owing to lower prices for their refined products and to reduced exports. A small distribution by the Phoenix Company, however, cannot be completely ruled out.

There remain, finally, Apex (Trinidad) and Anglo-Iranian—both largely dependent on the British market. The former has already increased its dividend for 1936, and the $\frac{1}{4}$ d. rise in British petrol prices promises a further increase as suggested in our table. But the Anglo-Iranian results are probably the greatest enigma of all. Should the board relax the caution so evident in last year's accounts, a big increase in profits might be shown this year, for an increase of 12 per cent. in gross earnings, as compared with 1935, appears possible. A dividend of 20 per cent. against 15 per cent. does not, in these circumstances, appear an extravagant forecast. For 1937, the advance in petrol may mean up to 5 per cent. more in gross receipts.

All in all, the results for 1936 should reveal a fair measure of recovery, which is likely to be uneven in its incidence on different companies. For the current year the outlook is no less bright, particularly if the winter season is comfortably passed in the United States. But even if oil prices fail to satisfy the inveterate optimist, increased production alone promises a satisfactory advance in receipts and dividends over the coming year. On this showing, current share levels appear to value the possibilities of 1937 confidently, but not extravagantly.

92½. Compared with the present level of the 1935 issue, again, there is but little attraction in its terms for the general investor, although the trustee who is still on the quest for redemption profits may find it more useful. On the eve of the issue, however, the 1935 stock, which stood at 93 ex interest on Tuesday, fell to 91 middle. It is subject to stamp duty, of course, but even after this adjustment the new loan appears to have been pitched fully half a point higher. Meanwhile, those investors who can draw sermons from redemption yields may note that, whereas the first portion of the debentures was priced to yield £2 14s. per cent., the second has been arranged on a £3 1s. per cent. basis.

* * *

Mr Keynes and the Markets.—In the gilt-edged market Mr Keynes is a best seller. The market always likes the tone of his voice, and finds his words "comfortable." In a series of articles in *The Times* this week (on which we comment on page 108) he emphatically contends that there should be no resort to the weapon of higher interest rates to check any incipient trade boom. With this view the market entirely agrees, but it fears, nevertheless, that Mr Keynes may be putting the offensive and defensive powers of the Bank of England and the Treasury rather high when he says:—

With the existing control over the exchanges, which has revolutionised the technical position, and with the vast resources at the disposal of the authorities through the Bank of England, the Exchange Equalisation Fund, and other funds under the control of the Treasury, it lies within their power, by the exercise of the moderation, the gradualness, and the discreet handling of the market of which they have shown themselves to be masters, to make the long-term rate of interest what they choose within reason. If we know what rate of interest is required . . . we have the power to make that rate prevail in the market.

The authorities must assuredly have been guilty of a dereliction of duty in allowing this week's instalment

London Electric Issue.—While the market was canvassing the possibility of a large Treasury operation (with re-armament financing at the back of its mind) the authorities were busy with a trustee issue. But it proved to be merely the second—and final—instalment of the London Electric Transport Finance Corporation's borrowing. The issue, for which lists were open all day on Thursday (in accordance with the now fashionable terms for trustee issues) is of £9,650,000 2½ per cent. guaranteed debenture stock. In all respects—except the issue price—it is identical with the £32 millions issued in July, 1935, for it is backed by Treasury guarantee and is redeemable between 1950 and 1955. The proceeds of the two issues total £39,966,250, and are within £33,750 of the Corporation's borrowing limit. For the investor it presents several points of interest. The first part of the loan received an auspicious reception at 97. But the second appeared to require some mustering of forces in the absence of an enthusiastic response to an offer at

of the Treasury-guaranteed London Electric loan, to be issued a nominal $4\frac{1}{2}$ points lower than its predecessor! Some brokers have lately been advising their clients to choose "dated" rather than "undated" gilt-edged stocks, in view of the possibility of an eventual stiffening of long-term rates. Before they advise the reversal of the switch, they may well desire a longer and more convincing experience of the power of the authorities, after having said "Basingstoke," to make it so.

* * *

With Mr Keynes's contention that a higher rate of interest will in itself be useless to prevent the development of speculative exuberance on the Stock Exchange, there will be widespread agreement, though a high rate has always been potent in pricking a bubble once it has been blown. The suggestion that the banks should be cautious in allowing their names to appear on prospectuses, and that the Stock Exchange Committee should exercise discrimination in granting permission to deal, is valid at all times, and not merely when a boom threatens. But Mr Keynes' proposal that such a movement should be checked by "a temporary increase of substantial amount in the stamp on contract notes (as distinguished from transfers) in respect of transactions in ordinary shares" will be unwelcome to many members of the Stock Exchange, who fear that it would give a fillip to the formation of a rival Curb Exchange.

Roping the Bulls in Wall Street.—Despite the unabated labour troubles in the motor industry, Wall Street has enjoyed a comfortable week, with rising prices in most sections of the market, and a heavy turnover. This testifies both to the underlying strength of the economic position and to the apparent weakening of the strikers' front, due to the opposition of the craft unions and of some non-union labour to the attempt of the United Automobile Workers to secure a monopoly of bargaining with the employers. With the labour forces divided, the employers can afford to assume the appearance of neutrality. Utility issues have come back into favour on the report of a Congressional Committee criticising the Administration's planning of public power projects. And the President's Budget Estimates favoured the market in so far as they had any effect at all. Steel shares were especially favoured by the rising expenditure on armaments. Further evidence of the determination of the Administration to avoid any speculative mania is provided by the statement in the report of the Secretary of the Treasury that a study is being made of income tax on investment and speculative profits. Various measures have already been adopted to make it more difficult to speculate on borrowed money, and existing taxes on capital profits are graded to discriminate against the speculator who holds his securities for short periods. There are many loopholes in these measures, but apparently there is to be no flagging in the determination of the Government to keep the market within reasonable bounds. The difficulty will be to decide just what is reasonable from an investment point of view; the suggestion from the Securities and Exchange Commission that the proper index is the earnings ratio obviously will not meet the case, since the prospect of future earnings is more important than present earnings in market valuations. There is no mathematical standard by which the difference between an investment price and a speculative price can be gauged, and therefore the efforts of the Administration must probably stop at creating an atmosphere unfavourable to speculation. This, presumably, is the correct interpretation of the many hard sayings of the Commission.

Industrial Profits in December.—The regular rate of increase in industrial profits continues to fluctuate on either side of 15 per cent. Our analysis of 175 company reports published in December reveals an increase of 15.49 per cent., against 13.49 per cent. for the previous month and 12.27 per cent. for the "December" companies of the previous year. The following table shows the rise in profits for the past seventeen months.

Reports published in	No. of Companies	Rise in Profits*	Reports published in	No. of Companies	Rise in Profits*
1935—		%	1936—		%
August	38	5.93	April	254	9.66
September ...	77	9.28	May	269	9.41
October	166	29.19	June	214	13.50
November ...	160	17.47	July	228	15.69
December ...	159	12.27	August	47	14.21
1936—			September ...	107	12.32
January	128	13.66	October ...	146	18.09
February ...	205	9.00	November...	177	13.49
March	236	17.39	December...	175	15.49

* After payment of debenture interest.

The total net profits covered by the December reports amounted to £18,438,723, compared with £15,964,449 for the preceding year. The increase in profits of £2,474,274 is general in nature. The largest rise amounts to £477,562 for iron, coal and steel companies. Tobacco earnings contribute over a third to the total, but, owing to the inclusion of the stable B.A.T. disclosed earnings, they have increased by only 5 per cent. Only three groups—shipping, tramways and omnibus, and building materials—show declines.

Company Notes

British Banking Profits.—With the publication of all the banks' profits statements and the Barclays' balance sheet, an attempt may be made to show the progress of true banking profitability during the past year, and its association with the growth of advances. Bank profits are, of course, disclosed after making provisions to inner reserves of unstated amounts, and they depend, more than those of many other companies, upon decisions of policy. But it is usual to assume that such provisions do not obscure the trend of profits. The rate of progress, again, is more accurately revealed if profits struck after income tax are "grossed-up" at the appropriate standard rate. In the following table the profits figures have been adjusted in this way, to give a more direct comparison with changes in advances, which are the banks' chief source of increasing earnings:—

	(£'000)	1929	1934	1935	1936
Barclays	Profits	2,915	2,203	2,300	2,485
	Advances	172,296	154,666	159,747	179,652
Lloyds	Profits	3,178	2,130	2,117	2,285
	Advances	191,011	135,927	140,294	154,813†
Midland	Profits	3,330	2,955	3,035	3,235
	Advances	210,374	163,815	177,023	193,333†
Nat. Prov.	Profits	2,320	1,717	1,746	1,885
	Advances	156,678	113,398	112,060	120,834†
Westminster ..	Profits	2,700	1,966	1,808	2,270
	Advances	146,757	110,358	114,533	126,465†
Total, Five Banks ..	Profits	14,442	10,971	11,008	12,100
	Advances	877,116	678,164	703,657	776,100

† November average figures.

For the "Big Five" as a whole total profits have recovered nearly half their fall between 1929 and 1932-33, and are now within 16 per cent. of the 1929 figures. Total advances (including the November figures in four cases in the absence of the balance sheets) are now 11½ per cent. below the 1929 figure. For purposes of exact comparison, it would doubtless be desirable to compute yearly average figures of advances in preference to year-end totals. But the table shows a very pronounced correlation between advances and the trend of banking profits as a whole.

* * *

For comparison between individual banks, the figures in the foregoing table are presented as percentages of the 1929 levels below:—

		1929	1934	1935	1936
Barclays	Profits	100	75.6	78.9	85.3
	Advances	100	89.8	92.7	104.3
Lloyds	Profits	100	67.1	66.6	72.0
	Advances	100	71.2	73.5	81.1
Midland	Profits	100	88.7	91.2	97.1
	Advances	100	77.9	84.2	91.9
Nat. Prov.	Profits	100	74.0	75.3	81.3
	Advances	100	72.4	71.6	77.2
Westminster ..	Profits	100	72.8	67.0	84.1
	Advances	100	75.2	78.1	86.2
Total, Five Banks ..	Profits	100	76.0	76.6	84.2
	Advances	100	77.4	80.2	88.4

Here marked differences are revealed. The balance sheet of Barclays Bank, whose dividend has been maintained since 1929, shows that advances now exceed the end-1929 level, but profits are still 15 per cent. below it. Lloyds Bank (using the November averages) also shows slower progress in profits than advances, but for the Westminster Bank (in the latest year at least—the 1935 figures were affected by the centenary bonus) the two totals are approximately 15 per cent. below the 1929 level. The opposite trend has been disclosed during the last three years by both the Midland and National Provincial Banks. For the bank shareholder these diverse trends rob a simple inference from movements in bank advances to profits of some of its force. Investors may also note the failure of advances to regain more than 88½ per cent. of the level of 1929, despite the fact that industrial activity is now running around 10 per cent. higher. New methods of company finance, the growth of large holding company organisations feeding their operating subsidiaries, and the ability of industrial undertakings actually to increase their liquid resources during the recovery period have all combined to limit the industrial demand for bank credit. According to the traditional pendulum, the earning power—and dividends—of the banks increase, and thus counteract the effect of higher interest rates on share levels as recovery develops into prosperity. Despite the progress of the past year, both in share prices and earnings, it would be premature to expect that the 1929 dividend levels could be regained without a considerable supplementing of earnings, towards which a further rise in advances would make a large and welcome contribution.

* * *

Millions From Sixpences.—Both in the speed of its publication and in the profits it discloses, the F. W. Woolworth report is admirable. Geometricity is still the dominant characteristic of earnings: total profits increased last year by 10½ per cent., compared with 8½ per cent. in the preceding year. On a comparable basis, the 1936 total distribution is increased by one-fifth, after adjusting for the free capital bonus issued in December last, and is covered one and a quarter times by available earnings. Yet the amount of undivided profits is still in excess of £3½ millions. The massive strength of the company's revenue position is analysed below:—

	1934	1935	1936
Trading profit	5,108,748	5,548,451	6,127,221
Written off properties ...	124,514	137,650	153,152
Do., fixtures	104,254	112,387	119,714
Directors' fees	30	44	20
Taxation	1,077,672	1,112,445	1,256,128
Staff fund	10,000	20,000	100,000
Preference dividend	232,500	232,500	228,750
Ordinary shares—			
Earned	3,559,778	3,933,459	4,269,457
Paid	2,325,000	2,906,250	3,431,250
Earned (%)	122.5	135.3	(a)
Paid (%)	80	100	(b)

Freehold buildings reserve 50,000 100,000 100,000
Carried forward

(a) Earnings expressed on new capital, 74.7 per cent.
(b) Interim dividend, 30 per cent. on 15,000,000 5s. ordinary shares. Final dividend (35 per cent.) and cash bonus (10 per cent.) on 30,000,000 5s. shares, after 100 per cent. capital bonus in December, 1936.

(c) After capitalising £3,750,000 of undivided profits, and charging £21,892 for expenses of new issue.

The expansion of purchasing power during the past year has vastly increased the company's turnover, but year has vastly increased the company's turnover, but advance of a longer order is indicated in the continued growth of balance-sheet items for properties. Although many of the stores established in recent years are in areas which, for a time, have provided less than the average return for the group, the 1936 accounts suggest that their earning power is increasing. The figures give no hint, on the other hand, of reductions in profit-margins or limitations upon stock ranges due to higher costs. Stocks per store amount to about £4,900, but total stocks have increased by some 23 per cent. during the year. This impressive advance suggests, in fact, that

rising prices are exerting a marked influence on replacement costs. Although they will be masked for some time to come by the effects of rising purchasing power, the future may show more fully how far the organisation reacts to rapidly rising prices. The 5s. shares are quoted at £4½ to yield £3 7s. 6d. per cent. on a 60 per cent. dividend.

* * *

British-American Tobacco Prospects.—British-American Tobacco £1 stock units are commonly regarded as one of the most stable and best-secured equities in the Stock Exchange List. Before the depression, 25 per cent. tax free was invariably paid, and since 1931 the rate has been 20 per cent. net. Disclosed earnings, of course, are subject to the powerful control of "policy," and they are consequently no more significant than the rate of dividend actually declared. But within this context of stable distributions, the market has never forgotten that the organisation is a world-wide trading concern, and that sooner or later it might expect some return, partial or complete, to the earnings levels of pre-1931. To some extent, perhaps, the wide geographical spread of its interests has protected the group from the worst ravages of depression. But now there is no major consuming country which is not set towards economic recovery. British-American Tobacco, in fact, should be one of the first companies to benefit from a recovery in the purchasing power of primary producing countries and from the growth of foreign trade when prosperity bursts through its nationalist bounds. For some time exchange difficulties and emergency taxation imposed by distressed governments have diluted the increase in profits from advancing turnover. But Sir Hugo Cunliffe-Owen expressed his confidence to the stockholders this week that, if the group continued to increase its business, the advance should be gradually reflected in disclosed profits—and, therefore, in dividends. If the present rise in primary commodity prices continues, that may prove a comfortably realised expectation. This expression of optimism strengthened the £1 units to 6½, at which level they yield a modest but very secure £3 17s. 9d. per cent. gross, with eventual prospect of more to come.

* * *

Suspension of Copper Restriction.—The abandonment, for the time being, of all restriction on copper production by the companies within the scheme, recognises quite frankly that no generous policy of releases can stem wildly rising prices when boom buying is in progress. For low-cost producers, such as the Rhodesian mines, a feverish rise of metal prices has its dangers, as well as its profits. As we show in a Note on page 111, the decision to free production has scarcely given the copper market a moment's pause. Copper shares, similarly, have been stronger on the news, for free production is a considerable bull point. If it is true that the Rhodesian companies had some 20 to 30 per cent. of capacity still in hand when they were producing 105 per cent. of standard quotas, it is evident that a tolerable fall in copper prices would not be inconsistent with a sharp increase in total profits. Such are the advantages of low-cost production. During this period of rapidly rising prices and advancing production, estimates of potential earnings are unlikely to be reliable. And this conclusion is reinforced by the probability that time will be needed before the producers can open the throttle fully. The prevailing high level of Rhodesian copper share prices, however, may yet be justified. It might be urged, perhaps, that Rhokana, which crossed the £14½ mark on Thursday, might conveniently be split into smaller denomination, for the market is not wide. For the six months to December, this concern estimates its net profit at £470,000, compared with £250,000 for the corresponding period of 1935. Nor should the incidental advantages of free production be ignored. The Beira Railway, whose debenture conversion was so successful this week, should gain in traffics, although the chairman has issued a warning regarding the expediency of raising the share dividend. For the Rhodesia and Mashonaland systems similar advantages to Rhodesia Railways Trust and to "Chartered"

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final dividend repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The yield on preference shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. A low yield may be due to a recent dividend distribution which is calculated on a "cum. div." basis.

SHORTER COMPANY COMMENTS

OTHER COMPANY RESULTS.—The full report of DE HAVILLAND AIRCRAFT shows profits of £132,185 against £115,257, but the earnings for the equity are lower, owing to a £22,000 increase in depreciation. Rubber companies continue to show uniform improvement, SEDENAK repeating the striking increase of 169 per cent. with profits of £23,894. Higher dividends by WILLIAM TIMPSON, LTD., JOHN LOVEYS AND COMPANY, and WEBER AND PHILLIPS are symptomatic of better conditions in the boot and shoe trade. Among investment trusts, GREAT NORTHERN INVESTMENT, whose profits are 3 per cent. higher, have raised their dividend from 3 per cent. to 5 per cent.; a similar rate of progress is shown by DEBENTURE CORPORATION, whose dividend, however, remains at 10 per cent. FANTI CONSOLIDATED INVESTMENT have earned some £46,000 more, at £109,808, but of this increase only £7,287 is due to higher interest and dividends.

ASSOCIATED PAPER MILLS profits are £46,564 against £30,711, the dividend from P. Garnett and Son being £12,500 higher. The gross earnings of INTERNATIONAL COMBUSTION show an increase of about £55,000 at £170,150, which combined with the saving of income tax provision (the existing reserve being adequate) permits the raising of the dividend from 20 per cent. to 30 per cent. MICHAEL NAIK AND GREENWICH have earned £281,740 against £252,088, but the increase includes adjustment for Dominion income tax relief, which appears to account for a dividend disbursement of £24,500 more, the same rate of 10 per cent. being payable on the same capital. A rise of no less than 28 per cent. is shown by the profits of UNITED TOBACCO (SOUTH), whose dividend (free of South African tax) of 40 per cent. compares with 30 per cent.

BANK AND DISCOUNT RESULTS

ALEXANDERS DISCOUNT COMPANY.—After rebate on bills not due, the net profit for 1936 is £205,519, compared with £333,764 for 1935. Balance sheets shows total assets, £31,473,929. Bills discounted and short-dated maturities stand at £15,705,114, an increase of £3,628,391 on the year. Investments in British and Indian Government securities are £534,481 higher at £13,439,281.

BANK OF THE MANHATTAN COMPANY.—The yearly statement at December 31, 1936, discloses total resources \$570,538,076, an increase of over \$22,000,000 on last year. During 1936 deposits increased by \$36,513,273 to a total of \$463,000,948, and loans by \$30,237,949 to \$155,897,531.

CLYDESDALE BANK, LTD.—Net profits for 1936, at £315,518, show an increase of £3,046. The 16 per cent. dividend absorbs £208,000. To reduction of bank buildings, £20,000. £35,000 is credited to super-annuation fund, and £50,000 to reserve surplus fund. Carry-forward increased from £102,405 to £104,923.

GLYN, MILLS AND COMPANY.—Total assets, December 31, 1936, £48,113,112, against £41,594,173 at end of 1935. Coin, bank notes and balance at Bank of England, £5,938,384, against £5,956,185. Bills discounted, £662,360, against £542,004. Advances, £7,750,649, against £10,014,218. Deposits, £41,039,208, against £38,200,591.

IMPERIAL BANK OF INDIA.—Net profits, half-year to December 31, Rs. 35,60,200. Brought forward, Rs. 29,35,400. Available, Rs. 64,95,600. Dividend, 12 per cent. per annum free of income tax, absorbs Rs. 33,75,000; to pension fund, Rs. 68,000; to premises account, Rs. 2,50,000; carried forward, Rs. 28,02,600.

LLOYDS BANK, LTD.—Net profit for 1936, £1,743,955, against £1,642,785 for 1935. Dividends, 12 per cent. on "A" shares, and 5 per cent. on "B" shares, as before, absorbing £1,369,922 against £1,392,380. To contingencies account, £250,000 as before. To bank premises account, £100,000, against nil. The amount carried forward is increased from £515,635 to £539,668.

MIDLAND BANK, LTD.—Net profits for 1936, £2,467,894, compared with £2,353,098 for 1935. Dividends, 16 per cent. as before, absorbing £1,738,257 against £1,766,753. To reduction of bank premises account, £350,000 against £300,000. To reserve for contingencies, £300,000, compared with £250,000. Carry-forward increased from £467,447 to £547,084. In 1935 a centenary bonus of 2 per cent. absorbed £220,844.

NATIONAL PROVINCIAL BANK, LTD.—Net profit for 1936, £1,770,173, compared with £1,665,437 for 1935. Dividends, 15 per cent., absorbing £1,421,912. To bank premises account, £100,000 as before. To pension fund, £200,000 against £100,000. Carry-forward increased from £922,406 to £970,667.

COMPANY MEETINGS

TURNER AND NEWALL, LIMITED

SATISFACTORY RESULTS—GOOD PROSPECTS

PROGRESS IN ALL COMPANY'S ACTIVITIES

MR SAMUEL TURNER'S ADDRESS

The annual general meeting of the members of Turner and Newall, Limited, was held, on Thursday, January 14th, at the Royal Station Hotel, York.

Mr Samuel Turner (Chairman of the company) presided. The Secretary, Mr John L. Collins, read the notice convening the meeting and the report of the auditors, Messrs Deloitte, Plender, Griffiths and Company.

After dealing with the accounts, the Chairman said:—As is my custom, I shall now give you such information about our business as I think may be of interest.

No doubt the most significant event of the year from your point of view is the issue of the additional shares to the ordinary stockholders on terms which, whilst advantageous to the company, have proved a source of great satisfaction to the stockholders. The issue has been a complete success from every point of view.

PURPOSES OF NEW ISSUE

The purposes for which we need the funds provided by this issue are, *inter alia*:—

(a) The opening up, development and equipment of the Havelock Asbestos Mine in Swaziland. This is a mine acquired by New Amianthus Mines, Limited, some years ago, and it is a proved property of great promise. The development of the property will necessitate our subscribing for additional shares in New Amianthus Mines, Limited.

(b) The acquisition of the balance of the shares and the bonds in the Keasbey and Mattison Company, which company has now been completely reorganised. The prospects here are excellent, but in order to implement our opportunities in this market we have to face substantial expenditure for additional buildings and plant. Subject to reasonable economic conditions prevailing in the United States, this undertaking will prove an asset of increasing value. As you may remember, an interest in this business was acquired at a time of great depression in the United States, and, in fact, at that time the Keasbey and Mattison Company was making heavy losses, but is now earning profits.

(c) We have decided to build and equip two additional factories in India, as our business in that country has grown at such a rate that the first works established there some time ago no longer suffices to meet the demand for our products. Our Indian company is now on a profit earning basis; during its early years it was a source of loss.

(d) The rapid increase in the demand for "Everite" asbestos cement pipes has made it necessary not only to double our output, but also to plan for a subsequent large increase.

(e) Further large extensions are now necessary at the Rochdale works of Turner Brothers Asbestos Company, Limited.

PENETRATION OF OVERSEAS MARKETS

These are the immediate requirements, but being engaged in a relatively new industry, we propose to continue the policy of penetrating overseas markets by establishing or acquiring works in them, as we have recently done with success in India and the United States. Such work, costly in its initial stages, steadily infuses new blood into our organisation and increases its chance of unbroken success in the future. Whilst your directors have actively exploited, in so far as they could with safety, each such opportunity in the past, they are aware of others of promise likely to come our way in the future.

Continuing the policy operated from the inception of our company, your directors have not been unmindful of the company, upon consideration due to the staff and employees of the company, whose work and loyalty so much has depended and will depend. They have established during the year a pension scheme for the benefit of the staff and employees, and decided to grant in future to the works employees their summer holiday with pay. In-cluding £10,000 allocated annually to the funds of Turner and Newall Welfare Trust, Limited, the cost of these changes will amount to about £50,000 a year, but your directors feel that a great company such as ours should march well with the times whenever possible in matters of this sort. We are fortunate, and

have always been fortunate, in having sympathetic relations with our staff and employees, and your directors feel that this is one of the company's best assets. In support of this good feeling, ever-increasing attention is being paid to maintain the very best working conditions from the point of view of comfort and hygiene in all new buildings, and in the extensions which are constantly being made to offices and works.

During the year, in all branches of our activity, we have been able to profit by the fact that we have been found ready to meet the increased volume of business as it has come to us. Our policy of continuing works development during the years of depression is the reason for our good fortune in this respect, and to-day our mines and factories have a greater output and are in a state of higher efficiency than ever.

SURVEY OF COMPANY'S ACTIVITIES

Now I will pass to a more detailed survey of our activities. In the raw material market our asbestos mines have benefited from an expansion in world demand for raw asbestos. This has enabled production to be increased and lower costs to be attained, but in Rhodesia and South Africa, owing to the great activity in gold mining, and consequent increased salaries of technical personnel, our savings in cost have been offset to some extent by additional expenses. I have already mentioned that it is now proposed to equip and operate the Havelock Mine. One of our smaller mining interests, the Amianthus Mine, is approaching the end of its life and will be closed at the end of 1937, but this has been known well in advance and the amortisation fund already established provides for this cessation of operations.

Our textile manufacturing companies, Turner Brothers Asbestos Company, Limited, and J. W. Roberts, Limited, continue in full activity. The goods they produce, i.e. asbestos yarn and cloth, asbestos and rubber packings, compressed asbestos fibre sheeting, transmission and conveyor belting, and allied goods, cover a wide range, and are supplied by us all over the world on a scale not attained by any other company. The market for such goods, which are bought and used by those engaged in the mechanic arts, has grown with rapidity of late and the prospects indicate a continuance of this growth.

DEMAND FOR FERODO PRODUCTS

Ferodo, Limited, our company specialising in the manufacture and sale of brake linings, has operated successfully in an active market. The growth of the demand for Ferodo products continues to tax our productive capacity to the utmost, despite the large extensions already completed.

Recent legislation has included the efficient braking of vehicles among the measures taken for greater safety on the roads. This will undoubtedly result in focusing considerable public attention on the matter, and it is the intention of Ferodo, Limited, to direct its advertising towards the stimulation of this interest. At the same time, the facilities offered by Ferodo, Limited, to those responsible for servicing the brakes of road vehicles will be developed and extended, and it is hoped that the excellent reputation which the Ferodo company enjoys in the motor trade will be increased by these additional service developments.

RECORD SALES OF QUASI-ARC COMPANY

The Quasi-Arc Company, Limited, has this year exceeded its previous records in the manufacture and sale of its world renowned electrodes and welding equipment. The extensions of that company's London factory have now been completed and are equipped with the latest automatic machinery for the production of electrodes.

British and foreign railway engineers have further developed, during the past year, the use of electric welding not only in bridge construction but also in the fabrication of locomotives and rolling stock.

Of all the industries which to-day use electric welding, ship-building has during the past year shown the greatest increase. I am glad to say that the Quasi-Arc Company has reaped the full

FANTI CONSOLIDATED INVESTMENT COMPANY, LIMITED

IMPROVED RESULTS

The ordinary general meeting of this company was held, on the 11th instant, at Southern House, London.

Sir Edmund Davis, the chairman, said that after deducting income tax there was a credit balance to be carried to the balance sheet of £109,808, against £64,175 at December 31, 1935, an increase of £45,633. With the balance of £68,449 brought forward there was a total of £178,257, against £142,024, an increase of £36,233.

The directors recommended the payment of a dividend of 15s. per share, plus a bonus of 3d. per share, which was equivalent to 15½ per cent., leaving £93,882 to be carried forward. Their investments were very well spread. In 1935 they had had 310 investments and in the present balance sheet they had 372 investments.

During the year the company underwrote an issue of £100,000 for additional working capital of the Kenya Consolidated Goldfields, Limited. As consideration they received an option over 400,000 of that company's shares of 2s. 6d. at par for twelve months, and a further option for a similar number of shares at par for eighteen months, of which their company's proportion was 13,500 shares of each option.

At their last ordinary general meeting he referred to the appreciation at December 31, 1935, which amounted to £97,325, and stated there would have been no difficulty, had the board so wished, to have increased the profit for the year then under review had some of the investments been realised and the appreciation actually turned into profit. Their investments stood in the accounts at December 31, 1936, at £696,209 on the basis of valuation at cost or market prices, whichever was the lower. To that they might add the appreciation above cost at December 31, 1936, namely £169,207, making a total of £865,506, which was the market valuation at that date.

If the resolution submitted that day was approved the average dividend paid over the last nineteen years, including bonuses, worked out at 10.57 per cent. per annum, which the directors felt sure would satisfy every member of the company.

The report and accounts were unanimously adopted.

RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED

DIFFICULT CONDITIONS

The fifty-first ordinary general meeting of this company was held, on the 12th instant, in London.

The Chairman, Mr S. C. Sheppard, said that the reserves now grouped together made a very good showing at £1,076,500 against the issued capital of £1,364,838, and outstanding debenture stock of £203,500.

To celebrate the fiftieth anniversary of the incorporation of the company the board had proposed to distribute a special Jubilee bonus of 8d. per share, less income tax. This bonus was being taken from the dividend received during the year from the English subsidiary, the Frumentum Steamship Company.

He expressed regret that the reduced profits, some £14,000 down, had obliged them to reduce the dividend to 8 per cent., but this was after placing £7,500 to debenture stock reserve and the carry forward was increased by £1,500. It had been a very difficult year from every point of view, for the Argentine crop had been relatively a failure, necessitating the purchase and shipments of wheat being controlled by a Governmental Grain Board, and the company had had to contend with lower rates of exchange for sterling and other remittances. The effect of this, together with the increased cost of raw material, had been so to increase the currency prices in Brazil as to undoubtedly check the consumption, to say nothing of creating an even more intense or cut-throat competition.

The recommended final dividend of 10.2d. per share, less income tax, making 8 per cent. less tax for the year, and the special Jubilee bonus of 8d. per share, less tax, were approved.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the nine days ended January 9, 1937, amounted to £31,736,000, against ordinary expenditure of £27,074,000. After allowing for an increase in Exchequer Balances of £541,614, the operations for the period, as shown below, decreased the gross National Debt by £3,882,000 to approximately £8,043 millions.†

THE BANK OF LONDON AND SOUTH AMERICA, LTD., has received telegraphic advice from the Valencia Branch that the gold surcharge for payment of Spanish customs duties has been fixed for the period January 11 to 141 at 142-81 per cent. The previous rate was fixed as from January 11 at 142-80 per cent.

South African, Central and South American and Australasian Exchange Rates appeared in the issue of January 2nd on pages 41 and 42. The Batavian Bank Rate was reduced on January 14th from 4 to 3 per cent., and the Albanian and Greek Bank Rates are now 6½ and 6 per cent. respectively. Other Overseas Bank Rates also appeared in the above issue.

GOLD AND SILVER

The following statistics of imports and exports of gold and silver for the week ended January 14, 1937, are issued by the Statistical Department of H.M. Customs and Excise.

Movement, April 29, 1925, to January 14, 1937 (inclusive) £154,566,724 in
Movement, September 21, 1931 (gold standard suspended) to January 14, 1937 (inclusive) £176,972,176 in

GOLD MARKET

Messrs. Samuel Montagu and Company write on January 13, 1937:—
The Bank of England gold reserve against notes amounted to £313,660,659 on January 6, 1937, showing no change as compared with December 30, 1936. Bar gold to the value of about £1,400,000 has been on offer in the market during the week. The prices arranged daily have shown a premium over the dollar parity, calculated on the exchange rate quoted at the time of fixing, but nevertheless the bulk of supplies has been taken for America. The s.s. "Comorin" which sailed from Bombay on January 9, 1937, carries gold to value of about £797,000.

SILVER MARKET

The past week opened with a recovery of ½d. to 21½d. for cash and 21½d. for forward, but prices subsequently sagged until 21½d. and 20½d. were quoted for the respective deliveries on January 9, 1937. A slight improvement registered on January 11, was lost on January 12, whilst on January 13, quotations are respectively ½d. and ½d. lower at 21d. for cash and 20½d. for forward.

Indian demand has fallen off, particularly during the latter half of the week, and there has been rather more inclination in that quarter to resell. China sales and some speculative resales have continued, whilst buying has included moderate demand on Continental account. The rather easier trend was probably in part induced by the publication of Press messages from Washington reporting that enthusiasm was lacking both in Congress and amongst officials of the Treasury for the retention of any part of the silver purchase policy other than the payment of the present special price of 77-57 cents for domestic newly-mined silver. Whether such enthusiasm exists in fact or not, it can by no means be assumed that responsible opinion is necessarily prepared to accept the idea of abandonment of the major portion of the silver policy with all that such action would imply. The undertone of the market appears to lack strength and falling a revival of Indian demand some further fall is not unlikely.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce fine
			Cash	Two Months	
Jan. 7	141 7	12 0-01	21½	21½	Jan. 6 45½
" 8	141 7	12 0-01	21½	21½	" 7 45½
" 9	141 6½	12 0-05	21½	21½	" 8 45½
" 11	141 8	11 11-92	21½	21½	" 9 45½
" 12	141 6½	12 0-05	21½	21½	" 11 45½
" 13	141 7	12 0-01	21½	21½	" 12 45½
Average	141 7	12 0-01	21-167	21-010	
Jan. 14	141 8	11 11-92	20½	20½	

The highest rate of exchange on New York recorded during period from January 7, 1937, to January 13, was \$4-91½ and the lowest \$4-90½.

Statistics for the month of December, 1936:—

	Bar Silver per oz. std.		Bar Gold per oz. fine
	Cash delivery	Two months' delivery	
Highest price	21½d.	21½d.	142s. 1d.
Lowest price	20½d.	20½d.	141s. 4d.
Average	21-2375d.	21-1875d.	141s. 8-28d.

† Free of income tax. (a) Paid on a capital of £2,750,000. (b) Paid on a capital of £1,250,000. (c) Equal to 90 per cent. on old capital. (d) Equal to 120 per cent. on old capital.

CITY OF SAO PAULO SIX PER CENT. GOLD BONDS 1908.—Bank of London and South America, Ltd., have received the funds for payment of 2½ per cent. of coupon due January 1, 1937.

THE MODDERFONTEIN DEEP LEVELS LIMITED.—First liquidation distribution 9d. per share has been declared payable to shareholders registered December 31, 1936.

THE LONDON MERCHANT BANK LIMITED.—Owing to the continuance of adverse conditions and the debit balance on profit and loss account, no dividend will be paid on "A" shares either for half-year to December 31st or on account of arrears.

CITY OF SAN PAULO IMPROVEMENTS.—This company will pay, on January 19th, one-half of the interest for the half-year ended February 29, 1936, on the 7½ per cent. first debenture stock. This interest carries additional interest of 2½ per cent. per annum, so that the distribution will be at the rate of £1 18s. 4d. per cent.

AMALGAMATED ANTHRACITE COLLIERIES, LTD.—No dividend will be paid on 7 per cent. preference shares due February 1st.

ERLANGERS, LTD.—Ordinary dividend, 4 per cent. as before. Balance sheet shows deposits £3,784,789 against £2,481,949, and advances £2,426,574 compared with £1,781,075.

HONG-KONG AND SHANGHAI BANKING.—Final dividend, £3 per \$125 share, making 5 10s. for year as before. Writing off bank premises account, \$1,000,000. Carry-forward, about \$3,340,000.

L. & J. WEBER AND PHILLIPS. Final dividend, 4½ per cent., making 8½ per cent. for year against 7½ per cent.

LOVEYS, JOHN, AND COMPANY. Dividend, 5 per cent. for 1936, compared with 3 per cent. for 1935.

SHORTER COMPANY COMMENTS

(Continued from page 136)

THE UNION DISCOUNT COMPANY OF LONDON, LTD.—Final dividend at the rate of 7½ per cent. per annum for half-year, 1936, and a bonus of 2½ per cent. £15,000 to staff provident fund (as last year). £250,000 is transferred to reserve. Dividend and bonus for the half-year to December 31, 1936, is equivalent to rate for the corresponding half-year, 1935, but requires an additional £10,000.

WILLIAMS DEACON'S BANK, LTD.—Dividend for half-year ended December 31, 1936, is at rate of 12½ per cent. per annum (less income tax) upon "A" and "B" shares. The net profits for 1936 (including contributions), £293,636, against £278,536 for 1935. The full year's dividend absorbs £234,375. To bank premises accounts, £30,000. Balance carried forward, £102,045 against £72,784 brought in.

APPOINTMENTS AND PERSONAL

Sir Frederick Pascoe Rutter has been re-elected chairman and Mr Philip E. B. Fooks, deputy-chairman of the Law Union and Rock Insurance Company, Ltd.

L. F. Callingham, M.A., LL.M., has resigned the chairmanship of Henekeys, Ltd., but will continue as a director. Mr C. S. Callingham, M.C., has been elected chairman, and will continue as managing director.

Lloyds Bank Limited announce the approaching retirement of Mr R. M. Rowley Morris from the management of their Pall Mall Branch. Mr T. E. R. Harris will succeed him as joint manager.

Mr Ernest E. Bird has been re-elected chairman of Legal and General Assurance Society for 1937 and the Hon W. B. L. Barrington re-elected vice-chairman.

Mr Malcolm Guy Hill, assistant manager, has been appointed deputy-general manager of Scottish Union and National Insurance.

Mr D. O. Beaton has been appointed special representative Cruise Department, Canadian Pacific Railway Company, London, succeeding Mr Wm. H. Powell, resigned.

National Provincial Bank, Ltd., announce that after 43 years' service, Mr Fred Waller, a joint general manager of the bank, will retire on January 31, 1937.

MISCELLANEOUS

LEYLAND MOTORS, LTD.—Profit, year to September 30, 1936, £463,012, against £364,887. Dividend, 20 per cent., compared with 17½ per cent. To reserve, £150,000, against £100,000. Carry-forward increased from £49,380 to £51,531.

UNITED TOBACCO COMPANIES (SOUTH), LTD.—Net profit year to September 30, 1936, £1,040,287, against £813,279. Ordinary and deferred dividends,

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

LAST week's pause in the upward movement of the wholesale prices of primary products was followed by a further, and fairly general, advance during the past few days. Moreover, several important developments again focussed attention on the commodity markets.

On Wednesday evening there came the announcement that the price of petrol was to be increased by a halfpenny to 1s. 6½d. per gallon, from January 14th, after having remained unchanged since May 1, 1935. On the same day the companies participating in the international copper restriction scheme made public their decision to suspend restriction forthwith, subject to the resumption of curtailment under certain (but undisclosed) conditions. This decision was due to the failure of the successive quota increases in stemming the upward rush of prices. During the past week, for example,

the price of standard copper rose by more than £5 per ton. The implications of this move are discussed in a Note of the Week. Thirdly, the terms of the revised tin control agreement, which was ratified on January 5th, and is to remain in force for five years, were announced at the end of last week. But as the market had been in possession of an outline of the new agreement, given in a Note of the Week, its publication had little effect on prices. Actually, quotations for tin are slightly higher on the week. The prices of lead and spelter continued their hectic upward movement, and rubber, after erratic movements, due partly to labour difficulties in the United States' automobile industry, was also dearer. Among textile materials, wool prices were again higher, and cotton was marked up a little.

Foodstuffs provided no headlines this week, but cocoa, raw sugar, tea and wheat continued to rise in price. Raw sugar,

(Continued on page 152)

THE VENEZUELAN OIL CONCESSIONS, LTD.—Production for the week ended January 9, 1937, was: Bolivar District, 194,135 barrels; Maracaibo District, 2,943 barrels; 197,078 barrels. The strike continues, and the general situation is unchanged.

THE KERN RIVER OILFIELDS OF CALIFORNIA, LTD.—The total production during December amounted to 141,285 barrels, or approximately 20,183 tons.

THE BRITISH BURMAH PETROLEUM COMPANY, LTD.—A cablegram has been received from Burma reporting the production of crude oil by this company for the month of December, 1936, as 37,361 barrels.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LTD.—Production for December, 1936, 125,066 barrels; deliveries for December, 1936, including purchased oil, 127,994 barrels; production for the week ended January 9, 1937, 26,744 barrels.

The Brookmire Forecaster for 1937

(Reprint of Last Year's—1936—Forecast)

1936—Progress to Accelerate

RECOVERY continues to be the keynote of the Brookmire Annual Forecast as another year begins. A review of 1935 is significant for 1936 chiefly because it reveals more conclusively a recovery pattern like those of the past which led to prosperity.

Confidence should continue to grow, in accordance with this pattern, thus replacing depression policies of retrenchment and liquidity with aggressive enterprise and forward planning.

Capital Expansion is thus initiated on a wide scale. Residential building in 1936 promises to experience a marked degree of revival, re-equipment of industry and transportation should gain further momentum, and plant construction should increase.

Business is expected to expand materially. Indicated gains are especially large in Construction and other Capital Goods industries. Many industries are likely to achieve new high records.

Election Influences usually do not alter the basic outlook when the economic tide rises strongly. While the Republican party is regaining some lost strength, present estimates indicate President Roosevelt's re-election. How Government policy (along with public sentiment) is likely to become more conservative, and Congress to become less unsettling, should the Bonus be paid, it would stimulate trade. Court decisions will probably be important in protecting constitutional rights, without necessitating serious readjustments.

Gold Bloc Devaluation, should it occur in 1936, as seems likely, would be a source of temporary unsettlement. But this may well be the development needed to induce world-wide co-operation with the United States in stabilizing currencies and reducing tariff barriers thereby enlarging international trade.

Financial Factors will play an increasing role in recovery. Refinancing should continue heavy, new financing is due to grow in volume, and mortgage money will probably flow freely into construction channels. Credit inflation is usually the ultimate result of plethoric money and all the billions of gold, large bank deposits, and unparalleled excess reserves possess enormous inflationary potentialities.

Commodity Prices are therefore likely to rise over a long period and ultimately reach much higher levels. In 1936, industrial materials should be stronger than agricultural products.

Bonds will probably remain at a high level for quite some time longer. Lower grades should be strengthened further by the improvement in earnings. Before the year is over, higher grades whose level is determined by rising interest rates may possibly ease slightly. Rising commodity prices will eventually become a depressing influence on bonds, but low money rates should remain a supporting influence.

Stocks should continue their main advance, but with increasing selectivity. However, after the marked rise in 1935, a reaction is logical to expect. It will probably come from higher levels, will likely occur in the first quarter of 1936, and may well be violent. Inflationary forces, plus prospects for increasing earnings, then point to resumption of the advance, carrying the Dow-Jones Industrial Average quite possibly to over 200 before the end of the year.

Acceleration of the Recovery is in prospect for 1936. The United States is likely to record the distinctly greater progress than the rest of the world. Existing Monetary Forces, added to the other potent Recovery Forces, foreshadow a marked Business Expansion and a much higher Price Level before this Cycle is completed.

Analyzes the Outlook for American Business and Investments

TO TAKE full advantage of developments as they occur, the investor must look, not to the past or even the present, but to the future. In the initial stages of recovery, improvement has been widespread and general; as the economic and business situation improves, other forces and factors complicate the outlook. Many questions face the investor in 1937... will the advance continue... along what specific lines... which industries are most favorably situated for investment... what about money and credit conditions? These are a few of the problems confronting him—problems far-reaching in their effects and important in making investment decisions.

How Brookmire Charted the Course of Business in 1936

Evidence of the notable accuracy of Brookmire forecasts in the past is seen in the reprint to the left. It is an exact reproduction of what Brookmire said for 1936. Read it carefully; in the light of what has actually happened since, it offers conclusive proof of the thoroughness and completeness with which pertinent factors are studied and analyzed by Brookmire. You will find the conclusions substantially borne out in practically every detail... further evidence of the soundness of Brookmire methods of analysis and recommendation.

The Past is History—What Will 1937 Bring?

In the 1937 Brookmire Forecaster the same Brookmire philosophy of investing, the same care in analyzing and evaluating underlying trends have been employed to present the outlook for the coming year. You can get the Brookmire Forecaster for 1937 with its definite, specific interpretation of the economic situation ahead—by sending us your name and address with \$1, or its equivalent. Accompanying the Forecaster are three other current Brookmire Bulletins which cover specific subjects in detail... including the Brookmire List of Approved Stocks... the situation on Trade Commodities... a projection of the trend of National Income... and a program of Industrial diversification for Investment Portfolios.

● Copies of the 1937 Brookmire Forecaster are now available. In making your request, please mention the *London Economist* and include \$1, or equivalent. To make sure of getting your copy at the earliest time possible—we suggest that you act promptly today.

BROOKMIRE
Corporation—Investment Counselors and
Administrative Economists—Founded 1904
551 Fifth Avenue, New York

Cable:
BROOKMIRE, NEW YORK

which closed the year practically at the same level as twelve months earlier, now seems to have been drawn into the whirlpool. The markets in meat and provisions were fairly quiet, quotations for eggs continuing their seasonal downward trend.

The concurrent rise of the prices of primary products in the United States shows that the movement is world-wide. Thus, Moody's index (December 31, 1931=100) rose to 209.6 on Wednesday against 207.1 a week earlier, 197.3 a month ago, and 168.6 on the same day last year.

COAL

SHEFFIELD.—Demand in most sections continues strong and quotations are firmer, both for industrial and domestic coal. The strike in South Yorkshire continues to affect supplies. The higher quota for January has given satisfaction, but output does not appear to have been sufficiently increased to offset the effects of the dispute. In consequence a certain amount of prompt export business could not be dealt with by shippers. There is a very heavy demand for furnace and foundry coke, while gas coke is almost unobtainable for domestic purposes, and nothing is being offered for shipping.

NEWCASTLE-ON-TYNE.—Inquiry for all classes of coal in this area is brisk. Prices are well maintained, for the chief concern of consumers is to obtain delivery. Northumberland steam coals are heavily booked, there being little surplus for prompt shipment. Good class screened coal is firm at 18s. 6d., with singles and doubles at 18s. 3d. per ton f.o.b. The position in Durham continues to improve, there being still a shortage of coking coal. Gas coal and bunkers are in steady demand. Patent oven coke remains firm under a brisk inland trade.

GLASGOW.—Although still affected by the influenza epidemic, the collieries are securing good outputs, which are being readily disposed of. The bulk of delivery is on contract account, only small quantities being available for new business. The home market is the principal outlet, industrial, utility and domestic needs being brisk; but the collieries are also well booked for some weeks ahead on export account. Shippers, however, complain that undue attention is being paid to inland business, where prices are more favourable. Nuts are notably firm all round, and navigation bunkers are also well sold ahead.

CARDIFF.—The improvement on the South Wales coal market is being well maintained. Shipments in the foreign and coastwise trades last week totalled 358,300 tons, compared with 308,222 tons in the corresponding week last year. As an unusually large quantity of spot and prompt tonnage is available, it is probable that this week's shipments will show a further increase. Prices are firm with a hardening tendency for all classes, and anthracite duff has reached the post-war record quotation of 11s. 6d. per ton. Coke is strong and patent fuel steady, while pitwood is firmer on an improved demand. The dock returns of the Great Western Railway Company for 1936 show that coal and coke shipments (foreign and coastwise) totalled 17.3 million tons, compared with 19.4 million tons in 1935, and patent fuel shipments 409,000 tons, against 590,000 tons.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that business has become less active since the new year, because works have been obliged to adopt a cautious policy owing to the crowded state of their order books. There has been no decline in demand, which appears inclined to expand, and the volume of export business on offer is beyond the industry's capacity.

Difficult conditions rule in the pig iron market and there seems little likelihood of the scarcity being relieved for some time to come. By a careful system of rationing, the works are endeavouring to meet the immediate requirements of consumers; but the latter are prepared in many cases to book larger quantities and further forward than producers consider prudent.

The situation in the semi-finished steel department is particularly difficult since no supplies of the qualities most in demand are available on the open market. Works have sold their output for several weeks to come and it appears difficult to obtain additional quantities from foreign sources.

The volume of business offered in finished steel is beyond the capacity of the works, although the latter are working at full pressure, and there seems little doubt that the current year's output will exceed that of 1936. Export business is difficult to arrange owing to the insatiable home demand, although a large inquiry has been received lately from most of the overseas markets.

SHEFFIELD.—The strength of the iron and steel market is fully maintained in all sections, with more business offering than can be accepted. The majority of sellers no longer promise early delivery. Pig iron makers are fully booked up for some months, and so heavy are deliveries under contract that the accumulation of any stocks at furnaces is out of the question. There is a shortage of foundry material and new business in basic pig iron is not easy to place. The addition of 7s. 6d. per ton in the price of this material has had no effect on demand. Forge requirements appear to be adequately met so far. Consumption of both East and West Coast hematite is heavy and supplies are distinctly short. Finished iron makers are experiencing more active conditions than for some time past. Common and marked bars are in good request, and crown bars are showing improvement. Continental competition is now hardly noticeable. The call for acid and basic steel billets continues to increase and in the case of basic iron, sellers are limiting their commitments. Wire rods, strip and stainless steel sheets business is at a high level. Structural steels are good. Iron and steel scrap prices are hardening. For heavy basic steel for melting 67s. 6d. per ton, delivered, is given as a seller's maximum.

Every available rolling mill in this area is fully employed. So insistent is the demand for all classes that steps are being taken still further to increase production.

MIDDLESBROUGH.—Buyers have no hesitation in paying the higher prices for pig iron announced before the end of 1936. Producers are well sold ahead, and, whilst demand continues to be exceptionally heavy, makers are doing their utmost to fulfil requirements. An additional blast furnace is expected to be started in this district next week, which may ease the stringency of the supply of foundry pig iron. There is very little iron available for prompt sale and control is exercised over deliveries in order to ensure that foundries receive supplies which will keep them covered. East Coast hematite is in strong demand by home consumers. Manufactured steel production is barely keeping pace with demand. Further orders could be placed for both semi-manufactured and finished steel, but makers are fully booked for deliveries within the near future.

The price of good Durham blast furnace coke is now 25s. 6d. per ton, delivered at the furnaces, whilst scrap is firmer and makers are now offering 62s. 6d. per ton, delivered at works.

GLASGOW.—A good start has been made at all the establishments in the West of Scotland. The amount of work on the books of Clyde shipbuilders far exceeds in tonnage the total launched in 1936. At several of the yards work on hand is sufficient to provide constant employment for well over twelve months. Marine engineering shops likewise are fully booked and are assured of regular employment for a long time to come. Steelmakers are working at capacity and are still finding it impossible to meet demand. The scarcity of supplies of practically every class is causing no little anxiety to the re-rolling industries, as supplies of Continental semis are not obtainable in quantities sufficient to meet requirements. Sheet makers are experiencing a greatly increased demand for both black and galvanised sheets and works in this district are unable to quote for early delivery. Prices all tend to advance.

CARDIFF.—A feature on the Swansea Metal Exchange on Tuesday was the more active demand for sheets, both for export and inland consumption. Tinplate works were well employed, and exports of tinplates last week totalled 8,887 tons compared with 4,199 tons the previous week, and 3,861 tons in the corresponding week last year. The steel furnaces continue to labour under the difficulty of an adequate supply of scrap, but they are operating at capacity. Prices for tinplates, galvanised sheets and steel bars are unaltered.

OTHER METALS

COPPER.—The past week was one of the most outstanding in the history of the industry. The cash price rose sharply and on Friday last exceeded £50 per ton for the first time since 1930. On Monday it jumped to £53 and on Wednesday to £54 5s., a gain of £5 7s. 6d. on the week. This outstanding rise, which was largely due to unusual speculative activity, induced the producers co-operating under the international scheme to remove all restrictions on production as from January 14. Arrangements have been made to resume control if necessary. The decision was quite in accordance with the policy of the scheme, which aims at stabilising copper prices at a reasonable level, in order to stimulate consumption. There is no reason to doubt that, in the long run, this week's action will have the desired effect. Its immediate effects should not, however, be over-estimated. Most producers are sold out for some time ahead, operators who have sold at much lower prices being now forced to cover; and available free supplies are largely held by firm speculators. For the time being, therefore, no sharp setback in the price of copper is to be expected.

In the United States the past week has also been an eventful one. In sympathy with London the U.S. domestic price was again raised, as from January 11th, from 12 cents to 12.50 cents per lb. Sales of copper in the United States amounted to 384,000 tons in the last quarter of 1936, compared with only 139,000 tons in the corresponding period of 1935. Here too, however, a great proportion of the sale has been speculative, so that the American position is no less artificial than that of London.

Sales on the London Metal Exchange: 7,750 tons on Monday, against 5,400 tons last week; 9,000 tons on Tuesday, against 2,600 tons last week; 6,750 tons on Wednesday, against 2,650 tons last week. Domestic spot was quoted at 12.80 cents per lb. in New York on Wednesday, against 11.67½ cents a week ago and 10.87½ cents a month ago. Wednesday's official closing price for standard cash in London was £54 5s. to £54 6s. 3d., compared with £48 17s. 6d. to £48 18s. 9d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 45,216 tons, showed a decrease of 121 tons, while stocks of rough copper, at 1,107 tons, were 350 tons larger.

TIN.—Tin was the only metal which experienced a quiet week. Nevertheless, Wednesday's closing prices, at £231 per ton for cash and £231 15s. for forward tin, showed gains of £2 5s. and £2 2s. respectively. The American strikes and the publication of the text of the new tin scheme were the main reasons for the relative quietness of the market, which was particularly impressed by the high quotas granted to Siam, French Indo-China, and the Belgian Congo, and by the fact that Siam and French Indo-China have also been allotted minimum export quotas (60 per cent. of their standards); the Belgian Congo has also received preferential treatment in regard to arrears of quota transfers from one year to another.

Sales of tin on the London Metal Exchange: 325 tons on Monday, against 275 tons last week; 225 tons on Tuesday, against 375 tons last week; 275 tons on Wednesday, against 275 tons last week. The New York quotation on Wednesday was 50.95 cents per lb., against 51.00 cents a week ago and 52.87½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £231 to £231 10s. per ton, compared with £228 15s. to £229 5s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,145 tons, a decrease of 53 tons on the week.

LEAD AND SELLER.—Both markets were very strong and quotations reached new high levels. During the week ended last Wednesday, spelter attracted particular attention and the price advanced continuously from £18 8s. 9d. to £22 15s. per ton. Turnovers were extremely high, particularly on Tuesday, when no less than 7,500 tons of spelter changed hands on the London Metal Exchange. The strong demand has certainly been largely speculative, although some substantial orders came in from genuine consumers. By the sharp rise in the price of spelter this week the difference between lead and spelter prices has been reduced to less than £6—a margin which, however, is still too high in view of the expanding consumption of spelter. In the lead position no new feature is to be recorded, the rise in the price of the metal being mainly due to the generally bullish sentiment of the market.

Sales of lead on the London Metal Exchange: 3,250 tons on Monday, against 3,050 tons last week; 3,750 tons on Tuesday, against 3,000 tons last week; 2,500 tons on Wednesday, against 2,350 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 5.50 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £28 11s. 3d. per ton, compared with £26 11s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 4,000 tons on Monday, against 2,550 tons last week; 7,500 tons on Tuesday, against 3,000 tons last week; 4,250 tons on Wednesday, against 2,750 tons last week. Wednesday's quotation in East St. Louis was 6.00 cents per lb., against 5.45 cents the week before and 5.35 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £22 15s. per ton, against £18 8s. 9d. last week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 5s. per flask of 76 lbs., the same as last week. Chinese

antimony was quoted at £64 to £65 per ton ex warehouse, as against £62 to £63 per ton last week. Chinese wolfram for "January-February" shipment was quoted at 32s. 6d. to 33s. 6d. per unit, c.i.f., the same as last week. Refined platinum was steady at £9 15s. per ounce.

TEXTILES

COTTON.—Manchester.—The general tone of the market has continued healthier. An encouraging business has again been done. Cloth sales have been rather larger than turnover in yarns. Numerous producers have tended to strengthen their position. Raw cotton prices have been slightly dearer. A feature of the demand in the Liverpool market has been the active buying of South American qualities. Consumption in the United States at the present time is of record dimensions.

American yarn quotations have been very firm, the tendency of prices being against buyers. A healthy business has been done, especially in ring beams. Egyptian qualities have been purchased rather irregularly. More business has been about in export numbers for India and the Continent.

There has been an expansion in cloth demand. A development of importance has been the larger sales for India. The bulk of the buying has been in bleaching styles, owing to merchants wanting to place orders before the higher charges for bleaching come into operation, but there has been a considerable turnover in printed and dyed fabrics. Steady buying has again occurred for Java and Egypt, especially in white goods. An demand has been experienced for South America and West Africa. Heavy goods have been bought for the Dominions. Rather more activity has shown itself in home trade cloths.

JUTE.—Dundee.—Business in jute cloth and yarns continues satisfactory, and both spinners and manufacturers are able to withstand all factory, and both spinners and manufacturers are able to withstand all attempts on the part of buyers to depress prices. Raw jute prices are being maintained around recent limits, and sellers are showing some reserve. Imports of jute into Calcutta this season have been heavier than usual for the first six months, but this is due to the increased demand from the Indian mills, which, as a result of the increase in working hours,

will use approximately 1,500,000 bales more than last season. Other countries have also purchased more jute this season. The statistical position in the jute industry, both as regards raw jute and goods, is strong, and there seems to be little fear of any decline in prices. The Indian Mills are still able to dispose of their additional output of Hessians and sackings, due mainly to improvement in demand from the United States, but the Argentine and Australia have also increased their purchases. In addition to competition from low-priced Calcutta manufacturers, Dundee spinners and manufacturers have now to face an advance of 4½ per cent. in wages recently granted by the Jute Trade Board, which, however, will probably be paid by the consumer.

Daisee-2/3 is still quoted at £19 per ton for the full group, and £19 10s. for good single marks, with fours from £17 10s., Tossa 2/3 from £19 15s., and fours from £18 17s. 6d., January-February. Good First Marks are named at £22 5s. and good Lightnings at £20 17s. 6d., while Hearts have been sold at £19 5s., January-February.

Jute yarns are experiencing a quiet steady business. Hessian descriptions are difficult to sell at 2s. 2d. for common 8 lb. cops and 2s. 3d. for 8 lb. spools, but twist is in good demand at 3½d. for 3 ply 8 lb., while Rove is very firm at £21 paid for 48 lb. and £16 15s. for 200 lb. Fine yarns are quiet but firm, and carpet yarns have been largely sold at 3½d. to 3¾d. for 14 lb. warp. Inquiry for jute cloth is good, and manufacturers are still asking 2½d. lowest for 10 oz. 40 in. and 2¾d. for 8 oz. They are still quite busy with orders on hand, and indeed find it difficult to give delivery owing to the curtailment of production due to influenza. Linoleum Hessians are quiet, but firm, while heavy goods remain in steady request. Calcutta goods have recently advanced in price to 17s. 7d. for 10 oz. 40 in., January, and 17s. 5d., February-June, with 8 oz. at 13s. 10d.

GRAIN MARKETS

WHEAT.—The market has been quietly steady, business being less active than of late. Meanwhile, reports of conditions in the United States winter wheat belt remain satisfactory.

On Wednesday last, "May" futures were quoted in Chicago at 135 cents per bushel, against 131½ cents the week before and 134½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 53s. per 496 lbs., against 52s. 6d. a week ago; No. 2 Northern Manitoba, ex ship, 52s., against 51s. 6d. a week ago. According to *The Corn Trade News*, total shipments of wheat and flour last week totalled 1,421,000 quarters, against 1,420,000 quarters in the previous week and 1,204,000 quarters in the corresponding week a year ago.

FLOUR.—The market remains steady. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 41s. per 280 lbs., against 41s. a week ago; delivered inner London, 40s. 6d., as compared with 40s. 6d. a week ago. Manitoba patents, ex store, 38s. 9d. to 40s. 3d., against 38s. 6d. to 40s. a week ago. Australian, ex store, 34s. to 34s. 3d., against 34s. to 34s. 3d. a week ago.

BARLEY.—Supplies of English barley for small and prices have advanced. Imported feeding descriptions have also risen in price. "May" futures were quoted at 88½ cents per bushel in Winnipeg on Wednesday, against 79½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, 34s. to 35s. as against 33s. to 35s. a week ago; "English malting," at farm, 36s. to 50s., against 36s. to 50s. last week. Californian (new), ex ship, 51s. to 60s., against 51s. to 60s. last week; Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 42s. to 45s. a week ago.

67, LOMBARD STREET, LONDON, E.C.3.

CHILD & CO., 1 Fleet Street, London, E.C.4, and Marygold House, Carfax, Oxford.

HOLT & CO., Kirkland House, Whitehall, London, S.W.1.

larger area is expected. The quantity of linseed afloat for Europe has increased to 155,500 tons (including 27,100 tons from India). Demand for linseed oil is fair, and prices of raw oil remain steady at around £28 per ton, naked, for January-April delivery, ex Hull.

Cottonseed is in rather improved demand at the lower levels. Black Egyptian afloat to Hull has been sold at £9 7s. 6d., and for shipment at £9 5s., but less would be accepted now. Cotton oil is in only moderate request for export. Oilcakes are in very good demand, and are firm.

RUBBER.—After again touching 11d. a lb., the spot price reacted slightly, but closed on Wednesday showing a further net gain on the week. Nearby rubber remains somewhat scarce, and United Kingdom stocks continue their gradual decline. Operators are consequently wondering what action, if any, the International Committee will take at its meeting on January 26th. Meanwhile, the strike situation in the United States continues to cause some anxiety. The spot price in New York on Wednesday was 21½ cents per lb., compared with 21¼ cents per lb. a week ago and 20½ cents a month ago. Wednesday's official buyers' price

for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10½d. on the corresponding day last week. In forward positions, business has been done at 10½d. for "February" shipment, as against 10d. to 10½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 76,501 tons, against 78,483 tons a week earlier. A year ago stocks amounted to 162,013 tons.

FURS.—The first silver fox auctions of the new year were held during the past week at Beaver House, Garlick Hill. The sale was well attended by British and Continental buyers—Paris being particularly well represented. Demand was good, and from 60 to 70 per cent. of the skins on offer were disposed of. Prices of high quality furs showed a gain of between 5 and 10 per cent., compared with end-December. Medium qualities were unchanged, while cheaper qualities were neglected and tended slightly easier. Meanwhile, interest in London is now concentrated on the general auctions, due to open at the end of the month. Since supplies of certain descriptions are rather scarce, and requirements are on the increase, the forthcoming sales are expected to be the best for several years.

WHOLESALE COMMODITY PRICES

The Boom and the Budget

THE attention of Parliament, which met again on Tuesday, will be largely concentrated for the next four months on problems of finance. The mysteries of Estimates, of Financial Resolutions, of Supply and of Ways and Means are not of great interest to the general public. But the whole financial policy of the State, of which they form the component parts, is of vital concern to every citizen. This year its importance is enhanced; for in more than one respect we stand at or near a major turning-point. The long period of industrial recovery is at a stage of maturity, and careful thought is already wisely being devoted to the aftermath of its inevitable end. Moreover, we are on the verge of enormous expenditures on re-armament which will gravely affect, if they do not unbalance, the Budget. The economic trend of the whole nation and, in the narrower sphere, the fiscal policy of the Treasury, are both threatened with reversal.

In the substantial body of discussion on economic policy which has recently been appearing, surprising unanimity has been reached on the essential points of the policy which ought to be pursued. The economists who took part in the recent symposium in *The Economist* showed only minor differences of emphasis, and Mr KEYNES in his recent articles in *The Times* has taken the same general line. They are all opposed to a deliberate increase in rates of interest. But if there is to be no deliberate contraction of credit, there is equally to be no further expansion; the fires of the boom are not to be fed by additional supplies of money.

Unfortunately, the practical application of this formula of moderating further expansion without raising interest rates is not quite as simple as might be thought.

Thus, the leading article in our Banking Section this week demonstrates that if the banks are to provide the increasing volume of advances demanded by expanding trade and industry, they must either secure additional cash reserves or else sell something like £100 millions of their gilt-edged investments. The latter alternative would mean higher interest rates, since in present circumstances the sale of so large an amount of securities could hardly fail to lower prices and raise the level of interest rates in the gilt-edged market. But the other alternative, an increase in cash reserves, implies a further increase in deposits, which are the main part of the public's supply of money. Bank deposits are already much higher than they have ever been before, although the general level of prices is still lower than it was at the turning-point of the last cycle in 1929. If this expansion is not carefully restrained, the upward tendency of prices may easily get out of hand and lead us into all the extravagances of a boom.

This, of course, is the normal dilemma of every period of expansion, and it could doubtless be surmounted by a practical compromise if it were not for the injection of a further disturbing factor. This is the Defence Loan, which was foreshadowed in the last Budget speech and is now believed in many quarters to be imminent. The most frequently mentioned figure is £150 millions. If a loan of this size has to be digested by the gilt-edged market, which has already shown signs of sagging, there can be no question of any sale of investments by the banks. On the contrary, the banks will probably have to assist in absorbing the loan if the new issue market is not to be drained by the needs of defence. Instead of

the banks' investments falling by, say, £50 millions to provide funds for an increase in advances, they will have to be increased. Deposits will go up by the amount both of the increased advances and also of the increased investments. In plain language, part of the money raised by the Government for purposes of re-armament will have been "created" by the banking system. The manoeuvre will be of a definitely inflationary character.

The probable consequences of a Defence Loan have only to be analysed in this way for it to be apparent that the issue of such a loan at this juncture would run directly counter to sound financial policy. The point may be sharpened by a contrast with the Public Works Loan which was urged on the Chancellor of the Exchequer some three or four years ago. A loan at that time would not have been inflationary, for there were idle savings. It could then have been used for works which would have enriched the nation, not for armaments. Nevertheless, the self-same Government and the self-same Chancellor who refused, in the name of orthodox finance, to raise a loan three years ago, when it was economically sound and could have been usefully employed, are now proposing deliberately to intensify the oscillations of the trade cycle in order to raise money for the sterile purposes of war.

These arguments against a Defence Loan have not hitherto been given the weight they deserve. Not that the case for a Defence Loan is otherwise impregnable; on the contrary, we stated at the time of the last Budget our opinion that on every count the loan is indefensible. It is never sound policy to borrow for unremunerative expenditures so long as it is physically possible to raise

money by taxation. It is myopic thinking to believe that the future can be made to bear the burden of present re-armament; guns and cruisers cannot by any means be borrowed from the future, and a loan merely complicates the Budgetary problem of the future without relieving the real burden of the present. Moreover, if there is a risk of war (and the whole defence programme assumes that there is), is it wise to face it with a Budget already heavily unbalanced?

On these general grounds we believe that a Defence Loan should be condemned at any stage of the trade cycle. In the conditions of to-day the argument is very much stronger. Indeed, there are positive virtues in increased taxation at a time when methods of controlling the boom are being sought. Nothing could be better calculated to restrain the excesses of speculative activities than increased taxation of the swollen incomes derived from the boom. Moreover, the pace of the boom is itself the best disproof of the hackneyed complaint that we are already taxed so heavily as to impede enterprise. If we could bear our present level of taxes in 1932, we can bear more to-day.

MR CHAMBERLAIN has not yet committed himself to a Defence Loan this year. Last April he deliberately left over for future decision how much of the non-recurrent cost of re-armament should be met out of taxation. The assumption that the whole of this cost is to be met in 1937-38 by borrowing has been read into his words by enthusiasts in the cause of armed profligacy. We trust he will take an early opportunity of stating that his next Budget, like its five predecessors, will be balanced without borrowing.

Mr Eden Hopes On

IN his speech to the reassembled Commons on Tuesday, MR EDEN stepped down from the academic heights of his discourse on Democracy last week. Once again he had to justify the Government's foreign policy; once again he set out its objectives. With most of MR EDEN's words in the House all Englishmen—and, as the foreign Press shows, public opinion in all Europe's democracies—would agree. Particularly is this true of his outspoken appeal to the rulers of Germany to choose, and choose quickly, between deliberate isolation from the European family of nations and equally deliberate co-operation in it. Whatever rebuffs such appeals may encounter—and the latest has received yet another from the German controlled Press—MR EDEN is right in saying, and saying again, that we desire economic collaboration with Germany, provided Germany herself is prepared to collaborate with all her neighbours in the great task of European political appeasement. That door must always be kept open for Germany, however often she herself bangs it to.

There remains, however, a sorry contrast between the lofty and unimpeachable sentiments, said by MR EDEN last week to inspire the Government's foreign policy, and the limping of that policy along the prosaic plains of practice.

The Foreign Secretary gave welcome reassurances over the Spanish zone in Morocco, "so far as concerns the alleged landing or preparations for landing of German troops"; he was not so reassuring over penetration of the zone by German-Italian "experts." And on Spain proper his speech was one long note of virtual apology for the Government's policy. It almost appeared as if the Government had banned volunteers for service in Spain by accident, as the outcome of academic research into the legal position. All MR EDEN could say to commend this singular gesture was that thereby we

did not throw away a "useful international lever in advance." The country will find it very difficult to accept this judgment in the light of the failure of other Powers to follow our good example in the matter of munitions and in the use of our ships. The French Government have found a more excellent way. They have legislated *ad hoc* on the volunteers question. The Act will become effective when, and only when, similar action is taken by the other countries concerned to ensure non-intervention.

The note of complacency in the Foreign Secretary's speech is to be explained by the Government's belief that the danger of a General European war arising out of Spain is now more remote. True, there is some basis for their belief in the growing realisation in Germany and Italy of the probable alignment of forces against them if they were to plunge Europe into war. It is every day becoming clearer that the economic forces against them would quickly become overwhelming; and in an economic race to-day Germany and Italy are severely handicapped. But this does not mean that they will not push on in Spain as far as they dare. Nor does it justify Governmental complacency over the issue of the Spanish conflict. This struggle may vitally affect the balance of European forces, which may shift to the grave disadvantage of the democracies if His Majesty's Government is content to see GENERAL FRANCO's minions conquer the Spanish people.

Unfortunately, MR EDEN's words suggest that this prospect does not unduly alarm him; for he seeks to comfort us with the thought that whatever may happen now, sooner or later the Spaniards will turn the foreigners out. Of all possible outcomes, he said, that which will see some foreign Power or Powers able to "dominate Spain for a generation . . . is the most unlikely." This may be so, but it is not the long view that guides the Fascist

Powers. MR EDEN admonished the dictators to remember the 24 million Spanish people. "In the long run," he said, "intervention . . . is bad politics." In a generation's time it may be. But when we see German or Italian Fascists consolidating their military grip on Spain, digging themselves in economically, and pouring men into the country, we cannot close our eyes to the fact that their prestige is more and more deeply engaged in the Peninsula. This means that with every month it will become more difficult for them to disengage themselves, or to allow their protégé to accept defeat or even compromise. Whatever may happen in thirty years' time, the German and Italian dictators are aiding and abetting GENERAL FRANCO now. If he wins with their aid, certainly for the next five years at least Spain will be run under German organisation, German advisers, German experts. It is what will happen in the next five years that will shape Europe's destinies in thirty years' time.

Consider for one moment the position which pre-war Germany carved out for herself in Turkey, without participating in any Turkish civil war. Turkey was run by Germans; the army was organised and officered by Germans; and, in less than a decade, Turkey was dragged into the last war on Germany's side—to her disadvantage and our acute discomfiture. Can we doubt that, whatever we may think will happen in thirty years' time, France's strategic position in Europe will become damaged, perhaps beyond repair, if Germany or Italy, or a combination of both, becomes established in Spain during the next few months or years. Such a situation is already well within the bounds of possibility. It is a prospect which, for the reasons that we gave in this place last week, cannot be viewed by any responsible British Government without the gravest misgivings for our national and Imperial security.

On this central, vital theme MR EDEN made two declarations. They may mean much or little, according as the Government is or is not prepared to implement them by deeds. First, the Foreign Secretary, replying to SIGNOR MUSSOLINI's assertion last week that Italy could not tolerate a "Red cell" anywhere on the Spanish

Mediterranean coastline, declared that the recent Anglo-Italian Pact contained "no word, no line, no comma," giving any foreign Power "a right to intervene in Spain, whatever the complexion of the Government in any part of the country." In other words, she is not entitled to intervene, and certainly not to intervene militarily, to suppress a possible autonomous Catalonia. Secondly, MR EDEN announced that it was Britain's interest to see that "the political independence and the territorial integrity of Spain shall be preserved."

Now this latter declaration is presumably to be taken as the Government's "Hindenburg line," on which it is ready to stand and fight. It has been warmly welcomed as such among the Continental democracies; and has earned praise for our Government. But as to the former declaration, which denies that we have admitted the right of any foreign Power to ban any shade of Government anywhere in Spain, are we to assume that this is a mere negation? Or is the Government prepared to prevent, by all the means at its command, any interference with Spain's affairs? Is it prepared to prevent such penetration of Spain and Spanish territory as we have described?

To these questions the Government still vouchsafe no answer. The public is left to draw its own conclusions from the course of events. In doing so, a significant index of the value of the Government's declarations will be its impression on the dictators and their reactions. HERR HITLER has not yet spoken. SIGNOR MUSSOLINI, however, in reply to MR EDEN's defence of democracy last week, said what he thought of democracies at the weekend. They were effete, "done for," "built on shifting sand," while dictatorships were "firm as granite." The dictators have listened to the British democratic Government's brave words. They have also looked upon the deeds that follow. By now they have some cause to believe that democracy talks big and acts small while dictatorships talk big and act bigger. It is now high time the British Government disabused them of any such notion. But that can only be accomplished by deeds, not words.

The Great Cities of Britain—I

The Story of Birmingham

TO-DAY, whatever associations the City of Birmingham may recall to the newspaper man, the actress or the engineer on oilfields abroad, it suggests to the average Englishman someone or something industrial. This habitual association, in fact, has had its own influence on the growth of the city in a world where industry generally goes where industry is.

Modern Birmingham is to a considerable extent a product of the last thirty years, and a surprising quantity of it is post-war, as the chart overleaf suggests. Especially since 1920, an increasing population and rising standards of life have produced new houses as striking in their numbers as the new people, whose Welsh or Northern accents may be overheard in the tramcars. Between 1920 and 1934, 67,308 houses were erected, private or municipal. Municipal building was responsible (by March 31, 1936) for 42,301 houses, at a capital expenditure of over £21 millions.

Many of the forces promoting Birmingham's present growth have been powerful over a long period. Materials are easily available; and the workers of the district are various and highly skilled. Further, enterprise is directed by a business community somewhat markedly habituated to the "change" of products, owing perhaps to a long and peculiar experience of the possibilities of metal. Birmingham is well placed for distribution in

Great Britain, including the growing industrial south. It has 3,000,000 consumers within thirty miles of the city centre. It operates an extreme range of industries, manufacturing composite products which require components and accessories. Thus, the city is a large market in itself. Like every other great industrial city, Birmingham takes in its own washing on a colossal scale. It was never as closely interested in overseas trade as some other areas of the country, and thus it escaped the post-war fate of the great exporting districts and gained by the tariff. Finally, its reputation for prosperity has brought further prosperity in the shape of new industries.

Out of Birmingham's original interest in metal, and its long pursuit of the many threads of joint demand and joint supply, has developed the city's present extraordinary range of industries. The older industries persist in the background—buttons, guns, edge tools, bedsteads, jewellery, steel pens—although they are usually much changed in technique and organisation. Hardware and hollow-ware still flourish, on a more standardised basis. The non-ferrous metal trades, after two centuries, regard themselves as merely on the fringe of knowledge of the properties of the materials with which they work. In particular, they produce a wide variety of alloys for the engineer. The engineers produce oil, gas and electric

engines. A characteristic Birmingham industry is the production of tubes, which may be adapted equally to a bedstead or a battleship's steam pipe. Birmingham also supplies the finest precision balances, huge lamps for lighthouses, and much else that need not be specified. But the transition from hardware to light engineering of the period 1880-1914 was the source of the largest of its present industries. These industries are so far from being new in the Midlands that already by 1914 the motor, tyre, cycle and electrical firms were among the leading Birmingham concerns. Their recent development has been very great. Birmingham is not a Detroit, but it carries some of the risks of a Detroit; a large number of its people now depend upon the motor industry in one form or another. The leading position in their respective trades of such works as the General Electric Company (at Witton), Cadbury and the big Birmingham breweries is well known. Birmingham has been fortunate in never having possessed a staple trade. We discuss the investment merits of the shares of some well-known enterprises in the Birmingham district on page 184 of this issue.

THE GROWTH OF BIRMINGHAM

The new elements introduced into the city's life by recent industrial growth will, doubtless, ultimately prove more far-reaching than the immediate prosperity they bring. The older Birmingham, by and large, was a city of small-scale works, little mechanical equipment and relatively low overheads. The small factory uses more machinery now than twenty, or ten, or even five years ago. The small manufacturer is still important. He is a force in the Chamber of Commerce. His products are examples of excellent workmanship, and the larger industries have frequently drawn on the managing ability and enterprise of the smaller units. But the big works are more truly representative of the newer Birmingham. They are constantly expanding, as Longbridge and Bournville daily show. They have considerable financial resources and highly specialised plant, employing sometimes from 7,000 to 12,000 persons, and their presence raises many interesting questions. Well-informed men have attributed Birmingham's past success, in part, to the existence of many medium-sized independent firms, who, in the face of changing demand, were able to swing over to new products. The same refuge is scarcely open to the big specialised plant. It may be that future difficulties on the marketing side

will tend to evoke increased resort to price and production agreements and to amalgamations. There are signs already that the tariff has stimulated the movement towards industrial combination. Nevertheless, Birmingham retains much of its faculty for painless transfer: a brass founder can still switch over to stainless steel, or a cinema become an enamelling shop, with an alacrity which would have pleased Ricardo.

In the last twelve months Birmingham's industrial life has been quickened in tempo, and even transfigured in many respects, by the imposition of direct or indirect rearmament contracts upon order books already filled by the general industrial recovery. Factories, both small and great, turning out the multifarious range of products for which the city is famous, are now partly engaged on armament work—in this shop 200 men will be turning components of shells, in that shop preparing parts of aeroplanes or tanks, or even gun-components. These two sources of demand have raised in an exceptionally acute form a series of problems which are presenting themselves in lesser degree in all the more prosperous areas of the country. Among them are shortages of labour, abolition of short-time, a great extension of overtime and the shift system, demands for higher wage-rates, delicate negotiations with jealous trade unions for a reduction of apprenticeship time, or for an expansion in the numbers of apprentices and trainees.

It is, however, not only employers who are faced with novel problems. The local authorities in their turn are, also, affected by the process of economic transformation. The "pulling power" of a big works in the matter, say, of municipal housing sites is obvious in Birmingham as elsewhere. But in its very Mecca (which is also the most conservative of English cities) municipal socialism is taking on new life, as it performs new duties. Birmingham's reputation for good government has in the past been based largely on the Corporation's trading undertakings in electricity, gas, tramways and water. But the present age demands what are called—rather unhappily—non-reproductive facilities: education, hospitals, maternity and child welfare centres, municipal buildings, parks, libraries and recreation grounds.

These events are the outward sign of a deep inward change. The "Birmingham tradition" during the last century, was based on the convictions and prejudices of the professional and manufacturing classes. They were black-coated, top-hatted, and service-going; they were proud, independent and understanding within their limits; at their best "as little likely to pick up a peerage as to drop an 'h'." The men and women of that period are still present to living memory; and their lives set the stamp upon a social tradition which embraced the artisan and the upper working class. But their tradition, tough as it was and is, is breaking down under the stress of a changed world.

Opinion in Birmingham, nevertheless, retains many native characteristics in the new age. It keeps uncommonly close, for example, to facts within its own experience. Birmingham is always inclined to say to a new theory: "Come to me again when you are a fact and I will begin to think about you." And this is no ill retort to many theories which never do return again, bringing their facts with them. But it is sometimes unhelpful in an age when theory and fact are less sharply differentiated than busy and confident men often suppose. Life in a great provincial city encourages a ready grasp of the everyday situations of practical life; it is a less favourable training-ground for the imagination whose exercise is essential to the solution of novel or complicated problems. How far is Birmingham aware of the benefits which will be harvested as the social tradition of the last century broadens and deepens, and as high culture, respect for ability, and public spirit are stripped of Time's old clothes?

Britain's Water Supplies

In a period of reviving industry we forget the measures for which we clamoured in depression. Similarly, during the last drought, public opinion was awakened to the problems of our water supply; to-day, with winter skies and full dykes, we ought not to forget the difficulties which still remain. The consumption of water per head in Britain is steadily increasing, with the wholly desirable raising of our standards of life; but, over a long period, rainfall remains constant. By what methods of conservation, distribution, administration and expenditure can these two facts best be reconciled?

Responsibility for the supply of water rests with a host of bodies, unequal in size and resources. Some 780 Local Authorities, 48 joint boards, and 173 companies, have statutory powers; while about 80 companies and over 1,000 private proprietors operate under no special Act. There is little uniformity of practice and scanty co-ordination.

Moreover, the administrative situation varies widely between urban and rural areas. In the cities, water undertakings are large, rateable value is high, and reservoirs are adequate for present needs. In rural areas there is a great number of separate undertakings; many places depend for their supply upon shallow wells; the administrative area is too small, and the cost falls upon too narrow a field. The consumption of water varies accordingly. Urban consumption is from 20 to 30 gallons per head per day, and rises in the 573 square miles of the Metropolitan Area to 36.5 gallons per head of the 8 millions of persons served. In rural areas, on the other hand, consumption falls as low as 15 to 20 gallons per head. These figures contrast unfavourably with the average daily consumption of 100 gallons per head in the United States of America. Other European countries also use more water per head than we do ourselves.

To these administrative discrepancies must be added the wide regional variations in British rainfall. The annual average varies from 100 inches in the Lake District, and 40 inches in the West, to 20 inches in the Eastern Counties. Nevertheless, the most marked feature of British rainfall is its unflinching constancy over a period of years—a fact which may serve as the basis of co-ordination and planning.

The authorities have for some time been alive to the need for further organisation. Particularly in times of drought, they have realised the administrative inadequacy and inefficiency of the unco-ordinated patchwork of supplying bodies. They have also appreciated, at such times, the sparsity of information about the water resources available. Measures for improvement have, therefore, been instituted from time to time.

In 1921 a Water Power Resources Committee was set up. A survey of inland water resources was attempted in 1924. In 1929 rural authorities were given increased borrowing facilities, and County Councils were empowered to make contributions to the cost of water services. A year later, the control of overground supplies of water was regularised by the Land Drainage Act, which set up Catchment Boards "to prevent flooding and to provide drainage." This was followed in 1934 by the latest and most drastic measure of reform. A further survey of inland supplies was inaugurated; an emergency grant of £1 million was authorised to assist relatively poor water authorities; and nine Regional Advisory Committees were set up "to increase and make permanent co-operation between water authorities in the use of sources and in distribution."

The major problems have thus been realised; but the steps which have been so far taken have been little more than palliatives. The provision of water supplies still rests in the last resort upon the initiative of local authorities, which may be small and poor, and of which there are too many to work properly together. The con-

sumption of water is still uneven over the whole country, and too low. The exact supply of water available is still unknown; and ignorance of underground supplies of water is supplemented by the uncontrolled and indiscriminate sinking of wells. Rural authorities are still deterred by the expensive capital cost of waterworks, despite the measures of 1929 and 1934. Too many are dependent upon unreliable shallow wells, liable to pollution. In these cases considerations of finance endanger the health of an important section of the population; the typhoid outbreaks of 1932 should serve as a warning.

Moreover, these problems are daily intensified by the shifting of population. This movement has taxed even the capacity of the Metropolitan Water Board, with its capital of £54 millions (March 31, 1936); and it has all but dislocated the supply of water in rural areas, which have recently become dormitories for large towns. It has been estimated that one residential dwelling, with garden and motor car, requires as much water as twelve cottages. And this "urban" demand comes in rural areas, where the population is scattered and the expense of the pipes system represents the principal cost of a permanent water supply.

Much, therefore, remains to be done. The problem is one of allocation and comprehensive control. The supply of water derived from rainfall is probably adequate for all likely needs; but full information must be available of the supplies from all sources. In particular, a comprehensive hydro-geographical survey is needed, with regular recording of underground water levels, and supervision of the sinking and use of wells.

It must also be made possible to distribute these supplies to satisfy all types of demand, uniformly and consistently. There ought to be a constantly satisfactory flow of piped water; and storage facilities should be as adequate in rural areas as in urban, to avert the ill consequences of shortage in times of prolonged drought. To these ends, administrative and financial reforms are necessary; the chaos of authorities must be ended; and the Treasury should be prepared, if necessary, to extend its system of financial guarantees to public utility borrowing for the supplying of water.

Some indication of the benefits of co-ordination on a large scale is given by the history of the Metropolitan Water Board. This Board came into existence in 1903, to serve London, in place of eight Metropolitan companies and two local authorities. It now serves some 20 per cent. of the entire population of Great Britain, and its development is illustrated by the following table:—

DEVELOPMENT OF METROPOLITAN WATER BOARD

	1904	1936
Capacity of storage reservoirs for unfiltered water (million gallons)	4,116	19,657
Capacity of reservoirs for filtered water (million gallons)	245	342
Area of filter beds	139	176
Number of primary filters	...	51
Number of mechanical filters	...	12
Horse power of pumps	32,177	56,640
Miles of water pipes	5,759	7,942

Some other British cities have approached the problem on broad lines, but much remains to be done in the rest of the country. Even in London, the question: "Water from Wales?" must almost certainly be asked again very soon. The elimination of waste, estimated at 25 per cent. per annum, is important; but far more urgent are the financial, administrative and technical reforms already outlined: the survey of sources; the co-ordination of authorities, over-riding local patriotism; the enlargement of areas of supply and responsibility; the spreading of the burden of cost; the elimination of pollution; the abandonment of technically unhealthy modes of supply, from suspect rivers and shallow wells; the storage of water against dry years; and the eradication of obstructive private interests. And the greatest of these desiderata is co-ordination. Resources and supply must be fully organised, in order that we may enjoy, with efficiency, economy, decency and good health, that great blessing of our climate—an adequate rainfall.

A Year of Rising Imports

THE recent trend of world production and international trade reveals the far-reaching repercussions on the world's trading relationships of changes in national economic policies. Some countries have sought self-sufficiency for strategic reasons; others have closed their gates to imports in an endeavour to solve the problem of domestic unemployment. Hence, while world industrial production (as measured by the German Institute for Business Research) has risen by 6 per cent. between 1929 and 1936, the volume of international trade last year, though it marked an increase of about 5 per cent. over 1935, was still about 14 per cent. below its pre-depression level. How has Britain's foreign trade fared in a year of rapid internal recovery?

The Board of Trade's figures (which we briefly summarised in a Note last week) show that domestic recovery, as always, has synchronised with a considerable expansion of imports, while the revival of exports has been distinctly sluggish. These tendencies are illustrated in the accompanying diagram, which shows the trend of the value of retained imports and of domestic exports since 1929. The excess of imports over exports, represented by the shaded area in the diagram, showed a substantial increase in 1936, when it was only £34 millions smaller than in 1929, despite the severe contraction in trade, and the imposition of a ramified system of tariffs and quotas in the meantime.

TREND OF RETAINED IMPORTS AND DOMESTIC EXPORTS
IMPORTS SHOWN BY THICK CONTINUOUS LINE

There are numerous explanations of the rapid rise in imports during 1936. The rising volume of industrial production absorbed increasing supplies of raw materials and semi-manufactured products. Moreover, home production of manufactures, such as certain kinds of machinery, required to be supplemented by purchases abroad, partly as a result of the exigencies of the armament programme. Finally, increasing national prosperity caused an increase in demand for foodstuffs and specialities in manufactures. Among manufactures, the increase in the value of imports was most marked in the case of certain products which are, in fact (though not in the Board of Trade returns), raw materials for industry—non-ferrous metals, machinery, oils, fats and resins, and iron and steel.

The effect of these changes is graphically set out in the next diagram and in a table on page 211. While the increase was by no means uniform, it embraced a large variety of products. A notable development was the

marked growth of purchases of metals and metal manufactures. Retained imports of iron ore and scrap rose from 4,984,000 tons in 1935 to 7,041,000 tons in 1936. And as domestic supplies of iron and steel could not keep pace with the growing home demand, imports of iron and steel advanced from 1,149,000 tons to 1,476,000 tons. Again, as the urgent need for certain types of machinery could not be satisfied by British manufacturers, purchases abroad rose from 69,000 tons to 101,000 tons. Some 20,000 tons of machine tools were purchased from abroad in 1936, compared with 8,000 tons in 1935 and 11,000 tons in 1929.

RETAINED IMPORTS BY CATEGORIES

How have Britain's exports been affected by domestic recovery and gradually improving world trade? Apart from the decline in coal shipments, due to the imposition of sanctions on Italy, two distinct and divergent tendencies were noticeable last year. First, there was a marked decline in the rate of increase of exports of certain commodities due to the inability of the industries manufacturing them to increase production sufficiently to meet the growing home and foreign demand. Exports of chemicals and non-ferrous metals and manufactures were actually lower last year than in 1935. The improvement in total sales abroad of iron and steel, implements and tools, electrical equipment and machinery was small, compared with that of the previous year. But other trades which were physically capable of satisfying an increased overseas demand benefited from the upward trend of international trade. Thus, manufacturers of cotton, wool and other textiles, and automobiles, substantially increased their foreign sales. Re-exports showed some improvement in 1936, partly as a result of the higher prices and of the greater world demand for primary products, some of which, like wool, are shipped to the United Kingdom before being distributed to other countries. A record of quantitative changes in the exports of important materials, and export values, appears on page 211.

What, briefly, are Britain's external trade prospects in 1937? The continuing rise in the prices of many important primary products is largely increasing the purchasing power of many overseas countries. World recovery may therefore be expected to make further headway this year. For Great Britain, however, there is at least one fly in the ointment. For, while British imports may be expected to continue their upward trend so long as internal business activity continues to expand, a number of our leading export trades, particularly the metal industries, may be physically unable to increase their foreign sales in proportion to the enlarged requirements of importing countries. On the other hand, a number of exporting industries, including the textile industry and coal-mining, should benefit substantially from the rising tide of international trade.

Bunkershölm Politics

By Our Correspondent in the Free City of Bunkershölm

A DRAMATIC series of events has caused extreme tension in the Free City. For centuries the inhabitants have been renowned for their love of violence. This instinct led them to give a warm welcome to the game of golf when it was introduced by a retired Scotsman not many years ago. Unfortunately, so rapid was the increase in players, and so furious their pursuit of the game, that the peaceful life of the City was rent by hatreds and rivalries. The situation was aggravated by the existence in Bunkershölm of numerous football, hockey and tennis clubs, whose members were treated by the golfers with egregious arrogance. In the consequent riots the golfers' steel-shafted weapons gave them an advantage.

Matters recently came to a head when the golfers took the decisive step of combining the Amateur Association, the Professionals' Union and the Caddies' Clump into a United Golfers' Front. It is rumoured that this step was facilitated by the use of lavish subsidies from a neighbouring Power, which in exchange received right of road across the Bunkershölm fairways. The formation of the Front at once gave the golfers a great superiority in numbers and organisation, enabling them to obtain command of the streets. They appeared everywhere clad in their uniform of "plus-fours" and leather jerkins, and soon fleshed their fangs by breaking up a meeting of Goalkeepers and Tennis Umpires, which had assembled in the Mariastrasse to make a joint protest. Two goalkeepers and three umpires were clubbed. The police did not dare to intervene.

The Front then issued a manifesto declaring its members to be above the law. Still more drastic action was taken next day. In view of the European situation, the Bunkershölm Senate had, shortly before, launched a recruiting campaign. To demonstrate its contempt of the Senate, the Front called a mass meeting and passed a resolution declaring the allegiance of its members to be due to the Golfers' Front, and to none other. It was at this meeting that Herr Sleisser, the Front Leader, delivered his famous "putters—not guns" speech. In this, he denounced the Senate's diversion of steel from golf clubs to armaments.

Usually well-informed observers predicted a setback for the Front when the municipal elections were held a fortnight ago. They reckoned, however, without the peculiar methods employed by the golfers. These dominated the polling booths with their brassies and exercised a virtual reign of terror. The Front also closed every course and nineteenth hole within its jurisdiction. It ordered all its members to vote at least twice, on pain of several strokes placed on their handicaps. By these questionable means the golfers obtained a majority. Though slender, it was sufficient for their purpose.

That purpose clearly emerged when the Golfers' Front began a systematic process of liquidating Opposition Parties. The Hockey Players were the first to go, on the ground that their clubs were a menace to public order. All their pitches were confiscated and converted into golf schools. A veritable tornado arose, in which there perished in rapid succession the Footballers, the Runners, the Rowing Club, the Fencers, and even the Darts Circle. Only the Tennis Federation remained standing.

The Tennis Federation was regarded as an arch-enemy by the Golfers' Front, which alleged that tennis-playing had a disastrous effect on golf and was therefore

a menace to every citizen of Bunkershölm. The Front was compelled, however, to proceed more cautiously against the Tennis Federation, since the latter had a very large and representative membership. It was even rumoured that the families of many prominent members of the Front were secret tennis addicts. Moreover, opinion among golfers was divided on the best policy to be adopted towards the Federation. More conservative elements favoured a compromise, while the radical wing clamoured for violence.

Matters remained in this uncertain state until yesterday, when the so-called "Excelsior incident" brought the crisis to a head. To commemorate its electoral victory the Front had caused a magnificent golf course to be constructed, the finest in Europe, which it named the Excelsior. The course was only completed last Tuesday, and a State opening had been fixed for yesterday morning, when, after the appropriate speeches, Herr Sleisser was to strike the baptismal ball. The uproar can be imagined, though not described, when it was discovered that during the preceding night the whole of the first tee, a superb piece of turf some twelve yards by seven, had been bodily removed, leaving a yawning chasm before the club-house.

The Commissars of the Golfers' Front met at once and issued a statement holding the Tennis Federation responsible. The Federation was accused of planning to incorporate the stolen property in a new tournament court. All its premises were immediately confiscated and its officers arrested. The latter are reported to have denied all knowledge of the crime and to have asked how it would have been possible for any of their members to penetrate the cordon of guards round the course. They are also reported to have aggravated their offence by saying that the missing turf would have been useless for tournament play. Death sentences are expected, though it is possible that some of the younger men will escape with long terms of penal servitude in a Caddies' Battalion. Rumour is current that Sir Samuel Hoare, as President of the English Lawn Tennis Association, has sent a cable to Herr Sleisser praying for clemency and offering to ban tennis in England until further notice. No reply has been vouchsafed.

Surprise has been expressed in uninformed quarters at the complete inability of the League Commissioner in the Free City to control the situation. The simple explanation is: he is no golfer. This, with his attendance at several tennis parties last summer, is quite enough to brand him in the eyes of the Golfers' Front, which has now passed from noisy obstruction to open defiance of the League. The latter is expressed by what is vulgarly termed "snook-cocking" parades. It is alleged that the Geneva organisation intends to replace the present High Commissioner by a Norwegian who is a scratch player. Such a step is likely only to exacerbate the tension; for if, as is possible, the new High Commissioner were challenged to a match by Herr Sleisser, and if, as is probable, the latter were defeated, there would be bloodshed in Bunkershölm.

Your Correspondent continues closely to observe the situation. This week he has had to burn all his white flannels; and he is now reading Padgham's *Advice to Beginners*. In view of exchange restrictions and the political situation in the Free City, he fears he will be compelled to receive a set of matched irons in part payment of his next month's salary.

Notes of the Week

More Steps to Freer Trade.—The recent speeches of the Prime Ministers of Holland and Sweden calling for freer trade have now been followed by further tentative moves in the same direction. This week both Mr Runciman and Sir Otto Niemeyer are visiting the United States. Sir Otto Niemeyer's visit is described as a private one, and he is actually travelling as a representative of the Council of Foreign Bondholders. Mr Runciman also remarked on arrival that he was on a holiday trip, though he proposed to pay a social call on President Roosevelt. It is not perhaps far-fetched to suppose, however, that over a purely social cup of tea the purely private conversation may spontaneously turn on such topics as Anglo-American trade, the Tripartite Monetary Agreement or even—in a hushed whisper—the war debts. Meanwhile, the French Government has appointed M. Georges Bonnet, whose economic and financial experience is great, to the French Embassy in Washington; and on Tuesday M. Bastid, the French Minister of Commerce, spoke to the Union of French Export Industries on the prospects of freeing trade. M. Bastid recalled the measures taken by the French Government to suppress import quotas at the time of the devaluation, and he specifically mentioned Mr Runciman's visit to the United States and Dr. Colijn's recent speech. Here are the strands of a movement which, as Sir Arthur Salter urged in *The Times* this week, might be concerted into a real attack by the democratic nations on the world's trade barriers. The formation of expanding low-tariff *blocs*, together with some modification of the most-favoured-nation clause, now seem the best methods of advance. And unquestionably the psychological moment has arrived.

The Livestock Bill.—The British Government's Livestock Bill, unfortunately, does not suggest that this country is in a mood to make real concessions in the cause of freer trade. Yet if Britain ought to make concessions anywhere, it is here. Beef is an important foodstuff that affects the cost of living, which is now rising. Beef is protected by a quota and not a tariff, so that protection could be sacrificed without loss of Budget revenue. The Government's Bill, however, is to crystallise the present "gentleman's agreement" quota by giving the Board of Trade compulsory powers to make restriction effective—both on foreign and Empire supplies. At the same time the Exchequer subsidy to the beef producers is to be raised to £5,000,000. The public can only comfort itself, on the prospect of this permanent dole, with the thought that, if the beef producers must be subsidised, it is best to do it at the expense of taxpayers as a whole rather than the relatively poor consumers of imported beef. Much less defensible is the levy on foreign beef imports, already voted by the House, which will reimburse the Treasury for part of the £5,000,000 subsidy to the home producer. Even the import levy, however, is a little better for the consumer than the remaining possible policy of forcing up prices by a quota alone. And as the Note on meat supplies on page 169 shows, beef supplies are being held at their present level rather than actually reduced by these devices; and prices have not yet risen greatly. The best part of the new Bill is that which provides for the reorganisation of marketing and slaughtering. Indeed, the Government can be warmly congratulated on placing in control an independent Commission and not the usual ring of producers. If this Commission uses its powers mainly to reduce costs and prices, it will do something to repair the reputation of the Government's agricultural policy.

The Dockyard Dismissals.—Public uneasiness over the recent dismissal of five men from Devonport and Sheerness Dockyards was on the whole increased rather than diminished by Sir Samuel Hoare's statement on

Tuesday. Sir Samuel stated that the men in question had been dismissed for "subversive activities," and not for their political opinions. Certain "highly-placed, responsible and experienced permanent officials," not restricted to the Admiralty, had investigated the case; but the men had not been informed of the charge against them, and they had not been heard in their own defence by the investigators. The Opposition were dissatisfied with this statement, and the Labour Party subsequently decided to put down a vote of censure. It is difficult for the public to form an opinion on the matter in the absence of further information. But many would like some assurance that the "subversive activities" mentioned by Sir Samuel Hoare consisted of definite attempts to interfere with the work of the dockyard and not merely the propagation of political opinions. More important still, there seems no reason why the men should not have been allowed to state their case—in secret of course—before a tribunal containing independent persons as well as Government servants. And might they not still be permitted to do so?

A New Left Front.—"United Front" appears to be the name which our extreme Left splinter parties assume when they want to emphasise the disunity existing between them and the Labour Party. The new alliance between the Socialist League, the Independent Labour Party and the Communist Party, approved by the Socialist League on Sunday in defiance of a Labour Party call for loyalty, accordingly describes itself as a United Front. The manifesto of the new Front calls for "unity in the struggle for immediate demands and the return of a Labour Government." Actually Sir Stafford Cripps only persuaded the Socialist League to adopt his policy by 56 votes to 38, with 23 abstentions. On the following day Professor H. J. Laski announced his adherence to the new body. It remains to be seen how many members of the Socialist League will resign, and how far the official Labour Party will go in taking disciplinary measures. If the members of the Socialist League are expelled from the Labour Party—as is almost certain—the Party will no doubt lose Sir Stafford Cripps' picturesque personality. But it will not lose much else; for the Socialist League has 3,000 members, and the Labour Party 420,000 individual and 2,000,000 affiliated members. Nor does the electoral record of the I.L.P. and the Communists suggest that the new Front has much future before it. In picturesque leaders it will, no doubt, be comparatively rich, with Sir Stafford Cripps, Mr Maxton and Mr Harry Pollitt. But in followers it seems likely to be poor.

Air Services for Britain.—The Committee under Brig.-General Sir Henry Maybury, appointed "to consider and report upon measures which might be adopted by His Majesty's Government or by local authorities for assisting in the promotion of civil aviation in the United Kingdom and their probable cost," presented its report (Cmd. 5351, 3s. 6d.) to the Air Minister on Wednesday. The report is a really valuable document; thorough, constructive and up to date. It considers that commercial air services inside this country have been restricted by four main factors: lack of adequately large aerodromes, lack of the necessary equipment for regular all-weather flying at such aerodromes as were used, the crucial problem of "access" to towns from aerodromes, which halves the average speed of every air journey between one centre and another in this country, and, lastly, the growing competition between existing air lines on the same journeys. To secure regular services the Committee propose the five-year experiment of a national air-junction between Manchester and Liverpool, from and to which all services would ply. This would cut

down operation mileage from 2,900 to 960 miles, and would involve only a slight delay in time. Thus, passengers from London to Bristol or Southampton would obtain frequent aircraft from London to Manchester and there connect with the equally frequent machines on the Bristol-Manchester arm of the star radiating from Manchester. In this way aircraft would serve six national districts and be kept loaded to an average degree of 68 per cent. Direct lines between cities connected through Manchester, or others, should only be maintained if traffic can cover costs. A single company, or a combination "working on the closest terms of co-operation," should be licensed to operate all services between the districts. The Committee does not recommend Government subsidies, except for carriage of mails; but they rightly recommend the Government to bear the costs of installation, maintenance and operation of wireless directional and night-flying apparatus, ultimately recoverable from registration fees. The capital cost is put at £320,000, and the extra annual cost at £200,000. Licences for other than the systematised routes should also be issued by one central licensing authority, but they need not be exclusive. The Committee observe that London will soon have seven aerodromes, approve the City Corporation's proposed purchase of the site near Ilford for a City aerodrome, and urge the need of a "standard" aerodrome north of London. They consider municipal authorities should bear all the cost of preparing their own aerodromes, since they will reap the benefit from them in traffic and fees. If these recommendations are soon carried out in broad outline, British civil aviation should be able to provide regular and safer air services.

Mr Roosevelt's Inauguration.—Nearly four years ago Mr Roosevelt's first inaugural address converted him in a few minutes from a hardly known and hardly trusted politician into a statesman of the first rank. Its boldness and decision, its promise of "Action, and action now!" ended the banking panic and started America off on that first sharp burst of rapid recovery. At his second inauguration on Wednesday of this week the state in which the American nation found itself provided little occasion for any similar drama. But the inaugural address was none the less as fine a piece of eloquence as could be desired. In form it showed Mr Roosevelt's gift for colourful, and yet colloquial, phraseology. In content it breathed the need for action almost as much as its predecessor. Those conservatives who have reconciled themselves to Mr Roosevelt's re-election by the belief that in his second term he would be as conservative as themselves, will find little in the address to strengthen their convictions; for it took no pains at all to be conciliatory. The President went out of his way to recall his much-criticised phrase of four years ago; he repeated the pledge "to drive from the

temple of our ancient faith those who had profaned it." Once more he challenged the "abuse of power by those who betray for profit the elementary decencies of life." There is clearly to be no pause in the campaign he has marked out for himself. He recognised the difficulty, in conditions of greater ease, of recapturing the original impetus. But he refused to be impeded by comfort, by opportunism or by timidity. Millions were still in want; millions still living "under conditions labelled indecent by a so-called polite society half a century ago." "I see one-third of the nation ill-housed, ill-clad and ill-nourished." But the picture was painted in hope, not in despair, for the nation would paint it out. "The test of our progress is not whether we add more to the abundance of those who have much; it is whether we provide enough for those who have too little."

Nor did the President avoid the problem of the means by which his ends are to be secured. Speaking in the presence of the Supreme Court, and recalling that 1937 is the 150th anniversary of the Constitution, he challenged by implication the whole interpretation of that document which is dear to many, if not most, Americans. The Constitution, he claimed, "did not make our democracy impotent"; it established "a strong Government with powers of united action." Democracy and freedom did not require the absence of power; they depended "upon lodging it with those whom the people can change or continue at stated intervals through an honest and free system of elections." The speech will serve as an inspiration far beyond the borders of the United States. The world can be grateful that it has at least one leader who speaks in accents of true Liberalism.

Strikes in America.—The American strike movement continues with full vigour. The shipping strike on the Pacific Coast has been in force since last October, although representatives of strikers and shipowners have at last agreed to confer. The struggle in the automobile industry, directed against General Motors, started in December. Stay-in strikes at strategic points have cut off the supply of essential parts, and of the 175,000 employees, the great majority are now out of work. Last week, negotiations, started by the Governor of Michigan, led to the announcement of a truce. Stay-in strikers were to be withdrawn, the company was not to try to reopen factories, or use strike breakers, and negotiations were to be opened between the company and the union. But before further progress had been made, the company declared its intention of negotiating also with non-union labour. Thus, it rejected, in the labour view, the first and fundamental union demand—the right of monopoly bargaining. The truce has been called off, and the fight continues to a finish, with violence growing on both sides.

The New York Trust Company

BANKING FACILITIES

100 BROADWAY, NEW YORK CITY

CABLE ADDRESS: NYTRUSTCO

EUROPEAN REPRESENTATIVE'S OFFICE: 8 KING WILLIAM STREET, LONDON, E.C.4

Member of the Federal Reserve System, the New York Clearing House Association and of the Federal Deposit Insurance Corporation

Although there has been some rioting at Flint, the conduct of the strike is generally in pleasant contrast to that of past large-scale labour disputes, which were more like civil wars. There are several reasons for this, the greatest being the fundamental change in public opinion, which is less inclined than ever before to tolerate industrial Bourbonism. Another factor has been the triumphant re-election of Mr Roosevelt, despite the efforts of Big Business to defeat him. At what point, and to what purpose the President will intervene, no one knows. After his inaugural address, it can hardly be doubted that his general sympathies are with the unions.

Signor Mussolini and Mr Attlee.—The momentous problem how to settle accounts between Democracy, Fascism and Communism was discussed last Sunday in a speech at Paris by Mr Attlee, and in an interview with Signor Mussolini published on the same day in the Nazi Party organ, the *Völkischer Beobachter*. Signor Mussolini made his own expectations clear. He looks forward to a Europe gone Fascist; and the reason for his optimism is his conviction that "the democracies are done for." As he sees them, "they are to-day, consciously or unconsciously, nothing more than centres of infection, carriers of bacilli, and handymen for Bolshevism." He evidently calculates that, on this account, the anti-Communist elements in democratic countries will find themselves compelled to turn Fascist and to throw themselves into the arms of the two Fascist Powers. This is the surprising interpretation which Signor Mussolini placed, in the interview, upon the new Anglo-Italian Mediterranean Pact. "It only strengthens the Berlin-Rome axis"; and "it is a logical extension of our efforts to secure the peace of Europe." The *status quo* which the Anglo-Italian agreement guarantees excludes, in his reading of the pact, the establishment of a Communist State in Spain or in any part of Spain. In other words, it leaves Italy and Germany still free to ensure Franco's victory and to prevent even a Catalan autonomous democratic State.

In Paris, Mr Attlee was more soberly engaged, not in boosting Democracy, but in pointing out the weaknesses which Democracy must overcome if it is not to be overwhelmed, with all its merits which the world can so ill afford to lose. Mr Attlee made three points: first, the democratic Powers must make material contributions to States less economically favoured, not by surrenders of territory, but by enlarging opportunities for trading in the vast commercial preserves of the world which they control. Secondly, they must preach tolerance. Thirdly, they must be as resolute and active as Fascism and Communism. "If we fear to take the necessary steps to save Democracy, Democracy will go down." This is surely the heart of the matter.

Germany's Kiel Canal.—Herr Hitler has scraped past the winter solstice on the strength of his denunciation of the inland waterways clauses of the Versailles Treaty on November 14th last. He has just taken a second bite at the same cherry in the hope that it may do instead of butter until the vernal equinox. He has issued a new regulation to govern the passage of foreign warships through the Kiel Canal. The Versailles Treaty provides that the Canal itself—though not the territorial waters at each end—shall be kept free and open to vessels of commerce and war of all nations at peace with Germany, on equal terms. The new German regulation lays down that warships and naval craft of foreign Powers may pass through the Canal only with authorisation, which must be obtained in good time beforehand through diplomatic channels. Under the much-maligned Versailles regime foreign Governments did not abandon the traditional diplomatic courtesies in applying for permission to send their warships through the Kiel Canal; and if the German Government were now to refuse permission, or only to grant it at the price of the

payment of prohibitively heavy differential dues, the foreign warships concerned could always take the alternative route between Denmark and Sweden, provided by Nature. So much for the use of the Canal in peace time. As for its use in war, the Treaty itself never stipulated that it should be open to the warships of countries at war with Germany—and indeed the Kiel Canal would be the last place in the world in which a Power at war with Germany would wish to hazard any warship it valued! The Versailles Treaty left Germany in possession of the whole of the territorial waters through which the Canal passes; and, ever since, warships have had to secure permission to pass into and through these waters. In a future war against a coalition between Russia and the Western Powers, Germany would be able, as she was able in 1914-18, to prevent her adversaries from communicating with one another *via* the Baltic. But, as the last war showed, this advantage would be important without being decisive.

Spain and Europe.—This week the rebel forces in Spain under the "radio General" Queipo de Llano have advanced from their base at Algeciras along the coast towards Málaga, while the militia in the latter city have occupied positions in the Sierra foothills flanking the communications along the coast. At Madrid, General Franco's attack on the Escorial road in the north-west has failed again; and in the south-east the Government forces have advanced to positions dominating the Getafe aerodrome. The road and railway from the capital to Valencia have been thus relieved of pressure; but Madrid itself is short of food and petrol supplies. The general situation has thus become even more one of stalemate. In Asturias, Navarre, and Catalonia, operations are at a standstill. The international front has also been less active this week. The London Non-intervention Committee on Monday resumed discussion of the Italo-German proposal of January 12th, to consider the imposition of an embargo on movements or disposal of any Spanish Government's gold deposited outside Spain. It is reported that the Chairman, the Earl of Plymouth, favoured examination of the proposal by the experts' sub-committee, but that the French, Czech, Russian and Swedish representatives objected to such action on the ground that it would be tantamount to intervention, of a particularly one-sided kind, in a matter touching the property of a Government friendly to all the Powers on the Committee save only the three Fascist States. Discussion of the Fascist proposal, surprisingly supported by Lord Plymouth, was therefore adjourned once more.

Anglo-Irish Discussions.—Much speculation was aroused by the talks in London between Mr Malcolm MacDonald and Mr de Valera at the end of last week. That the interview was more than formal was initially suggested by its duration; the Dominions Secretary, however, has since stated in the House of Commons that it was less than formal. His statement, incidentally, tended to correct the previous inspired denial that the conversations did not touch on constitutional or political relations between Great Britain and Ireland. The Government of the United Kingdom, he said, were ready to take any opportunity of reaching a satisfactory settlement of outstanding questions between the two countries. Mr de Valera has already declared his view that the partition of Ireland is the only such question of any importance remaining. At least a new economic and financial settlement now seems likely. The pact of last year (which was itself an enlargement of a previous compromise) freed a large section of the trade in Irish livestock and British coal and other manufactures from prohibitive duties. It is now to be extended for another year. To this pact is attributed the rise in our imports from the Free State from £12,500,000 in the first nine months of 1933 to £14,600,000 in the same period of 1936. and in our

exports to the Free State from £13,800,000 to £15,400,000 in the same interval. But there is still plenty of scope for the expansion of mutual trade by an agreed relaxation of the British duties that were imposed—with surprising financial success—in order to collect the defaulted land annuities, and a corresponding relaxation of the retaliatory duties in the Free State. The Government's fiscal loss would be made up in indirect ways, and would, in any case, be overborne by the political advantage it would bring.

Opinion in the Free State.—The attitude of responsible opinion in the Irish Free State towards a lasting Anglo-Irish settlement deserves serious consideration. Our Dublin correspondent summarises that opinion under four heads. First, the economic and political points of difference can be, and should be, separated; the economic dispute is capable of compromise and should be settled immediately, but the political one bristles with difficulties, and caution counsels delay. Secondly, the only person who can settle any of the disputes is Mr de Valera, since the Irish Opposition will endorse his settlement, whereas he will smash any settlement made by anybody else. Thirdly, the political problem is not now concerned with the status of the Irish Free State, since the "external association" solution has apparently been swallowed by Great Britain. Fourthly, the chief difficulties in the way of a settlement are the position of Northern Ireland, the naval bases at Queenstown, Berehaven and Lough Swilly. Now it cannot be sufficiently emphasised that no permanent peace between England and Ireland is possible while the *de jure* position of Northern Ireland remains unchanged. The major problem is thus the finding of a formula that will put the *de jure* position right in Mr de Valera's opinion, while leaving the *de facto* position unchanged. On the question of the naval bases some compromise is possible, and, as a matter of fact, many recent actions of the Free State Government (e.g. oil refineries at Dublin and the Shannon air base) are generally believed to be part of scheme of defence of the British Isles in war. This, however, would not be publicly admitted. All these matters are so difficult, especially that of Ulster, that it is hard to believe that they formed the subject of the de Valera-MacDonald talks. The problems pressing for a more immediate solution are the economic dispute and the Free State plans about the Coronation. The general feeling in Dublin on these matters is that the economic dispute should be settled without further delay, and that the Free State should play some part in the Coronation. A settlement of the wider issues would also be very popular; but it is realised that the Ulster difficulty is for the time being an insuperable obstacle and that more might be lost than gained by reopening issues which are temporarily insoluble.

Canada and the Commonwealth.—Piece by piece the story of the Dominion's part in the Abdication crisis is being fitted together. In the Canadian House of Commons, Mr Woodsworth, the Socialist leader, protested against the alleged unconstitutionality and secrecy of the Dominion Cabinet's behaviour. Mr Mackenzie King, moving a Bill to ratify Canada's assent to the Declaration of Abdication Act, thereupon revealed that he had directly advised his Majesty against the projected marriage with Mrs Simpson. On December 8th—the date of Mr Baldwin's last audience at Fort Belvedere—he had communicated with King Edward, through the Governor-General, expressing his Government's view that "the recognition by your Majesty of what, as King, is owing by you to the Throne and to your Majesty's subjects in all parts of the British Commonwealth should, regardless of whatever the personal sacrifice might be, be permitted to outweigh all other considerations." This, of course, must be regarded as an appeal, not as formal advice. Mr Bennett cordially supported the Prime Minister, but an important criticism came from Mr Cahan, who—taking the directly

opposite line to Mr Woodsworth's—deplored the insistence on formal Parliamentary sanction for executive decisions required under the Statute of Westminster.

Mr King was not yet able to give details of the Anglo-Canadian trade agreement, which was reported to have been reached in principle at the end of last week. It is understood in Ottawa, however, that in return for the continued guarantee of preferences and freedom of entry for the principal Canadian products in the United Kingdom market, Canada will lower her tariff on textiles (particularly woollens) and other United Kingdom exports. Still another Canadian announcement of Commonwealth importance has been Mr Dunning's Budget estimates for 1937-38. Ordinary expenditures, at \$410,465,000, are up some \$16,500,000, the greater part of which is accounted for by increases in the defence votes. The latter now total \$34,000,000, and approach the level of this year's defence appropriation in Australia. The air force is to be greatly expanded, and efforts will be made to have both 'planes and engines constructed in Canada. In these respects Canada is following the expressed policy of Australia and South Africa.

Elections in India.—This week the first provincial elections under the new Constitution began in India; they will not, however, be completed for another month. Interest and activity are reported to be intense throughout India, especially in the Congress party, which has hopes of winning in Madras, the Central Provinces, Bombay, and possibly one of the smaller provinces. The elections will be a test, not only of the new provincial constitutions and the new franchise, but also of the Communal Award of 1932. Great importance attaches, therefore, to the pact made between two prominent leaders of the Moslem and Hindu communities, respectively, in Bengal, Sir Halim Ghuznavi and the Maharajah of Burdwan. Its main points are that, although the present communal award in Bengal should stand, it should be subject to revision in ten years' time unless modified earlier by agreement; that the provincial Cabinet should always contain equal numbers of Hindus and Moslems; and that the public services should be recruited from the two communities in equal proportions, special terms being guaranteed for the smaller minorities—Europeans, Anglo-Indians and Christians. The Bengal Moslems are in a majority, which under the communal award is assured to them in the provincial legislature, as against the Hindus, but not as against all non-Moslem elements combined; and there appear to be dangers of deadlock if the party and ministerial forma-

tions follow purely communal lines. This gives special value to the Ghuznavi-Burdwan pact, which is said to be influentially supported in the two communities. In Bengal and elsewhere much may depend on the attitude of the representatives of the depressed classes, who may even—if they can find their Parnells—play the part of an Irish party holding the balance between two larger camps. Mr Gandhi's efforts to commit candidates for the legislatures to one side or the other in the campaign against untouchability reflect the tactical position in which the depressed classes find themselves.

Arabs and the Mandate.—The Royal Commission on Palestine took its last evidence this week, and is sailing for England at the week-end. Our fear that the Arab leaders' statement of their case might be extreme rather than persuasive seems, unfortunately, to have been borne out. Their grievances against the Mandate's administration have been almost swallowed up by their denunciation of the Mandate itself—which the Commission, under its terms of reference, cannot call in question. The Arabs have taken their stand unwaveringly on their claim for self-government for Palestine, which they assert was promised them by Great Britain during the war; otherwise (so they declared in evidence) they would have preferred to remain under Turkish rule. Auni Bey Abdul Hadi told the Commission that the Arabs had always been ready for a compromise with the Jews, and that, while stoutly opposed to any recognition of Zionism, they were prepared to sit down with the Jews and recognise their rights as a minority in the country. The realities of the problem of Arab economic inferiority were exposed by such pieces of evidence as Fuad Effendi's Saba's attack on the protective tariff, which furthered Jewish industry at the expense of the poor Arab agriculturist, and his demand for an income tax. The conflict in Palestine is grave enough without its being reinforced by clashes of fiscal interest comparable with the income-tax controversy in Kenya or the tariff controversy in Western Australia.

Losses in the Film Industry.—We find it hard to believe, as headlines in the popular Press during recent weeks have suggested, that joint-stock banks, insurance companies and groups of Lloyd's underwriters have abandoned their traditional caution and lost "millions," in the past year or two, in their dealings with film production companies. So far as is known, the banks have advanced no money for this kind of business except against a Lloyd's guarantee. The underwriters accepting these lines have limited their policies to amounts which, under the terms of contracts between the producer and a recognised distributor, will be paid when the film is delivered. Losses, however, there have undoubtedly been. How have they arisen? The explanation is to be found in the highly complex character of the film business. Every picture is necessarily so different from the last that costing is well-nigh impossible. If the budget for any picture is exceeded, the entire financial basis is upset. The distributor's guarantee is not operative until the picture is completed and delivered. Additional finance therefore becomes necessary for a picture whose intrinsic value has not increased. There are extreme cases reported where a picture budgeted to cost £80,000 has not left the studio until over £130,000 has been spent. Some of the difference has been provided by the immediate associates of the producing company; but in certain instances the underwriters have been compelled

to help the picture to completion. In many of these, money has undoubtedly been lost; but the underwriters' representatives have now gained sufficient experience to enable them in future to impose such conditions at the outset as will reduce risks of this kind to a minimum.

Another difficulty has been the failure of the distributor to realise the gross return on the picture, on which the producer based his venture in the first instance. Sometimes this has been due to the failure of the picture to appeal to the public. At other times, however, the blame has been put on the distributor, who may have merged the returns on a specified picture with those of a number of others in which the owners of the first picture are not financially interested. This again, appears to be a matter which will be ultimately adjusted by modification in the terms of future distribution contracts. It seems reasonable to assume that, in the long run, pictures will be made and completed at such a cost, and distributed on such terms, as will provide for all interested parties a reasonable participation in the resulting profits. We cannot believe that Mr Maxwell and Mr Ostrer have spoken the last word when they say that British pictures cannot be made at a profit. They, as owners of large circuits of prosperous theatres, are at liberty to credit any price they please to any particular pictures they are exploiting. Similarly, we should not be surprised to learn that large insurance interests, who are said to have lost part of their considerable investment in the film business in the last two years, have found compensatory returns in other directions.

Recovery in Coal.—The British coal industry is gradually making headway against the depression. Despite a further decline in exports and shipments for the use of steamers, production continued to expand last year owing to a marked improvement in home demand. As output rose by 5.6 million tons, while shipments fell by 4.8 million tons, home consumption has increased by more than 10 million tons between 1935 and 1936:—

BRITISH PRODUCTION AND EXPORTS OF COAL
(In millions of tons)

	Output of Coal	Exports	Shipments for the use of Steamers
1929	257.9	60.3	16.4
1933	207.1	39.1	13.5
1935	222.9	38.7	12.5
1936	228.5	34.5	11.9

Actually, home consumption of coal in 1936 was slightly above the pre-depression level and may be expected to show a further increase during the current year. There are signs, moreover, that the downward trend of exports has at last been arrested; for world demand for coal is increasing. Exports in December, for example, showed an improvement over those of the corresponding month in 1935, mainly as a result of heavier French purchases. The improvement in coal-mining, however, cannot be measured in terms of output alone; for owing to the increased efficiency attained by mechanisation, the current level of profits in the industry is considerably higher than in 1929.

Redundant Cotton Spindles.—The Spindles Board set up under the Cotton Spinning Industry Act, 1936, has published the results of its recent census of spindles. The total number of cotton-spinning spindles in Great Britain on September 14, 1936, was 40,501,414, of which 29,459,379 were mule spindles and 11,042,035 ring spindles. Yarns spun from American and Egyptian type cotton represented about 75 per cent. and 25 per cent., respectively, of total output. During the six months ended September 14, 1936, the spinning industry was operating at about 77 per cent. of capacity. The average number of hours worked per spindle was 883. A mill working full time during the six months would

have run approximately 1,152 hours, after allowing for holidays. During the half-year, 6.2 million mule equivalent spindles were completely idle. The total unused capacity of the industry during the six months, on the basis of mule equivalent spindles, was: completely closed mills, 4,000,000; completely stopped spindles in running mills, 2,200,000; and spindle hours unused on running spindles, 4,200,000, making a total of 10,400,000 spindles, or 23 per cent. of the total. It is pointed out that in 1934 the Colwyn Committee estimated that early in that year the industry contained 13,500,000 mule equivalent spindles more than were needed for full-time working.

During the last two and a half years, the unused capacity of the industry has been reduced by about 3,000,000 mule equivalent spindles. During the same period the number of spindles has fallen by about 6,000,000. It is known that a few mills have been bought by the Spindles Board, but owing to the improvement in business fewer spindles will now be offered at current prices, and the Board will probably have to pay more if they are to continue the process of elimination of redundant spindles.

London's Meat Supplies.—The Central Markets at Smithfield are the largest meat market in the world. They cover an area of about ten acres and handle produce to the value of over £35 millions annually. Though Smithfield serves a growing population, the volume of produce sold in the Central Markets last year was 1.6 per cent. smaller than in 1935. Supplies compare as follows:—

VOLUME OF SUPPLIES (in Tons)

	1935	1936
Beef and veal	248,269	248,738
Mutton and lamb	142,846	134,927
Pork and bacon	50,273	50,088
Poultry and game	23,312	23,169
Miscellaneous	12,077	12,320
Total	476,777	469,242

A sharp drop in sales of mutton and lamb was the most notable feature of the year. The percentage of supplies produced within the Empire fell from 58.1 to 57.8 in 1936, mainly owing to smaller Dominions entries.

SOURCES OF SUPPLIES (in Tons)

	1935	1936
British and Irish	133,498	132,794
Dominions	143,515	138,260
Foreign	199,764	198,188

Prices, as usual, fluctuated considerably. The price of beef, on the whole, showed little change from the 1935 average, but frozen mutton was generally dearer, and English mutton recovered after declining during 1935.

End of the Wheat Subsidy?—The steady advance of wheat prices has given rise to the rumour that the Wheat Commission will shortly suspend the "quota payments" on flour. Although the Commission has refused to authorise a statement, it is evident that action cannot be long delayed. The Wheat Act set up an ingenious system whereby the British wheat growers were guaranteed a standard price of 10s. a cwt.; provided that if total home production of millable wheat exceeded 27 million cwt. in any year the subsidy would be proportionately reduced. The funds required to make up the difference between the market price and the standard price are provided by a levy paid by the flour millers and importers. The "Gazette" average price of British wheat has risen this week to 9s. 11d. a cwt., and it is thus clear that the wheat subsidy must shortly disappear altogether. Hence the flour levy—which has been as high as 4s. 6d. per 280-lb. sack, and is now 1s.

per sack—must disappear also. Its early removal is the more likely since the Wheat Commission is reported to have a balance of over £1,000,000 in the "wheat fund" at the Bank of England. The price of flour is a direct determinant of the price of bread; and it is thus highly satisfactory that this subsidy, above all others, should automatically disappear with the passing of the circumstances which called it into being.

International Tube Agreement.—Representatives of the tube makers of eight countries, including Great Britain, succeeded, last week, after prolonged negotiations, in concluding a gentleman's agreement on minimum export sales prices. After nearly two years of cut-throat competition, the new understanding has won the support even of the German tube producers, who are enjoying manifold direct and indirect subsidies, and are not prepared to sacrifice their immense gains on the export markets. It is doubtful, however, whether a price agreement will be sufficient completely to stop competition. The former cartel, which came to an end in March, 1935, provided for co-operation within a far wider range than the present pact. And there are many forms of competition besides price cutting. The British tube industry, largely represented by Stewarts and Lloyds, has long been prepared for a renewal of international co-operation. Its organisation postulates a large home and export turnover, and though home demand has greatly increased, the company is still exporting not much less than one-half of its total output. Since the erection of the Corby plant, however, production costs have been considerably reduced; and British participation in the cartel is consequently in a much stronger tactical position than before.

Devaluation and Tourist Traffic.—The foreign tourist traffic, which is of such great economic importance to the Alpine countries, has been markedly affected this winter by the various devaluations of three months ago. Though detailed figures are not yet available, it is certain that the winter sports season as a whole has been good. France has benefited somewhat from an increase in transit traffic, and Switzerland has gained substantially at the expense of Austria. Swiss prices had already been cut in the deflation period; and the further reduction implied in devaluation consequently attracted to Switzerland many of the English tourists who had gone to Austria in the previous two years, when the schilling was depreciated and the Swiss franc still at par. At the same time, the devaluation of the Czech crown has diminished the number of Czechs going to Austria; and the German-Austrian agreement of last July has not yet been followed—owing to exchange difficulties—by any marked increase in the number of Germans going to Austria. Though Austria still remains popular with English tourists, therefore, there can be no doubt that the Austrian resorts must suffer from the loss of the currency advantage which they held in the last two years. One may hope that this loss will soon be made up by the steady growth, now apparent, in the traffic as a whole.

The NATIONAL BANK of NEW ZEALAND, Limited

Head Office:—8 MOORGATE, E.C.2

Subscribed Capital - £6,000,000

Paid-up Capital - £2,000,000

Reserve Fund - £1,000,000

Currency Reserve - £500,000

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

World Industrial Production.—During the past year industrial activity continued to expand in most countries of the world. Indeed, the volume of industrial production in 1936 in the world as a whole actually exceeded the pre-depression level by about 6 per cent. But, as the world's population has increased during the past seven years, industrial production per head in 1936, as estimated by the German Institute for Business Research, was still somewhat smaller than in 1929. The following figures show the economic progress of the world since 1913:—

WORLD'S POPULATION AND INDUSTRIAL PRODUCTION (1913=100)			
	Population (a)	Industrial Production	Production per head
1929	109	147	135
1936	118	156	132
(a) Estimates.			

But while industrial production in the world as a whole has made considerable headway since the depression, recovery has been very uneven, and a number of countries have so far gained little ground. Thus, the volume of industrial production in Holland, France, Poland, Belgium, Czechoslovakia, Austria, the United States and Canada was still well below the pre-depression level during the past year. Countries whose industrial output in 1936 was more than 30 per cent. above the level of 1929 include, in order of progress, Japan, South Africa, Sweden, Greece, Finland, Hungary, and Roumania. Industrial production has shown an increase up to 30 per cent. between 1929 and 1936 in Denmark, Estonia, British India, Australia, the United Kingdom, Norway, Chile and Germany. In view of the rise in the prices of primary products and the devaluation of the gold *bloc*, progress in 1937 may be less uneven.

* * *

International Balances of Payments.—Not the least valuable of the economic publications issued by the League of Nations is the annual volume on Balances of Payments. The issue referring to 1935 has now appeared.* The main body of the volume is taken up with summaries of the official estimates of the Balances of Payments of no fewer than 28 countries, many of whom have been stimulated to make these estimates by the enterprise of the League's Secretariat. The most interesting part of the volume, however, is the Introductory Chapter, in which all the estimates are reduced to the common (though mythical) basis of the "old gold dollar." The chapter contains also a number of comments on the general trends of international financial transactions. Figures are given, for example, of the net balances on current account of the three great creditor countries, Great Britain, the United States and France. The resulting totals are shown below:—

(Millions of "old gold dollars")				
	Net balance on account of goods	Net receipts from interest and dividends	Net receipts from other services	Total
1927	- 1,593	+ 1,823	+ 890	+ 1,120
1928	- 1,258	+ 1,867	+ 896	+ 1,505
1929	- 1,931	+ 1,967	+ 833	+ 869
1930	- 2,008	+ 1,859	+ 719	+ 570
1931	- 2,343	+ 1,432	+ 415	- 496
1932	- 1,294	+ 959	+ 9	- 326
1933	- 1,107	+ 907	+ 292	+ 92
1934	- 895	+ 843	+ 304	+ 252
1935	- 951	+ 916	+ 211	+ 176

The figures deserve close examination, for they are typical of the attempt made this year, by the compilers of the work, to illustrate changes in the relations between creditor and debtor countries during the last few years, stripped of the confusing effects of purely capital movements of funds, inspired by political or financial fears.

* * *

The usefulness of the figures, however, is limited in many ways. First, they are expressed in a currency which no longer has any existence; and the mere arithmetical fact of conversion from real currencies to a

* "Balances of Payments, 1935." Allen and Unwin. 6s.

mythical one, of much higher supposed value, automatically reduces the size of the figures. Secondly, since they refer to three countries only, changes may be due to accidental events in these countries rather than to the working of any principle applicable to creditor countries in general. Nevertheless, the figures do show the broad outlines of the changes that have taken place: the sudden disappearance of the creditor countries' lendable balances and their slow reconstruction after the crisis. It is possible that the 1936 figures, however, will reveal a much smaller positive balance. International trade, as it is at present developing, leaves little margin for international lending. And the vogue of bilateral treaties will impose still further restrictions on freedom of action.

* * *

The Cost of Poverty.—The first volume of the Local Government Financial Statistics for 1934-35* contains particulars of the financial transactions of poor law authorities in England and Wales during the year ended March 31, 1935. The returns show that the total expenditure on poor relief in 1934-35 was £42,507,265 against £40,155,020 in 1933-34. Expenditure on institutional relief rose from £19,472,167 to £19,682,572, and on domiciliary relief by 11.6 per cent. to £20,710,028; the actual expenditure on out-relief in money or kind was £18,706,837, an increase of £2,017,362, compared with 1933-34. Some £38,953,016 was found out of the general funds of the Councils, and was therefore derived in an unascertainable proportion from rates and the block grant established by the Local Government Act of 1929; this sum was equivalent to a rate of 2s. 10½d. in the £1 over the whole country. The returns relate to the fifth year during which relief has been administered by the Councils of Counties and County Boroughs, and an interesting table is included to compare the expenditure of 1934-35 with that of the Guardians in 1929-30. Striking features of this comparison are a decline of approximately £4.5 millions in the cost of institutional relief, due in part to the increased efficiency of the new regime, and an increase of over £6 millions in the cost of out-relief, largely to persons ordinarily engaged in some regular occupation. The figures necessarily do not reflect the measure of recovery attained between March 31, 1935, and the time of their publication; but, whatever virtues may be claimed for the new administrative regime, the statement of expenditure does emphasise the great burden laid upon the country by poverty and destitution. The statistics are a challenge; only by the restoration of trade, the revival of industry, and the improvement of health, housing and nutrition, can the burden be lifted.

* * *

Consumption of Fertilisers.—The following table, published by the British Sulphate of Ammonia Federation, shows world production and consumption of nitrogen in recent periods:—

WORLD PRODUCTION AND CONSUMPTION OF NITROGEN (In thousands of metric tons)				
Production:—				
	1929-30	1931-32	1935-36	
Sulphate of ammonia	867	824	995	
Cyanamide	264	134	270	
Nitrate of lime	131	79	156	
Other forms of nitrogen	478	378	765	
Chilean nitrate	464	170	192	
Total	2,204	1,585	2,378	
Total consumption	1,951	1,555	2,400	
Agricultural consumption	1,750	1,412	2,068	

Apart from the marked increase in the production of nitrogen, there is a striking decline in Chilean nitrate. But owing to the existence of an international agreement, prices have been well maintained. The increase in consumption was most marked in Germany, the United States, Japan, Italy, the U.S.S.R., France and Egypt.

The Strike in the Motor Industry

NEW YORK, January 12.—The stoppage in the motor industry has spread, because more plants have been unable to obtain materials, owing to the stay-in strikes. These are copied from the French strikes of last summer, except that the actual strikers are but a small fraction of the workers. The General Motors Corporation comprises some 65 plants, exclusive of unaffiliated concerns supplying special accessories. These plants are mainly concentrated near Detroit, but the rest are scattered.

Only a minority of the employees is organised; and these are divided among company unions, American Federation of Labour unions and Committee for Industrial Organisation unions. The C.I.O. unions number about 15 per cent. of the workers, with perhaps 10 per cent. more, supporting or sympathetic. The A.F.L. unions are opposed to the strike but are numerically smaller than the C.I.O. unions. The effectiveness of the strike depends upon the ability of the C.I.O. unions to create "bottle-necks" within the Corporation, and upon the shortage of materials created by such strikes as that in the glass industry. So far, the stoppages have been limited to the plants of the General Motors Corporation; but the shortage of glass and accessories is expected to lead to the closing-down of other plants.

A Balanced Budget in 1938

The Budget Message anticipated only a small increase in the public debt in the current fiscal year (ending June 30, 1937); and a balanced Budget in the fiscal year 1938. As relief expenditure for the fiscal year 1938 is omitted from the estimates, this forecast is provisional.

EXPENDITURE OF THE FEDERAL GOVERNMENT (\$000,000)

	Actual				Estimated		
	1932	1933	1934	1935	1936	1937	1938
Regular Oper. Exp.	3,271	2,918	2,426	2,736	4,794	3,804	3,201
Public works	440	428	552	704	869	1,147	908
Relief	...	351	1,853	2,361	2,342	1,875	13
Loans, etc.*	...	...	63	222	466	468	482
Social security	...	...	...	...	28	400	836
Debt retirements	413	462	360	574	403	405	402
Grand Total†	5,154	5,143	6,752	6,854	8,803	8,481	6,158‡

* Includes Agricultural Adjustment programme.

† Includes minor expenditures not itemised.

‡ Exclusive of relief, etc., provisionally put at \$1,500 millions.

The actual revenue in the fiscal year 1936 was \$4,116 millions, against an expenditure of \$8,803 millions, giving a deficit of \$4,687 millions, which included \$1,673 millions for the Veterans' Bonus. For 1937, revenue is put at \$5,828 millions, giving a deficit of \$2,653 millions, including \$563 millions for the Bonus. Supplementary appropriations are, however, expected before the end of the current fiscal year. For 1938, revenue is estimated at \$7,264 millions, and expenditure, exclusive of relief, at \$6,158 millions. This estimate anticipates an extraordinary increase in revenue.

REVENUE

	Actual	Est.	Est.
	1936	1937	1938
Income tax	\$	\$	\$
Miscellaneous	1,427	2,373	3,365
Social security tax, etc.	2,005	2,275	2,508
Customs	...	541	774
Total*	387	447	463
	4,110	5,796	7,264

* Includes minor itemised elements.

The most striking figures are the rapid increase estimated in the yield of the Social Security taxes, and the optimistic forecast of the income tax. This estimate is based upon the extension of recovery, and an increase in the revenue produced by the Undistributed Profits Tax, enacted a year ago.

The Distribution of Excess Reserves

In early December, most people in financial circles expected an increase of 50 per cent. in the reserve requirements for member banks. The January *Federal Reserve Bulletin* shows the geographical distribution of excess reserves in the first half of November, 1936:—

EXCESS RESERVES OF MEMBER BANKS					
	All Member Banks	New York	Chicago	Reserve City	Country Banks
Rates of excess to required reserves:—					
Less than 16½ per cent.	1,445	14	4	110	1,317
16½ per cent. to 33½ per cent.	1,171	8	1	71	1,091
33½ per cent. and more	3,772	15	12	155	3,590
Total Member Banks	6,388	37	17	336	5,998

The distribution of excess reserves is thus far from uniform. Banks holding 33½ per cent. of excess reserves could meet an increase of 50 per cent. in base requirements without adjustment; but only about half the banks fall into this category. Banks with 16½ per cent. could meet an increase of 25 per cent. without adjustment; but about a quarter of the banks would have to adjust their position to meet an increase. Therefore, it is now believed that, if reserve requirements are increased, it will be by not more than 25 per cent. It is, however, questionable if any quantitative and effective credit control is to be looked for in the near future.

The Progress of Recovery

Production reached a new level in November:—

BUSINESS INDICES (1923-5 = 100, adjusted for seasonal)				
	Nov., 1935	Oct., 1936	Nov., 1936*	Nov., 1936*
Industrial production (total)	96	109	114	114
Manufactures	97	110	114	114
Minerals	92	104	110	110
Construction contracts (total)	60	57	58	58
Residential	26	43	40	40
All other	88	69	72	72
Factory employment	88.0	94.3	95.8	95.8
Factory pay rolls	75.5	88.8	90.1	90.1
Freight car loadings	66	73	80	80
Department store sales	82	90	93	93

* Preliminary.

Total production has thus risen about 20 per cent. since November, 1935. Factory employment has increased by

Incorporated with
Limited Liability
in the U.S.A.

about 10 per cent., and pay rolls have risen as much as production and more than employment. Non-residential building contracts have declined owing to the fall in government contracts, which were exceptionally heavy a year ago. Residential building contracts have increased by 50 per cent. since November, 1935.

In May, 1935, when N.R.A. was ended, the production index was 85, the index of factory employment was 81.2, and of factory pay-rolls 68.5. Since that time, production has risen 34 per cent., factory employment 18 per cent. and factory pay-rolls about 31.5 per cent. It would be difficult to argue that it was the abolition of N.R.A. that caused this improvement, as N.R.A. had become virtually extinct before the Court decision; but the figures suggest that the ending of N.R.A. was in no visible way prejudicial to the workers in general. Instances can be found in which individual concerns have reduced wages and lengthened hours oppressively in the past two years, but this has been exceptional. The motor industry, for instance, has preserved the 40-hour week, and has an hourly wage-scale equal to or higher than in 1929. The work is better distributed over the year (because of the change in the seasonal introduction of new models) than before the depression. In the particular Corporation directly affected by the strike, labour conditions are fully equal to the average of the industry.

Higher Prices in the Shops

The rise in the price of primary commodities is being translated into higher consumer prices. It is not unusual for shops to announce that, when present stocks are exhausted, higher price schedules will be posted. For example, the price of cheap suits for men will be raised by about 10 per cent.; and a similar increase is expected in the price of various articles of individual and household use.

France

Business Revival and Political Calm

PARIS, January 21.—The political situation is very calm. After so many promises and so many disappointments, public opinion is welcoming the first signs of a revival of business. The political crisis, which was forecast for this month, is not likely to occur before Easter at the earliest, because the opponents of the Cabinet are powerless in face of the rising economic trend. There are, however, some members of the Opposition who place their hopes in the Treasury's difficulties; they are encouraged by the fact that the latest return of the Bank of France showed a new increase of the "New Advances to the state" by 1,350 million francs to 6,750 millions. But it is generally believed that, in case of need, the Treasury will find the necessary help abroad.

These Treasury difficulties have prevented the rising tide of confidence on the Stock Exchange from affecting the price of the "Rentes" to any great extent. The deposits of the great Parisian banks have, however, risen during November.

(Fr. '000,000 omitted)			
	Nov. 30, 1935	Oct. 31, 1936	Nov. 30, 1936
Crédit Lyonnais	10,614	10,425	10,614
Société Générale	9,155	8,645	8,867
Comptoir National d'Escompte ...	6,964	7,076	7,024
Crédit Industriel et Commercial...	1,355	1,401	1,507
Totals.....	28,088	27,547	28,012

Deposits have risen by 3,200 millions since the end of August, when they were lower than they had been for many years; the highest recent figure was 35,000 millions in the pre-depression years.

It will be noticed, however, that the total of 28,000 millions, which represents nearly 70 per cent. of the total resources of the French money market, does not afford the Government such large possibilities of action as the City of London, where the last total deposits of the

clearing banks was almost £2,300 millions. The smallness of the deposits of the French banks is partly the result of the development of the savings banks, which have accumulated (through a policy of high interest; 3½ per cent. at sight) a capital of 100,000 million francs.

Recovery in Foreign Trade

Total foreign trade in December was valued at 4,650 million francs; imports were 3,013 millions and exports 1,637 millions. Imports increased by 306 millions compared with November, while exports fell by 83 millions. The import surplus is thus 1,376 millions, against 987 millions in November, and 677 millions in December, 1935. Compared with December, 1935, imports increased by 1,045 millions, and exports by 346 millions. The import surplus is explained by the needs of industrial recovery, and by the rise in foreign prices.

The value of total foreign trade in 1936 was 40,852 millions of francs, against 36,470 millions in 1935.

(Fr. '000 omitted)			
	1935	1936	
Imports—			
Foodstuffs	6,263,664	7,795,300	+ 1,531,636
Raw materials	11,179,986	13,773,473	+ 2,593,487
Manufactured goods	3,530,315	3,829,271	+ 298,956
Total	20,973,965	25,398,044	+ 4,424,079
Exports—			
Foodstuffs	2,473,590	2,469,277	— 4,313
Raw materials	4,255,708	4,439,907	+ 184,199
Manufactured goods	8,766,442	8,544,441	— 222,001
Total	15,495,740	15,453,625	— 42,115

The year 1936 marks the first recovery in the total value of French foreign trade after 7 years of decline. The figures in volume are as follows:—

('000 tons omitted)			
	1935	1936	
Imports—			
Foodstuffs	5,496	6,225	
Raw materials	37,561	40,049	
Manufactured goods	1,564	1,675	
Total	44,621	47,949	
Exports—			
Foodstuffs	1,823	1,284	
Raw materials	24,629	25,220	
Manufactured goods	2,865	2,447	
Total	29,317	28,951	

The export figure for the year 1936 was lower than for 1935, but exports were rising at the end of 1936.

Budget Revenue Rising

Fiscal receipts in December were 3,689 millions:

(Fr. '000,000 omitted)			
	December, 1936	December, 1935	Rise or Fall compared with
Direct taxes	792	—	7
Indirect taxes	2,322	—	223
Other	22	—	5

Indirect taxes show a surplus of 156 millions over the estimates, compared with a deficit of 10 millions in November and 140 millions in October. Compared with 1935, receipts they show an increase of 223 millions in December, against one of 123 millions in November, and a decrease of 57 millions in October. This recovery is the result of the rise in prices and the revival of business. The yield of the turnover-tax was 549 millions in December, or 74 millions more than in December, 1935. Fiscal receipts for 1935, as a whole, were 27,000 millions, or 512 millions less than the estimates, and 603 millions more than the receipts of 1935.

20 per cent. Increase in Railway Receipts

The Government has accepted a Bill instituting the 40-hour week on the railways. This measure is intended to increase the staff of the railways by 60,000, and to diminish unemployment correspondingly. This measure will cost the railways more than 1,100 millions. Railway receipts for the fifty-second week of 1936 were 206,163,000 francs, against 170,735,000 francs for the same week of 1935, an increase of 20.75 per cent. The

increase was 19.51 per cent. in passenger traffic and 21.31 per cent. in goods traffic. For the whole year, the figures are:—

(Fr. '000,000 omitted)			
	1935	1936	Per cent.
Passengers	7,128	7,207	+1.10
Goods.....	2,683	2,674	—0.34

There was thus an increase in passenger traffic and a slight decline in goods traffic, compared with 1935.

Germany

The Fall in Unemployment

BERLIN, January 19.—The turnover of retail trade in 1936 was some 10 per cent. higher than that of 1935.

The Unemployment Insurance Board reports for 1936 a decline of 41.6 per cent. in the number of unemployed manual workers; and a fall of 35.9 per cent. in the number of unemployed non-manual workers. The greatest fall, one of 59.4 per cent., occurred in the iron, steel, and metal trades. The average time worked daily in all industrial occupations, which fell between October, 1929, and October, 1932, by 8.5 per cent., has since risen by 8 per cent. The average working day in October, 1936, was 7.68 hours. Most of the increase in working hours took place in 1933 and 1934. For technical reasons, employers chose to lengthen working hours before taking on more hands. Wage rates (as distinct from earnings) did not vary for any class of worker last year. No wage rates differ by more than 0.3 per cent. from the rates of 1933, but they average 16.5 per cent. below those of 1928. The highest wages for men are in building, brewing and bookbinding, and the lowest in textiles.

Pig-iron output in December was 1,258,300 tons; in 1936, output was 15,303,100 tons, against 12,841,900 tons in 1935, and 3,932,400 tons in 1932. The Friedrich Krupp A.G., Essen, has resumed dividend payments, at a rate of 4 per cent., for the business year 1935-36. Gross profit was Rm. 65 millions, against Rm. 48 millions in 1934-35; net profit was Rm. 14.4 millions, against Rm. 9.7 millions. The new net profit is 9 per cent. on the share capital of Rm. 160 millions. The dividend absorbs only Rm. 6.4 millions, and Rm. 4 millions goes to a special reserve for the execution of projects in the Four-Year Plan. The Vereinigte Stahlwerke A.G. (Steel Trust) announces the increase of its dividend from 3½ to 4½ per cent.

Boom in Shipbuilding

The last quarter of 1936 brought the German shipbuilding industry a great increase of orders. At the end of the year, orders had been placed for 248 ships of 978,945 gross tons, against 157 ships of 531,700 tons at the end of 1935. Some 150 ships of about 400,000 tons were for German firms, and some 550,000 tons were for foreign firms. The much lower total for German firms is due to the fact that orders definitely booked, but on which work has not begun, are not included. The capacity of German yards is limited, and it appears that work for foreign firms is being given priority. For the moment, it is not proposed to establish new yards, but according to the Reich Ministry of Communications, 265,000 tons per annum must be built for Germany in the next ten years. Because of the high subventions paid to foreign shipping, and the low costs of construction in the countries which have devalued their currencies, Germany's commercial fleet cannot, it is suggested, be renovated without the financial help of the Government. Emphasis is laid on the need for newer vessels. In a total of some 3,700,000 tons, 68 per cent. are more than ten years old. The vessels planned are mostly freight ships for traffic to the West Coast of South America, East Asia, and Australia.

The Prussian loan of Rm. 200 millions brought in subscriptions totalling Rm. 234 millions. The cash subscribers will therefore be rationed to 65 per cent. The

total Reich debt on November 30th is returned at Rm. 15,245 millions, against Rm. 14,010 millions in November, 1935. The foreign debt decreased from Rm. 1,704 millions to Rm. 1,458 millions, taking into account the new gold-bloc devaluations. Against an increase of nearly 2,000 millions in the home long-term or middle-term debt, the home short-term debt has declined by nearly Rm. 300 millions. The total of tax-credit certificates in circulation or on deposit with the Reichsbank as security, decreased from Rm. 1,299 millions to Rm. 871 millions. Rm. 3,500 millions were involved in the conversion of municipal debts, which was virtually completed last October; the result has been to reduce the interest charges by nearly Rm. 70 millions a year.

The Growth in "Credit Indebtedness"

An official return has been published on "The Credit Indebtedness of the German Economy"; it is presented as a reply to the foreign charge that the creation of work, re-armament, and public investment, have caused excessive credit expansion. The official definition of "credit indebtedness" covers the liabilities of agriculture, trade, industry, and public corporations, to banks and insurance companies, and liabilities under bond issues; but it does not cover debts between business undertakings or the share capital of companies. The return therefore embraces bonds (including foreign), mortgages, short-term credits (including bills, treasury bills, and advances on goods), and various other credits, including token coins in circulation. The total of these is shown to have changed little of late years, and relatively little compared with the total before the war, when the credit structure was itself different. The sum of public long-term debts was then much higher. The total of indebtedness was, at the end of 1913, 114,446 millions; in 1928, 84,896 millions; in 1932, 96,118 millions; and in 1935, 101,219 millions. Since 1928, public and private business have undergone great vicissitudes. The relative stability of indebtedness proves, it is implied, that such vicissitudes need have no great influence on the movement of credit.

The Campaign against Foreign Securities

Foreign securities have been depressed by the expectation that new restrictions on their sale and purchase would be imposed. This rumour mainly concerned those foreign and colonial stocks and bonds which, under the decrees of November, had to be handed over to foreign exchange banks. The market for Reichsmark bonds was, however, strong. Since January 1st, it has been possible to buy shares with blocked marks (including "emigrant" and "credit" blocked marks), only if the buyer had previously sold other shares. Blocked credits dating from before January 1st, new blocked credits, and credits arising from the sale of bonds, may not be used for the purchase of shares. These credits tend to flow to the market for home bonds. A new

official journal which is devoted exclusively to the Four-Year Plan makes it clear that, while concerns expanding their production will be allowed to raise capital by issuing bonds, they will be first expected to provide as much as possible of the needed capital out of their own savings; and the authorities will themselves determine whether this condition has been fulfilled. In general, the utterances of this official publication are "autarkic." "Self-sufficiency" is regarded as an end in itself.

Sweden

A Prosperity Budget

STOCKHOLM, January 16.—Political opponents of M. Wigforss, the Finance Minister, have sometimes pretended that his success in managing Sweden's State finances was to a large extent due to luck. To this M. Wigforss, who has a keen sense of humour, once replied that luck has long been considered an honourable quality in a statesman. The Budget proposals, which the Government has now submitted to the Riksdag, give proof not only of luck, but also of wise use of the blessings which economic expansion has conferred upon the country.

The new Budget shows on the revenue side an estimated rise in current revenues from taxation. Customs, the old-age pension fund and other revenue items have risen from Kr. 884.9 millions to Kr. 977 millions. This has enabled the Government to propose a Budget balanced at Kr. 1,291.5 millions, compared with Kr. 1,237.7 millions for the current Budget year. In spite of this increase in revenue, the Government has not found it advisable to lower taxes, partly on the ground that a reduction of taxes might give the present boom a dangerously accelerated turn.

Current expenditure is placed at Kr. 1,080.5 millions, compared with Kr. 967.3 millions for the present financial year. Of the surplus the Ministry of Social Welfare is to take Kr. 56.4 millions, mostly on account of the old-age pension reform voted by the Riksdag in 1936. The Ministry of Education is allotted an increase of Kr. 31 millions, the Ministry of Communications Kr. 11 millions and the Ministry of Finance Kr. 10 millions. The Budget of the Ministry of Defence remains unchanged at Kr. 170 millions. Most of these increases belong to the category of "automatic" increases in accordance with laws voted in 1936. Profiting by an available surplus, the Government has proposed to allocate Kr. 11 millions for wiping out losses from certain operations during the crises of 1922 and 1932, when certain bank claims had to be taken over by the State (Kreditkassa of 1922).

Egypt

Conference on the Capitulations

ALEXANDRIA, January 12.—With the exchange of the instruments of ratification of the Anglo-Egyptian Treaty of Friendship and Alliance, and with the transformation of the British Residency into an Embassy, Egypt has made another stride towards the attainment of full independence. Attention is now centring on the capitulations, the other important question still remaining in abeyance. A conference is to be held at Montreux next April; but this time negotiations will assume an international character, as about a dozen Powers will be represented besides Great Britain. An idea of the interests at stake may be derived from the following estimate, which was given on an official occasion by the President of the Alexandrian British Chamber of Commerce, at the outset of the world depression:—

The share in Egypt's wealth held by Europeans is out of all proportion to their numbers. The market

value on December 31, 1929, of public loans, stocks and shares quoted on this Stock Exchange totalled nearly £200,000,000 and it is no exaggeration to say that 90 per cent. of the amount is held by foreigners in and out of Egypt. In addition to this it is not unreasonable to suppose that an equally large amount is invested by them in their private business, in companies the shares of which are not quoted locally, and in land and house property in the large towns. On the other hand, we know that the area of agricultural land owned by Egyptians is just under 5 million foddans (acres) the value of which must be in the region of £600,000,000.

Heavy Defence Expenditure

The Government is now concentrating on financing the building of strategical roads and barracks as foreseen in the treaty, but it is apprehended that after the arrival of the British military mission the nation will be asked to shoulder further heavy expenditure for the expansion and modernisation of the Army. It is with this possibility in view that the Cabinet have launched a public subscription for national defence, which is meeting with great response. Apart from independent donations, the campaign is taking the form of a relinquishment of one month's salary by officials. Even the labour unions are participating.

In developing the taxation system, the Government may not rest content with introducing the stamp duty and the professional tax, but may resort to further temporary impositions, according to a recent hint by the Minister of Finance. A special account for the expenses incurred in carrying out the treaty will be created. This, in the words of the Minister, has been decided in order to avoid causing anxiety and shaking confidence in Egypt's finances. Meanwhile, however, the draft law on the stamp duty has come in for some serious criticism in business circles. It is maintained that, despite the moderate rates proposed, successive manipulations of cotton from field to wharf may result in the accumulation of an important total of taxes which would in the end injure the grower.

Progress of Economic Recovery

On the whole 1936 has been a year of steady and moderate progress. Total bank clearings in Alexandria and Cairo amount to £123,540,421, against £119,900,126 in 1935. The turnover in the futures Cotton Exchange was almost exactly the same as in 1935, namely 27½ million kantars. Notes in circulation reached £22,850,312 on November 30, 1936, against £24,602,522 twelve months earlier and £20,435,521 on November 30, 1934. The latter figures provide an important pointer, as financing in Egypt is done largely by notes rather than by bank credit. The correlation between notes in circulation and business conditions is therefore closer than in most other countries. The food and cost-of-living indices have also moved very narrowly (112 and 129 in November, 1936, as against 117 and 132 one year earlier); but there are indications of late that an advance is coming. Wages among black-coated employees are not improving, but manual workers are obtaining increases in some trades.

Agriculture presents a mixed picture. Although Egypt has produced the largest cotton crop on record and exports are lagging behind last season's figures, values are about 14 per cent. higher than a year ago and show no signs of weakness. Prices of rice are now on their way to recovery, but the wheat situation is not so good. The prohibitive tariffs set up during the crisis gradually led to over-production, and prices are about 25 per cent. lower than a year ago. The Cabinet has been roused to action, and Government-guaranteed bank loans on the new crop will be increased by 18 per cent. per unit. If the situation does not improve, an export bonus may be paid; but the continued advance in international prices may render this unnecessary.

The Stock Exchange has overcome by now its former apprehensions over the new political developments in Egypt, and the trend is upward. State funds, however, are not participating in the rise.

Canada

Trade Negotiations with Britain

OTTAWA, January 8.—During the eighteenth Federal Parliament of Canada, which reassembles for its second session on January 14th, the King Ministry proposes to secure authority for the replacement of the existing Railway Commission by a new Transportation Commission, which will seek to co-ordinate transportation in the Dominion. The Ministry will pass legislation to establish a Trans-Canada air service under the management of a semi-public corporation, in which the two railway systems will probably be given an interest.

If the revision of the Anglo-Canadian fiscal agreement is completed in time for the inclusion in the forthcoming Budget of the resulting changes in the Canadian tariff schedules, it should produce the most important debate of the session. But an element in the King Cabinet remains reluctant to concede the British demand for guaranteed margins of preference on certain important commodities over a period of years. It is being rumoured that, within the next few years, the Roosevelt Administration will be willing to consider another deal for the extension of the Canadian-American trade agreement. Since certain Ministers set more store by this pact, of which they can claim parentage, than by the Anglo-Canadian agreement, which was fathered by the Conservatives, they are averse to tying their hands by guaranteeing to Britain preferential margins which would make it difficult to give certain further concessions to the United States. The delay in the completion of the revision is arousing unfavourable comment in the Press. It is argued that discussions of international trade should not be influenced by considerations of party, and that to refuse the conditions asked for by Britain would be calculated to do serious damage to the fabric of Imperial Preference.

Ontario's Cancelled Power Contracts

The power contracts between the Hydro-electric Commission of Ontario and certain Quebec companies, which were arbitrarily cancelled by the Hepburn Ministry some time ago, have been brought to the forefront again by the Toronto *Globe-Mail*, which is the fruit of a merger under completely new ownership of the Liberal *Globe* and the Conservative *Mail and Empire*. This paper, which has been giving general support to the Hepburn Ministry, has vigorously attacked the cancellation policy as unfair to investors and damaging to the credit of the Province, and demanded its reversal by the opening of negotiations for new contracts with the power companies on an equitable basis. In reply Mr Hepburn accused the *Globe-Mail* of trying to refasten the yoke of the Quebec power ring upon the necks of the power consumers of Ontario, from which he had struck it off, and declared that the motive of a multi-millionaire mining magnate in buying two important papers and merging them was now clear. But in a later statement he intimated that he was ready to discuss the contracts with the power companies provided their representatives came as men of business, and not brandishing clubs as on former occasions. Critics of the Hepburn Government, however, advance the theory that, as the "Hydro" Commission, owing to increased industrial demand, urgently needs additional power supplies which it can only at present get from Quebec, the attack of the *Globe-Mail* is merely a smoke-screen to cover the retreat of Mr Hepburn. They recall that Mr I. W. Killam, of Montreal, who owned the *Mail and Empire* and sold it to its new proprietor, is heavily interested in at least one of the power companies affected, and hint darkly at some underground bargain in the sale of the paper, which deprived the Conservative Party of its chief organ in Ontario, and thereby benefited Mr Hepburn.

The *Globe-Mail*, however, is persisting with its campaign for the reversal of the Hepburn Ministry's policy. Mr Hepburn has summoned the Provincial Legislature of Ontario to meet on January 19th, which is

several weeks earlier than usual. He proposes to introduce legislation without delay, as the result of the emergency which has arisen. This legislation will be designed to safeguard the sovereign rights of the Province. It is being suggested that he wishes to forestall an adverse decision of the Privy Council on an appeal from a decision of the Ontario Court of Appeal, which declared invalid the cancellation of the power contracts. However, as the Commission needs more power, which it can only get at present from Quebec, the suspicion prevails that some sort of new bargain is being discussed behind the scenes.

Business Conditions Improving

Business remains remarkably buoyant for midwinter; and merchants everywhere, except in the drought-stricken districts of the West, are very satisfied with their Christmas and New Year trade, which was the largest for several years. The economic index of the Bureau of Statistics has been rising as follows:—

Week ended	Car Loadings	Wholesale Prices	Bank Clearings	Economic Index
January 4, 1936	68.1	72.8	94.4	100.1
December 19, 1936....	79.9	79.7	93.1	113.9
December 26, 1936....	84.6	80.2	101.5	116.6
January 2, 1937	81.4	80.8	96.9	115.2

The latest employment bulletin of the Bureau of Statistics shows that the seasonal contraction of employment at the beginning of December was smaller than in recent years.

General Rise in Prices

There is a general advance in commodity prices; and the rise in copper, lead and zinc prices is increasing the earnings of numerous mines. The wholesale price index of the Bureau, which stood at 80.8 for the week ended January 2nd, was exactly 10 points above the figure for January 4, 1936. The price index for farm products has risen 80 per cent. from the low point of December, 1932, and is now, for the first time for nearly seven years, above the level of the corresponding index for manufactured goods. Most underlying factors seem favourable to

continued progress towards recovery; but strikes are in progress in several Canadian plants, mostly in sympathy with strikes in affiliated plants in the United States.

Stimulated by strong export buying, the prices of wheat and other grains have continued to move sharply upward; and visible stocks of Canadian grain were on December 18th reduced to 115½ million bushels, as compared with 265 million bushels on the same date in 1935. Base metal prices have also risen, and in the week ended December 11th the price of iron actually made a greater advance than in the whole of the preceding three years. Preliminary estimates published by the Department of Mines forecast a record year in the mineral production of Canada. The greatest contributor to the increase is gold, the output of which is up by 15 per cent.

The net earnings of the C.P.R. for November, at \$3,528,651, showed an increase of \$83,243, and for the first eleven months of the year were \$19,769,303, a gain of \$677,793. Earnings of the C.P.R. in November, at \$2,383,271, were up \$54,116; and net revenue for the eleven months are up \$135,471.

Dissensions in Alberta

Mr Aberhart, the Social Credit Premier of Alberta, recently established what was styled a "planning committee" to work out a scheme of Social Credit for Alberta. It consisted of Dr Cross, Minister of Health, Mr Fallow, Minister of Public Works, Mr Maynard, Minister without Portfolio, and Mr Ansley, a member of the Legislature; and apparently it called to its councils a Mr John Hargrave, said to be known in England as the founder of the "Green Shirt" movement. Mr Aberhart's planning committee, with Mr Hargrave's co-operation, devised an ambitious plan based on three principles: (1) price discounts, (2) circulating debt-free money, and (3) social dividends.

Word from Edmonton that the Aberhart Ministry was giving careful consideration to this plan was immediately followed by the announcement that Mr C. C. Ross, the Minister of Lands and Mines, who was a mining expert and rated the most competent administrator in the Cabinet, had resigned. Mr Aberhart immediately replaced him by Mr Nathan E. Tanner, who combines the avocation of school-teacher with ecclesiastical activities as a bishop of the church of the Mormon colony in Southern Alberta, and is said to be a stern zealot in the Social Credit faith.

A Constitutional Crisis?

Meanwhile both Mr Aberhart and Mr Hargrave have issued statements containing assurances that the Alberta Government had no intention of precipitating a constitutional clash with the Dominion about its right to issue negotiable currency—which right has been reserved by the British North America Act to the Dominion. Reports from Edmonton, however, indicate that there has been a sharp struggle in the Aberhart Cabinet between the Radicals and the Moderates, of whom Mr Ross was the leader. At any rate, bankers and business men regard Mr Ross's withdrawal with dismay. So it can be taken for granted that they will apply the strongest possible pressure upon the King Government to persuade him to forbid the issue of the proposed scrip on the ground that it is a form of currency. Such action could scarcely fail to provoke a major constitutional crisis.

There are signs, however, of distinct restlessness and disillusion among the voters of Alberta. A Peoples' League, which has been formed with the avowed objective of compassing the doom of the Aberhart Ministry, is rapidly gathering recruits. But the adjacent Provinces of Saskatchewan and Manitoba are said to be strongly infected by the idea that the installation of a Social Credit Party in power might be a good move, not so much from any faith in the efficacy of Social Credit, but from a belief that a Social Credit Government would pass the same sort of drastic legislation for the curtailment of debt burdens as the Aberhart Ministry has done. The rise in the price of wheat and other primary commodities, however, is likely before long to moderate the spread of extremist doctrines in the Prairie Provinces.

Letters to the Editor

Monetary Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—In your interesting "Notes of the Week," in your issue of January 16th, on Mr Keynes's recent articles, you sum up various proposals with which I fully agree, with the exception of the last, i.e. "the maintenance of the rate of interest at or near its present level."

This is surely beyond the power of any government. It is true that by a policy of continually issuing paper money which is inconvertible, the rate of interest might be artificially kept low, but surely this would lead to a serious rise in the cost of living. There are evidences of this already in many directions. Under a sound state of finance the rate of interest is surely governed by the proportion which the supply of loanable capital bears to fixed or funded capital. That is still very large in the world, and likely to remain so for a considerable time.

Your journal was one of the first to suggest the Tripartite Monetary Agreement between France, the United States of America and this country as a step towards general stabilisation. To interfere artificially with the rate of interest would be to act contrary to the spirit and declared policy of the Agreement.

I am, Sir, etc.

D. M. MASON,

Chairman, Executive Committee, Sound Currency Association.

Imports and the Special Areas

TO THE EDITOR OF THE ECONOMIST

SIR,—It is surprising that, according to the letter in your columns from Mr J. W. Banfield, M.P., competition from Empire countries is encouraged at the expense of employment in Britain.

Imports, including, I note, leather goods, carpets and rubber footwear from Eastern Empire countries, where wage rates are absurdly low, and where conditions of labour are not strictly safeguarded as they are here, obviously create unnecessary problems for British manufacturers, and inevitably threaten the security and standards of British workers.

We cannot allow such anomalies to continue. The solution is, surely, to raise the standards of pay and conditions of workers in Empire countries, so that they bear some reasonable relation to those obtained here. Until that time, goods from low-wage countries should be subject to a duty which would protect the standard of living and production in Britain.

Indeed, the present position, if allowed to go on, can only lead to difficulties and antagonisms between the Empire countries. To avoid that, we must do as Mr Banfield suggests—review the whole question of Empire import competition. Why not call an Empire import conference?—Yours truly,

T. F. HOWARD.

London, W.C.1.

"Raising the Standard of Living"

TO THE EDITOR OF THE ECONOMIST

SIR,—Commander Stephen King Hall's letter on the above subject raises a very interesting problem. He says that an increase in national income can only be obtained by more work and more efficiency. Increased efficiency in production means a greater output per man, but with our present standards of efficiency and with a large number of unemployed workers production is so great that restrictive measures have to be applied to industry in order to maintain a profitable price level; so what would be the result of more men working more efficiently?

I think Commander King Hall falls into the common error of confusing wealth and money. Work rightly directed will increase the nation's wealth, but it does not increase the supply of money. It is quite easy to prove this. I produce wealth in my garden but no new money comes into existence with it.

Jersey

Yours truly,
T. L. MAWSON.

Books and Publications

The Forlorn Years

IN the recent history of international affairs, 1933, 1934 and 1935 are the forlorn years—those of lost opportunities, of fruitless recrimination, of totalitarian frowardness and democratic timidity. Dr Arnold Toynbee having arrived at the task of chronicling the world story of 1935—it extends from 1933 to 1936 for various subjects—is compelled for this purpose to publish two separate volumes for his annual Survey of International Affairs.* Moreover, a third volume is yet to appear.

The first handles the inflammable material heaped up by a resurgent military Germany; traces the decline and fall of the Disarmament Conference; gives a valuable section on the history of the East European Pact Negotiations; tells the detailed story of the Franco-Italian Agreement of January two years ago; and analyses German-Polish problems. Mr G. E. Hubbard contributes an able survey of Far Eastern relations, especially those caused by internal developments in China and Japan, and the sharpening of the tension between Japan and Russia over North China and Mongolia. And Mr H. V. Hodson cleverly and patiently carries on his task of unravelling the world's economic tangle, following the threads of raw material supplies and of major currency problems. His section is notable for the extremely comprehensive, yet deft, treatment of the principal restrictive marketing schemes for basic commodities. Dr Toynbee himself covers the European political canvas. The sections which stand out above the high level of his annual achieve-

ments are those devoted to the so-called Eastern Locarno and to the Franco-Italian Agreement of January, 1935.

Dr Toynbee shows, in the first, the way in which the Nazi Government steadfastly opposed the conclusion of a general mutual assistance pact embracing Russia, the Baltic States, Poland, Germany and Czechoslovakia; how Poland was forced to rally to the German viewpoint; and how the actions of the British Government (a creditable spot in a gloomy chronicle of British diplomacy) forced Germany to accord to other Powers the undeniable right to conclude mutual assistance pacts among themselves if they had concluded bilateral non-aggression pacts with Germany. The valuable addendum on page 252 of the 1935 *Documents*† volume contains much—but by no means all, or the most interesting—of the matter in the British Government's Blue Book on the negotiations for an Eastern Pact (Cmd. 5143). Without exaggeration, we would say that it is impossible fully to understand the European political problems and tension to-day if these sections of the two books are ignored. Nothing as adequate to that purpose has yet appeared.

Dr Toynbee's account of the Mussolini-Laval agreement is characteristically informed, detailed and penetrating. He also traces the connections between the Tunis situation, Abyssinia, and the French and Italian preoccupations over Germany and Central Europe in illuminating detail.

His other sections, e.g. those on disarmament, negotiations with Germany, Danzig and Poland, etc., have more of the chronicle in their make-up, enlivened by the author's style. His second volume, however, is very different. It is the self-contained story of the Ethiopian tragedy—a *débâcle* for the League and the two great democracies, England and France—that should have

collaborated in its leadership, but merely hamstrung it and each other, Dr Toynbee rightly adjudges this failure as of ecumenical importance; as the end of an epoch. His account is impartial—it is almost presumption to use that word of his work—and dispassionate; but, for all that, it is a terrible indictment of M. Laval's double-faced diplomacy, and of the British Government's timidity towards, not Italy, but the French. This indictment Dr Toynbee leaves at the feet of Clio. How he has been able to produce two such volumes of so high a standard in twelve months, almost defies comprehension. But here they are; and editors, journalists, students, and—let it be said—politicians should be grateful to him.

The volume of *Documents* for 1935, as usual, is comprehensive; a valuable companion to the two volumes of the *Survey*. The Stresa Conference and the Laval-Mussolini conversations, together with their repercussions in other countries, are fully documented.

Shorter Notices

"Ebb and Flow in Trade Unionism." By Leo Wolman. (New York) National Bureau of Economic Research. (London) Macmillan and Company, Ltd. 254 pages. 7s. 6d.

"L'Evolution du Syndicalisme aux Etats-Unis de Washington a Roosevelt." Par Robert Marjolin. (Paris) Felix Alcan. 256 pages. 25 francs.

American Trade Union organisation is the vital issue at stake in the present motor strikes, and these two books provide an invaluable basis for an understanding of its problems. M. Marjolin's work is a short but brilliant summary of American Trade Union history from the earliest times up to 1935. The main currents of change are clearly distinguished and properly set in their economic and social background. For those who require a general summary rather than a detailed treatise, M. Marjolin's book can be strongly recommended.

Dr Wolman's book is a sequel to his "Growth of American Trade Unionism, 1880-1923," and well maintains the high standard set by his previous writings. The analysis is mainly statistical, and there is a particularly valuable appendix giving detailed figures of trade union membership in all branches of industry and trade for the years 1900 to 1934. The effects of long-term technical changes, of cyclical variations in economic activity, and of political intervention on the part of the Federal Government, are fully discussed with reference to the actual figures of membership, and reasons are suggested for the strength and weakness of trade union organisation in various industries. Reference is also made to the influence of changes in the location of industry on membership, though this is not analysed in detail.

Dr Wolman discusses briefly the present dispute between the American Federation of Labour and Mr John Lewis's Committee for Industrial Organisation, and inclines to the view that the breach between the two is a serious split in the labour movement. His discussion is admirably impartial, but an examination of his figures suggests that the best hope for an expansion in trade union membership lies in the organisation on an industrial basis of the workers in the mass production industries. If Mr Lewis succeeds in this task, the membership of the C.I.O. may soon overtake and even exceed that of the A.F. of L.

"British Policy Towards Morocco in the Age of Palmerston 1830-65." By F. R. Flournoy. P. S. King & Son. 287 pages. 10s. 6d.

Recent events have again focussed the world's attention on Morocco, and lend a special interest to this book, the work of an American author, dealing with England's Morocco policy in the middle decades of the last century. The Morocco question really dates from 1830, the year of the French capture of Algiers; during the next thirty-five years, the "Age of Palmerston," the London Foreign Office was very much concerned with North Africa, and Dr Flournoy has found no lack of diplomatic material for his study. He deals with a period before the appearance of Germany on the Moroccan scene, but his account of it only serves to throw into relief both the persistence in later times of the original British attitude to the country, and the extent of the change which took place when Britain became the promoter, instead of the opponent, of French expansion there.

British policy in Palmerston's time was inspired by two motives, one economic and the other strategic. The economic

aim was to open up Morocco as a market for trade and to obtain tolerable conditions of business and residence for British traders—no easy task in view of the chronic disorder, anti-European sentiments and general "backwardness" of the Moorish realm. The strategic aim was to prevent any European Power from making territorial conquests in Africa in the neighbourhood of the Straits of Gibraltar, and with this end in view to "keep Morocco at peace with Europe," so as to afford no pretext for invasions. The two aims were not altogether harmonious, for whereas England shared a common interest with other European Powers in her effort to open Morocco to international commerce, her resolve to keep them at arm's length from Gibraltar involved her in a series of conflicts with the two other states in closest contact with Morocco, namely, Spain and France. Both nations were inclined to encroach on the integrity of Morocco, but it was French expansion that was regarded in the 'forties as really dangerous to British interests, and Sir Robert Peel feared that "unless the British held very decisive language to France, and were prepared to act upon it, with regard to Tunis and Morocco, they or so much of them as suited the purposes of France would follow the fate of Algiers."

The "very decisive language" which was actually used helped to bring England near to war with France in 1844, but it attained its end, and the independence of Morocco was preserved until the close of the nineteenth century. To-day "very decisive language" is again being used about Morocco, but it is addressed to a state which plays no part in the pages of Dr Flournoy's history.

"Aussenhandel und Wahrungsschutz." By Richard Riedl. Vienna: Oesterreichischer Wirtschaftsverlag. 88 pages. No price stated.

Dr Riedl, a former Austrian Cabinet Minister, here outlines a plan to abolish import quotas, and lower tariffs, within a group of what Anglo-Saxons have come to call "low-tariff" nations. After attacking the economic absurdities of the purely bilateral trading system, Dr Riedl proposes two accompanying international instruments by which the desired end is to be achieved; a new form of trade treaty, and a new form of financial agreement accompanying it. The new trade treaty and financial agreement have as their object, not the avoidance of import surpluses, but the "carrying" of such surpluses (export surpluses of one or two exporting countries will probably arise) by co-operation between the relevant countries' central banks and Government departments. Such co-operation would enable import surpluses to be financed by the relevant countries' central banks acting together, over a period long enough to enable the country with the initial import surplus to clear off its commercial debt to the other country in the form of increased visible or invisible exports to it.

Dr Riedl observes that a central bank need not fear inflationary effects if it finances an export surplus sold to a second country, for the period during which the second country cannot pay the amount of its import surplus. In this, despite the experience of Czechoslovakia in recent years when her export balances' proceeds were blocked abroad, Dr Riedl tends to underestimate the problems which would arise in countries like Bulgaria, where the temporary financing of unpaid exports would probably have immediate effects on the national price-structure. But his small book is timely and interesting; and his insistence on the need to make some such beginnings of a return to multilateral trade is cogently argued.

MONEY AND BANKING

British Banking Trends

THE leading British banks have now issued their accounts for 1936—and their balance sheets are summarised on page 212. There are naturally certain divergences between the accounts of the different banks, but three major developments are common to them all. The first is the increase in cash during the past year. The second is the expansion in their earning assets, and consequently in their deposits. The third, and most notable, development is the year's increase in their advances.

Before discussing the significance of these changes we may recall some of the technical considerations which affect the volume of bank deposits. These deposits certainly do not grow of their own accord. The true sequence of events begins with official policy, leading directly to a growth in bank cash, which initially may affect some banks more than others. The more fortunate banks see their cash ratios increase, and so are able to discount more bills, buy more securities and lend more money. The acquisition of these new assets automatically causes an increase in the total of bank deposits, but not necessarily in those of the bank which is buying the bills or securities; or making the loans. There is simultaneously a certain redistribution of the new bank cash, so that ultimately all the banks are able to add to their earning assets, and so to their own and each other's deposits. Thus, while an individual banker may not be able to see why his own deposits are increasing, in reality it is due to the activities of himself and his competitors, stimulated by an expansion in the aggregate supply of bank cash.

The recent upward trend of bank advances is, undoubtedly, a phenomenon of the highest significance. During the early days of "reflation" of bank cash and deposits, there was little or no new demand for loans, and the banks were consequently enabled—or compelled—to make heavy purchases of securities. By so doing they hastened the decline in the long-term rate of interest in 1932-34. Now that bank advances are increasing rapidly, must the banks necessarily become sellers of securities? And if their sales happened to coincide, say, with the flotation of a re-armament loan what would happen to the long-term rate of interest?

To answer these questions we may begin by drawing attention to the following table, based on the November averages. The December figures are distorted by seasonal changes:—

	Deposits	Cash	Call and Short Loans	Discounts	Investments	Advances
November—						
1929 { Amount	1,789	190	144	233	249	990
Ratio to deposits {	100%	10.6%	8.1%	13.0%	13.9%	55.3%
1932 { Amount	1,898	194	116	391	425	785
Ratio to deposits {	100%	10.2%	6.1%	20.6%	22.4%	41.4%
1933 { Amount	1,928	216	99	217	569	737
Ratio to deposits {	100%	11.2%	5.1%	11.3%	29.5%	38.2%
1935 { Amount	2,039	214	147	293	620	774
Ratio to deposits {	100%	10.5%	7.2%	14.4%	30.4%	38.0%
1936 { Amount	2,210	225	172	322	626	863
Ratio to deposits {	100%	10.2%	7.8%	14.6%	28.4%	39.0%
Alternative forecasts*—						
(a) { Amount	2,210	225	160	300	525	1,000
Ratio to deposits {	100%	10.2%	7.2%	13.6%	23.5%	45.2%
(b) { Amount	2,400	240	160	300	700	1,000
Ratio to deposits {	100%	10%	6.7%	12.5%	29.2%	41.7%

* For explanation see text below.

The table shows that the rapid increase in advances

began only a year ago. In spite of a continued expansion in cash and deposits, the banks during 1935 added very little to their investments. The table also shows that the combined percentage of investments and advances has remained fairly constant at between 65 and 70 per cent., though there has been since 1929 a turnover from advances to investments. It is also clear that, to restore the 1929 advance ratio of 55 per cent., the investment ratio would have to drop to 14 per cent. This would force the banks to realise some £300 millions of securities. There is no need to stress the effect realisations of this magnitude would have on the gilt-edged market.

This argument, however, involves a major fallacy, namely, that there is some compelling reason for the restoration of the 1929 advance ratio. But in that year, when bank advances amounted to £990 millions, there was a much higher commodity price-level, and industry, being more loosely integrated, was less able to provide within itself its necessary liquid resources. The 1929 advance total also contained a certain mass of frozen loans. Contrasting that year with 1937, it is arguable that perhaps some £1,000 millions of bank loans would provide the country with all the banking credit it would be likely to need to-day.

We have therefore taken this as our premise, and have prepared two hypothetical aggregate bank balance sheets of the future, which are shown at the foot of our table. The first leaves cash and deposits as they are to-day, assigns £460 millions to call and short loans and discounts, and places advances at £1,000 millions. Simple addition shows that this would reduce investments by £101 millions. The alternative forecast assumes a £15 millions increase in bank cash, a cash ratio of exactly 10 per cent., and therefore a £190 millions increase in deposits. This would permit of both an increase in advances to £1,000 millions and a rise of £74 millions in investments.

Judged by recent standards, this increase of £15 millions in bank cash is moderate. It could be brought about in many ways. The Bank of England could buy bills or securities from the joint-stock banks, and could simultaneously reinforce its Reserve by seeking and obtaining authority to raise the fiduciary note issue. The Exchange Equalisation Account could sell gold to the Bank of England and then buy Treasury bills from the joint-stock banks. There is thus no mechanical difficulty in the way of an expansion in bank cash sufficient to meet the growing demand for bank credit and to prevent any consequent break in the gilt-edged market.

The crux of the problem, however, depends on broader considerations. If it be true that we are committed to the maintenance of active trade and cheap money (both long- and short-term) and also to the financing of re-armament mainly out of borrowing, then what the bank accounts really teach us is that we have no escape from a further expansion of bank cash. Some of the consequences of this conclusion and its relations to national policy are touched upon in a leading article (see page 157). All we need say here is that a broad survey of our economic position in relation to the upward swing of the trade cycle lends more than their usual importance to the bank balance sheets of December 31, 1936. To the banks themselves, the increase in their resources and the growing demand for loans are certainly profitable. The public, however, ought to view these trends from a wider angle. The banking position remains sound, but the authorities should adapt their policy to a situation from which an inflationary movement involving an undesirable rise of prices might easily emerge.

Financial Notes

Bank Advances Analysed.—Both Mr Orme at Martins Bank meeting and Mr Fisher at Barclays Bank meeting alluded to the year's expansion in bank advances, and Mr Orme pointed out that Martins Bank advances now stood at 44 per cent. of deposits. Mr Fisher, who was taking the chair at his bank's general meeting for the first time, repeated and extended the analysis of bank loans given by his predecessor last year. He first gave the following broad division:—

Loans to—	PERCENTAGE OF TOTAL LOANS	
	End October, 1935	End November 1936
Productive industry	32.7	31.8
Professional and private ..	35.7	34.0
Farmers	7.9	7.1
Builders, etc.	7.5	8.8
Financial companies	4.9	7.5
Merchants, etc.	2.6	3.5

According to Mr Fisher, the heavy industries are still able to finance their increased activity without additional resort to the banks. The improvement in the financial position of agriculture explains the slight drop in loans to farmers. The increase in loans to merchants and wholesalers in raw materials and unmanufactured foods reflects the year's rise in commodity prices, while it is not surprising to see an increase in loans to builders. The big expansion in loans to financial companies, including insurance companies, trust companies and foreign banks, was accompanied by a parallel increase from 598 to 1,028 in the number of such borrowers.

F Loans to Private Borrowers.—Mr Fisher proceeded to give a most interesting analysis of Barclays Bank's loans to professional and private individuals. An abbreviation of his statistics is given below:—

Loans for—	PROFESSIONAL AND PRIVATE LOANS			
	Amount (£'000)	Per cent. of Total Advances	Number of Customers	Average Loan per head
Land and/or house purchase	17,408	10.1	16,682	1,043
Investment in securities	9,625	5.6	5,867	1,640
Loans to—				
Architects, estate agents, etc.	2,296	1.3	2,627	872
Business directors, managers and employees...	8,536	4.9	22,151	386
Doctors, etc.	2,523	1.5	4,724	535
Lawyers	2,042	1.2	2,186	932
People of private means, etc.	11,503	6.7	44,482	259
Others	4,729	2.7	20,290	233
Total	58,663	34.0	117,917	498

We ourselves have added the final column, in which we have deduced the size of the average loan to each customer. The aggregate amount lent for the purchase of land and/or houses is very striking, for in combination with direct loans to builders, it represents practically one-fifth of the bank's total advances. The banks are thus intimately concerned with the maintenance of building activity, if only because the interest on these loans represents an important source of income. Mr Fisher has explained that bank loans to buyers of houses represent temporary accommodation, pending the arrangement by the borrower of a long-term mortgage elsewhere; but even so the total bank loans of this character are commensurate in their aggregate with those of the leading building societies. Advances to finance investment in securities presumably represent loans to professional operators, for no doubt part of the money borrowed by the various classes of professional workers was used by them to pay for stocks and shares. The average "professional" loan ranges from £146 per head for schoolmasters and £212 per head for officers and clergymen to £872 for estate agents and architects and £932 for barristers and solicitors. This is a most useful analysis, and we should like to see a standard form adopted by all the banks and issued periodically.

A London Banking Change.—It was announced this week that the five directors of Grace Brothers and Company, Limited, an old-established firm of private bankers, had resigned. A statement was subsequently issued to the effect that the firm had decided not to continue its banking business, and that the plan under consideration contemplated a return of capital to the shareholders. The American house of W. R. Grace and Company will, it is believed, establish a London agency in the place of Grace Brothers and Company. The London house sprang from the activities of four brothers, who established themselves in London, New York and San Francisco last century, and that explains the link with the United States. At one time they had substantial South American interests, but during recent years Grace Brothers and Company have been engaged in normal private banking business. On June 30th last they had capital and reserves of £1,015,000, acceptances of £298,000 and deposits of £471,000. Except for standstill commitments of £197,000, offset by a contingency reserve of £60,000, the firm's position was very liquid. It is understood that a new balance sheet, dated December 31st last, will shortly be issued. The firm will continue to meet its acceptances as they fall due, and the market understands that it is ready to take up its bills at once if the holders so desire. So far there has been no such desire. The position of its standstill engagements has not yet been defined. No details are yet forthcoming of the reasons behind this change, but a director of the American house has alluded to certain divergences of policy. The City will regret the disappearance of one of its oldest houses, but there is not the smallest fear of any disturbance to the market, nor any suggestion of underlying weaknesses.

December Clearing Bank Averages.—The December returns of the ten English clearing banks reveal some interesting changes compared with November. In spite of the heavy Christmas currency withdrawals, cash averaged £11 millions more in December, partly because bankers' deposits were relatively low early in November and partly because of the banks' accumulation of cash during the last week of December. There was a further increase in deposits to a new high record, while the expansion in cheques in course of collection, etc., reflects the Christmas spending:—

	(In £ millions)					
	Dec., 1935	Nov., 1936	Dec., 1936	Oct., 1936	Nov., 1936	Dec., 1936

(a) Excludes District Bank.

(b) Includes District Bank.

The decrease in bank advances is solely due to the repayment of the French sterling credit of £40 millions, which began late in November and continued during subsequent weeks. As this repayment was governed by French gold sales to the Exchange Equalisation Account, a secondary consequence was an expansion in tender issues of Treasury bills. For this reason the December contraction in the banks' discounts was more than offset by an increase in their call and short loans; for although the banks were reluctant to take up new bills immediately before Christmas and the New Year, more bills were being issued, and these had to be taken up by the market. There was a slight increase in the banks' investments.

"Shillings and Pence."—The appeal to customers to tell their bankers to pay over to the King George V National Memorial Fund the amount of the odd shillings and pence in their accounts on the night of January 20, 1937, has rightly evoked a widespread response, and full credit is due to those who had this ingenious idea of collecting a large volume of funds. Nor is there any need for us to stress the merits of the object of this appeal. We are here concerned with a comparatively minor aspect, which, however, ought not to be allowed to pass unnoticed. The transfer of this money has involved bank staffs all over the country in a vast amount of additional clerical work, simply to look up the balance, debit or credit, of each customer and then to debit the account with the odd shillings and pence. This work was considerably heavier than it would have been if the appeal had been for an even number of pounds. The banks and their staffs have given their work ungrudgingly in recognition of the fact that contributions to the Fund can be in labour as well as in cash, and they are the last to suggest that they should receive special recognition. Yet we are sure that the general public do not realise the magnitude of this extra burden thrust upon the banks, and we are equally certain that the public would like to express their thanks. The Lord Mayor in fact has already done so, but we are confident that the suggestion needs only to be made, for a further tribute to be paid by an even more exalted quarter to the banks and their staffs, who alone made possible the success of this scheme.

The Union Discount Company.—The accounts of this company are now available, and so we can complete our survey of the 1936 results of the leading discount houses. Unlike Alexanders and the National, whose accounts we discussed last week, the Union has been able to reduce its outside liabilities in the form of loans and deposits, while at the same time both its discounts and its securities are practically unchanged. This is the main explanation of the increase of £10 millions in its profits. All this is due to the changes in the Union's capital structure, due to the issue last February of 50,000 new shares at a premium of £7 10s. and the subsequent capitalisation of £1,375,000 from reserves for the purpose of making the £5 shares fully paid. Allowing for the transfer to reserve of £250,000 from the current year's profits, the net result is an increase of £750,000 in paid-up capital and reserves—that is in the Union's internal resources:—

	December 31,		
	1934	1935	1936
Liabilities:	£ mill.	£ mill.	£ mill.
Capital	1.2	1.2	2.7
Reserve fund	1.8	1.8	1.0
Loans, deposits, etc.	52.2	59.2	57.3
Rediscounts	4.2	6.6	8.2
Rebate	0.3	0.3	0.3
Assets:			
Cash	1.4	1.5	1.5
Investments	14.2	16.2	16.1
Loans	1.6	3.8	1.4
Discounts	43.0	47.8	50.4
	£'000	£'000	£'000
Gross profits	308	310	320
Expenses	77	76	76
Net profit	231	234	244
To reserve fund	Nil	Nil	15
To pension funds	15	15	15
To dividends	194	194	204
Change in undistributed profits	+22	+25	-225

Owing to the increase in capital, the dividend required another £10,000, but both the final half-year's dividend and the cash bonus were reduced by half, to allow for the writing-up of the shares from £2 10s. to £5 paid. At the end of 1936 discounts equalled 73.5 per cent. and securities 28.1 per cent. of net resources, compared with percentages of 71.3 and 27.4 at the end of last year.

The Foreign Exchanges.—There has been some activity on the Continent, but the London market remains quiet. The New York rate was \$4.90½. Some interest is taken in the continued outflow of gold to New York, which last week alone amounted to £5.6 millions.

It is thought that American interests are prepared to bid for gold in the London bullion market with the tacit assent of the British and American authorities, who may not be unmindful of the impending repayment of the balance of the United Kingdom 5½ per cent. dollar bonds. It was announced on Thursday that the Egyptian Government intend to sell in the London market £10 millions of their gold reserves. The French franc remains pegged at Frs. 105.15, but there are rumours that the French authorities may drop the peg to the lower statutory limit of 43 milligrammes of gold to the franc. At the prevailing London-New York exchange, this would raise the pound to Frs. 112. The French Treasury is known to be in need of funds, and the exchange position is also weak. Dutch guilders are strong at Fl. 8.90, and the forward rate is not at par to a fractional premium. The Dutch Exchange Fund has had to sell another £5.5 millions of gold to the Netherlands Bank, in order to replenish its stock of guilders. The yen is inclined to be weak, in spite of the new Japanese exchange restrictions.

The Money Market.—Apart from a moderate afternoon demand for loans and some calling on Wednesday and Thursday, conditions have been very easy. The banks have not been eager buyers of bills, but there were some purchases of March and early-April Treasuries at ½ per cent. Since December 19th aggregate issue of Treasury bills by tender has been reduced from £617 to £575 millions as the result of the heavy seasonal influx of revenue. Last week's tender was only £30 millions, against £50 millions in early December, and this latest tender was almost entirely missed by the market. The tender rate was only 10s. 6.33d. per cent.

	Dec. 31, 1936	Jan. 7, 1937	Jan. 14, 1937	Jan. 21, 1937
	%	%	%	%
Bank rate	2	2	2	2
Clearing banks' deposit rate	½	½	½	½
Short loan rate:—				
Clearing banks	1½-1½	1½-1*	1½-1*	1½-1*
Others	1	½	½	½
Discount rates:—				
Treasury bills	1½	1½	1½	1½
Three months' bank bills	1½-1	1½	1½	1½-1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

There were rumours in the market on Thursday of another impending Treasury operation, but it was impossible to obtain any substantiation.

The Bank Return.—A further £4.5 millions of the Christmas notes have returned to the banks, and the circulation is now nearly restored to its mid-November level of £445 millions. The Reserve is now £63.6 millions, against £64.6 millions in the middle of November, so that the five-million net expansion in the credit base, due to the Bank's gold purchase in December, is beginning to reveal itself.

	BANK OF ENGLAND				
	Jan. 22, 1936	Dec. 30, 1936	Jan. 6, 1937	Jan. 13, 1937	Jan. 20, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	200.2	313.7	313.7	313.7	313.7
Note circulation	394.9	467.4	462.7	455.0	450.5
Banking Department:—					
Reserve	66.0	46.8	51.4	59.0	63.6
Public deposits	13.1	12.1	13.5	12.4	13.6
Bankers' deposits	118.9	150.6	110.2	106.7	100.3
Other deposits	36.4	39.2	38.4	38.3	37.6
Government securities	86.7	134.5	93.3	83.2	74.9
Discounts and advances	19.3	17.5	14.4	12.5	8.9
Other securities	14.5	21.2	21.1	20.8	22.1
Proportion	39.1%	23.1%	31.7%	37.4%	42.0%

There were further reductions this week in Government securities and discounts and advances, so that in spite of the week's return of notes from circulation, bankers' deposits have fallen by £6.4 millions. They are still higher than during the latter part of last year.

THE STOCK EXCHANGE

Commodity Bonds Reviewed

THE London Stock Exchange, ready as ever to invent portmanteau names, now dubs South American loans "commodity bonds." Though most bonds are dependent, directly or indirectly, on commodity prices, South Americans are traditionally and particularly sensitive. Many were in default before industrial depression descended on Great Britain, and until last September their progress towards recovery was limping. Since then, however, a major rise in commodity prices has gathered headway. The recovery of Argentina and Brazil has riveted the market's attention; and fully serviced bonds have shared a robust advance with issues in partial or total default.

The extent of the advance may be gauged from the accompanying chart, which compares the total "Municipal and General" index of 113 bonds with two of the component series of the index—namely, South (and Central) American and defaulted issues. Since the end of September, while the total index has advanced by 10½ per cent., the South American and defaulted indices have advanced by 22 per cent and 21½ per cent. respectively. Since September, 1935, the two series have advanced by 48 per cent. and 53 per cent. respectively. There has thus been a noteworthy correlation between the movements

"MUNICIPAL AND GENERAL" INDEX OF BOND MOVEMENTS.
(JAN.-JUNE 1934=100)

of defaulted bonds in general and South American bonds. This correlation is inevitable, for, with the exception of Argentine Government issues, not a handful of South American bonds qualify for full investment status. Even Argentina, favoured with political stability and rewarded for her good faith by a 3½ per cent. conversion operation last year, is ultimately one of Nature's beneficiaries, and Nature is a wayward patroness. Argentina thus has reason to congratulate herself on achieving a 4 per cent. credit ranking both in London and New York. A yield basis comparable with that of a stable British industrial is all too rare in the foreign market.

There are two Argentine issues, however, to which the institutional investor might well give fuller attention. The "B" (5½ per cent.) Certificates of the United Kingdom and Argentine Convention Trust are backed, at present, by 71.4 per cent. of 3 per cent. Conversion Loan, and the balance is covered ten times by Argentine Government securities. In 1941, this issue will be fully covered by Conversion Loan, and in 1951 it should be finally redeemed. A redemption yield of £4 2s. 6d. per cent. certainly appears generous for a security which is within four years of achieving gilt-edged status as to

capital and within nine years of full gilt-edged security for interest. The "C" Certificates of the Trust, again, are partially a gilt-edged "risk," for by 1953 they should be covered, £ for £, by 3 per cent. Conversion Loan, together with an additional 22.4 per cent. in Argentine 4 per cent. bonds. Taking final redemption at 120, the "C" Certificates, now standing at 93, offer a potential yield of approximately £4 10s. per cent.

It is true that a sixteen-year view is relatively long, even for the investor interested in so settled a community as Argentina. It would be wholly inapplicable, at the present time, to the case of Brazil. Recently, considerable market attention has been given to Brazilian bonds, particularly on foreign account. Some buyers appear to have been attracted by the increased debt service due after March 31st under the 1934 Debt Scheme. But Brazil's recovery, so far, has been a rather patchwork affair. Shipments of Brazilian coffee during the first ten months of 1936 were the lowest in volume for any normal year of the last decade, but the rise in prices has broadly maintained their value. As this rise has been of the order of 75 per cent., the Brazilian producer has even been able to make some profit after delivering his 30 per cent. "sacrifice quota." But the authorities have now apparently decided to peg the price, rather than to stimulate competition from poor quality coffee in other countries, or to jeopardise a producers' agreement.

Brazil's continued dependence upon a single commodity—despite her increased production of cotton and fruit—still limits her recovery possibilities. Her exchange position is improving, but the market may have been inclined to read too much into the President's intervention to secure a balanced budget. In view of the enforced reduction of the debt service, the fiscal position might well be stronger. Finally, a Brazilian Presidential election is to be held this year. If its counterpart in the United States was a potent market factor, how much more disturbing an influence may be exercised by an election in a quasi-authoritarian State, where rivalries between South and Central may have been driven underground, but have not been extinguished. On present indications, it would seem premature to expect any considerably increased offer from the Government when the 1934 Debt Scheme is reviewed, between now and September. The 1931 Funding and San Paulo 7 per cent. Coffee Realisation issues have some attractions for the speculative investor on their 7 per cent. redemption yield basis. But it is not impossible that they will be quoted at lower prices later on.

Both in Brazil and in Chile, the extent to which the British bondholder is likely to share in the fruits of recovery must depend partly upon the force with which his representatives insist upon his right to equitable treatment. The present working of the Chilean debt settlement aptly illustrates the force of this contention. The fact that Chile's Budget is balanced affords but scant consolation to the bondholder, whose interest is now restricted to an extra-budgetary moiety in the Government's income from nitrate and copper. The remainder of that income is devoted to redemption—in other words, to the purchase by the Government of its bonds at "knock-out" prices. The increase in the service from 9s. 6d. to 12s. 1.2d. per cent., announced last week, cannot be regarded with any great satisfaction. Nitrate revenues are still relatively depressed, and it is fortunate for the bondholder that a further increase in the copper tax is probable during 1937.

On any estimate of transfer possibilities, however, current market valuations of Chilean bonds appear anomalous. The 4½ per cent. and the 6 per cent issues receive 12s. 1.2d. per cent. equally. Yet the latter stand

fully three points higher (around 25½) than the former, though they would almost certainly take second place, as junior issues, if any increase were made in sinking fund provisions. Chile's trade statistics, again, give an optimistic impression of her free exchange resources, since a large proportion of her trade is conducted under compensation agreements. The market, altogether, seems to have gone far enough, for the time being, in discounting Chile's recovery possibilities, and her ability and willingness to pay larger sums in current interest.

We may, finally, consider the prospect of Peruvian securities. The Republic's recent record is mainly one of good intentions unfulfilled. In the 1936 Budget, resumed debt payments were proposed "within Peru's economic capacity." The subsequent rise in cotton and sugar prices has undoubtedly improved this capacity. Yet, with the exception of half coupons on the 7½ per cent. Guano Loan, standing at 54½, the interest service is in complete default. Consequently, Peruvian Corporation 6 per cent. debentures would appear much more interesting to the speculative investor, at 71, cum £19 arrears. Last year's gross traffic increase amounted to £185,461 (or 24 per cent.) and the stock thus profits directly from the Republic's recovery. Although subject to moratorium until the end of 1937 (or 1938 if extended), it represents an enforceable railway security in the last resort, and may still be preferred, under existing conditions, to the direct obligations of the Peruvian Government.

The broad conclusion suggested by this survey is that the rise in prices of "commodity bonds" has already largely discounted the effects of the rise in commodity prices. Of the ability of the issuing Governments to pay more to their bondholders there are clear signs, but their willingness is, perhaps, more open to doubt. The investor cannot, by thought-taking, increase the measure or pace of economic recovery; but his representatives can, and should, ensure that in the important negotiations which will be carried on during forthcoming months, his just claims will be urged by every legitimate means. If justice is to prevail, her elbow needs all the power that peaceful but determined suasion can afford.

Investment and Company Notes

Gilt-Edged Indisposition.—The gilt-edged market has not wholly escaped the prevailing epidemic. Long-dated British Government stocks were noticeably indisposed at the beginning of the week, and a few bears from other markets were emboldened to try the effect of a little speculative selling. Mr Keynes, for once, was their involuntary helper, for the market felt that he somewhat overstated his case last week. No one was convinced that the Treasury could maintain low interest rates by market manipulation alone. And Mr Keynes's omission of any direct recommendation of a broadening of the credit basis was regarded, rightly or wrongly, as an indication of his own reluctance to commit himself to such a policy at a time of rising prices, active trade and an unbalanced Budget. Broadly, the market feels that, if there were no Treasury "control," no "planned economics," and no Mr Keynes, the old-fashioned signs would now all be pointing to a rising tendency in interest rates. As things are, the consensus of opinion in the more responsible professional quarters is that some rise has now become inevitable; but it may be slow, and it will certainly not carry rates back anywhere near the level of eight years ago. For the immediate future, the question of a re-armament loan is the cynosure of speculative discussion.

FOR
SECURITY:
STABILITY:
STRENGTH:

This popular unit trust spreads your investment over 23 first-class British companies, all sound dividend payers and notable for their very strong financial and trading positions. The yield, from cash dividends only, was about 5% gross in the past year. Lloyds Bank Limited are Custodian Trustees of the underlying securities.

OVER 45,000 INVESTORS HAVE INVESTED MORE THAN £11,000,000 IN BRITISH INDUSTRY THROUGH THE MEDIUM OF THE "15 MOORGATE" GROUP OF UNIT TRUSTS.

7, Pall Mall, Manchester, 2

Member of the Unit Trusts Association

With its broad aspects we deal in a leading article on an earlier page. If last week's small issue of Treasury-guaranteed London Electric Debenture Stock was designed by the authorities to test the level of the waters round Mount Ararat, the experiment has not been wholly encouraging, for the dove has returned bearing a discount.

* * *

Wall Street and Inauguration Day.—The strength demonstrated by Wall Street during this week must be attributed to a general belief in the inherent buoyancy of prices and to some covering by "shorts," for specific news was no more than reasonably encouraging. The truce announced in the motor dispute proved to be short-lived, and was soon replaced by mutual recriminations, and by a renewal of hostilities. The strategic position of the Lewis Union is strengthened by the settlement of the Pittsburgh plate glass strike, which will allow supplies to flow to General Motors' competitors, and so isolate the major dispute. But Wall Street, determined to see the best side of everything, took encouragement from the increased activity of steel mills, which have taken the opportunity provided by a falling automobile demand to satisfy orders from other customers. News of the TVA negotiations with the utilities suggested an impending breakdown, on the rumoured determination of the President to refuse to compromise the full extent of his power programme. And his inaugural address was hardly in the mild Conservative tradition which had been forecast as the keynote for the next four years. Yet the market found consolation in the absence of specific threats against the moneychangers and speculators. An increase in car-loadings, and the announced \$60 millions expansion programme of United States Steel, found the market in the right mood. And so prices have advanced and turnover has increased, to Wall Street's satisfaction.

* * *

Building Society Trends.—Will 1937 see some slackening of residential building construction and

finance? Sir Harold Bellman recently addressed himself to this problem and concluded that any falling off of house construction and—by implication—building society business is bound to be gradual and not perceptible. No change of tendency is to be found in building society reports so far available. Significant changes in the tempo of progress or in the character of advances may be better studied when the results of the larger societies for 1936 are shortly published. Recent indications show no diminution of business. These accounts include the National and Woolwich Equitable, (which were discussed on page 592 of *The Economist* of December 19th), while the Leicester Permanent report shows an increase of £2,833,000 in mortgage assets during 1936 to £13,200,000. Further progress has also been reported by the two large Burnley Societies—Borough Building Society and Burnley Building Society. In view of the fall in the value of dwelling-house plans approved during 1936, their reports are very satisfactory. These figures are not a direct indication of actual building activity. But the societies are doubtless pursuing greater caution in advance business against builders' personal guarantees. Little progress has been made under the scheme laid down in the 1933 Housing Act for guaranteed advances on small houses for letting. The main event of last year in the movement was the formation in June of the Building Societies Association, which gathered in 200 members, representing 87 per cent. of the assets of societies formerly composing the National Association of Building Societies. A "Code of Ethics and Procedure" was drawn up and began to operate on October 1st last, but its precise significance cannot be estimated. It is to be presumed, however, that common lines of policy are now in force regarding the investment branches. Some relaxation of the limits imposed on new deposits was again introduced last year, and some societies showed greater willingness to accept new funds. Whether—and in what degree—common agreement has been achieved regarding mortgage business cannot be judged. But in view of the importance attached to this branch by the leaders of the movement, the Association should at least be feeling towards the main lines of corporate policy. After seven relatively fat years, the Biblical precedent is perhaps appropriate for the building society movement.

* * *

Birmingham Companies.—As the economic focus of the prosperous Midlands, Birmingham (whose story forms the subject of a special leading article on page 159 of this week's issue of *The Economist*) is the domicile of a large number of companies of first-class investment status. Their variety of products (though many are in the light engineering trades) is no less remarkable. And most of them have dividend records of enviable strength.

† Tax free.
(a) And 20 per cent. capital bonus. (b) Final of 15 per cent. on increased capital. (c) And 50 per cent. capital bonus. (d) And 50 per cent. capital bonus. Ordinary capital increased from £997,150 to £2,000,000 since report. Yield on 12½ per cent. dividend, £2 12s. 6d. per cent. and on 27-8 per cent. earnings, 5-8 per cent. (e) 6 per cent. interim and 10 per cent. final on larger capital.

The investor does not, on the whole, turn to Birmingham for high-g geared equities, but rather for the share which provides a regular 15 per cent. dividend with capital bonuses at intervals. *W. and T. Avery* is a share in point. The company's reputation as weighing-machine specialists is world-wide, and its prospects of further expansion of trade appear to be limited only by physical

capacity. Metal-working concerns, such as *James Booth, Fisher and Ludlow* and *Harrisons (Birmingham)* and *Birmingham Aluminium Casting* (now known to the investor as *Birmid*) naturally take a leading place among prosperous Birmingham companies. *J. Brockhouse* specialise in springs for the motor industry and produce forgings. Another link with the motor industry (which is dominated in the Birmingham area by the Austin Longbridge works) is provided by *British Piston Ring*, though this company actually has its headquarters at Coventry. There is no sign of depression in the recent record of these companies, as the accompanying table shows. Some concerns, like *Birmingham Small Arms* and *Birmingham Railway Carriage and Wagon*, have made slower progress, but re-armament demand and railway re-equipment should produce a marked effect upon profits in future reports. A prosperous industrial area implies prosperity for a wide range of consumers' goods industries. Brewery shares are therefore a leading feature in Birmingham's investment opportunities. They include *Ansells* (which produced a spectacular report and bonus last November), *Mitchells and Butlers* and *Wolverhampton and Dudley*. *Wilkinson and Riddell*, the wholesale drapery concern, pays 8 per cent. tax-free dividends with unfailing regularity. Even then, the list is far from complete. It would need to include *Southalls (Birmingham)* (producers of cellulose products), such concerns as *W. Canning*, *Delta Metal* and *John Harper* in the metal trades, and *Horseley Bridge and Thomas Piggott* among the heavier engineering concerns. Birmingham, in fact, is one of the provincial stock exchanges whose wares are frequently of definite interest to the outside investor.

* * *

Birmingham's Stock Exchange.—As befits a prosperous manufacturing centre, with a range of securities of keen local interest, Birmingham can make full use of its well-organised Stock Exchange. Like the Exchanges in other large provincial centres, it is represented on the Council of Associated Stock Exchanges. Its membership of almost exactly one hundred is thus bound by similar professional standards to those of the London market itself. There are numerous shares, particularly in the motor industry, which are valued in London to-morrow according to Birmingham's view to-day, but the liaison between the two markets in most sections is particularly close. Recent heavy dealings in small engineering concerns have been fed by a specialised demand from the Midlands, which has been canalised through the Birmingham Stock Exchange. In this manner, local economic patriotism and knowledge are wedded to wider dealing opportunities than a provincial market, of itself, could afford. With the growing wealth of its hinterland, therefore, the Birmingham Exchange seems destined to enjoy continued future progress.

* * *

Disappointing Imperial Tobacco Dividend.—This week's announcement by Imperial Tobacco is a less auspicious curtain-raiser to the tobacco-dividend season than the market had hoped. True, the total distribution of 25 per cent. tax free, against 24 per cent. for 1934-35, is the highest since 26 per cent. was paid for 1928. In 1929 a 25 per cent. share bonus was declared—and this feature of prosperity, to the market's general disappointment, is lacking in the statement. It is possible to make a provisional calculation of profits from the information published. Here, again, the estimated increase of £367,300 in profits which the following table reveals seems relatively modest:—

	Years to October 31st.		
	1934	1935	1936
Profit	9,589,008	10,268,210	10,635,549*
Preference dividends	852,209	852,209	852,209
Ordinary shares (tax free):—			
<i>Earned</i>	8,736,799	9,416,001	9,783,340*
<i>Paid</i>	8,435,840	9,015,131	9,390,762
<i>Earned (%)</i>	23-3	25-1	26-0*
<i>Paid (%)</i>	22½	24	25
General reserve	Nil	500,000	250,000
Carried forward	1,139,552	1,040,422	1,183,000

* Estimated.

An increase of 3.6 in total profits, compared with 30 per cent. for Carreras and 18 per cent. for Gallaher (in 1935), is surprisingly small. It is inconceivable that the group's sales should not advance at least as rapidly as those of its competitors. Nor can this slackening of progress be explained by rising leaf costs, which are equalised under the company's stock policy. In fact, these indicated profits give no clue to the group's actual earnings, and a first reading of the figures suggests that policy must have intervened between satisfactory earnings and their distribution. Robbed of the expected share bonus, "Imps." have been left rather high and dry. The £1 shares fell from 8½ to 8½ on the statement. A gross yield of £3 17s. per cent. leaves them in the stable industrial class, apparently bereft of full-blooded prosperity prospects.

* * *

Cable and Wireless Estimates.—Those speculators who carried the "A" ordinary stock to 25 on the December Cable and Wireless traffic apparently gave too little heed to its exceptional nature. The volume of Press messages during December reporting the abdication to the Empire and the eye-witness accounts of the cricket pundits from Australia suggests that it should be treated as exceptional. Complete traffic indices for the year enable us to put forward our usual earnings estimate for Cable and Wireless (Holding) 5½ per cent. preference stock. The average monthly index fell last year from 73.5 to 72.7. Using this fall as an indicator of total receipts of the Communications Company (not wholly accurate since it is based on 1929 and is thus adjusted to exclude new sources of revenue) it would appear that net traffics, after Government taxes, may have fallen by approximately £50,000. For 1935, the company had to provide £146,000 for exchange losses. In some directions this burden may be lower, but traffics originating in devalued gold currencies have presumably fallen in sterling terms since September.

Since the index number does not disclose the method of treating currency receipts, however, it is impossible to be definite on the point. But the poor traffic comparisons of September and October may be associated with gold currency devaluation. It seems reasonable, therefore, to allow £100,000 for exchange losses for 1936, but the figure is in the highest degree provisional. So far, plus and minus, on these assumptions, would cancel out.

On the operating side, changes are probably of a minor order. Such stable items as station working, cable maintenance and renewals, and rents should be little altered. Further savings on administration and pensions to retired staff may be expected, and income from subsidiary companies should again increase. A credit of £125,000 seems a fairly cautious estimate under these heads, but it might well be higher. Assuming that the Communications Company distributed its increased net earnings fully, and that the cable companies have maintained their investment income, Cable and Wireless (Holding) should receive this extra sum. In addition, Marconi's Wireless Telegraph enjoyed a better year, and a resumption of 6 per cent. dividends would mean an extra £30,000 for the Holding Company.

The latter will not be required to find the £64,534 due for preference share interest in 1935, but, on the other hand, the first year's working of the Cables Investment Trust has provided less than the expected revenue. All told, therefore, the net revenue of the Holding Company may be increased by £150,000—£175,000, bringing the total to £1,160,000. This sum would cover about fifteen months' dividend on the reduced preference capital (in arrears since March, 1934), or about 1.2 per cent. on the "A" ordinary stock assuming normal preference dividends. On this showing, the preference stock, at 106½ cum £15 gross arrears is an interesting speculative invest-

ment, but the "A" ordinary stock at 23½ must depend upon a rapid increase in normal traffics (which are somewhat slow to recover) to improve its prospects under any capital scheme which the Board may propose.

Triplex Capital Proposals.—The melon which the directors of Triplex Safety Glass are proposing to cut is of unusual shape. The existing capital consists of £200,000 in 10s. shares, now standing in the market at 8½. It is proposed, first, to make a share-for-share bonus distribution of 400,000 10s. shares. In the second place, "existing" shareholders (i.e. at present) will be offered 100,000 shares, one for four, at 70s. per share. After this issue is taken up, a further 100,000 free bonus shares will be distributed to members—one share for each share taken up. The scheme has apparently been designed to enable all shareholders to share in the capital bonus, even though they may not be willing to supply new capital. Shareholders, in fact, will find more than the bonus issues in share premiums. Shorn of its complications, the scheme provides that a holder of four shares at the present price receives four more free, and by paying £3 10s. may obtain two more. On this basis, the rights are worth about £4 15s. The raising of new money on this scale suggests rapid absorption of liquid funds. At the end of last June, net current assets amounted to £123,000, but the company is apparently carrying larger stocks, and stresses the advisability of keeping larger cash resources against "various contingencies." Substantial cash capital is also required for the development of a newly acquired subsidiary. Since the company distributed its profits up to the hilt last year, the dividend prospect on the enlarged capital (£500,000 against £200,000) depends largely upon the length of the gestation period of the new cash capital. Although trading reports are excellent, the market probably did well to rest on the proposals, for even assuming a 30 per cent. dividend in the current year, the yield would not be lavish.

Steel Share Outlook.—In the first three weeks' dealings of 1937 steel shares have been irregular. A six-shilling rise has been recorded by Hadfields, but other shares have remained near their Christmas levels. This week, irregularity has been very marked. A few individual shares, like John Brown and Colvilles, have progressed, but otherwise losses up to sixpence have prevailed. The market, indeed, is in a somewhat difficult position. Superficial bull points are not lacking, and they have been seized by bullish commentators. The production figures for December and for 1936 as a whole are entirely satisfactory. The latest Cartel announcement has further strengthened the export market in sheets. There are reports of a "gentleman's agreement" to control tube export prices. All these factors afford apparent justification for a marking-up of prices. The market, however, is well aware of the present difficulties of the trade. It is common knowledge that the raw material position—and particularly the situation in the scrap market—is rather disquieting, and it is abundantly clear that bottle-necks are appearing. The very strength of demand, indeed, is by no means an unmixed bull point, for production had already expanded far enough to yield full economies of large-scale production a year ago, and a further advance may even increase operating costs. The majority of investors, therefore, are inclined to bide their time until they see the accounts of some of the chief companies which report to December 31st—Baldwins, Stewarts and Lloyds, and Lancashire Steel. In the meantime, it seems that prospective earnings—apart from any profits which may be accruing by way of special prices to special consumers—are adequately discounted by the present levels of share prices.

Commercial Motor Progress.—Recent reports from commercial motor manufacturers have shown a more decisive improvement in profits, and the trend is

confirmed by the results of Leyland Motors. The 2½ per cent. increase in dividend to 20 per cent. is more modest than the market expected, but profits are 24 per cent. higher at £557,390. After providing £119,677 for income-tax, or some £34,400 more, the equity earnings are £291,294, or 42.4 per cent., and reserve receives £150,000. This conservative distribution policy has certain parallels with A.E.C., whose results were discussed in *The Economist* of December 5th last. Both companies are distributing half or less of their earnings. A comparison between profits and the number of commercial vehicles registered confirms the wisdom of increasing dividends roughly in accordance with the general rise in demand. Special factors may produce transient changes of profits for individual concerns in the commercial vehicle industry, although technical conditions are more stable than for private car production. Index numbers of profits of three commercial motor manufacturers and of new registrations of commercial vehicles show very close correlation in 1934-35, but some marked divergences in the latest year:—

	September, 1933-4	1934-5	1935-6
Total profits:—			
A.E.C.	100	109	185
Dennis	100	114	125
Leyland	100	112	139
Total, three companies.	100	112	149
Registrations	100	106	119

A repetition of the sharp increase of A.E.C. can hardly be relied upon, as demand fluctuates, but the table suggests that the traditional investment policy in the commercial vehicle market should still prove sound and profitable. Quite simply, it merely involves a spread of interest over Leyland and A.E.C., with Dennis as the third ingredient to taste.

A Preference Share Repayment.—Is there a case for repaying preference capital by a company well able to meet the dividend, but too comfortably endowed with cash for its current requirements? Judgment on the McIntyre, Hogg, Marsh repayment proposals depends on the answer to the question. The company has £120,000 issued in 5½ per cent. cumulative participating £1 preference shares, which have, in fact, received 9½ per cent. in recent years. It is proposed to pay holders 25s. per share, and to allot one ordinary share to them for every four shares held. By this operation, the ordinary capital would be increased from £219,000 to £249,000. The preference shares stand at 35s., and the ordinary at 45s. If allowance is made for the proposed capital rights, preference shareholders appear to have no cause for complaint, but in terms of income the

position is not so satisfactory. Holders will receive, for every four preference shares, only one ordinary share (paying 15 per cent.) plus cash which they will find some difficulty in reinvesting so as to obtain equivalent income with equal security. In any case, the scheme cannot be taken as a model by the generality of companies with "high-dividend" preference shares. The preference issue is small, and the double coincidence of large cash resources cum high-valued ordinary shares is anything but universal.

Company Results of the Week.—This week's reports include 18 bank statements, which are analysed on page 215, together with some 30 other companies. The bank reports are discussed in a leading article on page 179, and the results are set out on page 214, under the heading "Shorter Company Comments," together with a review of other company results.

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Barclays Bank, Martins Bank, Alexanders Discount, Liebig's Extract of Meat, Michael Nairn and Greenwich, South African Torbanite Mining and Refining, Sedenak Rubber Estates, Langen (Java) Rubber Estates, and United Serdang (Sumatra) Rubber Plantations. Mr E. B. Orme gave Martins Bank shareholders a comprehensive survey of the progress of trade, in particular shipbuilding and cotton, in which the bank is closely interested. At Alexanders Discount Company meeting Mr. Colin Campbell pointed out that the bulk of last year's profits came from securities and not from bills. Mr Edwin Fisher's address to Barclays Bank shareholders again included an interesting analysis of advances made to various occupational classes. At the Michael Nairn and Greenwich meeting, the chairman referred to the difficulties in overseas markets which the company is combating. Mr H. Eric Miller disclosed to Langen (Java) Rubber shareholders that some forward sales have been made by instalments at rising prices. The 1936-37 crop is estimated at 465 tons. At the United Serdang (Sumatra) meeting, he referred to the interest shown by buyers in high-grade palm oil from Eastern plantations. At the Sedenak Rubber Estates meeting, the chairman pointed out that an extra 1d. per lb. profit represents 3 per cent. on the company's capital. Mr W. Patrick Jones, at the South African Torbanite meeting, expressed belief that the full petrol quota would shortly be distributed. At the Liebig's meeting, Mr Kenneth Carlisle reported on the manufacturing programmes of the South African factories.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: FEBRUARY 2 ACCOUNT: FEBRUARY 4

This week has not seen the Stock Exchange at its happiest. Despite the arguments of Mr Keynes that, by taking thought, interest rates can be fixed at will, the gilt-edged market has remained despondent. Industrial conditions remain patchy, with investors more than half convinced that major rises on a broad front belong to the past. And in the commodity sections, the high prices of metals and rubber have proved rather vulnerable causing an early reaction in the shares.

Undoubtedly, the Funds have been the greyest section in the market. The talk at the beginning of the week was still concerned over the imminence of a defence loan and the Budget. The alleged vulnerability of the market to speculative selling was irresponsibly canvassed in some quarters. In consequence 2½ per cent. Funding fell to a low record, and despite the small mid-week recovery all stocks were well down on the week. London Electric Transport debentures were ½ discount on Wednesday.

Brazilian bonds attracted most attention in the foreign market at first, but considerable profit taking followed, and the advance was not renewed. Argentine Trust "C" Certificates improved one point on Wednesday. The position of Southern American bonds is discussed in a leading article on page 182. Conversion possibilities stimulated Austrian bonds and German issues made a strong mid-week recovery.

Fears of rising wage demands depressed home rail stocks from the opening, and there was no relief from the traffics, which are affected by heavy coal receipts a year ago. Marginal stocks and prior charges suffered alike. Activity promised to broaden in Argentine issues, but the news that the Argentine Senate had deferred consideration of the bill authorising the purchase of Cordoba Central brought about a heavy slump in the first debentures. Other Argentine issues reacted, despite impressive traffic receipts.

Industrial markets were irregular most of the week, and prices were generally lower than at the end of last week, although there were many exceptions. Monday was the best day in the iron and steel section, with John Brown prominent on good trading reports. Profit-taking later left most prices lower. The coal group saw slight gains on a small volume of business. In the aircraft section the main interest was provided by De Havilland which were bought on the meeting. The motor group was rather neglected. Triplex were in demand in anticipation of the bonus, and reacted afterward. There were signs of an improvement in some motors, particularly Standard in mid-week. Electrical equipment issues were still good, but interest tended to die away as the week advanced. In other sections of the market, Imperial Tobacco were lower on the distribution, which was not up to full hopes. Breweries were dull, and among rayon issues American Celanese were slightly higher. Shipping issues were higher, particularly Clan Line, and the hope of improved trade with Ireland had a good effect. Prices were irregular in the miscellaneous industrials section, with a falling trend, and no points of outstanding significance.

In the first part of the week, the oil market ranged from quiet to dull, though there was no weakness in prices. Selling from Amsterdam produced an inauspicious opening on Wednesday, but there was no difficulty in taking up stocks with Continental help later. The Trinidad group was the most interesting, especially Apex and Leaseholds, Shell and the Eagles being much quieter.

Rubber shares experienced a steady, though not serious, decline on the weaker commodity price, and were not helped by continuing labour troubles in the American motor industry. The best shares were steadily supported at the reduced levels. Investors appear to be holding back for a substantial fall in rubber and cheaper shares resulting therefrom. Tea shares were rather firmer than of late.

The mining market made an indifferent start, but once it had recovered from the speculative aftermath of last account, it looked out on Wednesday upon a brighter world. East Rand Consolidated was one of the few shares to be active

at first, but in mid-week interest revived in the developing mines, particularly West Witwatersrand and Klerksdorp. West Africans were contrary to the general trend, and quietened down after a fairly brisk opening session. Rhodesian copper issues made a good start, but almost at once begun to sag, and on Tuesday fell somewhat severely. Roans in particular. There was a slight rally in mid-week, on the firmer commodity price. Base metal shares were inactive.

The Paris Bourse saw a revival in mid-week, after a dull start, while in Berlin conditions were quiet, though without any real weakness in prices. Weaker commodity prices reacted on Amsterdam, which, however, shared in Wednesday's general recovery.

"FINANCIAL NEWS" MARKET INDICATORS

NEW YORK STOCK EXCHANGE

A burst of enthusiasm was evident on Wall Street at the close of last week, with steel issues leading the upward price movement on the U.S. steel expansion programme. This was taken as evidence that, strikes to the contrary, the steel industry fancies its future prospects. Electrical issues were close behind the leaders, and even motors were higher on the truce. Railroad issues were handicapped by the discussion between railwaymen's unions on wages. The first day of the current week found prices moving downward on the collapse of the motor truce. Copper issues fell on the lower commodity price abroad. Utilities were one of the few sections to hold firm, on the hope that division of opinion in the administration on the extent of government control would mean greater liberty for the private companies. There was a further slight fall on Tuesday, and metal stocks were lower on the lower commodity prices. But the President's Inaugural Address came to the rescue in mid-week by not

breathing any specific threats, and prices then recovered all their losses of the previous days. Business news apart from the automobile strike is still excellent; so far from there being any reduction in steel mill activity *Iron Age's* estimate for the week shows an increase to 81 per cent. of capacity compared with 79.5 per cent. last week. The bond market was strong in mid-week, except for Treasury issues.

CAPITAL ISSUES

THE new issue market is now giving greater attention to the small industrial company than at any time since recovery began, but the investor has also been offered the prior charges of an established brewery concern, and the ordinary shares of the second investment trust to be formed since 1931. For the long-term investor, who is prepared to hold his security through the changing sequence of interest rates, the debentures and preference shares of *Higson's Brewery* offer the traditional security of their class. The profits of this Liverpool company have increased fairly rapidly during the past three years, and are still progressive. The company's trading position is interesting, for it is partly independent and partly tied through Bass, Ratcliff and Gretton. The relative security of the debenture and preference stocks appears to favour the former. *British Isles and General Investment Trust* appears under well-known auspices. The prospectus emphasises that the investments will be spread over "a wide range of British and foreign securities, regard being had to countries where advantages from trade recovery may be expected." In view of the prevailing levels of British security prices, this policy is wise, and indeed essential. *Dussek Brothers*, whose 6 per cent. preference shares and ordinary shares have been offered this week (the latter at a 20 per cent. premium) is an established oil refining business of a specialised type. The current level of profits is estimated to be nearly twice that prevailing in 1934-35. A 10½ per cent. yield basis for the ordinary shares, therefore, is no more than reasonable. *Heenan, Beddow and Sturme* is a £67,500 merger of three businesses engaged in structural steel work and lock-making. In this instance also the ordinary shares are offered at a (50 per cent.) premium to provide a 10 per cent. average earnings yield basis, on the profits of the past three years. The issued capital of *Byard Manufacturing* is £60,000, consisting of 2s. ordinary shares which are offered at 100 per cent. premium, again putting the shares on an estimated 11 per cent. yield basis. This concern pays appreciably more than net asset value for the business taken over, but appreciably less than current valuation for an additional factory and plant which is also to be acquired. It is difficult to recommend shares of smaller companies to the general investor, for as recent prospectuses abundantly show, their profits are more volatile and their security is less

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

Profits, after depreciation, before directors' remuneration, years to October 10: 1934, £12,382; 1935, £15,344; 1936, £16,890. Confederation Securities, Ltd., take issue at 2s. 11½d., including expenses.

BY STOCK EXCHANGE INTRODUCTION

Beans Industries, Ltd.—Issued capital, 400,000 5s. ordinary shares and 110,000 5 per cent. cumulative £1 preference shares. Formed 1933 to acquire Bean Cars, Ltd., to carry on business of general engineers, ironfounders and drop forgers (latter section since sold). Profits, after depreciation, 11 months to November 30, 1934, £4,561; years to November 30: 1935, £8,260; 1936, £26,214. Net assets, £220,106 (excluding goodwill).

Butler Machine Tool Company, Ltd.—Issued capital, 800,000 5s. ordinary shares and 125,100 5 per cent. cumulative £1 preference shares. Business founded 1868. Net assets, £185,327, acquired for £203,800 (£18,473 goodwill), payable by £3,800 cash and 800,000 ordinary shares. Profits, after depreciation: 1933, Dr. £6,798; 1934, £12,053; 1935, £23,242; nine months to September 30, 1936, £31,064. Hoblyn and King take 75,000 preference shares at par for 6d. commission, and further 50,000 preference shares at par and 200,000 ordinary shares at 10s.

East of Scotland Trust, Ltd.—Particulars of issue of £100,000 3½ per cent. debenture stock, redeemable at par 1957, or from 1952 on notice. £50,000 stock sold to McAnally, Inglis and Littlejohn at 100, less ½ per cent. commission, with option on further £50,000.

BONUS SHARES

National Omnibus and Transport Company.—The directors recommend a share bonus of one new ordinary for every four ordinary shares held on February 13th.

ISSUES TO SHAREHOLDERS ONLY

Eastern Sumatra Rubber Estates.—Issue of 707,757 2s. shares to stockholders registered December 30th, at 2s. 6d. per share in the proportion of one share for every 10s. of stock held.

Gold Mines of Kalgoorlie.—Issue at par of 20,000 shares, which have been allotted to Gold Exploration and Finance Company of Australia, Ltd., that company having agreed to waive the rights of subscription which formed part of the purchase consideration for leases acquired by Gold Mines of Kalgoorlie, Ltd., in March, 1935.

Mutual Finance.—Issue of 800,000 ordinary shares of 1s. at 1s. 6d. per share.

Southern United Investment.—Issue of 15,000 £1 shares to shareholders registered January 4th at 25s. per share in proportion of 10 new shares for every 50 shares held.

R.F.D. Company.—Issue of 250,000 2s. shares at 3s. 6d., in the proportion of one for every two held on January 9th.

Gordon (Malaya) Rubber.—Issue of 257,000 ordinary shares 2s. at par, in proportion of one for every 10 ordinary held on January 18th. To provide funds for the acquisition of a rubber property in Negri Sembilan consisting of 495 planted acres.

British Tin Investment.—Issue of 1,065,600 10s. ordinary shares at 18s. 6d. each, in the proportion of seven for every 20 held on January 14th.

Mount Wellington.—Issue of 1,000 6 per cent. convertible debentures of £25 at par.

Boulder Perseverance, Ltd.—Issue of 1,500,000 1s. ordinary shares at 2s. 6d. sterling.

United States and General Trust Corporation, Ltd.—Existing £800,000 4½ per cent. debenture stock is to be redeemed at 102½ per cent., and £800,000 3½ per cent. debenture stock (1967-77) at 97 per cent. issued in its place.

Kimanis Rubber, Ltd.—Issue of 750,000 2s. shares at 2s. 3d.

CONVERSIONS AND REPAYMENTS

McIntyre, Hogg, Marsh and Company.—This company proposes to repay its 5½ per cent. £1 preference shares at 25s., and to offer existing preference shareholders one £1 ordinary share free for every four preference shares now held.

International Railways of Central America.—All outstanding first mortgage collateral 6 per cent. notes, due 1941, will be redeemed on May 1, 1937.

FORTHCOMING ISSUES

Richard Thomas and Company, Ltd.—The basis of the arrangements made with Messrs N. M. Rothschild and Sons is an issue price for the ordinary shares of 13s. 4d. per share and an issue price for the £7,000,000 4 per cent. convertible debenture stock of 99½ per cent. Subject to completion of the arrangements, the offer to shareholders will be posted on January 25th, and the public offer for sale will be advertised on January 26th.

RESULT OF ISSUES

London Electric Transport Finance Corporation.—Lists were opened at 9 a.m., January 14th, and closed at 3.30 p.m., January 14th. Applicants for up to £25,000 received a full allotment. Subscribers for larger amounts received about 88 per cent. of their requirements.

PRIVATE PLACING

Trans-Oceanic Trust.—This company has placed privately £50,000 3½ per cent. first debenture stock.

Watch America the Banker's Way . . .

To keep themselves well informed on the rapid changes in American business, leading bankers in Great Britain and on the Continent—as in America—depend on The Wall Street Journal.

The Wall Street Journal is complete, accurate, authoritative. It covers developments and trends in all industries, in banking, insurance, securities, commodities, import and export markets.

A wide inquiry conducted by certified public accountants revealed that American Bank Presidents consider The Wall Street Journal more useful to them than any other publication.

Free specimen copy, with subscription or advertising rates, furnished on request at London Office.

GOLDEN MOMENTS

England v. Wales

He's got to be good to get into his country's team—but what a Golden Moment it must be for him when he scores between the posts to give his side the victory.

But even the International, good as he is, can't smoke a better tobacco than "Cut Golden Bar" at a shilling an ounce. But it must be Wills's.

THE IMPORTANCE OF EXPORTS

MR EDWIN FISHER'S REVIEW OF THE POSITION AND OUTLOOK

The forty-second ordinary general meeting of Barclays Bank Limited was held, on the 21st instant, at Southern House, Cannon Street, London, E.C.

Mr Edwin Fisher (chairman of the bank) presided.

The Chairman, who was received with applause, said:—My Lords, Ladies and Gentlemen,—I will call upon the secretary to read the notice of meeting and the certificate of the auditors which appears at the foot of the balance sheet that has been submitted to you.

The Secretary (Mr W. N. Seeley) then read the formal notice convening the meeting and the report of Messrs Price, Waterhouse and Company, and Messrs Kemp, Chatteris, Nichols, Sendell and Company.

The Chairman: My Lords, Ladies and Gentlemen,—Is it your pleasure that the report and accounts submitted be taken as read? (Agreed.)

THE CHAIRMANSHIP

Before dealing with the ordinary business of the meeting, I should like to refer to the mention which is made in the report of the retirement in October last of Mr W. Favill Tuke from the chairmanship of the board.

To those who recall the words of Mr Tuke to the shareholders just two years ago, his decision to lay aside the exacting duties which the chairmanship of a large bank involves will not have come as a surprise. Nevertheless, his fellow directors accepted his resignation with great regret and are glad that, through his continued membership of the board, the bank will retain the benefit of his wide experience. I have been privileged to work in close association with Mr Tuke for 28 years and I thank him for much help and many kindnesses. His capabilities as a banker, his unflinching courtesy and his close interest in all that affects the welfare of the bank and of the staff, have earned for him gratitude from his colleagues and a feeling of real affection and respect from all who have worked with him. I feel sure that you share our great appreciation of all that Mr Tuke has done to promote the best interests of the bank during a long and honoured career. (Applause.)

As you know, I was elected to succeed Mr Tuke as chairman of the bank. I am not unmindful of the responsibilities which are attached to this position. I can only say that I shall do my best to justify the confidence which has been reposed in me. (Applause.)

Mr Goodenough has succeeded me as deputy-chairman of the bank. It is singularly appropriate that he should fill this important position; all who know him will realise that a better choice could not have been made and, for my part, I count myself fortunate in having him at my side. (Applause.)

We have recently suffered a severe loss in the death of Sir William Carruthers. Sir William was appointed a general manager following the amalgamation with the London Provincial and South Western Bank in

compared with the previous year. This movement accords with the experience of the other banks, as the deposits of the eleven London Clearing Banks, disclosed in their monthly statement for December, reached the record high level of £2,315 millions. If, for purposes of comparison, the figures of the District Bank be excluded, as that bank did not become a member of the London Bankers' Clearing House until January, 1936, the deposits of the other ten Clearing Banks were still a record. The average of the deposits of Barclays Bank in the year 1936, as returned in our monthly statements, was higher by £25½ millions than in the year 1935, and this increase compares with a rise of nearly £143 millions in the average for the ten Clearing Banks during the same period. The rise in the average level of bank deposits has been accompanied by an increase in the average holding of cash including balances with the Bank of England, which, together with a slight reduction in their ratio of cash to deposits, has enabled the banks to increase their earning assets and thus to provide the credit necessary to finance the growing commercial and industrial activity. In our own case, the average holding of cash in hand and with the Bank of England in 1936 was greater than in 1935, but the figures at December 31st last showed a decrease, compared with a year earlier, of £136,711 to £51,909,017 and the ratio to deposits stood at 12.08 per cent., against 12.79 per cent.

Money at call and short notice, at £26,318,800, is higher by £714,550.

BILLS DISCOUNTED

Bills discounted at the end of 1936, at £59,248,252, showed a contraction of £1,447,620 in comparison with the figures for the previous year, but our average holding for the whole 12 months, as recorded in our monthly statements, was greater than in 1935 by £7.7 million. This rise, which is common to the other clearing banks, no doubt reflects the increase in the average allotment of Treasury bills at the weekly tenders throughout the past year to £44.7 millions, against £37.7 millions in 1935. This latter increase has taken place in spite of the fact that the total of Treasury bills outstanding during 1936 has been appreciably lower than in the corresponding period of the preceding year. The expansion in the volume of Treasury bills available to the market must, therefore, have resulted from a decrease in those held by other parties, such as Government Departments and the Exchange Equalisation Account.

In recent years the Exchange Equalisation Account has had an important influence upon conditions in the discount market. When that Account was set up in 1932, and later, when its funds were increased, Treasury bills were issued to it, and these bills could be disposed of at any time that sterling was needed to purchase foreign currencies. Conversely, whenever the Exchange Equalisation Account sells foreign assets or gold, it has sterling funds to invest, and, although the manner in which these funds are employed may vary according to the circumstances prevailing, there is little doubt that the transactions of the Exchange Equalisation Account have an appreciable influence, at times, on the volume of Treasury bills available in the market.

AN INTERESTING PURCHASE

In this connection the purchase by the Bank of England, on December 15th last, of £65 millions in gold—which was accompanied by a reduction of £60 millions in the fiduciary note issue—is of particular interest, for, although the Chancellor of the Exchequer's statement in the House of Commons on that date did not make any reference to the source from which the gold was acquired, it was presumably bought from the Exchange Equalisation Account mainly against a transfer of securities—probably Treasury bills—by the Issue Department of the Bank of England. These securities can be disposed of whenever the Exchange Equalisation Account has to purchase foreign currencies to meet any exceptional demand for sterling.

Notwithstanding the larger volume of bills in the market, discount rates in the past twelve months have shown little change compared with 1935, the average rate of discount at which the Treasury bills have been allotted at the weekly tenders being only moderately higher at 11s. 7d. per cent., against 10s. 6d. per cent. for the preceding year. Of the total of some £59 millions of bills discounted held by this bank at the end of last year, nearly £36 millions were Treasury bills, while of the balance of £23 millions, a very large proportion was three months' fine bank bills, which were discounted at a similarly low rate. From these two facts it will be seen that, as an earning asset, bills discounted again produced only a very small return.

SCARCITY OF TRADE BILLS

Here I should like to refer to the scarcity of ordinary trade bills available to the discount market, which, although somewhat less pronounced than formerly, is still in evidence. This scarcity is due in part to the great reduction in the use of the inland trade bill, arising out of the changes in the system of financing domestic business. In recent years, other important influences have been the low level of international trade and certain alterations which have taken place in the method of effecting or receiving payment for goods bought or sold externally. A case in point is the conclusion of Clearing Agreements with other countries. Incidentally, these agreements tend to reduce the amount of the acceptances given by the banks for account of customers. At the end of December, the total of our acceptances and endorsements, etc., at £9,266,151, was higher than at the close of 1935, but it was appreciably smaller than the figure of £12,710,524 on December 31, 1930. Although the Treasury bill has gone a long way towards providing an alternative outlet for the funds at the disposal of the market, there can be little doubt that the long-sustained absence of a large volume of commercial paper must eventually have its effect upon market technique, as a result of dealing being so largely confined to one class of bill, namely Government paper.

INVESTMENTS

Our investments, without taking into account our holdings in associated banks, stand at £109,367,473. This figure is £3,240,153 higher than that shown in our balance sheet a year ago. On the other hand, owing to the increase in our deposits, the ratio of our investments to deposits has fallen slightly, being now 25.46 per cent., compared with 26.08 per cent. at the close of 1935. Of the total of our investments which I have mentioned, no less than £100,023,564 consists of securities of, or guaranteed by, the British Government, and you may be interested to know that by far the greater part of these holdings has a definite maturity date.

ADVANCES

Advances have increased to £179,655,011, against £160,549,222 on December 31, 1935, and the ratio of this item to deposits has risen to 41.82 per cent., compared with 39.46 per cent. The upward trend in advances is a further indication of improved industrial and commercial activity. In February last, in common with the other large banks, we participated in the credit for £40,000,000 granted to the French Treasury, but, as this accommodation was repaid before the end of 1936, it does not affect the comparison of our figures with a year ago.

Bearing in mind the activity in trade generally, it may be thought that advances would have shown an even larger increase on those of the previous year than has actually taken place. Although the figures are higher, and with the steady rise in commodity prices there are signs of an increasing demand for bank accommodation, a great deal of the current requirements of trade has doubtless been financed internally by the industries themselves without recourse to the banks, for in slack times working capital finds its way into liquid investments, and is therefore properly available for financing orders on a revival in trade. The approach to the banks for advances is, consequently, delayed. An excellent illustration of this fact is afforded by the decrease in our advances to the heavy industries, in spite of the well-known and substantial increase in activity which has taken place in these trades. There are various reasons to account for this reduction, but I would mention, in particular, the larger profits being earned, the realisation of investments and the favourable conditions for the flotation of new issues.

ANALYSIS OF ADVANCES

An analysis of our advances shows that, at the end of November, there were 202,228 customers having advances, compared with 200,744 at the end of October, 1935, the average advance being £854, against £774. The bulk of the advances made by the bank is to persons borrowing sums not exceeding £1,000, and at the end of November last the number of customers so borrowing accounted for 87.6 per cent. of the total, against 88.2 per cent. a year before. Loans to productive industry amounted to 31.8 per cent. of the total value, compared with 32.7 per cent. at the end of October, 1935. In this category, accommodation to farmers showed a slight reduction in amount and the percentage fell from 7.9 to 7.1. The financial position of agriculturists has undoubtedly improved as a result of some measure of recovery in conditions in the home farming industry, and this improvement has been reflected not only in a decline in the total of

advances to farmers, but also in a decrease in those advances which had been regarded as frozen or doubtful.

Advances to builders (including building material manufacturers and public works contractors) increased to 8.8 per cent., compared with 7.5 per cent. at the end of October, 1935. This was, of course, to be expected, for building activity in this country remains on a high level, and, although the rapid advance which had previously taken place in the construction of dwelling houses may have received a check, the erection of factories and workshops is still increasing and affords a further indication of the trading recovery. A marked rise from 4.9 per cent. to 7.5 per cent. occurred in advances to financial companies, under which heading are included insurance companies and brokers, trust companies and foreign banks, the number of such customers requiring accommodation increasing from 598 to 1,028. There was an increase in advances to merchants and wholesalers in raw materials and unmanufactured foodstuffs from 2.6 per cent. to 3.5 per cent., a rise which no doubt reflects the growth in imports and the improvement in the prices of these commodities.

LOANS TO THE "MAN IN THE STREET"

The largest single item in our analysis is once again that comprising the loans granted to professional and private individuals, in other words, money lent to the ordinary man in the street. This stands at £58.7 millions. You will understand that, although under normal conditions we consider it essential to know the purpose for which an advance is made, yet when we are lending to reputable professional and private customers it is not always possible for us to ascertain the exact use to which the money will be put. No doubt the bulk of the sums borrowed is used directly or indirectly to finance industry, whether wholesale, retail, productive or otherwise, but because the figure is so high I arranged for an analysis to be prepared which I will not recite to you here, but which you will find in the appended table. I suggest that these details call up to the mind a picture which is not devoid of human interest. I feel that no apology is needed for taking a step which helps to clothe figures, proverbially cold, with a garment of reality. (Applause.) You will notice that advances to professional and private individuals for the purchase

ADVANCES TO PROFESSIONAL AND PRIVATE INDIVIDUALS

	Amount	Per cent. of Total Advances	Number of Customers
1. For land purchase and/or for buying houses	17,408,429	10.1	16,682
2. For investment in stocks and shares	9,625,189	5.6	5,867
3. Miscellaneous :

(b) Architects, auctioneers, estate agents, surveyors, consulting engineers ...	2,296,249	1.3	2,627
(c) Army and navy officers and clergymen	502,297	.3	2,365
(d) Company directors, commercial travellers, managers, promoters, secretaries, salaried officials and clerks—Bank, civil service, insurance, etc....	8,535,758	4.9	22,151
(e) Medical. — Doctors, dentists, surgeons, chemists, nurses, medical clinics, nursing homes, pathological experts, radiologists, veterinary surgeons, etc..	2,523,274	1.5	4,724
(f) Solicitors and barristers...	2,041,838	1.2	2,186
(g) Teachers, schoolmasters, schoolmistresses, examiners, tutors, lecturers, etc.	426,394	.2	2,917
(h) Private, independent and retired business and professional people, married women, spinsters and widows, etc.	11,502,924	6.7	44,482
(i) Other employments	3,109,252	1.8	12,381
	58,662,710	34.0	117,917

of land or for the buying of houses is the largest item in this category. These loans are, in most cases, only required for short periods, pending the realisation of other assets, or the arrangement of a long-term mortgage through institutions, such as building societies, which undertake financing of this character.

In many ways the item of advances is the most important in the balance sheet, and every precaution is taken to conduct our lending on sound lines, undesirable speculation in stocks and shares, commodities, real estate or in other directions being actively discouraged. I am pleased to say that the quality of bank advances generally has greatly improved, and that, with better economic conditions, many loans which at one time had been thought to be doubtful have since become good. I express the hope that the lesson taught by the recent depression will not soon be forgotten, and that advantage will be taken of opportunities afforded in prosperous years to build up a reserve of financial strength, so that in periods of declining trade, industries will be able to improve their technical efficiency and secure an increase in their competitive power when it is most needed. Incidentally, expenditure on new equipment, at such times, would supplement any efforts which the authorities might make to promote employment by undertaking new public works. The suggestion, frequently and authoritatively made that, as far as possible, expenditure on such works should be postponed during times of prosperity, and that schemes should be ready to be put in hand whenever there are signs of a slackening in activity, deserves careful consideration.

NET PROFITS

The net profit for the year ended December 31st last, after payment of all charges and after making provision for all bad and doubtful debts and for contingencies, amounted to the sum of £1,894,361 os. 5d., an increase of £110,576 15s. on the previous year, to which has to be added the sum of £583,645 9s. 1d. brought in, making a total to be dealt with of £2,478,006 9s. 6d. The directors have applied £250,000 in reduction of premises account, and recommend the payment of the usual dividends at the rates of 10 per cent. per annum on the "A" shares, and 14 per cent. per annum on the "B" and "C" shares, less income tax, involving in all a net amount of £1,588,238 16s. 2d. and leaving a sum of £639,767 13s. 4d. to be carried forward.

CHEAP MONEY AND INDUSTRIAL RECOVERY

When considering the results for the past year, we have to bear in mind the easy conditions still ruling in the money market and the effect of the low rates of interest on our earning capacity. The continuance of these low rates has been due in part to official policy. Cheap money is one of the traditional correctives for industrial depression, and there is little doubt that the availability of large funds for employment at low rates of interest has been a factor in the revival of industry in this country. Very properly it acts as a stimulus to business; but it is necessary to guard against the danger of too much emphasis being placed on the importance of cheap money and too little on those other essentials which are necessary for the maintenance of healthy conditions, in which alone real prosperity can be assured.

In most cases, interest on borrowed money is only a minor item in costs of production, and if too great stress is laid upon the importance of cheap money as a means of maintaining and improving the activity in trade, small changes in interest rates may have an entirely disproportionate effect on confidence. Experience indicates that, while stringency in the capital markets might, and probably would, tend to retard progress, cheap and abundant supplies of money alone are not sufficient to promote development.

WISE ACTION OF THE GOVERNMENT

The general recovery which we are now experiencing undoubtedly owed its initial impetus to the wise action of the Government, which took the courageous step of placing our national finances on a sound basis and thus restoring confidence in sterling, not only at home, but also abroad. The extent of the faith in our currency is evidenced by the fact that certain people in foreign countries have recently been content to invest their resources in Bank of England notes for hoarding purposes, despite the fact that money so invested produces nothing by way of interest. Further, the revival of industry, which has been largely due to the expansion in internal, as opposed to external, activity, owes much to the change in our tariff policy. At the time when the step was taken, the United Kingdom was in danger of becoming the "dumping ground" for the surplus products of other countries, which were denied a market elsewhere owing to the spread of the

doctrine of national self-sufficiency. Moreover, the growth of this doctrine was itself preventing the export of an adequate volume of British products to pay for the arrivals from abroad.

Other factors which have contributed to the recovery in this country, during the past few years, are the improvement in our competitive power abroad following the depreciation of sterling, the conclusion of the Ottawa Agreements with Empire countries, the Trading Agreements entered into with foreign countries, the encouragement of agricultural production, and the relative stability of exchange rates between the countries of the sterling area.

Having dealt with the items in the balance sheet and given you explanations which I hope have afforded you a comparatively clear picture of the position of the bank in which you are shareholders, and of the conditions under which it has worked during the past year, you will no doubt expect me to say something of a more general nature before concluding the address from the chair.

INTERNATIONAL CURRENCY DEVELOPMENTS

One of the most important events of the year has been the devaluation of the French franc, which was followed by the readjustment of the values of other currencies, notably those of Switzerland, Holland and Italy. The necessity for these measures can be readily understood, for the prices ruling in these countries made it difficult for the home producer to face foreign competition and the re-alignment of currencies, which has now taken place, should do much to increase the competitive power of their industries by restoring a measure of price equilibrium with other countries.

As a result of these events, the possibility of securing a reduction in international trade barriers has improved. The currency adjustments, however, would have proved very difficult to carry out and might have had dangerous consequences, had they not been preceded by the declarations on monetary policy made by the Governments of France, the United States and this country, in which, while safeguarding their own position, they reaffirmed their intention to avoid action calculated to have a disturbing influence upon the international exchanges. The enunciation of this common desire marked a definite step forward in international co-operation, and a further notable feature of the declarations by the three Governments was the importance attached to the development of international trade and the progressive relaxation of the system of quotas and exchange controls, with a view to their ultimate abolition.

THE IMPORTANCE OF EXPORTS

I have already referred to the increasing prosperity in this country and to the part that the Government has played in the general restoration of confidence. These are matters for which we should be profoundly thankful, while we may well be proud of the general steadiness and admirable calm with which the people in these islands meet and confront new and difficult situations as they arise. The recovery in the United Kingdom, in other parts of the sterling area and in the United States has contributed towards a general revival, but we cannot overlook the political anxieties which persist in the international sphere. These anxieties are largely economic in their inception. Improved methods of production and the advancement of science should give an enhanced level of prosperity to the nations of the world. But in hoping, as we do, that this desirable end may be achieved, it would be foolish to deceive ourselves as to the length of the road or the difficulties to be met upon the journey. An improvement in the standard of living would go far to ease the political difficulties and lessen the prevailing feeling of discontent, particularly in those countries which are still struggling against depression and endeavouring to achieve a high degree of self-sufficiency at a heavy cost as the only goal which appears open to them.

The cause of a large part of the world's present difficulties is uncertainty and fear for the future. As this uncertainty has extended from the economic to the political sphere, nations have withdrawn more closely behind their own frontiers. Fears of currency instability, fears of industrial competition and latterly political fears—all these have resulted in a network of restrictive measures that have only served to aggravate the problems to be solved. The more effective the trade barriers and the greater the expenditure on armaments, the greater the burden on the people and the greater the spirit of discontent and suspicion.

FREER INTERCOURSE NEEDED

What is needed is undoubtedly freer intercourse between nations, so that goods, money and people can move with reasonable ease from country to country. Trade barriers must be relaxed; an international monetary system, based upon sound foundations,

must be restored. Spasmodic gestures are insufficient; there must be continuous co-operative action involving a more accommodating spirit in the relationships between countries and a determination so to conduct their internal affairs as to promote confidence abroad. A resumption of foreign lending, when conditions are favourable, would also be of assistance in reviving international trade, but the test which we apply to our domestic loans, namely, the ability to repay, must be kept well in view. Credits granted should be only for the purpose of financing remunerative development, so that the use to which the money is put will provide the interest and redemption payments on the loan, and not have the effect of merely imposing an additional burden upon the borrower.

ESSENTIAL OBJECTIVES

These requirements have been stated many times, but in recent years, new events of national and international importance have followed one upon the other with such kaleidoscopic rapidity that there may be a tendency to lose sight of the essential objectives. I have, therefore, restated them because I regard them as objectives which should never be allowed to pass entirely from our minds. But while we must keep these aims as ideals before us, we must recognise that it may be long before we can achieve them. For the time being, we can but observe the direction of the prevailing winds and shape our course accordingly. The world of 1937 is far removed from the old world of 1929 and even farther from the world of 1914. The war had something more than a passing influence on the economic organisation of nations and upon their mentality, whether belligerents or neutrals.

Those engaged in hostilities realised the very real danger of being too dependent on external sources of supply for the necessities of life. Those not so engaged, finding themselves unable to secure their customary quantities of imported goods, established new home industries, which, with the coming of peace, they felt obliged to protect. Similarly, many debtor countries, faced with the inability to obtain credit from abroad, have been forced to foster and encourage industries within their own boundaries. In those cases, where, for various reasons, a policy of increasing self-sufficiency has been pursued, steps have been taken to support certain industries, which it would be very difficult to retrace, even if there were the wish to do so. The desire for self-sufficiency is frequently more deep-seated than one might imagine, and certain countries are prepared to make substantial sacrifices for the sake of it. Such a policy may appeal to the spirit of independence, but while it inspires enthusiasm in its initial stages, experience will prove that the policy is short-sighted, because no country can afford to remain in isolation with limited access to and exchange with the other countries of the world.

POST-WAR CONDITIONS

The change in the creditor position of various countries resulting from the war has also had a marked influence on international financial and trading relationships, for in the period since 1914 it has not been practicable to make the necessary adjustments to meet the altered situation. America, in particular, as a great creditor nation, will continue, to a greater or less extent, to be a disturbing factor until the ability of her debtors to fulfil their obligations by sending goods is facilitated. The reduction of tariffs made by the United States in the special arrangements she has concluded with other countries has proved beneficial, but indications point to the fact that goods still cannot be sent to America to an adequate extent in payment of amounts due to her; nor will it be possible for her debtors to meet their liabilities automatically in this manner until the economic structure of the United States, which had been built up over a long period of years in accordance with her needs as a debtor nation, is adjusted to conform to her position as a creditor country.

Such an adjustment will involve a complex, difficult and lengthy procedure, but, in the absence of deliberate and conscious efforts to make the necessary changes, the natural play of economic forces will eventually provide a remedy. Various influences have affected American external trade in recent years, but already there are signs of adjustment—for example, the marked decline during 1936 in the excess of exports over imports. Nevertheless, a long time may elapse before the United States occupies a position comparable to our own, where for many years a large adverse balance of visible trade has enabled our debtors to meet their liabilities in goods.

REDUCTION OF TRADE BARRIERS

The re-adjustment of the values of certain important European currencies last year has also been followed by some reduction in trade barriers, and although these changes have been made chiefly with a view to preventing a rise in prices in the countries con-

DEPUTY CHAIRMAN'S REMARKS

Mr W. M. Goodenough (deputy-chairman): My lords, ladies and gentlemen, in seconding the resolution which has been proposed by the chairman perhaps I may be allowed to say a brief word on a matter on which he could not himself say much, but which it is appropriate to mention on this occasion. The shareholders will have the opportunity of expressing their thanks to the chairman, but I should like, if I may, on behalf of the board, not only to congratulate him on his speech, but also to voice to the shareholders our feeling of confidence in him and our assurance of loyal support to him in his important office. (Hear, hear.) We feel sure that as chairman of the bank he will add distinction to a family record which, in his own generation, is already a very distinguished one. (Applause.)

May I also add a word to what the chairman has said about Mr Favill Tuke? I can do so as one of a younger generation in the bank who have at all times received the greatest kindness, guidance and encouragement from Mr Tuke, and I think we should like it to be known how much we appreciate this, which is perhaps not the least of his many services to the bank and how warmly we thank him for his help in the past. (Applause.) My lords, ladies and gentlemen, I beg to second the resolution. (Applause.)

A SHAREHOLDER'S APPRECIATION

Mr A. J. Waley said that as a very old customer and friend of Barclays Bank he wished personally to congratulate Mr Fisher on having succeeded to the chair, and on behalf of all the shareholders he endorsed the high tribute which the chairman and Mr Goodenough had paid to Mr Tuke. They all hoped that in the greater leisure which he would now have at his disposal he would enjoy many years of health and happiness.

With regard to the chairman's speech, it was extremely satisfactory to recognise at what a very high total the gilt-edged securities now stood and that so large a proportion of the bank's investments were protected by being in securities which had a due date of maturity. As to advances, he assumed that as trade still further expanded, although money might not necessarily become dear, it would become more useful, and therefore bankers might look for a rather higher rate of interest on their advances than they had received in the past.

He had been very struck by the chairman's reference to the barriers existing in international trade. He felt sure that a real expansion of international trade could not be brought about until those barriers were relaxed. It seemed to him that the world had got to realise that barriers had tended to divert trade from their doors rather than allowing it to flow through to international business centres. He also wished to say a word of congratulation to Mr Goodenough, and expressed the hope that Mr Fisher would for many years occupy the high position to which he had attained. (Applause.)

The chairman thanked Mr Waley for his personal references and the kind remarks he had uttered about his address to the meeting.

The resolution was then put to the meeting and was carried unanimously.

THE DIRECTORATE

Mr Hugh Exton Seeborn (vice-chairman) then proposed the following resolution:—

"That the Right Hon. Lord Bethell, the Right Hon. Lord Essendon, Mr Edwin Fisher, Mr Peter Forrester, Mr William Macnamara Goodenough, Mr Claud Edward Pease, Mr Herbert Leslie Melville Tritton and Mr William Favill Tuke, the retiring directors, be re-elected directors of the company."

Mr R. L. Barclay, C.B.E., seconded the resolution, which was unanimously adopted.

The Rt. Hon. Lord Ebbisham, G.B.E., moved:—

"That Messrs Price, Waterhouse and Company and Messrs Kemp, Chatteris, Nichols, Sendell and Company, chartered accountants, be reappointed auditors to the company, at the usual remuneration, to hold office until the next annual general meeting." These great firms, he said, had been their auditors for many years and deserved the utmost confidence of the shareholders.

Mr F. W. Raffety seconded the resolution, and it was passed unanimously.

THANKS TO MANAGEMENT AND STAFF

Mr W. H. Wiggin, D.S.O., said that he had the responsible privilege of proposing on behalf of the shareholders a very cordial

cerned, they should have a favourable effect over a wider area. Much remains to be done, however, and, therefore, while we must keep alive our ideals, we must do everything possible to make the most of existing opportunities. For example, in the absence of freer trade, bilateral agreements have their uses, and can do a great deal to foster and extend our overseas business. The conclusion of trade agreements, many of which have been beneficial to our exporters in recent years, may not be an ideal method, but it has proved useful and, in the absence of a better way, cannot be discarded. By these agreements, the United Kingdom has obtained the reduction of certain foreign tariffs, fair quotas for the products of her industries in external markets, the payment of certain outstanding commercial debts and the provision of exchange to pay for British exports, as well as to meet interest due to investors domiciled in the United Kingdom. It would certainly be unwise in present circumstances to do anything to prejudice a method which, in the limited directions in which it has been tried, has secured an advantage to industrialists and others in this country.

A RESULT OF DEPRESSION

One result of the depression—a natural outcome of the restrictive measures so widely imposed—has been to force Governments to enter more fully into the commercial, industrial and agricultural life of nations. Side by side with this movement, there has been a further advance in the co-ordination of effort in the conduct of industry and a tendency towards planned production and price control. Although, therefore, we may believe in the personal element in business and consider that much may be lost if individual enterprise and initiative continues to dwindle, yet we must realise that, to-day, the principle of large-scale organisation of output and sales has found favour all over the world, and this country cannot do otherwise than give it an adequate trial in appropriate cases.

One of the outstanding developments in the United Kingdom has been the assistance afforded to the farming industry at home, and as a result of the steps taken there has been considerable progress in the direction of organised marketing and control. Apart from any influence this policy may have in promoting efficiency, it is a necessary departure in view of the organisations set up on behalf of agricultural producers abroad. In its early stages, the policy must of necessity be experimental, and a true balance must be maintained between the interests of the producer and the consumer. But there is already evidence that, if judiciously carried out, large-scale organisation is likely to prove beneficial and thus compensate to some extent for the loss of individual freedom on the part of agriculturists.

IMPORTANCE OF FOREIGN CONNECTIONS

Before concluding my address, I should like to express the hope that the prosperity which exists in most sections of the home market, and the difficulties of conducting foreign trade, will not result in the development of domestic business to the neglect of overseas connections. Such a policy, if pursued, would be short-sighted and unsound, for the time may well come when domestic business will prove less attractive than at present, and foreign connections, once lost, are not easily recovered. Moreover, the extension of international trade, and the resulting increase in world prosperity and decrease in world unemployment, are vital factors in the establishment of world peace.

It is largely in times of depression that we hear so much talk of war, for prosperous and productive trade creates remunerative employment, which, in turn, induces a feeling of general well-being and peaceful contentment. It is surely not too wide of the mark to assume that all men and women of every nation desire and long for peace, whatever outward signs there may be to the contrary in a world that is peculiarly subject to mass suggestion in times of depression, unemployment and economic strain. If the cause of peace can be furthered by developing international commercial relationships, it can be said with confidence that the great trading community of this country will most assuredly play its part. (Applause.)

I now beg to move: "That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1936, duly audited, be received, approved and adopted, and that a final dividend at the rate of 10 per cent. per annum on the 'A' shares, and 14 per cent. per annum on the 'B' and 'C' shares, less income tax, be declared, payable on the 1st proximo, to the shareholders registered in the books of the company on December 31st last." I will ask Mr Goodenough, the deputy-chairman, to second the resolution.

vote of thanks to the general managers and all the staff of the bank for the very valuable services which they had rendered during the year under review. The proposing of this resolution was, in one sense, a difficult task because almost everything that could be said in support of it had been said on many occasions before, and it was difficult to avoid giving the resolution somewhat of the appearance of being merely a formality. On the other hand, it was an easy and very pleasant task to have to perform, because, in fact, it was far from a formality—it was a sincere and genuine appreciation of good work done and honest service rendered to the bank. Very few words were necessary in order to commend such a resolution to the shareholders. The excellent figures submitted and the clear explanation of the affairs of the bank which the chairman had given were themselves quite adequate indications that such results could not have been achieved without very hard work on the part of a great many people, and those people were mainly, of course, the staff of this great institution.

SERVICE TO CUSTOMERS

On previous occasions a great deal had been said about the qualities required to make a good bank official and the many difficulties which beset their path, so that he would not enlarge on that aspect of the question. He would content himself with referring to the tradition which animated the whole of the staff of giving cheerfully, in every possible way, all the service they could to the customers of the bank and to the public generally who might be potential customers. The Chairman had referred to the staff as the ambassadors of the bank, and that was certainly a very true way of describing them, because they were the people who came into direct contact with the public, and it was on them that the success and prosperity of the bank depended. It was therefore with very real sincerity that he moved: "That the cordial appreciation and thanks of the shareholders be given to the general managers and the whole of the staff for the manner in which they have carried out their duties during the past year." (Applause.)

Mr P. Forrester said that he could fully confirm all that Mr Wiggin had said as to the excellence of the staff, and he had great pleasure in seconding the resolution.

The vote was unanimously accorded. Mr Norman S. Jones (one of the general managers) said that he wished sincerely to thank the shareholders for the generous appreciation they had shown of the efforts of the staff during the past twelve months. He thought the shareholders would agree that Barclays Bank had earned for itself a high reputation for courtesy and quality of service, and he could assure those present that the cordiality with which the resolution had been moved by Mr Wiggin, seconded by Mr Forrester, and received by the meeting, would encourage them all to still greater efforts in an endeavour to maintain that reputation. (Applause.)

LORD EBBISHAM'S TRIBUTE

Lord Ebbisham said that he had very much pleasure in moving a warm vote of thanks to Mr Edwin Fisher for his able chairmanship of the meeting. In succeeding those great chairmen, Mr Goodenough and Mr Tuke, he followed two brilliant holders of the office. The shareholders had every confidence that Mr Edwin Fisher would be no less able and efficient in his great task and that he would fully justify the tribute paid to him by the deputy-chairman earlier in the proceedings. Their new chairman was a practical banker, having courage, vigour and vitality, and he was in daily attendance at the bank. They all wished him health, happiness and success in the responsible position he had undertaken. (Applause.)

Mr C. J. Band said he was glad to have the privilege of seconding the vote of thanks to the chairman, because he had been closely associated with the bank for forty years and had carried on practice in premises belonging to the bank during the whole, or nearly the whole, of his professional career. He first became acquainted with Mr Fisher when that gentleman came to Birmingham as a local director, and both customers and staff had very happy recollections of the period during which he served the bank in that capacity and were delighted to hear of his appointment to the highest position in the bank. Mr Fisher obtained, during those years in Birmingham a first-hand and close knowledge of all the important and varied industries carried on in the Midland counties, and he was quite sure that the experience he gained at that time was of the utmost value to himself and the bank. The banks of this country were conducted in a manner that must of necessity be the envy of the whole world. On behalf of friends, numerous customers and many of the bank's trusted managers in the Midlands, he offered to Mr

Fisher their best wishes for a very happy and successful future as chairman. (Applause.)

The vote was cordially approved.

The Chairman having thanked the mover and seconder for the kind way in which they had submitted the resolution and the shareholders generally for their cordiality in receiving it, the proceedings terminated.

SOUTH AFRICAN TORBANITE MINING AND REFINING COMPANY LIMITED

PROGRESS OF THE NEW INDUSTRY

The second annual general meeting of this company was held in Johannesburg on December 21, 1936.

Mr W. Patrick Jones (deputy-chairman) said that operations were commenced at the refinery in January last in the processing of imported crude. The first deliveries of "Satmar" motor spirit to the trade were inaugurated in the same month and met with a satisfactory reception from the public. Owing to technical difficulties the plant had been operating only intermittently, but it was anticipated that full capacity would be reached in 1937.

Underground operations had proceeded satisfactorily, and it was now estimated that the payable torbanite on the portions of the farm Mooifontein held by the company indicated that there were 5,200,000 tons of torbanite having a value of 43 gallons of oil per ton over a width of 17.1 inches. A total of 400,000 gallons of torbanite crude had been produced, and most of that had been sent to the refinery at Boksburg. Then, again, they had put through their refinery torbanite oil, without admixture with imported petroleum, and had made from it petrol of the same high quality as they made from imported crude. This had been distributed to the trade in the blend which represented their standard product, and had been accepted and approved by their customers. The production of petrol had risen from 19 per cent. of their quota in July to 92 per cent. in November.

They were now distributing 80 per cent. of their present quota in the free delivery area, and had every reason to believe that within the next few weeks they would distribute their full quota. That was conclusive proof not only of the grade of petrol offered for sale, but of the service given to the trade and to the consumer. The price of imported petrol had been reduced by 5d. per gallon, which would mean a loss in revenue to the company of 4d. per gallon. It was hoped, however, that the Government would adjust the Custom's duty and railway rates so that the position of the company would not be prejudiced.

The report was unanimously adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED.

MR H. ERIC MILLER'S REVIEW

The twenty-ninth ordinary general meeting of this company was held, on the 21st instant, in London.

Mr H. Eric Miller (the chairman), who presided, said that the net quantity of rubber they had been allowed to export was 7,384,620 lbs., leaving a balance of 428,335 lbs. produced before August 31, 1936, to be carried forward in the balance sheet at bare cost of collection, manufacture and distribution. The average net sale price of 7.06d. per lb. showed an increase of 1.37d. per lb. Cost of producing the rubber crop showed little change from the previous year. The total rubber export duty now imposed by the Netherlands Indies Government amounted at current exchange to about one-halfpenny per lb.

Producing countries had exported during 1936 about 860,000 tons of rubber, against which absorption in consuming countries looked likely to total 1,025,000 tons—an increase of 90,000 tons—and nine-tenths of the increase was in the U.S.A. Many of the Continental countries would undoubtedly have taken more rubber than they did, had sufficient foreign currency been available.

The company had forward sales booked for shipment throughout 1937 totalling 1,800 tons at an average of 8.72d. per lb., c.i.f. America. Their subsidiary products, palm oil, palm kernels and gambier, all showed satisfactory profits. The large buyers throughout the world were showing a keen interest in the high grade palm oil produced on eastern plantations. The United Serdang company had always ranked as one of the leaders in the plantation rubber industry and fully merited the proud position it held.

The report and accounts were unanimously adopted and a dividend of 10 per cent. was approved.

MARTINS BANK LIMITED

PROFIT INCREASE FOLLOWS WIDENED ACTIVITIES

HEADWAY IN NATIONAL PROSPERITY

RIISING PRICES

CONTROL OF EXPANSION NECESSARY

MR E. B. ORME'S CONFIDENT SURVEY

The 106th annual general meeting of shareholders of Martins Bank, Limited, was held at the bank's head office, Liverpool, on the 19th instant.

Mr Edward B. Orme, Chairman, presided, and in moving the adoption of the report and accounts, said: My Lords, Ladies and Gentlemen,—

Last year at this time we had to record the death of His Majesty King George V. Recently the country experienced a crisis, now fortunately surmounted, but I am sure you will not expect me to make any further reference to it beyond wishing a long, prosperous and happy reign to Their Majesties King George VI and Queen Elizabeth.

The report and accounts for the year have already been sent out, and, as usual, I assume you will take them as read.

It is with deep regret we report the death of two of our directors during the year. Mr Francis Priestman, who had been chairman of the North Eastern board since 1923 and a director of the North Eastern Bank for four years prior to its amalgamation with our bank in 1914, died in February last, while Mr Phillips, who for eight years had been a member of the board of the Lancashire and Yorkshire Bank before the fusion of that bank with Martins Bank in 1928, died last month. The service rendered to the bank by both these gentlemen was extremely valuable, and we shall miss their co-operation.

Mr Oswald Dobell, who had for some time been desirous of relinquishing his business duties, resigned from the board in March last, and I am pleased to be able to express here our high estimation of his valued and unremitting service, which extended over a period of twenty-eight years during twenty-four of which he was a member of the committee of management. Mr E. R. Bowring has been elected to a seat on the board, subject to your confirmation at this meeting. Mr Bowring is a director of Messrs C. T. Bowring and Company, Limited, who are among the oldest customers of the bank, his firm having opened with our Heywood's branch only four years short of a century ago. We are glad to have his assistance, and we are pleased to welcome him here to-day.

Following my usual practice, I will preface my remarks by reference to the balance sheet and profit and loss account for the year, which present some interesting features.

INCREASED FUNDS AND PROFITS

The net profit is £769,988, an increase of £76,871 as compared with last year. This is the result of a considerable increase of funds in our hands and of their employment in expanding advances throughout the year, a satisfactory feature upon which I will speak later. We brought £233,466 into profit and loss account from last year, so that we have £1,003,454 available for distribution. A dividend at the rate of 7 per cent. was paid in July last, and it is proposed to repeat that for the final half-year, making 14 per cent. in all. These two dividends will require £582,406. We have added £50,000 to premises redemption account, £75,000 to staff pension fund, and we carry forward £296,048. Our published reserve stood at £3,100,000. This has been increased to £3,300,000 by a transfer of £200,000 from investment reserve.

You will observe that the bank's liquid position has been maintained. Cash in hand and at the Bank of England stands at £9,880,333, that is 10.5 per cent. of our liabilities to the public, and our total cash items amount to 20.7 per cent. of those liabilities. Our money at call and short notice at £5,535,000 is some £590,000 in excess of last year, but, on the other hand, Treasury bills and bonds are down by £3,520,575. Commercial bills still fail to come up to former levels and show little change as compared with a year ago. Investments are now some £3,200,000 less than at this time last year, and appear at £32,982,921. Bank premises and rentable properties show a

reduction of £71,130 at £2,596,215. Acceptances, endorsements, etc., together are higher by £2,173,097, and as the bulk of these items is in respect of foreign trade it is satisfactory to report that the trend to which I referred a year ago still continues.

GROWING DEMANDS OF BUSINESS

Again I have to record a substantial increase in our deposits. They now amount to £93,475,145, an increase of £6,187,582 on the year. But the largest increase in any item in our balance sheet is in our advances, which at £41,277,079 are £11,768,480 higher. They thus again take the premier place among our assets, and it is noteworthy that whereas investments last year represented 41 per cent. of our deposits, the comparative ratio to-day is 35 per cent., while advances, which last year were 34 per cent., are now 44 per cent.

An analysis under twenty-eight headings reveals the wide diversity of our advances, and shows that by far the largest individual item is that in respect of personal and professional overdrafts, which account for 21 per cent. of the total, with an average for each account of only £485, while the average per overdraft account for all our advances is under £1,200, demonstrating that the customer of moderate means is the mainstay of our business.

Cotton still does not take from us the accommodation required in days of greater prosperity in that trade, and it is somewhat surprising that, notwithstanding increasing turnover, advances to the wool trade do not record a greater increase as compared with last year. On the other hand, considerably higher figures are shown for general produce, retail traders, shipping and shipbuilding, paper, the motor industry, and, to a less extent, coal, iron and steel; while, as may be expected, such industries as aeroplane manufacturing, building and general engineering have also drawn upon us. Increases have further to be recorded in the accounts of our municipal corporation customers and in public utility and our kindred companies. As some of these advances are of quite a temporary nature, a modest decline may be seen in the near future in our total, but the general indication is that gradual expansion of the lending side of our business may be expected.

TRADE'S "DEFINITE HEADWAY"

We may gather from the account I have given of the course our advances are taking that the recovery in the country's trade, foreshadowed in my remarks last year, has made further and definite headway. We have ample evidence of this in whichever direction we look. The figures with regard to diminishing unemployment are most encouraging, rail traffic returns are better, the retail trade, a sure index of the spending power of the people, whether on necessities or luxuries, month by month, has shown increasing expansion; while the annual reports of industrial and other concerns, with their welcome announcements of dividends, have been read by shareholders with an interest they had almost lost owing to the monotonous regularity with which their capital had gone unrequited during the last few years.

BASIC TRADES ADVANCE

Shipbuilding throughout the country has recently received a much needed impetus, and this not only by reason of the Government's rearmament programme. As a result, on Merseyside, for instance, we are looking forward to a year of great activity in our shipbuilding yards, entailing a largely increased pay roll, the effects of which, we hope, will be felt by all classes throughout the area. And in this connection I may say that it is a matter of profound satisfaction to everyone concerned that the great Liverpool shipping concern, the Cunard-White Star Line, have recently decided that the construction of one of their new liners is to be carried out on the Mersey in the building yards of

Cammell, Laird and Company, whose works have been associated with the port for more than a century.

Reference to activity on the Mersey impels me to allude to the annual review of the chairman of the Mersey Docks and Harbour Board, which is always instructive, but which this year, in addition, was particularly stimulating. Although his survey only brought the record of the year up to July 31st last, he was able to say that he found it difficult to sustain any suggestion that the shipping trade of the port was suffering from exceptional distress, and he quoted figures showing that the tonnage of vessels paying dock tonnage rates last year reached a mark only exceeded on two previous occasions. Further, as the increase in the Dock Board's revenue from rates and dues was mainly in respect of goods, the inference was that ships using the port were carrying better cargoes.

It is a natural transition from shipbuilding to the iron, steel and coal industries, especially when one reads a recent statement that 22,000 tons of coal had been required to produce the 6,500 tons of steel used in the construction of two tankers. There is undoubted improvement in both trades; in the iron and steel trade following the safeguarding of the industry, under which imports into the country are regulated, and in the coal trade, the basic industry of the country, where controlled selling is beginning to have its effects, although it only came into operation last autumn. Production in both industries during 1936 largely exceeded that of the previous year, and this year gives promise of even better trade.

IMPROVEMENT IN COTTON

Our interest in cotton is, of course, very extensive. While we are able to record some real improvement, we have yet to reap the full reward of much patient effort in many directions to bring about better conditions. The Cotton Spinning Industry Act, now formally in operation, the price maintenance scheme, which it is hoped will be consistently carried out, and other measures, may be expected to have their looked for effect, but it is not unlikely that general trade recovery throughout this country and abroad will supply a natural demand for the output of Lancashire's main industry and render artificial measures unnecessary. Facts may be left to speak for themselves, and the increasing number of mill companies now making profits or cancelling out losses is eloquent. The recovery may be slow, but it is gathering strength. I hope I may not be regarded as unduly optimistic in this respect, for I know too well the views held in some quarters that certain of Lancashire's foreign markets are permanently lost, some of our former customers having become not only self-providing but actually competitive with us. It is probable, however that this particular competition is reaching its limit and that, with expanding home trade and extension to our Dominions, Crown Colonies and more favourable foreign markets, the reputation of Manchester goods will once more assert itself, bringing a full measure of prosperity to the country, where in many areas it is still sorely needed.

AGRICULTURE AND WOOL

Of agriculture generally there is little improvement to record during the year; so much depends upon natural causes beyond man's control. And it has to be admitted that some of the schemes evolved for their benefit have yet to convince farmers of their efficacy. With regard to wheat, poor crops at home and abroad have coincided, and the position may best be summed up in the statement that 1936 has been notable for the production of the smallest crop since 1920. For the fourth successive year, stocks have been drawn on to meet requirements, and by the time this year's crops of the northern hemisphere are available, world stocks will have been reduced to the minimum. Trading has been on a large scale, and prices have advanced to levels not reached for a number of years. If larger crops are not harvested in the present year we may actually have a world shortage in sight.

Advancing prices, notwithstanding temporary disturbance owing to tariff disputes between Australia and Japan, have also been seen in the wool textile industry, which has experienced activity in all its branches. The position generally may be regarded as healthy, as it is based upon consumption requirements; speculation is not much in evidence.

PHASES OF PRESENT PROSPERITY

So far, I have been able to place before you a record of steadily increasing trade recovery, commenced hesitatingly some four years ago and gradually gathering momentum until in the last few months it assumed the nature of a boom. It is manifestly

most desirable that caution should dictate our views in these circumstances, but I must confess that at the moment I cannot see any signs, apart from possible European political complications, of an early cessation of the country's present prosperity. We should, however, not lose sight of the fact that whereas recovery is gradual over a long period, the reverse process is not so deliberate. Abnormal activity and rapidly advancing prices of all classes of shares on the Stock Exchange emphasise the prudence of this reflection.

Recovery has, in the main, been confined to our internal trade. I believe this has still some way to go. Building has played its part in the progress made, and even if we are to see slackening in the erection of residential property, further slum clearance and construction of commercial and industrial premises must give increasing employment for some time to come. Reorganisation of some industries is now having its desired effect, but there are others still to respond to the remedies applied to them, and until these and the special or distressed areas have been brought to the point of sharing in general prosperity we cannot, with assurance, say that our internal recovery is complete. The problem of the special areas, in particular, calls for solution, and any delay in dealing energetically with this must be regarded as a reproach to the rest of the country. The recent appointment of industrial advisers to the Commissioner for the Special Areas lends confidence to the hope that this solution will speedily be found.

During the last few years the motor industry also has made great strides and taken its part in the industrial revival. And it must be recognised that in practically all sections of industry that have contributed to this welcome upswing in internal trade, the imposition of protective tariffs has had an important effect.

Even if we were to assume that all the factors in our internal recovery were beginning to lose some of their quickening power, it is certain that rearmament expenditure will supply a fresh and powerful stimulant. No doubt some of our recovery has already been due to Government orders in this respect, but if the programme that has been envisaged is to be carried out vast sums have still to be spent, and it is safe to predict that increasing activity, employment and apparent prosperity will follow. It is not, however, a pleasant prospect for the taxpayer, who will reflect that borrowed money has to be repaid, especially when it is remembered that the expenditure is for non-productive purposes.

RIISING COMMODITY PRICES

We must further not shut our eyes to the fact that much of our prosperity is due to four main measures of expediency or necessity, namely, protective tariffs, to which I have already referred, our departure from the gold standard, the embargo upon foreign lending, and exceptionally cheap money, and that the lifting of any one of them would very materially affect our position. All these measures have helped our domestic trade, but their effect, combined with protective action taken by other countries, has seriously impeded international trade.

We have recently seen a quite exceptional rise in the price of certain commodities, such as cocoa, rubber, wool, wheat and various metals, and all indications point to a continuance of this upward trend. The cause has to be traced back to post-war conditions and the recent depression. Low prices and artificial restriction gradually reduced surplus stocks. Reviving trade absorbed them, and the last six months of boom conditions have caught the markets short of future supplies. Hence the striking rise in prices. It is impossible to estimate the extent to which this will go, or to measure its effect, but it has already benefited the producers of primary products enormously, and placed them in the position of being able to purchase the goods of other countries. This augurs well for the flow of international trade. The effect upon our home trade has still to be felt, but higher prices for raw materials mean increased cost for manufactured goods, and this, in turn, will affect the cost of living. The position is not one to be viewed with easy satisfaction, and will require careful handling if we are to stabilise our prosperity and avoid the usual results of too rapid expansion. Moreover, it is bound ultimately to influence this country's monetary policy, as the normal outcome of continued trade expansion, with a general rise in costs on the scale we are experiencing, is without doubt dearer money.

THE GOLD IMPETUS

I base my favourable outlook for world trade largely upon the increasing production of gold. Hitherto, the full benefit of this has been lost owing to America and France absorbing the world production. So far as France is concerned, the flow there may probably be considered at an end. America—since the war a creditor nation and a high tariff country—could not avoid

taking gold. Actually during the last three years there has been an influx of gold into America greater than the world's production in that period. Her ability to attract this has, to a very considerable extent, been created by Europe's purchases of her securities. This condition may not repeat itself during the next three years, and the world's gold production will, to some extent, be available to create credit in countries which of late have been drained of this necessary backing.

As I have said, primary products in many cases have doubled in price from the low point of 1931 to 1932. With gold in freer distribution they would be likely to maintain present high levels, and this must, as already indicated, create "two-way" world trade. The profit on manufactured goods, with the employment entailed and the services required from our railways and shipping, will, I consider, offset the extra cost of our purchases abroad.

THE EXPORT SIDE

The increased spending power of the people with its accompanying demand for an improved standard of living calling for the import of foodstuffs and other commodities, and the requirements of prospering industry in respect of raw materials of all kinds, has resulted in our being faced with an adverse visible trade balance, now being accentuated by the rapidly rising commodity values. This can only be adjusted by development of our export trade, an essential factor in any complete recovery of our economic position. Unfortunately, the very fact of our internal prosperity militates against a balance of trade favourable to us, for with lucrative contracts at home industrialists will be apt to ignore the export side of their business. Serious attention, therefore, is required, and is no doubt being given to this aspect of the case. Tariffs and restrictions, however, still remain, with little, if any, alteration, and the almost total absence of foreign lending continues. There is, of course, no lack of counsel upon the best methods of correcting the situation, but the practical difficulties are great. An important step was taken in September last, when Great Britain, the United States of America and France, precedent to the devaluation of the French franc, entered into an agreement to maintain as far as possible equilibrium in international currencies. This was expected to have, and actually had, a material influence in steadying the exchanges; but the full benefit to be derived from the welcome collaboration of the three parties to the agreement, which was joined in immediately by other European countries and gave promise of being capable of further application, has been frustrated to a large extent by the deplorable political conditions developing in Europe.

FOREIGN LENDING

The crowning incident in our recovery would undoubtedly be the resumption of foreign lending, signalling, as it would, the return of confidence in foreign affairs, but with existing unsettled conditions abroad achievement of this appears impracticable at the moment. Nevertheless, encouraging returns from Canada, Australia, Africa, Scandinavia, the Argentine, and other quarters, give indications of improvement which may have far-reaching effects upon international trade, and even lead, along with the stabilisation of currencies, to the recommencement of international lending, formerly one of Great Britain's main contributions to world progress, and the foundation of her own prosperity.

Before moving the adoption of the report, I must again tell you of the very high opinion I have of the ability and hard work displayed by our general manager, Mr Furniss, his colleagues and the executive generally, in obtaining results such as those shown in the balance sheet submitted to you. (Applause.)

The Chairman concluded by moving the adoption of the report and accounts.

Lord Colwyn, one of the deputy chairmen, seconded the adoption of the report and accounts, and the motion was unanimously carried.

Lord Ebbisham proposed the re-election of Mr A. Harold Hibby, Mr W. R. Glazebrook, Mr R. M. Holland-Martin, and Sir Frederick J. Marquis, as directors, and the confirmation of the appointment of Mr E. R. Bowring as a director. Lord Ebbisham said it was most satisfactory to note that the bank had taken its full share of the additional business resulting in the recovery of the country's trade. For the bank's consistent progress they were greatly indebted to the chairman and the directors, and to the general manager and staff.

Mr Thomas Purgold seconded the motion, which was adopted. On the proposal of Mr A. Kentish Barnes, seconded by Mr H. W. Garnett, the auditors, Messrs Harmood Banner and Son, Liverpool, Messrs Peat, Marwick, Mitchell and Company, London,

and Messrs Thomas Bowden Sons and Nephew, Newcastle-upon-Tyne, were re-appointed.

VIGOUR AND VITALITY OF THE BANK

Colonel Denis H. Bates proposed a vote of thanks to the directors, the standing committee and the general manager and other officers and staff of the bank for their valuable services during the year. Colonel Bates said the big increase in advances to customers proved the health of the bank and the growing prosperity of the country's industry, and, further, it denoted the courage, vigour and vitality of the bank. (Hear, hear.) None who passed through the recent cyclonic depression could fail to be thankful for the ready assistance and advice of the general manager, backed by the stability of the bank. (Applause.)

Mr W. Davidson seconded, and the resolution was carried with acclamation.

Mr J. M. Furniss, general manager, in reply, expressed his gratitude for the consistently able advice received from the chairman and standing committee, whose close attention was always given to the bank's major daily problems, and also from the board. He acknowledged also the help received from his colleagues in the executive in all districts of the bank, and indeed the whole staff, which had contributed to the satisfactory year they had experienced. (Applause.)

A hearty vote of thanks to the chairman for presiding, proposed by Mr W. E. Mounsey, brought the meeting to a close.

MICHAEL NAIRN AND GREENWICH, LIMITED

CONTINUED PROGRESS

The fifteenth annual general meeting of Michael Nairn and Greenwich, Limited, was held, on the 18th instant, in London.

Sir Michael Nairn, Bt. (the chairman), said that the net revenue receivable from investments, interest, etc., amounted to £281,739, which compared with £252,088 for the year 1935, and the directors were again in the position to recommend the payment of a final dividend of 7½ per cent., making a total of 12½ per cent. for the year and in addition the payment of a cash bonus of 2½ per cent. The carry-forward amounted to £66,370 as against £64,638 last year.

Their trade interests were world-wide, and while it might appear that there should be no limit to the expansion of their overseas trade, it must, however, be remembered that trade embargoes, currency restrictions and exchange variations rendered the extension of their markets overseas increasingly difficult. As the world prosperity on a sound basis was only possible by a resumption of international trading, it was to be hoped that some of the restrictions might ere long be sensibly relaxed. The various unilateral trade agreements negotiated by the Government had already produced important results on British trading interests abroad.

As chairman of the company, he was in constant touch with the activities of all their subsidiaries, and he was very pleased to report continued progress in all departments during the past year. These were days of keen competition in the linoleum industry, and the policy of the board had always been to maintain their factories and organisation in that state of efficiency which would enable them successfully to stand up to competition wherever it might be met.

The transference of the Greenwich plant to Kirkcaldy was still in process, but the task was one of considerable magnitude and they were taking care to see that it was carried out with the minimum of interference with their manufacturing interests. Fortunately, trade continued to expand and that fact might necessitate the maintenance of the plant at Greenwich for some years to come.

The report was unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

ALEXANDERS DISCOUNT COMPANY, LIMITED

CONDITIONS IN DISCOUNT MARKET

RETURN ON SHORT-DATED SECURITIES

MR COLIN CAMPBELL REVIEWS THE POSITION

The 69th ordinary general meeting of Alexanders Discount Company, Limited, was held, on the 20th instant, at Southern House, Cannon Street, London, E.C., Mr Colin F. Campbell (chairman of the company) presiding.

The Secretary (Mr P. C. Tong) having read the notice convening the meeting and the auditors' report,

The Chairman said:—Gentlemen, I assume you will take the report as read, as usual. (Agreed.)

In submitting the accounts to you once again at the close of the year, the shareholders will appreciate from them that the liquidity of the company has been fully maintained and the strength of the balance sheet remains unimpaired. This is a matter which calls for some satisfaction under existing conditions, because we have again passed through a year during which our normal business was reduced to a minimum; in fact, the purchase and sale of Treasury bills constituted over 80 per cent. of our turnover in bills.

No less an authority than the Governor of the Bank of England, when speaking at a bankers' dinner at the Mansion House in October, referred to the discount market in the following terms. Mr Norman said: "The discount markets are in a sorry plight. I find that five years ago they had two hundred and twenty or two hundred and thirty million bills to cover, and I find that as many months ago they had one hundred and thirty millions. I do not give these as complete figures, but I give them as comparable figures, and the difference between two hundred and twenty million and one hundred and thirty million is the measure of the reduction of the proper business which has come into this market."

TRADE BARRIERS

When this state of things is going to end I cannot say, but it is evident that so long as the trade of the world is beset with quotas, tariffs and every conceivable obstacle, there is small chance of a return to that free interchange of commodities between the nations which must be a prelude to that prosperity in the discount market which we so greatly desire.

In the meantime we have to live as best we can and it is fortunate that the market in short-dated Government securities has given us this opportunity. There are risks, of course, in carrying a large block of Government securities and substantial reserves are needed for this to be done with any degree of safety, but the risk is limited by the early maturity of our investments and, after all, were we engaged in a large turnover in commercial bills as in the days before the war, the element of risk would still remain.

PROFIT FROM SECURITIES

It is from our holding of securities that the bulk of the profit earned last year has been derived. This profit is less than in 1934 and 1935, but this was only to be expected, as the profit in these years was exceptional. It will be remembered that in 1934 the general trend of securities was in an upward direction, while in 1935 there were many fluctuations in prices affording opportunities for making profits without any very marked decline in the year. Furthermore, we witnessed in the past year several serious political events, notably the conquest of Abyssinia by the Italians and the civil war in Spain, both of which caused a serious dislocation in the stock markets for the time being.

At the same time, when considering the profit-earning capacity of the company, it should be borne in mind that the return on the short-dated Government securities is now greater than was the case a year ago, due to the lower prices at which they stand, and further the big reserves created in 1934 and 1935 against a possible fall in the price of these securities remain unimpaired, so that in attempting to forecast the future I think we can do so with some degree of confidence so far as 1937 is concerned.

A STEP IN THE RIGHT DIRECTION

The recent exchange arrangements between the United States, France and this country, to which several other countries have also subscribed, are a step in the right direction, and the great pros-

perity now being enjoyed in this country in consequence of the home trade demands, together with the re-armament programme, should react favourably on our market ultimately. But over and above these considerations stands the rise in the price of raw materials, which will materially increase the purchasing power of those countries where these primary products are produced.

It is reasonable to expect that exports to these countries will be increased thereby and that financial facilities will be required by means of bills of exchange for the movement of these shipments, but, with regard to this all-important question of exports, it is essential that our manufacturers and merchant houses, who have connections abroad, should maintain their establishments even though for the time being they are fully engaged in carrying out contracts for the home trade and for armaments at very remunerative prices, and also, may I add, it is equally essential that some of the restrictions on imports which are at present in force should be removed by these importing countries.

MONEY MARKET RATES

In the money market, rates have continued to rule at a low level with the Bank rate of 2 per cent. unchanged throughout the year. The London deposit rate of the clearing banks continued at $\frac{1}{2}$ per cent., while the average rate for Treasury bills was 11s. 6d. and for Bank bills 11s. 10d. The Chancellor of the Exchequer again took advantage of the cheapness of money by issuing £100,000,000 2½ per cent. Funding Loan in November at 98½ per cent., maturing 1952-57. Of this issue 53½ per cent. was payable before the end of the year, so that with the proportions of the Funding 2½ per cent. and the Treasury 1 per cent. loans issued in December, 1935, but payable in 1936, a total of £309,500,000 was actually raised by the Treasury during last year. On the other hand, £194,000,000 was repaid by the redemption of the Treasury 2 per cent. and Treasury 3 per cent. loans.

THE ACCOUNTS

With regard to the figures in our accounts, you will observe that the British Government securities stand at 13½ millions against 12 millions nine hundred thousand a year ago. The bulk of the securities are short-dated with only a few years to run. The bills discounted are higher at 15 millions seven hundred thousand, against 12 millions in 1935, and the figures in the aggregate amount to 31 millions against 26 millions. I can again repeat what I have said on several occasions, that there are no obligations of any kind outstanding relating to foreign governments or foreign municipalities. (Hear, hear.)

DIVIDEND MAINTAINED AT 19 PER CENT

Turning next to the profit and loss account, the current expenses are £7,800 less than a year ago, whilst the gross profit is £205,000, against £333,000 in the previous year, and the rebate on bills discounted is £140,000 against £161,000.

When considering the profits earned last year it should be borne in mind by shareholders that two courses were open to the directors in view of the depreciation in the value of the securities as at December 31, 1936, compared with the same date in 1935. One course was to charge this depreciation against the fund of £300,000, which had been specifically set aside for this purpose, and the other was to leave the fund intact and to provide for this depreciation out of the profits of the year. Your directors decided upon this latter course as being the more conservative policy of the two, and it accounts to a large extent for the reduction in the profit shown in the accounts.

The final dividend now recommended to the shareholders of the ordinary shares is at the rate of 20 per cent. per annum, making 19 per cent. for the year, being the same as in 1935, while the preference shareholders also receive the usual 6 per cent. Before sitting down, I would like to bear testimony to the very successful way in which Mr Newcomb has guided the company during a difficult year and to thank the sub-manager, together with the whole staff, for their loyal and excellent work. (Applause.)

The report and accounts were unanimously adopted.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

THE ANGLO-ARGENTINE AGREEMENT

The seventy-second annual general meeting of Liebig's Extract of Meat Company, Limited, was held, on the 21st instant, at Southern House, London.

Mr Kenneth M. Carlisle (chairman and managing director) said that the year had on the whole been characterised by more favourable trading conditions, especially in this country, which had made more substantial progress along the road to recovery than its neighbours in Europe.

The company's standard proprietary products under the well-known trade marks of Oxo, Beefex, Lemco, Fray Bentos, etc., had continued to enjoy the patronage of an ever-widening circle of the public, who utilised them to an increasing extent for the promotion and maintenance of health and vigour, as well as for flavouring and improving the dishes which formed a large part of the important daily curriculum of meals in every household. What custom they had acquired they confidently expected to maintain, and the high quality combined with the ready application of their products encouraged them to look forward to a steady development of their sales.

CONTINENTAL MARKETS

In the Continental markets, on the other hand, although in some countries their figure of turnover showed a pleasing and promising expansion, there had been little evidence as yet of any genuine desire or defined action to remove or even lessen the burden which the quantitative limitation of imports laid on the flow of international trade. It was to be hoped that the good intentions so universally expressed, to loosen the shackles on trade, would be put into practice without too great delay, and that international commerce, which showed distinct signs of an urge to revival, would once again be allowed to follow a freer and less harnessed course.

Their factories in South America had been in operation throughout last season with important programmes of manufacture, which were limited only by the number of cattle each plant could secure within the circumscribed range of economic prices.

The figure of profit returned was £262,839, or just over £5,000 higher than that shown last year, and the directors recommended a final dividend of 6 per cent., making 10 per cent., free of tax, for the year. Having regard to the unsettled conditions on the Continent and to exceptional losses experienced in Rhodesia, consequent on the severe and protracted drought which had afflicted that country, he hoped the result would be considered satisfactory.

A feature which had been causing them no little concern had been the propensity of one of the Provincial Governments in Argentina to increase the taxation on land, especially on properties held and farmed on a large scale. Having regard to the limited productivity of the land, which in many districts was suitable only for stock farming and was not susceptible of sub-division for closer agricultural settlement on an economic basis, the policy could only be considered a most short-sighted and injurious one.

ROCA-RUNCIMAN PACT

An event of importance in the annals of Anglo-Argentine relations had been the renewal of the Roca-Runciman Pact. It need hardly be said that certain of the provisions in the new agreement had not been acclaimed with enthusiasm by the live-stock farmer in Argentina, for they established for the first time in the long history of Anglo-Argentine commercial intercourse the principle and regime of a tariff on the products of the highly-graded herds, which had been developed to provide this country with its requirements of beef prepared and marketed in the best possible conditions. The new duty of 3d. per lb. dressed weight represented, at the official rate of exchange, approximately 25 per cent. of the value of a steer of good average weight on the growers' estancia on the basis of prices ruling for the two years prior to the new agreement, and thus constituted a very heavy burden for the producer to shoulder. All engaged in the industry were now waiting with concern to learn what proposals the Argentine Government might have in view to relieve the producers of the incubus which the possible assumption of the whole duty would lay upon them.

With a view to broadening the basis of supply of the raw materials on which their factories in Europe depended, they had been examining possibilities further afield, and it had been decided to establish a factory in Kenya for the industrialisation of cattle on similar lines to those adopted in their plants elsewhere.

The report and accounts were unanimously adopted.

SEDENAK RUBBER ESTATES, LIMITED

SUCCESSFUL RESULTS—GOOD PROSPECTS

The twenty-seventh ordinary general meeting of Sedenak Rubber Estates, Limited, was held, on the 20th instant, in London.

Mr Philip C. Turnbull, O.B.E. (chairman), who presided, said: The changes in the balance sheet since last year are few, the two principal being the expenditure of £4,376 on the upkeep of immature areas, and the £8,967 cost of export rights. If the latter expense, rendered necessary by the regulation scheme, had not been entailed, the earnings for the year would have been over 10 per cent. on the company's issued capital, but their purchase was unavoidable, to enable the crop of 2,250,000 lb. to be dealt with, and were thus a profitable investment.

Part of the crop, about 24 per cent. of the standard assessment, has been sold forward over the whole of 1937 at an average of 9d. per lb., and, although the market has gone higher since those sales were made, shareholders will agree that it was a wise policy to secure for a part of the crop a price in excess of last year's selling price. On the basis of last year's crop, every additional 1d. per lb. profit is equivalent to a further 3 per cent. on the company's capital.

The output was taken from the older areas of the Sedenak and Pontian divisions, no crop being taken from Glencoe, but during January we are opening up the first clearings in that section, a matter of some 588 acres, and this should enable us to reach the permitted export of 80 per cent. of our standard assessment without drawing on our young budded areas at all.

We have taken the opportunity to transfer a further £5,000 to reserve account, which now stands at £40,000, and I feel sure this step will meet with your full approval, as past experience has taught us the necessity for building up reserves during periods of relative prosperity so as to keep the balance sheet was published a corresponding amount of £5,000 nominal value of Government securities has been added to our investment portfolio.

The report was unanimously adopted and a dividend of 6 per cent. approved.

The resolution providing that all the issued shares in the company be converted into stock, and that such stock be transferable in amounts of £1, was carried.

LANGEN (JAVA) RUBBER ESTATES COMPANY, LIMITED

SATISFACTORY RESULTS—IMPROVED PROSPECTS

The twenty-seventh ordinary general meeting of this company was held, on the 15th instant, in London, Mr H. Eric Miller, chairman of the company, presiding.

The Chairman, in the course of his speech, said: On the whole the results of the year under review make a satisfactory showing. In the year ended August 31, 1935, we purchased export licences for over 130,000 lb., enabling us to account for the 951,000 lb. harvested that year, whereas in the year ended August 31, 1936, the percentage exportable averaged a lower rate, and we had further to reduce our exports by selling back to the Government 126,800 lb. of our own licences, leaving us with only 693,365 lb. for export.

Turning now to the profit and loss account, we show a net figure of £7,987 15s. 9d. for the year, and, adding the amount brought forward of £11,805 6s. 5d., we have an available total of £19,793 2s. 2d.

Our interest in Namoe Tongan Rubber Estates, Limited, in Sumatra, is equivalent to about 115 acres of young rubber, mostly budgrafted. That company has recently issued a satisfactory report, and, although it has not paid a dividend, the whole of its preliminary expenses, amounting to £5,522, have been written off and the sum of £8,000 was carried forward at the credit of profit and loss account. That company should be able to make a good showing in their next report, and we hope to receive a satisfactory dividend.

In pursuance of what we believe to be sound policy we have made some forward sales by instalments at rising prices, totalling about 190 tons for shipment throughout 1937 at the London equivalent of 9d. per lb. We do not know yet what our 1937 standard production is to be, but working on the 1936 figure and the percentage so far fixed for exports, the crop to be accounted for on 1936-37 working should be close on 465 tons.

We anticipate being able to present to you a satisfactory account of our stewardship a year hence.

The report and accounts were unanimously adopted and the payment of a dividend of 6 per cent., less tax, approved.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended January 16, 1937, amounted to £28,820,000, against ordinary expenditure of £10,803,000. After allowing for a decrease in Exchequer Balances of £371,107, the operations for the week, as shown below, decreased the gross National Debt by £18,163,000 to approximately £8,025 millions.†

GOLD MARKET

Messrs Samuel Montagu and Company write on January 20, 1937:—The Bank of England gold reserve against notes amounted to £313,660,659 on January 13, 1937, showing no change as compared with January 6th. In the open market the amount of gold offered at the daily fixing was about £1,400,000. There was very little change in prices, which, based on the exchange ruling at the time of fixing, included a small premium on the dollar parity. Most of the gold offered, however, was secured for the United States of America. The s.s. "Cathay," which sailed from Bombay on January 16, 1937, carries gold to value of about £443,000.

SILVER MARKET

Prices have shown wider fluctuations, but the tendency has been downward, quotations on January 20, 1937, being 20½d. for cash and 20½d. for two months' delivery, as compared with 21d. and 20½d. for the respective deliveries on January 13th. The Indian Bazaars and speculators have made further resales, but there has been less inclination to sell at the lower prices, as which India has also made purchases; buying from this quarter, however, has been limited, and the demand for early shipment appears to have been satisfied for the time being. The market has rather a dull tone, but there are indications that more resistance might be encountered at a slightly lower level.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard	Price of Silver New York per ounce .999 fine
			Cash	Two Months
Jan. 14	s. d.	s. d.	d.	d.
" 15	141 8	11 11-92	20 1/2	20 1/2
" 16	141 7	12 0-01	20 1/2	20 1/2
" 17	141 7	11 11-96	20 1/2	20 1/2
" 18	141 7	11 11-96	20 1/2	20 1/2
" 19	141 7	11 11-96	20 1/2	20 1/2
" 20	141 8	11 11-88	20 1/2	20 1/2
Average	141 7-67	11 11-95	20 1/2	20 1/2
Jan. 21	141 8 1/2	11 11-79	20 1/2	20 1/2

The highest rate of exchange on New York recorded during the period from January 14, to January 20, 1937, was \$4.91 1/4, and the lowest \$4.90 1/4.

Statistics for the month of December, 1936:—

	Bar Silver per oz. std.	Bar Gold per oz. fine
Highest price	21 1/2d.	142s. 1d.
Lowest price	21 1/2d.	141s. 4d.
Average	21.2375d.	141s. 8.28d.

SHORTER COMPANY COMMENTS

OTHER COMPANY RESULTS.—Revival in the shipbuilding and repairing trade is well illustrated by the £20,000 increase in SMITH'S DOCK COMPANY'S profits of £79,668. The profits of TRANSVAAL AND DELAGOA BAY INVESTMENT are the highest for recent years. Among rubber companies, TAMIANG earnings are 54 per cent. higher at £27,607. Improved boot and shoe profits are shown by STEAD AND SIMPSON and L. & J. WEBER AND PHILLIPS. Each has achieved a 15 per cent. increase in profits, and the latter company is raising its dividend by 1 per cent. to 8½ per cent. PHILLIPS RUBBER SOLES records a small setback, with earnings of £53,613 against £58,068, owing to the higher cost of raw materials. Among textile companies, JOHN CROSSLEY AND SONS show a substantial recovery in earnings from £56,588 to £85,351, but the dividend is raised only from 6½ per cent. to 7½ per cent. the reserve allocation being trebled at £30,000. Earnings of NATIONAL OMNIBUS AND TRANSPORT COMPANY have further improved to £88,694. Of the seven Trust results published this week, considerable progress is shown by GENERAL CONSOLIDATED, NEW YORK AND GENERAL, and LONDON STOCKHOLDERS, though the two latter companies are not yet resuming dividends. A record volume of sales is reported by CINZANO, who have earned £123,576 against £89,355. Growing prosperity among engineering firms is illustrated by the £23,000 increase in J. AND E. HALL profits. A lower price for sugar accounts for the small setback in TRINIDAD SUGAR ESTATES' profits.

BANKING RESULTS

BANK OF IRELAND.—Profits for 1936, £378,927, compared with £386,594 for 1935. Dividend maintained at 13½ per cent. To contingencies reserve, £75,000 against £100,000. Balance forward increased from £86,775 to £100,970. Deposits, £32,835,254 against £32,244,814. Advances, £14,233,783 against £14,044,952. Total assets, £45,160,768.

BELFAST BANKING COMPANY, LIMITED.—Net profit for 1936, £106,056 against £105,182 for 1935. Dividend, 11 per cent. as before. Carry-forward increased from £76,032 to £114,988. Deposits, £14,044,212, compared with £14,673,248 at end of 1935. Advances, £6,085,684 against £6,681,178.

COUTTS AND COMPANY.—Total assets at end of 1936, £26,365,665, compared with £25,550,204 at end of 1935. Deposits have increased from £22,751,748 to £23,864,920. Advances, £10,378,191 against £8,540,082.

MUNSTER AND LEINSTER BANK.—Net profits, second half-year, 1936, £68,727 against £69,236 for second half of 1935. A dividend of 6 per cent. is declared as before. The sum of £15,000 is placed to contingencies account, £5,000 to reduction of premises account, and £5,000 to pension fund. Deposits, £24,437,421 against £24,493,225. Advances, £10,285,754 against £10,390,656.

ROYAL BANK OF CANADA.—Balance sheet dated November 30, 1936, shows total assets \$855,588,457, against \$800,919,700 at November 30, 1935. Deposits, \$746,764,498 against \$688,366,512. Profit, \$3,504,241. Dividend, 8 per cent. as before. Carry-forward increased from \$1,609,554 to \$1,913,796.

STANDARD BANK OF SOUTH AFRICA.—Total assets, September 30, 1936, £77,691,058, compared with £73,069,270 at September 30, 1935. Deposits, £61,636,933 against £58,369,371 at September 30, 1935. Bills discounted, advances, etc., £34,301,099 against £29,092,820.

THE NATIONAL BANK.—Net profit, half-year ended December 31, 1936, £111,439, compared with £110,555 for second half of 1935. The dividend is maintained at 6 per cent. To reserve, £10,000 as before, and £10,000 against nil to bank premises account. Carry-forward increased from £37,084 to £38,523.

THE NATIONAL BANK, LIMITED.—Accounts for half-year ended December 31, 1936, show net profit of £111,439, compared with £110,555 for second half-year, 1935. Dividend, 12 per cent. per annum as before. To reserve fund, £10,000. To reduction of bank premises, £10,000. Carry-forward, £38,523.

THE NATIONAL CITY BANK OF NEW YORK.—Total assets, December 31, 1936, \$1,904,799,797, compared with \$1,880,679,850 at end 1935. Capital, surplus and undivided profits, \$133,462,953 against \$168,144,278. Deposits, \$1,713,840,229 against \$1,652,366,244.

ULSTER BANK, LIMITED.—Net profit for 1936, £182,602 against £180,514 for 1935. Dividend, 14 per cent., free of tax, for year. The sum of £35,000 against nil is to be written off bank premises account. Carry-forward increased from £76,889 to £84,470. Deposits, £21,769,446 against £21,694,129.

APPOINTMENTS AND PERSONAL

Mr W. M. Codrington, Lieut.-Colonel Sir Francis Humphrys, and Mr Mark Patrick, M.P., have been elected directors of Carreras, Ltd. Mr H. W. Danbury retains his seat on the board, but has relinquished the chairmanship to Mr Edward Baron.

Grace Brothers and Company, Ltd., have decided not to continue their banking business, and a return of capital to Grace Brothers and Company, Ltd., shareholders, is contemplated. The Right Hon. the Earl of Donoughmore, K.P., P.C., the Hon. B. P. Bouvier, E. D. Spring-Rice, Viscount Saurdale and Sir Murrrough John Wilson, K.B.E., have resigned from the board.

Bengal Doars Railway Company, Ltd., have elected Lieut.-Colonel W. R. Izat, D.S.O., R.E., to the board, in place of the late Sir H. P. Burt, K.C.I.E., C.B.E.

Seager, Evans and Company, Ltd., have appointed Mr R. H. Byard and Mr A. H. Cheney, A.C.A., as joint managers.

Mr A. W. Pelling, chief of the Securities Department of the Bank of Adelaide, London, retired on January 16th, after 40 years' service.

Mr J. E. F. de Kok has been offered a seat on the board of Shell Transport and Trading, in place of Sir Henri W. A. Deterding, resigned.

Dr E. F. Armstrong has been appointed director of Commercial Gas Company, in place of Mr Frederick McLeod, deceased.

Mr B. E. Uffindell has been appointed a director of F. W. Woolworth and Company, in place of Mr R. H. Parker, resigned.

Mr Patrick Nicholson has been appointed managing director, jointly with Mr Denys Lawson, of Fifteen Moorgate Unit Trusts, Ltd. Sir Cuthbert Headlam, Bart., D.S.O., has been appointed a director, and Lord Stanley of Alderley has been appointed secretary.

Mr H. A. Ward, M.I.Mech.E., has joined the board of Bennis Combustion, Limited, and will act as general manager.

Mr Henry Willis has been elected vice-president of the London Life Association, Ltd., in succession to Mr Gerald Dudley Smith, whose death occurred on December 29, 1936.

Mr H. S. Milligan, general manager of North British and Mercantile Insurance, has also been appointed general manager of Railway Passengers Assurance, manager of the Ocean Marine Insurance, and general manager of the Fine Art and General Insurance. Mr R. G. Knowles has been appointed manager of Railway Passengers Assurance Company.

BUILDING SOCIETY RESULTS

BOROUGH BUILDING SOCIETY (BURNLEY).—Report for 1936 shows assets £4,558,667, an increase of £411,387 over 1935. Share capital increased by £249,139 to £3,726,472. Amount due to depositors is £594,269, an increase of £124,319. The record sum of £34,479 has been added to reserve. Due from borrowers, £4,351,345. Net profit amounts to £152,506.

BRADFORD SECOND EQUITABLE BENEFIT BUILDING SOCIETY.—Total assets, December 31, 1936, £7,279,708. Advances on mortgage, £1,390,614. Average liability per mortgage, £394. Due to shareholders, £5,540,209, and to depositors £1,402,080. Participating shareholders receive £3 10s. per cent. net. To reserve, £35,000. Carry-forward, £13,260.

BURNLEY BUILDING SOCIETY.—Amount owing on mortgages end 1936, £13,184,603, average under £391. Shares, £9,953,237; deposits, £3,283,497, together showing an increase of £1,113,014 over 1935. Balance of income, 1936, £411,622. Interest new series shares, 3½ per cent., free of tax. Old series, £3 13s. 6d. per cent., tax free. To premises, £13,960. To reserve, £50,000. Carry-forward, £26,546.

EASTBOURNE MUTUAL BUILDING SOCIETY.—Preliminary figures for year 1936 show total receipts £825,029, an increase of £67,945 compared with 1935. Total assets at December 31, 1936, estimated to exceed £1,870,000, an increase of 11 per cent.

MISCELLANEOUS

ANGLO-JAVA RUBBER COMPANY, LTD.—The company has purchased an estate in Johore, comprising 2,239 acres, of which 2,234 acres are planted with rubber, for £28,612 5s. 1d. in cash and allotment of 1,362,778 1s. shares.

UNION CINEMA COMPANY.—The auditors' estimate of profits for the past three years is as follows: 1933-34, £223,686; 1934-35, £260,887; 1935-36, £329,286.

STEAD AND SIMPSON, LTD.—Profit for 1936, £47,151, compared with £44,866 for 1935. Ordinary share dividend, 10 per cent. as before. Carry-forward increased from £85,151 to £96,611.

LONDON NIGERIAN TIN MINES.—Balance of profit for year to June 30, 1936, £204,581, compared with £144,247. Ordinary dividend, 15 per cent., compared with 12 per cent. Carry-forward increased from £23,988 to £31,742.

CHILEAN DEBT PAYMENT.—A payment of 12s. 1½d. per cent. is to be made this year on Chilean bonds. This compares with 9s. 6d. per cent. paid a year ago.

PHILLIPS RUBBER SOLES, LTD.—Net profit for year to September 30, 1936, £70,526, compared with £73,922 for preceding year. Ordinary dividend, 12½ per cent. for the year as before. Income tax absorbs £16,912 against £15,855. To be written off patents, etc., £5,000 as before. Carry-forward increased from £16,137 to £16,714.

TRINIDAD SUGAR ESTATES.—Profit for year to September 30, 1936, £21,279 against £26,151. Ordinary dividend, 7½ per cent. for the year. Carry-forward increased from £594 to £1,623.

CABLE AND WIRELESS, LTD. (Index Numbers).—Monthly figures reduced to working day average. Working day average of comparable receipts, year 1929 = 100.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

THE strong upward trend of the prices of primary products was interrupted this week by a sizeable and fairly general reaction, due partly to the labour difficulties in the United States' automobile industry. As corrective movements usually take place after a sharp rise or fall in prices, this week's decline in prices does not necessarily portend a change of trend, especially as there has been no alteration in the underlying factors governing demand and supply.

Optimism, tempered by caution, was the keynote in the market for non-ferrous metals. Quotations for copper, lead, spelter and tin were marked down, but the decline did not go very far. The market in rubber was less active and prices were slightly lower owing to the interruption of work in the United States automobile industry. Linseed and linseed oil declined on the attitude of reserve adopted by buyers. American raw cotton was marked down in view of the uncertainty concerning the effect of the forthcoming disposal, by the United States Government, of some of the stocks held by them. Similarly, opening quotations for merino wool at the sales in London were not fully maintained as the auctions proceeded. Quotations for raw sugar were maintained, but wheat prices declined under the pressure of increasing supplies from Argentina and Australia. Generally, any unfavourable news, even if of little consequence, was sufficient to bring about a decline in prices this week.

A similar corrective movement took place in the United States. Thus, Moody's index of the prices of primary products (December 31, 1931 = 100) fell to 207.9 on Wednesday, against 209.6 a week earlier, 202.3 a month ago, and 168.8 on the same day last year.

COAL

SHEFFIELD.—Home demand for all grades of industrial coal is active, and prices are firm. The continuance of the dispute at five collieries in the Doncaster area is hampering supplies. Household coal is firm, and moving fairly freely. Small and graded coal is the most difficult to obtain, demand being exceptionally strong. Smalls are in heavy request by electricity undertakings. Furnace coke is strong, and gas coke is almost unobtainable outside contract, any quantity available being quoted at 30s.—31s. There is little or no change on the export market. Shippers are unable to get all the coal of the descriptions they need. The only alteration in export prices is in slacks, which are now quoted from 12s. 6d. to 15s. 6d. per ton.

NEWCASTLE-ON-TYNE.—The market continues firm for all classes, and there is good evidence that much more coal could be sold for prompt shipment if supplies were available. Collieries are now well booked over this year and a number of Scandinavian consumers are turning their attention to next year's requirements. Screened steam coals are fully sold, prices being nominal through lack of supplies. Durham coking coal is very scarce, prime brands having been sold at 18s. per ton f.o.b. Coke of all descriptions is very firm, and with the gradual opening of additional furnaces in this area there is no likelihood of any ease.

GLASGOW.—Prices remain firm all round. Collieries are well booked for some time ahead, and with output sub-normal owing to influenza and labour troubles, very little fuel is available for new business. This applies specially to export, and complaints are heard that shippers are forced not only to refuse new orders, but also on occasion, to cancel loadings already arranged. There is much interest in the question whether the existing organisation is sufficiently flexible to meet the new conditions arising from the spread of trade recovery. In the home market, which is absorbing the major portion of production, industrial, public utility and household requirements are brisk, and coastwise business remains steady.

CARDIFF.—The Cardiff coal market continues moderately active; a welcome development has been the increased demand for large steam coals. Foreign and coastwise shipments last week totalled 425,200 tons, compared with 358,300 tons during the corresponding week last year. Total shipments during the three weeks ended January 17th were 1,164,600 tons, an increase of 3 per cent. over the corresponding period last year. Prices remain firm, and in some cases the Control Board is now imposing a minimum of 21s. per ton for best large steams, and 20s. for second classes, prompt shipment. These prices represent advances of from 6d. to 1s. 6d. per ton, while smaller increases have taken place in ordinary steams, dry large, and in both Western and Eastern Valley Monmouthshire coals. There has been no abatement of the scarcity of washed and sized grades, but quotations for these classes are unaltered. The market in coke is still very active, and patent fuel and pitwood are firm. There have been important inquiries in the market, but no new contracts have been concluded. The Great Western Railway Company are contemplating improvements in shipping facilities at Barry to provide against the contingency of a substantial expansion in trade. Meanwhile, however, existing facilities are more than adequate for current business.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that production of iron and steel is maintained at a record level. Markets are less active, however, owing to the comparatively small tonnage of material available for near delivery. The insatiable home demand leaves only a small proportion available for export. Production on the Continent is not sufficient to meet the requirements of overseas markets, and buyers abroad are becoming uneasy regarding their future supplies and are anxious to place orders.

In the pig-iron department most consumers have bought well ahead, and producers have sold their output for some months to come, in one or two instances until the end of next September. A considerable amount of

business is offering, however, in the shape of supplementary parcels to meet urgent requirements, and this is not easily placed.

The situation in the semi-finished steel department is still difficult, and, although works are operating at capacity, output falls short of consumers' needs. It is expected that additional plant will be brought into production during this month; but this can scarcely be sufficient to make up the deficiency between demand and supply.

Heavy quantities of finished steel are passing into consumption, but there seems to be no slackening in requirements. Steelworks are concentrating more upon maintaining deliveries than upon seeking fresh business; nevertheless, a heavy tonnage of orders is circulating in the market.

MIDDLESBROUGH.—Fresh inquiries continue to be received for all classes of pig iron and steel. Makers are, however, so fully contracted for early delivery that they are not able to negotiate new business for prompt requirements. The scarcity of pig iron is not so acute as at the end of last year, and, whilst home consumers are being kept fully supplied, further shipments are being made to foreign destinations. In addition to the cargo of about 1,500 tons which was shipped to Denmark last week, a parcel of over 1,000 tons has just been forwarded to Sweden. Total shipments of pig iron from the Tees during the first nineteen days of January amounted to 6,286 tons, against 4,187 tons during the same period in December. East Coast hematite makers are also well sold and are unable to entertain all the inquiries received. Prices are maintained at the official figures of 81s. per ton for No. 3 Cleveland foundry pig iron, delivered locally. The official quotation for East Coast mixed numbers is 97s. 6d. per ton delivered locally, less 5s. rebate.

Steel producers have substantial contracts to execute, and, in some cases, are oversold. Every effort is being made to keep home requirements fulfilled, whilst shipments abroad are being well maintained, chiefly to the Colonies. Foreign semi-manufactured material is less easily obtainable. Sheet makers have advanced export prices, which are now:—Black sheets (No. 24 gauge), £12 per ton f.o.b.; galvanised corrugated sheets (No. 24 gauge), £14 15s. per ton f.o.b. This increase will probably be followed by a revision of prices to home consumers.

Steel scrap is scarce, but buyers are adhering to 62s. 6d. per ton for heavy steel melting material delivered at the works. Imports of iron ore continue to be well maintained, the total quantity imported into the Tees during the first 18 days of January being 77,700 tons, against 89,700 tons during the same period in December. Two cargoes of ore have arrived from Bilbao during the past week, but freights are well maintained, the rate in operation for Bilbao-Middlesbrough being 9s. 6d. per ton. Good Durham blast furnace coke is firmer at 25s. 6d. per ton, delivered furnaces.

SHEFFIELD.—The iron and steel market remains active. Producers of pig iron are in most cases well booked over the first half of the year, and are not anxious to add further to their commitments. The position in foundry and basic pig iron shows no indication of easing, and consumers are finding difficulty in placing new business even for odd parcels. Requirements of forge iron are more easily met, but there is no great surplus. Lincolnshire makers are still off the market here, and consumers are largely dependent upon Derbyshire producers. There is no sign of expansion in hematite supplies, and there is now a marked shortage. Demand for iron and steel scrap is increasing, and prices show a hardening tendency. In finished iron the improvement of the last few months is well maintained, especially in common and marked bars, which enjoy a good demand. Crown bars are also in growing request. Prices in all sections of the market remained unchanged.

Despite the heavy output, it is impossible to overtake the demand for basic steel billets, and acid qualities are now running them close. Stainless steel in its various forms, as well as wire rods, strip and bars, are in ever-increasing request. All the heavy forges, foundries and rolling mills in this district are working to capacity, and will certainly remain busy during the next few months.

GLASGOW.—An enormous amount of work has been placed in Glasgow and the West of Scotland since the beginning of the year, involving thousands of tons of steel. Shipbuilders, locomotive builders, carriage and wagon-builders, makers of steel structures of all kinds, marine and other engineers and makers of machinery have all received much work. Despite intense activity, steel plants find it impossible to meet the demands of users. Materials are unobtainable at short notice, and at many of the plants output has already been sold for several months ahead. Re-rollers are finding it impossible to get sufficient supplies either from home producers or from the Continent to ensure continuous running of plants for more than a few weeks ahead. The uncertainty regarding supplies of raw materials is causing anxiety in the re-rolling industry.

CARDIFF.—The tinplate works are maintaining output at approximately 70 per cent. of allotted capacity under the pooling scheme, but shipments last week totalled only 3,685 tons, against 8,887 tons the previous week, and 3,710 tons in the corresponding week of 1936. The inland demand is normal, but because of the slump in exports, stocks have increased from 3,203 tons to 5,179 tons. It is now officially reported that production of tinplate, terneplate and blackplates last year totalled 824,795 tons, compared with 708,234 tons in 1935, and of this output 386,738 tons were exported as against 373,061 tons, and 438,057 tons retained for home consumption and stocks, compared with 335,173 tons. For the first time in the history of the industry the proportion retained for the home market was greater than that exported. Inland requirements of sheets have been a little more active, and blastfurnaces and steelworks are well employed. Prices of steel bars, tinplates and sheets are unaltered.

OTHER METALS

COPPER.—Prices turned easier, the official quotation on Tuesday being £50 6s. 3d. On Wednesday there was a rally to £51 8s. 9d., representing a decline of £2 16s. 3d. on the week. There has been a selling wave of considerable magnitude this week and daily turnovers on the Metal Exchange were on a high level. The market was, however, able to absorb all offerings without undue difficulty—a fact which reveals the fairly strong technical position. The weakening of prices, particularly the slump on Tuesday, was only partly due to the removal of restriction. The American strike movement was an important factor. The market output are reflected in supplies. It is to be expected that even relatively small increases in production will have a marked influence on the statistical deliveries. In December extra-United States copper stocks increased by no less than 10,360 short tons to 192,100 short tons, while United States stocks declined by 10,250 tons to 161,040 tons.

Head Office:

POULTRY, LONDON, E.C.2

Sales on the London Metal Exchange: 5,750 tons on Monday, against 7,750 tons last week; 4,300 tons on Tuesday, against 9,000 tons last week; 4,100 tons on Wednesday, against 6,750 tons last week. Domestic spot was quoted at 12.27½ cents per lb. in New York on Wednesday, against 12.80 cents a week ago and 11.50 cents a month ago. Wednesday's official closing price for standard cash in London was £51 8s. 9d. to £51 10s., compared with £54 5s. to £54 6s. 3d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 45,038 tons, showed a decrease of 178 tons, while stocks of rough copper, at 1,107 tons, remained unaltered.

LEAD AND SPELTER.—After violent fluctuations both metals were on balance slightly easier. In the case of lead Messrs Metal Traders, Ltd., in their last weekly report that as a result of the recent sharp rise in prices very large supplies of old lead have come on the British market. In addition, production of new lead is apparently on the up-grade, while consumption is at present adversely affected by seasonal influences. Spelter—in spite of the improving state of consumption—still suffers from the high current output. According to Metallgesellschaft extra-United States spelter production during the first eleven months of 1936 aggregated 911,386 metric tons, an increase of 6.45 per cent. on the year. The daily rate of output in November was the highest for a number of years. At the beginning of the new year several zinc refineries on the Continent, which had been idle since 1932, resumed operations; hence there is little reason to expect any fall in spelter production in the near future.

Sales of lead on the London Metal Exchange: 2,100 tons on Monday, against 3,250 tons last week; 2,050 tons on Tuesday, against 3,750 tons last week; 2,700 tons on Wednesday, against 2,500 tons last week. The New York quotation on Wednesday was 6.00 cents per lb. against 6.00 cents a week ago and 6.00 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £27 6s. 3d. per ton, compared with £28 11s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 5,000 tons on Monday, against 4,000 tons last week; 4,050 tons on Tuesday, against 7,500 tons last week; 3,000 tons on Wednesday, against 4,250 tons last week. Wednesday's quotation in East St. Louis was 6.00 cents per lb. against 6.00 cents the week before and 5.45 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £21 5s. per ton, against £22 15s. last week.

TIN.—Tin has again been neglected. Sales have been on a very small scale, while supplies are showing signs of expansion. The chief reasons for the easiness of tin were on the one hand the fear that the new international tin agreement might lead to the maintenance of high supplies; and on the other, the American strike movement. As tin is much more affected than any other metal by the American strikes—the U.S. automobile and tinplate industries are the largest tin consumers in the world—this market is likely to remain very sensitive and nervous until the position in the United States is clarified.

Sales of tin on the London Metal Exchange: 150 tons on Monday, against 325 tons last week; 200 tons on Tuesday, against 225 tons last week; 175 tons on Wednesday, against 275 tons last week. The New York quotation on Wednesday was 51.10 cents per lb., against 50.95 cents a week ago and 51.90½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £229 10s. to £229 15s. per ton, compared with £231 to £231 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,442 tons, an increase of 297 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 6s. per flask of 76 lbs., against £14 5s. a week ago. Chinese antimony was quoted at £64 to £65 per ton ex warehouse, as against £64 to £65 per ton last week. Chinese wolfram for "January-February" shipment was quoted at 33s. 6d. to 34s. 6d. per unit, c.i.f., compared with 32s. 6d. to 33s. 6d. last week. Refined platinum was steady at £9 15s. per ounce.

TEXTILES

COTTON.—Manchester.—Throughout the past week inquiry has continued active, and numerous spinners and manufacturers have booked orders on a free scale. Many producers have strengthened their position and buyers have had to pay full prices. Only minor fluctuations have been occurred in raw cotton rates. Dealings in futures in Liverpool have been restricted owing to the uncertainty concerning the effect of the "loan" cotton to be released by the American Government next month. Trade demand for cotton has been healthy, especially for South American qualities. Forwardings to spinners are of record dimensions.

American yarn quotations have again been raised. An encouraging business has been done, especially in ring beams. Spinners have been able to improve their margins. There has been a little more activity in Egyptian qualities.

The general inquiry in piece goods has been encouraging. From the point of view of buyers, the question of delivery has been more important than price, and some customers have been surprised at the way in which manufacturers have recently extended their order lists. The revival of demand for India has been maintained, and an extensive business was done. Steady buying has again occurred for Java and Singapore, with a few more sales in fancies for China. Shippers to Egypt have displayed more enterprise, and a healthy turnover has taken place for West Africa and South America. Freer buying has been reported in home trade fabrics. It is a long time since manufacturers were in such a strong position to dictate terms of fresh contracts to buyers.

January 23, 1937

Consuming centres, like Bradford, are quieter, with prices tops slightly in buyers' favour. It is possible to-day to buy average 64's tops at 38-38½d., and w/p 64's at 39-39½d.

Consuming centres, like Bradford, are quieter, with prices tops slightly in buyers' favour. It is possible to-day to buy average 64's tops at 38-38½d., and w/p 64's at 39-39½d.

MISCELLANEOUS COMMODITIES

RUBBER.—After again touching 11d. per lb. on Friday of last week, the spot quotation declined in sympathy with the general tendency of commodity prices this week. An important factor has been the continuance of the strike troubles in the United States motor industry. A further bearish influence is the expectation that the International Committee may take active steps, after its meeting next Tuesday, to increase the supply of near rubber. The spot price in New York on Wednesday was 21½ cents per lb., compared with 21½ cents per lb. a week ago and 20½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10½d. on the corresponding day last week. In forward positions, business has been done at 10½d. to 10¾d. for "February" shipment, as against 10½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 74,659 tons, against 76,501 tons a week earlier. A year ago stocks amounted to 161,447 tons.

VEGETABLE OILS AND OILSEEDS.—The market in oilseeds

is quieter; in the absence of demand business is restricted. Linseed is easier in sympathy with wheat and other commodities. Crushers both here and on the Continent, having earlier made substantial purchases of Plate for shipment, are not increasing their commitments at the present stage. The harvest in Argentina appears to be progressing satisfactorily and heavy shipments of new seed are now being made. The quantity afloat for Europe has thus increased to 177,500 tons (including 27,400 tons from India), an advance of 22,000 tons on the week. The balance of the Indian old crop is moving off slowly, but not much remains for export. Favourable reports are to hand of the progress of the new crop, shipment of which cannot commence until the end of April at the earliest. Linseed oil has declined by fully 20s. per ton and consumers are still by no means actively interested.

Cottonseed has taken a decidedly easier turn and demand has fallen off. Cotton oil remains steady, but on a lower level. Reports are current that America is in the market for further supplies of refined oil, but to what extent is not known. A feature has been the strength of palm kernels and palm kernel oil which are 50 per cent. dearer than some months ago. Demand for oilcakes is satisfactory and late prices are maintained.

WHOLESALE COMMODITY PRICES

UNITED KINGDOM: LONDON, January 20th

ourselves face to face with forces which if left uncontrolled would result in an upward spiral of costs and prices. The comparative ease with which large profits had been made would then be replaced by the difficulty of avoiding heavy losses, and the rush to get out of commitments would be far more precipitate than the former eagerness to enter into them.

But beyond indicating the new co-operative system of the Treasury, Bank of England and the Big Five, the chairman of the Midland Bank did not commit himself to an expression of opinion on what measures should be taken to prevent the vicious spiral from beginning. Like MR BECKETT and others, he set his face against any rise in money rates; and left it at that. All the bankers want their advances to increase and cheap money to be maintained. But this, by itself, is no safeguard against the vicious spiral. It might easily become the very reverse.

Bankers and economists are at one, however, in their desire to see world trade expand. This would be both a preventive of a runaway boom and a stimulus to our lagging export trades and the Depressed Areas in which they are mainly situated. MR BECKETT, MR EDWIN FISHER of Barclays and MR ORME of Martins rightly emphasised the need to develop this languishing side of our national economy; and MR ORME again expressed the hope that a resumption of foreign lending would accompany it. LORD WARDINGTON, chairman of Lloyds Bank, said we should look ahead and foster our export trade forthwith, not ignore it in our present prosperity.

Now, it is self-evident that the best and least abrupt brakes on the forces tending to set up a vicious spiral of

costs and prices in this country are a relaxation of our import restrictions and a careful control over capital extensions and public or semi-public works of a capital nature. The added stimulus of the growing re-armament programme calls for compensation by damping-down those projects whose initiation would now cause nothing but congestion and a hectic boom in our basic industries. The rise in world prices can be best slowed down and co-ordinated by such modification of trade barriers as will even out wide disparities between national price levels. That would benefit this country; and our invisible exports would rise with our visible exports, as they always do when world trade expands.

Three of the chairmen of the Big Five have declared this week that industry is not yet coming to them for the proportion of advances which it took before the depression. The implications of this are discussed in our Banking Article on page 242. If prosperity is not to turn into a runaway boom, and if we are not to create for ourselves an economic dilemma as acute as that of 1931, the Government and their advisers—official, and, like bankers and economists, unofficial—must evolve without delay an economic policy which looks both to our internal and our external difficulties. It is not for nothing that our bankers' speeches this week have been as much concerned with world-wide economic trends and tendencies as with our domestic problems. In currency relationships, in movements of prices, and in trade, the world is working forward to a new unity. In the last year its progress has been startlingly rapid. This country has everything to gain, and nothing to lose, by encouraging this tendency to the utmost of its power.

What Herr Hitler Ought to Say

WE go to press this week on the eve of one of HERR HITLER's full-dress speeches. The speech will be important, for the Reichstag has been specially summoned to hear it on the fourth anniversary of the FUEHRER's accession to power, and it is being delivered on a Saturday, which is HERR HITLER's day of action—and MR BALDWIN's day of repose. What would we have him say at this juncture of Europe's fate?

Before we can answer this, let us glance for a moment at the setting. Nearest in time we have to note M. BLUM's speech of last Sunday and the concerted German and Italian replies to the British note on arresting the flow of foreign volunteers to Spain.

The French Prime Minister's speech was a masterly combination of firmness and politeness. The speech disclaimed any desire to push the Germans into a deal—repudiated by them in advance—in which they would be required to trade away their political freedom of action in exchange for economic aid. But with still sweeter reasonableness he declined to give away French security *gratis* by supplying Germany unconditionally with French sinews of war. He also declined to abandon the collective system and, specifically, to disinterest himself in the fate of France's friends and allies in Eastern Europe. Indeed, he proclaimed as the characteristic feature of the policy of his Government their "tenacious and unshakable resolve to maintain peace indivisible."

This places beyond all doubt the limitations on Germany's capacity for competitive re-armament. Germany is evidently not going to be equipped, at the expense of other countries, with the means of conquering the world. She cannot have French butter as well as German guns. Germany cannot hope both to outstrip her neighbours in the accumulation of munitions of war in the narrower sense, and at the same time to build up

in the same ratio those reserves of other commodities without which a modern war cannot be waged. Unsupplemented, Germany's total national resources are in fact inadequate for the gigantic task of world-conquest; and it now looks as though Germany were also being disillusioned of her hopes of climbing to ascendancy in Europe by the devious route of making herself mistress of Spain, then of Czechoslovakia, and then of Central Europe.

The German and Italian replies on the question of volunteers are satisfactory only in so far as they suggest that the two Fascist Powers may be genuinely seeking a line of retreat from their policy of surreptitious piecemeal intervention on GENERAL FRANCO's side. Both the new notes welcome the proposal for an immediate stoppage of the inflow of foreign volunteers (with or without inverted commas). They propose that a date shall be agreed after which the flow shall cease, and that effective concerted measures of control shall be taken to ensure that the agreement is observed. True, they go on to propose that the foreign volunteers already fighting in Spain shall be recalled, and that an end shall also be put to financial and propagandist assistance to either party. These counsels of perfection may be interpreted as deliberately "impossibilist" stipulations designed to prevent agreement and so gain still further time for playing the game which the Fascist Powers have been playing hitherto. We believe, however, that the notes are rather to be interpreted as an admission that in Spain the Russians have been a match for the Germans and Italians in arms, and their superiors in the political arts. If this interpretation is correct, the Russians would be well advised to resist the temptation of savouring their success and seeking to improve the occasion. The wise course for Russia is to assist France and England in building a golden diplomatic bridge

over which Germany and Italy may be able to beat a rapid but still dignified retreat.

And what is the moral for HERR HITLER? If we may assume that he cannot hope to conquer Europe in Spain—and cannot hope to conquer her in Central Europe without arousing France to military intervention—then has not the moment arrived for him to come to terms? Is he not bound to lose by persisting in a Four Year Re-armament Plan which apparently cannot bring Germany any gains proportionate to the sacrifices entailed? No doubt coming to terms is harder for the FUEHRER to-day than it is for SIGNOR MUSSOLINI with an Abyssinia in his pocket. But we do not believe it is beyond HERR HITLER's powers to put the case convincingly to his own people. This is precisely his forte; and if he can rise to the occasion it is perhaps within his power to produce the oratorical *chef d'œuvre* of his career.

HERR HITLER's problem is to stop re-arming and to make a genuine peace with his neighbours, while persuading his countrymen that they have already got their money's worth out of the privations he has imposed upon them up to date. For this he could surely make out a plausible case. He has always proclaimed two main aims with manifest sincerity: on the one hand, to aim with Germany that equality of status and influence with the other Great Powers which she lost in the Great War; and, on the other hand, to make Germany the champion and saviour of Europe from the many the menace of Communism. The second of these two aims cannot be achieved until the first has been assured, and it is arguable that—in view of the unwillingness of the ex-victors to disarm—the re-armament of Germany was the only practicable road to the restoration of her equality. But if we grant these propositions, the measure of Germany's re-armament is

the crucial question; for to fulfil its purpose it must be a measure which produces equality without going on to produce war.

This condition is axiomatic; for HERR HITLER, as well as MR BALDWIN, has already declared his conviction that another European war could end in nothing but the destruction of European civilisation. By allowing an armaments competition to ramble into war—as in the end it must if it is not stopped by agreement—the would-be saviour of Europe from Communism would be playing straight into the Communists' hands. The would-be restorer of Germany's equality would be condemning his own country to attain equality of status at zero level.

Why cannot HERR HITLER tell his countrymen on Saturday that Germany's re-armament has, in fact, already attained its purpose? That Germany now stands again on a footing of perfect equality with all the other European Powers? That she will be in no danger of losing this equality by entering into an armaments limitation agreement? Why cannot he say that her national energy and skill will insure her a leading rôle in any European enterprise, whether warlike or peaceful? Why should he not declare that a magnificent field lies before her, if she will take the lead in showing Europe how her peoples may co-operate in beating their swords into ploughshares and exorcising the spectre of Communism by banishing those sufferings and the fears which give it substance? It is in HERR HITLER's power to-day to cry "I am your leader" to the European forces making for peace. If he sincerely took this line, he would have a response of which neither he nor his countrymen would ever repent.

The Great Cities of Britain—II

Glasgow's Industrial Problem

A LARGE portion of the industrial belt of Scotland was scheduled in 1934, under Act of Parliament, as a Special Area. Glasgow is within, but not of, the Area; for the schedule specifically excluded it. At the 1931 Census, the population of the City, which has thus been marked off from the region of which it is the social and commercial centre, amounted to 1,088,000. Thus, it included between one-fourth and one-fifth of the population of Scotland. The Special Area contained rather more than another fourth. Between 1921 and 1931, the population of Glasgow rose by 3.5 per cent., while the population both of the surrounding area and of Scotland as a whole actually declined.

Glasgow stands on the Clyde, about 20 miles from the "Tail of the Bank" at Greenock, where the river widens into the Firth. Along those 20 miles of river are the shipyards from which Glasgow's chief modern title to fame is derived. The Clyde, though it first received the "Queen Mary," is not itself a natural carrier of giant vessels, but has had to be laboriously altered to provide a passable channel. Some of its shipyards are within and some without the city boundaries. The 32,700 persons engaged in shipbuilding and marine engineering in Glasgow comprised the biggest single class of workers specified in the 1931 Census. Both within the city itself, however, and in the surrounding area, much employment is given by many kinds of engineering work, in-

cluding the making of locomotives, electrical apparatus, and agricultural machinery; by the building of bridges, piers and railway stations; and by the production of iron and steel, on which all these industries depend. In

Glasgow alone, such industries (grouped in the Census Report under "Manufacture of Metals, Machines, Implements, etc.") gave employment in 1931 to 105,300 persons. But many other figures testified to the variety of Glasgow's activities. The manufacture of food, drink and tobacco occupied 28,500 persons, the clothing industry 21,400, paper 16,700, textiles 16,200, and woodworking 13,700. The total engaged in commerce and finance was 108,600 and in transport and communication 47,500.

Within Glasgow, in short, are combined a main group of industries more or less directly related to shipbuilding, and a large number of industries which are not so related. This fact goes far to explain the freedom which Glasgow has enjoyed in recent years from the extreme depression experienced in certain parts of the surrounding area which were dependent on one moribund industry. It also explains Glasgow's comparative ill-fortune, judged by conditions in Britain as a whole. In July, 1931, the proportion of unemployment among insured workers in Glasgow was about 27 per cent.; in Glasgow *plus* what is now roughly the Special Area, it was 32 per cent.; in Great Britain as a whole it was 21 per cent. In July,

World Economic Tendencies

WORLD economic activity is to-day at a higher level than ever before. All countries, however, have not benefited equally from recovery; for an historical review reveals that the past seven years have witnessed far-reaching changes not only in the relative prosperity of nations but also in the economic forces within the various countries. What is the nature and significance of these changes?

In order to throw light on this problem, we have assembled the essential data in convenient form in our Trade Supplement, published for the first time in its revised form with this week's issue of *The Economist*.

Broadly, the purpose of the Trade Supplement is to enable readers to keep abreast of economic changes in the United Kingdom and elsewhere. It contains a general review of the trend of business at home and abroad, followed by comment on the latest developments in the leading British industries and in the more important countries, supplemented by a mass of statistical data. While the comment on economic tendencies at home and abroad has been extended, the principal change has been made in the statistical section.

The new statistical section has been specially designed to provide essential data, not only of changes in individual countries, but also of the trend of world production and trade and of the output, consumption, stocks and prices of leading raw materials and crude foodstuffs. Some of these statistics, such as *The Economist* indices of business activity and the index of advertising expenditure on branded goods in the British Press, are not available elsewhere. In the main, however, the data are drawn from such various, and often little known, sources that they have not, so far, been accessible to the general reader, except as the result of considerable research. The statistics comprise more than 500 series and are drawn from over one hundred sources. Details of the arrangement of these statistical series, as well as of other changes made in its contents, will be found on the first page of the Supplement.

INDICES OF WORLD PRODUCTION AND TRADE (1929=100)

The new statistical series have been carried back to 1929 in order to indicate the economic changes which have taken place since the onset of the world's greatest depression. The havoc wrought by the depression is revealed in the annexed diagram, which shows the course of world trade, industrial activity and output of foodstuffs; as estimated by the League of Nations.

Both world industrial activity and the volume of international trade suffered a headlong decline between 1929 and 1932. From 1932 onwards, however, industrial

activity and the volume of world trade began to expand again. But while industrial activity in 1935 was only about 5 per cent. below the 1929 level and has since exceeded it, the revival in international trade proceeded at a considerably slower rate, an indication of the tendency to self-sufficiency set in motion for strategic or economic reasons. The course of the production of industrial raw materials followed fairly closely the trend of industrial activity, but the output of foodstuffs actually increased during depression. While the increased output of foodstuffs could only be sold at considerably lower prices, and therefore caused difficulty to the farmer, it nevertheless mitigated the disastrous social repercussions of the slump among industrial workers and largely explained the marked rise in real wages in Great Britain during the depression.

The incidence of the depression and of the subsequent recovery on the various countries of the world has been far from uniform. Industrial countries suffered from a severe contraction of production and from unemployment, while the population in agricultural countries had to accept a marked reduction in the monetary value of their products, and, hence, in their standard of living. The course of industrial activity in some of the more important countries is shown in the following table.

INDICES OF INDUSTRIAL PRODUCTION

	(1929=100)		
Country	1932	1935	1936
Austria.....	64.3	79.6	83.2 (Jan.-Oct.)
Belgium.....	69.1	80.6	78.3 (Jan.-Sept.)
Canada.....	58.1	81.3	87.5 (Jan.-Oct.)
Chile.....	87.0	120.1	125.4 (Jan.-Nov.)
Czechoslovakia.....	63.5	69.9	77.6 (Jan.-Oct.)
Denmark.....	91.0	121.0	124.7 (Jan.-Nov.)
Estonia.....	78.3	106.4	120.1 "
Finland.....	83.3	125.0	132.4 (Jan.-Sept.)
France.....	68.8	67.4	70.4 (Jan.-Nov.)
Germany.....	53.3	94.0	105.0 (Jan.-Oct.)
Greece.....	100.9	140.7	131.0 (Jan.-June)
Hungary.....	76.9	76.9	127.4 (Jan.-Sept.)
Italy.....	66.9	91.8	Not available.
Japan.....	97.8	141.8	146.9 (Jan.-Sept.)
Norway.....	92.7	105.1	113.9 (Jan.-Oct.)
Netherlands.....	62.3	66.3	68.7 (Jan.-Sept.)
Poland.....	53.9	66.4	71.4 (Jan.-Oct.)
Spain.....	88.4	86.9	Not available.
Sweden.....	...	119	12.8 (Jan.-Nov.)
United Kingdom.....	83.5	105.7	114.1 (Jan.-Sept.)
United States.....	53.8	75.6	86.9 (Jan.-Nov.)
U.S.S.R.....	183.4	293.4	362.3 (Jan.-Aug.)

In the majority of industrial countries the depression reached its lowest level in 1932. Some countries, including the United Kingdom and most of the other countries which left the gold standard in 1931-32, have not only reached, but surpassed, the pre-depression level of activity. But in the United States, the volume of industrial production last year was still appreciably below the 1929 level. In Japan, industrial activity declined only slightly during the depression, while the U.S.S.R. continued to make rapid progress.

During the past few months, however, world recovery has tended to become more general. The expansion of industrial activity has reached a stage where the world's output of primary products can once more be sold at remunerative prices. Indeed, prices of raw materials and crude foodstuffs have taken a strong upward turn, and in some cases are again approaching, or have already risen above, the 1929 level.

The implications of the rising trend of prices are very far-reaching. The volume and value of international trade, for example, may be expected to increase in the immediate future. The decline in the value of world exports of primary products and semi-manufactured articles between 1929 and 1935, amounting to some £1,500 millions, indicates the scope of the changes in international trade which will be facilitated by a further rise in prices. Moreover, the improvement in the purchasing power of primary producing countries should be accompanied by a considerable expansion of trade in manufactured articles. Many fetters still hamper the exchange of commodities between countries and are likely to prevent the proportion of world production which enters international trade from reaching its former level. But in spite of this serious handicap we may expect a considerable expansion of international trade during the next few years.

A Road and Rail Controversy

1: The Road Transport Case

Should road transport adopt the railway system of charging "what the traffic will bear"? The question affects every transport user; and the answer may have far-reaching repercussions on the future relationship of the two services. The following article summarises the views of an expert in road transport. The railway reply will be given in a subsequent article.

No feature of modern life is more typical than the daily increase in the volume of traffic carried on the roads, and no problems are more acute than those to which road transport has given rise. Humanitarian considerations demand a sharp and lasting decline in the loss of life. Efficiency requires an improvement in the making and maintenance of roads. It is no less needful for the sake of economy that the waste of energy and resources entailed by the lack of co-ordination among the different providers of transport facilities should be eliminated. Action has already been taken; road transport has been subjected by statute to stringent regulation, and restrictions have been imposed by the licensing system. The wider problem of the relation between road and rail transport has been investigated by the Salter Committee; but there still remain issues which provoke much controversy, and of these none is more debated or more important than the relative charges made by road and rail for the carriage of commodities.

Closer co-ordination between road and rail goods transport must follow from the licensing of the road haulage industry, and the use of this system to maintain an equilibrium between supply and demand, favourable to the sellers of road transport facilities. The crux of the problem lies in charges, and it has been contended that, because the theories of road and rail rates are different, co-ordination can only be achieved if road transport adopts the railway system of charging or *vice versa*.

Road haulage charges are determined by competition, for the industry cannot for long quote rates either below the haulier's costs of performing a particular piece of work or above the cost to the trader of doing it himself. There is thus not much room for a rates classification. The argument of the road interests is that, if railway rates were made to correspond to their "cost of service," an automatic division of function would be obtained by which the trader would naturally send his traffic by the cheaper agent.

Railway rates are based on a classification, by which traffics are graded into 21 classes, roughly according to their value in relation to their weight. The argument is that consignments must be charged according to "what the traffic will bear"; all must cover the direct costs involved in their movement, but the contribution towards overheads will be greater from high-value than from low-value traffics. Low-value traffics are carried for less than they would pay if they covered their full costs, and high-value traffics pay less than they would if the low-value traffics were not carried.

This classification system can only work effectively under a monopoly. Where there is competition, the high-value traffics, charged more than their full costs, are the most vulnerable, and from this arises the complaint that the road haulage industry has skimmed the cream off the railway business. There has, therefore, been a tendency to undermine the classification system by granting exceptional rates and, since 1933, "agreed charges" to meet road competition. At the present time, only 31 per cent. of railway freight revenue is derived from traffics carried at standard rates.

This tendency for rail rates to fall where the traffic is competitive is shown in the increasing length of the average haul of merchandise rather than in the average receipts per ton. The average receipts per ton for mer-

chandise and livestock fell only from 17s. 6½d. in 1923 to 17s. 5½d. in 1935, but the average length of haul rose from 84.1 miles to 104.5 miles. For minerals and merchandise the receipts per ton were 5s. 1½d. and 5s. 3½d. in the two years, and the length of haul 54.2 miles and 63.8 miles, while for coal, coke and patent fuel the receipts per ton were 3s. 7½d. and 3s. 7½d., and the length of haul 42.4 miles and 42.2 miles.

Since the existing localisation of British industry is in part the result of the railway rates structure, the railways' suggested solution of the rates problem is for road hauliers to base their rates on the railway classification. The hauliers contend, however, that this is impracticable, since under it they would lose business to traders' own vehicles, and each of the 26,000 operators would tend to concentrate on the highly-rated traffic and avoid the low-rated.

Is there, in fact, a difference between road and rail rates corresponding to the divergence in theory? A study of the figures suggests that, in practice, road and rail rates are such as to give *much* the same average net return *per load* for all classes of traffic. The fact that road rates are based on costs does not imply that the rate per ton is the same for all commodities; there is, in practice, a natural classification system for road rates based, not on the value of the commodity transported, but on a number of factors which affect the costs, such as bulk, the number and frequency of consignments, and the ease of handling, loading and packing.

The following table analyses the railway position as far as possible:—

RAILWAY RESULTS, 1935

	Receipts per ton (excl. Free-hauled)	Average Receipts			Average Wagon-load at Starting Point	Average Length of Loaded Wagon Haul	Wagons (Loaded and Empty) per Wagon Forwarded
		Per Loaded Wagon-mile	Per Loaded Wagon Forwarded	Per Wagon-mile Loaded and Empty*			
Merchandise	17 5½	5.467	2 9 0	4.557	2.92	107.6	154.9
Minerals, etc.	5 3½	9.011	2 7 2	4.957	9.53	62.8	117.8
Coal	3 7½	9.063	1 14 6	4.532	10.11	45.7	91.4
Average.....	6 4	6.898	2 2 3	4.605	7.10	73.4	121.1

* Based on an estimate of 50 per cent. empty wagon-miles for coal traffic and 45 per cent. empty for minerals and classes 1-6.

† Average loaded wagon-miles per wagon forwarded.
‡ Classes 7 to 21, and livestock.
§ And merchandise classes 1 to 6.
|| Including coke and patent fuel.

The difference between the receipts on a wagon-load and on a wagon-mile basis for the different categories of traffic on this showing is surprisingly small, in view of the difference in the receipts per ton. The explanation lies in the variations in the loading factor obtained. It is not more profitable to haul merchandise many more miles than minerals or coal, even though a greater return is shown. Coal is relatively cheap to haul compared with merchandise, and, moreover, the annual loss of £800,000 by the railways on collection and delivery charges is almost entirely attributable to merchandise traffic, on which it averages 4d. per ton. Thus the net return per wagon-load does not vary greatly for the different classes of railway traffic, and it would appear that in practice rail rates are nearer to "cost of service" than might be inferred from the average rate per ton.

If the railway rates classification does correspond reasonably closely with "cost of service," then the co-ordination of road and rail rates can be achieved without sacrificing the railway rates structure. It might be modified to secure a better division of function between road and rail, in the direction, probably, of increasing the rail rates for short-distance and cross-country work and reducing them for main-line trunk services. Road transport is, in general, better suited than rail for cross-country work, and the main-line trunk routes give the railways the best net return. The danger is that the much-needed co-ordination of road and rail transport may be delayed by the exaggeration of the difficulties involved in bringing the two rate systems into line.

Notes of the Week

The Air Programme.—On Wednesday Mr Simmonds, Conservative Member for a Birmingham division, moved a resolution in the Commons urging the inadequacy of our air strength, and calling for an acceleration of the Government's expansion programme. He declared that of the 71 new squadrons due by March 31st under the 1935 expansion programme (to a total of 1,500 first-line machines), only 26 complete squadrons were ready; and he explained that many of those ready were only half-manned, giving a false impression of completion. At the current rate of progress, the programme would be one or two years in arrears by the time the 1935 expansion had been carried out—to say nothing of the extra 250 first-line machines of the 1936 additional programme. Our factories were hopelessly congested, deliveries were much in arrear, and primary supplies of materials were inadequate. Mr Simmonds urged the need for a reserve of such materials. Captain Balfour, seconding the motion, proposed that we should buy foreign aircraft for the immediate future.

Sir Thomas Inskip, Minister for Co-ordination of Defence, said the strength of the new programme depended on the number of reserves behind first-line machines—there were large numbers of such reserves—and on the striking power of the various machines and squadrons. Squadrons had been re-equipped with later types of heavier armed, faster machines; the numbers of such machines per squadron had therefore been modified; more medium and heavy bombers than fighters and light bombers were now being provided. Eighty-seven squadrons had been formed, 13 of which were "one-flight" squadrons only; 100 would be formed by March 31st, when the 124 of the programme should be ready. Of the 100, 22 would be on a one-flight basis. The remaining 24 should be ready by July. The time-lag of which Mr Simmonds spoke could not, to the best of the Minister's knowledge, be more than three or four months. Mr Churchill then declared that of the 100 squadrons to be ready by March 31st, 22 would be of one-flight only, with perhaps three officers apiece only, instead of 18 or 19. Reckoning full squadrons, he estimated we should be 46 short of 124 squadrons by the end of March.

Migration in the Empire.—One of the signs of returning prosperity is a revival of interest in migration to the Dominions. Parliamentary debates on the Empire Settlement Bill, however, have lacked spirit. Experience during the depression has saddened many enthusiasts, while those who still preach migration cannot evade the powerful facts that tell against it—the fall in the birth-rate, the mechanisation of farming, and the restriction of primary production. Several Opposition critics of the Bill asked why the matter should be regarded as urgent. Its urgency is administrative rather than economic. The existing Empire Settlement Act expires next May, and the Government wish to prolong its machinery lest they should be found unprepared when economic forces again produce a need for large-scale migration. In view of the advice they have received (both from Lord Astor's Committee and from the Malcolm MacDonald Interdepartmental Committee) that emigration to the overseas Empire is most unlikely to return to the pre-depression scale, the Government show an extraordinary optimism, or excess of precaution, in setting a maximum of £1,500,000 to the amount to be spent under the Act on migration schemes in any one year; for the peak figure in past experience was only about £1,250,000. At the same time, however, they are taking powers to contribute up to 75 per cent., instead of 50 per cent., to the cost of assisted migration schemes. The Dominions Secretary reported in the House that the Canadian and New Zealand Governments were not yet ready to welcome assisted migrants, and that inquiries among the Australian states

by the Commonwealth Government had elicited positive replies only from Queensland and South Australia. There has been, it is true, an ebullition of interest in migration in New South Wales, where opinion is crystallising round the idea that the migrants should be skilled industrial workers, and that with men must come capital. Mr MacDonald himself stressed the manufacturing as opposed to the agricultural needs of the Dominions, rightly adding that as our own industry revived we could spare few skilled industrial workers to go overseas.

Meanwhile, General Smuts has been predicting a great future for South Africa as a populous and important state. Hitherto the Union has not ranked among the chief immigrant countries of the Empire. The prosperity of the Rand, however, has provided a new stimulus, and the inflow of European migrants has created difficult problems of its own. Dr Malan's motion for the exclusion of Jews was opposed by the Government; but the latter immediately introduced their own Bill regulating by individual licence the immigration of non-British subjects. The Government admitted that the Bill was intended to check Jewish immigration. If anti-Jewish feeling, indeed, is growing strong in South Africa, prevention of immigration may be a lesser evil than action against the Jews inside the country.

Canada: a Judicial Committee Ruling.—As we go to press the Judicial Committee of the Privy Council in London has ruled as invalid five Acts passed by the Parliament of Canada. The Acts were passed to give force to Mr R. B. Bennett's New Deal proposals of 1935; and appeals were made to the highest Court of the Empire on Constitutional matters by certain Canadian Provinces. These Provinces had already received negative judgments on their appeals to the Supreme Court of the Dominion; and they therefore exercised the right which still remains to them, despite the Statute of Westminster, 1931, to appeal on matters affecting their State rights to the Judicial Committee in London. By itself this is an interesting legal and constitutional point; for the Irish Free State's position is officially that of Canada, and Mr de Valera has gone so far as to abolish all rights of appeal to London; and the recent case of Western Australia reminded both the Dominions and ourselves that the functions of the Judicial Committee within the Commonwealth have not yet been fully clarified.

The appellant Provinces of Canada in the present case objected first, and unsuccessfully, before the Canadian Supreme Court that the Dominion Parliament had no powers to pass the Acts of which complaint was made. They took their stand on the rights accorded them by the Constitution of 1867. The Acts were to establish Dominion systems of unemployment and social insurance on British lines, labour exchanges, national marketing of primary and necessary products, and a Dominion Trade Commission. Lord Atkin, delivering judgment in five of six appeals, ruled invalid the Weekly Rest in Industries Act, the Minimum Wages Act, and the Limitation of Hours Act, though the Dominion Parliament urged they were implementations of international conventions. Lord Atkin said the Parliament should only legislate on provincial matters by co-operation with the provinces. It is interesting to note that the Judicial Committee upheld the Canadian Supreme Court's approval of the legislation prohibiting preferential rebates and selling at unreasonably low prices to eliminate competitors; but it ruled *ultra vires* the Natural Products Marketing Act. The system of Dominion standard marks for produce complying with

Dominion standards was approved. It is impossible to say, as yet, how much of Mr Bennett's New Deal stands up to these final legal decisions.

Mr Runciman in Washington.—The President of the Board of Trade was careful to explain when he left this country for America that his journey was concerned exclusively with his private affairs, and that though he would visit Washington it would be merely of courtesy, however, have apparently necessitated considerable excursions into public affairs. To judge by the reports, Mr Runciman and various members of the American Administration have been engaged on the first stage of negotiations for a trade treaty between the United States and the United Kingdom. These talks are still necessarily in a very preliminary stage and have apparently progressed no further than an exploration of the general basis, if any, of such a treaty. It is earnestly to be hoped that the later and more detailed stages will be reached as soon as possible, for few things could give greater encouragement to the movement for freer trade than an agreement between the world's two greatest commercial nations. It is as well, however, to realise the limited scope of such a treaty. According to American law it must be reciprocal; that is, the concessions offered by either party must be approximately equal. But on the British side there are two very large obstacles to any really far-reaching reciprocal agreement. In the first place, American sales to the United Kingdom are very much greater than British sales to the United States, and if the British Government were to pursue the policy it has followed in all its other agreements, it would insist that one of the principles of the new treaty should be a nearer approach to balance between imports and exports. This could only mean that America would be asked to give much larger concessions than she would receive.

But though this difficulty could be cleared away, it is a little difficult to see what large concessions to American trade could be given. Any attempt to reduce duties on American agricultural products would be blocked by the terms, and by the whole theory, of the Ottawa treaties. Reductions of duties on American manufactures, such as automobiles, would be resisted on the ground that the British industries which would be affected are vital for national defence. These difficulties have been realised in America, and it has been suggested that the conclusion of a treaty would be of such great value that the British Government should regard it as a matter of high policy. But even in the realms of the highest policy it is a little difficult to imagine the Government abandoning either British and Dominion agriculturists or the domestic motor manufacturer. An Anglo-American Trade Treaty would indeed be of the greatest value. But it would be myopic if Britain merely concluded an agreement with America for its moral effect rather than for its practical influence on the course of Anglo-American relations, economic and otherwise. We hope the negotiations which Mr Runciman has initiated will not prove one more illustration of the severe limitations which the British Government's policy imposes on its own freedom of action.

Dockyard Dismissals.—Whatever the events which led to the summary discharge of five dockyard workers, unheard and undefended, the Government does not seem to have handled the episode in a way calculated to dispel uneasiness. The Admiralty began by refusing to make any further statement. Questioned in the House, the First Lord disclosed that his lips were sealed in the interests of public policy; but at least he admitted that the dismissed men had been given no chance to vindicate themselves before a body of Civil Servants (including some members of departments other than the Admiralty) which had reviewed their case. The steps

taken by the Leader of the Opposition and the trade unions to ventilate the matter further echoed a considerable body of anxious opinion. That sabotage in the Services should be rigorously prevented, and that publicity would be injudicious, are propositions to which most people would agree. But the fact remains, and the speeches of the First Lord and the Prime Minister in Tuesday's debate on the vote of censure did nothing to remove it, that to deprive men of their livelihood on Secret Service evidence, without any opportunity to defend themselves, is contrary to the liberty of legal redress inherent in democratic practice. Subversive activity cannot be tolerated; the machinery of Secret Service espionage cannot be made public; *salus populi suprema lex*. But some method of hearing appeals against summary dismissals *in camera* would do much to persuade public opinion that justice was as adequately protected as possible in difficult circumstances.

Palestine Reservists.—Some warmth of feeling was generated in the House of Commons, on Friday of last week, by the failure of some 500 of the Army Reservists who were taken from their civilian employment, last summer, to serve in Palestine, to secure reinstatement in their former employment. It is true that some 300 have found other work, and that steps are being taken by the War Office and the Ministry of Labour to secure employment for the remaining men. Nor can it be presumed that all these men would have retained their jobs, if they had not been drafted abroad, since in many cases the work they had was temporary. Nevertheless, there was a feeling in the House, last week, that the responsible authorities might well have made more satisfactory arrangements to ensure to the Reservists the reward of security. At a time when much is heard of the inability of the Army to secure all the recruits it needs, the equitable obligation on employers to see that service abroad is not a handicap is reinforced by the argument of expediency—*pour encourager les autres*.

White Waltham.—A dangerous Parliamentary storm was just averted this week by the Government's decision to override the desire of the Air Ministry to establish a "shadow" aircraft factory at White Waltham, near Maidenhead. The Ministry's policy was defended by Sir Philip Sassoon on the ground that the site was conveniently accessible from the "parent" firms in Coventry and Bristol. Members of Parliament fiercely assailed his argument; they claimed that it was illogical and unfair to plant what would virtually be an industrial town of some 25,000 inhabitants in an agricultural area, when there were Special Areas already equipped with the necessary facilities, amenities, and skill.

Complaints came from Tyneside, South Wales, and Lancashire, whose spokesmen were not slow to point out the anomaly of such a decision by a Government who had previously appealed to employers to locate their enterprises, wherever possible, in the Depressed Areas. Last Wednesday, Mr Baldwin announced that the Ministry, recognising the "wider considerations" involved, would seek a new site in Lancashire. So long as Depressed Areas remain, it will generally be agreed that, even when other things are equal, the balance ought to be weighted in their favour. And in this case other things were not equal, for there were obvious technical and strategic advantages in the establishment of a new aircraft factory in an old-established industrial area, far removed from London, from London's river, and from the North Sea. It is true that, in the long run, industrial location must be determined by the cost and accessibility of the factors of production. Efficiency on these counts alone would have decided against the White Waltham project.

L.C.C. Election Campaign.—Although County Council elections are not held until the first week of March, the campaign for the control of the London County Council has already been launched. The reason for this early start is that principles are at stake which affect a far wider circle than London ratepayers. For 27 years before 1934 the Municipal Reform Party governed London on the principle that low rates were the criterion of good policy. Since March, 1934, however, the Labour Party, led by the Rt. Hon. Herbert Morrison, have been in control; and they have adopted a policy of extending public services, sometimes even in defiance of the National Government. Whatever party had won in 1934, an increase of rates would have been inevitable, in view of the falling rateable value of the county. The real question which is now to be decided is whether Londoners feel that they have received value for their additional contributions. During their term of office the present rulers have made a determined effort to abolish slums. In 1935-36 a record total of 2,750 flats were built, and it is anticipated that even this figure will be doubled in the current year. A three-year education plan provides for the modernisation and overhaul of all schools. Waterloo, Chelsea and Wandsworth bridges are being rebuilt, London's exit to the west and other main thoroughfares are being improved. Town planning to prevent haphazard development has been applied to the whole County area, and £2,000,000 has been offered to acquire open spaces for a Green Belt beyond. The ratepayers of London, whatever their views may be on county politics and finance, certainly cannot accuse their elected representatives of inaction.

United Front?—The executive committee of the Labour Party did not permit the picturesque assets of Sir Stafford Cripps' personality to outweigh the liabilities involved in his rebellious alliance with the Communist Party and the I.L.P. in the new Left Front. The Socialist League, which was with difficulty led astray by its leader into this new venture, has been disaffiliated. Its members have been asked to choose between loyalty to the Labour Party and wandering in a sparsely populated wilderness of Marxism. There seems little doubt of the upshot: the doctrinaires will continue to regard the "bourgeois" Labour Party as the "real enemy" of the working classes; a few individuals will prefer the exciting leadership of Mr Maxton, Mr Pollitt and Sir Stafford Cripps to the constitutional respectability of Mr Attlee, Mr Greenwood and Mr Dalton. But the great majority of Socialists, including most of the members of the indicted League, will realise that the future of Social Democracy, as they conceive it, must rest with the organised mass of workers, with the Labour Party and the Trade Unions. The decision of the many-sided Labour Movement has been consistently given against the Communist

solution in every possible way. And the Labour party itself is bound to enforce its policy, without regard to the rank or ability of the dissentients.

Railway Wages.—The Associated Society of Locomotive Engineers and Firemen have chosen a rather roundabout way of accepting the inevitable with dignity. A few weeks ago, the Railway Staff Tribunal rejected their claim for higher wages and shorter hours, because the railway companies could not afford it, and because it was more extensive than the claim advanced jointly by all the railway unions, and refused, in July, 1936. The delegate conference of the Society has formally disapproved of the findings of the Tribunal, and has instructed its executive committee to reopen negotiations with the railway companies. The negative end of such negotiations is not in doubt. Inevitably, the drivers and firemen will have to associate themselves with the other railway unions in the preparation of further claims, to be presented next July. They should find encouragement in the fact that this was the line of action suggested by the Tribunal. Indeed, the Tribunal went further: they forecast that it might be financially possible in the summer of this year to restore the last quarter of the cut made in wages in 1931.

A Coal Strike Threat.—The decision of the Mineworkers' Federation to take a national strike ballot over the dispute at Harworth Colliery Notts., raises issues curiously similar to those involved in the present labour troubles in the United States. A manifesto issued by the Federation last week insisted upon the right and duty of miners to join their own democratic organisation, and not to be forced into unions under employers' control or influence. The proposed national strike will be directed against what is described as "the last remaining stronghold" of the Industrial Union; and the leaders of the Federation complain of the drafting-in of large bodies of police to support the organised employers in Harworth district. Freedom of organisation must be maintained, for without it, trade union recognition and the wider liberty of the subject would be deprived of meaning. But a national strike in the coal industry would be a drastic step with direful consequences. The trade unions of the United Kingdom have won great concessions since 1931, with virtually no resort to the strike weapon. Will this peaceful progress, which has contrasted so markedly with events elsewhere, be permitted to continue unbroken?

Floods and Strikes.—Widespread floods are becoming an annual illustration of the need for strong Federal control of the American national economy. This year the floods have come rather earlier than usual and have produced greater havoc. The area mainly affected so far has been the middle valley of the Ohio between the western side of the Alleghany mountains and the Mississippi. Great cities such as Cincinnati and Louisville have been inundated, cut off from the rest of the country and threatened with famine, fire and pestilence. There have been the usual stories of levees being blown up and vast areas deliberately flooded in order to protect the lower valley. The flood waters have not yet reached the Mississippi itself, but preparations are being made for a very serious emergency when they do. The Ohio-Mississippi river provides an almost perfect illustration of the helplessness in such matters of the States. From where the Ohio leaves the mountains until the Mississippi is close to its delta, the river never ceases to be the boundary between two or more States, none of which is consequently either able or willing to undertake the responsibility of flood control. The violence of Nature has distracted attention from the growing violence of Man in the automobile strike. It is impossible yet to see which side is gaining an advantage in that struggle.

The Administration is being drawn in gradually, and the recalcitrance of General Motors Corporation is compelling it to take the workers' side, even if Mr Roosevelt were not already inclined, by political philosophy and electoral gratitude alike, to favour Mr Lewis's bid to "organise" the industry.

Alexandretta.—At the meeting of the League Council at Geneva this week, settlements have been achieved for both the Franco-Turkish dispute over Alexandretta and the Polish-German dispute over Danzig. There is a specific likeness between the two problems. Both of them are concerned with a port of one nationality and a hinterland of another—with a strong neighbouring Power of the same nationality as the port, and a weak minority in the port whose interests have been in danger of being sacrificed in a deal between the other parties. France, however, has come out with more credit than Poland; for, while the Poles have placated the Nazis by abandoning the non-Nazi German element in Danzig to its fate, the French have persuaded the Turks to agree to terms which give fair measures to the non-Turkish as well as to the Turkish element in Alexandretta.

It is now agreed that the district of Alexandretta and Antioch shall be under the sovereignty of the Syrian Republic; and the sovereign Power is to have control over the district's foreign policy and customs. On the other hand, the district is to be demilitarised under a guarantee treaty between Syria, Turkey and France; and it is to enjoy a thorough-going local autonomy; and Turkish is to be the principal official language. This language question was the last obstacle to agreement for the Turks demanded that the official language should be Turkish exclusively. It is now settled that there should be a second official language to be determined by the League Council, which will naturally designate the Arabic language. There is also to be a resident League High Commissioner; and no change is to be made in the status of the territory without the Council's approval.

—and Danzig.—While the best features of the post-war regime in Danzig have thus been introduced into the new regime for Alexandretta, the League Council, at this same session, has accepted, with small modifications, a Polish proposal for giving the Danzig Statute a further precarious lease of life by robbing it of its redeeming features. There is still to be a League Commissioner at Danzig, but he is not to be Mr Lester, and he is not to exercise any authority. The Danzig Senate is still to declare its intention of abiding by the terms of the constitution, but this is not to prevent it from depriving the non-Nazi Danzigers of political and civil rights, and keeping them in prison. In fact, the Danzig Statute is to become a façade behind which, during Hitler's good pleasure, Poland will enjoy her economic treaty rights in a Nazified Danzig in exchange for having arranged for the complete Nazification of the Free City. This Polish policy is as short-sighted as it is ungenerous; but it has a formidable precedent in the sacrifice of Abyssinia. M.M. Delbos and Eden showed some dislike of allowing the League to be exploited in this fashion. They have insisted that the new High Commissioner is to report whether the execution of his duties is, in fact, possible.

The Political Crisis in Japan.—This week, there has come to a head in Japan a political crisis which has been brewing ever since the Japanese Army ran amok in Manchuria in the autumn of 1931—if we are not to carry the story right back to the revolution of 1868. Ever since Japan first "went Western," there have, in fact, been two major political forces in the country—

the fighting services on the one hand and big business on the other. From the time of the Washington Conference to 1931, big business was in the ascendant. Since 1931, the preponderance has lain with the Army, as it lay during the Great War. The Army has now pushed its ascendancy over the Government to a point at which big business has openly rebelled in the Diet. The Japanese Army's policy resembles Herr Hitler's in being bound to bring financial ruin on big business, even though it may have a remote chance of conquering a great empire for the Army.

On the 21st of this month, Mr Hirota's Ministry was fiercely attacked in the Lower House for its subservience to the Army. Thereupon, the Diet was suspended, the Ministry resigned, and, on the advice of the Elder Statesman, Prince Saionji, the Emperor entrusted the task of forming a new Ministry to General Ugaki. At the moment of going to press, it is still uncertain whether the General will succeed; for the crux of forming a Ministry in Japan is the constitutional right of the fighting services to insist upon the Ministries of War and Marine being filled only by active members of the respective services, who are agreeable to their comrades in arms. This right gives either service a veto over the formation of any cabinet. General Ugaki is not *persona grata* with his fellow-soldiers, who have not forgotten that, as War Minister in a Minseito (Liberal) Cabinet, he once reduced the Army's strength. If on this account the Army now refuse to allow General Ugaki to fulfil his mission, they will be compelled in effect to take over the Government themselves. Only so can they carry out their avowed programme of huge budgets unbalanced by vast military expenditure, with a view to sweeping wars of conquest. This Japanese crisis is thus momentous both for Japan and for the British Empire. Nowadays, the Japanese fighting services are by no means Anglophil.

Germany and a Portuguese Colony.—At the outbreak of the rebellion in Spain, the Foreign Minister of Portugal paid a hurried visit to London to see Mr Eden. It was then reported that he had come to impress on the British Government his country's unwillingness to have any Portuguese colony bandied about by the Great Powers as a bait to attract Germany within the net of general European negotiations. At the same time he made it plain that Portugal, itself something approaching a totalitarian State under Professor Salazar's financial dictatorship, would not tolerate a proletarian Spain. This accounts for the persistence with which Britain's oldest ally has backed up the military and commissariat aid which the German and Italian totalitarian States have given to General Franco. Now this week comes a highly circumstantial report from

7, CHANCERY LANE, LONDON

Berlin that the Portuguese and Germans have signed an agreement whereby Germany receives payment for arms, etc., supplied to Portugal, by economic exploitation of Angola.

* * *

It is reported that the well-known I.G. Dye Industry, and several iron and steel and engineering works, are presumably to exploit mines, deposits of potash, etc., in Angola, free of charges, selling or transforming the material for use in Germany. Thus, against whatever Germany sends to Portugal, she will receive proceeds in Reichsmarks or in free foreign currencies: a consummation which Dr Schacht devoutly wished in public recently. It is said that, in such circumstances, political sovereignty over the exploited area is not important. For the time being, that is true. But German industry will need to find the capital to exploit Angola; and at a later date, the political orientations of Portugal and Germany may be found to conflict; in which case sovereignty of Angola may play a big rôle. Incidentally, the Government of the Union of South Africa must be viewing this latest advance of German influence with some misgiving. It was only the other day that they regulated the status of the Nazi Party in South-West Africa. Angola is contiguous with South-West Africa. It is also a good strategic position commanding the route to the Cape, should Britain ever have to back completely out of the Mediterranean.

A Revival of German Investment.—The German Institute for Business Research estimates the total amount of capital investment for extension and replacement last year at Rm. 13,500 millions. As the following table shows, investments during 1936 practically reached the post-war peak of 1928:—

	Investments in Rm. millions	Per cent. of Total falling to	
		Public	Private
1928	13,758	59.7	40.3
1932	4,247	63.5	36.5
1936	13,500	72.3	27.7
1933/1936	38,357	71.0	29.0
1926/1929	50,312	61.6	38.4

Total investments in the four years of Germany's industrial rationalisation (1926 to 1929) were considerably higher than those in the first four years of the Nazi regime. But the share of public investments increased from 59.7 per cent. in 1928 to 72.3 per cent. in 1936—a notable increase of State activity. The influx of foreign loans amounting to Rm. 4,781 millions from 1926 to 1929 largely helped in financing the rationalisation, which enormously increased Germany's industrial capacity. This rationalisation in turn facilitated the rapid production of armaments in the last three years.

* * *

From 1933 to 1936 Germany received no new foreign loans. Private capital issues were negligible. Public works bills, later known as re-armament bills, replaced the hitherto normal methods of financing. In fact, all private

capital issues were, and still are, prohibited. Only thus was the Government able to manage and employ the capital market to consolidate the dangerous mass of short-term debt, amounting to Rm. 4,200 millions at the end of 1936. Excluding tax remission certificates, mortgage debentures, and municipal debentures, German capital issues have developed as follows:—

	Public Loans	Private Loans	Bonus Shares	Public Loans as per cent. of Total
(In million marks)				
1928	663	294	1,339	28.9
1932	248	10	150	60.9
1933	71	2	91	43.3
1934	75	4	143	33.8
1935	1,636	3	156	91.2
1936 : 10 months...	1,937	48	379	92.9

The table needs no comment. During the first ten months of 1936 private capital issues increased to 427 million marks, largely due to the reconversion of the Stahlverein and the Commerz und Privatbank into private concerns, and to the reconstruction of the three most important German shipping companies. Now the German Press announces pending issues of nearly Rm. 100 millions of private industrial loans. The capital is to be raised for the erection of plants for producing oil from coal under the Four-Year Plan. It is to be raised as follows: Rm. 10 millions by the Chemische Werke Essener Steinkohle A.G.; Rm. 22.4 millions by the Mühlheimer Bergwerksverein; Rm. 24.5 millions by the Hoesch-Köln Neussen A.G., Dortmund; and Rm. 10 millions by the Krupp A.G. There are also smaller issues for new staple fibre plants in Thuringia, and for extension of copper production. Thus private capital issues are expected to increase rapidly. In fact, the Government is just about able to finance the current re-armament programme proper; but the financing of the raw material production programme must be left to industry and the private capital market.

* * *

An Electricity Supply Grievance.—A number of comments and criticisms of the working of the Electricity Supply Act of 1926 have reached us from an expert correspondent. The writer admits the undoubted efficiency in planning and administration of the Grid scheme under the Central Electricity Board, but suggests that the financial arrangements made between the Board and the companies and municipalities who own stations are inequitable. The whole cost of output, including that of electricity retained by the owners and electricity taken by the Board, is initially charged to the Board. The Board in most cases recharges the owners with costs "as they would have been if the Act had not been passed." Thus, it is alleged, the Board pays only for the additional fuel, oil, water and repairs necessitated by the working of the Grid; no contribution is made by the Board for the payment of interest, depreciation, debt-redemption or management. In this way, it is contended, the Board enjoys "free use" of the owners' plant, regardless of the shorter life of plant under intensive Grid operation.

* * *

It is true that the interlocking of stations under the Grid scheme makes it unnecessary for companies and municipalities to maintain spare or reserve plant. But the recharge made to owners by the Board includes interest, depreciation and other charges on so-called "ghost" plant, available under the Grid in times of stress. It is also true that, when special plant has to be set up for Grid purposes, the Board does bear the capital cost. Moreover, owners have not so far suffered any actual loss, since their extra running costs are met by the Board. But the loss will be felt, it is claimed, when the time comes to renew plant, which will come sooner than it would have done under non-Grid operation,

because plant is more intensively used. The provision of the 1926 Act, that owners may then claim temporary relief, merely complicates and postpones the problem.

* * *

There are two main obstacles to the redress of this alleged injustice which is stigmatised by our correspondent as "Nationalisation without Compensation." The Central Electricity Board cannot give any compensation, or make any contribution to capital costs, without a legislative amendment of the financial restrictions laid down in 1926. Moreover, it is pointed out, a minority of owners of supply stations do not lose by the existing arrangement, since they accept the Board's charges on area tariffs which, in their cases, "are less than those calculated under independent or non-grid costs." They are not anxious, therefore, to see any change effected. If the implications of this criticism are correct, if the Board is using private plant without making an adequate payment, and if the more efficient owners are suffering, while the less efficient relatively benefit, our correspondent's complaint deserves consideration in the proper quarter.

* * *

Declining Population.—The attention being paid to the future course of the population of the country is constantly on the increase. The latest evidence of this is the interesting paper read by Mr. F. J. C. Honey to the Institute of Actuaries last Monday. Mr Honey has attempted to make a more rigorous estimate of probable changes in the next few decades than has yet appeared. Estimates of this kind depend, of course, on the assumptions made. Mr Honey has made what appear to be the conservative assumptions that the present trends of change both in fertility and in mortality will be continued. The results he reaches are not notably different from those obtained by other statisticians. He has not extended his estimates further than the year 1971, and he predicts a population for Great Britain in that year of 38,492,000. At first sight this conclusion would seem to refute the alarmists. But first appearances are deceptive. The figure relates to Great Britain, while most other estimates have been for England and Wales. Secondly, it is common ground that the rapid fall will come more than thirty years hence. If Mr Honey's figure be compared with Dr Enid Charles's three alternative estimates, and rough correction made for the population of Scotland, it will be found that Mr Honey's figure for 1971 is only slightly higher than the lowest of Dr. Charles's. But this lowest estimate of Dr Charles, when continued, indicates a population of only 4,400,000 for England and Wales in 2035. It would seem to be a pity that Mr Honey did not continue his estimate a little further to confirm, or refute, this alarming forecast. Mr Honey's paper contained a number of interesting reflections on the effects of a declining population. In particular, he suggested that, owing to changing age distribution, the total funds of life insurance companies in this country may soon be reaching their peak, and that the growing proportion of elderly people in the population will lead to a steady increase in claims, while the thinning ranks of younger men will produce a steadily falling volume of new business. Changes of this sort are much more imminent than the fall in the total numbers of the population, which is still a generation ahead.

* * *

Shipping Recovery Continues.—The expansion of world activity and commerce, discussed on page 226, is revealed by the latest returns of laid-up shipping tonnage in this country, published by the Chamber of Shipping. At the beginning of this year only 192,800 net tons of British shipping was unemployed, compared with 423,200 tons a year ago and over 2,000,000 tons in 1932. A third of this total consists of vessels which have

been laid up for more than a year and are relatively inefficient, while a further 45,000 net tons consists of tankers, subject to an international restriction scheme. Thus it is literally true to say that the problem of unemployment in shipping has been solved. But since the world's commerce is now on the upgrade, and as new vessels cannot be built at short notice, there may soon be a problem of scarcity. Moreover, as freight rates have already risen above the average for 1929, the shipping subsidy has proved self-liquidating. The index of freight rates of the Chamber of Shipping, which is used as a sliding-rule for the subsidy, was 104.2 (1929 = 100) in October, 104.3 in November, and 127.5 in December. Hence, the Board of Trade decided last week that no subsidy payments should be made for voyages, or parts of voyages, carried out in 1937, "unless and until the fact is established that the average level of freight rates for the year is less than the average for 1929." But although freight rates may show a seasonal decline during the slack season, the average level for 1937 is unlikely to be lower than in the pre-depression years.

* * *

Ship Valuations for Insurance.—The first lesson learnt by the student of insurance is that a policy is a document of indemnity and nothing more. Later on he learns that every marine policy is something quite different from an indemnity because in case of loss it undertakes to pay an agreed sum irrespective of the actual value of the article. It deals not in true values, but in insured values; and if that insured happens to be the greater of the two, then the assured gets something greater than an indemnity. The difference is most noticeable in policies on hulls, which are usually effected for twelve months and carry the same insured value throughout the period, without reference to changes that may be taking place in the value of tonnage. The anomaly, in fact, goes further than this, since the insured value may remain unchanged for years even though a shipping slump may have succeeded a boom, and for technical reasons marine underwriters are more concerned to maintain the insured value at a high figure than to correlate it to the true value. This practice has been seriously criticised by the Courts, and a committee was recently appointed to consider the matter. It now reports that, while there is no evidence of ships having in recent years been thrown away for the sake of a too high insured value, it would nevertheless be better if underwriters insisted in their policies on a dual valuation. That means one figure payable in the event of a total loss and another figure up to which partial losses may be paid. This method was introduced some years ago, but it has never been popular with shipowners. In view of the recent rise in the value of tonnage it is not

at the moment a matter of urgent importance. Theoretically, the single valuation system is indefensible, but whether it is really so objectionable in practice may be questioned.

More Road Passenger Vehicles.—The Fifth Annual Report of the Traffic Commissioners in Great Britain shows that, for the second year in succession, the number of road passenger vehicles in use has increased. In 1930 the number of omnibuses and coaches in use was 52,648. The Road Traffic Act of that year placed all omnibus and motor-coach services under the control of the Traffic Commissioners, and their total declined in 1931, by nearly 14 per cent., to 46,230. Subsequent changes have been as follows:—

Year ended December 31st	No. of Vehicles Licensed	Passenger Journeys (Millions)	Passenger Receipts (Millions)	Vehicle Miles (Millions)	Receipts per Vehicle Mile
1931	46,230	5,269.5	58.4	1,318.9	10.68
1932	46,458	5,344.9	58.2	1,323.7	10.61
1933	45,393	5,424.0	58.1	1,313.0	10.67
1934	45,785	5,722.1	60.0	1,345.8	10.77
1935	46,437	6,031.5	62.1	1,381.4	10.85

The increase in the number of vehicles mainly reflects the development of municipal bus undertakings, particularly the substitution of buses for trams and the inauguration of services for new housing estates. The total number of operators has, however, decreased by 433 during the year, to 5,313. Absorption of the smaller operators by the large undertakings continues (see *The Economist*, July 18, 1936, page 112), but out of 5,313 operators some 4,896 still own fewer than ten vehicles. The figure of 6,031.5 million road motor passenger journeys (to which must be added 3,971.4 million passenger journeys on trams and trolley-buses) compares with 1,699.1 million (longer) passenger journeys by rail transport. The total passenger revenue by road in 1935 was £62,100,000 for omnibuses and coaches, plus £22,100,000 for trams and trolley-buses, compared with £61,100,000 on the railways.

British Crops in 1936.—That the weather did not deal kindly with the arable farmer last year is evident from a study of the Agricultural Returns of England and Wales, issued by the Ministry of Agriculture recently. With the exception of mixed corn, beans and root crops, yields were generally below average in 1936. In the following table, the acreage figures relate to the June census in each year, while the production figures for 1936 are still provisional:—

PRELIMINARY CROP STATISTICS								
Crop	Estimated Total Produce		Acreage		Estimated Yield per Acre			
	1935	1936	1935	1936	Average of 10 years 1926-35	1935	1936	
	'000 Tons	'000 Tons	'000 Acres	'000 Acres	Cwt.	Cwt.	Cwt.	
Wheat	1,623	1,378	1,772	1,704	17.7	18.3	16.2	
Barley	656	663	792	819	16.3	16.6	16.2	
Oats	1,138	1,080	1,418	1,420	15.8	16.0	15.2	
Mixed corn	71	75	93	97	15.7	15.3	15.4	
Seeds hay*	1,795	1,674	1,386	1,339	26.9	25.9	20.9	
Meadow hay†	4,842	4,733	4,643	4,689	19.7	20.9	15.3	
Beans‡	93	93	133	121	16.4	13.9	13.4

Turnips and swedes	4,590	5,579	493	448	11.7	9.3	12.5	
Mangolds	4,567	4,885	250	245	18.7	18.3	19.1	

† Hay from clover, sainfoin and grasses under rotation. ‡ Hay from permanent grass. § For stock-feeding or seed.

Under many headings the yield per acre last year was lower than in 1935, but the decline, as a rule, was distinctly moderate.

A 15 per cent. drop in wheat production is traceable to a 4 per cent. fall in acreage and a substantial decline in the yield. A slight increase in the area under oats was more than offset by a reduction in the yield per acre, the total output being consequently 5 per cent. smaller than in 1935. In the cereals group barley made the best showing, the slight fall in the yield being insufficient to counteract the effect of an increased acreage. June rainfall was favourable for the growth of hay, but the continuance of wet weather during July seriously hampered harvesting, and the crop was consequently badly damaged in many districts. The area under root crops was reduced last year and, except in the case of mangolds, production was lower than in 1935.

Britain's Fish Supplies.—The latest Monthly Return of Sea Fisheries gives details, by volume and value, of British takings of fish during the twelve months to December 31st last; and thus makes it possible to estimate how the deep-sea fishing industry fared during 1936. The table below shows that, while British takings of white, or demersal, fish were heavier last year than in 1935, the aggregate value of the catch suffered a reduction of 3½ per cent., due to a sharp decline in prices realised for the principal varieties. However, in the depressed herring industry, an increased supply was absorbed at better prices than in 1935:—

Category	Quantity		Value	
	1935	1936	1935	1936
	Cwts. '000	Cwts. '000	£ '000	£ '000
England and Wales:—

Great Britain:—				
Total wet fish	19,854	20,876	15,808	15,719

* Including other items not separately specified.

Supplies caught by British fishing vessels are supplemented by purchases from overseas. Imports of fresh and frozen fish into the United Kingdom as a whole totalled 1,648,000 cwts., valued at £2,507,000 last year, against 1,874,000 cwts., valued at £2,545,000 in 1935. On the

other hand, the bulk of the herrings caught by British drifters are exported abroad. Total British exports of this fish were a little lower, at 3,768,000 cwts. last year, compared with 3,786,000 cwts. in 1935, but realised £2,653,000, against only £2,402,000 in the preceding twelve months.

Rubber Supplies and Prices.—Owing to the rapid increase in consumption and prices, the International Rubber Regulation Committee decided last month to revise its previous allocation of quotas for the first half of 1937. Instead of allowing exports at the rate of 70 per cent. of assessed capacity during the first half of 1937, the Committee then decided to permit exports at the rate of 75 per cent. of assessed capacity during the first quarter, and at the rate of 80 per cent. during the second quarter of 1937. Notwithstanding this increase in supplies, the price of rubber continued its sharp upward trend. The lull in the upward movement, noticeable recently, is almost entirely due to the dispute in the United States automobile industry. Realising that prices might continue to advance, the International Rubber Committee decided this week to provide for a further increase in supplies during the third quarter of the current year, by raising the export quota of the restricting countries to 85 per cent. of assessed capacity during that period. In view of the fact that output cannot be increased at short notice, the policy of the Committee is to be commended. But as current quotations, at about 10½d. per lb., are already well above the price at which efficient producers can operate at a reasonable profit, a still more liberal policy might, with advantage, have been adopted. The Committee is meeting again on March 16th. If the recent increases in quotas fail to arrest the advance of prices during the intervening period, the Committee would be well advised to consider following the example of the copper producers by suspending restriction altogether for the time being.

Wholesale Prices Checked.—The world advance in wholesale prices has at least received a check, and the past fortnight's movements have been irregular. In England, the complete *Economist* index number has risen by 0.4 per cent., but the primary products index has fallen by 0.5 per cent. This divergence is mainly due to technical reasons, and does not indicate an increase in prices of manufactured goods, with the exception of cotton yarn and cloth. In the United States, our primary products index number has fallen by 3.0 per cent., while the complete Irving Fisher index number has fallen by 0.5 per cent. The French wholesale price index number is slightly higher than a fortnight ago.

* These figures relate to Jan. 20th.

This tendency for wholesale prices to react is on the whole healthy, for last autumn's advance had been very rapid. So far the decline is more marked in the United States than in England.

The irregularity of the past fortnight's movements in British prices is confirmed by the divergent movements of the group index numbers. There was a definite increase in "other foods," due to advances in tea, coffee, cocoa, butter and coco-oil. Most of the other groups were slightly lower.

The Economist Index

(1927 = 100)

	Sept. 18, 1931	Dec. 30, 1936	Jan. 13, 1937	Jan. 27, 1937

1913 = 100	83.1	109.1	111.0	111.4
1924 = 100	52.2	68.5	69.7	70.0

Many leading primary products have fallen in price during the past two weeks. They include wheat, maize, Australian wool, hemp, jute, non-ferrous metals and rubber. Higher prices are recorded in the case of barley, oats, meat, cotton yarn and cloth, flax, coal, Swedish timber, and petrol. These increases are additional to those in "other foods" group, which have already been mentioned.

A World Sugar Conference.—It was announced in Geneva on Wednesday that Mr Ramsay MacDonald, President of the Monetary and Economic Conference of 1933, and Dr Colijn, Chairman of the Conference, had agreed that a new international conference should be called this year to consider the production and marketing of a single commodity—sugar. It will be held in London, probably in April. The announcement comes as no surprise to the industry. As long ago as July, 1935, a White Paper, issued by the British Government, declared the latter's belief that the industry could be set on an economic basis only by international agreement; and their intention to invite the sugar-exporting countries of the Empire to make a joint endeavour to reopen negotiations. Subsequently, the non-Empire countries established unofficial contact, through a committee, with the British Government. And, last but not least, sugar prices started to rise before the end of 1936. Within the past month, prices on the London terminal sugar market have risen by as much as 20 per cent., and they were further marked up on this week's news. Undoubtedly, agreement should be more readily obtainable in 1937 than in 1933, but the task will be far from easy. It is true that world consumption has exceeded production during each of the last four seasons, and visible stocks have been reduced by nearly 50 per cent. since 1934-35. But a considerable surplus of capacity still exists; and the world's consuming markets are so closely protected, in the interests of domestic producers, that the "free" world market covers little more than 10 per cent. of total production.

Administrative Red Tape

WASHINGTON, January 18.—The President's proposals for simplifying and strengthening the executive branch of Government have not received the attention they merit. His special message to Congress was fully reported in the newspapers, but the public has read little about them. The President has talked often in the past about his administrative problems. Having held office most of his adult life, he is a professional public servant, with a professional enthusiasm for his own problems. During his first term, he found himself beset by enormous administrative difficulties. The more than one hundred Government agencies were constantly getting into each other's way. Important and parallel functions could not be co-ordinated, and the President was repeatedly absorbed in plans for new administrative arrangements. But administrative problems are not "news." The public likes to assume that the men on the job are masters in their field.

The President was always seeking a way to simplify the functions of the Administration, while at the same time he was multiplying them many times. His efforts were not marked with success. The most deserved criticism of the Roosevelt Administration during its first term was its disorganisation. Part of this can be laid to the President himself for being unable easily to delegate authority. Anyone familiar with the work in the Departments at Washington will have heard the laments that arose of the endless delays in reaching decisions, because they had been reserved by the President to himself. The finest experts in the land rushed to Washington with the launching of the New Deal. Working for small pay, and under great pressure, they zealously mapped out innumerable plans for the betterment of the country. But one by one most of their hearts were broken, and they returned again to private life.

The history of Roosevelt's first term will never be adequately written without a full chapter about the idealism which became enmeshed in Governmental red tape, and was choked to death. For a while the Government had at its disposal the finest assortment of talent that ever assembled in a national capital. The President has been criticised for disregarding the Civil Service in his first term, without acknowledgement that the type of public servants who rallied to him was superior to anything that a Civil Service could provide. Since the campaign, the President has been quoted as expressing relief that the Republicans did not attack him where he admitted he was weakest, for the inefficiency of his Administration. It is characteristic of him to acknowledge the weakness, and to begin his second term by advocating sweeping changes to eradicate it.

Reform of the Executive

The proposals themselves can be summed up in the reduction of executive Departments to twelve, and the

The COMMERCIAL NATIONAL BANK and TRUST COMPANY of NEW YORK

An International Bank working with the principal banks of the world as correspondents. No foreign branches

FIFTY-SIX WALL STREET, NEW YORK

Cable Address: COMTRUST

Member: Federal Deposit Insurance Corporation

enlargement of the Cabinet to include a Portfolio of Public Works and one of Social Welfare. The Interior Department, so different from the Home Office in Great Britain and the Ministry of the Interior in France, is to be cut down. It will become the Department of Conservation, charged primarily with the administration of natural resources. Presumably, however, it will continue to administer territorial possessions and Indians. But the long duel between Secretary Ickes and the Relief Administrator, Mr Hopkins, over public works, will not occur again. The new Minister of Public Works, who will probably be Mr Hopkins, will have complete charge of Government expenditure in his line.

The President accepts boldly the Landon programme for Civil Service reform, another characteristic gesture. He is ready to include in the Civil Service every Government employee (with a few exceptions in the lowest grades) up to the Under-Secretaryships, where policy-making begins. But the President has not quite pleased the Civil Service reform specialists, because he proposes to put the Service directly under his own control, instead of under an independent Commission as at present. The argument against this is that a future President, intent on paying political debts with Government jobs, might manipulate the Civil Service.

Liberal Criticisms

The greatest opposition to the proposals is to the loss of independence by such bodies as the Federal Power Commission and the Inter-State Commerce Commission. Liberals are not unwilling to have them controlled by Mr Roosevelt, but looking back to the regimes of Harding and Coolidge, they wonder what progress could have been made, if the Commissions had been subject to their dictation. They admit the cogency of the President's argument that his proposals give to the executive branch of the Government the strength and effectiveness which under the Constitution it ought to enjoy. But they are not so much enamoured of logic as they are fearful of possibilities in the future.

One basic reform proposed by the President is the abolition of the Comptroller-General's Office. Mr McCarl, who had the post at the hands of Congress under most explicit terms of independence, built up the office to be a fourth branch of Government. Before the Treasury could hand over funds for spending by the Departments, he exacted of them the most detailed statement of how it was to be spent, and then took upon himself to determine whether the plans were consonant with the legislation which appropriated the money. Not only did this give him a veto over the President in his own branch of the Government; it consumed an unconscionable time, and hampered the Administration on repeated occasions. It also won for Mr McCarl the eulogies of all enemies of the New Deal.

At one time he was mentioned as a possible opponent of the President last year. Those who wanted a watchdog sniffing at the President's expenditure will oppose the abolition of Mr McCarl's office, although his own term has expired. But since most legal experts agree that the Constitution allows for no such powers, Mr Roosevelt will probably have the very deep satisfaction of seeing the Office closed. The President has had many blue prints of constitutional reforms on his desk since he first came into power. He has often announced these to the Press, and it now seems likely that he will see some of his plans made law.

Deadlock in the Motor Strike

NEW YORK, January 19.—Negotiations for the settlement of the strike in the General Motors plants appear to have broken down. Some of the plants occupied by stay-in strikers have been evacuated. Complete details of a very confused situation are unobtainable, but the outlines are clear enough. A majority of the workers are unorganised; the organised minority are divided among the Federation of Labour Unions, the United Automobile Workers (C.I.O.) and the Company Unions. The U.A.W., which is alleged to number about 15 per cent. of the workers, is probably the largest single organised group. It is obviously difficult to negotiate under such conditions. While the U.A.W. claim to have increased their membership since the strike began, well-informed persons state that they have lost members; and that a majority of the strikers are "professionals." In any case, the Company Unions probably comprise a majority of all the workers. It is impossible, however, to get a clear picture of what is going on.

Federal Control of Child Labour

Few American topics are more misunderstood in England than the question of child labour in the United States; the opinion that child labour is widely prevalent is accompanied by the impression that it was abolished by N.R.A. and restored when N.R.A. ended. This opinion is balanced by the horror, often expressed by returning Americans, at the prevalence of child labour in London. Child labour in the United States has been subject to State control, and is defined, either by specific laws governing factories, or in the regulations for compulsory school attendance. As a result, there is considerable diversity. Broadly speaking, minors under 16 years of age are not often employed in the United States, but industrial child labour does exist in parts of some Southern States; and children are generally "employed" on the family farm in all agricultural areas. The proposed Twenty-second Amendment to the Constitution reads as follows:—

"The Congress shall have the power to limit, regulate and prohibit the labour of persons under 18 years of age."

This Amendment was originally submitted in 1924, under the Coolidge Administration. Since then, it has had a chequered history, having been defeated and ratified successively by a number of States; it has now been ratified by 25 States; and ratification by 11 more States is necessary for adoption. The President has addressed letters to the Governors of these States urging ratification. New York State has not ratified this Amendment, yet Governor Lehmann, in urging ratification on the State Legislature, offered the opinion: "It is very unlikely that Federal standards would be as strict as those we now have in our State." Whether the adoption of the Amendment would give Congress exclusive jurisdiction and so necessitate the lowering of State standards would presumably be left to the Courts.

Uncertainty in Banking Circles

The steep rise in commodity prices seems to have been checked within the past few days. It is rumoured that consumers have resisted increases. There has also been a small rise in short-term interest rates; the New York bankers are uncertain about action which may be officially taken to reduce excess reserves. It is now six weeks since quasi-official despatches forecast such action, but no action has been taken. The consequence is a kind of nervous apprehension in the banking system; this shows itself in erratic markets for Government securities. General business continues at a high level, and shows no adverse effects of the strike as yet. It is reported, however, that the Pacific Coast is beginning to feel the pinch of the protracted maritime strike.

France

Treasury Needs and Revived Business

PARIS, January 28.—Social disturbance has died down. The Communists, at their national Congress, expressed Radical-Socialist doctrines in which Marxism had only a very small place, as an ideal for some remote future. The whole country wholeheartedly supports the foreign policy of M. Blum. In Parliament the minority is divided and powerless. The Cabinet thus appears stronger than ever. The experts, however, show great anxiety. The financial needs of the Treasury are vast and importunate, while the benefits of a revival of business—even when admitted—appear more like a long-term speculation.

It seems that the attraction of French funds abroad, combined with a certain internal grudge against the so-called Socialist Government, constitute an obstacle for the French capital market which could only be surmounted by foreign assistance, a breakdown abroad, or by a long and persistent recovery of business. The latter hope was expressed by M. Blum himself in his speech at Lyons.

Rising Prices

The rise in wholesale prices does not appear to have been as regular in January as during the preceding months, in consequence of the decline in foreign raw material prices and of the stability in the prices of French foodstuffs:—

French Prices	1913=100				
	Jan. 2	Jan. 9	Jan. 16	Jan. 23	
General wholesale index	500	501	510	511	
National products	528	528	534	537	
Imported products	449	454	468	466	
Foodstuffs	514	517	527	527	
Raw materials	488	489	497	498	

Deposits in the public savings banks, which had constantly increased till 1932, have since then regularly declined. The withdrawals were moderate during 1933 and 1934, and practically nil in 1935. But they were very large in 1936, at nearly Frs. 5,000 millions. It seems that the rise in prices, and the re-stocking of raw materials, as also the revival of business, have contributed to cause withdrawals, notably by small depositors who had been attracted during the deflation by rates of interest much higher than those of the banks.

The Direction of Foreign Trade

During 1936 the United Kingdom still stood at the head of France's list of foreign clients:—

Country	In millions of francs			
	French imports from	1935	French exports to	1936
Belgium	1,400	1,614	1,815	1,865
U.K.	1,579	1,798	1,615	1,911
U.S.A.	1,788	2,534	718	877
Germany	1,738	1,771	1,051	667
Italy	404	212	596	137

Switzerland, Holland and Argentina follow Germany, in that order. The figures of French trade with Italy are included above to show the exiguous dimensions of the recovery after the abandonment of sanctions.

FIXED DEPOSIT ACCOUNTS

Rates will be quoted on application.

Coal Mines

Production in the French coal mines during December totalled 3,923,827 tons, in 23 working days, against 3,536,912 tons in November (21 working days), and 3,994,936 tons in December, 1935 (22.3 working days). Average daily production was therefore 170,600 tons, against 168,400 tons in November and 179,000 tons in December, 1935. For 1936 as a whole, production in the French mines was 46,146,600 tons, against 47,106,800 in 1935. The production of coke in the coke plants of the coal mines was 3,926,800 tons, against 3,893,600 tons in 1935.

Germany

The Motives of Foreign Policy

BERLIN, January 26.—The Reichstag will meet for a one-day session on January 30th. It was announced last week that Herr Hitler would reply to Mr Eden's statement in Parliament of January 19th; and it is likely that M. Blum's later address will also be dealt with. Neither of these utterances was favourably received. Mr Eden was criticised because he treated Germany as the one obstacle to a European settlement. It is realised that the German attempt to reveal Russia as the real offender has failed in Great Britain. Mr Eden's greatest offence, however, is his claim that every European State is "a potential partner in a general settlement." This old British theory of the "indivisibility of peace" is here described as M. Litvinoff's invention. Mr Eden's opinion that the alternative for Europe does not lie between Right and Left dictatorships is particularly unpalatable. Months before Signor Mussolini, Herr Hitler denounced Democracy as a preliminary stage towards Communism. In reality, however, the "ideological" motive of German policy is artificial. The main motive is to isolate Russia from France.

Law Reform

A new law to restrict the sale of agricultural land is announced. The effect is to apply generally the Nazi principle that land is not merchandise to be freely bought and sold. Permission to transfer land will be refused if the transaction is contrary to any material public interest. The Minister of Justice announces that the Civil Code is not, as was expected, to be revised. The Code is condemned as a mere relic of the past. A "reaction against individualism" will be the principle underlying the new system of private law; but this will be embodied, not in a Code, but in separate legislative acts. These will embrace personal and family law, the law of communities, associations, corporations and estates, and the law of real estate.

Speaking on the Four-Year Plan, Herr Wagner declared that high prices for raw materials must be accepted as a fact, but that means will be found to prevent any decline in the standard of living. Recent balance sheets indicate that many concerns, in particular in the steel-coal group, have sufficient liquid resources to invest in new raw material plant; but some of the pulp-paper companies, which will produce materials for the substitute textiles, are not so well off and will presumably have to borrow.

Foodstuffs, Employment and Production

Butter and fat cards are now everywhere in use. The regulations are not, however, strictly observed, since there is (in Berlin at least) an adequate supply of butter. Eggs and some other foods are still scarce and may be had only by householders who consent to buy things they do not require. A slight decline in employment was seasonal and occurred mainly in the building trades. The output of coal in 1936 increased by 13½ million tons, compared with 1935. The production of lignite increased by 10½ per cent., to 161,340,000 tons. The exports of German tubes, details of which have been published

because of the new international agreement, have risen from 94,210 tons in 1934 to a record total of 366,950 tons in 1936. In 1935, the chief customers were British India, with 32,200 tons, the United States with 17,200 tons, Holland, Argentina and Brazil. The British market was almost entirely lost, and the German delivery fell from 33,200 tons in 1931 to 1,500 tons in 1935.

Increase in Export Trade

Imports in December totalled Rm. 367 millions, Rm. 11 millions more than in November; the main increase was in raw materials. Exports totalled Rm. 457 millions, Rm. 35 millions more than in November; the main increase was in manufactures. The export surplus for 1936 was Rm. 550 millions, against Rm. 111 millions in 1935. Exports increased by nearly Rm. 500 millions. The export of manufactures rose by nearly Rm. 500 millions.

Imports		Millions of marks	
		1935	1936
Livestock and foodstuffs		1,435	1,499
Raw and semi-manufactured		2,315	2,321
Manufactured		408	397
Total		4,159	4,218
Exports			
		1935	1936
Livestock and foodstuffs		96	88
Raw and semi-manufactured		862	878
Manufactured		3,312	3,802
Total		4,270	4,768

Reich revenue from taxation in December was Rm. 1,216 millions, against Rm. 967 millions in December, 1935; and in the first nine months of the financial year the yield was Rm. 8,585 millions, against Rm. 7,190 millions in the same months of 1935. Of the increase Rm. 1,263 millions was derived from direct taxation and taxes on business. Money last week was plentiful.

The Revision of State Frontiers

By a law "Concerning Greater Hamburg and Other Territorial Readjustments," Altona with Wandsbeck, Harburg-Wilhelmsburg and a number of other Prussian communes have been incorporated in the State of Hamburg. In return Hamburg has ceded to Prussia Cuxhaven and a number of other communes. The State of Lübeck goes to Prussia, with the exception of two communes in Mecklenburg; Wilhelmshaven has been ceded by Prussia to Oldenburg; the Rhineland enclave of Birkenfeld, belonging to Oldenburg, goes to Prussia, and the Oldenburg district lying between Holstein and the Bay of Lübeck to Prussia. By far the most important of these changes is the union of Hamburg and Altona, with populations of 1,130,000 and 242,000 respectively.

Palestine

The Cost of Police and Defence

JERUSALEM, January 16.—The Government of Palestine has now issued a statement of Government finance for the first half of the fiscal year, April, 1936, to April, 1937. This covers nearly the whole period of the Arab General Strike, which came to an end early in October. The figures show a decline in revenue compared with the corresponding period in 1935, from £P3,000,000 to £P2,000,000. The principal fall was in Customs, where it amounted to over £P600,000. Government expenditure for the half-year showed an increase, compared with the corresponding period in 1935, of nearly £P250,000; this was due to the higher cost of the police, amounting to over £P100,000, and of the defence forces. Nevertheless, the finances of Palestine still seem healthy. The Government has kept intact its large surplus of over £P6,000,000, which, paradoxically, was slightly increased during the six months under review. This was partly because, during the troubles, it was impossible to carry out the large programme of public works, for which the Budget of 1936-37 had provided.

A Boom in the Orange Trade

The most recent figures of non-Government finance in Palestine strengthen confidence in the recuperative powers of the country. In October, immediately after the end of the strike, imports showed an increase over the previous month of 44 per cent., while exports amounted to £P129,000, against £P72,000 for the previous month, and surpassed the figures of October, 1935. The export of oranges, which is the principal item in Palestine's foreign trade, is expected to rise considerably this year; up to the middle of January it was 30 per cent. higher than last season. The events in Spain have helped Palestine in the competition with her greatest rival in European markets. The annual export of oranges rose from 99,000 tons in 1933 to 224,000 tons in 1935; during the same period, exports from Spain fell from 904,000 tons to 689,000 tons. Great Britain is still the principal importing country for Palestine citrus fruit; but the League of Nations' attempt to propagate the idea of better nutrition in all countries should help to secure larger markets for the fruit in many countries of Europe, where the consumption of oranges is still woefully small.

Business Confidence Maintained

Deposits in the Palestine banks rose slightly during the period of the crisis, April to October, 1936; and the deposits of the Credit Co-operative Societies amounted to nearly £P3,000,000. The value of advances made by the banks to their customers rose from six and a half to seven and a half million Palestine pounds during the period. On the other hand, owing to reduced business activity, the amount of bills discounted fell by about 25 per cent.

The consumption of electric power during recent months has been steadily rising. The figures for September and October, 1936, showed an increase of between 25 and 35 per cent. compared with the same months in 1935. A similar indication of confidence is furnished by the figures of the registration of new companies in Palestine during the last quarter of 1936. In those three months thirty companies were formed, with an aggregate capital of £P238,000. During the same three months, seven Palestinian companies increased their share capital by over £P100,000. The largest increase was that of the Arab Bank, from £P45,000 to £P105,000, which suggests that the Arabs are developing fresh enterprise.

There were fears some months ago of a recurrence of violent unrest in the spring, after the orange season was over; but although there is still great tension between the two communities, there is now less apprehension. The fact that the Arab Committee finally decided to give evidence before the Commission suggests that they are prepared to wait for the decision of the British Government, which is not likely to be announced before the summer.

Argentina

Transport Co-ordination

BUENOS AIRES, January 20.—The Message to Congress announcing the Government's intention to buy gradually, and within the limits of its resources, the privately-owned Argentine railways, which accompanied the Bill for the purchase of the Córdoba Central Railway, was for the purchase of the Córdoba Central Railway, was probably more a declaration of principle than an indication of an imminent sweeping change. The idea that the railways should be operated solely in the public interest, and not as a means of profit, was clearly expressed. Railway transport, the Message said, should have to bear only those tariffs necessary to pay the cost of material and rolling stock.

The Federal Transport Co-ordination Bill, which has now passed the Senate, provides for the creation of a Committee comprising: a President of Argentine nationality, appointed by the Government for four years and

eligible for re-election; the President of the National Roads Board; the Director-General of Ports and Navigation; the Director-General of Railways; the Administrator of the State Railways; and one representative each from the railway companies and the motor transport companies. The Bill stipulates that permission must be obtained from the Committee for the running of motor services in or between Federal territories, or between these and the Provinces, or between the Provinces and the Federal capital. The Committee will co-ordinate transport by land and water; and must approve all rates for the carriage of goods and passengers. The Minister of Public Works stated that the object of the Bill was not to protect exclusively the interests of railway capital invested in Argentina, but to contribute to the return of general prosperity. The railways, however, constituted so important a part of the public services that it was the duty of the Government to safeguard them against disaster.

The Recovery of Business

Cash revenue for 1936 amounted to 961,073,222 pesos, against 892,193,681 pesos in 1935. Revenue from credit operations was lower than last year (204,092,975 pesos compared with 312,322,848 pesos). Expenditure fell to 1,164,431,643 pesos against 1,212,994,303 pesos in 1935. The General Budget for 1937, excluding special accounts, anticipates an expenditure of 983,383,197 pesos, of which 833,932,197 pesos will be met out of general revenue and the remainder out of bond issues.

Exports for 1936 were valued at 1,652,448,641 pesos, against 1,569,349,057 pesos in 1935, an increase of 5.3 per cent. The largest increase was in the value of wool exported, which rose by 36,007,800 pesos, or 31.2 per cent. Grain shipments in 1936, compared with the two previous years, were as follows:—

(In Metric Tons)

	Wheat	Maize	Linseed	Oats	Rye	Barley
1934...	4,670,814	5,497,190	1,408,574	495,979	103,950	538,188
1935...	3,914,506	7,018,582	1,875,407	393,619	245,880	403,151
1936...	1,619,049	8,388,216	1,557,524	170,596	136,737	232,527

Maize shipments increased, while the shipment of other grains fell considerably, because maize, being a late-sown crop, was unaffected by the drought of 1935. The weather has been favourable for agriculture, and there are prospects of another record maize crop.

Thus, the end of 1936 saw the State finances in a sound position. A strenuous attempt was being made to regulate the growing trade on road and rail within the Federal districts. There was virtually a boom in the trade in wool. This satisfactory state of affairs was coupled with the expectation that the export of maize, already of record dimensions, would increase considerably during the coming year.

The Distinctive System

The Scottish Provident Institution

Under *The Distinctive System* the premiums are so moderate that, at early and middle ages, the annual sum charged elsewhere for a Whole Life Assurance of £1,000, with profits, will here secure from the first as much as £1,300 or thereby with right to share in the Surplus.

Letter to the Editor

The Boom and the Budget

TO THE EDITOR OF THE ECONOMIST

SIR,—In your leading article this week you argue that further recovery will require a substantial increase in bank advances, but must not be allowed any more cash. You imply that I agree with this. You infer that a substantial increase in bank advances, unaccompanied by any increase in cash, will cause a heavy fall in gilt-edged securities and a rise in the long-term rate of interest; which is not indeed a necessary inference (since buyers for the banks' investments may be as readily forthcoming as they would be for a new issue), but is probable in the actual circumstances. Thus you wind up with the old conclusion, which I was particularly concerned to dispute in my *Times* articles, that, if the principles of "sound finance" are observed, recovery is bound to raise the rate of interest. May I try to define the issue more precisely?

In the first place, I am not convinced by your forecast that an increase will be required in the amount of bank advances up to the 1929 level. The quantity of deposits is considerably above the 1929 level (£2,210 millions, compared with £1,789 millions), and, unless the market, becoming alarmed about the prospects of the gilt-edged market, gets keen on keeping liquid, this quantity of deposits ought to support a larger national income. Thus, whilst some further increase in advances is quite likely, I doubt the need for so large an increase as the £137 millions which you forecast. This is borne out by Mr Edwin Fisher's very interesting analysis of bank advances which you publish in the same issue, from which it appears that only about a third of bank advances are taken by productive industry, merchants, etc., or applying his percentages to the banks as a whole, say £305 millions, of which the increase you forecast is about 45 per cent. Moreover, we are probably through the period of recovery at which the demand for bank advances, as distinct from new issues, is keenest, namely, when working capital is being increased and repairs and renewals are being carried through but increased cash profits are not yet to hand.

Nevertheless, since my calculations involve some doubtful factors, I am ready to admit that you may conceivably be right about the demand for advances; or, at any rate sufficiently right for the problem under discussion to reach significant dimensions. But if so, surely it must be advisable to allow some increase in the basis of credit? It cannot be wise to put on the brake at that stage and in

that way. Even your extreme hypothesis only requires an increase of £15 millions in bank cash.

For consider the nature of the two alternatives. If you force the banks to sell their investments, your policy is to reduce the price of gilt-edged securities until someone with idle cash is induced to part with it in exchange for them, thus placing cash which was idle at the disposal of the new borrowers. The other alternative is to leave the quantity of idle cash unchanged and to supply new cash to the borrowers. The former increases the velocity, and the latter the quantity, of the circulation. But to suppose that the former course prevents prices from rising is a fallacy. Prices are a function of the degree of activity. They can only be checked by reducing the activity, i.e. by not making the new advances; though to make them at the expense of the rate of interest will, of course, impair future activity. Thus your policy is the historic one—of not checking the boom, but of making sure that it is followed by a slump. Since you cannot intend this, could not the argument be reconsidered?

Yours etc.

J. M. KEYNES.

King's College,
Cambridge.

[If we have misrepresented Mr Keynes's views, we are sincerely sorry; we wrote no more than that he took "the same general line" as other economists who have written on the subject of monetary policy.

Mr Keynes himself is scarcely accurate in his statement of our own views. Nowhere in our leading article of last week can justification be found for the belief that we advocate either the deliberate increase of interest rates to moderate the boom, or even a rigid limit on the expansion of bank deposits. On the contrary, we pointed out that, were it not for the threatened Defence Loan, the dilemma of the banks (whether to increase deposits or to sell investments) "could doubtless be surmounted by a practical compromise", i.e. by some increase in deposits (but not enough to breed a wild rise of prices) and by some sale of investments (but not enough seriously to affect the gilt-edged market).

The point to which our argument was directed was that the issue of a large Defence Loan would rule any such compromise out of court and face us with the blunt alternative of an extravagant expansion in the supply of money or a sharp rise in interest rates. Mr Keynes nowhere mentions the Defence Loan. But is it not the crux of the problem? Without it, he and we both agree that the problem is soluble. With it, would Mr Keynes still be confident of avoiding a dangerous boom without raising interest rates?

The technical points raised in Mr Keynes's letter are referred to in our banking leader on page 242.—ED. *Econ.*]

Books and Publications

National Income in the Trade Cycle

THE importance of the nature of the production and distribution of the National Income has never been more widely recognised than to-day. Problems of nutrition, public finance, market analysis and trade cycle theory depend largely on statistical measurements of the income and consumption of various social groups; of the output of various industries and services; and of the accumulation of fixed and working capital. Mr Colin Clark's new book* is likely to be the standard work in this field for many years to come. In his "National Income, 1924-31," Mr Clark proved himself to be a keen and able statistician. In his present work he has been able, not only to give more accurate statistical estimates, but also to extend the range of their application. This book is a statistical reference book of inestimable value to the economist, and, in addition, it provides material for the economic historian and the economic theorist. In its breadth of interests Mr Clark shows himself to be a real social philosopher.

In his estimates of wages, salaries and incomes from property in the years 1924-35, Mr Clark mainly follows

* "National Income and Outlay." By Colin Clark. Macmillan and Co., Ltd. xix, 304 pages. 12s. 6d.

the method of his previous book, but also makes full use of the census of 1931. He estimates that money wages fell by no more than £150 millions between 1929 and 1932, and had by 1935 exceeded their 1929 level; while salaries showed even greater stability. Profits and interest fell sharply in 1931-33, but were greater in 1935 than in 1929; while rents rose without interruption throughout the whole period. Wages to-day absorb a slightly higher percentage of the national income than before the war; but there has been a distinct shift from profits to salaries, owing to the decline in the numbers of independent workers. "The working and lower-salaried classes do not enjoy a more equal distribution in the sense of their having a greater share of the national income . . . but within the wealthier classes, the distribution of income is somewhat more equal."

To arrive at his estimates of incomes Mr Clark examines in detail the net product of agriculture and industry, making full use, not only of the censuses of production of 1924 and 1930, but also of the Import Duties Acts Inquiries of 1933 and 1934. One of his most valuable new contributions is his analysis of costs and profits in various industries in 1930, 1933 and 1934. In a later chapter he carries the analysis further by estimating output per worker employed in various branches of economic activity, both before the war and in recent years.

The rôle of the State and of Local Authorities in effecting changes in the distribution of income is well illustrated by the analysis of the amount and incidence of direct and indirect taxation. On general grounds, however, Mr Clark's treatment of Government income may be open to criticism. Following English tradition, interest payments on the National Debt and other "transfers" are excluded from the total of the National Income, but indirect taxes are added in, on the ground that they are in the nature of monopoly profits, which have to be included in the value of output as a whole. An alternative method would be to treat the State in exactly the same way as a public company as regards receipts and expenses, and to include in the National Income the "true" budget surplus or deficit, after account has been taken of all capital items. Mr Clark does not, it may be noted, regard death duties as capital receipts, or the cost of warship or aircraft construction as capital expenditures.

In the last third of the book Mr Clark deals with a number of general questions, relating to the accumulation of capital, the rate of economic progress and the variation of prices and costs in the present trade cycle. His well-known figures for the output of capital goods are revised and brought up to date; and a valuable new technique is developed for relating investment to total income, and the rate of profit per unit of output to the price of capital equipment. Estimates of savings are, however, far less easy to make. Working and middle-class savings, which pass through savings institutions of various kinds, and net savings of public authorities are fairly easy to determine, but no reliable estimates are available for the savings of the wealthy. Mr Clark works out figures for company savings by applying the results of *The Economist's* sample of industrial profits. He takes the percentage of profits (after debenture payments) placed to reserve, as given in the sample, and multiplies by his own figures for the total national profits and interest. Here he appears to make a slight error, as the relevant percentage is merely the proportion of profits before debenture payments placed to reserve. This would involve a change of some 10 per cent. in his figures, which would also presumably include all or part of the total of trading losses which he calculates separately. Mr Clark gives convincing evidence that, at the present time, the contributions of the wealthy to national savings are almost entirely in the form of insurance premiums and death duty payments. Indeed, in recent years, there is evidence that the rich have been living on their capital.

It is impossible in the space of a review more than to touch on some of the most striking of Mr Clark's results. Mention must, however, be made of his fascinating analysis of Gregory King's estimates of the National Income in 1688, and of his useful summary of various estimates made during the last eighty years. Perhaps his most startling conclusions are those of the last two chapters. His final sentence, indeed, epitomises the challenging character of the whole book:—"There remain yet to be discovered the laws determining the rate of economic growth of particular communities, and the amount of capital invested seems to be an effect rather than a cause."

Shorter Notices

"The Law of Peace." By C. van Vollenhoven. Macmillan. 261 pages. 10s. 6d.

Professor van Vollenhoven, the distinguished Dutch expert on Indonesian customary law and interpreter of his fellow-countryman Grotius, is little known in this country outside the legal profession. This is a translation of his last book, written a year before his death (in 1933), and addressed to the general student of international affairs. The book is named after that part of "International Law" which ought to be its predominant part, the Law of Peace. This comprises the body of international legal rules governing the relations of nations in times of peace, including rules for the prevention of wars, and for the re-establishment of peace once war has broken out. The book traces the history of the Law of Peace from 1150 to 1932. It is a study of positive international law as it really existed and governed

the conduct of nations. This comparatively short book (261 pages) gives no more than the main conclusions of a laborious piece of research into historical fact.

The array of evidence, thus derived from the study of positive international law, tellingly suggests that lasting peace can only be established if human society is deliberately organised for the purpose of preserving international peace. Legally, this implies the establishment of an impartial supranational authority, capable of legislation, judicial proceedings and administration (including international executive forces, such as an international police). It is Professor Vollenhoven's distinctive contribution to international law that he argues this thesis on the basis of positive law, with no reference to moral or natural law.

Professor Vollenhoven considers Article 11 to be the pivot of the League Covenant. He maintains that this Article involves a legal (and not only a moral) obligation on the part of the League to stop any war once it breaks out without wasting time in determining who is the aggressor. It is the League alone which may legally use force in the international sphere, just as national police may alone do so in a local brawl. Only the League, therefore, ought to possess arms on a vast scale, while individual States should be disarmed to the level necessary for internal security. Professor Vollenhoven is, of course, realistic enough to be fully aware of the political difficulties of such a programme. But he is anxious to state clearly what legal stipulations and what actual conduct are necessary to ensure a reign of peace. In short, Professor Vollenhoven is not only an excellent jurist but also a first-class historian who displays a shrewd political instinct, and combines with it a fervent desire for peace and a keen international spirit.

To Mr Horsfall Carter, who translated the book from the French, a special word of praise is due. He has given us a model translation of a very important book.

"Statistical Year-Book of the League of Nations, 1935-1936." Allen and Unwin. 339 pages. 10s.

The new League Statistical Year-Book gives, as in previous years, a general view of the most important phenomena of a demographical, economic, financial and social order. Most of the data it contains are carried down to the end of 1935, and in other cases include also the first quarter of 1936. The tables in which they are presented facilitate, in so far as is possible, comparisons between one country and another. They relate in particular to the following matters: territory and population; labour conditions (unemployment, employment, wages, hours of work); production (agricultural products, dairy products, fisheries, minerals, metals, chemical products, electricity, etc.); indices of world production of raw materials; indices of industrial production; international trade and balance of payments; transport (merchant shipping, railways, air traffic); public finance (budgets, public debts); banks and currency questions (circulation, reserves of gold and foreign assets, exchange rates, discount rates, bank deposits, share prices, yield from bonds, issues of capital, etc.); prices (wholesale and retail price indices, prices in gold francs). Various improvements make the Year-Book even more complete than in former years.

MONEY AND BANKING

The Problem of Bank Credit

A WEEK ago we pointed out that for the London clearing banks alone advances had risen during the year ended November, 1936, by £89 millions. We suggested that if this expansion continued, either the banks would be forced to realise some of their investments or there would need to be a further expansion in bank cash. We showed that if the latter alternative were adopted, an increase of only £15 millions in bank cash would probably be sufficient to bring about the desired result, and that such an increase would not be incommensurate with the annual increase that had actually occurred during recent years.

Since our article was written, this question of the supply of banking credit and the uses made of it has been taken up by some of the bank chairmen at their annual meetings. Our general comments upon their speeches will be found in a leading article on page 221, but some of the points made are germane to our present examination of banking policy. For example, Mr Beckett, the Westminster Bank chairman, declared himself wholeheartedly in favour of cheap money, and roundly stated that at present there was no shortage of bank credit. Mr McKenna, of the Midland Bank, expressed a more guarded view. He foresaw certain dangers, one of which was the growth of a speculative bubble based upon bank loans. He made the pregnant suggestion (to which we shall return later), that the banks should concert measures for the restriction of loans required wholly or mainly to finance speculation. He also made the point that only one-third of last year's increase in the Midland Bank's loans represented new industrial or commercial borrowing. Rather less than one-third was due to further special loans to local authorities, and the balance had been taken by professional and private customers.

This question of the proper volume and distribution of bank credit is also discussed by Mr J. M. Keynes in a letter which is printed on page 240 of this issue. We may here conveniently begin by accepting Mr Keynes' point that British industry is to-day not the main borrower from the banks. Mr Fisher's analysis of Barclays Bank loans, 34 per cent. of which go to private and professional borrowers, makes that clear, and Mr McKenna's speech confirms this view. On the other hand, Mr Fisher has shown that the banks are playing an unexpectedly significant part in the financing of the building boom, while Mr McKenna implies that the official control over the issue of municipal long-term loans has thrust on the banks an important share of the financing of public works. Private and professional borrowing, of course, covers a multitude of sins, which the bankers are often not in a position to detect, let alone pass judgment upon. This makes it a little difficult to accept Mr Keynes' low estimate of the amount of bank credit involved in the industrial recovery or of the amount of the further increase still to be expected; and we notice that Mr Keynes himself is not entirely convinced. On the other hand he has certainly made one fundamental point, namely that during the upward phase of the trade cycle there are both a varying demand for bank loans and a varying tendency to repay them. In the earlier stages of revival, repayments are in excess of new loans, as borrowers regain their solvency and are able to liquidate their debts. Bank advances therefore contract, as happened in 1932-33. During the next stage fresh borrowing becomes the greater influence, and the total of loans expands. Mr Keynes now suggests the existence of a third stage, during which bank loans are again repaid, but this time out of increasing profits and

the proceeds of new capital issues. This suggestion is hardly borne out by the history of past periods of industrial activity, or indeed by the experience of last year, when, in spite of rising profits and an active new issue market, advances increased rapidly. Again, as a matter of current practice rather than theory, we are inclined to envisage a period of fresh borrowing to finance the growing activity of the re-armament industries.

Mr Keynes also discusses our two alternatives of a realisation of bank investments or an increase in bank cash and deposits, as a means of satisfying any new demand for bank loans. Bank deposits are not uniform, and it is misleading to base arguments entirely upon their aggregate size. Some, to quote Mr Keynes' words, are idle, in the sense that their owners regard them as savings, while others are active in the sense that they are continually being drawn upon and transferred from one owner to another. Mr Keynes' point can here be expressed very simply. If the banks sell securities for "idle" cash, then there is an automatic reduction in "idle" deposits. The banks now, by hypothesis, make fresh advances, which on the whole create "active" deposits. Conversely, if the banks have fresh cash pumped into them, so that they do not have to sell investments, then the increases in advances and active deposits take place without the reduction in their investments and in idle deposits. As a matter of economic theory, and quite apart from any reactions, which under the first alternative would follow a fall in gilt-edged prices, we suggest that the second alternative is the more calculated to provoke a rise in prices. For under it the idle deposits would remain in existence, and there is always the possibility that some of them might awaken and become active.

If this is a fair summary of the general banking position to-day, how ought banking policy to be directed? We can assume, as part of the data of the problem, that we are at a mature stage of the trade revival, and that we are committed to heavy re-armament expenditure, some of which may be financed by borrowing. If the decision is to borrow, it is unlikely that the authorities will choose the horn of the dilemma which involves higher interest rates.

In these circumstances, ought private demands for bank credit to be rationed? And, if so, by whom and on what grounds? Mr McKenna has already made the suggestion of concerted bank action to check borrowing by private individuals for the purpose of speculation on the Stock Exchange; and Mr Keynes prefers some form of rationing as an alternative to higher interest rates. Rationing, however, is too crude a term to employ; and it might be neither practicable nor desirable to draw Mr McKenna's rigid line between speculative and other borrowing. The better word to use is "discrimination," for that is what bankers are already doing every day of their lives. In assessing each application for a loan, a banker has regard to his knowledge of the customer, to the collateral offered, and very often to the purpose of the loan. Even in the case of a running overdraft, the banker watches that the customer keeps within his limit, and also sees that money is regularly coming into the account as well as going out.

Bankers should, it is suggested, go a stage further and agree to judge new applications by the national interest, as well as by the canons of banking practice. Obviously where a customer requires a further loan to finance the completion of a legitimate project, that should not be denied. Loans connected with re-armament or other work of national importance must equally be

granted. On the other hand, when it is the case of starting a new enterprise, the banker should look ahead and satisfy himself that there will be room for that enterprise, and a demand for its products, not only under the boom conditions of to-day, but also under such conditions as may well prevail in two or three years time. This is even more important than Mr McKenna's proposed discrimination against loans for speculation.

Such a development of banking practice would in no sense be revolutionary. It would, however, be a real safeguard against the dangers of expansion of the credit base which may be needed to float a defence loan on the crest of the trade cycle. It would be less brutal than the alternative of a sharp rise of interest rates, and to that extent we agree with and, indeed, are elaborating Mr Keynes' thesis. On the other hand, we do not regard a slight stiffening of interest rates with quite the same feelings of dismay as Mr Keynes. Interest rates are now so low that they could rise some way before they would be as high as they have been in many periods of sustained activity.

Financial Notes

The Outlook for the Franc.—The raising of the French Bank rate from 2 to 4 per cent. on Thursday came at the end of a period of heavy pressure on the franc that it did nothing to alleviate. The spot rate has been consistently held by the French Control at Frs. 105.15, but the three months' rate has been fluctuating outside Frs. 3 discount until frequent official intervention brought it back again. The outward flow of funds from Paris that this denotes is directly attributable to growing rumours that the pegged rate for the franc was to be brought down to its lower statutory limit corresponding to about Frs. 112 to the pound. The pressure was relieved somewhat on Wednesday owing to the rumours that a loan was to be raised in London. The next day it was understood that the loan would take the form of a £50 millions 3½ per cent. credit, for three months, with the right to renew for two further periods of three months. The loan is to be to the French railways, but it will assist the Treasury indirectly. Presumably, the three London houses which are believed to be arranging the loan have obtained the necessary safeguards that the sterling needed for its repayment will be forthcoming. A loan of this size may afford no more than temporary relief and may not rule out the possibility of a drop in the franc to its lower statutory limit.

The Norwegian Bank Rate Increase.—The recent increase from 3½ to 4 per cent. in the Norwegian Bank rate was not entirely unexpected. It may partly have been intended as a corrective to the recent boom on the Stock Exchange, particularly in shipping shares, and partly to check the present building boom, but it was also intended as a corrective against currency hoarding. Between January 1 and November 30, 1936, bank deposits fell from Kr. 2,854 to Kr. 2,669 millions, while the note circulation rose from Kr. 334 to Kr. 406 millions. This is indicative of hoarding as well as of more active trade, and it was felt that a stiffening of money rates was required in order to attract funds back to the banks. One cause of hoarding has been the new tax on bank deposits imposed by the Labour Government, which even on small deposits was at the minimum rate of 0.4 per cent. of the size of each deposit at the end of the year. The tax is deducted at source, and for some small depositors has been greater than the amount received by them in interest during the year. It is understood that this tax has now been modified so as to apply only to interest on the bank deposits, but in the meantime it is easy to see why deposits have been shrinking. Generally speaking, trade is sound, but some bankers feel that a small country like Norway, with a limited supply of capital, requires a higher bank rate than is necessary, say, in London.

The Foreign Exchanges.—Apart from the movement of the franc it has been a relatively quiet week in the foreign exchange market. The dollar has been fairly active from time to time, but rates have shown little variation. The extremely prosperous conditions in Sweden, due largely to the rising prices for timber, were reflected by the unusual strength of the Swedish exchange rate, which though remaining at its official level of Krs. 19.37-19.42, was consistently bid. There was also a strong selling movement in Swiss francs and Argentine pesos. This is attributed to German demand, and more particularly to the fact that the latest date for returning foreign holdings to Germany under the new penal law, is February 1st. As the German Government is in need of sterling and dollars, it was arranged that the holders should transfer their funds into these currencies in their own names, so that the Reichsbank does not appear in any of the transactions. It is understood that it is only in Zürich and Buenos Aires that German funds are still held in quantity, holdings in other centres having been transferred after the passing of previous and less drastic laws.

The Money Market.—Conditions in the money market have been extraordinarily quiet during the past week. The reason is not hard to find. The amount of Treasury bills secured by the market last Friday was no more than 24 per cent. of the tender, of which the best that can be said is that it was substantially more than the previous week when the allotment was only 5 per cent. Consequently the market has been starved of bills and unwilling to sell the few it had to the banks. Rates accordingly remain at their minimum.

	Jan. 7, 1937	Jan. 14, 1937	Jan. 21, 1937	Jan. 28, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	1	1	1	1
Short loan rate:—				
Clearing banks	1-1*	1-1*	1-1*	1-1*
Others	1	1	1	1
Discount rates:—				
Treasury bills	1/2	1/2	1/2	1/2
Three months' bank bills	1/2	1/2	1/2	1/2

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

As next week's tender is being raised from £30 millions to £35 millions, some improvement in the situation is expected. Outside competition is always impossible to estimate, however, and in view of the large balances that must be accumulating in London from such prosperous countries as Canada, South Africa and the Argentine, it will probably continue to be heavy.

The Bank Return.—The increase of £1.8 millions in the note circulation is a normal development for the end of the month. It accounts for the corresponding fall in the Reserve.

Bank of England					
	Jan. 29, 1936	Jan. 6, 1937	Jan. 13, 1937	Jan. 20, 1937	Jan. 27, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	200.5	313.7	313.7	313.7	313.7
Note circulation	397.1	462.7	455.0	450.5	452.3
Banking Department:—					
Reserve	64.0	51.4	59.0	63.6	61.8
Public deposits	15.9	13.5	12.4	13.6	12.1
Bankers' deposits	106.0	110.2	106.7	100.3	98.4
Other deposits	36.7	38.4	38.3	37.6	38.4
Government securities	80.0	93.3	83.2	74.9	78.6
Discounts and advances	18.8	14.4	12.5	8.9	8.0
Other securities	14.0	21.1	20.8	22.1	18.7
Proportion	40.3%	31.7%	37.4%	42.0%	41.4%

The slight falls in both public and bankers' deposits are such that may occur in the normal course of events. The only other movement is a change-over of about £3½ millions between Government and other securities.

THE STOCK EXCHANGE

"Gearing" and the Investor

WHEN industrial recovery swells to boom, and increased dividends and bonuses are like British victories in the Seven Years' War ("We are forced to ask every morning what victory there is, for fear of missing one")—in such an epoch Income seems a small thing beside Capital Appreciation, and every man is his own tipster. But the instability of company profits is universal and eternal; and to forecast changes in earnings and dividends is an indispensable part of the technique of every serious investor, whether the times be good or ill.

For the last four years, British industrial profits have been rising, almost without interruption. A blind man, with a pin and *The Stock Exchange Official List*, can hardly have gone wrong. But the obvious has now been largely discounted, and a period may be approaching when *selectivity* will command a higher premium. The modern investor has at his command an intelligence service far more detailed and scientific than that of pre-war days. Government returns, index numbers of prices and production, the pronouncements of statesmen, bankers, company chairmen and economists—all reveal the strength and direction of prevailing winds, both in industry as a whole and in individual industries. But before the investor in ordinary shares can translate this invaluable information into orders to buy or sell, he must consider one factor which is all too often overlooked—namely, the incidence of a given movement in total profits on the percentage earnings and dividends of an equity share.

Most British companies have debenture and/or preference capital, as well as ordinary capital; and a rise or fall of x per cent. in aggregate profits, consequently, will *never* raise or lower the residual equity earnings in exactly the same proportion. If two companies each increase their net profits from £100,000 to £150,000 (i.e. by 50 per cent.), but one has fixed charges of £10,000 and the other has fixed charges of £80,000, then the available *ordinary* earnings of the one will rise from £90,000 to £140,000 (i.e. by 56 per cent.), while those of the other will advance from £20,000 to £70,000 (i.e. by 250 per cent.). If the fruits of recovery are passed on to the companies' proprietors, the holder of 100 ordinary shares in the second company will obtain a larger increment of income, and a more than proportionate rise in capital value; for market prices will tend to discount, not merely the increased immediate rate

of dividend, but the prospect of more rapid increase in the future. To the relationship between rigid and flexible capital requirements the term "gearing" is commonly applied in Britain; in America it is usually known as "leverage." Both terms are apt and self-explanatory. The ancient philosophers agreed that, given a fulcrum and a lever of requisite length, a child could move the earth. It is even more certain that, by varying the leverage between fixed and equity capital, a modern company board can so alter the dynamics of its ordinary shares that changes in equity earnings are quite disproportionate to changes in total earnings.

The investor has only to glance down *The Stock Exchange Official List* to realise that there is no sort of uniformity in the matter of "gearing," in British company practice. Austin Motors, Imperial Chemical Industries, and Staveley Coal and Iron, for example, are all well-managed, prosperous and progressive concerns, which stand in the front rank of their respective industries. But debentures and/or preference shares account for 83 per cent. of Austin's total issued capital (at nominal value), for only 32 per cent. of Imperial Chemical's, and for none whatever of Staveley's. Austin's capitalisation is "high-g geared," Imperial Chemical's is "low-g geared," and Staveley's is "non-g geared." A given percentage increase in *total* profits means more to an ordinary shareholder in Austin than in I.C.I., and very much more than in Staveley.

In practice, as all investors know, industrial profits are seldom stable for two years together. Earnings are affected by the trade cycle, by the differing experience of separate industries within a single cycle, and by the vicissitudes of individual company fortunes within a single industry. Successful investors—and their advisors—endeavour to take account of all three factors in framing their policy. Should they not include "gearing," also, as a fourth factor? In the table at the foot of this page we have set out the relevant data for eight representative British companies, whose activities cover a wide range of industries, and whose capitalisation illustrates every stage between "high-gearing" and "no-gearing." We invite our readers to relate the respective percentage increases in total earnings and equity earnings, in the latest as compared with the most depressed recent year, to the gear ratio of each company.

The conclusions are most striking. Whether the total

INVESTMENT OF TRUST FUNDS

The investment of trust funds in Government securities and other permitted trustee investments at present prices involves a risk of capital depreciation which cannot be considered negligible.

An investment in bank shares or the shares of insurance companies through one of the unit trusts specialising in bank and insurance shares, which relieve the investor of all personal liability in respect of uncalled capital, offers an alternative satisfactory both as regards safety of capital and security of income.

For the convenience of trustees a Draft Deed of Indemnity and a Draft of an Indemnity under Hand have been prepared by leading Counsel for use in cases where the trustees are requested by the beneficiaries to make investments outside the authorised list of trustee securities.

The various drafts and forms together with full particulars of the Unit Trusts of Bank and Insurance Shares can be obtained through any Stockbroker or Bank or direct from the Managers.

movement in profits has been large or small, the discrepancy between aggregate earnings and equity earnings has been greatest in the highest "geared" companies. Between 1932 and 1936 the ordinary earnings of Austin and Staveley increased by almost the same percentage (79 against 74), but this result was secured by an increase of only 19 per cent. in Austin's profits against one of 74 per cent. in Staveley's. A recovery of 11 per cent. in J. and P. Coats's total earnings increased the ordinary stockholders' earnings by 13 per cent., while a recovery of 17 per cent. in Lever Brothers' aggregate profits raised the earnings of the fortunate ordinary shareholders by no less than 159 per cent. Both Lever Brothers and Austin have reduced their fixed interest burden in recent years by debenture conversions, and this has tended to heighten the contrast from the ordinary shareholders' viewpoint; while recent increases in the fixed capital of Allied Newspapers have had the opposite effect. The most spectacular showing of all has been made by Vickers, which has combined a particularly high proportion of prior charges to total profits, in its worst recent year, with a relatively rapid rate of subsequent recovery in aggregate earnings. Several of the companies in our list have yet to disclose their results for 1936; and as profits have presumably continued to rise, the effects of "gearing," in their case, will appear still more striking in a few months' time.

The figures suggest an obvious moral for the investor. Other things being equal, it is good policy to buy "high-g geared" shares when profits are rising and to sell them speedily when profits begin to fall. At the moment, the prospects of the American market are of special interest to British investors. Are typical American equities more, or less, "highly geared," than British equities? And how can "gearing" best be measured? These questions will form the subject matter of subsequent articles in *The Economist*.

Investment Notes

Easier Markets.—It is an eternal puzzle to the layman why Stock Exchange terminology should associate market uneasiness with easier markets. The paradox has been much in evidence this week, when the industrial share markets and some of the more speculative sections have shown the same recessionary symptoms as have been observable in the gilt-edged market ever since the turn of the year. The reaction has gone far enough to be clearly recorded by Stock Exchange altimeters. The Actuaries' Index of 178 ordinary shares, for example (December 31, 1928 = 100) has fallen from 91.6 on November 17, 1936, to 90.5 last Tuesday; and *The Financial News* index of thirty market leaders (July 1, 1935 = 100), which reached a peak of 124.9 on November 18th, is now 122.5. There has been something more than a change of mood in a market which at present sees little right where recently it saw nothing wrong. For the first time the generality of operators, as distinct from the forward-looking few, are deeply wondering whether the twin pillars of recovery—low interest rates and advancing industrial profits—are eternal. No one believes that there is the slightest probability of any deliberate official attempt to raise interest rates; and no one denies that, if there were the same economic environment to-day as three or four years ago, the authorities could proceed to take the necessary steps to preserve cheap money by a new broadening of the basis of credit. But even the bankers who have been at pains, this week, to deny the present existence of a state of boom in industry have given the impression that they fear its imminence.

Under such conditions, the market frankly does not like the prospect of a re-armament loan. And if the view gains ground that the Government can and will finance its requirements by a series of funding issues, of moderate size, rather than by direct action, the partial recovery in gilt-edged prices which now seems overdue may come about. It still remains to be seen, however, whether

The Economist's forecast—made many months ago—that the autumn of 1936 might see the peak point of industrial share values, will not come very near the mark. A further increase in disclosed company earnings is, of course, inevitable during the next few months, but share market prices have already discounted it. The market, indeed, is quick to react when published results do not come up to its more optimistic expectations, as is shown by its reception of the Thomas Tilling dividend this week. The course of market values will, in fact, be governed during the next few weeks and months mainly by expectations of the figures which will be disclosed a year hence. And the speculative operator is inclined to attach increasing importance to the probable effect of rising prices, labour pressure, and the competition of rearmament demand for available industrial resources.

* * *

Foreign Bond Chronicle.—The statement that some £20 millions has been received by bondholders during 1936, through the activity of the Council of Foreign Bondholders may be open to various interpretations. No investor, however, will challenge the qualitative assertion that the Council's work has become increasingly fruitful and essential as the capacity of the debtor countries to pay has improved. It has achieved a more equitable settlement with Bulgaria and Greece, who for long had made the merest token payments. It would be false to assume that debtor countries as a whole are yet treading the path of rectitude. Numerous South American States and Provinces—including Colombia, Costa Rica, Ecuador, Mexico, Paraguay and Peru—have made no overtures to resume debt payments, although their economic position generally is improving. These States are doubtless more attracted to Wall Street than to London, as a source of new capital. For this reason, bondholders will welcome the evidence of greater co-operation between the bondholders' organisations in the two centres. The liaison between the several Euro-

pean creditors' committees has always been close, and has been reinforced during 1936. But co-operation on the two sides of the Atlantic might well be strengthened. Important discussions on the Brazilian debt service are to be held before next September, and there are several features in the 1934 Debt Plan which call for reform. That consideration applies with even greater force to the basis of Chile's payments. It is widely believed that New York is wholly opposed to the application of as much as 50 per cent. of the specific revenues to repurchase of debts, and this case, put in co-operation, must impress the debtor. Bereft of legal sanctions for the prosecution of their claims, bondholders can protect their rights only through a solid investment opinion represented by all the creditors' organisations working in concert.

* * *

Japanese Credit.—No mere Western investor can hope to unravel the paradoxes in Japan's political situation. But their repercussions—the assassination of the Prime Minister last February and the resignation of the Cabinet less than a year later—prove one thing at least to the investor—that the Army is an increasingly turbulent factor in Japanese politics. It has burdened the Japanese "extraordinary" Budget with ever-increasing armaments demands; industry has felt the consequences in higher taxation; and savings on the internal debt which were obtained through conversion operations last year are but partial compensation for the rapidly increasing debt charges since 1932. How is the external bondholder affected? It is customary to assume, since Japan's external debt represents a relatively small proportion of the whole, that Japan has neither desire nor incentive to default, and this reasoning is still broadly true. But the tax now levied on Japanese holders of external debt—though it does not, of course, apply to other nationals—leaves only an external breach open for any future saving. In any event, the risk of budgetary and political developments is bound to produce rather wide price fluctuations in Japanese issues. The present Cabinet crisis may be "solved" sooner or later, but the realities of the Far Eastern situation cannot inspire full confidence in investors seeking remunerative openings for foreign investment.

* * *

Sheep and Goats.—The full report of the Securities and Exchange Commission on the feasibility and advisability of the complete segregation of the functions of dealers and brokers contains a considerable amount of useful material on conditions in American stock markets. The general conclusions of the reports were known some time ago; the Commission found that the combination of the two functions led to a conflict of interest which might involve abuse, and that floor trading by members exerted an undue influence on prices, incited public speculation, produced disorderly markets and interfered with the effective fulfilment of the brokerage function. Statistical evidence is produced in the report to show that floor trading was principally centred in active stocks and tended to accentuate rather than smooth out fluctuations in prices. The specialist is particularly favoured with chances to exploit his position, but the report found that since the enactment of the Securities Exchange Act of 1934, at any rate, there had been practically no manipulation of the market by specialists. During the period reviewed, specialists were found to trade against the trend more often than with it and in moderately active and inactive stocks in relatively greater degree than in active stocks. The evidence suggested, therefore, that the specialist, acting as broker for others and as dealer on his own account, had not taken advantage of his opportunities for abuse, but, in contrast to the floor dealer, had definitely contributed to the making of a continuous and orderly market. The conclusion drawn by the Commission is that control of markets must be developed gradually and not by immediate legislation. The report is valuable, not only for its examination of this particular issue, but also for the picture it gives of the conduct of stock markets in America.

New Company Registrations in 1936.—The annual total of company registrations compiled by Messrs Jordan and Sons, Ltd., invariably gives a valuable clue to the level of new enterprise and the penetration of limited liability into private businesses. The total of 13,742 companies registered in 1936 is the highest recorded, and though the "original" capital of £158,221,238 has been exceeded, it is some £21,500,000 above the preceding year. Original capital, it may be noticed, is not synonymous with issued capital, particularly for a public company which begins its official life as a £100 private company. For the second time, however, public company registrations, of which there were 418, with a capital of £49,359,643, are lower both in number and in capitalisation. Private companies continue to rise steadily, with 13,324 companies, or 97 per cent. of the total. Comparisons from 1933 onwards are given in the following table:—

Years	Public Companies		Private Companies		Totals	
	Number Registered	Capital	Number Registered	Capital	Number Registered	Capital
1936	418*	49,359,643	13,324	108,861,595	13,742	158,221,238
1933	339	39,857,395	11,054	64,888,361	11,393	94,545,556
1934	446	69,761,622	12,029	73,778,784	12,475	143,540,406
1935	430	64,870,733	12,673	81,763,377	13,103	136,634,110

* This includes 107 "Companies Limited by Guarantee" and "Associations Not for Profit" without Share Capital.

There are twenty companies with original capitals of £1,000,000 or more, against fourteen companies, the largest single registration being the £6,500,000 of Union Cinemas. Among the individual groups, land and building provides both the largest number and the largest capital. The investment, finance and banks group is a close second. The importance of building activity is apparent in the year's totals. If builders and brick and cement makers are added to the land and building group 2,587 companies result, with original capital of £35,113,348, or 22 per cent. of the total. It is consoling, perhaps, to mark the appearance of British Air-Raid Shelters, Ltd., in a year which has also witnessed the formation of 115 aircraft companies.

* * *

Insurance Share Index.—Each quarter of 1936 saw our insurance share index at new high levels. The index closed the year at 5,111, compared with 5,060 at the end of September and 4,952 at the end of March. The 1936 yearly index is calculated at 5,031, compared with 4,497 for 1935 and 3,406 for 1929. The movements of the 24 component shares are given below:—

	1934	1935	1936	Mar. 31, 1936	June 30, 1936	Sept. 30, 1936	Dec. 31, 1936
Alliance	2,208	2,316	2,525	2,478	2,478	2,520	2,562
Atlas	3,452	3,667	3,968	4,063	3,905	3,936	3,968
Caledonian	4,820	5,032	5,464	5,535	5,221	5,535	5,787
Commercial Union	4,449	4,694	4,870	4,789	4,789	4,789	4,690

Last quarter's advance, however, results from a handful of sharp individual advances, like the Sun Life and Legal and General. Pluses and minuses, in fact, were exactly counter-poised, for 10 indices were up, 10 down and four unchanged.

Company Notes

Investment in Glasgow.—It has been said of the Scottish Stock Exchanges that they are in close enough touch with London to miss none of the bargains, but sufficiently remote to distinguish between a cheap share and a rank speculation. But the Glasgow Stock Exchange is much more than a mere winnowing house. It could not have become the largest among the associated Country Stock Exchanges on its dealings with London alone. Its market in local shares, in fact, is of the highest importance. The official list of the Glasgow Stock Exchange provides the clearest commentary upon the city's industrial development (which we discuss in a leading article on page 223); its rivalry with Bristol as a colonial port after the Union, its establishment of a textile industry, and its subsequent development as the world's greatest builder of ships, coupled with the growth of a local coal and steel industry. But many of the concerns whose shares enjoy a free Glasgow market also interest a far wider circle of investors.

* * *

Some Glasgow Companies.—To represent Glasgow's economic diversity by a dozen companies or so may be cavalier, but the selection at least emphasises the interest of English investors in famous concerns beyond the Border. *John Brown*, indeed, is a world-famous shipbuilding concern, while *Yarrow* is famed for boilers and destroyers. *Fairfield*, also, builds destroyers and marine machinery. Heavy industry may be justly represented by *Covilles*, which became the premier steel producer of Scotland through the acquisition of Steel Company of Scotland, and Lanarkshire Steel. Assuming normal preference dividend only had been provided in 1935, the ordinary earnings would have represented 13.4

METALS AND MINERALS TRUST

Introduced January 4th, is already proved by the extent of applications for its Certificates, to be meeting a strong public demand.

Gold, Diamonds, Base Metals and Minerals.

A well spread investment in these promising groups is offered in the Metals and Minerals Trust by the promoters of the successful British Industries Fixed Trusts and Electrical Industries Trust. Units can be bought through any Stockbroker or Bank.

per cent. on the capital. The way is now cleared for dividends on the £1 ordinary shares, now standing at 31s. 3d. *Clyde Valley Electrical Power* supplies a large Glasgow hinterland exceeding 1,000 square miles. This concern has the impressive record enjoyed by all power companies, but its earnings suggest a closer link with industrial conditions than many companies would claim. *J. and P. Coats*, although actually centred at Paisley, is a Glasgow company in essence. This is a popular share among large and small investors, and greatly favoured by unit trusts. With the improvement in the company's world market—particularly America—investors may hope that last year's fall in earnings will be reversed. Among the Colonial companies, *James Finlay*, with its associated tea-growing companies, is probably best

known. Textiles are represented by *Fleming Reid*, who cater for the knitter, and by *Linen Thread*, whose latest profits of £325,438 show an increase of £63,785, and comfortably cover the 8½ per cent. dividend. Finally, overland transport is represented by *Hurst Nelson* and *North British Locomotive*. The former has made satisfactory progress, but larger railway equipment orders, particularly from abroad, are essential to restore full prosperity. The majority of typical Glasgow shares are apt to feel depression and prosperity in somewhat extreme form. But, as the last three years have abundantly shown, this very fact heightens their immediate appeal during recovery. For its long-period implications we commend investors to a study of our leading article on an earlier page.

Richard Thomas Questions.—The first instalment of the financing of the large-scale development programme of Richard Thomas and Company (which was described in a leading article on page 368 of our issue of November 21, 1936) has been carried out this week. The plans, which were explained by Sir William Firth at the meeting on Monday, comprise the construction of a complete new American-type plant at Ebbw Vale—a steelworks, strip mill, sheet mill and finishing plant—and the modernisation of the Redbourn plant. Their financial aspect is a little staggering. The Ebbw Vale plant will cost £7,500,000, and the Redbourn modernisation £1,000,000. Further, the company proposes to convert its existing debentures (or redeem them in cash) and to pay off the £1,600,000 bank overdraft. This involves a total outlay of £11 millions. Towards this sum the company has therefore issued this week £7 millions of 4 per cent. debenture stock at 99½, and has offered ordinary shareholders new shares, at 13s. 4d. each, in the ratio of two for five. The fixed interest debt will thus be increased from £1½ millions to £7 millions, and the share capital from £6½ millions to £7½ millions. Even this spectacular operation, however, is insufficient to cover the whole cost of the scheme, and a balance of £1,940,000 will remain to be found, either by a new

issue at a later date or from allocations out of profits. A debenture issue of this size, with the gilt-edged market in its present temper, could hardly have been easily absorbed. The issue price offered no encouragement whatever to the stags, and about 73 per cent. of the issue was left with the underwriters. Nor did the provision for optional conversion of the debenture stock into ordinary shares at a 200 per cent. premium carry any immediate attraction for the market at a time when the shares commanded a premium of only 125 per cent. The first step in the financing has thus achieved an indifferent success.

The prospects of this bold programme, in fact, are difficult to assess. Sir William Firth showed unexpected assurance in presenting a blue-print of the profit prospects for the next three years. In 1939-40 the group is expected to earn £2,500,000 (equivalent to nearly 26 per cent. for the ordinary shares), compared with a close estimate of £1,450,000, for the year ending March 31st next, which is itself nearly double the profit of 1933-34. The attainment of this striking estimate depends upon a number of factors, and not all of them are under Sir William's control. The technical claims of cost reductions from the American continuous strip mill process are doubtless valid. But to justify these claims the mill must work to capacity, and this exceeds half of the group's present sheet and tinplate capacity and is equal to the group's whole production in 1935-36. It represents one-fifth of the national capacity, and could meet the demand for sheets from the motor trade (for which it is peculiarly suited) twice over. The erection of a plant of this size in an industry which is still working far below capacity will require an industrial adjustment, and might involve difficulty. Will the Richard Thomas "old type" mills close down? Will the group's share of the total market be increased by one-half under agreement? Or will a period of unregulated competition arise?

Only under the second of these alternatives would the profit estimates be realised. If demand were steadily to grow, such agreement might well be reached. But if demand is affected, sooner or later, by cyclical influences, it would be more difficult to envisage the maintenance of such an agreement. If price-cutting were to result, Richard Thomas would enjoy an important technical advantage, but profit margins might be reduced for a considerable period. The same argument applies somewhat more strongly to the group's 50 per cent. expansion of its ingot capacity. Here, the medium-term prospect is surely a little uncertain. The future does depend upon the board's successful handling of this rapid expansion programme. Meanwhile, the ordinary shares, at 13s. 7½d., yield 6 per cent. on last year's dividend, and over 7½ per cent. on the expected 15 per cent. dividend for the current year. They will be subject to an upper peg of 20s., for at that price debenture holders will exercise their options. But the present price suggests a somewhat cautious market view of the prospects for the next three years.

Woolworth and Rising Prices.—Mr. W. L. Stephenson's remarks to F. W. Woolworth shareholders at the end of last week could not have been more frank and revealing. The company, which earned £5,854,335 in 1936, is faced with a special problem of rising costs in its context of a low maximum selling price. Last year's increased profits were achieved through a considerably expanded turnover, for both rising costs of stocks and operating involved a moderate reduction in profit-margins. Since trading profits increased by 10½ per cent., therefore, the volume of sales made considerably greater progress than the profit figures would suggest. The chairman recognised the two factors as complementary consequences of recovery. But the margin for "play" between costs and selling prices is obviously less for a 6d. chain store than for others with higher maximum prices. Although the board does not anticipate a rise in the prices of manufactured goods which would seriously affect the company's range of

stocks, it was made plain that it would (and, incidentally, could) raise the selling price limit if necessary. The directors would evidently be reluctant to contemplate such a break with tradition, but there is no reason to suppose that it would affect profits—unless it were for the better. It has worked advantageously, for example, in the United States and the Irish Free State. For 1937, the company is sheltered from part of a further rise in costs by substantially increased year-end stocks, but turnover in this business is so rapid that forestalling can have only a minor influence on profits. The market has professed its concern this week at the spread of anti-chain store publicity, but it seems likely that the expectations of further capital bonuses, to which the chairman referred, will prove the more potent factor. At 84s. 4½d., the 5s. shares yield £3 11s. per cent. They seem proof against a moderate rise in prices of manufactured goods.

U.S. Steel Corporation.—The increasing number of British investors who are now holders of United States Steel common stock will be fully satisfied by the Corporation's preliminary statement of net earnings for 1936. The total—\$50,525,684—is equivalent to \$2.90 per common share. There could be few more spectacular illustrations of the high-gear nature of recovery in the steel industry, for net earnings in 1935 were still no higher than \$1,146,708, equivalent to a mere 32 cents per \$100 7 per cent. preferred share. A comparatively short time should elapse, however, before the preferred shares receive their full dividend arrears, for the latest payment of \$1.75 leaves \$9.25 per share outstanding. A clue to 1937 earnings is provided by the level of operations. For 1935 these averaged 38.8 per cent. of capacity. Activity increased last year to 59.4 per cent., and the current level, which is still expanding, represents 75 per cent. of capacity. It would appear, however, that no effective increase in prices was made in 1936. The common stock has advanced from 46½ last year to its present "high" of 93½, and the news, within the last fortnight, that the Corporation will spend \$60 millions in the next few months on new equipment and modernisation, has acted as a further fillip. The current quotation appears to discount future earnings confidently but not, perhaps, excessively.

Investment Trust Progress.—Is the grey uniformity of modest improvement in investment trust results at last being broken? Certainly, brighter recovery reports are no longer such rarities. The time-lag between industrial earnings and trust dividends is being reduced, and directors have enjoyed both opportunity and incentive for switching from stable into "recovery" stocks. From the large number of recent reports, the six companies included in the following table give a representative impression:—

Company	Appreciation (+) or Depreciation (-) of Portfolio		Ordinary Stock				Price	Yield (%)
			Earned		Dividend			
	Pre- vious Year	Latest Year	Pre- vious Year	Latest Year	Pre- vious Year	Latest Year		
Metropolitan	−3	+8	12.5	13.8	11	12	300	4.00
Great Northern	+15	+28	5.3	7.5	3	5	166½	3.00
Traction and General Sec. Scottish United..	−7	+7	12.2	13.6	11	12	277½	4.32

London Stockholders*	−0.5	+7	7.5	8.9	5	6	140½	4.40
	−15	+?	0.2	2.5	Nil	Nil	17/6*	Nil

* £1 shares.

† After charging one year's preference dividend.

Four companies have raised their dividend, maintaining the same margin of earnings. Although *Second Scottish United* has not yet resumed ordinary payments, all preference arrears are now extinguished. The improvement recorded by *London Stockholders* is, relatively, one

of the best of recent weeks, though ordinary stockholders must still exert patience. The entire earnings have been conserved. Comparison of total revenues reveals that, while *Metropolitan* and *Traction and General* show an advance of 2 per cent. only, the remaining companies can claim increases of 11 per cent. or more. In every case market portfolio values exceed book totals, whereas only one trust in the previous year showed an appreciation. Five of the companies give an analysis of their holdings, which reveal an increase, consistent if not large, in the proportion of ordinary shares now held. In part, this is due less to actual changes in the portfolio, than to the rise in equity shares generally. A return of moderate activity in trust stocks is illustrated by a considerable number of small debenture issues, and by the formation of a new company. Current yields, however, show no general disposition to discount substantial dividend increases.

Cable and Wireless Estimates.—The estimates for Cable and Wireless put forward in *The Economist* of last week (page 185) must be slightly revised in an upward direction. By an arithmetical error, the average monthly index of "traffic" last year was taken as 72.7, instead of 74.4. On the latter basis, it may be estimated that the value of net traffics increased by approximately £50,000. Maintaining all our other estimates unchanged, therefore, we reach the conclusion that the net revenue of the holding company may be increased by £250,000 to £275,000, which would bring the available total to, say, £1,260,000. This sum would cover rather more than sixteen months' dividend on the reduced preference capital, or about 1.6 per cent. on the "A" ordinary stock, assuming normal preference dividends. Our conclusions on the respective merits of the two securities are unaffected by this small adjustment of earnings estimates.

Gas and Electricity Dividends.—The results of important gas companies which are now appearing may be somewhat inconclusive as to the trend of the industry, but they provide no background for optimism. The full implications of the maintenance (as for seven years past) of the *Gas Light and Coke* ordinary dividend at 5½ per cent. must be judged when the full accounts are available. *South Metropolitan Gas*, on the other hand, have again reduced their distribution by ¼ per cent. to 5½ per cent. This decline is not large in itself, but similar reductions have occurred at intervals since the payment of 6½ per cent. in 1930. This lower dividend itself requires a transfer of £30,000 from the Special Purposes Fund to revenue. The quantity of gas sold rose by ½ per cent., but the proceeds were some £30,000 lower at £2,736,322, and the rise of £43,000 in total revenue, at £3,941,042, was due to increased rentals and by-products revenue. Manufacturing expenses at £1,885,631 are 3 per cent. higher, illustrating the vulnerability of the industry to rising coal costs. The outlook for this particular undertaking is further clouded by the price dispute which arose last autumn. The problem of granting lower rates for large consumers, to meet the competition of

electricity, must be reconciled, by all gas companies, with the maintenance of the domestic consumer's goodwill. Among the first electricity dividends, *Yorkshire Electric Power* maintains its ordinary distribution at 8 per cent.

* * *

Rand Ore Reserves.—The Rand mines show few striking changes in their ore reserves at the end of 1936. But to this general statement several important and interesting exceptions can be traced in the comparative table on page 278. East Rand Proprietary shows an increase of over 750,000 tons and a slight raising of values. Including the additional tonnage locked up in shaft and safety pillars, the increase amounts to no less than 1,500,000 tons. Durban Deep also records an increase in quantity, although values show some decline. Gains of important extent have also been registered by Brakpan and Daggafontein. On the reverse of the medal, Randfontein recorded a drop of 838,000 tons in quantity and 0.4 dwts. in value, and a sharp fall in the shares resulted. But this fall—like the rise in East Rand—can be considered excessive. South African Lands appears in our table for the first occasion. The company had developed 1,542,210 tons of ore averaging 6.18 dwts. over 49.78 inches at the end of 1936. Vogelstruisbult, which started preliminary crushing at the end of November, reports ore reserves fully developed "based on a pay limit calculated to conform approximately to existing conditions in respect of gold price and working costs" at 927,000 tons, averaging 5.6 dwts. over a stopping width of 37.4 inches.

* * *

Ashanti and Bibiani.—The Ashanti Goldfields report, writes our Mining Correspondent, suggests the approach of stabilisation rather than rapid progress. During the year to September last, an increased tonnage of ore produced a lower average yield at a slightly reduced cost. The fall in the extraction to 91.21 per cent. from 92.7 per cent. in 1934-35, and 92.7 per cent. in 1933-34 is, however, slightly surprising. Net profits amounted to £964,120, only £9,580 higher than the previous year. But since £30,720 previously reserved for depreciation on gilt-edged was written back, the amount available is increased to £1,084,400 against £1,006,720. A total dividend of 95 per cent. has thus been paid against 85 per cent. Ore reserves now stand at 1,458,030 tons, averaging 20 dwts. This shows an increase of 308,800 tons and a trifling improvement in value. Results in the outlying properties have not fully confirmed encouraging indications, but the ore position will allow an increased tonnage of better grade to be treated this year. The round 100 per cent. which some shareholders looked for last year, might thus be achieved, but if it were the shares would yield no more than 5 per cent. The associated Bibiani undertaking has made less than the expected progress. The revised estimate of ore reserves is 2,049,300 tons value 30.8 dwts., an increase of 343,100 tons in quantity and a decrease of ½ dwt. in value. Owing to delay in obtaining machinery, it is unlikely that the 30,000 tons treatment plant can be ready in less than eighteen months.

* * *

West Rand Investment Trust.—This Trust, whose formation was recently announced amid active share dealings in developing gold mines, is likely to see the official light of the London Stock Exchange early next week. The Trust will have an issued capital of £3,000,000 in 10s. shares, with £1,000,000 capital in reserve. These 6 million shares will be subscribed by

finance companies in the Anglo-American Corporation group at 15s. per share. The latter include the parent company, Rand Selection, Consolidated Mines Selection and New Era Consolidated. The Trust will acquire the following principal holdings:—

	Present Value	Approximate Total Value
550,000 Western Reefs.....	4 5/8	2,285,000
210,000 West Witwatersrand..	18 1/2	3,820,000
200,000 Libanon.....	36/6	365,000
200,000 Venterspost.....	50/9	508,000

These holdings, with a current value of nearly £7 millions, will be transferred below their current market prices and the preferential rights of the vendors to subscribe for additional shares in West Witwatersrand go with them. Finally the new company will retain £850,000 as working capital, to subscribe for new issues and enter into new business. The market anticipates dealings to open on the basis of 22s. 6d.-25s. Holding companies are so much the natural order of mining finance that investors will probably accept that newcomer as gladly as all its forerunners. It has the advantage, at any rate, of centralising the Anglo-American group's interest in the new field, and its spread should interest the mining speculator.

* * *

Company Results of the Week.—The results of 36 other companies, including *Westinghouse Brake* and *Tilling and British Automobile Traction*, are analysed on page 280, and are discussed on page 279 under the heading, "Shorter Company Comments."

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Midland Bank, Westminster Bank, National Provincial Bank, District Bank, The National Bank, Union Bank of Australia, Hungarian Commercial Bank of Pest, National Discount Company, Union Discount Company of London, Joseph Nathan, Richard Thomas, F. W. Woolworth, and Nigel Van Ryn Reefs. A leading article on page 221 discusses the bank chairmen's addresses to their stockholders. The Right Hon. R. McKenna pointed out to Midland Bank proprietors that the rise in advances was not entirely due to more active industry, as local authorities and private individuals each took about one-third. At the Westminster Bank meeting, the Hon. Rupert Beckett discussed various methods of meeting the bill for armaments, and came down on the side of increased taxation. In referring to the danger of gilt-edged investment depreciation, Sir Sidney Peel assured his hearers at the National Discount meeting that the great majority of their securities were short-dated. At the National Provincial Bank meeting, Mr Colin Campbell discussed assistance for the Special Areas in relation to the necessity for developing overseas connections. Sir R. Noton Barclay, addressing District Bank shareholders, alluded to Lancashire's continuous adjustment in counteracting the loss of much of her cotton export trade. At the National Bank meeting Mr Michael J. Cooke referred to the possibility of peak activity being reached in certain industries. Sir William Goschen, addressing Union Discount shareholders, declared that a *de jure* fixation of currencies was vital for a permanent restoration of world trade. Shareholders of Joseph Nathan and Company learned that the Glaxo Laboratories had again shown satisfactory advance both in trading and profits. Sir William Firth's outline of the Richard Thomas development programme is discussed on page 248. Mr. W. L. Stephenson's frank remarks at the F. W. Woolworth meeting are discussed on the same page. At the Union Bank of Australia meeting, Mr Hugh D. Flower alluded to the increased demand for banking accommodation resulting from better trade and rising values of primary products. Mr Philip Weiss disclosed that the valuation of securities by the Hungarian Commercial Bank of Pest took no account of last year's advances in Stock Exchange quotations. At the Nigel Van Ryn Deep extraordinary meeting, Mr Richard Humble explained the purposes of the increase in the authorised capital.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: FEBRUARY 2 ACCOUNT: FEBRUARY 4

THE account has ended with even less enthusiasm than it started. The bank chairmen singing their optimistic strains in unison, have not stirred the industrial market. Gilt-edged have made no response to their general belief that the time to damp down the boom is not upon us. Commodities have shown that they can react as well as advance. There is in every part of the "House" a much more chastened spirit than that of a month ago, and the public investor has so greatly reduced his interest in the markets that, after the post-bags have been cleared by 11 o'clock, the floor has presented an appearance of sub-normal activity.

Gilt-edged were at least offered the sop of "No Armament Loan" from a section of the press, but this rumoured official wink produced hardly a nod. With the open alternative—perhaps "supplement"—would be the better word—of increased taxation, the market is no better pleased. The rest of its sagging tendency was attributable to fear that the banks might throw out their large holdings if advances increased further (as one chairman hinted)—thus ignoring the possibility of an expanded credit base—and to the somewhat unlikely hypothesis that the Exchange Account was disposing of gilt-edged acquired from the transfer of £65 millions of gold to the Bank in December. Old Consols led the fall with a drop of 1 point in December, and 2½ per cent. Funding were specially depressed. No section of the Trustee market escaped the consequences of the fall, which was resumed, after a partial rally, on Wednesday and Thursday.

In the foreign bond market, German issues opened higher, and were again supported in mid-week, in expectation of a mollifying statement from Herr Hitler at the week-end. Brazilians improved sharply at first on the Santos Sevens coupon payments, but profit-taking was quick to follow. Japanese bonds (whose outlook in the light of the Army's political strength is discussed on page 246) became steadier, and Chinese loans advanced further.

Although the shadow of a strike was removed over the week

end, home rail stocks did not maintain their opening firmness. Southern deferred were an early feature, and were still bought after the rest had turned tail. The poor traffics, coupled with the enfeebled condition of the gilt-edged market, affected marginal and prior charge stocks alike in mid-week. In the Argentine market, B.A. Great Southern advanced 1½ points on the largest traffic for years, and took the rest of the stocks with it. Cordoba issues recovered sharply after the hasty selling at the end of last week.

Uncertain movements characterised the industrial market. Some of the American shares, particularly U.S. Steel (on the earnings shown on page 249) made headway in mid-week. John Brown were in demand on the eve of the share bonus announcement. Hadfields and Projectile and Engineering found buyers, but falls in Tube Investments and Stewarts and Lloyds, to mention only two examples, coupled with the disappointing Richard Thomas issue, showed that the iron and steel market was in poor form. Electrical equipment and motor shares were generally lower, and the Tilling dividend was found particularly disappointing. Linen Thread improved on the results, and O.K. Bazaars on the dividend, but Harrods reacted and bank shares were a distinctly dull feature.

Textiles relieved the general uncertainty with a fairly active week, but the miscellaneous leaders showed as many small losses—in shares like Metal Box and Turner & Newall—as rises, among which British Oxygen were probably best.

Oil shares opened with renewed attention for Trinidad shares, while V.O.C. advanced sharply on the strike settlement. Business became sub-normal, however, and although there was faithful investment support for the leaders, Trinidad issues fell out of favour.

The decision of the International Committee to increase the rubber quota to 85 per cent. for the third quarter produced a short-lived rise in the commodity and in the shares. This was not maintained on Wednesday and Thursday. Tea shares produced unwonted firmness on the opening days, on the firmness at the auctions, but profit-taking checked the advance.

Kaffirs opened firm, but almost immediately sentiment changed to selling, checked for a time by more settled conditions on Tuesday. West Witwatersrand and Western Reefs again provided a feature at first, but the whole market turned lower from Wednesday onwards. Roan Antelope responded to the quarterly profits figures, but did not maintain their rise, and "Jungle" gold shares also lost ground.

GOLDEN MOMENTS

England v. Wales

He's got to be good to get into his country's team—but what a Golden Moment it must be for him when he scores between the posts to give his side the victory.

But even the International, good as he is, can't smoke a better tobacco than "Cut Golden Bar" at a shilling an ounce. But it must be Wills's.

2 oz. vacuum tin

 Highest 1937: Ordinary Shares 124.8 (Jan. 4); Fixed Interest 136.6 (Jan. 4).
 Lowest 1937: Ordinary Shares 122.5 (Jan. 28); Fixed Interest 134.0 (Jan. 28).

ACTUARIES' INVESTMENT INDEX

Two new indices are now available, and are included below in our usual monthly table of fixed interest securities; one is for 4 per cent. Victory Bonds, and the other for 3½ per cent. Conversion Loan and 4 per cent. Consolidated Loan combined. The price index for 178 industrial ordinary shares stood on Tuesday last at 90.5, against 90.8 a month ago and 84.4 a year ago. The yield is higher than either a month or a year previously, the respective figures being 3.71, 3.68 and 3.50 per cent. A selection of the component indices follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Yield (%)		
	Year Ago (Jan. 27, 1936)	Month Ago (Dec. 29, 1936)	This Week (Jan. 26, 1937)	Year Ago (Jan. 27, 1936)	Month Ago (Dec. 29, 1936)	This Week (Jan. 26, 1937)

NEW YORK STOCK EXCHANGE

PRICES on Wall Street trailed downwards from the middle of last week to the middle of this, with the broken-off motor strike negotiations and the widespread floods as the major disturbing factors. Motor and steel issues were naturally in the most sensitive position, but merchandising and industrials were almost as greatly affected in mid-week. On Wednesday came the signs of a recovery, and steel issues took the lead despite the estimate of *Iron Age* that steel mill activity was down to 75 per cent. of capacity compared with 81 per cent. last week. Encouragement was derived from the improvement in U.S. steel earnings, which exceeded expectations. Utilities suffered a setback from their recent modest improvement, the ending of the T.V.A. conference by the President being taken as evidence of his sympathy for Mr. Lilienthal's whole-hogging devotion to the full development of the original plans for distribution to consumers, and of his rejection of a compromise solution with private suppliers through a common power pool. High-grade bonds have been slightly depressed on the anticipation of impending sales by the banks if reserve requirements are increased further, but in mid-week there was a reversal of this movement.

ADVICE ON AMERICAN STOCKS

Recognizing the demand of both private investors and financial institutions in Europe for first-hand advice regarding American securities and the cyclical trend of the American Stock Market, Major L. L. B. Angas of 301 Park Avenue, New York City, who is now established as Investment Counsel in America, is prepared to accept enquiries regarding this service.

CAPITAL ISSUES

THE week's capital issues are distinguished by the £7 millions debenture issue of *Richard Thomas*. For reasons outlined on page 248, the market could not wholly evade some questions regarding the expansion scheme, and the stock opened, with over 70 per cent. still in underwriters' hands, at between 3 and 4 points discount on Thursday. The remaining issues, mainly by offer for sale, make up an impressive total, however, judged even by recent standards. The offer of *Horlick's* 5s. ordinary shares at 22s. 6d. attracted the considerable interest which all branded products companies enjoy in these times. Not merely the balance sheet structure, but also the issue price, reflects the "goodwill valuation" attaching to such well-known businesses. After three years prosperous trading, the shares are issued at a 8.2 per cent. earnings yield basis on the latest (1935) results, and no more than 5.7 per cent. on average for the period. With the explicit warning in the prospectus that the directors intend to maintain a conservative distribution policy, the scope for advance in the shares appears to depend largely on a further rapid increase in earnings, for they appear fairly well priced in relation to recent profits. *Transport Services* is a commercial road transport and freight broking concern. After three years of remarkable stability of profits, the latest figures show a sharp jump, which enables the 5s. ordinary shares to be put on sale (at 40 per cent. premium) on an 11 per cent. earnings yield basis. The preference share on issue, although small, is reasonably secured in relation to its yield. Two preference issues have been made this week. *Lamson* first, by offer for sale, is of 5 per cent. £1 shares in *Lamson Investments*, whose dividend appears adequately covered. The second is of 6 per cent. £1 shares in *White House (Regent's Park)*, issued at par. This is a large flat property, stated to be let to the extent of 690 out of 758 flats for periods between one and three years. On the basis of full letting and estimates for operating expenses, the dividend is covered "three times," according to the prior deductions method employed in the prospectus. The shares do not offer any special attractions at a time when interest rates appear to be rising, and flat competition to be increasing. *Stevenson, Hardy and Company* sustained a loss in 1935 of £4,495 and a profit for 1936 of £28,734. The fluctuating nature of the profits of this oil distributing concern, indeed, is clearly evident in the prospectus. Among the £72,985 assets taken over, stocks of petrol and oils appear at £46,748, and an investment in an Australian oil distributing company is valued at £24,756, at cost. The 10s. shares offered at 25 per cent. premium belong to a speculative category. *Cochran and Company, Annan*, a boiler making concern, has rapidly restored its pre-depression profits. This prospectus follows the pattern of recent issues in the engineering trades—incorporating a premium of 25 per cent. on the ordinary shares—but the earnings yield basis of 8.2 per cent. is lower than the speculative investor might expect. The last offer for sale in the 25 per cent. premium category is of the 4s. ordinary shares of *Ben Hall and Son*. This is a woollen manufacturing business which earned large profits in its latest complete year. The vendors, however, appear to have been distinctly modest in framing their price for the business. It may be asked, further, whether supplementary calculations of earnings on the basis of a three months' profit figure are really helpful, in view of the possibility that seasonal influences may have some effect upon profits, in addition to normal trade risks. One statement for information only has been published on behalf of *Matthew Wells and Company*.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at the option of the holder the yield is calculated by reference to the latest dividends, accounting being given of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

CURRENCY STABILISATION PROBLEMS

TRADE RECOVERY AND CHEAP MONEY POLICY

BANKS' STRONG LIQUID POSITION AND RESOURCES

THE RT. HON. R. McKENNA'S ADDRESS

The ordinary general meeting of shareholders of the Midland Bank Limited was held, on the 26th instant, at Southern House, Cannon Street, London.

The Chairman, the Right Hon. R. McKenna, said:—Ladies and gentlemen,—The year just closed has been unusually eventful. At home we have passed through a grave and distressing constitutional crisis, ended by the happy accession of King George VI; abroad conflicting political and social theories have been pressed with increasing vehemence, culminating in Spain in ruthless civil war. Moreover, in financial and economic affairs the year has been of exceptional interest.

Internationally, the most striking occurrence was the devaluation of the European gold currencies. By this operation, after years of earnest but unavailing deflationary effort, the remaining gold bloc countries found relief from the overvaluation of their exchanges. They were supported by an international understanding that Great Britain, the United States and France would in future use all available means for keeping the currencies of the three main trading nations stable in terms of each other.

This understanding marks a notable advance in monetary management. For the time being it is admittedly no more than an emergency measure which can be abandoned by any participant at very short notice, may at any time be revised, and embodies general principles rather than specific obligations. Nevertheless it has had the immediate effect of removing some of the uncertainty surrounding rates of exchange, and may pave the way to more permanent arrangements for stabilising currency relations. Already the invitation to participate in it has been accepted by

Already the invitation to participate in it has been accepted by three other countries, and it is not too much to hope that the tentative French and Dutch steps associated with it may lead to some general lowering of tariff barriers. More important in the direct effect on international trade is the rise during the past year in prices of primary commodities. The first result of this movement is an increase in the purchasing power of countries exporting these goods, and the second is a larger return to innumerable investors. The expansion of world trade has already proceeded further than seemed likely a year ago, and promises to go further still if peace is maintained.

GROWTH OF SPECULATION

GROWTH OF SPECULATION

The second danger to which our position is thought to be exposed is excessive speculation. The disastrous experience of the United States some years ago renders us especially open to anxiety on this point. If speculation in an extravagant degree were to develop and were allowed to rise to a height even remotely comparable to that reached formerly in Wall Street, the consequences would justify the alarm of our most pessimistic observers. No one is safe in making any confident prediction, but we may fairly ask what signs of dangerous speculation exist to-day. There has certainly been considerable activity in the capital market in the past year, but it has been mainly for sound investment. The loans made by banks for the purpose of carrying stocks and shares indicate the degree of speculation existing at any time, and, though I cannot give you the figures of other banks, those of our own are on a sufficiently wide basis to provide a fair estimate of the whole.

SUPPOSED IMPENDING DANGERS

Nevertheless, while the progress of international trade is encouraging, it is still true that our recovery has occurred almost entirely in the domestic field—a fact which has given rise to some apprehension for the future. It is generally recognised that the trade improvement is largely due to the policy of cheap and abundant money steadily pursued since 1932, but it is alleged that recovery on this basis cannot be regarded as on a firm foundation. In the first place it is argued that trade expansion must itself lead eventually to dearer money; and secondly that cheap money engenders evils which can be corrected only by making money dearer. The first of these gloomy forecasts can be readily disposed of. In spite of the very large growth of production and employment in this country, credit is still as plentiful, at rates just as low, as at the beginning of the process. The banks have a wide margin of resources available for advances should greater demands be made upon them. The second cause of apprehension is much more serious, and calls for inquiry whether the evils to which cheap money is said to give birth are now present or imminent, and, if so, what means are available to cope with them.

In the period of greatest depression our Stock Exchange loans amounted to barely one per cent. of our deposits. In 1928, when for a time conditions were booming, they had stood at 4 per

for a time conditions were normal. If we take the mean between these extreme limits we get 2½ per cent., the figure which experience suggests as normal. Our Stock Exchange loans are still well below this normal. They have risen, it is true, considerably in the last year, but not more than might reasonably be expected from the great expansion of genuine investment; they do not indicate speculation on an extravagant or dangerous scale. It is certainly the fact that of late years there has been a growing tendency to buy and pay for stocks and shares by means of direct loans from the banks, but the increase in loans of this kind is not enough to cause alarm. Moreover, recent experience tends to confirm the conclusion that there is no dangerous speculation. More than once in the last few months foreign and domestic events have occurred which would have had a disastrous effect on a really speculative market had there been one. I do not say that a speculative mania could not develop in this country; we have had it in the past and we might have it again; but I do say there is no sign that one is developing, nor do I think one to be probable.

LABOUR POSITIONS

The reasons put forward for thinking that the existing conditions have little remaining stability can be summarised under the heads of labour shortage, excessive speculation and a possible adverse balance of international payments. Of these potential evils shortage of labour is undoubtedly the most immediate. Notwithstanding the high total of workpeople still listed as

GLYNN'S LYDENBURG.—Ordinary dividend $7\frac{1}{2}$ per cent. compared with 10 per cent.

UTILITIES AND GENERAL TRUST.—Ordinary dividend 2 per cent. for year against 1 per cent.

GRIFFITHS (WILLIAM) AND COMPANY.—Ordinary dividend 5 per cent.
for year against nil

YORKSHIRE ELECTRIC POWER.—Final dividend 5 per cent., making 8 per cent. for the year as before.

GUARDIAN INVESTMENT TRUST.—Final dividend 4 per cent., against 3½ per cent. making 6½ per cent. for year against 6 per cent.

WANDSWORTH AND DISTRICT GAS.—Final consolidated ordinary dividend 3½ per cent., making 7 per cent. for year as before.

NATIONAL FIXED TRUST.—Seventh distribution on unit B certificates for half-year to January 15, 1937, 3.6142¢ net per share unit.

REDFERN'S RUBBER WORKS.—Final dividend 15 per cent., making 17½ per cent. against 12½ per cent.

DISTURBANCE OF THE BALANCE OF PAYMENTS

Let me turn now to the third alleged reason for thinking that the present conditions are not stable—the fear that the balance of international payments is turning against us. On this head I think we are sometimes inclined to be unduly anxious. The only certain figure on which the balance of international payments is calculated is that for merchandise, and, as this is given monthly and is always heavily against us, we are predisposed to take an alarmist view. The figures which offset this adverse balance—figures for income from overseas investments and earnings from shipping and other services—cannot have the solid weight of exact official monthly returns; they appear only once a year and are matters of estimate, if indeed some of them should not more properly be described as matters of conjecture. The adverse balance on merchandise account for last year was £347 millions. In some earlier years when the balance on all accounts was undeniably much in our favour this particular balance was far more heavily against us. Thus for 1927, a moderately good year, the records of the Board of Trade give the adverse figure on merchandise account as £387 millions and the favourable balance on all accounts as £82 millions.

In the improbable event of the official estimates for 1936 showing a small uncovered import surplus, I do not think we should be alarmed. It has to be remembered that the estimates are deliberately conservative, and that in the early stages of international trade recovery increased imports of raw materials, which are rising in cost, are for the time being unbalanced by greater exports. It is, then, probable that any small shortage of receipts, if there is one, will prove to be no more than temporary.

EXCHANGE VALUE OF THE POUND

In the long run the surest indication of the trend of the balance of international payments is a decided tendency of the exchange value of the pound to move up or down. The course of the true exchange value of sterling is difficult to trace under present conditions, for the situation is obscured by heavy capital movements one way or the other and by official intervention in the market. We do know, however, that the Exchange Equalisation Account has bought large quantities of gold in the past year, and it seems unlikely that these purchases have been made entirely against foreign demands for sterling on capital account. If the balance of payments were running against us the exchange value of the pound would tend to decline, and, in the absence of offsetting capital movements, exchange equilibrium could be maintained only by official purchases of sterling. The fact that the trend of operations over a number of years appears to have been the other way indicates that no lasting weakness has thus far developed in our balance of international payments.

If the conditions in respect of labour, speculation and international payments are as I have endeavoured to outline, it seems unlikely that we have yet reached a stage at which the upward trend of industry and trade will be halted. We must not blink the fact, however, that cheap and abundant money, so beneficial to trade and industry, provides a fertile field for the growth of the adverse influences to which I have referred, and we may yet find ourselves face to face with forces which if left uncontrolled would result in an upward spiral of costs and prices. The comparative ease with which large profits had been made would then be replaced by the difficulty of avoiding heavy losses, and the rush to get out of commitments would be far more precipitate than the former eagerness to enter into them. If, as is probable in such conditions, the reverse movement gathered strength, the effects on trade and industry would be both sudden and violent. It is, then, no more than common prudence to review the position from time to time, and if we see possible dangers ahead to consider the best way to prevent them.

When we were on the gold standard the recognised check to boom conditions, whatever their cause, was a rise in the Bank rate and a contraction of credit. Boom conditions weakened the exchange value of sterling, and the statutory duty to maintain gold parity forced the Bank of England to adopt restrictive measures. The remedy certainly achieved its object, but at the same time it seldom failed to do much more than the occasion required. It fell with like effect on all trade and industry and on all markets, whether speculative or not, and by forcing down prices far more quickly than costs tended to produce a condition of business stagnation. Such procedure was unavoidable when we were living under the obligations of the gold standard, but is it necessarily the right procedure now that we are free from them?

AVAILABLE MEANS OF PROTECTION

In answering this question two general considerations are reassuring. First, there is much wider perception of the dangers

which may arise, and much better understanding of their nature, than have existed hitherto. Harsh experience has driven home its lessons. And secondly, we have now a highly co-ordinated monetary system. The few great commercial banks work in harmony with the central bank, and all, in matters affecting trade and industry as a whole, act under such general directions as the Treasury may find it advisable to give. We are no longer subjected to the blind force of gold movements; we have an instrument of immense power working as occasion requires under a single direction. With these things in our favour it ought not to be beyond the wit of man to find the appropriate safeguard against each danger as it arises, without forcing our industry back once more into stagnation.

Consider first the risk of excessive speculation. I do not wish to be dogmatic on the subject, but it seems to me that the remedy lies with the banks. They have the power, acting together on an agreed basis, to place a curb upon speculation by directly restricting the quantity of credit used for that purpose. Genuine business would not be affected; there would still be cheap money and abundance of credit for legitimate trade, but there would be no easy money for the mere speculator. I repeat, there are no sufficient indications at present of dangerous speculation, but should this appear a powerful remedy could be provided by the concerted and direct action of the banks without recourse to high rates and indiscriminate restriction of credit. The country ought not to be required to submit to general stagnation as a cure for the activity of speculators.

LABOUR SHORTAGE AND INDUSTRIALISTS

I turn next to labour shortage, a problem which is admittedly not easy to solve. There is little scope here for concerted action, except so far as it may be possible to assist the transfer of labour from one trade or locality where there is a surplus to another where there is a scarcity. In the main, reliance has to be placed on the prudence and forethought of the individual industrialist. The essence of the danger lies in over-expansion of capacity for the production of capital goods, but, as this arises from the independent action of many firms scattered over the country, the individual *entrepreneur* does not always recognise it. His action appears to himself to be no more than a capital expenditure promising an early and substantial return.

Great caution is needed in introducing new capital into industry when a shortage of labour becomes widespread. Banks make only temporary advances for the purpose of capital outlay, so that restriction of banking credit would be no safeguard. A partial remedy appears to lie in the close scrutiny to which new issues have for some time been subjected, but no external measures can be fully effective unless industrialists and traders themselves take a long and cautious view, based upon the far wider information available now than ever before.

BALANCE OF PAYMENTS AND CREDIT

When we come to the balance of international payments, on the other hand, restriction of credit appears to be the only available means for correcting an adverse condition. A lasting shortage of receipts from abroad, arising from exports, services and interest, would indicate that our price level was too high in relation to world prices and our current consumption greater than it should be. True, our monetary system provides an automatic remedy, inasmuch as rising prices call for an increase of currency in circulation, which of itself reduces the cash held by the banks. Since the banks will wish to maintain their customary ratio of cash to deposits they will be forced to bring down deposits by a general restriction of credit. This would be the natural course of events unless the Bank of England by its open market operations were to supply additional cash. But with the balance of international payments steadily against us, indicating that our prices had risen too high relatively to world prices, could the Bank of England be expected to prolong this condition by further increasing the quantity of cash? For my part I should not expect it, and in the circumstances of our own economic life I should regard a persistent deficit on the balance of payments as the true warning of boom conditions. Happily, however, that evil does not appear to be at hand.

ELEMENTS OF ELASTICITY

I have now dealt with the principal dangers which seem at all likely, in the near or more distant future, to threaten the continuance of sound business recovery. There remain to be mentioned three important elements of elasticity in our monetary system. First among these I would place the Exchange Equalisation Account, which has maintained reasonably steady exchange rates while leaving us free internally from the chance effects of the operation of a rigid gold standard. By its use our authorities

have been able to offset movements of capital which, had they occurred under gold standard conditions, would have led to grave disturbance of our internal situation. The "floating balances" of international finance have lost their terrors. The operation of the Account imposes a heavy responsibility upon the authorities, whose constant watchfulness is essential in correctly interpreting the movements in the exchange market. I think they are to be congratulated on their handling of this new instrument.

A further element of elasticity is provided by the statutory facilities for varying the fiduciary note issue. We had recently a striking example of the utility of these provisions, when the Issue Department of the Bank of England received £65 millions in gold from the Exchange Equalisation Account and handed over £60 millions of its Government securities in partial payment. By this transaction the fiduciary issue of notes was reduced by £60 millions; but the reduction of the fiduciary issue was not its purpose. To use the current phrase, the authorities were desirous of sterilising an excessive influx of gold. They were faced with the same problem which has recently confronted the monetary authorities in other countries, notably the United States—the problem of preventing an undue increase of credit in consequence of large official purchases of gold. The simplicity and neatness of the transaction illustrate the immense advantage of skilled management under the new flexibility permitted by the law.

LIQUIDITY OF COMMERCIAL BANKS

Elasticity of another but no less valuable kind is to be found in the liquidity of the commercial banks. The ratio of advances to deposits stands to-day below 40 per cent., whereas in earlier years, when the volume of credit was subject to constant restriction, it varied between 50 and 60 per cent. In consequence, if industry should require larger advances the banks have an ample margin of lending power. Moreover, the general quality of the outstanding volume of advances is far higher. All the banks whose figures I have seen earned larger profits last year, and there can be no doubt that a contributory factor has been the decline in bad debts. With a continuance of the same wise handling of our monetary system that we have had in the past five years we need not fear a return of the stringency to which our business life was formerly subjected.

For all these reasons we may, I think, take a confident view of the future. I have given grounds for concluding that the dangers inherent in an advanced stage of recovery induced by cheap money are not immediately at hand. I have, moreover, ventured the opinion that we are in a far stronger position to combat them with appropriate measures if they should become real and immediate. There is need for unremitting watchfulness and prudence on the part of industry itself as well as the banks and financial institutions generally; but with clearer perception of the dangers, fuller understanding of their nature, and better weapons to cope with them, I feel sure they can be overcome without recourse to those rough and ready measures which in curing particular evils inevitably brought about a general trade recession.

POSITION AND PROGRESS OF THE BANK

Before passing on to the position and progress of our bank I want to express the great pleasure we all feel in the complete restoration of Mr Hyde's health and vigour. We welcome him back very cordially, and trust that he will now enjoy many years of undiminished strength. Let me also express to our general managers and their assistants our appreciation of their fine work under Mr Hyde's leadership in keeping the bank strong and liquid and maintaining its high standards of service and efficiency. In this task they have enjoyed the fullest support of managers and staff in head office and at the branches, and to all of these I would convey sincere thanks on behalf of our 72,000 shareholders.

The past year has been unusual for the almost complete absence of changes on our board. The only one I have to record is the appointment of Lord Wigram, who came to us with a great record of public service, and whom we welcomed with special cordiality for his outstanding personal qualities.

The upward trend of profits in the past few years was maintained in 1936, though the figure is still well below those recorded when higher average rates were earned on our assets. The increase of about £115,000 on the year, notwithstanding the absence of any rise in money rates, is attributable partly to the rather greater demand for advances and for short loans, particularly those yielding higher rates of interest. Moreover, the increase in total deposits has been largely on current accounts, while it has been possible with a more abundant supply of bills to reduce the proportion of unproductive cash to a figure close to what had come to be regarded as normal. The expansion in the services rendered to customers in return for higher earnings is

reflected in an addition of roughly 6½ per cent. to the turnover on current accounts.

PROFIT AND ALLOCATIONS

Adding together the profit for the year, approximately £2,468,000, and the balance brought forward from the previous year's account, a total of £2,935,000 is available. The board have utilised the increased profits to strengthen further the position of the bank, and to that end have raised by £50,000 each, as compared with a year ago, the appropriations to reduction of bank premises and to reserve for future contingencies. These absorb £350,000 and £300,000, respectively. An interim dividend at the rate of 16 per cent. per annum, less income tax, was paid in July, and the directors now propose a final dividend at the same rate. By reason of the increase of threepence in the standard rate of income tax, the amount of which is provided before striking our net profit, the sum required for dividends is slightly lower at £1,738,000. These various allocations leave a balance of £547,000 to go forward into the next account as against £467,000 last year. I trust you will approve the policy of utilising increased profits to reinforce the internal finances of the bank, bearing in mind the losses incurred in years of depression.

NEW RECORD OF DEPOSITS

During 1936 deposits again showed greater steadiness in amount, but the trend was even more strongly and consistently upward than in previous years. The rise of £45 millions over the year has established a new balance-sheet record at £487 millions. As I have already said, we have been able to employ these enlarged resources somewhat more fully than in the previous year. Although the cash item on the balance sheet has increased proportionately with the rise in deposits, the average of the cash ratios recorded in our weekly statements throughout the year is somewhat lower, at 10.7 per cent., than in 1935. At the same time, the liquidity of our position has been in no way diminished, for the increase in the total of our bill holdings and short money has more than compensated the decline in cash.

Money at call and short notice shows a rise of £2 millions. As indicated earlier in my address, the increase in accommodation to stockbrokers is being closely and continuously watched to avoid undue expansion. Our bill holdings have risen in total by £5 millions, and here the constituent changes are interesting, for our discounts of trade bills, as opposed to Treasury bills, have actually declined. From this it may be inferred that the general business recovery has induced little or no renewed resort to the trade bill. Moreover, although international commerce is now showing considerable expansion, the widespread clearing and quasi-barter arrangements preclude a corresponding growth of the supply of bills from this source. This fact is emphasised again by the absence of any appreciable increase in our liabilities for customers on acceptances and by the decline in forward exchange transactions. Passing to another item, in view of the limited scope for employment of funds in trade financing, we have again increased our holdings of investments, adding to them on balance about £16½ millions of Government securities.

FURTHER RISE IN ADVANCES

Perhaps the most encouraging movement revealed by the balance sheet is the further rise in advances, which are £12½ millions higher on the year. This is a welcome development, common to all the banks, but we should be on our guard against the frequent assumption that it is entirely due to the increased requirements of more active industry and trade. To judge from our latest regular analysis of the advances on our books, little more than one-third of the rise over the year can be accounted for in this way; rather less than one-third is the result of further special loans to local authorities; and the balance consists of advances for private and professional purposes, largely to facilitate the greater volume of investment in real property. Nevertheless, it seems now that business advances proper have passed the low point, reached in 1935, and are definitely if slightly on the up-grade.

The failure of advances to rise along with the great expansion in the nation's business is still a mystery to many people. The explanation, I think, is simple, and two years ago I mentioned the principal causes contributing to it. In order to arrive at some measure of their relative weight, however, the causes of the reductions between 1931 and 1936 in a number of individual advances have been inquired into more closely. Only a relatively small sample could be examined, but the combined results are worth recording. They showed that the most important factors were new issues of capital resulting in repayment of bank indebtedness, and the association of formerly independent units in such a way that joint internal financing becomes practicable. These two processes alone seem to have accounted for perhaps as much as one-half of the net decline in our trade advances

over the five-year period. Less important, though substantial, factors were improvement in the borrower's business; the substitution of non-banking accommodation for bank advances; and customers' sales of securities for the purpose of repaying advances. The results of this inquiry justify the statement that industry has been enabled, through the monetary policy pursued by our authorities, to finance itself to a larger extent than formerly. Much as we may welcome this change when viewed in the light of long-term economic stability, it means that the earnings of banks on their most profitable assets have not recovered correspondingly with general business revival.

The premises items on the balance sheet, taken together, show a decline over the year, resulting from the further writing down of properties with a view to strengthening the financial position of the bank. Work is now well forward on the completion of the head office building by erection of the two wings in Poultry, and in our branch offices the process of repair and reconstruction, necessary to maintain a proper standard, is regularly continued.

AFFILIATED COMPANIES

Our affiliated banks, the Belfast Banking Company, The Clydesdale Bank and the North of Scotland Bank, have shared in the expansion of banking business associated with trade revival. The North of Scotland Bank recently celebrated its centenary, and enters upon its second hundred years with the congratulations and good wishes of us all. Nearly twenty years have passed since the first of our affiliation arrangements was entered into, with the Belfast Banking Company. At that time associations were established which we have accounted of the highest value, on personal as well as business grounds.

It is, then, with a deep sense of loss that we bid farewell to Mr David McKee on his retirement from the position of senior Director. Mr McKee has been in the active service of his bank for no less than 69 years, a period that must be almost unique, and has watched it grow from a small undertaking with twenty-nine branches and £2½ millions of deposits to an institution with fifty-one branches throughout Northern Ireland and deposits of £14 millions. His own contribution to the progress and strength of his bank is incalculable, for he has been for 46 years a member of the general management. No one knew Northern Ireland better than he, or had a shrewder judgment of conditions and prospects in its business affairs. In his long career he has won the abiding affection of past and present colleagues throughout the British Isles and of numberless friends outside the banking world. He takes with him into retirement our earnest hope that release from the cares of office will enable him to enjoy to the full the leisure he has so richly earned.

EXECUTOR AND TRUSTEE COMPANY

Our Executor and Trustee Company continues to record steady expansion. Two new branches have recently been opened, extending its direct representation to twelve provincial centres. The nature of the company's business is such that the progress achieved is not fully reflected in its balance sheet, but other figures provide striking evidence of growth in all sections of its activity. Comparing the present position with that of eleven years ago, when the company had only one office, the number of appointments accepted has increased sevenfold. The number of wills in process, together with marriage settlements and other trusts in active operation, is nearly five times greater, while the total amount involved has been multiplied by more than three. Altogether, the business of all kinds transacted by the company last year represented a sum of well over £100 millions. This development not only confirms the wisdom of branch expansion; it reveals more widespread recognition among the public of the advantages of appointing a corporate trustee of unquestionable standing and specialised knowledge and experience.

CONFIDENCE IN THE FUTURE

From the facts and figures I have given you I think it may fairly be concluded that the bank and the affiliated companies have all grown in strength and prosperity during the past year. They have shared in the general business recovery, which happily is not yet at an end. It may be that last year's rate of expansion will not be maintained, but we can at least anticipate with confidence that business will be fully as good in 1937 as in 1936. If to these favourable prospects at home could be added the stimulus of general appeasement in international affairs, the possibility of which seems at the moment a little nearer, we could be assured of a still wider extension of prosperity throughout the country.

The report was adopted, other ordinary business was transacted, and the proceedings ended with a vote of thanks to the Chairman.

THE NATIONAL BANK LIMITED

CONTINUED IMPROVEMENT IN ECONOMIC CONDITIONS

MR MICHAEL J. COOKE'S SPEECH

The annual general meeting of the National Bank, Limited, was held, on the 28th instant, at 13 Old Broad Street, London, E.C.

Mr Michael J. Cooke, Chairman of the bank, said:—We propose to pay a dividend at the rate of 12 per cent. per annum, less tax, and we transfer £10,000 to reserve fund and £10,000 in reduction of bank premises account, to which I have already alluded, carrying forward to the new account £48,522. I venture to think, Ladies and Gentlemen, that the figures will commend themselves to you as being quite satisfactory.

The very low money rates to which I have referred on previous occasions continued to operate during the last six months.

An abundance of funds has been at the command of the Short Money Market at ½ per cent. per annum, and the Treasury Bill Allotment rate during that period has averaged only 11s. 3d.

The improvement in economic conditions which began in this country in 1932 continued throughout 1936. Industrial activity generally is running at levels considerably above the pre-depression maximum attained in 1929, and though some areas are still gravely depressed, in some cases the super-imposition of armament demands upon commercial requirements is leading to a volume of output limited only by the capacity of existing plant. In estimating the situation, it would not be wise to overlook the possibility that in certain directions saturation point may be approaching. The rate of building construction in the last few years has been so unprecedentedly large that its indefinite continuance cannot be counted upon. The outlook for 1937 is promising, but the detailed elements in the picture may be changing. Fortunately, the world environment is definitely encouraging at the present time, at least so far as the economic sphere is concerned, and continuance of general recovery is no longer so dependent as it was even a year or two ago upon the continued expansion of a few sheltered industries, such as house building, within Great Britain.

In the past, the prosperity of this country was intimately associated with that of the overseas world. Tariff and currency changes here and elsewhere have somewhat modified the truth of this generalisation, but its general soundness can hardly be brought into question. During 1936 a series of important events has greatly contributed to improve the external environment. Recovery in the United States is proceeding almost as rapidly as in this country; the long delayed, but probably inevitable, devaluation of the currencies of the gold bloc countries has produced an immediate halt in the deterioration of their position, and signs of recovery are accumulating. The conclusion of the tripartite agreement in September of last year confirms the impression afforded by the actual course of the foreign exchanges in recent months, that the era of violent currency changes is over, and that the uncertainties and difficulties caused by them are a thing of the past. Easy money conditions have enabled the conversion of overseas indebtedness to proceed, and the pressure on the balances of payments of these countries is therefore diminishing at the same time as their purchasing power is improving through the smaller burden of indebtedness.

From the standpoint of the overseas world, however, the most important phenomenon is the sharp rise in wholesale prices now in progress. Increased industrial activity here and elsewhere—however regrettably accentuated by the requirements of the armaments race—is affecting the prices of basic raw material: the higher level of income and the greatly improved volume of employment is affecting the volume of consumption of food-stuffs and the raw materials of the textile industries. The consequence must be a rise in the national incomes of the overseas countries, as well as a welcome improvement in the earnings of shipping, which directly benefits the balance of payments of this and other large ship-owning nations. Many of the overseas countries have been starved of late years as a consequence of falling prices and redundant stocks. While it is natural and right that part of the increased demand generated in this way should, and undoubtedly will, benefit local industry in the first instance, part will benefit the export industries of this and other countries. Looking at the situation from the special standpoint of this bank, it is gratifying to record that Ireland, as primarily a raw material producing country, is benefiting from the developments already mentioned. In addition the prolongation of the Coal-Cattle Pact between this country and the Irish Free State is of the highest significance, and it is hoped that other pacts on the same lines will soon be put into operation.

The report and accounts were unanimously adopted.

WESTMINSTER BANK LIMITED

FEATURES OF PAST YEAR'S FINANCIAL AND TRADING SITUATION

BENEFITS OF RISE IN COMMODITY PRICES

NEED FOR CONTINUANCE OF CHEAP MONEY

PROGRESS OF BRITISH INDUSTRY

THE BANK'S DIVIDEND MAINTAINED

THE HON. RUPERT E. BECKETT'S ADDRESS

The annual ordinary general meeting of the Westminster Bank, Limited, was held, on the 27th instant, at the head office of the Bank, 41 Lothbury, London, E.C.

The Hon. Rupert E. Beckett (chairman of the Bank) presided. The notice convening the meeting and the auditors' report having been read by the secretary (Mr F. Mytton), the directors' report, the balance sheet, and the profit and loss account were taken as read.

The chairman said: My Lords, ladies, and gentlemen, in accordance with custom, at the opening of my address I will acquaint you with the changes that have occurred in the directorate during the past year.

CHANGES ON THE DIRECTORATE

With great regret, I have to report that we have lost by death two of our senior directors. In April last, Sir George Murray died after a short illness, at the ripe age of 86. After a distinguished career at the Treasury, he gave 24 years of assiduous service to the bank. His kindly humour and shrewd judgment of affairs gained him the affection and respect of all his colleagues.

Then in November last, Mr R. Hugh Tennant died, after some months of illness. His first interest in banking, dating from 1903, was as a director of Crompton and Evans' Union Bank, later, absorbed by Parr's Bank, of which Mr Tennant was deputy chairman at the time of the subsequent amalgamation with the London County and Westminster Bank in 1918. He was appointed Chairman of Westminster Bank in 1927, and after his retirement from that post in 1930 remained a director until his death. Mr Tennant made his mark in other business activities as well as banking, and being thoroughly conversant with various phases of industrial and commercial life, he rendered eminent service to this bank in all the posts he filled. As a personal friend of more than 40 years' standing I mourn his loss, and his passing is a matter of deep regret to us all.

In October last, we invited the Marquess of Willingdon to a seat on our Board, which I am pleased to say he accepted. It is a matter of gratification to us all that we have been able to secure the services of one with such an eminent record of public service. (Hear, Hear.)

BANK'S BALANCE SHEET

I now propose to give some account of our stewardship of your interests during the past year. The steady growth in the credit base since 1932, greatly accelerated in 1936, has naturally been reflected in an increase in the deposit items of the banks. Our own deposits have grown during the past year by over £45 million to nearly £368 million.

There has been no proportionate increase in the demand for bank advances, and the problem of profitably employing these increased resources has forced the banks to enlarge their investment holdings throughout the period of credit expansion. For the year that has just closed, this increase has not been very substantial so far as this bank is concerned. Indeed, in comparing our balance sheet figures for 1936 with those for 1935, it will be observed that the increase of deposits of £45 million, to which reference has already been made, is mainly distributed, as to £6 million in investments, £10½ million in advances to customers, and £26½ million in money at call and short notice. The other items of the balance sheet call for no particular comment, and I now pass to the profit and loss account.

PROFIT AND LOSS ACCOUNT

The profit for the year is £1,731,955, an increase of £329,300 on the previous year's declaration. You will recollect that in 1935 we charged to the expenses of the bank, before declaration of our profit balance, the cost of the centenary bonus to the staff, pensioners and

widows. After payment of the dividends at the customary rates, the sum of £200,000 has been allocated to the officers' pension fund, and, while last year no transfer was made to our premises account, this year we are enabled to resume this desirable provision by an allocation of £200,000. In 1935, the centenary bonus of 2 per cent. to the holders of partly-paid shares was charged to our profit and loss account and our carry-forward was brought well below the customary figure. This year we are enabled to increase our carry-forward to £516,936, a balance comparable with our previous practice.

The Ulster Bank figures are set forth in a separate print. You will observe from this that the bank well maintains its position and has earned a slightly increased profit. As regards our subsidiary Westminster Foreign Bank, an important event during the year almost on the point of expiry, to our freehold at No. 18 Place Vendôme. The new building enables us to improve the facilities and accommodation available to our customers, and to add to the comfort and well-being of our staff.

THE ECONOMIC SITUATION

In each of the past four years, I have been able, in reviewing the events of the preceding twelve months, to indicate the extent to which recovery from the depression had taken place, particularly in this country. This year, I am glad to be able to say that the pace of this recovery at home has been fully maintained, and that in many countries overseas, with whose prosperity our own well-being is so closely bound up, conditions of trade and employment have shown considerable improvement.

Unfortunately, the political developments of 1936 have been of a very disturbing nature. International confidence, already seriously impaired as a result of the Italian invasion of Abyssinia, received another setback in March through Germany's repudiation of the Locarno Pact and military reoccupation of the Rhineland. After a few months of comparative tranquillity, civil war broke out in Spain, and in spite of the acceptance of the principle of non-intervention by the leading powers in Europe, this has constituted a further menace to European security. In addition to these formidable adverse factors, rearmament has continued apace in every country, and though this has given a direct fillip to industrial activity and employment, it cannot have failed to retard the growth of confidence which is vital to the rehabilitation of international trade.

CO-OPERATION FOR EXCHANGE EQUILIBRIUM

In the economic sphere, as distinct from the political, the latter part of the year witnessed an event that might well have been, and may yet prove to be, the turning-point in the course of national trade policies. I refer to the devaluation of the French franc, which took place in September, and which was quickly followed by the devaluation of the Dutch, Swiss and Italian currencies. Much more important to the world at large than the change of policy on the part of the French Government was the tripartite agreement among France, the United States and our own country to co-operate in maintaining exchange equilibrium and in efforts to modify trade restrictions.

For years these restrictions have exercised an increasingly powerful hold on trade, and the occasion of the French currency devaluation was hailed as an excellent opportunity to undertake a drive against all such prohibitions. Unfortunately, events since September have done little to encourage the high expectations then entertained. Not only has the initial force of the currency re-alignment been spent without imparting that impetus to world trade which had been hoped for, but there has been little sign yet of any action, concerted or otherwise, to rid the world of the many other restrictions which are preventing the growth of international commerce. The longer the delay the less effective is such action likely to be, and the less will be the driving force derived from the act of devaluation.

PROGRESS OF BRITISH INDUSTRY

There is abundant evidence of rapid progress last year in British industry, which derived its main stimulus from the internal market. Industrial production has been on an appreciably larger scale than in 1935, and it is particularly gratifying that in all the branches of industry included in the Board of Trade's calculations some advance has been registered. The number of unemployed in Great Britain has fallen by some 240,000, and the number of workers in employment has grown steadily to the record figure of 11,132,000. In addition, short time has become much less prevalent, wage rates have risen, and industrial disputes have been comparatively few and without serious consequence. The movements of statistics relating to railway traffics, bank clearings, currency notes in circulation, new capital issues, and retail sales, indicate without exception a greater degree of prosperity than has been experienced for a number of years.

IRON AND STEEL TRADES

The most notable feature of the industrial history of 1935 was the striking improvement made by the iron and steel trades. During the past year, their progress continued, and the production of steel in 1935, itself a record, was exceeded by 18½ per cent., the output in 1936 being nearly 11½ million tons. The revival of the steel industry is based largely on the growth of building activity and industrial expansion. Home consumption rose last year by over 2 million tons in comparison with 1935, and it is anticipated that in the current year there will be a further increase in demand from the leading steel consuming industries, on which will be superimposed the requirements for the rearmament programme. Steel works are operating nearly at full capacity, and if demand continues to expand it will become necessary to make additions to plant, but this is a process which necessarily occupies many months.

Pig-iron has lagged somewhat behind steel in the recovery, but the production increased last year by 19½ per cent. to the highest level since 1920. Here also the works are operating nearly at full capacity, and there is now little suitable idle plant which can be brought into production. It is significant that all available scrap metal is already being absorbed in the manufacture of steel, which means that the production of steel can be increased only from pig-iron, and the indications are that there will be a short supply of the latter. The erection of new blast furnaces is under consideration, but they will take a substantial time to build. A slight betterment can be discerned in the coal industry, and it is significant that the number of workers engaged in coalmining, which had been declining for some years, showed an increase. Despite a further contraction of 11 per cent. in exports, there was a small expansion in total coal production, the home market absorbing a heavier tonnage than in any other year since 1927. The fact that inland consumption has risen so substantially suggests that the adverse effects upon the trade arising from the more economical use of coal are being overcome, and that consumption is now increasing in spite of them. The output of coal last year, at 229 million tons, was 3 per cent. higher than in 1935, and was at the highest figure since 1930.

Engineering benefited considerably from the continued activity in public works and in house building, from extensive replacement and renewal work for the railways, and from the provision of additional plant for industry, as well as from Government orders for rearmament purposes.

SHIPBUILDING

The shipbuilding industry, although by no means restored to its former prosperity, enjoyed a better year, orders having reached a larger aggregate tonnage than for a long time past.

The strengthening of demand for shipping, and the hardening of freight rates, are healthy developments which may presage a further expansion of activity in the shipyards. The industry to-day is obliged to rely almost entirely upon the home market, however, the volume of business secured from abroad last year having been of negligible proportions.

As coal, being largely dependent upon exports, showed the least improvement among the heavy industries, so among textiles cotton fared much less favourably than either wool or rayon. The value of overseas trade again showed little increase in comparison with that of the preceding year. During the year the Cotton Spinning Industry Act, which provides for the elimination of redundant spindles, came into force, and minimum selling price schemes for yarns were put into operation. Wool textiles have passed through a moderately satisfactory period. The improvement in internal purchasing power has been reflected in better sales in the home market, but exports have increased only slightly. The output of

rayon reached a new high record, as might be expected in a comparatively young and flourishing industry.

OVERSEAS TRADE

The feature of our overseas trade during the past year has been the decline in the ratio between exports and imports. Imports have grown considerably, while exports have remained almost stationary, with the result that the gap between them has widened from £275 million to £348 million, an increase which can be only partially offset by the anticipated larger contribution of our invisible exports to the credit side of our national trading accounts.

The probability of the emergence of a net adverse balance of payments has occasioned a great deal of comment and a certain amount of apprehension, and it may not be out of place to examine here some of the causes which underlie this unwelcome development. The influence upon international trade in general of the unfavourable political events to which I have already referred has been aggravated by intensified nationalism in some countries, which has prompted the drastic curtailment of their imports. In this country, there has been a large increase in the production of armaments, and a continuance of a high level of building activity, both of which have necessitated the importation of raw materials, but have contributed nothing on the export side. At the same time, the steady rise in prices throughout the past year has increased the cost of imports, without, however, having an equivalent effect upon exports.

Then in certain industries, intense activity in the execution of home orders has prevented manufacturers from taking full advantage of opportunities of overseas trade, and in many cases business has had to be turned away. However regrettable this may be from a national point of view, it is hardly surprising that manufacturers, finding themselves able to keep their factories fully employed on home business, with the much smaller risks this involves, have found little inducement to develop the export side of their trade. But it is earnestly to be hoped that this condition of affairs will not be allowed to result in the permanent loss of export markets, for the time will inevitably come when the home market will no longer be able to absorb the entire production, and overseas customers will again be needed. Expanding imports are frequently regarded as a sign of national prosperity. They may well be, but they have to be paid for, and in the long run they cannot be afforded unless a correspondingly increased volume of exports can be sold.

RISE OF COMMODITY PRICES

By far the most important happening in the economic sphere during the past year has been the sustained rise of commodity prices. In my address to you a year ago, I took occasion to comment on the remarkable stability of prices in this country since our suspension of the gold standard in 1931, contrasting our experience in this respect with those of certain other leading countries, where the range of prices had been far more considerable. Since I made my remarks, we have witnessed an advance in prices which has proceeded month by month at an accelerating pace, and wholesale prices to-day, as measured by the Board of Trade, are some 10 per cent. higher than they were a year ago, and 14½ per cent. higher than in July 1935, when the movement began. The significance of this increase lies in its uninterrupted course and in the fact that it represents the first considerable rise of prices in this country since the low levels associated with the depression.

Already, the rise has occasioned a certain amount of misgiving. Yet as long ago as 1933, the Chancellor of the Exchequer told the World Economic Conference that the British Government attached the greatest importance to securing a rise of prices and that, to this end, "credit should be made available by a policy of cheap money, and such credit should be actively employed." The rise of prices which was universally recognised as desirable is now in full course. Monetary policy is, however, only one of the factors in a development of world-wide extent. During the past twelve months, wholesale prices in practically every country of importance have risen by something like 7 per cent.

EFFECT ON AGRICULTURAL PRODUCTS

The most significant, and at the same time the most hopeful, aspect of the rise of prices is its incidence on agricultural products. The agricultural communities of the world were the first to suffer in the years of depression, and their difficulties were the severest. It was through the serious contraction of their purchasing power that manufacturing countries were in their turn drawn into the pit of depression. It is fitting, therefore, that the recovery of prices, with all that it implies in returning prosperity, should have made

its presence felt first in the primary producing countries. These countries' exports now pay for larger imports of manufactures, and at the same time enable them to resume or to increase payments of interest on their bonds held abroad, which had been suspended or seriously reduced.

In the majority of cases, the rise of prices has been brought about in the healthiest possible way—by improvement of the balance between supply and demand. The colossal stocks which were depressing markets have gradually been reduced to more normal proportions, and, whether by the hand of Nature, or by artificial means, or by a combination of the two, current outputs have been brought more into accord with prospective consumption.

The recovery of industry has brought about a gradual revival of genuine consumptive demand for nearly every industrial raw material, and fuller employment and higher wages have meant increased consumption of foodstuffs. Under these combined influences, prices have begun to move upward, not hitherto in the spectacular manner associated with a boom, but in the steady way that encourages a further expansion of trade. It is safe to say that commodity prices owe little of their increases so far to undue speculation.

NO SIGN OF A BOOM

A rise of prices from the recent abnormally low levels, though it may be detrimental to a few, confers undoubted benefits on the community as a whole. But it is accompanied by dangers, and it is important that we should profit by the lessons of the past if harmful effects are to be avoided. The prices of certain commodities have recently shown a tendency to rise more abruptly than is justified by their statistical positions, and these advances have been accompanied by sharp rises in certain shares on the Stock Exchange—rises which over-discount prospective yields for a long time ahead. It is in the liability of such a movement to get out of hand that danger lies.

There are, fortunately, some respects at least in which the present situation differs from those which have succeeded previous depressions. I see no convincing evidence that a boom is yet developing. Prices so far have not risen unduly, profiteering is not rife, and there is no shortage of commodities such as has been associated with booms in the past. Credit remains plentiful and cheap, and company flotations and capital operations are subject to much closer scrutiny than ever before.

Whilst, therefore, I am sensible of the dangers of an excessive rise of prices, I think that those who already advocate steps to check the present rise are prematurely apprehensive. The control of prices is itself not without dangers. It is important to remember that prices are symptoms rather than causes, and undue interference with them destroys both a valuable guide in the exploitation of resources in the ways best fitted to man's needs and desires, and a safety valve of much importance in the operation of the economic system.

The only effective method by which the general price level can be controlled is by regulation of the volume of money and credit in active circulation. In other words, the rise of prices can be checked only through a contraction of credit, and the adoption of a deflationary policy which is the very antithesis of that which has carried us thus far out of the slough of depression. I, for one, do not believe that present circumstances justify such drastic action.

A WELCOME DEVELOPMENT

In my view, the rise which we have so far seen in commodity prices is, generally speaking, based on a firm foundation and is a development to be welcomed. The few instances of excessive rises have resulted from special conditions of supply or demand, which we may expect to see rectified. Nevertheless, it is necessary that those in authority should keep a watchful eye on the movement, lest in any particular direction speculation should exceed its legitimate functions.

No survey of a year can be complete that stresses developments which have been favourable and ignores or glosses over any which may hold dangers, and I have therefore mentioned what seem to me to be certain vulnerable points in our economy. If we do not learn from past errors, the pitfalls into which we have so often stumbled will snare us again, without, on this occasion, any justification for an extenuating plea of ignorance or inexperience.

The recovery so far seen has been a fairly general experience throughout the world, proving again that, with countries linked by innumerable ties, the prosperity and well-being of the one or the few spread and overflow with the same inevitability as did depression some years back. But with large and important countries still pledged, whether from choice or from sheer necessity, to live unto themselves and to exclude international trade as far as possible, in

defiance of the fact that their former greatness was built and founded so largely upon that very trade, the rest of the world is denied a full measure of recovery. Enlightenment will assuredly come to those countries, to their own benefit and to that of the world at large.

NEED FOR CHEAP MONEY

Ominous clouds still overhang the political sphere, but if only these can be dispersed, the year promises still further trade progress for this and other countries. All the favourable factors which I have mentioned earlier are found present at this year's opening, and in some cases they are still gathering strength. Moreover, there are perhaps now clearer indications of methods of self-help than have been discernible at the commencement of many previous years.

The first necessity appears to me to be the continuance of the policy of cheap money. During the past year, there have been from time to time signs that the supply of credit is not quite so plentiful as in recent years, and the most sensitive rates have been inclined to harden under the influence of important though passing events. Expanding trade and higher commodity prices were responsible for an increase in advances by the eleven clearing banks of some £80 million during 1936, an appreciable rise from the corresponding figure of £31 million in 1935. Nevertheless, we should still be some distance from the necessity for dearer rates. Building and commercial construction formed the basis of our recovery, and these have been, more recently, supplemented by rearmament activity.

A tightening-up of credit would not affect rearmament but would undoubtedly diminish the amount of new building and commercial construction, apply a brake to business enterprise, and exert an adverse psychological effect all round. Industry and commerce still need every facility open to them to continue their development. It need not be feared that, granted the necessity for continued cheap money, its maintenance will be a matter of difficulty, for the authorities have ample powers to expand the credit basis as that is deemed desirable.

VALUE OF A SOUND BUDGET

With other nations rearming at a feverish pace, we have, after long delay and with great reluctance, been forced to strengthen our own defences, and accept an armaments bill as an inevitable and distasteful necessity. Not by any means the least important factor in our progress has been the background of a sound budget. We faced the difficulties of the situation in 1931, shouldered heavy burdens, and came successfully through to a balanced budget, and since then we have not looked back. Our country is still one of the very few which manages to balance income and expenditure, and this situation is of such fundamental importance, both for our own self-esteem and as a visible sign to the outside world of our determination to be rooted in stability, that we must again be prepared for sacrifice. So far as it is possible, therefore, the bill for armaments should be met out of current revenue. We must be prepared to face heavier taxation, with this consolation—that the country is in a far better position now to bear an added burden than it has been for a number of years past.

I have already remarked on the paramount necessity of developing our export trade by all the means at our disposal. Only by a radical improvement in that sphere can we hope to make further reductions in unemployment—a task which becomes more and more difficult as time goes on—and to bring abiding help to those areas whose dire needs have so far presented an almost insoluble problem. It is good to know that intimate knowledge and experience of these areas have been obtained, and that the public conscience has been quickened, so that a lively sympathy may in the near future be translated into some more practical form of help.

THE FUTURE

In my address to you on this occasion I have confined myself to a review of the past year, pointing out how events have affected the financial and trading position of this country as shown by its general progress. Any attempt to forecast the future trend of affairs, save in the most general terms, would be futile—this because the political outlook is unusually obscure, and the future is more than ever governed by events abroad, where we may do no more than exercise the influence we possess in the direction of peace and sanity.

There has been little amelioration of tariffs, quotas and other restrictions, and though the various exchange equalisation funds have performed their functions of preventing violent fluctuations in exchanges, we have not been brought much nearer to a common denominator in the shape of definite parities between this country, France and America. The necessity for equalisation funds is proof

that the genuine functions of the various exchanges are to a great extent still in abeyance. By this I mean that these funds have taken the position that should be filled by the passage of goods themselves. They help to maintain the international value of a nation's currency when neither by the amount of goods exported, nor in some instances by its own domestic price-level, can such value be justified. It is in fact the fictitious position of turning credit into a commodity, the true commodity, goods, being lacking. Nevertheless, exchange equalisation funds can do a great deal to counteract the ill-effects of any sudden flight from a particular currency, and have, indeed, already proved their utility in neutralising the effects of large capital movements.

The measure of stability already attained amongst the chief currencies of the world is the result of economic co-operation. Is it too much to hope that political considerations will not be allowed to stand in the way of a wider collaboration, through which alone the universal desire for lasting peace and prosperity can be achieved? (Applause.)

The chairman then moved the adoption of the report and accounts and Lord Hunsdon, deputy chairman, seconded the resolution, which was carried.

The retiring directors were then re-elected, and the auditors were re-appointed for the year 1937. To a vote of thanks to the staff for their admirable work during the past year, the chief general manager, Mr Charles Lidbury, responded, and a vote of thanks to the chairman terminated the proceedings.

THE UNION DISCOUNT COMPANY OF LONDON, LIMITED

REVIEW OF MONEY MARKET CONDITIONS

BENEFICIAL RESULTS OF GOVERNMENT POLICY

SIR WILLIAM GOSCHEN'S ADDRESS

The seventy-ninth ordinary general meeting of The Union Discount Company of London, Limited, was held, on the 28th instant, at Southern House, Cannon Street, London, E.C.

The Hon. Sir William H. Goschen, K.B.E., the Chairman, presided.

The Secretary (Mr C. W. Holliday) having read the notice convening the meeting and the auditors' report,

The Chairman said:—Gentlemen,—The past year has been an interesting one from the members' point of view. They will remember that the company's jubilee occurred in April, 1935, and almost a year ago their authority was asked for and obtained by the board to increase the capital and resources by £500,000 and thereafter to capitalise the uncalled liability on their shares, which was 100 per cent. of what was paid up on these shares.

CAPITAL STRUCTURE

The balance sheet at December 31, 1936, now shows the effect of these operations on the capital structure of the company. For a number of years the board had in mind the cancellation out of reserves of this uncalled liability on the company's shares—the only class of shares issued—and they felt that the Jubilee would be an appropriate occasion on which to mark the event and carry it out.

The board believe that for several reasons shares or stock with no liability (for which there is now general precedent in the banking world) are now preferred to those with a liability, and such shares or stock can be more easily dealt with in the case of deceased members. I have no doubt the members will realise the advantages of this cancellation of the liability on their shares, and the directors consider that the recent issue of capital on bonus terms was in harmony with the company's progressive growth and struggle.

CURRENCY VALUES

The cheap money policy, we are now being told from various sources, will soon be a thing of the past, and these prophets confront us with statistics making comparison with conditions and figures—pre-war and post-war—that suggest that we may be on the eve of higher bank rates and dearer money. In view of the depreciation of currencies and the greatly increased gold production any statistical comparisons with previous data, I feel, can be no longer relative or of any value.

Memories are short, and with the kaleidoscopic changes in the inter-mixture of political and economic affairs that have occurred

since this country was driven off the Gold Standard in 1931, and the effects of this domestically, and particularly on International trade—it is essential that we do not lose sight of what are the fundamental problems that remain for settlement—in which *de jure* fixation of currencies is a vital one if world recovery in trade is to be permanently secured.

GOVERNMENT'S FAR-SIGHTED ACTION

The two most important changes in policy made by the National Government have involved the reversal of two British ideals—both beneficial and far-sighted in their consideration for the welfare of all nations. These changes were the abandonment of Free Trade and the abandonment of disarmament. The foundation for our country's belief in both policies was that "our example" and what was thought to be the obvious advantages to all nations of such policies would lead to their eventual general adoption. It is true that for some time before the War our united belief in Free Trade was getting thin and that in 1931, after the experiences of the post-War years, its supporters were mainly confined to those who were blind to the benefits it gave to foreign workmen over our own.

However, the National Government saw the realities of the position and adopted moderate protection and fair play in the international exchange of goods—which policy, in fact, uncovered a hidden reserve for production and consumption of goods made in this country, and this has played a great part in our recovery in recent years. Another factor which emerged after we were driven off gold—and which was not foreseen—was that as a great credit country we were always the biggest buyers of world goods, and that, as a consequence, our prices did not then rise in accord with academic theories and the expectation of the on-gold countries—whose prices fell because they were large sellers on balance.

INTERNATIONAL TRADE

International trade is the exchange of goods and services, and cannot recover unless the creditor countries, and particularly the greatest of them—Great Britain and the United States—square the international account by taking goods and services—and not gold—otherwise any premature attempt to *de jure* fixation of currencies may lead to a repetition later on of the events of 1931.

And keeping in mind the tendency of the British people towards beliefs in "ideals" and "examples" (lately shown again in world disarmament), it is disturbing to find this same idealism finding renewed expression in a certain school of thought advocating an immediate concurrence in a *de jure* fixation of exchange, particularly with the United States, the excuse for which once more being the belief that "while this policy might not be to our advantage at first, in the long run it was bound to be of benefit to all, and to ourselves more than to any of the others." Past experience has surely taught us by now that British policy, when it has been based on "ideals" and "examples," has almost always proved to be mistaken—in the end disadvantageous, dangerous and perhaps destructive, and we trust that the Government will continue to base the National Government policy, as they have already done, on realities, economic facts and common sense, until such time has arrived when world co-operation is an accomplished fact and what were and still are the objectives of British "idealism," peace, goodwill and prosperity for all nations.

The Chairman, after referring to the details of the balance sheet, moved the adoption of the report and accounts, which was carried unanimously.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To Publisher, "Economist Newspaper Ltd.,"

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

THE RISE IN COMMODITY PRICES

NEED FOR INTERNATIONAL CO-OPERATION

MR COLIN F. CAMPBELL'S ADDRESS

The annual general meeting of the shareholders of the National Provincial Bank, Limited, was held at the Head Office, 15 Bishopsgate, London, E.C.2, on the 28th instant, for the purpose of receiving the report and balance sheet, electing directors and auditors and transacting other ordinary business.

Mr Colin F. Campbell (the chairman) presided.

Mr R. H. Cutting (the secretary) read the notice convening the meeting and the report of the auditors.

The chairman said: My lords, ladies and gentlemen, Before speaking to you to-day about the affairs of the bank, I know that you will all join with me in hoping that the reign of King George VI and Queen Elizabeth will be crowned with a full measure of blessing and prosperity, both to them and the Empire. (Hear, hear.)

We have this year returned to the practice of holding our annual meeting on the premises of the bank. The last time was in 1919. The changes which have been effected consequent on the extension of our premises to Old Broad Street have made it possible to use this room and if the experiment proves satisfactory to the shareholders, we hope to continue to hold the meeting here in future years.

CHANGES IN DIRECTORATE

During the year under review, I regret to say we lost through death a very distinguished colleague in Sir Felix Schuster. He will long be remembered as the Governor of the Union of London and Smiths Bank, but along with this his reputation as an international banker stood very high indeed, and he is greatly missed by a large circle of friends both in this country and abroad.

Since the close of the year I regret to say that we have also lost through death Major G. D. Smith, who was one of the extraordinary directors of the bank and who was for some time previously a director of the Union of London and Smiths Bank before its amalgamation with this bank.

We have appointed two Directors during the year to seats on the Board, the Right Honourable Lord Aberconway and Sir Victor Schuster. Lord Aberconway bears a high reputation for his knowledge of all matters connected with shipbuilding, coal, iron and steel industries, besides which—if you will allow me to digress from business—he is president of the Royal Horticultural Society, whose fortnightly Flower Shows in Vincent Square are a delight to many of us. (Hear, hear.) Sir Victor Schuster has been a banker since he left Oxford, and not only is he well versed in banking practice, but he has made a special study of international banking. I have no doubt that you will heartily approve of these two appointments.

Then we are about to lose the services of Mr Waller, a joint general manager of the bank, who is retiring at the end of this month after a long service of 43 years, included in which is a period of 13 years as joint general manager. We shall all miss Mr Waller very much, and he carries with him not only our cordial thanks for his services to the bank but also our hope that he will enjoy to the full the leisure to which he is now so well entitled. (Applause.)

SATISFACTORY ACCOUNTS

The one hundred and fourth annual report of the directors to the shareholders is now before you, and I hope the healthy situation disclosed in the figures of our balance sheet taken out on December 31 last will meet with your approval.

The largest item, current, deposit and other accounts, has increased during the year by over £18,000,000 to £320,898,298. This figure is a record in our history.

There are no important changes to bring to your notice in the other items on the liabilities side of our balance sheet.

On the assets side, coin, bank notes and balances with the Bank of England at over £34,000,000 amount to 10.7 per cent. of our deposits.

Money at call and short notice shows an increase of nearly £4,000,000 and Bills discounted at £44,000,000 are over £4,000,000 up.

The return to the bank on these two last named items has again been disappointing. The Treasury Bill rate during 1936 stood at an average of 11s. 7d.

Investments, apart from those in associated and subsidiary banks, show a decline compared with the previous year's figure of nearly £2,500,000.

GROWTH OF ADVANCES

On the other hand, you will be pleased, as I am, to see that advances have increased from £112,000,000 to £122,000,000. This latter figure is 37.9 per cent. of our deposits, as compared with 36.9 per cent. at the end of 1935.

We have during 1936, as in previous years, endeavoured to play our part in supporting the financial requirements of our borrowing customers; and it has been our great pleasure to see industrial concerns which we have supported through several years of depression showing evidence of a return to a more prosperous state and to increased financial strength.

The profit statement discloses a nett profit of £1,770,173 3s., being an increase of £104,735 15s. 8d. over the previous year.

The dividend continues at 15 per cent. as before, and after allocating £100,000 to bank premises account, and £200,000 to pension fund against £100,000 a year ago, there remains to be carried forward £970,667 1s. 2d. an increase of £48,260 15s. compared with the previous year.

GREAT BRITAIN'S GOOD RECORD

Looking at the record of our country as a whole, we have every reason to be satisfied with its work and spirit during the past year. In spite of being subjected to severe shocks and many uncertainties, it has maintained its business progress with a calmness that has won the admiration of the world, and has belied the forecasts of those who have been telling us that the present activity is too feverish and artificial to last and must be succeeded by early reaction. On the contrary, many indications show that the rate of progress in some departments of business has been accelerated during the year, and that we can look forward with confidence to a continuance of this activity.

You will have seen so many records in the press of the fine achievements of most branches of our industries that I will not weary you now with statistics. It is enough to say that the movement and expansion of currency, the bank clearings, railway traffic and employment figures, increases in wages, retail trade returns and the volume of our imports, all point to a steady growth of our country's income and prosperity firmly based on well-distributed purchasing power.

HARD-HIT INDUSTRIES IMPROVE

It is also most satisfactory to note that some of the industries that were hardest hit by the depression have lately shown signs of joining in the general recovery. Shipping has benefited from the greater movement of produce and of raw materials generally, which has brought about an increase in the rate of freights. The breaking up of old vessels also has stimulated activity in our shipyards. The cotton industry has not only been quickened by a large number of orders for Coronation materials, but has shown that its capacity for export, assisted by the rise in commodity prices involving increased purchasing power of its overseas customers, is full of vitality.

Only a few weeks ago the chairman of the Indian section of the Manchester Chamber of Commerce, when presenting the annual

report, reminded his hearers that, "The Lancashire textile trade is the largest consumer of raw materials in this country, and it cannot be too often stated that the export trade in cotton piece goods and yarns is still the country's largest export trade and India the most important market. Indeed, the preservation of this trade is still one of the most valuable and essential factors in the economic position of this country as a whole."

THE TRADE BALANCE

The rise in commodity prices which has taken place inevitably gives rise to certain apprehensions which it would be unwise to ignore. In the first place it has been, to some extent, the cause of the widening in the gap between the values of our imports and exports, which has caused so large an increase during 1936 in what is called the adverse balance of our overseas trade. As you will doubtless have seen, our total imports were valued at £849,000,000 and our total exports at £501,000,000, leaving a difference of £348,000,000 which is £73,000,000 greater than in 1935. The adverse balance on trade in merchandise, our visible trade as it is called, has been a normal feature of our account with the rest of the world for many generations. Against it we can always set a balance on the right side in what is known as our "invisible" trade, thanks mainly to the earnings of our merchant ships, sundry commissions, and the amounts due to our investors on account of interest and dividends an capital invested all over the world. There was a time when these invisible exports not only covered the adverse visible balance, but left us with a surplus estimated at something like £200,000,000 for purposes of further investment abroad. In recent years, owing to shipping depression and the prices of commodities, which drove our debtors into partial or complete default and reduced the profits of capital invested abroad, this balance in our favour has shrunk seriously, so much so that in 1934, according to official estimates, it had turned into a small debit balance and in 1935 it was only £37,000,000 on the right side.

INVISIBLE EXPORTS

It must be remembered that the official figures, the result of careful enquiry, are necessarily based very largely on estimates. Nevertheless, in view of this figure for 1935, the large increase in our visible imports, as compared with that of exports, during 1936, has naturally caused a certain amount of uneasiness, since it is generally assumed that the improvement in the value of our invisible exports cannot be sufficient to counterbalance it. This improvement, however, must certainly be substantial, for the rise in commodity prices, which is to some extent responsible for the higher value of visible imports, must also have brought a good addition to the profits of the many British companies and enterprises working overseas and must also have enabled those debtor countries, whose exchange position is chiefly influenced by exports of primary commodities, to meet their debt charges more easily and fully. In addition to this, the higher rates of freight lately earned by our shipping companies will surely be found to have shown a considerable increase in this item in our balance sheet, so that altogether the balance ought not to be far on the wrong side. Moreover, the improvement in these sources of overseas income has only appeared lately and may fairly be expected to continue during the present year, and any fear that we are living on our capital to any great extent can easily be exaggerated. The balance of payments may still be slightly on the wrong side, but we can surely hope that before long these invisible exports will increase to an extent sufficient to produce a balance on the right side, and that foreign lending to good borrowers will be rendered easier than is the case at present.

WHOLESALE PRICES

The heavy fall in wholesale commodity prices was one of the worst symptoms—some people even consider it to have been the main cause—of the depression which involved the whole world in distress in the years from 1929 to 1932. Owing to it the primary producers saw their incomes in many cases cut in half by a change in economic conditions for which they were in no way responsible and against which they had no defence. The rise in wholesale prices, which are still in most cases substantially below the levels of 1928, is thus a correction of an influence which produced incalculable distress, not only among the agricultural and mineral workers whom it affected most directly, but also among the manufacturers—both employers and workers—in the older countries which found so many of their customers impoverished and so had to curtail output and suffer the miseries of unemployment.

There is, however, another point of view which is worthy of some thought. If this rise in commodity prices were to go so far as to cause a considerable increase in the cost of living, followed by a rapid advance in wages, we might be faced with a serious rise in the cost of production. Warnings have already been uttered by chairmen of industrial companies as to this possibility and we can only hope that it will be possible to adjust prices and wages to avoid any such result. There are many factors besides the price of raw materials which affect the cost of the finished article, and it is reassuring to bear in mind that greatly increased industrial turnover, coupled with substantial improvement in the efficiency of plant and equipment, should act as a powerful factor in preventing an undue rise in prices.

EXPORT TRADE

Turning now to our export trade, it is well to consider it in its connection with the problem of our trade balance. Besides the rise in commodity prices which has made us pay more for our purchases, the growth in our exports has been hindered by many causes, and not least by the interruptions due to the war in Abyssinia and the tragedy that is being enacted in Spain. The inability of our industries to meet the pressing demands of the home market and at the same time to fulfil an increasing number of orders from overseas is a further case in point. This inability has not been due to too high a level of costs in this country, but to the fact that many of our chief industries are already working at full capacity and cannot find the skilled men required to produce any increase in output.

CERTAIN ARTIFICIAL ACTIVITY

Overseas orders, even on account of the most solvent customers, are often complicated these days by questions of credit and are rendered unattractive by the difficulties of exchange restrictions. So that it is very natural for industry, at present fully occupied at home, to pay less attention to the overseas market, but it will be unfortunate if British industry is tempted by these considerations to neglect opportunities for increasing its connections abroad and even to allow old connections to be lost, perhaps for all time. It is important that we should remember that our present activity is to a certain extent artificial, though there is no need to exaggerate the extent to which this is so. Most of our recent recovery has been due to sound business reasons, abundant credit, political confidence, and the conviction that there is plenty of demand for industry's output if it can be offered at a price that consumers can pay. The great activity in house building, though perhaps started by official encouragement, was based largely on the increase in the wages bill which enabled thousands of people to secure the better homes which had long been overdue to them. But our re-armament programmes certainly a temporary matter and though we can be sure that it will keep industry busy for some time, the day will come when its effect will taper off and we shall go back to the normal demands of our defensive forces.

When that time comes it is likely enough that we shall find a good deal to do towards improving social conditions, but nevertheless it is essential that some other substantial outlet should be found to take up some of the slack that will make its appearance when our armament needs have been satisfied. By far the most promising outlet of this kind seems to be offered by overseas trade, the volume of which is sure to be increased by greater stability in exchange and the rising prices of commodities.

SPECIAL AREAS

The urgent need for developing overseas connections is relevant to another vital question, namely, that of the special areas. These districts, as is well known, have been chiefly those which have been hard hit by the decline in international trade, and its revival is the soundest cure for their troubles. The idea that this condition can be ameliorated by allowing the inhabitants to drift into the areas which are busy on domestic orders is both wasteful and unsympathetic. If such a policy were adopted, it would create a wilderness where there was once a hive of industry; it would involve the uprooting of people who love their homes and neighbourhoods and transferring them to places where everything would be strange and a good deal unpleasant to them. Surely we can find a better way by means of special efforts for resuscitating, where possible, the trades that formerly flourished in these areas, and where that is not possible, by creating new industries so that life and activity can be re-introduced. The alternative of depopulation and the loss of all inherited tradition is one to be resisted.

PROSPECTS AT HOME AND IN THE EMPIRE

The prospects for the present year, within the horizon of our home and of the British Empire, are such that we face it with confidence notwithstanding the clouds abroad. Abundant credit confidence notwithstanding the clouds abroad. Abundant credit has been available on very favourable terms to British industry in all its branches. Some fears have been expressed lest rising commodity prices and expanding trade should cause demands on our credit system which would enforce a reversal of this policy. I see no reason to anticipate embarrassment from any such development. In present conditions the power of our monetary authorities to influence the price of money is almost unlimited, and they are evidently determined to use it on the side of maintaining an adequate supply of credit. This was shown by their action, just before last Christmas, in transferring £65,000,000 of gold from the Exchange Equalisation Fund to the Bank of England, chiefly against securities taken from the Issue Department of the Bank. The net result of this transaction was an addition of £5,000,000 to the basis of credit, relieving to that extent the seasonal strain on the money market and increasing its resources for the future.

INTERNATIONAL OUTLOOK

Finally, I hope that this year may witness the beginning of an era of more cordial co-operation in international affairs, for which our Government has always worked so hard. The abandonment of the gold standard by the few stalwarts of the gold *bloc* last September had long been expected, with some apprehension concerning its immediate effects. As it turned out, having been carefully prepared for by our French neighbours with the co-operation of the American Government and our own, it was hailed as a turning-point in international monetary affairs, indicating that in future they were to be handled in a spirit of mutual assistance. The example of France was quickly followed by Holland, Switzerland and Italy; and, since Germany's adherence to the gold standard has long been more nominal than real, we can now say that the old gold standard, with its rigid parities that were at one time so useful to trade and long-term finance, is buried, possibly to be succeeded by some more elastic form of gold standard which would meet the needs of home trade besides securing international co-operation.

On the other side of the Atlantic, America is facing her problems with characteristic courage. Measures have been taken to prevent the development of speculative mania which had such adverse results in and after 1929, and the whole country seems to be full of determination to win its way back to industrial prosperity. Owing to the enormous consuming power of that great and wealthy country, to the complete recovery is of the highest importance to the rest of the world. Both South Africa and South America are deriving benefit from the higher prices of commodities, and in the Far East there are indications of more normal business conditions in China.

We hope that during the coming year political uncertainties may be less unsettling and that the aggressive tendencies of some of our European neighbours may be modified.

It will be the privilege of this country to exercise all the influence it possesses in the world of business to establish international understanding and intercourse, and so take a leading part in the development of the well-being of all nations. (Applause.)

I beg to move:—
"That the report and accounts, as presented, be received and adopted."

Mr F. A. Johnston seconded the motion, and the chairman having replied to shareholders' remarks, it was carried unanimously.

FORMAL BUSINESS

Sir Alfred Lewis, K.B.E., then proposed the re-election of Sir Harcourt Butler, G.C.S.I., G.C.I.E., Mr Colin Frederick Campbell, Mr Colin Cooper, Mr Francis Alexander Johnston, the Rt. Hon. Lord Aberconway, C.B.E., and Sir Victor Schuster, Bt., as directors. Mr C. G. Hamilton seconded the motion, and it was unanimously adopted.

On the proposition of Mr John B. Braithwaite, seconded by Mr J. Scovell Adams, Sir Nicholas Edwin Waterhouse, K.B.E. (of Messrs Price, Waterhouse and Company) and Sir William Henry Messrs Peat, Marwick, Mitchell and Company), Peat, K.B.E. (of Messrs Peat, Marwick, Mitchell and Company), were re-appointed auditors for the current year.

VOTES OF THANKS

Mr C. E. Bartholomew, O.B.E., moved a vote of thanks to the directors, general managers, branch managers and other officers of the bank for their efficient management and services.

Mr John Cadogan seconded the vote, which was cordially passed, and brief acknowledgments were made by the chairman and Mr Ernest Cornwall (chief general manager).

A vote of thanks to Mr Colin Campbell for his able conduct in the chair, proposed by Mr Edward Bramley and seconded by Mr Stuart Scrimgeour, concluded the proceedings.

HUNGARIAN COMMERCIAL BANK OF PEST

SUCCESSFUL YEAR'S WORKING

INCREASED PROFITS

A meeting of the board of directors of the Hungarian Commercial Bank of Pest was held, on the 19th instant, with Mr Philip Weiss in the chair.

The board confirmed that the balance sheet for the year 1936 shows a net profit of 4,354,312.90 pengő, as against 3,301,098.23 pengő in 1935, after allotting a considerable sum, exceeding the obligatory and usual allocations, to the pension fund, and without taking into account the carry-forward from the previous year.

ALLOCATIONS

The board of directors resolved to recommend to the 95th ordinary general meeting of the shareholders, to be held on February 3rd, at 4.30 p.m., the allocation, as last year, of 1,500,000 pengő for the payment of a dividend of 3 pengő per share; further to add 1,000,000 pengő to the ordinary reserve fund and 200,000 pengő to the reserve fund for depreciation of the bank's real estate. The benevolent funds of the staff are to receive 60,000 pengő, while the amount of 2,093,273.23 pengő is to be carried forward for 1937.

DEVELOPMENT IN ALL BRANCHES

The net profit for 1936 exceeds that of the previous year by 1,053,214.67 pengő, as a result of a healthy development in all branches of business. The amount applied to writing off was only 612,000 pengő. Although calculated on the usual rigorous basis, this amount is considerably less than the previous year's requirements.

The bank's profit and loss account this year for the first time shows separately the incomes and charges of the head office and branches. In the past, as far as the branches were concerned, only their net earnings were included in the figures.

DEPOSITS

Savings deposits increased roughly by 1,800,000 pengő, while current account deposits decreased by 5,450,000 pengő, making the aggregate amount of the deposits 290,210,000 pengő, or 3,664,000 pengő less than last year. The deposits of Hungarian account owners increased, but the current account deposits, on balance, show a reduction, which is accounted for by withdrawals of depositors abroad who availed themselves of improved transfer facilities.

The total of guarantee business increased from 26,122,000 pengő to 34,400,000 pengő.

Among the assets, the items of cash on hand and due from banks decreased from 40,106,000 pengő to 29,390,000 pengő, while claims outstanding rose from 108,645,000 pengő to 116,294,000 pengő and bills discounted from 145,098,000 pengő to 149,635,000 pengő.

VALUATION OF SECURITIES

The valuation of the securities has been made in accordance with the traditional conservative principles and without taking into account last year's advances in Stock Exchange quotations. The stock of Government and public loans and other securities decreased from 23,953,000 pengő to 22,217,000 pengő, and the participation in banking institutes and other undertakings diminished from 22,784,000 pengő to 22,213,000 pengő.

The volume of business shows a general increase.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

DISTRICT BANK LIMITED

EARNING CAPACITY FULLY MAINTAINED

NEW INDUSTRIES IN LANCASHIRE

COTTON EXPORTS TO INDIA

SIR R. NOTON BARCLAY'S REVIEW

The annual meeting of shareholders of District Bank Limited was held, on the 29th instant, at the Head Office, Spring Gardens, Manchester.

The Chairman, Sir Noton Barclay, presided. He said:—
Ladies and Gentlemen—I feel that my first word to you to-day must be with regard to the circumstances under which I find myself in this chair, which you have for so long been accustomed to see occupied by Sir Christopher Needham.

When he was reappointed chairman last year, Sir Christopher Needham informed the Board that as soon as certain matters then pending had been arranged it was his desire to be relieved of these duties. In September last he reminded his co-directors of this and then tendered his resignation, which was accepted with much regret by all his colleagues. The board thereupon did me the honour of inviting me to fill the office of chairman. Mr F. J. Dickens has succeeded me as deputy-chairman. In him I have at my side a man of wide experience and mature judgment.

Sir Christopher, who was first appointed to the board in 1915, has served the bank in the capacity of chairman for a period of over fourteen years with great distinction and an entire devotion to its interests. As you are aware, his work culminated in the merger with the County Bank and by the admission of the bank to the London clearing.

We are all glad that though he has vacated the chair Sir Christopher is retaining his seat on the Board, and we shall continue, therefore, to have the benefit of his ripe experience.

During the past year we have added to the board by the election of the Rt. Hon. Lord Balfour of Burleigh. I much regret that owing to his absence on a short trip to New Zealand he is unable to be with us to-day. I regret also the absence to-day of three other members of the board, Mr Hacking and Mr Beith, who are both in South Africa, and Sir Kenneth Lee, who is recovering from a recent operation.

BALANCE SHEET

You have before you the accounts for the past year, and I will refer in the first place to the balance sheet.

There is no change in the capital or reserve fund, which are equal in amount, a position enjoyed by only one other large bank. Current, deposit, and other accounts show an increase of more than £5,000,000 on last year's figures.

A rise of nearly £1,000,000 to £6,250,319 in the item endorsements, guarantees, and other obligations reflects to some extent a larger volume of business handled by our foreign department. The corresponding responsibility of customers to the bank is shown in the contra item.

Our assets are rather higher than last year. Money at call and short notice is more than £4,000,000 up, and shows to some extent how the additional deposits were employed. On the other hand, bills of exchange show a fall of £1,500,000, the bulk of which is due to the redemption of Treasury bonds included in this item last year.

The investments at £29,398,248 are approximately the same amount as a year ago, though you will observe that our holding in British Government securities has been increased and of other investments reduced. The market values of our investments, I might mention, are considerably in excess of the book values.

The advances at £27,398,273 show a gratifying increase over last year and reflect the improvement in trade experienced during the last few months. The debts are well spread, and full provision for all bad and doubtful debts has been deducted.

With regard to the bank property, which stands at £1,553,789, this is rather lower than a year ago. £50,000 has been provided in this year's accounts, and there have also been some realisations of redundant offices. On the other hand, we have continued to expand and have opened a number of new branches, including an office in Birmingham. In addition the expenditure on the head office alterations and extensions, which are now completed, is included.

PROFIT AND LOSS ACCOUNT

I refer you now to the profit and loss account. You will see that the net profit for the year after payment of all expenses, including directors' fees, and after full provision for all bad and doubtful debts, contingencies, and income tax, amounts to £490,324. This compares with £419,589, but it must be remembered that we had not a full year's profits from the County Bank last year.

With £261,103 brought forward there is therefore £751,427 available, and as you will see from the report we have appropriated to the pensions and annuities fund £70,000, and to the bank property item £50,000. After these dispositions have been effected and provision made for the dividend at the same rate as last year, there remains to be carried forward to the next year's accounts the sum of £269,236.

The difficulty of employing short monies at remunerative rates has persisted in the past year, and there is as yet no change in these conditions. It is, of course, necessary to keep a large proportion of our resources in a liquid state, and it is satisfactory to note that in spite of the low return on such funds the earning capacity of the bank is more than maintained.

The continued increase which is shown in the number of our accounts is encouraging. Statistics show that, although there has been little change in the distribution of capital in the last twenty-five years, the growth of the national capital has added considerably to the number of people whose incomes bring them into the classes from which bank customers are drawn. There is no reason why we should not anticipate a further increase of capital in the years which lie immediately ahead with a corresponding increase in the number of bank customers.

Sociologists, however, forecast that the population of this country should reach its zenith within the next decade, and that thereafter there will be a rapid and accelerating decline. Assuming they are correct in this forecast, the ultimate reaction on all business is incalculable.

In passing I would remark on the amazing fact that the serious decline in population which appears to face us in the not far distant future, with its inevitable reactions on all phases of our communal life, has provoked so little comment. To my mind, failing some unforeseeable change, this will ere long be a dominating factor which must govern all our future planning.

STAFF

I feel that I should refer to statements which have recently appeared in the Press regarding the remuneration of our staff. I welcome the opportunity of doing so, because those statements have not represented the facts, and I hope that you, as shareholders, have not been misled by the propaganda which has been circulated. I need scarcely say that the welfare of our staff is a matter of greater concern to us than it can be to the officials of any outside organisation which attempts to intervene, and it is our constant endeavour to see that the men and women who give us loyal service shall be enabled to live under conditions calculated to promote their welfare and happiness.

Many references have been made to certain anomalies which existed in the case of those who were formerly in the service of the County Bank, and whose remuneration in some cases compared unfavourably with that of the members of the District staff. The chairman of the County Bank, in the speech which he delivered at the meeting which authorised the amalgamation, said: "Our officials and staff will be taken over on terms in regard to salary and pension as advantageous as those which they now enjoy." That was a pledge with the fulfilment of which we might have rested content, but we went further. We realised that in one institution it was undesirable to have two scales of remuneration, and so we decided to remove such anomalies as existed and increase the pay of the County men where it was inferior. But time was needed for the fair and equitable adjustment of these matters, and our chief officials have had, as I am sure you will realise, many problems to deal with and many

ENGINEERING

adjustments to make in relation to the ordinary business of the bank during the period which has elapsed since the merger. Our Staff Committee, which is an independent and democratically elected body, was informed as long ago as February, 1936, of our intention to rectify anomalies in salaries, and that promise has now been fulfilled. I am satisfied that there is no legitimate cause of complaint. The rate of remuneration paid to our staff, the many provisions for their well-being, such as our pension scheme, and the help which is on occasion given to those who have to meet the major crises of life, constitute conditions which compare very favourably with similar employment elsewhere. I am happy to think that this is recognised by a majority of our staff.

During the past year the completion of the work involved by taking over the County Bank and arrangements consequent upon our entry into the London Clearing have necessitated considerable extra calls upon them. I desire to express to our Chief General Manager and the whole of the staff our appreciation of the willing and loyal manner in which they have responded to these calls and our cordial thanks for the efficient services which they have rendered.

DEVALUATION

The outstanding international financial development of the year has been the devaluation of the major gold bloc currencies. As a striking example of the value of international co-operation, it is interesting to observe that the recent action of Great Britain, France, and the United States with regard to devaluation has made it possible for many difficulties to be avoided. The reactions of countervailing duties, quotas, and competition in currency of depreciation have been avoided by agreement, and it is to be hoped that the beneficial effects of mutual assistance thus manifested will stimulate nations to continue to co-operate in the future and facilitate a general agreement regarding stabilisation.

COTTON

Fortunately the general improvement in the economic position in Great Britain has recently been reflected in an improved demand for yarn and cloth. There are no statistics available which show what proportion of the improvement is for home consumption and what proportion is for export, but from such figures as are available it is reasonable to deduce that the greater increase has been for home consumption.

The total export of cotton yarns in 1936 showed a slight increase as compared with 1935 from 141,674,600 lbs. to 150,935,200 lbs. On the other hand, the yardage of cotton cloth exported fell by 1.6 per cent. Whilst our exports to countries other than India increased by 94,917,000 square yards, or 6.7 per cent., this was more than offset by a decline in exports of cloth to India, which fell by 126,596,000 square yards, or 23 per cent.

BRITISH BARGAINING POWER

Various suggestions have been made that the Government should give assistance to Lancashire, but no concrete proposals have yet been put forward by any representative body. I feel sure that if any practical scheme could be formulated for the benefit of the cotton industry as a whole it would have the Government's sympathy. In the meantime the Board of Trade might give more assistance in view of the attitude of other nations and of our Overseas Dominions towards us. We have the power to bargain and we should use it.

Negotiations are shortly to be initiated for a new commercial agreement with India, and in this connection the continued fall in our exports to that country is a factor which cannot be ignored. Owing to our large purchases we are in a particularly favourable position to bargain. Apart from any other imports from India, Lancashire last year increased her purchases of raw cotton from £3,493,548 to £5,004,291. The economic position of India is improving, and a larger demand for cotton and rayon goods, perhaps particularly the better qualities, may not unreasonably be looked for. In view of our contributions to Indian export trade we have a strong claim for terms which will allow us a fair share of their import trade. It is essential that everything possible should be done to arrest the grave decline in Lancashire's exports to that country.

During the year a Spindles Board was set up to purchase redundant spindles under the Cotton Spinning Industry Act. Progress has been slower than was anticipated, possibly because the impoverished spinner hopes that continuance of the recent improvement in trade will enable him to recover his position.

Apart from demands connected with building, there was in 1936 a widespread movement for the re-equipment of factories which make heavy calls upon the engineering trades. To this may be added the increased demands of the railways and of transport generally for new equipment; also that of the motor-car factories, which experienced a busy year, whilst the rapid expansion in the home demand for electrical power and lighting brought an increase of business to the electrical engineering trades. In the latter part of the year the Government's defence plans were also producing a marked effect upon the engineering industry as a whole.

As a result of the enormously increased demands of the building, shipbuilding, and engineering trades the production of iron and steel enjoyed a prosperity which, a few years ago, would have been regarded as an impossibility. The British production of pig iron last year amounted to over 7,685,000 tons, an increase of nearly 20 per cent. as compared with that of the preceding year. The output of steel showed a still more striking improvement, being practically 11,700,000 tons, as against only 5,200,000 tons in 1931.

Producers are having great difficulty in satisfying orders within a reasonable period, for not only is equipment strained, but also raw materials are not easy to obtain at remunerative prices.

NEW INDUSTRIES IN LANCASHIRE

Lancashire is showing signs of success in her efforts to overcome the depression, and there is continuous adjustment to counteract the loss of a considerable proportion of her cotton export trade. New industries are being established in the county, and East Lancashire especially is showing a welcome tendency in this direction. The year has also seen new industrial establishments set up in the Manchester area, and an increase in the number of inquiries for business sites and premises. In the current year many firms have also acquired land for the purpose of extending existing works. The chairman of Trafford Park Estates has recently pointed out that "sending goods from London to each of the 45 towns in Great Britain which had a population of over 100,000 necessitates their being carried a total distance of 8,487 miles, but sending goods from Manchester to each of these towns (including London) necessitates a carriage of only 5,220 miles. Manchester thus shows a saving of nearly 40 per cent. in distribution distance to the whole of Great Britain." It is satisfactory to note that the volume of traffic on the Manchester Ship Canal continues to improve, and that the last season has been a record one in the importation of raw cotton to Manchester.

THE OUTLOOK

We look back upon a year in which there has been considerable recovery. This recovery, founded largely in the first place on building, both domestic and commercial, has in recent months expanded until practically all branches of industry are benefiting. Recently re-armament has taken a hand, and large orders placed by the Government are accentuating trade activity.

An estimate in *The Economist* puts the amount expended and to be expended by our Government on defence for the three fiscal years ending 1937/38, at the huge sum of £475 millions, and it is not easy to estimate the ultimate effect of such an uneconomic outpouring of public money. As a country whose prosperity is still essentially bound up with the export trade, we must regard as serious any influence which might cause our costs and prices to rise above those ruling in other countries. For this reason, although we are not alone in indulging in large expenditure on re-armament, our position is somewhat vulnerable, as we may find ourselves at a disadvantage through our rising costs in competition with these other countries. The difficulty with which this country may yet be faced, and in fact the effect has been brought home to us already, is the sharp rise in prices of foodstuffs. Our competitors are not all so dependent on external sources of supply for these products, so that our cost of living may be disproportionately raised.

The system of quotas and tariffs remains with us, and the real need of this country—a major recovery in our export trade—is thereby impeded.

A CAUTIOUS VIEW

Past experience has taught us to expect depression to follow expansion, and with trade steadily on the up-grade our present

The report was unanimously adopted.

RICHARD THOMAS AND COMPANY, LIMITED

MODERNISATION OF PLANT

SIR WILLIAM FIRTH'S SPEECH

An extraordinary general meeting of Richard Thomas and Company, Limited, was held, on the 25th instant, at Southern House, London, to consider resolutions increasing the capital of the company to £11,000,000 by the creation of 6,000,000 new ordinary shares of 6s. 8d. each, and increasing the borrowing power up to £10,000,000, or up to the amount of the issued capital for the time being, whichever might be the greater.

Sir William Firth (chairman and managing director), after referring in detail to the increase in the capital and the borrowing power, said: The standard method of manufacturing sheets and tinplates in the United States differs substantially from the British practice. The latter, speaking broadly, has changed very little during the past 30 years, while in America, during the past 14 years what is known as the Continuous Hot Strip Mill and Cold Reduction Method has become standard practice.

A SIGNIFICANT DEVELOPMENT

You may have noticed in the January issue of *The Iron and Coal Trades Review* a New Year's message from Mr Myron C. Taylor, chairman of the United States Steel Corporation, the largest steel company in the world, in which he stated that the most significant development was the completion and putting into operation in 1936, of three additional Continuous Wide Strip Mills, and the construction now under way, or about to be started, of six more. There is a Continuous Wide Strip Mill in course of erection in Germany, and one now being built in Russia under the American Rolling Mill Company's licence. It is therefore, no technical speculation to invest money in such a plant. The first plant was built in America some 14 years ago and its great success has led to the building of others by all the leading steel companies of America, and the total capacity of such plants, in America alone, including those in course of erection, approximates 11 million tons per annum. I do not anticipate the erection of numerous strip mills in this country, because, in the first place, the licence we hold gives to the company the exclusive right to manufacture strip sheets in Great Britain by the American Rolling Mill company's patented process, and grant licences, and, in the second place, the cost of such plant is substantial and cannot be undertaken lightly.

NEEDS OF THE MOTOR INDUSTRY

The following is an extract from representations made by the Society of Motor Car Manufacturers and Traders, Limited, to The British Iron and Steel Federation, issued this month. It reads:—"Apart from all questions of price and productive capacity the motor industry is also seriously concerned regarding the quality of certain British steels. In this direction the problem is most acute in the case of sheet steels, used in the production of motor-car bodies.

"Unfortunately, continual trouble is caused by the quality of the British material, the temper of which is so inferior that fractures frequently occur, interrupting the steady flow of sheets through the presses. The breaking down of flow production, which the industry is trying so hard to maintain, retards its competitive position both at home and overseas. This trouble has been so marked in recent months that in spite of their determination to buy British where possible, some motor manufacturers have been forced to consider importing American material although the delivered prices are slightly higher. These prices, incidentally, are only greater, by a few shillings per ton, and this, after rail charges in America, Dock dues, ocean freight, insurance, import duty and rail charges in this country have been added.

"In some quarters the opinion is held that taking into account the smaller scrap losses, and the unbroken run of pressings, American material could be used more economically. This is obviously not a course which the motor industry wishes to follow, as its sole desire is to support United Kingdom industry. It must, however, have the co-operation of the steel industry. It is hoped that, with the rolling mills working to capacity some further definite and determined efforts will be made to modernise plant and processes so that consumers may be assured of improved quality and better delivery. The motor industry is aware of the research into the subject of deep pressing which is proceeding, and is gratified also to hear that proposals are afoot to establish in this country a rolling mill of the type now used with such success in America, and working on the continuous cold reduction process. Its introduction in this country will be regarded with the greatest interest and it is earnestly hoped

that, when brought into operation, it will be used to produce the type of material required for the production of motor bodies."

NEW MODERN STEEL WORKS AT EBBW VALE

I think you will agree that if you had up to now any doubt about the wisdom of your directors in building a modern plant, this considered opinion of the motor industry as a whole will cause you to change your opinion. You will appreciate that it would be of little use to have modern rolling equipment if we delivered to it inferior steel. We have therefore committed you to build a modern steel works, adjacent to this American hot and cold strip mill, where special qualities will be made, and delivered without carriage cost, to the adjacent slabbing mill, which will form part of the hot and cold reduction strip mill plant. We shall have at Ebbw Vale the most modern sheet and tinplate plant in the country, equal to any in the world, consisting of coke ovens, by-product plant, blast furnaces and steel furnaces and the American type plant, already referred to, and shall, from our own coal, limestone and ore, mixed with imported ore, manufacture sheets and tinplates equal to any in the world, and this quality will be attained at a cost lower than is possible of attainment in old type plant. We have informed the trade that we intend to work this new plant fully.

We do not anticipate any serious diminution in operations in our old type plants arising from our ownership of these modern mills. In any case, whatever the risk in that direction may be, it is, in my judgment, of national importance that Great Britain should possess at least one modern sheet and tinplate mill and be in a position to produce a quality of material equal to that produced elsewhere. It cannot be without satisfaction to shareholders that, although foundation work will be somewhat more expensive than it might have been on the most favourable sites, the new works are being erected in a distressed area—in a district where workmen have patiently suffered enforced idleness for many years.

[FUTURE] EARNING CAPACITY

As to profits, for the six months ending last September our gross profits were better than the same six months of the previous year to the extent of £138,000, and your directors estimate that we shall earn during the 12 months ending March next not less than £1,450,000 gross.

We intend to increase our depreciation allocation by £125,000, making it £350,000, and on this basis there will remain, after providing for all interest charges and preference dividends, approximately £600,000, making available for income tax reserves and dividend on the ordinary shares ranking for dividend an amount equal to 19 per cent. of the present issued capital. These are, of course, group figures. These profits will have been made against lower profit margins than rule to-day, and it is therefore reasonable to assume that next year our profits will be higher than for the current year, and I shall be disappointed if, in 1940, when the new plant is in operation, we earn less than £2,500,000 gross, which, after providing £650,000 per annum for depreciation, would leave available for dividend on ordinary shares, income tax and reserves, a sum equivalent to approximately 26 per cent. on the nominal amount of the ordinary share capital if the debentures by then have not been converted. If they had been converted, the sum available would be equivalent to an earning power of 21 per cent. Conversion, however, would rid the ordinary shareholders of the prior charge of £280,000 per annum, and increase the depreciation and reserves to approximately £10,900,000 as against a combined issued capital—preference and ordinary—of £9,828,679 and no debentures.

If we should return to a period of chaotic competition and the world should not succeed in finding a solution of its present grave problems, and we are faced with open competition, then the position of your company will be second to none in this country, because, in open competition, the possession of such modern plant as we shall have will give us a lower average cost than that of competitors, and a superior quality to what competitors have to offer, and these conditions, supported by our very strong selling organisation which is in direct contact with consumers all over the world and all the leading consumers in this country, will enable us, I have no fear, to achieve results that will compare favourably with those of any competitor.

Your directors cannot do more than give you an assurance that possession of this modern plant will put your company in the front rank of all sheet and tinplate producing countries in the world and ahead of any sheet and tinplate company in this country.

The resolutions submitted were unanimously approved.

NIGEL VAN RYN REEFS, LIMITED

INCREASE OF CAPITAL APPROVED

An extraordinary general meeting of the company was held at Winchester House, Old Broad Street, London, E.C.2, on Tuesday, January 26, 1937, at which it was resolved:—

1. To increase the capital from £100,000 to £200,000, and
2. To amend the Articles of Association.

In the absence of the chairman, Mr W. A. Wills, Mr Richard Humble presided, and explained that the first resolution was merely a precautionary measure in case, at some future time, it might be considered advisable to issue further capital either for cash or the acquisition of properties. For the present the directors had no projects in view and saw no prospect of an early issue.

With regard to the second resolution, these were amendments to the Articles of Association required by the committee of the Johannesburg Stock Exchange before granting an extension of the existing permission to deal. The Chairman explained this was necessary in view of the fact that the majority of the shareholders were domiciled in South Africa.

The company's solicitor, Mr Ernest Salaman, offered to explain any individual amendment or amendments if any of the shareholders present required elucidation.

Both resolutions were put to the meeting and declared by the Chairman to have been carried.

The proceedings then closed.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended January 23, 1937, amounted to £36,761,000, against ordinary expenditure of £11,574,000. After allowing for a decrease in Exchequer Balances of £148,131, the operations for the week, as shown below, decreased the gross National Debt by £25,335,000 to approximately £8,000 millions.†

COMMERCE AND TRADE

SURVEY OF COMMODITY PRICES

WITH the strike situation in the United States showing no improvement, the pause in the general upward movement of commodity prices continued this week. But movements were rather irregular, and no general down-turn was discernible.

The event of the week was the decision of the International Rubber Regulation Committee to leave the production quotas for the first two quarters of the current year at 75 and 80 per cent. of standard respectively, as previously arranged, but to permit exports at the rate of 85 per cent. during the third quarter. Since the market had feared that the Committee might take steps to increase current supplies, this decision exerted a bullish influence, which was more than sufficient to outweigh the effect of the interruption of activity in the American automobile industry. Base metals were somewhat irregular. Copper staged a recovery and spelter was also somewhat higher, but lead lost some ground and tin was again rather weak. Irregular movements also occurred in the textiles group. Thus, American cotton was marked up, but Egyptian sakel again eased in price; raw wool was dearer, but tops relapsed sharply. Hemp and jute were rather cheaper, but flax enjoyed an improvement over last week's rates.

Increased selling pressure and a dull demand were responsible for a further fall in the price of wheat; other grains and flour followed suit. Linseed was affected by similar influences, and

prices eased in a dull market. Among other foodstuffs, meat and bacon were practically unchanged, but eggs recovered slightly on shorter supplies. Colonial makes of butter and cheese were cheaper, and the recent spectacular rise in cocoa was reversed. By way of contrast, competition at the Mincing Lane tea auctions was strong and quotations again hardened.

Mainly in consequence of the drop in grains, prices of primary products in the United States were again lower. Thus, Moody's index of the dollar prices of staple commodities (December 31, 1931 = 100) fell from 207.9 on January 20th to 205.3 on Wednesday last, against 206.5 a month ago and 171.4 on the corresponding day last year.

COAL

SHEFFIELD.—The position of the export coal trade shows little change from last week. Inquiries for prompt shipment and forward deliveries are good, but prices are not suiting buyers. The supply of coke is short, and the situation will not ease until later in the year, when the new coke ovens are producing. Blast-furnace qualities are in good demand. Household coal is in strong request, and prices are firm. Industrial fuels continue active.

NEWCASTLE-ON-TYNE.—The difficulty that confronts colliery managements in the North-East coalfield to-day is the problem of obtaining increased production to meet the "boom" conditions which have so suddenly come over the market. Output is temporarily affected by the influenza epidemic, but apart from this there is a shortage of suitable workmen in areas where output could be considerably increased. All classes of coal are in keen demand, and prices tend to higher figures. Best Northumberland steam coal is 19s. 6d., with doubles and singles 18s. 6d.,

(s) Represents dividend and bonus 10 per cent. against 3 per cent. for previous year.

and trebles 19s. per ton f.o.b. Coking coal is very scarce, prices being around 19s. 6d. f.o.b. for almost any class. Bunker coals are exceedingly firm, prime brands having been sold for next month's shipment at 20s. per ton f.o.b.

GLASGOW.—The main feature of the market is the pronounced scarcity of supplies for new business. Collieries are heavily booked for some time ahead, and with the requirements of industry, public utility undertakings and household consumers on a large scale, little surplus remains to meet the inquiries of foreign buyers, notwithstanding that these are of such proportions as would normally be very welcome. The position has recently, of course, been aggravated by minor labour stoppages, but apart from such influences, is nevertheless quite serious from the point of view of shippers, who find difficulty in many cases, in fact, in securing quantities contracted for. It seems clear that efforts must be made to introduce a greater measure of elasticity, for at such times as the present it is essential, with a view to the future, to maintain export connections. In the circumstances, shipment prices are mainly nominal.

CARDIFF.—The scarcity of steam coals for prompt positions has been accentuated, and quotations for practically all these classes have recorded further advances during the past week. Best Admiralty large are now ruling up to 22s. 6d., and best second 21s., while best Monmouthshires ruling up to 18s. 6d. to 19s. 6d. and Eastern Valleys from about 17s. 6d. to 18s. 6d. Most grades of smalls have also hardened, with coking 17s. 6d. to 18s. 6d. Quotations for bituminous descriptions classes now ruling up to 16s. 6d. Quotations for market Genoa options are firmer. show no change, but in the anthracite market Genoa options are firmer. The disorganisation of stems as a result of the gales reacted unfavourably on shipments last week, and at 956,100 tons they were nearly 15,000 tons less than in the previous week, and 36,000 tons less than in the corresponding week last year. The docks, however, are better supplied with tonnage this week, and loading, therefore, is more active, particularly at the Barry Docks. Coke, patent fuel and pitwood are unchanged. There are inquiries in the market for 100,000 tons of large steam coals for the Italian State Railways, and for 15,000 tons of sized coals for the Mauritius Railways.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that in most sections of the markets the difficulty of placing orders for reasonably near delivery dates is limiting the volume of business.

In the pig-iron market production is rationed amongst consumers; but stocks have been reduced to a minimum and little headway has been made in overtaking arrears of deliveries. In some districts slightly easier conditions have developed and a certain amount of pig iron has been released for export. The quantities, however, are small and quite inadequate to meet the heavy inquiry from abroad. Recent price advances in the home market have had no influence upon the demand, and consumers of all kinds of pig iron would willingly book for larger orders than the producers can see their way to accept in the present congested state of their order books.

In the semi-finished section the demand is considerably in excess of supply, and anxiety is felt regarding the position which may develop later in the year. Disappointment has been caused by the delay in the arrival of Continental semis owing to the shortage of steel which now prevails in the principal manufacturing countries.

Acute scarcity also rules in the finished steel market, notwithstanding the heavy tonnages which are being delivered by the makers to the consuming works. Although there is a heavy export inquiry, the quantities available have had to be severely restricted in order to meet so far as is possible the requirements of the home market.

SHEFFIELD.—The position in the iron and steel market shows very little change, and there is barely enough material to meet consumers' needs. Makers of forge and foundry iron are fully contracted and accept it. Buyers business could easily be placed if producers could accept it. On the other hand, the accumulation of stocks at works and furnaces is out of the question, and the increasing shortage of supplies is causing anxiety. Requirements for basic pig are still greater than supply. Lincolnshire makers remain off the market completely, which puts a heavy load on Derbyshire material. With regard to East and West Coast hematite, the position is practically unchanged, makers finding difficulty in meeting their commitments and are not anxious to undertake new business at present. In finished iron, business is stronger than for some considerable time, common and marked bars being in active demand. Crown iron is not in such keen request, though requirements are increasing. The demand for basic steel billets cannot be met in full, despite the fact that production is on the up-grade. In the case of acid billets, the position is not quite so difficult. The growing armament work in this district is making it somewhat awkward to keep pace with ordinary work, and the demand for special steels has made it necessary to increase production capacity as it is difficult with the present output fully to meet requirements. Electric and open-hearth furnaces are working to capacity, and owing to heavy Government work steel foundries and rolling mills are fully employed. Quotations everywhere are unchanged.

MIDDLESBROUGH.—The blast furnace which was lighted at the Skinningrove works a week ago will produce basic iron, the number now in operation in this district being 31, of which two are producing foundry iron, 11 hematite, and 18 other kinds. Total shipments of pig iron from the Tees, up to and including January 26th, amounted to 6,551 tons, against 6,410 tons for the corresponding period of last month. Production is still below demand, and, whilst buyers are keen to negotiate new business, there is very little pig iron available for prompt and, consequently, actual business being transacted is small. Official prices, both for foundry pig iron and East Coast hematite, are unaltered.

Producers of semi-finished steel are doing all they can to meet the requirements of re-rollers, who are now finding it increasingly difficult to secure sufficient supplies of foreign material.

In the finished steel departments, manufacturers are very busy, and, in some cases, are finding it difficult to keep deliveries up to contract requirements. An increase of 12s. 6d. per ton has been made in the price quoted for plates and sections for export. Sheet makers are asking a premium on the list prices to home users in view of the recent official advance in the export price. It is reported that a proposal is under consideration to place an embargo on the export of scrap iron and steel. In the meantime, heavy steel melting scrap is in strong demand, and can easily be sold at 62s. 6d. per ton delivered at the works. The price of good Durham blast-furnace coke is 25s. 6d. per ton delivered at the furnaces here, with sellers not keen to contract too far ahead. Arrivals of foreign ore have been delayed, to some extent, by bad weather, but there is actually no shortage.

GLASGOW.—The situation in the West of Scotland is unchanged. While steel makers, makers of semis and re-rollers are all running plants to capacity, they are unable to meet the demands made upon them, and are anxious concerning future supplies. All users of steel are unable to

make contracts for such regular deliveries of their particular raw material as would ensure them being able to meet the obligations they have already undertaken. The demand for finished steel is also far in excess of production, and, while prices continue to advance both for home and export business and deliveries quoted are in most cases for months ahead, buyers are willing to place orders under these conditions. In Glasgow and district manufacturing concerns are all busy and new work is plentiful, while inquiries also are numerous and include much important business. The position at the Clyde shipyards continues to improve.

CARDIFF.—The feature of the tinplate trade last week were exceptionally heavy shipments, which totalled 9,128 tons, compared with 3,685 tons the previous week and 4,160 tons in the corresponding week last year. Tonnage conditions were the chief reason, but the demand is quite good both for the export and inland trades, although production is not as high as it was in December. Prices for tinplates and sheets, as well as bars, are unchanged but firm. The scarcity of scrap is handicapping operations at the melting furnaces, and in some quarters users are asking for increased importation of foreign steel-bars.

OTHER METALS

COPPER.—After wide fluctuations prices closed on Wednesday £1 up at £52 8s. 9d. for cash and £52 10s. for forward. There have again been fairly large sales, but all offerings were well absorbed. The recovery in copper prices was to some extent connected with a major explosion at the Chilean Chuquicamata mine—the largest copper mine in the world. No reports as to the damage done by the explosion are available. But since the explosion occurred in a powder magazine and not in the mine itself, the Chilean output will probably not be greatly affected.

According to the British South Africa Company, Ltd., the Northern Rhodesian copper output amounted to 17,132 tons in December last, as compared with 14,636 tons in November and approximately 10,900 tons in the months before the various increases in quotas. The Rhodesian output for the whole of 1936 was 142,340 tons, against 143,500 tons and 137,897 tons respectively in the two preceding years. Rhodesian producers have thus been able to make full use of the 50 per cent. increase in production quotas of last autumn.

Sales on the London Metal Exchange: 2,500 tons on Monday, against 5,750 tons last week; 2,500 tons on Tuesday, against 4,300 tons last week; 2,500 tons on Wednesday, against 4,100 tons last week. Domestic spot was quoted at 12.37½ cents per lb. in New York on Wednesday, against 12.27½ cents a week ago and 11.57½ cents a month ago. Wednesday's official closing price for standard cash in London was £52 8s. 9d. to £52 10s., compared with £51 8s. 9d. to £51 10s. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 44,155 tons, showed a decrease of 883 tons, while stocks of rough copper, at 1,057 tons, were 50 tons smaller.

LEAD AND SPELTER.—Both metals fluctuated sharply during the past week. While lead closed 1s. 3d. lower at £27 5s., spelter, at £21 16s. 3d., experienced a net gain of 11s. 3d. The latter development is connected with a report that there are some difficulties with some of the underground workers of the Zinc Corporation (the well-known Australian producer), which, according to the company's own statement, is adversely affecting its mine output. The basic position of both markets has not materially changed during the past week, although turnovers at the London Metal Exchange—particularly in the case of spelter—have shown a considerable decline.

Sales of lead on the London Metal Exchange: 1,750 tons on Monday, against 2,100 tons last week; 1,300 tons on Tuesday, against 2,050 tons last week; 1,200 tons on Wednesday, against 2,700 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 6.00 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £27 5s. per ton, compared with £27 6s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 1,100 tons on Monday, against 5,000 tons last week; 1,300 tons on Tuesday, against 4,050 tons last week; 1,700 tons on Wednesday, against 3,000 tons last week. Wednesday's quotations in East St. Louis was 6.00 cents per lb., against 6.00 cents the week before and 5.45 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £21 16s. 3d. per ton, against £21 5s. last week.

TIN.—The market was again adversely affected by the United States strike movement which imposes serious restrictions on the buying activities of the largest tin consumers in the world. In addition, offerings are increasing; so that there is the possibility of a further slight deterioration in prices unless United States buying revives. According to the International Tin Research and Development Council's preliminary figures, the world tin output amounted during 1936 to about 171,000 tons, against 140,700 tons in 1935. Consumption reached 154,000 tons, against 142,500 tons. These figures give little basis for an improvement in the price of tin.

Sales of tin on the London Metal Exchange: 260 tons on Monday, against 150 tons last week; 200 tons on Tuesday, against 200 tons last week; 315 tons on Wednesday, against 175 tons last week. The New York quotation on Wednesday was 50.10 cents per lb., against 51.10 cents a week ago and 51.45 cents a month ago. Wednesday's official closing quotation in London for standard cash was £227 to £227 5s. per ton, compared with £229 10s. to £229 15s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,391 tons, a decrease of 51 tons on the week.

PLATINUM.—Platinum prices, which had been stationary at £9 15s. per ounce since October 23, were raised by £2 on January 26th. The increase was due to the activities of the New York market, where a large demand by hoarders is in evidence. It is believed that this demand is connected with the restrictions imposed on holdings and movements of gold in various countries and that, therefore, no early signs of an abatement will occur. Industrial demand for platinum is running on a very high level at present, but offerings are quite sufficient to cover any possible demand by hoarders. Should prices be forced up further in connection with the demand by hoarders, the supply of old platinum, which has disappeared since prices have been at a low level, is likely to revive and may then lead to major disturbances in the market position of this metal.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 6s. per flask of 76 lbs., against £14 6s. a week ago. Chinese antimony was quoted at £65 per ton ex warehouse, as against £64 to £65 per ton last week. Chinese wolfram for "January-February" shipment was quoted at 34s. to 35s. per unit, c.i.f., compared with 33s. 6d. to 34s. 6d. last week. Refined platinum was raised from £9 15s. to £11 15s. per ounce.

TEXTILES

COTTON.—**Manchester.**—During the past week spinners and manufacturers have made further progress and most producers have sold more than current output. The general improvement in the market has been accelerated since the beginning of the year. Only minor fluctuations have taken place in raw cotton prices, the level of values being generally unaltered. Some particulars have been announced with regard to the plan in the United States for releasing loan cotton, but a good deal of confusion exists. There are fears in some quarters of an appreciable increase in the area under cultivation for the new crop. In the meantime consumption continues at a high level.

Prices for American yarns have again advanced and spinners have widened their margin of profit. The improvement has been particularly noticeable in ring beams. The larger sales have been well maintained. Demand in Egyptian qualities has been somewhat irregular, but some producers have had a better week. Steady buying has occurred in shipping yarns for India and the Continent.

A substantial business has again been done in piece-goods for foreign outlets. Speculative buying by local Indian merchants has contracted somewhat, but a larger indent trade has been done. A feature of the buying has been the activity in light bleachers and white shirtings, but printed and dyed fabrics have also moved off freely. Fancies have been booked for Hong Kong, Java and the Straits Settlements. More activity has shown itself in light bleaching descriptions for Egypt. Further buying has taken place in heavy shirtings and printed and coloured goods for West Africa with encouraging orders in printed and dyed sorts for South America. Rather more has been done in fine cloths for the Continent. The sales in home trade fabrics have been larger, the demand covering a wide range of goods. More idle looms have been restarted.

JUTE.—**Dundee.**—Some discontent has arisen in Indian jute mill circles, and the uncertainty as to what is to happen has created a weakness in the goods market. The Hooghly Jute Mill has been refused permission to extend the number of looms beyond 200 hessian and 254 sacking and has, in consequence, intimated resignation from the Mills' Association. As six months' notice must be given to the governing body, it will be near the end of July before withdrawal can be effected. There are rumours that other mills are displeased with the workings of the Association and a note of anxiety has crept into the trade. It will be remembered that strenuous efforts were made by the Associated mills to get the non-member mills to become members and work in conjunction with the Association, but though sixteen months have elapsed since the controversy first began, the question seems to be no nearer a solution and the "outside" mills continue to work as many hours as they please, generally 108 per week, compared with the Associated Mills' 54.

Raw jute is being fairly well maintained in price. The imports into Calcutta and Chittagong for the first six months of the season to December 31st last were 6,683,000 bales, compared with 4,938,000 bales for the same period last season, of which the Indian Mills have received 4,166,000 bales and 2,778,000 bales respectively. The additional quantity this season will be required to meet their greatly increased consumption. Exports for the six months totalled 2,350,000 bales, against 2,201,000 bales showing that the augmented production in India is not adversely affecting output in other countries. During 1936 the Indian mills produced 525,555,956 yards more of hessian cloth and bags and 130,497,219 yards sacking cloth and bags than in 1935, the combined total last year being 3,179,188,547 yards, representing 1,070,671 tons.

The full group of Daisee-2/3 fell to £18 8s. 9d. done, but since recovered to £18 12s. 6d. and Tossa-2/3 to £19 8s. 9d., February-March. Good First Marks and Lightnings are nominal in the absence of offers, while Heart CCP is quoted at £19 2s. 6d. and Ram at £19 5s., same shipment. Spinners are only buying small quantities.

A large business has been done in jute yarns and spinners are all very busy. Common 8 lb. cops have been sold at 2s. 1½d. and 2s. 2d. and 8 lb. spools at 2s. 2½d. and 2s. 3d., and the higher rates are now the lowest that spinners will accept. Other yarns are firm.

Cloth business continues quietly but steadily, and prices are well maintained at 2½d. for 10 oz. 40 in. and 2½d. for 8 oz. A good inquiry prevails.

Calcutta Hessians dropped sharply to 16s. 9d. for 10 oz. 40 in. and 13s. 5d. for 8 oz., February-June.

GRAIN MARKETS

WHEAT.—In response to increased selling pressure and a dull demand, the price of wheat was easy at the end of last week. Although a better tone was evident in the first half of the current week, prices showed a net loss at the close on Wednesday. Shipments from Argentina have been particularly heavy recently. Meanwhile, according to *The Corn Trade News*, Germany is accumulating a reserve of foreign wheat, while Italy seems likely to import larger supplies than had generally been supposed.

On Wednesday last, "May" futures were quoted in Chicago at 126½ cents per bushel, against 130½ cents the week before and 135½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 49s. 9d. per 49½ lbs., against 50s. 9d. a week ago; No. 2 Northern Manitoba, ex ship, 48s. 9d., against 49s. 6d. a week ago. According to *The Corn Trade News* total shipments of wheat and flour last week totalled 2,207,000 quarters, against 1,535,000 quarters in the previous week and 1,352,000 quarters in the corresponding week a year ago.

FLOUR.—The market remains quiet and prices have again eased. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 39s. 6d. per 280 lbs., against 40s. a week ago; delivered inner London, 39s., as compared with 39s. 6d.

a week ago. Manitoba patents, ex store, 37s. to 38s. 6d., against 37s. 6d. to 39s. a week ago. Australian, ex store, 33s., against 33s. 9d. a week ago.

BARLEY.—After another week of dull trading, prices are again lower. "May" futures were quoted at 80½ cents per bushel in Winnipeg on Wednesday, against 80½ cents a week ago. Quotations per 44½ lbs. in London on Wednesday were: "English feed" at farm, 36s., as against 36s. to 38s. a week ago; "English malting" at farm, 38s. to 50s., against 38s. to 50s. last week. Californian (new), ex ship, 51s. to 60s., against 51s. to 60s. last week; Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 49½ cents a bushel in Chicago, against 51½ cents a week ago and 51½ cents last month. Quotations in London, Wednesday: "English Black," at farm, 25s. to 27s. per 33½ lbs., against 25s. to 27s. a week ago; "English White," at farm, 25s. to 27s., against 25s. to 27s. a week earlier; mixed Canadian feed (Vancouver), landed, 23s. 9d. per 320 lbs., compared with 23s. 9d. last week.

MAIZE.—In sympathy with wheat and in response to heavier shipments from Argentina and excellent crop prospects in that country, the market has again eased. "May" futures were quoted on Wednesday at 106½ cents per bushel in Chicago, against 107½ cents a week ago and 105½ cents last month. Quotations in London, Wednesday: "Plate," landed, 24s. 6d. per 480 lbs., compared with 25s. 3d. a week ago; "Plate," ex ship, 23s. 6d., as against 24s. 3d. a week ago; "Plate," January, 23s. 9d., as against 24s. 3d. a week ago; yellow maize meal, ex wharf, was quoted at £6 10s. to £6 12s. 6d. per ton, as against £6 12s. 6d. to £6 17s. 6d. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	Jan. 29, 1936	Dec. 30, 1936	Jan. 20, 1937	Jan. 27, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	86½	129	123	119½
Chicago (No. 2, Winter) —Cents per 60 lb.	98½	101½	99½	135½	130½	126½

The visible supply of wheat in Canada amounts to 56,288,000 bushels, against 58,280,000 bushels last week, and 130,545,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat.....	Cwts.	Cwts.	Cwts.	Cwts.
1 week to January 23.....	285,131	365,964	430,164	343,038
21 weeks to January 23.....	6,508,883	8,135,975	8,181,487	6,235,077
Average price of English wheat per cwt.	s. d.	s. d.	s. d.	s. d.
	4 4	4 10	6 6	9 11

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
January 21, 1933.....	Cwts.	Cwts.	Cwts.	s. d.	s. d.	s. d.
January 20, 1934.....	241,550	242,427	39,495	5 4	6 11	5 9
January 20, 1935.....	285,131	251,263	51,401	4 4	9 4	5 7
January 26, 1935.....	365,964	267,119	54,588	4 10	8 0	7 0
January 25, 1936.....	430,164	262,375	52,155	6 6	8 2	6 0
January 16, 1937.....	258,780	321,321	73,362	9 11	10 1	8 4
January 23, 1937.....	343,038	382,587	69,672	9 11	10 3	8 5

OTHER FOODS

BACON.—Demand has been quiet this week. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English: 90s. to 94s.; Canadian, 80s.; Danish, 90s., the same as last week. Arrivals in London last week included Danish, 12,118 bales; Canadian, 7,385; Dutch, 2,302; Lithuanian, 748, and Polish, 2,049, as against 13,520, 7,387, 2,353, 1,105 and 2,592 bales, respectively, in the previous week.

BUTTER.—The market for Colonial makes eased under a slow demand; a better business was encountered at the lower level. Danish has risen in price this week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 89s.; Australian, choicest salted, 88s. to 89s.; Danish, 116s.; compared with 93s., 93s. and 112s., respectively, a week ago.

CHEESE.—Cheese has again been a quiet market, and prices for Colonial descriptions are lower on the week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 86s. to 88s.; Canadian, finest coloured, 71s. to 72s.; and New Zealand, finest coloured, 51s.; against 84s. to 88s., 70s. to 72s., and 52s. 6d., respectively, a week ago.

COCOA.—After the remarkable advance of the past few months, a sizeable reaction occurred this week. The spot quotation in New York on Wednesday was 11½ cents per lb., as against 12½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, February-March, was quoted 52s. per 50 kilos, c.i.f. Continent, against 56s. 6d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 11,269 bags; delivered, for home consumption, 6,223 bags; exported, 169 bags; stocks, 124,800 bags, against 119,627 bags a year ago.

COFFEE.—The London spot market has been steady. In New York prices were marked up at the end of last week, and a quiet tone has since prevailed. On Wednesday, Rio No. 7 (cash) was quoted at 9½ cents per lb. in New York, as compared with 9 cents per lb. last week and 8½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 149 cwt.; delivered, for home consumption, 72 cwt.; exports, nil; stocks, 8,192 cwt., against 12,493 a year ago.

Central and other South American, landed, 5,799 cwt.; delivered, for home consumption, 2,351 cwt.; exported, 1,749 cwt.; stocks, 58,331 cwt., against 59,253 last year. Other kinds: landed, 4,042 cwt.; delivered, for home consumption, 3,710 cwt.; exported, 486 cwt.; stocks, 103,401 cwt., against 132,664 last year.

EGGS.—Prices recovered somewhat this week, on smaller arrivals. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 12s. 6d. to 13s. per 120, as against 12s. to 12s. 3d. last week; while Danish (15½ lb.) made 9s. 3d. to 9s. 9d., as against 8s. 9d. to 9s. last week.

FRUIT.—Partly on account of weather conditions, business at Covent Garden market has been rather slow this week, states *The Fruitgrower*. A spell of cold weather would now be welcome. Demand for apples is moderate, with stocks moving slowly and prices generally easier. English Cox's receive the best inquiry. Pears are in short supply and hold their price despite an inactive demand. Few English are on the market, and Californian are clearing slowly. Some excellent peaches and nectarines have been to hand this week from South Africa, while the first of the new season grapes from the same source are due in a few days, together with larger supplies of pears. Hothouse grapes remain short, and consequently sell at firm prices. Oranges are a slack trade, with ample supplies on hand, and prices are generally easier. Grape fruit sell rather better, but lemons are cheaper on a slow demand.

MEAT.—At Smithfield Market, business has been on a moderate scale and prices show little alteration. On Wednesday last, Argentine chilled hindquarters were quoted at 4s. 2d. to 4s. 6d. per 8 lbs., as compared with 4s. to 4s. 4d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,873 tons and an increase of 805 tons on the corresponding week last year. Beef and veal accounted for 5,116 tons, mutton and lamb 2,999 tons, and pork and bacon 943 tons, as compared with 4,961, 2,505 and 929 tons, respectively, in the same week of 1935.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Jan. 23, 1936.....	d.	d.	d.	d.	d.	d.	d.
Dec. 3, ".....	12.83	12.74	13.80	10.77	10.28	11.82	12.84
Dec. 10, ".....	12.67	12.44	14.50	11.61	10.24	11.61	13.03
Dec. 17, ".....	12.55	12.42	14.51	11.47	10.30	11.58	12.92
Jan. 7, 1937.....	12.54	12.58	14.67	11.47	10.35	12.14	12.97
Jan. 14, ".....	12.82	12.66	15.14	11.87	10.64	12.12	13.31
Jan. 21, ".....	13.12	12.95	15.42	11.75	10.71	12.21	13.53
Jan. 28, ".....	13.47	13.26	15.58	12.41	11.08	12.31	13.83

The quantities catalogued for this week's public auctions in Mincing Lane comprised 50,006 packages of Indian and 19,540 packages of Ceylon tea. The market in Indian grades was again strong and active, with quotations showing an advancing tendency. At Tuesday's Ceylon auctions there was a strong demand for plain and low medium teas up to 1s. 2d. per lb., and these were rather dearer. The higher-priced teas were rather irregular, but were usually dearer. Export demand was good.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampung, spot, in bond, was quoted at 3½d. per lb., sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, 2 tons; delivered, 19 tons; stocks, 1,802 against 1,527 last year. White, landed, 138 tons; delivered, 45; stocks, 11,754, compared with 13,357 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. 3d. per cwt., ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. New crop, "January-February," in singles to Continent and U.K., was quoted at 9s. 6d. per cwt., against 9s. 7½d. last week. Movements in London last week were as follows: Landed, 382 tons; delivered, 251; stocks, 1,291 tons, against 3,874 a year ago.

SUGAR.—In London the spot market in raw sugar has been firm, but rather quiet. The New York spot market has been quietly steady. The spot price in New York on Wednesday was 3.75 cents per lb., as compared with 3.75 cents per lb. last week and 3.90 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "March" delivery at 6s. 0½d. to 6s. 1½d., against 5s. 10d. to 6s. a week ago.

VEGETABLES.—Canary Island tomatoes are easier at Covent Garden this week, and are not expected to improve, states *The Fruitgrower*. Steadily increasing supplies of cucumbers encounter only a moderate inquiry. Forced asparagus has eased on heavier arrivals, but house-grown beans are firmer. Rhubarb is down a point, on larger arrivals, and mint is more in evidence. Mushrooms are easy. Greenstuff remains plentiful and cheap, but cauliflowers are doing a little better. Onions are cheap, with looks a fair trade. Supplies of potatoes at the various London markets show a tendency to increase, but trade has been slow. At the Borough on Tuesday, quotations for best siltland King Edward were maintained at from 9s. to 9s. 6d. per cwt. ex market.

MISCELLANEOUS COMMODITIES

RADIUM.—During the past three years, the price of radium has fallen from about \$65,000 to \$70,000 to \$25,000 per gramme. This development is mainly due to cheap offering by the Canadian Eldorado Gold Mines, Ltd., which works the newly-developed uranium deposits of the Great Bear Lake region. By November 16th last, the Eldorado Company had completed the production of the first troy ounce of radium, and it is now producing at the rate of about 2 grammes per month. This compares favourably with the production of the Union Minière du Haut Katanga, in the Belgian Congo, whose output is about 5 grammes a month, and is sufficient to ensure that Eldorado will have an important influence on world radium prices. In the circumstances, it is of great importance that this concern does not intend to support the price-raising policy of the Union Minière. The present price, according to a statement of the general manager of Eldorado, is sufficiently remunerative and the company will not seek a higher return. There is certainly a large market for radium at this level of prices and an increase in production may be looked for in the near future.

RUBBER.—After considerable fluctuations, the spot price closed on Wednesday showing a gain of ¼d. on the week. The rise was due to the decision of the International Committee at its meeting on Tuesday to leave the quotas for the first and second quarters of the year at 75 per cent. and 80 per cent. of standard respectively, as previously arranged, but

The Truth about Germany under National Socialism

The present financial and economic position of Germany, and the relations between the National Socialist Party and the German Army Chiefs, have hitherto been wrapt in mystery.

German foreign and military policy, and the resources of men and munitions which are available to support it, overshadow Europe and perhaps the world. What is the truth about Germany's policies and resources?

For many months economic, financial and military experts associated with THE BANKER—the organ of British banking—have been engaged on a Survey of the present condition of Germany. This Survey is as comprehensive as it is unbiased. No less than 75 pages have been given over to an analysis of the German War Machine in 1937, German finances under Nazi Rule, Germany's Economic War Preparations, and the real value of the former German colonies. A full account of the remarkable changes which have been made in every important German industry is also included in the Survey. Though moderation and the strictest care for facts have animated all who have contributed to this Survey, the result of their efforts can only be described as astonishing.

The description of the present condition of Germany as it is depicted in the February number of THE BANKER should be read by everyone interested in public affairs or in finance and industry.

Copies of this number will be sent (2s. 9d. post free) to any address in the world on application to the Publisher.

THE BANKER
20 Bishopsgate, London, E.C.2

to raise the quota for the third quarter to 85 per cent. The market had feared a more bearish decision. Meanwhile, the outlook on the demand side is still obscured by the continuance of the American strikes. The spot price in New York on Wednesday was 20½ cents per lb., compared with 21½ cents per lb. a week ago and 21½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10½d. on the corresponding day last week. In forward positions, business has been done at 10½d. to 10¾d. for March shipment, as against 10½d. to 10¾d. a week ago. Stocks in London and Liverpool at the end of last week totalled 73,059 tons, against 74,659 tons a week earlier. A year ago stocks amounted to 161,707 tons.

VEGETABLE OILS AND OILSEEDS.—Quiet and almost inactive conditions rule, and despite the fall in prices there is little desire on the part of consumers to do business. Shipments of the new Argentine linseed have continued at the rate of 50,000 to 60,000 tons per week, and the quantity now afloat for Europe (including 18,000 tons from India) now exceeds 195,000 tons. A considerable proportion of this will soon be

arriving off the coast or at ports of discharge to relieve the shortage of spot supplies. Crushers here appear to have their immediate requirements covered and are awaiting a favourable opportunity and a revival of the oil demand. The quantity of linseed arriving at the Argentine seaboard is reported to be twice that of a year ago. The Government report says that both in quality and yield the seed just harvested is irregular. Uruguay, it is estimated, will have a crop of 124,500 tons, as against 76,380 tons last season. Only small quantities of Indian linseed are now being shipped, and the balance of the old crop is put at no more than 22,000 tons. Linseed oil has further declined, but is steadier. There has been less anxiety to realise, though values have dropped 35s. per ton during the month. Current value of raw oil, ex Hull mill, for February–April delivery is now around £26 5s. per ton (ex Hull mill).

Cottonseed is easy in the absence of effective demand, and refined cotton oil is quoted 10s. per ton lower but is about steady. Most other vegetable oils have an easy feeling. Oilcakes are in good demand, and late prices are maintained.

WHOLESALE COMMODITY PRICES

UNITED KINGDOM: LONDON, January 27th

An Anti-Tariff Move

FOR seven years the principal countries of the world have been fighting universal economic depression. Their weapons have been forged at home. Home markets in every trading country have been turned by State action during the depression into closed preserves for home producers, both industrial and agricultural. The apparatus which brought about the change has been fastened upon the economic life of every country—crisis tariffs, import quotas, restriction and marketing schemes, subsidies, and State-sponsored monopolies for large vested interests.

The result, after seven years, is that whereas the world's industrial activity is back at its 1929 level (it should normally have shown a very considerable growth in these past seven years) the volume of world commerce in 1936 was still only a little over four-fifths of its pre-depression magnitude. To-day, when unproductive State expenditure on armaments contributes an ever-growing stimulus, every country discovers a certain unbalance in its national economy. In highly protected home markets, for example, people begin to talk of boom conditions. On the other hand, in the sphere that is still conditioned by world economic influences, there are so-called distressed areas, languishing export trades, and redundant industrial or agricultural capacity.

To the dangers of such distortion, and of the complacent disregard of foreign trade to which it gives rise, three of our leading bank chairmen drew attention last week. Their warnings were timely. World trade is now reviving. World commodity prices and shipping freight rates have made a sudden and considerable spurt upwards during the last twelve months. The world's primary producers, first to succumb to the depression,

are utilising this access of purchasing power to buy finished goods. Indeed, a welcome breeze of cool reason is beginning to play about those novel expedients adopted in an atmosphere of panic during the depression.

During the last few weeks negotiations have been resumed between the Scandinavian countries, headed by Sweden, and the Netherlands and Belgium-Luxemburg Customs Union to vitalise the Oslo Convention of 1930. This only bound those countries not to raise their mutual tariffs without consultation; but even that proved abortive. Far more promising was the Ouchy Convention of July, 1932, between Belgium-Luxemburg and the Netherlands for the establishment of a freer-trading group of nations. That Convention provided for annual and reciprocal 10 per cent. reductions in the Customs duties of the two countries during five years, until these were halved. Its privileges were open to all countries who would make the same reductions. But, unfortunately for those countries who were not prepared to modify their barriers, it involved a qualification of their most-favoured-nation rights. On that ground, despite the blessing of the League Economic Committee, the British Government disapproved, and so destroyed it. At the same time, the British Government, acting within the letter of the most-favoured-nation clause but scarcely within its spirit, concluded the Ottawa Agreements, which effectively imposed fresh handicaps on the trade of many countries with Britain and her Dominions and Empire. The inevitable reaction to the Ottawa gesture, and to the new British tariff accompanying it, was that the countries most affected proceeded to strengthen their own barriers. Ottawa had, in fact, quite the opposite

effect to that which MR BALDWIN declared to be its intention—namely, to loosen the shackles of world trade.

This week the KING OF SWEDEN and his Foreign Secretary, HERR SANDLER, have made a visit to Brussels, after which HERR SANDLER proceeds to DR COLIJN at The Hague, to negotiate further. This week, too, the President of the Board of Trade, MR RUNCIMAN, returns from the United States, where he has utilised a nominally private visit to discuss with PRESIDENT ROOSEVELT and MR SECRETARY CORDELL HULL an Anglo-American commercial agreement. Again, this week it is reported from France that the rise in French prices, which has been throwing the franc slightly out of alignment with the pound and dollar, is to be kept in check by new reductions in tariffs and increases in import quotas. The Dutch Government this week have agreed to maintain import quotas, but to take the first opportunity of abolishing them. In Switzerland and in Belgium the same broad principle is being followed.

Here, then, we have what could be made the nucleus of a freer-trading group of nations. France, the United States and Britain are the three Powers whose joint manifesto on September 26th last enabled the gold *bloc* currencies to be brought into better alignment with those of the sterling and dollar countries. That tripartite statement expressly contained as its own *raison d'être*: "To

foster those conditions which will safeguard peace and will best contribute to the restoration of order in international economic relations and to pursue a policy which will tend to promote prosperity and to improve the standard of living." On the actions of these three Governments depend, to a decisive extent, those of the Scandinavian countries, Belgium, the Netherlands, and many others. These countries are the great colonial Powers of the world. If, now that world trade is stirring beneath its shackles like Gulliver waking in Lilliput, the British Government still maintains a *non possumus* attitude, which it did both in 1932 and again last autumn at Geneva after the tripartite currency agreement, it will be responsible for more than delay in the recovery of world trade. It will be blocking a course that offers high hope—possibly the only hope—of easing the political strain. It will run the risk of leading our unbalanced economy into grave future difficulties. It will tend to aggravate those autarkic influences, so stridently acclaimed in Germany last week-end, which may prove the undoing of our economic system. After seven years of depression and domestic recovery, we have to-day a chance to restore the economic balance, both of the nations and the world. The British Government should this time throw the whole of its weight behind a most propitious movement. As BENJAMIN FRANKLIN said: "No nation was ever ruined by trade."

Herr Hitler's Speech

HERR HITLER'S speech in the Reichstag last Saturday was ambiguous at every turn. If that was its aim, it was a masterpiece of rhetoric, though perhaps not so masterly an exhibition of statesmanship. It is the business of statesmanship to get things done. But HERR HITLER'S speech read like that of a man who finds he has carried out the programme on which he came into power four years ago, and does not know what to do next.

In his speech on Saturday, one last squeeze was given to the Versailles orange. The war guilt clause of the Treaty was repudiated, and the Reichsbahn and the Reichsbank were declared free from foreign servitudes, which in fact had already lapsed. The dictate of Versailles made HITLER'S fortune; but now the last drop of juice has been squeezed out of it "till the pips squeak"—to give a new application to a historic phrase. What is the Nazi leader—and the German nation—to make of the empty skin?

The FÜHRER said—and it is perhaps the most striking sentence in last Saturday's speech—that "the time of so-called surprises has thus been ended." This sounds precise. But ambiguity creeps in when we recall that he said exactly the same thing on the morrow of March 7th last. And we must also remember that he was probably speaking to the Reichswehr as much as the world; and the Reichswehr is known to be opposed to military surprises—for the present. Is it peace? We should have been inclined to believe him if, in this speech, his devotion to peace in the abstract had not merely been a refrain to so many refusals of other people's suggestions for ensuring peace in the concrete.

He rejects, for instance, the very idea of armaments limitation by international agreement. Germany alone will decide what scale of armaments Germany needs. "A general recognition of these principles would contribute to a lessening of the tension. Germany is happy to have found Italy and Japan to be of the same opinion," and she is content that Great Britain should likewise act as her own armaments assessor. But this sacred right of self-determination in armaments is not, apparently, applicable to "the armaments of that Power which is the basis of the armaments of all the

others." What is sauce for Germany, Italy, Japan and Great Britain is not to be sauce for Russia.

In the abstract, again, HERR HITLER smiles upon international trade. "I do not believe that there can be durable economic co-operation except on the basis of a new mutual exchange of goods." This confession of faith might have been copied from any issue of *The Economist* since 1843; but he quickly proceeds:—

I cannot build the future of the German nation on the assurances of a foreign statesman or on any international help, but only on the real facts of production. . . . I rejoice at every increase of our foreign trade, but in view of the political situation I shall not regret anything that will guarantee to the German people their existence when other nations have perhaps become the victims of Bolshevik infection.

In the Hitlerian analysis, durable economic co-operation across the frontiers is tantamount to giving a Nazi hostage to Communism!

Accordingly, the Four-Year Plan "does not allow of any change," and "it will give permanent employment to those workmen who are now being released from [*sic*] the armament industry." This German industrial programme with a Russian caption seems to wear a poker face. We had supposed from previous Nazi utterances that the purpose for which these formidable sacrifices were being demanded of the German people was to put Germany in a position to wage a great war. Now we are told that, instead of being for the promotion of German re-armament, it is really a means of supplying alternative employment. Swords into ploughshares instead of ploughshares into swords! But is it peace?

HERR HITLER proclaimed two lists of foreign States: a list of those with whom Germany's relations are "very friendly," and a quainter list of States which are "realities" in spite of the fact that their foundation-date has been subsequent to January 30, 1837. The latter list contains only three names: Germany, Italy and Poland. Italy and Poland figure in the first list as well, alongside Austria, Hungary, Bulgaria, Greece, Portugal, Spain, and notably Yugoslavia. But neither list contains the names of Czechoslovakia and the Baltic States. We are left to infer that these four un-

mentionable States—all of which are less than twenty years old—are in German estimation *Saisonsstaaten*, seasonal States, creatures of a day. This ominously expressive term was made in Germany for application to Poland before the German-Polish Pact of 1934. To-day it seems to be transferred to some of Poland's, and Germany's, weaker neighbours. Is it peace?

Happily the speech gives some warrant for guessing that it may really now be peace in respect of Spain.

Germany has no interest in Spain but the cultivation of those economic relations which Mr Eden himself has described as so important and profitable. Germany has no colonial claims on countries which have taken no colonies away from her. Our sympathies with General Franco and his Government are in the first place of a general nature, but they are also based on the hope that the consolidation of a real National Spain may lead to a strengthening of the European economic system. We are ready to do everything that may lead to a restoration of orderly conditions in Spain.

This passage—particularly the culminating sentence—reads as though HERR HITLER were contemplating a liquidation of the Spanish adventure. If this is really in his mind, he can be assured in advance that both the British and the French will be ready to build a golden bridge for him—when his Italian ally also retires from Spain.

The sentence about colonies leaves no room for the complacent assumption that, if only we go on re-arming

The British Film Industry—

Economics of the Films

EVERY week throughout the year some 30,000 transactions culminate in the delivery of more than 20,000 miles of film to provide entertainment for an average of 20 million persons in about 4,500 cinemas in Great Britain. From this enormous length of film material, some 4,500 programmes are built up every Monday, and 4,000 every Thursday, each programme containing, on the average, three to four separate items. These impressive results are obtained with an absence of fuss which pays high tribute to the efficiency of their organisation; with a precision that almost rivals the clock at Greenwich; and with an indifference to hail, rain, snow and fog which the newest Atlantic liners cannot excel.

In the present series of articles, we propose to describe the economic structure, function and financial basis of the British film industry. The first fact which confronts the inquirer is the preponderance of foreign over British films in the British market—a preponderance which has been materially reduced since the passing of the Cinematograph Films Act in 1927, but is still considerable.

Most of the foreign feature films come from America and are produced in Hollywood. These can be sharply divided into those made by the so-called major and the independent companies, respectively. The major companies have their own studios, their own large cinema circuits and their own exchanges (the American equivalent to our renting organisations). What most concerns us here, however, is that they also run their own renting (i.e. distributing) companies in Great Britain, through which all their films are marketed. On the other hand, the films produced by the independent American companies are distributed almost exclusively through British renters. They are distributed under contracts which involve substantial cash payments for each film delivered, as well as a participation in the results of their exploitation in Great Britain.

There are other distinguishing features between films

and sit tight on Tanganyika, Germany will give up hope of trying to recover her own colonies and will help herself instead to somebody else's—e.g. Angola or Netherlands India. It seems that the colonies which Germany wants back are, after all, the former German colonies now under mandate. But even here HERR HITLER later hinted that he might claim colonies anywhere.

One curious feature of the speech is HERR HITLER'S sensitiveness to the foibles of democrats, Christians, West Europeans and such small deer. Officially they no longer count—except perhaps as breeding grounds for the maggot of Bolshevism. Democrats? They are scum. Yet the Nazi prophet feels constrained to commend his own revolution by describing it as "democratic in the highest sense of the word." Christianity? Sheer treason to the tribal State. Yet the human FÜHRER has to proclaim his "gratitude to the Almighty" and his "faith in the consent of Him who stands above us" in order to intimate that he is as firm a believer as ever KAISER WILHELM was in the God of Abraham, Isaac and Jacob, instead of being an anti-God man like those Muscovite publicans or that sinner HERR ALFRED ROSENBERG. League of Nations? An insult to common sense. Yet it is an insult to Germany to accuse her of cultivating isolation.

HERR HITLER is doubtless satisfied that these propositions can be reconciled. The world asks: Is it, then, peace? HERR HITLER leaves the world wondering.

derived from these two main American sources. The services of all the leading star actors and actresses, which have high box-office value, are controlled by the major companies. The pictures made by them are, consequently, scheduled to cost, and actually do cost, many times as much as those produced by the independent companies. Well-authenticated estimates put the average cost of the major companies' productions in the region of \$400,000 per film, while those of the independent companies average less than \$100,000. It is therefore to be expected that all the best American films, which are produced and "dressed" most lavishly, and utilise the highest degree of technical efficiency, will find their way to the American-controlled British companies. The relatively inferior American pictures, on the other hand, which have stars and directors of a bygone year and stories which have been rejected by the major companies, will tend to find their way to the British renting companies. The cost estimates which we have quoted refer to feature films, whose running time is not less than one hour. But much the same differences apply to "shorts," consisting of cartoons, whose running time is six to seven minutes, to interest films, which run from nine to eleven minutes, and to two-reel comedies, whose duration is about twenty minutes. In short, nearly all the best American films are reserved to, and handled exclusively by, the American companies registered in Great Britain. The British renting companies are allowed to handle only the residue of films, which are much less lavish, much less attractive, and much less costly.

The importance of the British market to the major American companies is indicated by the figures of the estimated sums which are annually remitted to them for their films. Well authenticated estimates have put the total in recent years between £6 and £7 millions. It is a reasonable assumption that of this sum not more than half-a-million goes to the independent

companies in America. The balance of £5½ to £6½ millions measures the return which the British market yields to the major American companies. This is a decidedly substantial contribution to the cost of the entire output of pictures in American studios, which is believed to be not more than £20 millions. It accounts for the attention paid in America to every movement in the trade on this side, which might possibly affect the volume of remittances. All other non-American markets together yield the companies less than half as much as the British market alone.

When we turn to the position of British films we find a complete reversal of the high-lights and the shadows of the landscape. The cost of British pictures produced last year is said to have exceeded £4 millions. The output was similarly capable of division into major products—and others. The latter were largely composed of "quota" pictures, made for the American companies to satisfy their statutory obligations under the Quota Act. These pictures, which accounted for much more than half the total length produced, are believed to have cost an aggregate of about £800,000 to £900,000. The balance, whose average cost was four to five times as large, was financed and produced almost exclusively for British renters. It may be stated with confidence that the return obtained from America for the exhibition of British pictures makes an almost negligible contribution to their cost.

One further estimate deserves mention. The American-controlled British companies which, as we have seen, are concerned in the remittance to America of over £6 millions annually, are small in number. About eight companies probably account for more than £5½ millions, and two of these account for nearly £3½ millions. It follows that the individual concerns have large financial resources, which are likely to be of service to them in meeting any competitive threat or resisting any hostile combination on the consumers' side.

We may next consider the economics of the theatre side of the industry. As the fixed charges and running costs of a cinema theatre do not alter materially from week to week, the only real variable is the cost of the programme. In negotiating for films, therefore, the exhibitor concentrates the whole of his attention on the price he pays. He may decide, for example, that a particular film, featuring Garbo, Jessie Matthews, Robert Taylor, Shirley Temple, Clark Gable or Charles Laughton, ought to increase his average receipts by perhaps 50 per cent. On this estimate he determines the maximum cost he is able to pay. Suppose the average weekly receipts in a given house are £300, and the fixed charges and running costs £110. The average film programme will probably cost £90 to £100 each week. Now, suppose a good Garbo subject is offered which the exhibitor believes will increase his takings to £450, leaving him with about £340 to cover the cost of the film and his profits. He may possibly be compelled to agree to pay £225 for the film—which will bring his programme cost to £275 and his total costs for the week to £385—although this will leave him a profit of only £65, which is less than his average weekly profit. But he has two good reasons for this sacrifice. In the first place, the maintenance of the support he receives from his patrons may be contingent on his showing the best films; and in the second place, it may be essential to him to retain the goodwill of the renter who controls the distribution of the exceptionally attractive film.

The operations of renters in this country are severely controlled by the Quota Act. Before any dealings can take place with exhibitors, every film must have been shown either to a London trade audience (a trade show) or to a paying audience of the public (a première). No contract is valid unless it provides

that the date of exhibition shall be not more than six months after the contract date. Both provisions were introduced at the request of British companies. Though there have been notorious breaches of their terms, they nevertheless have produced a situation less unfavourable for the competition of British films than existed before the passing of the Act. But they impose limitations on freedom of contract which have no parallel in any other industry. Both renter and exhibitor are further affected by the quota obligation; the former must acquire a certain number of films, and the latter must screen a certain proportion of British films. Naturally, in view of the conditions we have already described, the exhibitor prefers to obtain his British films from British renters and his foreign films from American renters. But in practice it frequently happens that the foreign renter wishes to use his good American films as a lever for placing his inferior British films; while the British renter, similarly, is anxious to force his inferior foreign films on the exhibitor who wishes to obtain his superior British films.

Another factor in the film market, which cannot be ignored, is the system by which the entire body of exhibitors is broken up into what can best be described as a series of monopoly priorities. To illustrate this in its simplest form, let us suppose that in a given district there are three cinemas, of approximately equal value. Let us assume that each of these could afford to pay £150 for a particular film, but that three other adjacent cinemas can afford, respectively, only £70, £50 and £30. Now, any one theatre of the first series may negotiate for the film; but it is likely to insist on an agreement which will prohibit any simultaneous exhibition of the film by either of the other two houses, and its exhibition for some weeks afterwards by any of the second series of houses. The renter will, naturally, prefer to deal with one of the larger houses. But if any of the first run exhibitors refuses to pay the price demanded, the renter can still secure his gross return by dealing with the smaller houses, who may impose no ban on simultaneous exhibition.

There are two main types of contract between renters and exhibitors. The first is the simple flat-rate contract which calls upon the exhibitor to pay a fixed amount for a fixed period of exhibition. This is generally associated with inferior films when these are shown in leading theatres as a support to a "star top-liner," or in small theatres where the average takings are less than, say, £100 weekly; or for theatres which are open on Sundays; or for short films, including cartoons, interest films, one- and two-reel comedies and news reels. The second type of contract is a so-called sharing-term arrangement, which gives the renter a fixed share—varying from 25 per cent. to 50 or even 60 per cent.—of the net box-office receipts while the film is in the programme. Sometimes the sharing-term contract provides for a guaranteed minimum sum for the renter.

So much for the structure of the British film industry. The reader will now appreciate the economic forces determining the destination and distribution of films among exhibitors, and the prices which exhibitors can be induced to pay. These forces, it will be seen, are extremely complex, and, in some important respects, anomalous. The organisation of the whole industry is, to say the least, peculiar to itself. Its net effect can, however, be summed up in a sentence. Fixed prices for any film or class of film, at any given theatre, simply do not exist. In every case the skill of the salesman is exerted to raise, and the skill of the exhibitor to reduce, the price demanded. But there are certain modifying considerations which are present in the mind of the renter, and these will be the subject of a concluding article.

The Great Cities of Britain—III

Metropolitan Manchester

LARGE cities are usually associated in the popular mind with certain characteristics. Many of these popular ideas may be as fanciful as the golden street paving of London; some may be survivals from a distant past; and others will be sound impressions of the city of to-day. Manchester's list of popular associations includes rain, cotton, the Ship Canal, Free Trade, the Manchester School, Wythenshawe, *The Manchester Guardian*, the Hallé Orchestra, Miss Horniman and the Repertory movement, and, more popularly, the City and United football teams. Some might add the saying: "What Manchester thinks to-day, England thinks to-morrow," but they would be either naïve or malicious. Unkindest of all are those who add soot to rain and associate the city only with fog and gloom.

Some of these impressions—though not all!—nevertheless catch something of the spirit of the place. Its predominant theme is most readily found in certain of its institutions. Its social philosophy has long been regarded as bound up with principles sufficiently important and characteristic to earn the title of the Manchester School. The principle underlying this school of thought is a belief in individuality and in freedom from restriction, whether by way of tariffs or other types of governmental interference, or of the danger to the individual that comes from monopoly and privilege.

This rather aggressive individualism is still a characteristic of Lancashire folk. To the Southerner it sometimes appears to present a brusque and ill-mannered aspect. Undoubtedly, if natural environment really influences character, rugged countryside and wintry weather are reflected in Lancashire people. But it is fashionable to-day to seek for a material explanation of temperament and outlook. And certainly a rapidly expanding industrial community—with its captains of industry, its self-made men, and its prosperity based on selling in the markets of the world—would provide a basis for much of the philosophy of Manchester.

The industrialisation of the city began as far back as the sixteenth century, but the advance was most rapid after 1750. The period from 1800 to 1850 must indeed have been an exciting time for those who lived through it. During these years the population of the town expanded from 75,000 to over 300,000. Factories were being established and fortunes made; and the value of cotton manufactures exported rose at a sensational rate. Not all the city's energies, however, were absorbed in trade, for the period was equally momentous in political and social life. The establishment of the Manchester Statistical Society was but one example of its fertility. As the nineteenth century wore on, the fortunes of the city threatened to decline. But they were restored, with a new vigour, by the opening of the Ship Canal and of the Trafford Park trading estate. In the light of post-war events these developments were particularly fortunate, since they provided something to which Manchester could turn when disaster overtook the cotton industry.

The average export of cotton piece-goods in 1910-13 was 6,651 million linear yards. In 1925 this figure had

fallen to 4,637 millions and in 1931 to 1,790 millions; it has since risen to nearly 2,000 millions. That the cotton textile industry will regain a much larger share of its lost trade is doubtful, in view of the establishment of mills in other countries and the intensity of Japanese competition. In a contracting industry self-made men may become self-ruined, and the virtues of unmitigated individualism tend to become suspect. If at the same time there is a growing belief in governmental intervention, at home and abroad—a belief which finds expression in tariffs, quotas, subsidies and marketing schemes—the championship of free trade and individual enterprise is heroic, but a little hazardous. Despite the long period of depres-

sion, the Lancashire cotton industry still remains individualistic; but the acceptance of the recent Surplus Spindles scheme, after a long struggle within the industry, is a marked departure from earlier principles. Nor is it certain that a straightforward issue between Protection and Free Trade would sweep the Manchester seats in the latter's favour to-day as it did in 1906 and 1923. Manchester and the cotton industry still depend for their prosperity on the widest possible international trade, but two factors have modified their current outlook. The first has been the general raising of tariff barriers throughout the world, with its consequential technique of trade agreements. This development has, temporarily at least, turned Manchester's energies in the direction of securing favourable clauses in these agreements for its own industries. The second factor has been fierce competition from Japan, particularly in the coarser textile goods, which has reconciled some Lancashire manufacturers to a certain measure of protection, if only as a means of maintaining the standard of living of their workers. The Free Trade Hall, however, still stands as a monument to the Anti-Corn Law League, and in the face of adversity the Manchester School still struggles to maintain its loyalty to the principles on which its prosperity was founded.

No Manchester institution better reflects the outlook of the city than the City Council. During the nineteenth century, by its activities in every sphere of local government, this body came to be regarded as the "foremost example of English modern municipal government." In more recent years the burden of public assistance expenditure has somewhat limited the Council's activities. But the civic faith and energy which supported the Ship Canal have lost none of their vigour. The City may lay claim, for example, to the first municipal airport. Its policy is particularly well exemplified by the development of Wythenshawe, a garden city which will in time house about 100,000 people. This satellite of Manchester, which has been planned on the most up-to-date lines, is almost wholly owned by the Council. The Corporation even has power to lend money to industrialists for its suitable development. Its progress coincides with a five-year plan for slum clearance, in the course of which some 15,000 condemned houses will be demolished. Within the last couple of years two prominent citizens of Manchester have published books urging the planning and rebuilding of the city on modern standards. One writer,

indeed, has been sufficiently enthusiastic to produce a plan to rebuild the entire city by 1985.

To many people, Manchester's other name is still "Cottonopolis." As a commercial centre of Lancashire, the city necessarily is closely interested in the changing fortunes of the cotton industry. But Manchester is more than Cottonopolis. Even within the area limited by the boundaries of the City Council, its interests are widely diversified. But the activities of Manchester proper are closely bound up with the provision of finance, merchandising and other facilities for the products of a much wider area. Trafford Park, with its important electrical and other engineering works, is in Stretford; and the docks are mainly in Salford. As a measure of its importance, the population of the city is more misleading than that of any other town outside London, though the present estimate of about 770,000 places the city fourth in size in England. But in such a closely built area local authority boundaries lose their significance. Within the area covered by the Manchester and District Joint Town Planning Committee there is a population of about 3,000,000. But even this boundary touches on other industrial areas, and a 50-mile radius from the centre of the city embraces the West Riding and the Potteries, in all about 10 million people.

Manchester is the commercial and financial centre for much of this vast area. The Manchester Bank Clearings of £534 millions are easily the largest outside London. The same is true of the activities of Manchester as a financial and insurance centre. Other sources of employment arise from the metropolitan character of the city. The printing and publishing trades employ nearly 20,000 people in Manchester alone, partly because the city is the northern printing and publishing centre for the great national dailies. The demands of this large area for food

and clothing and the excellent transport facilities afforded by the port, railways and roads have made Manchester the chief provincial market for most kinds of foodstuffs and the headquarters of the Co-operative movement. The diversity of industrial activity in Metropolitan Lancashire can be illustrated by a few figures. The area included in the Manchester, Salford and Stockport sub-employment exchanges covers about 560,000 insured workers. Of this figure about 55,000 are in general and electrical engineering; nearly 50,000 in the clothing trades; 100,000 in distribution; 56,000 in cotton spinning and weaving; 30,000 in building; and 21,000 in printing and publishing. Among the smaller industries, rubber with 12,000, and furniture and chemicals each with 8,000 add to the diverse picture.

Clearly, the problems which face the city to-day are to maintain itself as a metropolitan centre and to make some re-adjustment for the decline in the cotton industry. The former problem is probably the easier, though it is partly bound up with a solution of the latter. Notwithstanding its diversity of industries, the Manchester district is still closely concerned with the fortunes of the cotton industry—as its unemployment rate of a little over 10 per cent. would suggest. But it is significant that, in the Metropolitan Lancashire area, the period 1925-34 saw an increase of 62,000 insured persons in the expanding industries and a decrease of 22,000 in the declining industries, bringing the number of insured persons employed in the expanding industries up to 54 per cent. of the insured population of the area. Such a change speaks well for the versatility and resources of the area. It only requires a continuance of the improved trend in the cotton industry, which has made its appearance in recent months, to restore Manchester fully to industrial health.

Canada's Illegal New Deal

WHEN the Supreme Court of the United States ruled successive measures of Mr Roosevelt's New Deal unconstitutional, the Press of Great Britain broke into many columns of report and comment. Last week, when the Judicial Committee of the Privy Council ruled the trump cards of Mr Bennett's New Deal invalid under the Canadian Constitution, the more earnest of the English papers duly and drily reported the fact, but the mass of newspaper readers might reasonably have been forgiven for failing to observe that it had happened at all. This contrast may be explained, but not excused, by the fact that the wealth and population of the United States are a dozen times greater than those of Canada. For the importance of the judgments does not lie only in their immediate effect on the economic and political life of a nation of eleven million people. They raise wider problems for Great Britain and for other countries of the Empire. They bring into the arena of controversy the relations between the British Parliament and the Constitution of Canada. They also provide an example, and reflect a tendency, which may apply to such federal countries as Australia and India will soon be.

The Judicial Committee has ruled that it is beyond the powers of the Federal Parliament of Canada to pass legislation dealing with minimum wages, hours of work and weekly periods of rest in industry, with unemployment and other social insurance, and with the regulation of marketing under schemes ostensibly modelled on our own agricultural Marketing Acts. The leading point in the judgments was their Lordships' rejection of the Dominion's claim to be able to enact labour laws under its power to make and carry out treaties, the treaties in question being International Labour Conventions. They also rejected what was, in effect, a plea of national emergency. On the Acts dealing with industrial conditions the Supreme Court of Canada had divided equally; the other two it also had ruled unconstitutional. Like-

wise, in declaring valid measures to enforce compositions between farmers and their creditors, and to make it a penal offence to engage in business practices in restraint of competition, the Privy Council endorsed the earlier decisions of the Supreme Court of Canada. Only as regards the Act applying a system of national marks and standards, which has been ruled valid contrary to the Supreme Court judgment, has any Canadian decision been reversed. Hence there is little fresh foothold for nationalist agitation against the Privy Council appeal, which Canada has already barred in criminal cases.

The issue of Canada's constitutional status is raised more indirectly. At present the Constitution of Canada, contained in the British North America Acts of 1867 to 1930, is excepted from the operation of the Statute of Westminster by a special clause in the Statute itself. It therefore can be amended only by Acts of the United Kingdom Parliament, which is legally able to amend it in any way it pleases, with or without the consent of the Canadian Dominion or provincial Governments. The theory is now commonly accepted, however, both here and in Canada, that the Canadian federation was an inviolable compact, and that substantial amendments of the British North America Acts must be supported by the unanimous voice of the Dominions and provinces. If that unanimity existed, there is no doubt that Parliament on this side would at once concur. If, however, the pressure of a majority in Canada in favour of extending federal powers, in the field of social and economic reform, became so great that Parliament at Westminster was asked to amend the Constitution notwithstanding the opposition of some of the provinces, then our legislators would be faced with an awkward problem. That possibility in itself is unlikely, but a similar issue may be raised in a roundabout way. Parliament may be asked to delete from the Statute of Westminster the clause safeguarding the British North America Acts, and thus

to enable Canada to amend her own Constitution. If the Dominion and the provinces were agreed on the process whereby the Constitution might be locally amended, again the British Parliament would have no difficulty in deciding what it should do. But if the agreement in Canada were not complete, the alternatives would once more be deadlock or an embarrassing responsibility for the Parliament of the United Kingdom.

The judgment raises even wider imperial issues, which we discuss in a Note on page 296. Meanwhile, what is Canada to do? Mr King has suggested a Royal Commission on the amendment of the Canadian Constitution, a delaying procedure that might put off the day of decision until sufficient agreement had been secured between Dominion and provinces to tide over until the next slump. Lord Atkin remarked in his judgment that Dominion-provincial co-operation was the proper means whereby Canada should fulfil internally her international obligations on matters outside the normal scope of federal powers. And at Ottawa this week the Government successfully resisted a motion to appoint a Select Committee on reform of the Constitution, on the ground that agreement between the Dominion and the provinces was essential. It is impossible, however, in the light of past experience, to hope for rapid progress in this direction. The Privy Council's judgment, altogether, has raised a host of problems, which call for speedy resolution in the interests of the Empire, no less than of Canada herself.

A Road and Rail Controversy

II: A Railway View

In the following article, written in reply to last week's statement of the case for freedom in fixing road charges, an expert in railway management contends that the railways are unfairly handicapped in their competition with road transport by the restrictions imposed by Parliament. The writer concludes that similar regulations should be made for road transport.

EVERYBODY engaged in public transport would agree with the writer of last week's article that the co-ordination of road and rail transport is "much needed." But before co-ordination can be achieved certain misconceptions must be cleared away.

In spite of the references in the preceding article to "stringent regulation," there is, in fact, no statutory control of the charges and conditions of carriage of road hauliers. On the other hand, there are stringent statutory conditions attaching to the carriage of goods by rail: there is a classified system of standard or maximum charges; companies are obliged to publish their charges and exceptional rates; they must not discriminate between traffics, and they must carry whatever goods are tendered. Moreover, traders can apply to the Railway Rates Tribunal for lower charges. Although it is generally agreed that this system should be continued, it is clear that it cannot co-exist with an unregulated system of charging by the highly competitive transport on the roads.

The argument of the previous writer that the systems of charging on road and rail were not, in fact, dissimilar, since both corresponded with the "cost of service," is unsound. It was supported by a table of figures, partly derived from the companies' returns, but arbitrarily altered and supplemented. From this table the writer deduced that the receipts on a wagon-load and on a wagon-mile basis were very similar for the different categories of traffic. But the figures compared were not comparable, and afforded little guidance to gross earnings from the several hundred million consignments carried annually, which vary greatly in their weighting from year to year.

The views of "cost" advanced in last week's article

were equally fallacious. Restricting his argument to haulage cost alone the writer stated ingenuously that it was not more profitable to haul merchandise than minerals or coal. It was then an 'easy step to the conclusion that "the net return per wagon-load does not vary greatly for the different class of railway traffic," and that "in practice rail rates are near to cost of service." But haulage costs are not the whole story; net return is not simply the difference between gross receipts and haulage costs; stations and the permanent way, for example, have to be provided and maintained.

Thus, the figures in "The Road Transport Case" were misleading. They were, further, one-sided. The writer quoted no figures of the "average net return per load" from road traffic. Nor did he consider the large volume of merchandise conveyed by passenger train. A comparison of average rail rates multiplied and divided by various numbers (where the average includes high and low class traffic and long and short distances) with unspecified average road rates but with different proportions of traffic carried, distances and services—leads us nowhere. Averages for like groups of commodities raise difficulties enough, but when the ranges of the groups are only partly connected the averages must defy valid comparison.

The suggestions which were advanced for reform were no more convincing than the writer's uncertain exposition of the present situation. It was suggested, for instance, that a better division of function between road and rail would be achieved by increasing rail rates for short distances and reducing them for main-line trunk services. The reaction of the coal exporter to this proposal would be to point out that the census of last March showed that the average distance of haul for the nearly 5 million tons of coal shipped in that month was only 21½ miles; 3¼ million tons were conveyed distances of less than 20 miles.

Actually, railway rates are already on a diminishing scale per mile, since Parliament has regard to factors other than haulage. In the case of shipment coal in railway wagons, the variations last March were from 9.89d. for one mile to 0.56d. per mile for over 300 miles.

It was stated in the preceding article that road rates are determined by competition. The same is true of rail rates where competition exists, but with the important addition that rail rates are in many cases further reduced by statutory requirements. This difference operates to the disadvantage of the railways. The railways are also required to publish their charges and to apply them without discrimination as and when required by a trader, who has selected the cheaper agent for the dispatch of a particular consignment. Rail rates are, therefore, finally determined upwards by statutory restraint and downwards mainly by competition; road rates, on the other hand, are fixed by competition, limited only by cost of service. There is no fair comparison.

Thus, the charges and the conditions of carriage on the railways are governed by Act of Parliament; while road transport companies have complete freedom in these respects. It is not true to say that "consignments on the railways must be charged according to what the traffic will bear"; value in relation to weight is merely one factor in the fixing of railway rates. What happens is that "what the traffic will bear" applies only as a reducing factor where the classified rate is more than a particular traffic can bear.

The law governing railway charges differs fundamentally from the law governing road charges; the two are incompatible, and in such circumstances co-ordination is impracticable. The prime desideratum is equality of treatment. Either or both must be changed to secure homogeneity, and Parliament should be guided by the national interest in deciding the direction of the change. There should be like treatment of the two means of transport; as regards the fixing and regulation of rates, and as regards publication, non-discrimination and the obligation to carry. Only when that is achieved will the way be clear for co-ordination. Meanwhile, the railway companies have on numerous occasions pointed out that disturbances of trade and consequent repercussions must occur if the existing system of rail rates is allowed to disintegrate into collapse.

Notes of the Week

The Honours List.—The delayed New Year Honours List was unexciting. Recent developments in economic policy were reflected by the conferring of a baronetcy on Mr Malcolm Stewart, the former Commissioner for the Special Areas; and industrial recovery was signalled by the granting of a peerage to Sir Harry MacGowan, chairman of Imperial Chemical Industries, and of promotion in the peerage of Lord Greenwood, chairman of Dorman Long. Recognition of the arts was limited but unexceptionable; the Warden of New College, Mr H. A. L. Fisher, had earned the Order of Merit by his unique position in the world of education and historical scholarship; and the Director of Music of the B.B.C., Dr. Adrian Boult, has done a great work for music and English musicians. The political implications of the list were perhaps less commendable. The accession of a new king, after a crisis in which the whole nation and all parties showed a striking solidarity, might surely have been marked by more generous recognition of men and women outside the circle of Government allegiance.

* * *

Parliament and Merchant Shipping.—Depression and disaster at sea have produced a considerable decline, in recent years, in the tonnage of British merchant shipping—as we show in a subsequent Note. And it was only seemly that the House of Commons should consider, in one and the same week, the state of the industry and the seaworthiness of its ships. On the latter point there was little disagreement; the findings of the Wrecks Commissioner and the High Court judgment in the “La Crescenta” case of 1935, together with the wrecks and disasters of the last few years, had amply revealed that the intentions of Samuel Plimsoll, forty-three years ago, were still being evaded; that, though overloading was an offence, it did not at law constitute unseaworthiness; and that, therefore, overloaded ships might still put to sea. A Bill to remove this anomaly was read a second time. The safety of life at sea was recognised as a paramount consideration, not to be affected by exigencies of business or profit.

* * *

A Bill to continue the subsidy of £2,000,000 paid to merchant shipping was less cordially received. There was some confusion in the arguments advanced by the Government spokesmen. It was alleged that the subsidy had saved the tramp shipping of this country—regardless of the contribution to this result made by the recovery in trade. It was claimed that every British ship and every British seaman could now find employment. And it was urged that the subsidy must be continued. But the recovery of world trade was not brought about by the British subsidy, nor is prevailing activity a sound argument for continuing that assistance. So long as freight rates maintain their present levels there may, in fact, be no actual payments. But so long as the subsidy remains *in posse* there is considerable danger that its potential recipients may come to look upon its indefinite continuance as a matter of right. It was comforting to notice that, not only from Opposition speakers, but also from the Conservative benches, came warnings that the subsidy must not be maintained longer than was absolutely, and objectively shown to be, necessary.

* * *

The Empire and the Crown.—At a first glance the Regency Bill, which secured its second reading on Tuesday, seems to imply nothing new in constitutional theory. There are, indeed, obvious innovations—the permanency of the provision for a possible regency, the separation of the regency from the guardianship of a minor Sovereign, the fact that the Regent will be the next in line of succession, never the Queen Consort or

Queen Mother—but they appear straightforward enough. Further study, however, shows the Bill to be an essential part of the re-drafting of the concept of a six-fold Commonwealth Crown that has been enforced by the abdication crisis and the approaching Coronation. The Bill, as Sir John Simon explained in the House, does not apply to the Dominions, who prefer (he said) to legislate for each necessity as it may arise. This in itself is new and far-reaching in its implications. Perhaps the most important innovation is the distinction drawn between the Imperial functions of the Crown and those which the King performs as quasi-Governor-General for the United Kingdom and its dependencies. This distinction is all but explicit in the Regency Bill, notably in Clause 6, which provides for the appointment of Counsellors of State in the event of illness not amounting to complete incapacity, or of the absence or intended absence from the United Kingdom. To the Counsellors shall be entrusted “such of the royal functions as may be specified.” This clearly refers to the United Kingdom functions, and leaves the residuum of imperial functions proper to be performed by the Crown in person. No doubt this is a shadow cast before the expected revision of the Coronation Oath and ceremonial.

* * *

The Moscow Sentences.—The *dénouement* of the Moscow trial has been as bewildering to the outer world as all its earlier stages. Last Saturday death sentences were passed on thirteen out of the seventeen prisoners. The four whose lives have been spared include the two names of Sokolnikov and Radek, who are not only the most celebrated but also the most deeply self-implicated of all. Moreover, the alternative sentences passed on these four—that is, ten years’ imprisonment for the two just named and for Arnold, and eight years for Stroilov—are remarkably light. Indeed, short of an asylum in England, a prison in Russia is probably the safest place of residence for the next decade for any Russian Communist who has accused himself of being a Nazi agent. Why so light a punishment for men who have confessed, whether in accordance with the truth or not, to so sensational an act of high treason? Is it because mercy is popular? There are hints that it would have been still more popular if all the seventeen had been let off with their lives. But then why execute the death sentences—if, as is officially reported, they have been executed—upon the thirteen obscurer prisoners whose continued existence would at any rate have been less of a nuisance to Stalin than that of Radek? We can only take some slight satisfaction in the reduction of the death-roll by four units. The motives of the Russian Government remain as impenetrable as before.

* * *

The Factories Bill.—Four generations have passed in industrial England, and to each a law to regulate the conditions of work in factories has been belatedly given; the Factory Acts of 1833, 1867 and 1901 all came, in one sense, 25 years too late. The Bill introduced into the House of Commons this week has been pondered for over two decades. The Bill of 1913 was lost in the excitement of war; political alarms cut short the Bill of 1924; and since 1925 the present proposals have lain sterile in the Home Office, waiting for Parliamentary time. Meanwhile, the outmoded, unwieldy and unworkable Act of 1901 has “regulated” an industry changing completely in technique and organisation from the structure of the nineteenth century. Women and young persons may still (as in 1847) work in any week up to 60 hours; safety provisions are largely confined to the mere fencing of machinery, hoists and lifts; even the

classification of undertakings into “factories” and “workshops” is derived from a period when the use of mechanical power was mainly confined to large units. The obsolete character of the existing law has been further thrown into relief by the advance made in other countries, and the researches and conventions of the International Labour Office.

* * *

The new Bill proposes to abolish the traditional and accidental distinctions between factories and workshops and between textile and non-textile concerns. It provides that the weekly working hours of women and young persons shall not exceed 48, and that the daily working hours shall not exceed nine. Every factory will be permitted, however, to work overtime up to an aggregate of 100 hours in the year, subject to a maximum of six hours in any week. Moreover, the Secretary of State may permit women to work 150 hours overtime annually in trades subject to seasonal pressure. The amount of cubic space required per person is increased from 250 cubic ft. to 400 cubic ft.; a standard of reasonable temperature is laid down; and there are provisions to secure sufficient and suitable lighting. Existing provisions for safety are recast; and new regulations are laid down for escape in case of fire. Cleanliness and the removal of dust are provided for; and young persons will not be allowed to carry any weight that is likely to cause injury.

* * *

The proposed factories Bill is timely and welcome, and many of its provisions are doubly so. But the measure shows signs of its hoary origins and tardy arrival; and many of the vices of traditional factory legislation are perceptible. Why is this Nine-Hours’ Bill, like the Ten Hours’ Act of 1847, confined in its regulation of hours to women and young persons? In France, the new Forty-Hours’ Law applies to all adults. Why must the reduction of hours be largely invalidated by overtime provisions which will permit in fact the working of a 54-hour week? Is not a 48-hour week for young persons under 16 in any case excessive? Nor are certain of the Bill’s administrative provisions calculated to allay criticism; to make possible the postponement of the new safety provisions for four years is to ignore the recent rise in the accident rate; and a similarly possible postponement of the overcrowding clauses is barely justified by the plea that certain depressed industries cannot afford to make changes. We are still very far from correlating our law with the best modern practice; and the conditions of work for young persons hardly square with official pronouncements on the subject of physical fitness. The number of inspectors will be increased; they will have a great and difficult task before them.

Schoolchildren’s Meals.—Mr. Shinwell proposed a motion in the House of Commons on Wednesday which called for the provision, at the taxpayers’ expense, of at least one free meal per day, in addition to milk, for every child attending an elementary or secondary school. The great increase in the importance attached to the problem of nutrition was evinced by the fact that the provision of free meals was nowhere challenged in principle. The Conservative amendment merely deprecated the wholesale character of Mr Shinwell’s scheme and attempted to shift the responsibility on to the shoulders of local authorities. This latter suggestion is quite definitely retrograde; so long as local finance is what it is, local responsibility will mean local neglect in many of the centres where assistance is badly needed. It does not, however, follow that the Labour scheme can be accepted whole. There was some dispute about its probable cost, but it would in any case be large. The problem of adequate nutrition for the people of the country is so vast that it is probably a mistake to start on the assumption that free food is to be provided for all irrespective of need or circumstances. If the attack is concentrated on a narrower front, it can be all the more intensive. Experience with the Means Test does not encourage the suggestion of further inquiries into the incomes of individual families. But it is fully possible to establish other rough, and less inquisitorial, criteria of need (the fact, for example, of unemployment or of more than a given number of children in a family). Economies made in this way would enable the campaign for better nutrition to be carried beyond the State-aided schools—which, in any case, do not contain all the children of the nation.

* * *

Popular Front.—Several recent events have made it clear that there is no possibility of the early formation of a coalition of the Left. The disaffiliation of the Socialist League by the Labour Party emphasised the clear-cut division between Marxist and evolutionary Socialism; while the reply this week to the letter of the “For Intellectual Liberty” Group, made by the Executive of the Liberal Party, also throws into relief the differences between various sections of Left opinion. The reply sympathises with the appeal made for united action to support the League and collective security, to lower trade barriers, to overcome unemployment and malnutrition, and to maintain and adapt to modern needs our system of democratic government. It welcomes the attempt to explore these common aims by bodies such as the “Next Five Years” Group and the activity in the constituencies of bodies like the Council of Action which seek to focus public attention on them. But the Executive’s reply recalls the philosophic differences between the Liberal and Labour creeds in regard to private enterprise and the function of the State. It expresses the view that an electoral “bargain” is

impracticable in the present state of political opinion and would not be implemented by constituencies; though under a system of Proportional Representation, it would be possible for progressives of all parties to work together for common ends. The net result is thus a negative from both Liberal and Labour headquarters. It may, however, be taken for granted that the attempt to focus opinion on matters of immediate reform, which to many seem more urgent than ultimate dogma, will continue.

* * *

Floods and Strikes in America.—The attention of the American public continues to be divided between the Ohio floods and the Michigan strikes. And in both there is nothing the public can do but wait for the crisis. In the case of the floods, the crest of the water is passing the junction of the Ohio and the Mississippi as we go to press. If the containing levees can hold at the junction, the anxiety will be directed towards the levee system of the Mississippi itself. Since the disastrous floods of 1927, a great deal of work has been done on the river banks. But it is still part of the strategy in the event of very heavy floods (such as this one) to allow some of the excess water to spill over into the flat lands on each side of the river and drain back into the main watercourse after the crest of the flood has passed. For this reason, large territories are being evacuated and it is said that the number of refugees is the largest ever known. In spite of these precautionary measures, however, there is some risk that the levees themselves may break. If that happens, the damage will be incalculable. The President's vast public works programme, announced this week, contains proposals to prevent future disasters of such a magnitude.

* * *

The Government's struggle with the floods is at least a clear-cut one, in which future events are at least partly predictable. The same is not true of the automobile strike, where the main lines of strategy of the contending parties are entirely confused by momentary tactics. On Tuesday a circuit court granted General Motors an injunction against the "stay-in" strikers who are still occupying some of its plants at Flint. Before any attempt at eviction had been made, however, Mr J. L. Lewis, chairman of the Committee responsible for the strike, conferred with the executive vice-president of General Motors and the Governor of Michigan, but the results of these deliberations had not been announced when we went to press. Even in the confused labour history of the United States there has seldom been a strike in which the issues were less clear than in this one. The only thing certain is that with every day that it lasts the chance of real harm being done to the progress of American recovery as a

whole is sensibly augmented. Meanwhile, in Washington, the two crucial problems of the country are being discussed. These are the methods by which another speculative boom is to be avoided, and the fundamental principles of American policy in an arming world. In the one matter, a further step has been taken by another increase in bank reserves, which is discussed in a Note on page 306. In the other, so-called neutrality legislation is under discussion in Congress. Much depends, both for America and for the world at large, on the precise form in which this legislation is cast.

* * *

French Defences.—This week's debate in the French Chamber on the national defences ended in a notable demonstration of support for M. Blum's Government. The final vote of confidence was 405 to 186. The War Minister, M. Daladier, has won a striking measure of popularity with the Service chiefs for his, to them surprising, fervour in the cause of efficient national defence. In his speech on Tuesday he was extremely frank. He informed the Chamber that in the last few months Germany had doubled the original one-year conscript service, thus holding a larger military force available and increasing the reserve strength. The German General Staff had concentrated on mass production of extremely efficient artillery for plunging fire, on the perfection of the network of motor roads this year, and on mass production of aircraft. The French Government, viewing the increase in armed strength of Germany, Britain, Russia, Poland, Italy, Czechoslovakia, and even Belgium and Switzerland, had to follow suit. In this vicious prodigality, the old tag is justified: "*L'appétit vient en mangeant.*" France would remain true to the citizen army, but reinforce it with highly mechanised divisions of specialist troops, above all for the manning of the Maginot Line, which now stretches from Dunquerque to the Jura.

* * *

M. Daladier admitted that the armament programme had been about three months in arrear, but declared that the curve of production had touched normal, and that the delay was now being overhauled. M. Pierre Cot, Minister for Air, stated that the 1,010 first-line machines of the programme replacing the now obsolete material of the 1932 expansion were ready; and the further expansion to the 1,500 mark was forging ahead. In addition, new reserves would double France's air strength—giving, in effect, a total of 3,000 brand-new machines. The aircraft were superior to those of Germany and equal to those of any other country, save only, perhaps, Russia. Both the Ministers reported that the nationalisation of the factories turning out tanks and aircraft components had resulted in manifold increases in output. Doubtless, in the present state of Europe, *le brave bourgeois* reads this with an access of confidence. But it is another pungent example of the perversion of Western countries' economic effort to preparations for their mutual destruction.

* * *

Reichsbank and Reichsbahn.—Herr Hitler's announcement about the Reichsbank and the Reichsbahn made some stir in Berlin, writes our correspondent there. In foreign quarters it seems to have been wrongly taken as a threat to the security of the Dawes and Young Loans. Herr Hitler, however, made clear that his aim was to vindicate "equality of rights"; he expressly described the proposed bringing of the two undertakings "entirely under the sovereignty of the Reich" as a last blow at the Versailles Treaty. In fact the security of the loans could not be endangered by changes in the status of the bank or the railways. No change in the Bank Law of 1924, as modified in October, 1933, has yet been announced. Herr Hitler's announcement, however, implies that the Reichsbank's compulsory connection with the Bank for International Settlements, as estab-

lished by the Young Plan, has terminated. At present the President of the Reichsbank must belong to the B.I.S.; and to the B.I.S. was duly submitted the Bank Law amendment of 1933, which abolished the General Council, transferred the right to appoint the President and directors to the Chancellor, and legalised open market operations. Probably the connection between Reichsbank and B.I.S. will be voluntarily maintained, but it is certain that any future amendments of the Bank Law of 1924 will be put through unilaterally. Any such changes will certainly not be in the direction of nationalisation; for nationalisation was more than once rejected before the War. Under pre-War law the Reichsbank merely stood "under the supervision and direction of the Reich," with the Chancellor as supreme authority; and it is suggested that this condition may be restored. Possibly the present restrictions on the giving of public credits may be relaxed. Reichsbank law has, however, been of little interest to foreign creditors since the obligation to sell gold or foreign exchange disappeared.

* * *

Changes in the status of the Reichsbahn are also foreshadowed by the appointment of Dr. Dorpmüller, who has been Director General since 1926, as Minister of Communications. Posts will henceforth be separated from Communications, and will have their own Minister, Dr. Ohnesorge. At present the Railways Corporation is a joint-stock company, of which all the ordinary shares are held by the Reich; some of the preference shares are in private hands. The original Rm. 11,000 millions of Reparation bonds have been replaced in the balance sheet by a reserve of the same sum. The Reparations tax, which replaced the Dawes Plan bonds, is now collected as an ordinary tax. It is possible that the joint-stock company organisation may be abandoned; and that the railways, like the posts, will be operated by the Reich, but will be independent of Reich finance. Railway preference shares were heavily sold in Berlin this week; it was feared that they might be converted into bonds, and that the present high (7 per cent.) dividend guaranteed by the Reich would disappear.

* * *

Nazi Germany: A Survey.—The current February issue of *The Banker* is devoted to a most comprehensive survey of Germany during the four years of the Nazi regime. The Nazis' progress in the fields of national finance, re-armament, economic preparation for war, industrial organisation by the Party-State, unification of banking, agriculture, the Press, colonial claims, foreign trade, and the Reichsbank, is described, analysed, and appraised. This survey of Germany is the most authoritative that has yet come into our hands. The authors are both English and German and—as a glance at the articles on the Budget (on which no official figures have appeared since 1934) and on Germany's military machine and economic war preparations show—they have first-hand knowledge of Germany's latest military and administrative apparatus. The following estimates of Reich budgetary expenditure and armament expenditure are carefully calculated:—

Year	Reich Budget Expenditure (In millions of Rm.)	Expenditure on Armaments
1932-33	6,700	...
1933-34	9,700	3,000
1934-35	12,200	5,500
1935-36	16,700	10,000
1936-37	18,800*	12,600

* Approximately.

Four-years' total for armaments, Rm. 31,100 millions, or £1,730 millions at an average rate for depreciated marks of Rm. 18 to the £1.

The writers conclude that the system of financing the growing proportion of arms expenditure by bills constitutes only a *potentiel d'inflation*. The totalitarian State could nip an inflation, begun by a run to discount the

bills, in the bud. Germany can, they say, continue to build up armaments for some time without fear of financial collapse.

* * *

But it is very interesting to perceive, in one article after another—especially the authoritative article on German economic war preparations—that one main conclusion emerges: Germany is travelling as fast as Russia to State Socialism. Private concerns and persons are only allowed to take the risks of financial loss; the State takes the cash, and lets the credit go. Industry, banking, foreign trade, even agriculture, are already virtually run by the State; and they must now become more so. They subserve the Party-State's programme for organising people and country as a disciplined striking force, able to withstand shocks severer than those of 1914-18. In this light it is interesting to read the conclusion to the editorial foreword:—

The truth is that most Englishmen find it difficult to discover any fundamental difference between what the poverty of our language forces us to call the "principles" of Communism and Nazism. They certainly do not feel that England is well cast in the role of financial missionary to save Germany from Bolshevism. The conclusion of the whole matter is that Herr Hitler must reap what he has sown, and his "nuisance value" must be discounted in his own disillusioned country and not in the City of London.

This is plain speaking. The survey which prompts it should be read and pondered. Unhappily for Europe as well as Germany, its conclusion seems unescapable.

* * *

President Azaña Speaks.—The speech of President Manuel Azaña in Valencia was of far more importance than perhaps was conceded to it in the British Press, for two reasons. First, it was a clear enunciation of the principles for which the Government was fighting. It was, in this respect, a conservative speech which emphasised that the constitutional Republic must continue, as representing the interests of all Spaniards, and that the integrity of its territory and the independence of its Government must be maintained. Herein it acquired added significance from the fact that his utterances came after consultation with and full approval of his Cabinet of Ministers who now represent, not only the political parties of the original Popular Front, but the large mass of working population which a year ago held aloof from the Government, preferring to go along in its own revolutionary way. The second important feature consisted in his references to the international phases of the conflict; namely, Spain neither exports nor imports politics and "has contracted no manner of political compromise with any country in the world." The sovereignty of Morocco as a foreign State had been violated; the equilibrium of Western Europe had been broken by intervention of Foreign Powers in aid of the rebels for motives which went beyond the mere acquisition of air and sea bases and commercial advantages. There is also a growing tendency to realise the truth that in the new Spain things can only go well if it be made "the Spain of all Spaniards," where all mass opinions and tendencies are respected. This was given expression to by Señor Azaña when he said that the

fight was not for a Communist Spain, or a Syndicalist Spain or a Spain of Republican parties. Quite the contrary. Worker and intellectual, professor and *bourgeois*, the syndicates and the political parties were fighting for the Spain of all Spaniards. This disposition to recognise that no Spain which is not "the Spain of all Spaniards" can succeed is also seen in a new youths' movement which, though in its infancy, is one of the most significant things born of the social revolution.

Détente in Spain?—From our Barcelona correspondent we learn that in Valencia a Youths' Congress was recently held, out of which there emerged a Youth Popular Front. It was proclaimed that youth must put a strong shoulder to the wheel to help along the task of Spain's transformation. What was particularly significant was the common accord that youth, whether Socialist, Communist, Syndicalist or Catholic, must stand together, sweeping aside the mere doctrinal views and the intolerance of their elders. The general secretary, Santiago Carrillo, stated, for instance (and there was no dissenting voice), "Catholic youth has a decisive rôle in the fight against Fascism. . . . The traffickers in religion must not be confounded with those sincere Catholics who, like ourselves, aspire for the liberty and prosperity of the worker." This is in the highest degree symptomatic. A passage from the speech of the Communist woman deputy, Dolores Ibarruri, known as "La Pasionaria," at the youths' congress, is significant as indicating how even outstanding *doctrinaires* are swerving to an acceptance of a social pattern which should be a mosaic of all shades of opinion and doctrine. She said: "I affirm that the burning problem of youth is the formula 'all in one'; Socialists, Communists, Anarchists, Republicans, Catholics, all who love their country, all united." It would thus seem that from widely separate points there proceed lines of convergence in the Azafia postulate of "Spain for all Spaniards." It is not a dream impossible of realisation. Spaniards themselves may yet surprise Germany, Italy, and also the world of non-Fascist States.

—**And the Moral.**—These recent tendencies in Spain are proclaiming the all-important message that a vindication of the Legitimist cause will not mean, as its enemies assert, a sweeping triumph either for Communism or for Anarchism. This come-back of the moderates began with President Azafia's speech. On January 28th, the President's speech was followed up by one in the same vein from the Minister of Public Works, Don Julio Just. On January 31st an appeal for Republican union was made by Señor Martínez Barrio, the Speaker of the Cortes. And on Monday *El Socialista* published an article from the pen of the Minister for Air and Marine, Don Indalecio Prieto, in which he spoke freely of the points of military weakness in the Government's camp and appealed for unity as the sovereign remedy. It has, indeed, been evident from the beginning that Anarchism, which is the native Spanish brand of Leftness, is not a dispensation under which any community can win, or even wage, a war. On this account the Communists, in spite of being an exotic growth in the soil of Spanish politics, have been gaining at the Anarchists' expense in virtue of combining Leftness with discipline. But the Communists cannot seriously hope to rule the roost on the Government side; and even if they did, this would merely give MM. Mussolini and Hitler a pretext for prodding General Franco into victory on the points of

foreign bayonets. If the Communists have reconciled themselves in France to playing a modest part in a popular front, the case for their adopting the same policy in Spain is even more cogent.

The New Japanese Cabinet.—Within the last week General Ugaki's attempt to form a Government has broken down owing to the absolute refusal of his military colleagues to provide him with a War Minister. The task has been taken over, and carried through to success, by General Hayashi—an officer who is not *persona ingrata* to the other members of his own service. The personnel of the new Ministry, including the new Ministers of War and Marine, is not so reactionary as had been expected at first; and, in particular, the appointment of Mr Yuki, the president of the Industrial Bank, to the Ministry of Finance appears to have been received with relief and pleasure in the business world. In fact, for the moment the Army seems to be satisfied with its successful assertion of a right to prevent the formation of a Ministry by any statesman who is not to the Army's taste. The naked struggle for power between the fighting services and big business, which came to the surface the other day, has been temporarily allowed to disappear underground again. Since armaments mean profits for somebody, the desiderata of the two great powers in Japanese life can be reconciled to some extent; but in the long run the bill will have to be paid by a peasantry which has long seemed near its last gasp.

The Japanese Army, as has been amply proved by the events of the last half-dozen years, is now in a position to exclude from office any Government that would be unwilling to lend itself to the Army's policy, while at the same time this policy—which is one of sheer military expansion in Eastern Asia—can have no effect upon the domestic agrarian crisis in Japan except to aggravate it by the application of expensive false remedies which can work no cure. Under this military domination, Japan is piling up her troubles at compound interest. We devoutly hope that, when the bill is finally presented in some form in which payment can no longer be put off, the Japanese Army will not run amok and thereby make the rest of the world, as well as the unfortunate Japanese nation, take its share of suffering for the Japanese Army's political and economic ineptitude.

Canada and the Privy Council.—Last week the Judicial Committee of the Privy Council ruled some of the key measures of Mr Bennett's New Deal invalid under the Canadian Constitution. We discuss the question of Canada's constitutional status, in the light of this decision, in a leading article on page 290. What is likely to be the reaction of Mr Mackenzie King's Government to the repudiation of its predecessor's measures? While they were in Opposition, the Liberals did not oppose the New Deal measures (except the Marketing Act) on their merits, though they made the most of their opportunity to stand as defenders of the Constitution; and of course it is the Liberal Government that has pursued the recent appeals. But Mr King's political prestige was not at stake upon a judicial vote, as Mr Roosevelt's was or as Mr Bennett's might have been. There are, however, wider issues than these. The Judicial Committee's ruling, following the United States' cases and the Committee's own rejection of the Australian marketing laws, makes it clear that the strict interpretation of federal constitutions—if these were drawn up before Government intervention in economic affairs was so widespread as it is to-day—must be a bar to acts of governmental regulation in economic and social matters, on lines which are accepted as normal and wholesome in unitary countries like Great Britain.

The Canadian Federal Government had undoubtedly expected that the Committee would be more generous in interpreting federal powers, in view of its famous

decisions in 1932 on cases concerned with aviation and radio. In both of these the authority of the Dominion was upheld, chiefly under the treaty-making clauses of the Constitution. Lord Sankey said, in the former case: "The real object of the (British North America) Act was to give the central Government those high functions and almost sovereign powers by which the uniformity of legislation might be secured on all questions which were of common concern to all the provinces as members of a constituent whole." So long as federal constitutions are interpreted in this manner they appear to offer no insurmountable hindrance to social and economic measures which are capable of being justified on their merits as matters of national importance. But Lord Sankey's dictum has not, apparently, appealed to Lord Atkin and his fellow judges. The present tendency towards strict interpretation, and therefore towards the rejection of new economic measures, will cause serious thinking, not only in Canada, but also in Australia and in India. For India is looking forward to the setting up of a federal constitution in which appeals in constitutional cases will lie, as in Canada's case, to the Judicial Committee of the Privy Council.

Gold Dollar Bonds.—Too late for comment last week, the House of Lords on January 28th delivered the final decision on the petition of right brought against the Crown by the International Trustee for Protection of Bondholders Aktiengesellschaft. Of an original \$250 million United Kingdom Government 5½ per cent. American issue of Notes in 1917 the bonds in question are the part (\$143,587,000) which was converted into twenty-year bonds dated February 1, 1917. In 1934 the bondholding company claimed eventual repayment from the British Treasury in accordance with the wording of the bond, which gave an option of repayment at \$4.86½ to the £1 in London, or "in gold coin of the United States of America of the standard of weight and fineness existing on February 1, 1917." The company naturally elected to receive, after the devaluation of the dollar in 1933, an extra margin of devalued dollars sufficient to make up the value of the amount in 1917 gold dollars. In the court of first instance in 1935 Mr Justice Branson held that the law of England applied; and, after distinguishing *Feist's Case*, that, as the American Congress Resolution of June, 1933, had voided all gold-dollar clauses in bonds, and expressly released all obligors from paying their gold-dollar obligations in equivalent (and therefore greater) sums of devalued dollars, either the bond could be discharged in New York by the nominal sum in devalued dollars, or else at the optional fixed rate of \$4.86½ to the £1 in London.

The Court of Appeal reversed this judgment on November 1st last, maintaining that the clause in the bond fixed only a measure of value received and value to be repaid; not the mode of payment. They agreed the law of England applied. From this the Crown appealed, and won its case last week. Lord Atkin, announcing the decision, said their Lordships agreed that the law of the United States applied; and that, after the Congress Resolution of 1933, there was accordingly no doubt but that the suppliers (the company) were only entitled to receive "dollar for dollar, in any coin or currency which at the time of payment is legal tender for public and private debts" in the United States. (The Resolution expressly states that "obligation" means any obligation payable in money of the United States.) There seems little doubt after this case that, notwithstanding the sense of the language in which such bonds have been couched, if the Government of a country in whose currency payment *can*, at option, be made, have expressly released obligors from obligations to pay a sum measured in gold, the bonds can be construed according to the law of that country.

Recovery in Shipbuilding.—Shipbuilding, one of the last of the more important industries to emerge from the depression, continued to make rapid headway during

the past year. None the less, the mercantile tonnage of vessels launched during the past year was still 24 per cent. below the level of 1929. The trend of launchings in the United Kingdom and abroad in recent years, as given in the annual statistical summary published by Lloyd's Register of Shipping, is shown below:—

MERCANTILE TONNAGE LAUNCHED (In thousands of gross tons)			
	U.K.	Abroad	World
1913	1,932	1,401	3,333
1929	1,523	1,271	2,793
1933	133	356	489
1934	460	508	967
1935	499	803	1,302
1936	856	1,262	2,118

While progress last year has been satisfactory, the United Kingdom's share of total construction has fallen appreciably, from 55 per cent. in 1929 to 40½ per cent. in 1936. The capacity of mercantile vessels launched abroad in 1936 was almost as high as in 1929, while the tonnage constructed in this country was still 44 per cent. below the pre-depression level. There has been a serious decline in foreign orders, partly due to subsidised construction abroad, which is causing anxiety among shipbuilders in this country. Nevertheless, the rising trend of world trade points to a further improvement in the industry this year.

Shipping Freights Decline.—The sharp rise in shipping freight rates during December was followed by a setback in January. Despite the improvement in the shipping position last year, it has been evident that the recent rate of increase in freight charges could not continue. The reaction last month was partly due to seasonal influences. In any case, *The Economist* index of shipping freights for January is still 26 per cent. above the level of a year ago:—

	(1898-1913 = 100)				
	Average, 1913	Jan., 1936	Nov., 1936	Dec., 1936	Jan., 1937
European waters	110.0	96.7	126.1	142.5	135.5
North America	113.1	92.8	100.1	105.6	117.2
South America	123.4	86.1	102.9	127.8	141.8
India	106.3	102.5	123.1	125.0	130.7
Far East and Pacific	117.4	93.5	113.5	126.2	140.5
Australia	127.9	92.6	108.6	142.1	147.8
Total	116.3	94.1	112.4	128.2	118.9
1913 = 100	100.0	80.8	96.6	110.2	102.2

As will be seen from the more detailed analysis of changes in freight rates between December and January, there was a substantial decline in Home Trade charges:—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	111.6	-22.7	South America:—		
Bay—outwards	146.8	-11.0	Outwards	89.9	+ 7.3
Bay—homewards	187.1	+ 8.1	Homewards	193.7	+20.7
Mediterranean:—			India—outwards	101.1	+ 8.5
Outwards	107.6	+ 5.8	India—homewards	160.3	+ 2.9
Homewards	148.4	+ 0.6	Far East, etc.	140.5	+14.3
North America	117.2	+11.6	Australia	147.8	+ 5.7

As the pressure for tonnage is normally highest towards the end of the year, the recent decline in rates does not necessarily portend a change of trend. Trade is still on the upgrade, and, as the latest returns of the Chamber of Shipping indicate, there is now practically no idle shipping tonnage in this country.

Menace of Strike Disorder

NEW YORK, January 26.—Another phase of the negotiations for a settlement of the Automobile Strike terminated abruptly when Mr Lewis of the C.I.O. peremptorily called on Mr Roosevelt for retaliation on the "economic royalists" who had opposed the latter's reelection. That particular conference adjourned, but another was almost immediately called. The General Motors Corporation has declined to attend while the factories are occupied. In the meantime, the General Motors Corporation has announced that it intends to open certain of its plants, which gives rise to fears of disorder.

The situation is as obscure as ever. The corporation employs about 135,000 persons, most of whom are now out of work. It contends that 79 per cent. of them have no sympathy with the strike and wish to resume work. The U.A.W. asserts that a majority of the workers favour the strike, and that General Motors' statistical expression of opinion was obtained by duress. Considering the issues at stake (in Flint, for example, about 80 per cent. of the recently employed population is now deprived of income), one would suppose it to be possible to discern authoritatively the sentiments of the workers; but the strike has been in process for almost a month and the claims are as widely disparate as ever.

Flood Calamity

The floods along the Ohio seem to be even larger than the calamitous inundations of last spring. Three great cities are affected—Cincinnati and Evansville (Indiana) and Louisville (Kentucky)—and many smaller cities. Half of the forty square miles of Louisville is under water, and altogether 600,000 or more persons have been obliged to vacate their homes along the valley. In Cincinnati the flood was complicated by a fire which swept over an area of about two square miles. In the flood area, power and light plants have been largely put out of operation; the transportation systems are moving, if at all, on greatly reduced schedules; and in some places the drinking water systems have been injured.

The rise in the price of primary commodities, uninterrupted and violent in the last two months of 1936, has encountered a substantial setback. Nevertheless, it appears that there is still an underlying upward trend in the price structure which has not yet been fully felt. Whether the price trend is the result of a confident outlook or the cause of it, the fact is that, in spite of the

great strikes (the glass strike and the longshoremen's strike have just been settled), the year has opened with production and trade at a level which would have been called highly prosperous in the 'twenties. Steel operations, at 81 per cent. of capacity, were at a new high level, and the two-point decline this week is attributed to the floods rather than to any slackening of demand. Indeed, the strikes, large as they have been, have had no visible general effect, or rather, their influence has been obscured; while they have doubtless reduced activity in some areas, the fear of strikes elsewhere has probably stimulated activity. So far as one can conjecture, the recent decline in the price of primary commodities is not so much an indication of slackening demand as a setback in a movement which has become patently speculative.

The Implications of a Balanced Budget

In six years our public debt has increased by about \$18,000 millions, or at the rate of about \$3,000 millions a year. To a great extent, this deficit has been financed by bank credit, created *ad hoc*. Assuming that the revenues forecast in the present schedules are realised, it would appear that the public debt will increase by only a nominal sum in the current calendar year; unless the requirements of the Stabilisation Fund for gold purchases run into unusually large amounts. It would seem that the transition from a period of large and continuous deficits financed by bank credit to a period of small deficits and increased taxation must involve credit considerations of the greatest importance.

Cheaper or Dearer Money?

There is some talk of higher money rates. In 1936, the Federal Government borrowed about \$4,000 millions of new money, the State and local governments \$700 millions, and industry \$1,200 millions. The prospect is that, in 1937, the Federal Government will require less—perhaps very little; the local governments about the same, and industry more. But it would presume a very great increase in new corporate financing, or a very wide error in Treasury estimates, to bring up the total demand for new capital to the level of 1936. This is the argument for lower money rates. The argument for higher rates is antithetical. Industry borrowed little from the public in 1936; but it expended on plant and equipment far more than these figures would suggest, largely out of accumulated depreciation funds, undistributed profits from the depression years, etc. Such corporate cash savings are now reduced, and to maintain the 1936 rate of capital expenditure would require much greater demands on the new issue market. Furthermore, one of the largest, if not the largest, single source of capital accumulation in this country has been undistributed corporate earnings, a source now closed by taxation. Distributed corporate earnings are now dispersed among capitalists whose investing capacity is reduced by income and estate taxes.

For these two reasons, it is argued that the process of capital accumulation and mobilisation has been profoundly altered in recent years, when the "over-saving" theory of the business cycle has had a real influence on legislation. It is therefore concluded that, under existing conditions, a smaller fraction of a given national income becomes available to the capital market in the form of corporate or individual savings; thus, the demand for capital will press upon the supply of savings and occasion higher interest rates. It is not certain, however, that bank deposits will continue to expand by the same large percentages as in the past, since this expansion has largely represented the influx of foreign capital into this country in the form of gold.

France

The Strain on the Franc

PARIS, February 4.—The import surplus in January exceeded 1,300 million francs. It reached, for the four months after the devaluation, a total of more than 4,000 million francs. This was due to a considerable accumulation of imported raw materials in anticipation of the revival of business, a further rise of world prices and a second devaluation of the franc.

Payment for these purchases abroad, added to a slight but persisting efflux of capital and the non-repatriation of the proceeds of export sales, put a great strain on the Exchange Equalisation Fund; the difficulty was further increased by the pessimistic views of a former leader of the Opposition, who described the economic policy of the Government as leading the country to catastrophe. Rumours that the franc would fall to its lower statutory limit of 43 milligrams of gold, and a renewed speculation, compelled the French financial authorities to take energetic measures. M. Auriol declared that the rumour of a further devaluation was unfounded; the rediscount rate of the Bank of France, which had stood at 2 per cent. since October 14, 1936, was increased to 4 per cent.; and the rate for advances was raised from 3½ per cent. to 5 per cent. This step is in striking contrast to the cheap money policy of the Government. If the Minister of Finance were to abandon the present discrimination against devaluation profits; that is if gold were purchased at its real price of 140 francs; if, moreover, he were to announce that some attempt was being made to balance the Budget, now that the revival of business is an unquestionable fact; then the general rise in prices, which has stirred the Stock Exchange to activity, would rapidly improve the situation.

As things are, the horizon has not been cleared by the announcement of the new English loan of £40 millions, which is designed to afford merely a breathing space to French finance. But it is rumoured that foreign loans will be issued by other French public undertakings, and the Government hopes to reach the opening of the Paris Exhibition in May without difficulty.

Increased Imports of Coal

The rise in wholesale prices was arrested for the second consecutive week:—

	(1913 = 100)			
	Jan. 9	Jan. 16	Jan. 23	Jan. 30
General index	500	510	511	512
National products	528	534	537	540
Imported products	454	468	466	462
Foodstuffs	517	527	527	528
Industrial products ...	489	497	498	499

Total coal production in 1936 was 46,147,000 tons, against 47,107,000 tons in 1935 and 48,640,000 tons in 1934. It rose by 487,000 tons during the first five months of the year and fell by 1,448,000 tons during the last seven months of the year, because of the strikes, and because of the recent introduction of the shorter working week. Total consumption was 69,629,000 tons against 67,812,000 tons, an increase of 1,817,000 tons. Imports of foreign coal rose by 189,000 tons between January and May and by 1,000,000 tons from June to December. Total imports increased from 19,718,000 tons in 1935 to 20,907,000 tons in 1936. Of this total, 35 per cent. was imported from Great Britain, 30 per cent. from Germany (Saarland excluded), 18.8 per cent. from Belgium and 8.4 per cent. from Holland. The average price per ton of imports was 90 francs during the first quarter of 1936; 95-96 francs during the third quarter; and 123 francs at the end of the year, after the devaluation of the franc.

The number of men employed in coal mines has risen for the first time for many years. There were 231,900 men employed at the end of December, 1936, against 223,800 at the end of 1935. The average wage paid for the third quarter was 36.71 francs, against 32.47 francs in 1935. In the mines of the North it was 37.54 francs, against 33.17 francs in 1935. Costs, if paid holidays and

the 40-hour week are taken into account, have increased by 40 per cent., and the selling price has risen by only 39 francs a ton; the average yield of production has diminished by 6.8 per cent. compared with the first quarter of 1936.

Germany

Attack on Joint Stock

BERLIN, February 2.—The Nazi Party is hostile to joint-stock companies. It objects to "anonymity," which it contrasts with "personal responsibility" ("leadership"), and particularly dislikes the "democratic" system of ultimate control and management by shareholders. An earlier law was intended to change joint-stock companies into "open trading companies," with personal responsibilities and unlimited liability. For companies with large capital this was not practicable. The new law practically eliminates the authority of the shareholders' meeting and the boards of supervision, and transfers these powers to the salaried directorate. Hitherto boards of supervision have largely controlled company affairs. In future their only rights will be to appoint, discharge and fix the remuneration of the directors and to supervise their activities; but the boards will themselves have no power of management. The shareholders' meeting will have no influence on management, unless expressly appealed to by the directorate. It will be left to the shareholders to decide the distribution of profits, but since the shareholders will not determine the amount of the profit, their right will probably amount to little. Thus, it is argued, "shareholders' parliamentarianism" is abolished. Within the directorate, which henceforth will collectively exercise almost all power, the "leadership" principle is further strengthened by giving the chairman an ultimate right of decision.

Relaxation of Industrial Activity

The number of employed at the end of 1936, according to the Sickness Insurance Board, was 16,955,000, against 15,600,000 at the end of 1935. The pressure of work in the production-goods trades eased off very considerably in December; in consumption-goods trades the relaxation was less marked. In the construction of machinery and vehicles (which includes shipbuilding) employment improved. The retail trade turnover of 1936 is returned at Rm. 28,000 millions, against Rm. 25,200 millions in 1935. The number of marriages contracted on the basis of marriage loans since the loans were begun was 700,000, and the sum of the loans Rm. 420 millions. Half a million children have been born of such marriages.

The production of ingot steel in 1936 was 19,157,500 tons, against 16,419,200 tons in 1935 and 5,750,000 tons in 1932. The steel syndicates report little change in the home market. The wire market has been very active. Cement sales in 1936 totalled 11,530,000 tons, against 8,630,000 tons in 1935, and 644,000 tons were exported, against 531,000 in 1935. The sales of the Ruhr Coal Syndicate were 98,020,000 tons, against 88,720,000 tons in 1935. The shortage of coking coal and of coke caused by the iron boom has led to some improvement in prices.

Increased Liquidity of Business

The market for bank shares has recently been active and firm; one exception was the Dresdner Bank. Newspapers predict that the Deutsche-Disconto and Commerz- und Privat Banks will increase their dividends from 4 to 5 per cent. The Berliner Handelsgesellschaft, the first great bank to report for 1936, returns its net profit at Rm. 3,157,000, against Rm. 3,128,000 for 1935, and a dividend of 6½ per cent. against 6 per cent. The chief change in the profit and loss account is the doubling of profits from securities and investments. The increased liquidity of private business is shown by a sharp decline of loans and an increase of investments in

THE TRUTH about GERMANY under NATIONAL SOCIALISM

The present financial and economic position of Germany, and the relations between the National Socialist Party and the German Army Chiefs, have hitherto been wrapt in mystery.

German foreign and military policy, and the resources of men and munitions which are available to support it, overshadow Europe and perhaps the world. What is the truth about Germany's policies and resources?

For many months economic, financial and military experts associated with THE BANKER—the organ of British banking—have been engaged on a Survey of the present condition of Germany. This Survey is as comprehensive as it is unbiased. No less than 75 pages have been given over to an analysis of the German War Machine in 1937, German finances under Nazi Rule, Germany's Economic War Preparations, and the real value of the former German colonies. A full account of the remarkable changes which have been made in every important Germany industry is also included in the Survey. Though moderation and the strictest care for facts have animated all who have contributed to this Survey, the result of their efforts can only be described as astonishing.

The description of the present condition of Germany as it is depicted in the February number of THE BANKER should be read by everyone interested in public affairs or in finance and industry.

Copies of this number will be sent (2s. 9d. post free) to any address in the world on application to the Publisher.

The BANKER

fixed-interest securities and bills. Standstill liabilities declined by Rm. 5 millions. The Reichskredit Bank's net profit in 1936 was Rm. 3,213,000 and its dividend was 6½ per cent.

The demand for credit at the end of January was normal. The increase in Reichsbank credits and investments in the last week was Rm. 437 millions, against Rm. 359 millions in the corresponding week of 1936. The Gold Discount Bank increased its circulation of notes in December by Rm. 300 millions. The *Deutscher Volkswirt* puts the present transfer on foreign loans at Rm. 220 millions a year, which is considerably below the last Reichsbank estimate. According to Dr Schacht, the capital foreign debt has shrunk to Rm. 11,000 millions. The last return by a Reichsbank official (which was unofficial) was for January, 1936, when the total was Rm. 13,000 millions. Dr Schacht's figure probably takes into account the recent gold *bloc* devaluations.

Spain

War-Time Trade

VALENCIA, January 29.—A scheme to co-ordinate foreign trade with the exigencies of the war is being worked out by the Department of Economy. This has led to agreements with England and France, and a contract for the sale of Spanish mercury through a London firm; the two trade agreements are compensation arrangements; 70 per cent. of British payments for Spanish goods, and 60 per cent. of French payments, are to be applied to payment for goods sent to Spain.

A new plan to reorganise the economy of Spain is being considered. This will include: monopoly-marketing through co-operative societies under Government control; a modern tariff system; the electrification of transport and industry; and the industrialisation of agriculture. The many rivers and streams of Spain could produce more energy than any other river-system in Western Europe; they offer vast possibilities of irrigation. There remains the problem of financing these projects.

Co-operation and Orange Production

Problems of agriculture and land-tenure are also engaging attention. The problem of the small-holdings on the Mediterranean and Atlantic seaboard is one of individual cultivation and co-operative marketing. That of the extensive and largely arid *latifundia* of the interior is one of irrigation and mechanical cultivation.

The rice industry has been organised on co-operative lines for nearly five years; and orange cultivation is being similarly reorganised. The domestic price of rice is fixed, and exports are subsidised. The orange market has been left free; the fruit has declined in quality, and it is hoped to remedy this by compulsory co-operation. It is urged that foreign statements that the orange plantations are being inefficiently run by peasants who have stolen them from their lawful owners are untrue; the proprietors fled; and peasant production is being organised and controlled. The export trade is now advancing rapidly.

The Remoulding of Spanish Life

The Communist Minister of Agriculture, Don Vicente Uribe, has defined the peasant problem. He maintains that the peasant must be made a "free man on free land," freed from the yoke of the local "boss" and the usurer. The difficulty, he states, is that the peasant, having been downtrodden for so long by a reactionary caste, is bewildered; he does not understand the efforts which are being made to help him; and is even inclined to resist them. The problem is to see the point of view of the peasant, to realise his ignorance and oppressive

traditions, and to ensure to him the fruits of his labour. In the last resort, however, "the interests of the collectivity of all must come before the rights of the individual," declares Senor Uribe.

The burden of these plans and theories is that the future Spanish State will be very different from the old one. Its social, political and economic structure will be very much modified. Collectivisation and co-operative management will be the ruling principles; of these, co-operation engages most attention. Collectivisation, if pursued too hurriedly, endangers production, and is alien to the Spanish character. There is already an outcry against an excess of committees, although it is realised that only under responsible control can things prosper.

Greece

Reducing Expenditure

ATHENS, January 18.—Expenditure has been reduced by over 1,500 million drachmas, and the Budget for 1937-38 will include further measures of economy. These economies will be made permanent by the decision of the Government not to fill the posts in the Civil Service which fall vacant. Moreover, the annual charge for public pensions, which increased in two years from 1,000 million drachmas to 1,200 million drachmas, will be reduced by a revision of all the pensions recently granted.

By this policy of economy the Government hoped to meet any possible deficit in the Budget; a deficit of more than 1,000 million drachmas was anticipated before the present Government was formed. The expenditure required for defence will also be covered, as well as the cost of social relief and of public works. The Finance Minister hoped to do this without increasing taxation. Since this statement was made, it has been found necessary, however, in order to devote an annual sum of not less than 500 million drachmas to social insurance and relief, to increase several taxes (taxes on tobacco and limited liability companies, stamp duties, telegrams, postage dues, etc.). Answering a question about the foreign debt, the Finance Minister replied that negotiations with the foreign bondholders, concerning the service of the debt, were going on. He expected that an agreement would be reached by the end of March, 1937.

The Control of Foreign Trade

In the course of 1936, the foreign exchange reserves of the Bank were diminished by some 21 million gold (pre-war) francs. Owing to the import surplus, it is argued that a liberal exchange policy can not be introduced. There is no reason at present, it is officially stated, to intensify restrictions, and rumours that the Government will tamper with Greek properties in foreign countries are unfounded. On the other hand, there is nothing to justify a relaxation of control for the time being. A statement made by the Minister of National Economy anticipated a rise of Greek exports in 1937, and an inflow of foreign exchange, of not less than £8,000,000, from the export of tobacco alone. The Government's policy, he said, was to decrease imports from abroad and to increase exports, in order to reduce the import surplus. He admitted that the restrictions on imports had not yet fulfilled the expectations of the authorities. Consequently, private clearings had been discontinued, excess imports were no longer permitted, and the official clearing and the trade agreements with foreign countries were to be revised. On the other hand, he said, domestic industries would be encouraged. He particularly mentioned an expansion of the textile industry. Commercial relations with Germany were very close, the Minister added, and Greece would be very glad to participate officially in the Leipzig Fair.

Irish Free State

Industrial Grievances

DUBLIN, February 1.—The progress of industrialisation has received a great deal of publicity recently at the annual meetings of the Chambers of Commerce and the banks. In many of the protected industries saturation point has been nearly reached, and the pioneers of the new undertakings are now concerned less with seeking shelter from foreign manufacturers than with competition within the Free State. The Minister for Industry and Commerce is coming to be regarded less as the fairy godmother who by a wave of the magic tariff wand can make uneconomic enterprises profitable, than as the stern mentor who is unkind enough to insist that protection exists not for the benefit of the manufacturers but for that of the nation. Mr Lemass never makes a speech without pointing out that protection involves duties as well as rights, and that consumers are entitled to goods of a high quality at a reasonable price. The manufacturers, not unfairly, retort that their costs of production have been raised by the Government. The Conditions of Employment Act raises the cost of labour, the Control of Manufactures Act raises the cost of capital, and the policy of decentralisation deprives many of the new industries of the advantage of the external economies of production. The consequence is that the new concerns can never hope to produce for export. Indeed, even the old exporting industries are exporting less than the old, and are tending to supply their foreign customers from new factories situated outside the Free State. This is, of course, part of a world tendency for industries to develop branches abroad, but the tendency is being accelerated here by the artificially high costs of production.

The maintenance of an export trade depends therefore on the country's capacity to export agricultural products. Moreover, the income of agriculturists

constitutes the principal demand for the output of the protected industries. Although prices have risen, Irish agriculture remains discouraged and depressed. The chairman of the Bank of Ireland referred with regret to the steady decline of deposits in the rural areas. At the annual congress of the Dairy Shorthorn Breeders' Association it was stated that there had been a deterioration in the quality of Irish livestock, in spite of the Livestock Breeding Act. The best cows and heifers are being exported, and the dairying industry is declining in spite of all the measures that have been taken to assist it.

Living on Capital

The deterioration of livestock is symptomatic of a general wastage of capital in Irish agriculture. The new industries have attracted much attention, but it is doubtful whether the amount of investment for which they have been responsible is as great as the amount of old investment which has been allowed to fall into dilapidation or decay.

The repayment of bank advances by farmers in many cases reflects an indisposition to invest in repairs and renewals of fixed and working capital. If the wastage of old capital is greater than the creation of new, the nation is living on its capital. If, in addition (as appears to be the case), the new capital investment is financed, not from current savings, but from the sale of external securities, the country is living on its capital in a second sense.

The following table shows that the external trading position has continued to improve:—

Year	Imports	Exports	Balance
1935	£ 37,347,860	£ 19,920,062	£ 17,427,798
1936	39,915,652	22,523,365	17,392,287

But the more thoughtful observers of the apparent prosperity of the Free State are deeply concerned by the extent to which the country may be said to be living on its capital.

Letters to the Editor

Bankers, Boom and Budget

TO THE EDITOR OF THE ECONOMIST

SIR,—I am glad that I misunderstood you in thinking that you were opposed to a further increase in bank deposits, if this were necessary to prevent a rise in interest rates. That is to say, on the assumption that there is no Defence Loan. But what is to happen, you ask me, if there is a Defence Loan? I agree with you, as you know, in urging that the Defence Loan, if any, should be kept as small as our reasonable capacity for taxation permits. But if, in spite of our arguments, there is a loan of (say) £50 million to £100 million this year, does it follow that we are forced back on reversing the downward trend of the rate of interest?

I do not think so. I still think that there are better expedients available to retard activity in directions other than rearmament, if we wish to retard it, and that these should be used by preference. But, if you will let me, I should like to explore a little further the technical aspects of the position.

In the first place, it does not follow that the Defence Loan cannot be gradually taken up by the public. With increased activity incomes rise and increased savings become available corresponding to the expenditure paid for out of borrowed funds; or if defence replaces other activities, then the savings which would have financed these activities are available to take up the Loan. Similarly, if it is convenient for business to finance itself through bank advances rather than through public issues, the savings which would otherwise have taken up the public issues are available to relieve the banks of part of their gilt-edged securities. Thus the need for increased deposits is not measured either by the size of the Defence Loan or by the increase in bank advances. It depends on two other factors; first of all, on activity as measured, roughly speaking, by the national income in money, which governs the demand for active deposits; and secondly on the psychological atmosphere towards gilt-edged and other securities which governs the degree of the desire to hold liquid balances. Unfortunately, though very naturally, the readiness to put savings into gilt-edged securities is largely influenced by the ideas which get about as to whether the gilt-edged market is likely to rise or to fall in the future.

It is the latter factor which needs careful handling. If the public is deprived of its normal supply of idle balances by the demand for active balances, or if it gets nervous about the prospects of the gilt-edged market, then I feel strongly that, unless we deliberately desire to raise the rate of interest, this demand for idle balances should be satisfied for the time being, the extra idle balances being subsequently withdrawn as a change in the atmosphere or in the circumstances permits.

Thus it is not a shortage of savings which will impair the position of gilt-edged securities, but a change in psychological expectations as to their future prospects. I believe that it is most important to prevent such a change by maintaining stability in the gilt-edged market. For,

if the change occurs, it will make the task of avoiding the slump more difficult. The weakness in gilt-edged securities during the last week or two is an illustration of how psychological the market is and how easily its nerves are upset. The weakness is partly due to anxiety about the Budget. But I believe that it is also partly due to the discussions which have been going on in various quarters about future policy. For, although almost all the participants in the discussion have deprecated a decline in the market and have taken, on the whole, a cheerful view against its likelihood, the discussion has drawn the attention of the public to the fact that the future of the gilt-edged market is not *certain*; and this has been quite enough to affect prices adversely. The actual movement so far is, of course, trifling. But if it were to be allowed to proceed to any length, the effect on public confidence would greatly aggravate the difficulty of our future task.

Yours, etc.,

J. M. KEYNES.

King's College, Cambridge.
February 2, 1937.

[We wish we could share Mr Keynes' confidence that the flotation of a large Defence Loan would create no insoluble monetary difficulties. But we fear that his wholly praiseworthy anxiety to avoid any rise in interest rates is leading him to ignore some of the dangers.]

It is *possible* that a Defence Loan would be gradually taken up by the public without any rise in interest rates. But in present circumstances it is very unlikely. Last year, the banks' investments increased by £25.8 millions (December averages) and there was no significant net increase in the supply of stock in the gilt-edged market, and yet gilt-edged prices sagged. If a Defence Loan were to be absorbed, it would require quite substantial assistance from the banks.

There is also a seed of danger in Mr. Keynes' phrase "the psychological atmosphere towards gilt-edged and other securities which governs the degree of the desire to hold liquid balances." One of the normal events of a boom is that the public discriminates between fixed-interest and other securities. If, when that happens (and it is already beginning), liquid balances are to be provided in sufficient amount to keep up the price of gilt-edged, will they not be more than enough to start a speculative boom in industrial equities?
